COMPOST FACT SHEET #5
Compost Bulking Materials

Bulking Materials and Carbon Sources

The ratio of carbon to nitrogen in feedstocks is an important consideration in optimizing the composting process. Composting wet, high nitrogen materials like manure and food scraps, requires the addition of a carbon source in order to provide the microbes with an energy source. Carbon sources can also serve as a bulking material, absorbing moisture and allowing air movement through the pile.

When securing bulking materials, remember that, “All carbon is not created equal.” Wood chips are not the same as shavings, shavings are not saw dust. All carbon sources can be used, but which to use depends on the situation and goals of the producer.

Wood Chips

Wood chips can be in the form of chips from a chipper, which produce a fairly consistent size of 2”, or tub grindings that come out in a variety of sizes with some long pieces. Their purpose is to promote natural air flow in the pile. When using bulky material, less turning is required, saving time and money. Depending on the end use of the product, the chips may need to be screened out, but can be reused in the next pile.
Shavings

Shavings have more surface area than wood chips which makes the carbon more available, but because of their structure they tend to clump when wet, which can impede good airflow.

Saw Dust

Because saw dust has very fine particle size, it is an excellent source of carbon. However, the fine particle size and lack of structure does not facilitate air circulation in the pile. It is also quite absorbent, and when moisture fills the spaces, air has a hard time circulating. If using fine materials like saw dust, the pile will need to be turned more frequently. Air can also be forced through the pile, but this can be challenging with dense material.

Hay/Straw

These dried grasses are a good carbon source but they tend to mat (become a thick mass) if not well broken up and mixed in. They require more turning, but if mixed in proper ratios, can work well.

Paper Products

Cardboard and newspaper are occasionally used as bedding on dairy farms and thus become part of the compost pile. They provide carbon and good absorption, but not much airspace. Some farms using corrugated cardboard that has gone through a bedding chopper have been successful composting it with the manure without other bulking materials.

Corn Cob/Stalk

These materials can be used to provide a carbon source and provide for more air flow. Stalks can be size reduced in a bedding chopper. Spoiled feed tends to add both carbon and nitrogen as well as converting the spoilage into a usable product.

Leaves and Yard Trimmings

Leaves and yard wastes (small sticks, discarded produce, and garden residuals) can be used as a bulking material and carbon source. They can add structure to the pile and are readily available from municipalities. Farmers have directly incorporated leaves into fields to increase organic material, but composting them first will make the nutrients and organic matter more available to crops.

One caution with leaves: When they are collected, they are vacuumed or picked up with a loader. With these collection methods you can get more than leaves; watch for rocks, garbage, glass and other contaminants that may be hidden in the leaves. Carefully manage wet grass clippings as a nitrogen source. Unless well managed, they can cause the pile to become anaerobic and odiferous.

CAUTION!
Be sure carbon sources do not come from treated or painted wood products.

NOTE!
When using a static pile composting method, it is important to use a bulker carbon source to keep the pile aerated.

HELPFUL HINT!
Ask road/tree crews working in your area if chipped brush and branches are available. Have a convenient place for workers to drop material off.
Contact list for sources of bulking materials for composting. Fill in the blanks and post in an easily accessible location as a reference.

The Cornell Waste Management Institute makes no warranties or representations, expressed or implied, as to the fitness for particular purpose or merchantability of any product, apparatus, or service or the usefulness, completeness, or accuracy of any processes, methods or other information contained, described, disclosed, or referred to in this fact sheet.
New York State Compost Facilities Search

A map of compost facilities, transfer stations, and compost education and demonstration sites in NY and surrounding states can be accessed at: http://compost.css.cornell.edu/maps.html (see example below).

Please check the map and help us update the information by letting us know of additional facilities or other changes.

Cornell University Farm Services
Compost Facility

Website: http://cwmi.css.cornell.edu/compostfs5.pdf

County: Tompkins
Owner: Public, College/University
Contact: Bill Huizinga
Address: Stevens Rd, Ithaca, NY 14850
Phone: 607-258-7235
E-mail: gl4@cornell.edu

Feedstocks
Food Waste (Pre and/or Post Plate): Yes
Floral waste and trimmings/plants: Yes
Manures: Yes, research animal bedding - Cow, Poultry, Horse
Other Feedstocks: compostable serveware

Source of Feedstocks
Greenhouses/Florists: Yes
Restaurants: Yes
Manure: Yes

Additional Information: All material comes from Cornell University campus facilities, no waste is accepted from outside the University. A tipping fee is charged to fund the site operation. The food waste includes pre and post consumer waste along with a large amount of compostable paper and dinnerware items.

Compost Process
How is waste composted? Piled in windrows

Finished Compost
Is compost for sale?: Yes
Is compost used on site?: Yes
