advice or other assistance. Just prior to his retirement he suffered a heavy loss in the death of his wife who had long been in frail health and upon whom he lavished the most tender care. He leaves to mourn his loss two sons, two daughters and thirteen grandchildren. To him they were a source of pride and great comfort. With full assurance they can always look upon his life as that of a distinguished seeker after truth, a superb teacher and best of all a truly Christian Gentleman.

F. P. Russell, B. S. Monroe, L. F. Randolph

Donald English

December 27, 1885 — July 9, 1974

Donald English, professor of economics, emeritus, was born in Oakland, California. He was a graduate of the University of California, Berkeley, in the class of 1909. At Berkeley he studied under Henry Rand Hatfield and Wesley Clair Mitchell, serving as an undergraduate research assistant to Professor Mitchell, who strongly recommended that he pursue an academic career. Upon graduation, he immediately received an appointment as an instructor at Washington State College, where he taught economics for two years. In 1914 he received the M.B.A. degree from Harvard University. His special field was accounting theory, but he was broadly trained in general economics and financial theory.

In September 1914 English came to Cornell to teach accounting theory and practice in the Department of Economics with the rank of assistant professor. In 1918 he was promoted to the rank of professor. For the next thirty-five years until his retirement in 1953 he was a vigorous, exacting, and hard-driving teacher in the College of Arts and Sciences. Never one to seek student popularity, he held his students to the highest standards of sound reasoning, accuracy of detail, and promptness in the performance of all assignments. Many students thanked him in later years for holding them to standards that they had sometimes resented as being interferences with their pleasant extracurricular activities.

English was long active in University and community affairs. In 1934 he was appointed to a three-member committee on control of athletics. As a result of the activities of this committee, Cornell's athletics program was reorganized, and James Lynah was appointed director of athletics and physical education.

In 1937, while a faculty representative on the Cornell Board of Trustees, he drafted the retirement pension system for the faculty in the endowed divisions of the University. He served as chairman of the Department of Economics from 1925 to 1946. He served jointly on the faculties of the College of Arts and Sciences and the School of Business and Public Administration from 1946 until his retirement in 1953. He was active in the Ithaca Community Chest, serving as chairman of its budget committee in 1941 and 1942. He also served on the board of trustees of the Ithaca City Hospital.

English gave generous amounts of his time to helping several undergraduate organizations (the *Widow*, the *Masque*, and the *Cornellian*) keep their accounts straight and preserve their chronically precarious solvency.

Although not a gregarious person, Donald English was sociable and extremely generous to his friends and close associates. He loved good food and lively conversation. He held strong opinions that he could defend with skill and vigor. He was not easily fooled. On the floor of the University Faculty he could be devastating when he felt that nonsense was being solemnly offered as sense.

During the last five years of his life English was almost totally blind. He could neither read nor watch television. But he insisted on living alone, spending many hours listening to radio programs of great variety, in even the worst of which he found something to interest him. He was delighted to have friends drop in for visits. He seldom burdened them with his problems. He was cheerful, uncomplaining, bright, and alert until the very day of his death. He outlived most of his friends, but those who have survived him remember him with genuine respect and affection. He served the University well for many years.

George H. Hildebrand, Clifton W. Loomis, Paul M. O'Leary

Frederick Seward Erdman

October 27, 1901 — September 22, 1968

Frederick Seward Erdman, professor emeritus of mechanical engineering, died suddenly on September 22, 1968.

Professor Erdman was born in Sidon, Lebanon (formerly Syria), where his parents, Paul Erdman and Amanda Cleveland Jessup, were missionaries. He completed three years of high school at the American Community School in Beirut, Lebanon, before his family moved back to the United States. His fourth year of high school was spent at Mercersburg Academy, Mercersburg, Pennsylvania, and after graduation he was admitted to Princeton University.

He had four busy years studying at Princeton where he was a member of the crew and also a member of the glee club.

After graduating from Princeton in 1924 with a B.S. degree, Professor Erdman went back to Lebanon where he taught physics and general sciences for a year at the American University of Beirut.

In 1925 he returned to the United States and entered Massachusetts Institute of Technology. He completed his studies for the engineering degree in 1927 and was awarded the B.S. in mechanical engineering. From 1927 to 1928 he worked for the Worthington Pump and Machinery Corporation at Cincinnati, Ohio, mainly to get practical engineering experience in research and design. In 1928 he accepted an assistant professorship at Robert College in Constantinople, Turkey. The crossing of the Atlantic was also a honeymoon voyage, as Professor Erdman was married to Mary W. Nicol just before leaving. He taught various engineering subjects to college juniors and seniors for the next eight years. The teaching experience instilled in him the desire for more advanced study; therefore, in the fall of 1936 he came to Cornell University on the Sibley Fellowship and began working for his Master's degree by conducting research on hydraulic or jet propulsion of ships. His findings here revealed that previous attempts to put this theory into practice failed because of inadequate pumping mechanisms. This fact led directly to his investigation of propeller pumps for his Ph.D. thesis. He was awarded a Master's degree in 1937 and the Ph.D. degree in June 1941.

In July 1941 he was appointed assistant professor of mechanical engineering at Cornell University. He was promoted to associate professor in 1944 and professor in 1949.

During his membership on the faculty he taught required and elective courses and also performed studies for the frozen food industry with special reference to engineering features.

In 1948 he was a visiting engineer at the Brookhaven National Laboratory and for the next three years was retained as a consultant on a liquid-metal pump project.

His 1955-56 sabbatic leave was devoted to helping the Cleveland Electric Illuminating Company solve their turbogenerator problems.

He published several papers in the areas of fluid dynamics, refrigeration and instrumentation. He was the coauthor of a classic book entitled *Principles of Food Freezing*.

In February 1961 Professor Erdman was appointed associate dean of the Graduate School and he held this position until his retirement in June 1967.

Professor Erdman was highly respected by his students as an excellent teacher and a strict, but very fair person. He was especially known for his precise definitions of technical terms and clear explanations of some very difficult technical topics.

Besides his scholastic activities, Professor Erdman was frequently a consultant to several engineering companies involved in fluid dynamic problems, and he was also several times an expert witness in gas explosion trials.

Professor Erdman was a deacon, elder, and chairman of the Session executive committee of the First Presbyterian Church in Ithaca; secretary-treasurer of the Board of Trustees of Beebe Chapel; and chairman of the Board of the Catherine Street Missionary Apartments.

He was president of the Cornell chapter of the American Association of University Professors; member of the American Society for Engineering Education and former member of the regional executive committee; member of the American Society of Mechanical Engineers; and member of the American Society of Heating, Refrigerating, and Air Conditioning Engineers.

His main recreation was sailing, and he maintained a sailboat on Cayuga Lake for many years.

Professor Erdman is survived by his widow, Mrs. Mary Nicol Erdman of Ithaca; four daughters, Mrs. David Blais of Omaha, Nebraska, Mrs. Douglas Merkle of Colorado Springs, Colorado, Mrs. Horace Mann of Montgomery, Alabama, and Miss Constance Erdman of Ithaca; a son, Frederick Seward Erdman, Jr., of Rochester; and ten grandchildren.

All those who knew him intimately will remember him as a righteous person and a loyal Cornellian.

W. Donald Cooke, Howard N. Fairchild, David Dropkin

Albert J. Erdmann, Jr.

May 17, 1911 — June 11, 1965

Dr. Albert J. Erdmann, Jr., a member of the staff of the Department of Medicine for more than twenty years died on June 11, 1965, at the age of 54.

At his death Dr. Erdmann was Assistant Attending Physician and Clinical Assistant Professor of Medicine, but in recognition of his devoted and productive work in the Department he had been recommended for promotion to Associate Attending and Clinical Associate Professor to be effective July 1.

Dr. Erdmann was born in New York City and attended Lincoln and Hotchkiss Schools. He received his Bachelor of Arts degree from Yale in 1933 and his medical degree from Harvard in 1937. His graduate training was obtained at the Peter Bent Brigham Hospital in Boston and the Cornell Medical Division of Bellevue Hospital. During World War II Dr. Erdmann served four years overseas as an Army Captain.

In addition to conducting an active practice of medicine, Dr. Erdmann maintained many professional interests during his career. He was one of the most dedicated and reliable teachers in physical diagnosis in the Medical College. He served as an Attending Physician in Bellevue Hospital, headed the Diabetic Clinic there, and also served as a tutor and Attending Physician in the General Medical Clinic at The New York Hospital. He was intimately involved in the development of the Cornell Medical Index as an aid in the recording of the history of patients and continued his interest in its use and improvement.

Dr. Erdmann is survived by his wife, Mrs. Joan Untermeyer Erdmann, and his children, Albert John III, Anthony Carl, Ann Louise, and Abigail Brant.

E. Hugh Luckey

William Harry Erickson

April 4, 1916 — October 21, 1998

William Harry Erickson was born in McKeesport, Pennsylvania on April 4, 1916. After graduating with a B.S. degree in Electrical Engineering from the University of Pittsburgh in June 1938, Bill joined the Duquesne Light Company in Pittsburgh, Pennsylvania, where he became an electric-power transmission and distribution engineer specializing in the design of transmission facilities. During this period, he was also a graduate student at Carnegie Institute of Technology. In 1942, he came to Cornell as a civilian instructor in steam engineering in the U.S. Navy V-12 officer-training program as a specialist in motors and generators. He joined the School of Electrical Engineering as an Assistant Professor in 1945, received the M.S. degree in Electrical Engineering from Carnegie Tech in September 1946, became an Associate Professor in 1947, and attained full professorial rank in 1953. When Charles R. Burrows resigned as Director of the EE School in 1957, Professor Erickson served as Acting Director for two years and as Assistant Director from 1959-65. From 1965-71, he was an Associate Dean of the College of Engineering. Bill returned to teaching duties in 1972 and also served two separate three-year terms (1972-75 and 1979-82) as a member of the administrative board of the Division of Unclassified Students, a college department that supervised undergraduates who were in academic difficulty. He retired as Professor Emeritus in July 1982. The major portion of Bill's 40-year academic career at Cornell was devoted to undergraduate education in the EE School and in the college, with emphasis on the application of engineering methods. He was also an ardent advocate of good technical writing and humanities studies in an engineering curriculum.

In 1946 and for years afterward, the large number of students who were enrolled in the Schools of Chemical, Civil, and Mechanical Engineering were required to take special courses in electrical engineering. Professor Erickson was given the task of organizing and teaching these "service courses," and served as a mentor to a group of graduate students who were appointed as his teaching assistants. Several of these young instructors later became members of the EE School faculty. Since a suitable textbook was not available, Bill wrote and distributed a series of class notes on basic electrical engineering and dc and ac machinery that he dubbed "Electrical Engineering for Non-Electrical Engineers." In collaboration with the late, Professor Nelson H. Bryant, who wrote the electronics component, the notes were expanded into a textbook entitled *Electrical Engineering, Theory and Practice*. The first edition of this popular text was published in 1952, a second edition came out in 1959, followed by a paperback edition in 1975.

Professor Erickson's background and expertise in electric-power systems and machinery were invaluable in the Naval training program, in the development of his text, and throughout his academic career. His familiarity with engineering practice allowed him to construct challenging thought-provoking problems that were incorporated into his text. Unlike the usual rote exercises found in many textbooks, every problem in the text required a firm understanding of the principles involved in order for the student to achieve a correct solution. Bill often received requests for a solution manual from users of his text at other colleges but his typical response was, "I've given you the correct answers. You'll learn something if you figure out the solutions by yourself."

In the early 1950s, Bill helped initiate and taught many sessions of a required senior EE engineering-reports course that featured preparation of technical articles and oral presentations. When the Division of Basic Studies was established in the College of Engineering in 1961, Bill initiated Eng. 101 and Eng. 102, Engineering Problems and Methods, as introductory engineering courses at the freshman level. The courses featured consideration of major examples of modern engineering, emphasized the interrelationship of the several professional fields, and described the role of the engineer in society. Bill taught these courses for 10 years in addition to his duties as Assistant Director of the EE School and as Associate Dean of Engineering. During those years he also continued his service-course management and teaching responsibilities, and served as class advisor at all class levels. Upon his return to active teaching without administrative responsibilities, and until his retirement, Bill applied his machinery and power-system expertise to introductory electrical engineering courses at the sophomore level, and particularly to the junior laboratory courses that came to be known over the years as "Super Lab." He was a junior and senior advisor throughout those years and served as advisor for several Master of Engineering projects, including design of a Mars Rover, and a windmill power generator.

Many of Bill's major contributions to the College of Engineering occurred while he was Associate Dean of Engineering. In his initial task of restructuring the Engineering curriculum from a five-year to a four-year program, he achieved a smooth and relatively trouble-free transfer to the new curriculum due in large part to his direct approach and clearheaded solutions to the problems that arose during the transition process. His strong belief in the need for engineers to have a thorough grounding in the humanities led to the establishment of a college requirement in the new program of at least 30 hours in the College of Arts and Sciences. During his tenure as Associate Dean, Bill was responsible for over-all undergraduate affairs in the college, and was particularly effective in his work with the Academic Standards Committee where his stern but eminently fair judgments administered to students in academic difficulties ultimately caused many of those students to improve their records and graduate

successfully. In later years, these same students often expressed their gratitude to Bill for his positive impact on their successful careers.

In addition to his classroom responsibilities, Bill was an active participant throughout the years in the work of many committees, including among others, Long Range Planning, Financial Aids, Nominating, and Physical Education and Athletics, at the university level; the Core Curriculum, Professional Programs, Policy, and Academic Standards, in the College of Engineering; and as a multi-term member of the governing Faculty Committee in the EE School. In off-campus activities, he was registered as a professional engineer in New York State, served as Chairman of the Ithaca Section of the American Institute of Electrical Engineers (AIEE), and was the Chairman of the AIEE Summer General Meeting held in Ithaca in 1961. Bill was named a Fellow of the AIEE in 1962 “for contributions to engineering education.” When that organization became the Institute of Electrical and Electronic Engineers (IEEE), he continued his membership and became a Life Fellow of IEEE in 1981. He was elected to the engineering honor societies Tau Beta Pi, Eta Kappa Nu, and Sigma Tau, and was a member of the American Society for Engineering Education.

Bill was an avid golfer, had a keen interest in baseball, and organized the EE School Franklin Hall Bowling League. However, his particular long-time interest was in the “Sport of Kings.” His overall gaming success with the horses is not known but he always maintained that his principal concern was with statistics. On several occasions, he was a speaker at student-award banquets where he delivered a “lecture” that he called “Horse-Racing for Non-Horses”, a corollary of “EE for non-EE’s.” On these occasions, he would display his secret formula for track success: a long roll of paper covered with complex mathematical symbols.

In 1955, Bill was elected President of the Exchange Club, an Ithaca branch of a national service club. Soon after assuming office, Bill discovered to his dismay that the constitution of the club contained a clause that banned non-white persons from membership. Under Bill’s leadership, the local club voted to withdraw from the national organization and form a new group, the Ithaca City Club, that is still in existence. On April 23, 1956, the *Ithaca Journal* reported that on the previous Saturday Bill was presented with a plaque that reads: “B’nai Brith of Ithaca, New York honors William H. Erickson for outstanding achievement towards equality of man.”

Bill and Mary Margaret Mannion were married on December 27, 1941 in Chicago, Illinois. Their 40 years of life together, principally in Ithaca, ended when Mary Margaret died on August 19, 1981. Bill is survived by his son, James Paul and his wife Suzanne, of Fairport, New York; his daughter, Mary Ann and her husband, Thomas McMahon, of Stamford, Connecticut; a sister, Ada Dickey, of Monroeville, Pennsylvania; a sister, Dorothy

Erickson, of Fond du Lac, Wisconsin; his sister-in-law, Barbara Mannion, of Chicago, Illinois; and his brother-in-law, Robert Mannion, of Cleveland, Ohio. He was predeceased by his brother, G.F. Erickson.

Bill Erickson will be long remembered as a dedicated teacher and advisor; a man of exemplary honesty and integrity who set high academic and professional standards for himself, his associates, and his students; and a highly respected colleague, and a true friend.

Paul D. Ankrum, Norman M. Vrana, Simpson Linke

Myrtle H. Ericson

November 5, 1909 — August 28, 2006

Professor Emerita Myrtle H. Ericson passed away on Monday, August 28, 2006 at St. Benedict's Health Center in Dickinson, North Dakota. She was a long-time Food and Beverage faculty member of the School of Hotel Administration. During her 31-year career at Cornell, her enthusiasm for and knowledge of fine food and food production techniques changed many students' views on dining and how food should be presented. As an academic advisor, she was always available to her students, providing good advice delivered in a sincere and pleasant demeanor.

She was born in Cottonwood, South Dakota, the daughter of Peter J. and Esther Ericson. She received her elementary and secondary education in Vermillion, South Dakota, her Bachelor of Arts degree from the University of South Dakota at Vermillion, and her Master of Science degree from Iowa State University in Ames, Iowa. She took additional course work at the Culinary School of New York and Columbia University in New York City.

She began her career as an educator by teaching high school in Chester and Beresford, South Dakota and at Sioux City, Iowa from 1931-39. She taught at the University of South Dakota at Vermillion from 1939-44 prior to joining the faculty at Cornell in 1944. She was an Instructor from 1944-47 and an Assistant Professor of Food and Nutrition from 1947-50 in the College of Home Economics. In 1950, she became an Associate Professor in the School of Hotel Administration and taught Advanced Food Production and Menu Planning. Professor Ericson instilled in her students a respect for the quality of the ingredients used in food production and an appreciation for the artistry of food presentation long before these concepts became common in the Restaurant Industry. She focused her research efforts on experimental foods, recipe standardization and fancy foods. Her work on standardization of food production recipes using the metric system of measurement helped the Restaurant Industry produce more consistent products and achieve accurate yields and costs. She was the author of numerous food and beverage related publications, which appeared in the *South Dakota Journal of Food Science*, farm journals, Cornell Extension bulletins, and *The Cornell Hotel and Restaurant Quarterly*. Professor Ericson served as a food consultant to several hotel companies around the world. She also conducted seminars internationally. She was awarded the title of Professor in 1961. She retired from the School of Hotel Administration in 1975.

Professor Ericson was a member of the American and New York Home Economics Association and the American Association of University Women. She was listed in *Who's Who in America* in 1957. She was an avid sports

enthusiast; she liked playing golf, swimming, and bowling. She enjoyed attending athletic events at Cornell and watching sporting events on television in her retirement years.

Professor Ericson was a long-time Hanshaw Road resident in Ithaca. In the mid 1990s, she moved to Dickinson, North Dakota to be nearer family members. She resided at the Evergreen Retirement Center, and served as a consultant for renovations to the Food Service facilities there as well as menu planning.

She is survived by several cousins, and was predeceased by her parents, two brothers and a sister.

Stephen A. Mutkoski, Chair; George Bantuvanias, David Dunn

Millard Clayton Ernsberger

June 12, 1862 — January 25, 1940

The death of Emeritus Professor Millard Clayton Ernsberger at the Tompkins County Memorial Hospital on January 25, 1940, after a short illness, removed from the Engineering Faculty one of its ablest teachers.

Professor Ernsberger was born at Varick, New York, on June 12, 1862. He received the A.B. degree from the University of Rochester in 1888, entered a law office in New York City, and was admitted to the bar in 1891. While he was practicing law he became interested in the development of photography, and that pursuit led in 1897 to his appointment as manager of the pictorial department of the New York tribune. Meanwhile he was cultivating a more absorbing interest in the study of the rotary steam engine. In 1899 he went to work as a draftsman for the McIntosh-Seymour Company of Auburn, New York, builders of large steam engines, and there he trained himself so thoroughly that he became one of the company's designing engineers.

He had been employed by that company for seven years when his attention was drawn to a problem of education. There was a movement on foot at the University of Rochester to set up a department of engineering. He was consulted, as a graduate of that university engaged in the practice of engineering, and was retained as adviser. While that project was maturing he came to Cornell in 1906, earned the degree of mechanical engineer after two years of study, and served here for another year as instructor in Heat-Power Engineering.

In 1909 he organized the new department at the University of Rochester and remained there as its head until 1921, when he was drawn back to Cornell by the offer of a professorship of Heat-Power Engineering. He held this chair here until 1930, when he retired from teaching.

He was a member of Alpha Delta Phi, Phi Beta Kappa, Sigma Xi, Atmos and the American Society of Mechanical Engineers.

The wide range of Professor Ernsberger's abilities was exemplified by his successive interest in such various things as the practice of law, the development of photography, newspaper illustrating, the practice of engineering, and finally engineering education. He was by nature a scholar. Throughout his life he was an eager student of history, literature, architecture, and the natural sciences. He brought to his reading a critical appreciation, a retentive memory, and a mature judgment of values. He was an agreeable and inspiring companion.

He embodied in his life what the engineering colleges envisage for the future, a wide cultural background and a sound training in science as well as in its application to practical use. His lectures were models of logical precision and were delivered with scholarly diction and with a wealth of illustration from his wide knowledge of human achievement.

Dora W. Erway

November 19, 1889 — December 5, 1976

Professor Erway, the wife of Edgar W. Erway, was associated with the College of Home Economics at Cornell, in the Household Art Department from 1921 to 1945 and was acting head of that department from 1944 to 1945. When the department name became Housing and Design, she served as associate professor from 1945 to 1956 and was named professor emeritus after her retirement in 1958.

Professor Erway's distinguished career as an artist began in her native Fitchburg, Massachusetts, when she was eight years old and in third grade. During elementary school, her work was published in School Arts magazine. While in high school and at Massachusetts Normal Art School, she began extracurricular activities, studying under many of the finest teachers in this country and abroad. Eight summers between 1906 and 1916 were spent at Commonwealth Art Colony, Boothbay Harbor, Maine; in the summer of 1917 she studied design at Chicago University and in 1918, color with Albert Munsell and sculpture with Cyrus Darlin in Boston. Three years at Columbia University included summer and evening classes of painting at Provincetown, Massachusetts, and Textile Vocational School and Manhattan Trade School in New York City. In 1919, she received the highest grade in the New York City examination for New York textile vocational teachers. Her interests also included courses in psychology at Brown and Cornell universities; education and architectural design at Cornell and interior decoration at Lucy Taylor's school at Nantucket, Massachusetts; painting in Paris, France; color with Rudolph Schaeffer; and theatre design and crafts with Norman Edwards and Douglas Donaldson in Hollywood, California. She painted in the Saguenay region, Canada, studied the life habits and crafts of the San Ildefonso Indians of New Mexico, and painted in Georgia and Cuba, as well as in Japan, China, and India. During a sabbatic leave in 1955, she spent seven months in South America studying Inca civilization and culture. She traveled extensively in the United States, Europe, and around the world.

A gown and wrap of Paris design, made in Hong Kong during her travels to the Orient, have been added to the Cornell Costume Collection. Her American costume dolls, designed by her students, have been exhibited twice yearly at Uris Library, Cornell University. One doll was given by Queen Marie of Rumania.

Professional experiences before coming to Cornell included teaching of sculpture and social welfare work in North Bennett High School, Boston; supervising drawing, manual training, and clothing, public schools, Maine; directing industrial art, public schools, New Jersey; and teaching home furnishings, color and design in Massachusetts,

Maine, New Jersey, Connecticut, and at the University of Nebraska. She did free-lance work in textile and costume design, selling to well-known firms such as Cheney Silk.

Mrs. Erway's paintings, largely water colors, were widely published in French art magazines and exhibited in many cities in the United States, including a one-woman show at Dudensing Gallery, New York City. Her name was listed in *Leading Women of America*, *Who's Who in the East*, and *Art contemporain livre d'or*.

Her articles on teaching design were published in the *Journal of Home Economics*, and she served as associate editor of the journal for five years. For six years, she was chairwoman of the Related Art Committee of the American Home Economics Association and was responsible for that committee becoming a division of the association. She was also responsible for a two-year traveling home economics art exhibit that was shown from Maine to California. She organized working home economics art committees with state chairpersons in thirty-six states. She was vice president of the New York State Southern Tier Home Economics Association.

Mrs. Erway made art a way of life, inspired others with the beauty and wonder of the world around her, and allowed no compromise of standards or achievements. The year of her death she received seventy-five Christmas cards from former students. To them and her associates, Dora Erway remains a legend.

M. Vivian White, Ruth B. Comstock

José Fernando Escobar

December 20, 1954 — January 3, 2004

As someone who lived nearly half his life on borrowed time, Chepe Escobar lived it to the fullest.

Born in Manizales, Colombia, and educated in Colombia, Brazil and the United States, Chepe was given a diagnosis of terminal cancer while still a graduate student at the University of California, Berkeley. He became active in his own treatment and overcame the disease to recover completely, completing his Ph.D. degree in Mathematics from Berkeley in 1986. He went on to forge a distinguished career that led him to positions at Chicago, Indiana and Cornell and netted him an invitation to the White House in 1992 to be honored as a Presidential Faculty Fellow. He was a member of the Colombian Academy of Science, and held an honorary degree from the Universidad del Valle in Colombia, where he frequently was a visitor. He held visiting positions as well at the Instituto de Matemática Pura e Aplicada (IMPA) in Brazil, the Courant Institute of Mathematical Sciences at NYU, the Mittag-Leffler Institute in Sweden, the University of Warwick in England and the Institut des Hautes Études Scientifiques (IHES) in France.

Chepe joined the Cornell faculty in 1994 as Professor of Mathematics and quickly became an active mentor of a large group of graduate students and postdoctoral fellows. His mathematical research was in differential geometry, spectral geometry and mathematical aspects of general relativity theory. Chepe was world-renown for his research; his work and ideas were highly appreciated by his peers.

Differential geometry is the area of mathematics that studies geometric problems using the methods of differential equations. The main objects studied are called “manifolds”, generalizations of ordinary two-dimensional surfaces such as the plane, the sphere and the torus. Manifolds may or may not have boundaries; the upper hemisphere of the sphere has a boundary—the equator—while the entire sphere does not. Cosmologists suspect that the entire universe forms a three-dimensional manifold without boundary. The notion of curvature, a quantitative measure of the local deviation from flatness, allows us to distinguish between manifolds. The plane has curvature zero, while a perfect sphere has constant positive curvature. Positive curvature can be seen in a piece of onion skin, which tears when you try to flatten it, while negative curvature is illustrated by the shape of a saddle, which would tend to fold rather than tear when it is flattened. A perfect sphere is the same everywhere, so its curvature is constant, whereas the surface of the earth is flatter near the poles, so its curvature varies. Although the surface

of the earth is curved, we do have maps to represent portions of the surface on a flat piece of paper. Certain maps, including the Mercator projection, have the property of being “conformal”, which means that angles on the map are equal to the corresponding angles on the earth, even though distances must inevitably be disturbed.

A fundamental problem in differential geometry is the Yamabe problem, which asks whether every manifold can be mapped conformally to a manifold of constant curvature. When Chepe began his thesis work, the Yamabe problem had recently been solved affirmatively for manifolds without boundary by a group of mathematicians including Rich Schoen, his thesis advisor. Chepe’s thesis, and much of his subsequent work, dealt with the Yamabe problem for manifolds with boundary, where there are additional difficulties to be overcome; for example, new ideas are required just to determine what conditions should hold for the boundary. Chepe was able to solve this problem in most cases, and to do so he had to introduce new methods in nonlinear partial differential equations.

As one who had come to the United States as a graduate student, Chepe had strong opinions about the treatment of international graduate students and the problems they had to overcome, often pointing out that seemingly minor changes in the local rules governing international applicants have serious consequences. He was a consistent advocate for students who were less than privileged and was particularly outspoken about those who made their careers pretending to be their advocates while often doing more harm than good. And quietly, he held strong opinions about the effects of United States policies on Latin America. Once, after returning from a visit to his family, he volunteered that things were much better in Colombia now that the United States was more concerned about the situation in Venezuela.

Chepe had many interests outside mathematics. As a youth in Colombia, he was a competitive diver, winning national and international championships. He enjoyed fine wines, cooking Colombian dishes for his friends and salsa dancing. And he loved soccer. He played in a local league while he was living in Ithaca. When his health became an issue again in the past few years, and he was for a while unable to play soccer, he made it a part of his treatment program to get a satellite TV connection so he could watch the soccer channels from Latin America. He said that watching soccer released in him the same feeling of well being he got from playing.

After serious surgery in the summer of 2000, he once again became active in his treatment, observing a strict diet and traveling to Germany for specialized care. That he recovered from this surgery was clear when he again was able to play soccer. On his last visit to his surgeon in New York, the doctor asked him for the secret of his remarkable recovery from the surgery.

In the fall of 2003, Chepe was at the very beginning of a sabbatical leave at IMPA in Rio de Janeiro, a city that he loved, when his health began to fail. Eventually he returned to Colombia, and he died there surrounded by his family and friends. He is survived by his brother, Arturo Escobar, of Chapel Hill, North Carolina, and his sister, Maria Victoria Escobar, who resides in Colombia.

Laurent Saloff-Coste, Robert Strichartz, Louis J. Billera

Evan W. Evans

1827 — May 22, 1874***

“Whereas the late Evan W. Evans, formerly professor of Mathematics in this University, and the first elected member of the Faculty has recently died, and we deeply respect him and regret his loss not only on account of his very great mathematical abilities and attainments, his rare proficiency as a philologist and his varied general culture, but on account of his skill as a teacher, his calm and considerate judgement, his careful integrity and conscientious regard to his duty as a man, and we wish to record our sense of his great merits and of the loss which the University and Society sustained when he was prevented from further services to either, “Resolved, that the foregoing be inserted in the minutes of this meeting as an expression of the feelings of this Faculty, and that a copy of the same be furnished to the family of an departed friend.”

* According to plaque in Sage Chapel.

** Died at Ithaca.

Jennette Evans, M.D.

January 1, 1892 — August 23, 1981

Jennette Evans was born in Canaseraga, New York. The daughter of a minister, she spent her early years in rural communities of upstate New York. She attended Cornell University, graduating with the Bachelor of Science degree in 1914. She taught at the Greigsville Consolidated School for a year, then moved to the High School of Commerce, Springfield, Massachusetts, where she taught general science and home economics for three years. She then attended Cornell University Medical College and received the Doctor of Medicine degree in 1922, at a time when it required unusual determination for a woman to complete such studies. This was followed by a rotating internship at the Syracuse Memorial Hospital. She was licensed to practice medicine in New York State in 1923.

In 1923 Dr. Evans returned to her alma mater in Ithaca as assistant professor of hygiene and medical adviser of women, a post she held until 1943. During this period she taught courses in hygiene and Physical and Mental School Health Problems. Though she held an academic position, her advice was often sought on matters of a more clinical nature. She kept up her interest and proficiency in patient care by taking postgraduate courses at the Trudeau School of Tuberculosis, the Mayo Clinic, the Phipps Clinic of the Johns Hopkins University School of Medicine, and other institutions.

In 1943, following organization of the newly created health service by Dr. Norman Moore, with its orientation toward student medicine, Dr. Evans's responsibilities changed and she became assistant professor of clinical and preventive medicine; in 1948 she was promoted to associate professor. In accordance with her new responsibilities in clinical medicine she spent several summers at the Cornell University Medical College studying the newly developing field of vaginal cytology, first under the direction of Dr. Ephraim Schorr, then with Dr. George Papanicolaou, for whom the Pap test was named. She applied the techniques of this field to the study of variant menstrual cycles and their hormonal treatment. She personally carried out most of the technical procedures, as evidenced by the staining jars and slides in a corner of her office. She maintained an interest in general medicine and was valued as a consultant to the Women's Physical Education Division. She was a member of the American Medical Association and the New York State Medical Society.

Throughout her academic and clinical career, Dr. Evans was known for her deep concern and caring attitude toward her students and patients. She retired in 1962, returning briefly in 1966 to help during a period of staff depletion. Following retirement she was awarded the title of associate professor emerita.

She enjoyed choral music and during her earlier years on the campus was a member of the Sage Chapel Choir. After retirement she followed her artistic interests by the study and practice of drawing. She appreciated flower gardens and took particular delight in the Minns Garden on campus. She continued to live at her house on Wait Avenue until declining health would no longer permit the independence she enjoyed.

Dr. Evans is remembered for her empathy with students and her bright smile, friendliness, and helpfulness to students and colleagues.

Dr. Evans was the widow of James S. Webb, who died in 1959. She is survived by a daughter, Mrs. Virginia Richmond, of Oneida, New York; a twin brother, Paul Evans, of Burlington, Vermont; three grandchildren; and two great-grandchildren.

Paul H. Darsie, M.D., Marjorie F. Doris, M.D., Raymond Haringa, M.D.

W. Duane Evans

June 10, 1909 — May 25, 1974

Professor W. Duane Evans died unexpectedly of a heart attack in Washington, D.C. on Saturday, May 25, 1974. Although formally due to retire on June 30, 1974, he was planning to continue his academic activities and had scheduled teaching responsibilities at Cornell for the 1974-75 academic year.

Professor Evans was born on June 10, 1909, at Watertown, New York, the son of a Presbyterian minister who later became a chaplain in the U.S. Army. He studied chemical engineering at Clarkson College, receiving his Bachelor of Science degree in 1930.

He began his career as an engineer at the National Bureau of Standards in Washington. However, as the federal government moved to deal with the social and economic problems of the thirties, he became involved with the research activities of a variety of agencies including the National Recovery Administration, the Works Progress Administration, the Department of Justice, and ultimately, in 1939, the U.S. Bureau of Labor Statistics.

It was a stimulating time and place for the development of systematic research in the social studies and Duane Evans was actively and substantially involved in raising the standards of this research. His contributions were both substantive and methodological. In addition to his formal duties, he found time in a busy schedule to teach and write on statistical techniques and the application of mathematics to economic problems. He made substantial contributions to the statistical theory of sampling.

His affiliations and honors from the 1940s on indicate the scope and quality of his efforts. He served the Bureau of Labor Statistics as chief of the Productivity and Technological Development Division, as chief of the Division of Interindustry Economics, as chief economist, chief statistician and, after 1962, as associate commissioner. He was on the faculty of the American University from 1947 to 1964 as adjunct professor of economics, on the faculty of the U.S. Department of Agriculture Graduate School from 1940 to 1964, and on the Faculty of Economic and Political Science, Cambridge University, during 1953-54. He served as a consultant to the Anglo-American Productivity Council and was a member of the U.S. delegation, International Statistical Institute, in Rome in 1953, in Rio de Janeiro in 1955, in Stockholm in 1957, in Tokyo in 1960, and in Ottawa in 1963. He received the Rockefeller Public Service Award in 1953 and the award for Distinguished Service, U.S. Department of Labor, in 1953. Professor Evans was a fellow of the Washington Academy of Sciences, the American Statistical Association, and the A. A. A. S.; he was a member of the American Economic Association, the Econometric Society, and the

Conference on Research in Income and Wealth. He published numerous articles and reports on input-output data and projections, on productivity and the effects of technological change, and on statistical methodology. The interindustry study of the U.S. economy for 1947, done with Marvin Hoffenberg, is a model for later research in this area.

In 1964 Professor Evans retired from U.S. government service and joined the faculty of Cornell University with a joint appointment in the New York State School of Industrial and Labor Relations and the Department of Economics in the College of Arts and Sciences. He taught courses in mathematical economics for the Department of Economics and courses in statistics for ILR. He brought to bear on his teaching the wealth of experience that he had gained in working for the Bureau of Labor Statistics and attempted to instill in his students a feeling for the valuable contributions that can result from the judicious use of statistical methods in practical problems. His presentations were enhanced by a wry sense of humor. He was most helpful to graduate students in all stages of their training and was especially helpful to those whose backgrounds in statistics and mathematics were deficient. He was a valuable member of many ILR committees, especially the Graduate Committee, in which he served several terms as chairman. He contributed significantly to recruitment and to the development of academic programs in the Department of Economics.

In his family and social life, Duane Evans was a man of wide-ranging interests and unexpected skills. He was a gourmet cook, not just upon isolated occasions but upon a day-to-day basis; he was an accomplished pianist and had an extensive collection of recorded music, as well as sound recording and playing equipment; his engineering training, collection of tools, and mechanical skill made it possible for him to undertake and complete household tasks that most of us would not even contemplate; he was an avid flower gardener; and he loved to fish from the family cottage on the St. Lawrence River. His accomplishments were made more remarkable in the face of the severe pain that he endured over many years that resulted from the loss of a leg in an automobile accident.

His friends and students will miss the congenial hospitality which all of his interests and personality engendered.

He is survived by his wife Edna, a daughter Patricia Duane Evans Exter, a son Craig Duane Evans, and a grandson Trevor Duane Exter.

Isadore Blumen, T. C. Liu, Philip J. McCarthy

George Abram Everett

April 15, 1875 — September 15, 1958

George Abram Everett, Professor Emeritus of Extension Teaching, died in a Montreal, Canada, hospital September 15, 1958, following an operation. His home since retirement had been in Potsdam, New York.

The son of Luther and Martha (Abram) Everett, he was born on a farm at Fort Jackson, St. Lawrence County, New York, on April 15, 1875. He had five sisters and a brother, Dr. Frederick Everett, who was a graduate of the Cornell Medical College.

At Potsdam Normal School he took the four-year academic course. Entering Cornell University with a state scholarship in 1895 he received his A.B. degree in 1899 and his L.L.B. degree in 1901. After being admitted to the bar in the fall of 1901 he started practice in Potsdam. In September of 1902 he was called to Cornell as an instructor in public speaking. From 1904 to 1906 he taught English at the Lawrenceville Academy, Lawrenceville, New Jersey, going from there to a similar position in the Flushing High School, Flushing, New York. He returned to the Public Speaking Department at Cornell in 1909 as Assistant Professor. In 1912, he was called to the College of Agriculture by Dean L. H. Bailey to institute a course in oral and written expression as Professor of Extension Teaching. He remained in this position until his retirement June 30, 1943.

Professor Everett was considered an exceptionally stimulating teacher by his colleagues as well as by the thousands of students fortunate enough to study speech under his tutelage. One of his chief contributions as a teacher was the work done with contestants on the Eastman Stage, a prize speaking contest held during Farm and Home Week. Some judgment of the standards he achieved can be drawn from an excerpt taken from a letter written to former Dean Calloway by Andrew D. White: "I have always considered the Eastman Stage as one of the best things that Cornell University has acquired and it has given me great pleasure to be present at its contests Again and again I have insisted both privately and publicly that it usually has merit above most college and university prize contests and debates."

As a boy, Professor Everett had attended a grade school with many students of French Canadian descent. Here he learned the peculiar nuances of this dialect which he used so effectively in reading the poems of Drummond and other writers who used the French Canadian dialect. For many years he delighted faculty and student groups with these readings. Anyone fortunate enough to have heard him read Drummond's "My Old Bateaux," would have had an unforgettable experience. He was an expert dry fly fisherman and had "wet a line" in most of the best water in

Northern New York and in Quebec. His canoe paddles which he fashioned by hand from wild cherry, were truly works of art in wood.

He was married to Anna E. McEwen of Madrid and Ogdensburg, New York, in 1907. The Everetts had two children, Martha, A.B. and Phi Beta Kappa, Cornell, who died in 1951, and Richard who died as a young man after a serious illness of many years' duration. Professor Everett was a member of the Presbyterian Church, the Republican Party and the Masons. He is survived by Mrs. Everett, who is making her home in Potsdam.

His students will always remember his warm and friendly personality, his intellectual interests, his strong convictions, and his peculiar ability to spark the hidden potentials of expression that so often were dormant in most of them.

G. E. Peabody, G. S. Butts, C. H. Freeman

Herbert Lyman Everett

August 9, 1922 — July 12, 2002

Herbert Lyman Everett, Professor of Plant Breeding, Emeritus, who died on July 12, 2002 in Ithaca after a long struggle with Parkinson's disease, served the university in a broad range of activities: teaching, research, administration, and international outreach. His specific interests included students, teaching, corn genetics and breeding, and his family, department, college, and university. He is remembered for not only his accomplishments but also his constant good humor, kindness, and desire to help others.

Herb was born in New Haven, Connecticut on August 9, 1922. The family moved to Clearwater, Florida, returning to New Haven upon the death of his father where Herb attended the New Haven public schools. Following his graduation from Hillhouse High School in 1939, Herb entered Yale University. Like many in his generation he was drafted into the armed services in 1942 at the end of his junior year, serving in the Army Air Corps until his discharge as a First Lieutenant in 1945. He returned to Yale University to complete his B.A. degree in Botany, then continued his studies to earn his M.S. degree in Plant Genetics in 1947 and his Ph.D. degree in Plant Genetics in 1949. From then until 1952, Herb was a Research Assistant in the Department of Genetics at the Connecticut Agricultural Experiment Station where he worked with Dr. Donald F. Jones.

In 1952, Herb was recruited by the Department of Plant Breeding to join the College of Agriculture to teach the basic college course in genetics and to be responsible for the research in breeding and genetics of field corn. He was promoted to Associate Professor in 1953, and to Professor in 1964. He spent one year in 1956-57 in the Philippines as a Visiting Professor, part of the Cornell contract with the College of Agriculture at Los Banos (UPCA). In 1961-62, Herb spent a sabbatical leave with the Rockefeller Foundation at Chapingo, Mexico. He returned to the Philippines in 1964 to serve as project leader for the Cornell – UPCA contract. Upon his return to Ithaca in 1966, he became the Director of Resident Instruction for the College of Agriculture, serving in this role until 1977. That year, he returned to the department to resume his teaching and research activities. Herb retired as Emeritus Professor in 1983, but continued to teach genetics until 1985.

Dr. Everett served his college and the university in many significant ways. He was secretary for the Agriculture College faculty during his term as Director of Resident Instruction. Between 1979 and 1983, he served as Cornell's Ombudsman. His calm demeanor and constant good humor fitted him well for this office. He served on and was chairman of the University Faculty Committee on Academic Programs and Policies and the University

Commencement Committee. It was during his term as chairman of the Commencement Committee that the ceremony was moved from Barton Hall to Schoellkopf stadium. For the State University of New York, he was the representative for the College of Agriculture and Life Sciences and was the Chancellor's appointee to the Central Awards Committee. At the national level, he served and became chairman of the Resident Instruction Section of the Division of Agriculture, National Association of State Universities and Land-Grant Colleges and later Vice Chairman of the Executive Committee of the Division of Agriculture. He also served on the Task Force on Education in Agriculture and Renewable Resources of the National Research Council. At the community level, Herb found time to be a member and president of the Ithaca-Cayuga Rotary Club and served on many boards of the First Congregational Church. He also served a term as Vice President of Planned Parenthood of Tompkins County.

For years, Herb shared with a colleague in the Department of Plant Breeding the responsibility for teaching the basic genetics course at Cornell. This course served as the only introduction to genetics for students from all colleges at Cornell. This rigorous course included both classical and modern topics in genetics, and a weekly laboratory session, required of all students, was an integral component of the course. When in the 1960s, an undergraduate major in biology was put into place through the newly formed Division of Biological Sciences, the genetics course that Herb and colleagues established became a required course for the new major and responsibility for teaching it passed to Division faculty. With the dissolution of the Division, the course still remains a requirement for the undergraduate major in biology at Cornell.

Herb made significant and lasting contributions to the science of corn breeding and genetics, and to corn growers and farmers. While at the Connecticut Experiment Station, Herb was co-developer of a superior new corn inbred named C-103. This inbred became one of the most widely used corn parents ever developed. Its progeny are still widely used by U.S. corn breeders. Herb was also involved in the early development of hybrid sweet corns and in adapting fertility restoring genes that made practical the use of cytoplasmic male sterility to save labor and costs in seed production. At Cornell, Herb developed some 12 successful corn hybrids. Chief among these was Cornell M-3, the most widely grown corn hybrid in New York history. Throughout his research career, Herb successfully balanced basic and applied elements, helping to advance to the science of corn breeding, while developing improved corn varieties for seed growers and farmers.

During his career in Plant Breeding, Herb served as major professor for 25 students, half of whom were from other countries. The lasting bond these graduates have with Cornell is due in no small part to their association with Herb as students and continuing on into their professional careers.

Herb was married to Dottie (Dorothy Burgess) in 1944. Their son, Herbert L Everett, Jr., and daughter, Anne Lee Everett, are both graduates of Cornell.

William Pardee, Harry Stinson, Robert Plaisted

Watson Harry Everhart

June 5, 1918 — October 1, 1994

Professor Emeritus Watson Harry Everhart had a long and distinguished career in the science and management of fisheries and in higher education. Born June 5, 1918, in Connellsville, Pennsylvania, Harry began his training as a biologist at Westminster College (Pennsylvania) where he received a Bachelor of Science degree in 1940. Two years later, Harry completed requirements for a Master of Science degree from the University of Pittsburgh and entered the Air Force, rising to the rank of Squadron Commander.

In 1945, Harry resumed his academic training by entering a doctoral program at Cornell University in fishery science, with minors in vertebrate zoology and insect ecology. Completing requirements for the Doctor of Philosophy in 1948, he joined the faculty at the University of Maine as an Assistant Professor. In 1950, Harry was appointed Chief of Fisheries, Maine Department of Inland Fisheries and Game; and in 1955, he was appointed Chief of Research, Maine Atlantic Salmon Commission, two posts he held simultaneously while remaining an active faculty member at the University of Maine. He was promoted to Associate Professor in 1952 and to Professor in 1956. During this time, he co-authored a text in fishery science which served as the basic treatment of this subject for virtually all universities offering such a curriculum. It was rewritten with Cornell colleagues; this text is now in its third edition.

In 1967, Harry became Chairman of the Fishery Major at Colorado State University, returning five years later to Cornell as Chairman, Department of Natural Resources, a position he held until retirement in 1982. He was named Professor Emeritus the following year.

As Chairman, Harry effectively represented his department at college, university, state, and national levels; remained active in the classroom; and guided the department through a period of rapid evolution. His students perhaps best remember him as a mentor for their professional writing skills, a task Harry was especially suited for from his experience as Editor-in-Chief (1960-61) of the *Transactions of the American Fisheries Society*, one of the world's top two journals in fishery science and management.

Over the course of his career, Harry's research focused principally on fish habitat management in the broadest sense of this term. Publications of Harry and his graduate students ranged from studies of heavy metal toxicity to the effects of land use on fish habitats. In addition, he published basic works on the fishes of Maine and Colorado and on the restoration of Atlantic salmon.

While at Cornell, Harry began a long association as a consultant to the Great Northern Paper Company (Maine). He continued important work in this capacity until stricken with Alzheimer's disease. His death, at the age of 76, was due to complications from this disease.

Watson Harry Everhart was a leader in his profession during a time when fishery resources were coming under rapidly increasing stress. Through his writings, teaching, and administrative leadership, he played an important role in the development of a science to deal with these problems. The discipline of fishery science was in its infancy when Harry began his career and he played a significant role in guiding it wisely through the formative early years.

Richard Baer, William Youngs, Ray Oglesby

Kenneth Warnock Evett

December 1, 1913 — May 28, 2005

Kenneth Warnock Evett, 91, Professor Emeritus in the Fine Arts Department, died May 28, 2005 in Ithaca, New York. Professor Evett was born in Loveland, Colorado on December 1, 1913, the middle son of Charles Evett and Sarah Warnock Evett. He and his two brothers, Paul and Robert, left their mountain roots to move east in pursuit of careers in arts and letters.

The memories of his childhood were rich with talks of the family's willful animals (his father ran a livery stable in Estes Park), the equally capricious Model-T, and his mother's love of classical music and literature as well as her devotion to watercolor painting. He also recalled the pleasures of fishing for brook trout in Estes Park, playing tennis on a court the boys had carved out of a hillside, and riding on horseback through the magnificent landscape of the Rockies.

Professor Evett's first encounter with the American art scene occurred when he was encouraged to show some of his drawings to Thomas Hart Benton, who happened to be visiting wealthy Texas neighbors in Estes Park. Benton recommended Kenneth for a scholarship to the newly founded Fine Arts Center in Colorado Springs, where he met a colorful assortment of artistic celebrities and local aristocrats. He also met Betty Schluss, recently graduated from Tufts University, who would become his companion for 66 years. They enjoyed a heady mix of high-spirited Bohemian life and forays into the Rockies to picnic, sketch and ski.

After a year teaching art to Denver junior high students, Professor Evett was awarded a commission from the WPA's Federal Section of Fine Arts to paint a mural for the Humboldt, Nebraska Post Office. In all, he painted six murals for post offices in Colorado, Kansas and Nebraska. In 1941, with the onset of WWII, Professor Evett sought work in Woodstock, New York. After a year, he was lured back to Colorado Springs where, despite six-day weeks of exhausting and numbing work as a welder, again was swept up in the stimulating world of artists, musicians, and local elites. The Depression, the role of Russia in the war, the work in the factory, his left-leaning friends, and his Presbyterian sense of righteousness (instilled in him by his devoutly religious mother) all pushed Kenneth to join the Party. He left a few years later alarmed by threats against his life and appalled when Stalin's atrocities became known.

After a year's stay in Cambridge, Massachusetts in 1944, Professor Evett taught at Salem College in Winston-Salem, North Carolina. A year later, he was hired by a wealthy patron of the arts to direct a small artist's colony housed in

a rambling structure several miles outside Hot Springs, Virginia. Throughout these troubled and turbulent years, Kenneth continued to paint and to seek ways to make a living through his painting.

In the fall of 1948, while Professor Evett was meeting with Antoinette Kraushaar, his dealer and the owner of the prestigious New York gallery, she answered a call from John Hartell, Chairman of the Fine Arts Department at Cornell University. Did she perhaps know of a painter who might be able to fill in for a semester? Thus began Professor Evett's thirty-one years of affiliation with Cornell, primarily devoted to teaching studio art, but also spent as a passionate Cornellian who helped organize art festivals, spoke at symposia, published in *Epoch*, and helped save the A.D. White House from the wrecking ball. In addition, he was inordinately concerned with the fate of Cornell athletic teams, especially the football, basketball and hockey teams. He often remarked that his mood would rise or fall for days depending on the outcome of weekend games.

Professor Evett's artistic abilities and integrity received increasing public recognition during his years at Cornell. He had 12 one-man shows at Kraushaar and was represented in group shows at the Whitney Museum of American Art, the Metropolitan Museum of Art and the Corcoran Museum of Art in Washington, D.C. His paintings are included in the permanent collections of the Newark Museum, the Munson-Williams-Proctor Institute and the Montclair Museum, among many.

In 1954, Professor Evett won a nationwide-juried competition to paint three murals for the Lincoln, Nebraska State Capitol building rotunda. The award not only provided him with a substantial prize with which he took his family to Rome, Italy, to spend his first sabbatical year, but also brought him some unwelcome national-level publicity when a Nebraskan legislator offered mocking comments about the "modern" art in the capitol building.

Professor Evett's painting and drawing style moved through several phases, from densely painted realistic figurative works of the 1930s and 1940s, to the starker India ink drawings based on the *Iliad* and the *Odyssey*, to the sometimes apocalyptic sumi ink landscapes of the 1950s and back to intensely colored oil paintings of imaginary landscapes and mythic Greek scenes. He began painting watercolors from nature in the 1960s, at first somewhat free in the brush work and light in tonality. As he explored this difficult medium through the 1970s and 1980s, his images became more saturated with color, the draftsmanship more defined and the volumes of objects more pronounced. He and Betty traveled widely in Europe, the American West and along the coast of Maine, where he painted one or two watercolors each day, almost regardless of the weather, the terrain, or curious onlookers. Exposed to the elements and equipped only with a lightweight folding stool, a table of fine French paper, a few

tubes of paints, a jar of water and a single 1” brush, he painted directly from nature, never once making a pencil sketch to guide his hand.

Professor Evett was also a gifted writer. His essays on art and architecture published in *The New Republic* attracted the attention of New York magazines, one of which offered him a job as its full-time art critic. Although he could not play a note on any instrument, he loved music that ranged from the blues and jazz to classical music, especially the “sublime” Mozart. His fondness for Mozart became even more intense after he read the complete letters of Mozart. While his literary tastes were also eclectic, he particularly relished the humanity of Anthony Trollope’s novels and the beauty of Shakespeare’s sonnets. He was unusually articulate for a visually oriented person and his care with words marked and enriched his teaching style. He was open to and supportive of his students’ work and would sometimes buy their creations—a sign of affirmation.

Professor Evett lived a long and extraordinary life, and while he faced the genuine challenges of near poverty during the Depression, keeping a family intact through World War II, and functioning in the sometimes cut-throat environments of both the academic and art worlds, he knew he lived a charmed and privileged existence. He was ever grateful for his wife Betty’s years of love and support, and he took great pleasure in the lives of his children and grandchildren.

Professor Evett’s wife, Betty; his children, Daniel (Janet Snoyer), Elisa (John Miller), and Joel (Roberta Boylen); his grandchildren Jessica and Willem; and numerous cousins and their children survive him. His grandson, Peter Evett, predeceased him in 1995.

Office of the Dean of Faculty

James Ewing

December 25, 1866 — May 16, 1943

The death of James Ewing on May 16, 1943, after an illness of several months, brought to a close the long career of one of the most distinguished members of the faculty of the Cornell University Medical College and one of the foremost of the world's leaders in the great field of cancer research.

The son of Thomas and Julia Hufnagel Ewing, Doctor Ewing was born in Pittsburgh and there obtained his preliminary schooling. He then entered Amherst College, from which he was graduated in 1888. His undergraduate years must have been happy as well as profitable ones for they left him with a love for the study of philosophy and an attachment for some of his old teachers which remained with him throughout the many crowded, strenuous years of his life.

Entering the College of Physicians and Surgeons of Columbia University in the autumn of 1888, he soon came under the spell of the distinguished Professor of Pathology, Doctor T. Mitchell Prudden, for whom he developed a deep admiration and affection and by whom his future career was profoundly influenced.

After graduation in Medicine in 1891, and after a medical internship in Roosevelt Hospital, he returned to Prudden's laboratory and there began his life-work in pathology.

Much of his time during the next few years was spent in a study of the pathological changes in the cells of the blood which resulted in the publication in 1901 of his treatise *Clinical Pathology of the Blood*. The book immediately won wide recognition and did much to arouse deep and general interest in this important subject. During the Spanish War, in 1898, some months were spent at the camp for returned soldiers at Montauk Point, in an intensive study of malarial fever, to the knowledge of which he made a number of significant contributions.

In 1899, one year after its founding, he was made Professor of Pathology in the Cornell Medical College, and for the next thirty-three years he remained one of the most virile and effective members of its faculty. Perhaps no teacher in the history of the school has left so deep an imprint of his personality upon both students and teachers. His profound knowledge, and his unlimited capacity for work, his brilliance as a teacher, and his friendly and sincere interest in his students—all these combined to win for him a very unusual measure of admiration and popularity.

The study of tumors, which gained his attention early in his career, came more and more to be the chief interest and concern of his life, and it was characteristic of the man that this interest should extend far beyond the purely

pathological aspects of the subject to the vastly important humanitarian ones of treatment, prevention, and cure.

This absorption in the study of tumors and his growing authority in that field, led to his appointment, in 1912, as pathologist to the Memorial Hospital for the Treatment of Cancer and Allied Diseases, to which institution thereafter so much of his activity was to be devoted.

About this time began his association with the late Doctor James Douglas, a wise and understanding philanthropist, whose chief purpose in life was to use his large fortune for the advancement of knowledge which might ultimately lead to the cure of cancer. Doctor Douglas came to lean heavily upon Ewing for advice as to how he could best help in advancing the work of cancer research, and the association led to very generous financial aid to the Memorial Hospital and to the development of greatly enlarged facilities for cancer research, especially in the field of radium and the x-rays.

In 1913, Memorial Hospital became affiliated with Cornell University Medical College, and Doctor Ewing was made President of the Medical Board of the Hospital. He subsequently became Director of Cancer Research and, upon his retirement from the chair of Pathology at Cornell in 1932, was made Director of the Hospital, a position which he held until his retirement in 1939.

In 1919, after ten years of unremitting labor, he published his great work on tumors, entitled *Neoplastic Diseases*, which was to establish him as an authority upon that subject. The book has since become a standard text all over the world, is now in its fourth edition and has been translated into several foreign languages.

Although the dominant note in James Ewing's whole life was work —unremitting and indefatigable work—and although he allowed himself few relaxations, there was one form of sport in which he indulged with enthusiasm and which gave him deep enjoyment. He was an ardent tennis player, in spite of the fact that an illness in early life had left him with a shortened leg and a pronounced limp. Even with this serious handicap, his tennis game was far above the average for normal players and he was a formidable antagonist for any but the most expert. His association with the West Side Tennis Club of New York continued for a great many years. He served as its president in its early years, was active in its councils, and could be counted upon to be on hand for every important tennis event, even when he was no longer active as a player.

Doctor Ewing was one of the founders of the American Society for the Control of Cancer and of the *Journal of Cancer Research*. At the time of his death he held the position of Professor of Oncology in the Cornell Medical College and that of Consulting Pathologist to the New York and Memorial Hospitals.

Even an incomplete list of the distinctions and honors conferred upon Doctor Ewing is long and impressive. He was given a doctorate in science by his alma mater, Amherst College, by the University of Rochester, the University of Pittsburgh, and Union University. The degree LL.D. was conferred on him by Kenyon College and Western Reserve University. His international honors included the Order of Leopold (Belgium), the Order of the Southern Cross (Brazil) and an honorary doctorate from the University of San Maro in Peru, the oldest university in the Western Hemisphere.

In 1933, he received the Janeway Medal from the American Radium Society; in 1940, the Clement Cleveland Medal from the New York City Cancer Committee; and, in 1941, the Distinguished Service Medal and Award of the American Medical Association.

Doctor Ewing was married, in 1900, to Miss Catherine Crane Halsted whose untimely death a few years later caused a profound and lasting change in his personal and domestic life. His one son, Doctor James Halsted Ewing, is now a lieutenant, U. S. N. R.

To those of us privileged for so many years to enjoy close association and close friendship with James Ewing, the memories of him that remain most vivid will be, not those of his extraordinary achievements in his chosen field, but rather those of the homely virtues of honesty, sincerity, generosity, and unfaltering loyalty to his friends which he possessed in such unstinted measure.

Inta Miške Ezergailis

September 11, 1932 — January 1, 2005

Inta Miške Ezergailis was born in Riga, Latvia on September 11, 1932. In 1944, along with millions of other Eastern Europeans, she and her family were caught up in the exodus of people fleeing the advancing Red Army. They reached Berlin in time to endure the Allied carpet bombings of the city, an experience that fuelled a life-long commitment to pacifism. After the war, she and her family were shunted from one refugee camp for displaced persons to another, from Lübeck to Ansbach to Bad Aiblingen, where Inta attended a Latvian high school and then a German *Realschule*. In 1950, her family immigrated to the United States and settled in Boston, where she completed her high school work and entered Simmons College, graduating in 1955 with a B.A. degree in Social Sciences. In 1957, a year after her family resettled in Cleveland, she married Andrew Ezergailis (now a retired professor of history at Ithaca College). In 1964, the couple moved to Ithaca.

In 1965, Inta began graduate study in German Literature at Cornell. Among the academic mentors who left a lasting influence on her were Eric Blackall, Matthijs Jolles, Burton Pike, and Paul de Man. Although she had not majored in German Literature as an undergraduate, she completed an M.A. degree in 1967 and the Ph.D. degree in 1969, when she was appointed Assistant Professor of German Literature. During the first years of her career, she concentrated on the writings of Thomas Mann. Her dissertation, written for Burton Pike and Herbert Deinert, became her first book, *Male and Female: An Approach to Thomas Mann's Dialectic* (1975). Later, she edited a collection of articles, *Critical Essays on Thomas Mann* (1988). With the advent of feminist literary scholarship, Inta's interests shifted in large part to women authors. Her *Woman Writers – The Divided Self: Analysis of Novels by Christa Wolf, Ingeborg Bachmann, Doris Lessing and Others*, appeared in 1982. Her last scholarly book, *Nostalgia and Beyond: Eleven Latvian Women Writers* (1988) marked a return to abiding interests in poetry and her native country. In addition, she published numerous articles, in English and Latvian, in scholarly and intellectual periodicals. In fact, she became the guardian of the Latvian poetic tradition and its most important exponent outside of Latvia, editing, translating, and interpreting it for an international audience.

Inta's engaging personality made her a favorite of students, especially undergraduates. Her freshman writing seminars were popular throughout her entire career at Cornell; in fact, she taught a freshman seminar each semester for twenty-five years. Anyone who passed her classroom at 8 a.m. could see Inta laughing and smiling her wonderful smile and waving her arms as she walked about the room. Those who looked a few seconds longer could notice that those normally somnolent freshmen were also laughing and smiling, if not waving their arms,

and having almost as good a time as Inta, who was also enjoying getting more out of them intellectually than they realized. One of her freshmen summed up the experience succinctly, if not quite elegantly: “Professor Ezergailis was a wonderful teacher and a damn fine lady.”

During the last decade of her life, Inta’s interests shifted from scholarly analysis of German and Latvian literature to writing poetry in English. An active member of the Cascadilla Poets, she produced a number of poems, some of which her husband, Andy, has prepared for publication. *Inta’s Poems I* appeared shortly after her death; a second volume is scheduled for publication in late 2005. This final stage of Inta’s life project was vitally important to her for coming to terms with the often terrifying experiences in what one of her poems calls this “unwieldy ragged universe”—the loss of childhood and home, the trauma of war, the death of her mother, the ravages of cancer. But they also celebrate quiet insights gleaned from nature (especially from birds and a large family of dogs and cats), and the epiphany of food, family, and friendship, learning—again as one of her poems says—to “mend what can be mended.”

Inta’s husband of forty-seven years, Andrew Ezergailis of Ithaca, daughter, Anna (Toronto), and a sister, Gunta Vittands (North Andover, Massachusetts), survive her. We mourn the loss of her wonderful, deep laugh, her wisdom, and her warm humanity.

Bonnie Buettner, Arthur Groos

Jean Failing

March 17, 1913 — January 30, 2008

Jean Failing, former Dean of the College of Human Ecology at Cornell University, died January 30, 2008 in Ithaca. Born March 17, 1913 in Portland, Oregon, she was the oldest child of three to parents Marjorie Holcomb Failing and Edward J. Failing.

She received B.A. and M.S. degrees from the University of Oregon, and the Ph.D. degree in Counseling Psychology from Ohio State University in 1940. Before coming to Cornell, Professor Failing taught at Centralia Junior College, Washington. In 1939, Flora Rose, then Dean of Cornell's College of Home Economics, invited her to join the counseling staff as an Instructor. Martha Van Rensselaer, the founder of the New York State College of Home Economics, had retired her position as co-director with Flora Rose, but was still active in College and University communities. During her tenure at Cornell, Jean served as Chairman of the Counseling Service, as Coordinator of Resident Instruction, Associate Dean of Resident Education and then as Dean of the College from 1974-78. She retired as Emeritus Professor in 1978.

During her years at the College, Professor Failing exercised firm leadership in support of excellent undergraduate education and the recruitment of a highly qualified student body as well as helping to build a program with strong links between theory and practice. She advocated strong departments, and a multidisciplinary commitment to solving real world problems, with particular attention to non-formal education for New York State citizens. She traveled frequently throughout the State, visiting high schools and explaining the College's mission and programs to educators and families. She provided committed leadership to recruiting a diverse student body and built the foundation for the changes the College would undertake in decades to follow.

During her tenure as Dean, she launched the College's first drive for private funds, raising \$250,000.00 for student support, teaching projects and other College needs. She led the College through the planning for the first major addition to the 1933 building: Martha Van Rensselaer Hall. The North Wing was completed in 1965.

She initiated the first traveling institutes throughout the State in cooperation with county cooperative extension associations. College faculty members presented current issues in nutrition and health, the American family, the delivery of human services, and energy and consumer policy. The objective of the institutes was to "bring the best research and knowledge on vital topics to those who need it the most, the people of New York." It was during her tenure at the College that the name was changed to Human Ecology (1969). Professor Failing helped champion

the change and accepted responsibility for explaining the re-interpretation of the College's mission to alumni, educators, policy makers and citizens throughout the State and beyond.

In service beyond Cornell, Professor Failing was Chairman of the Council on Interaction, for the National Association of Land Grant Colleges and State Universities and served on several other committees at the national level. She was Chairman, Northeast Region, Home Economics Administrators, and on the Advisory Council of the National Association of Extension Home Economists. At Cornell, she chaired the Cornell Committee on Academic Records and Instruction.

During her many years as a highly effective educator and administrator, Jean Failing always maintained a personal warmth and congeniality in her daily interactions with people. She was open and sensitive to the concerns of others, whether students, faculty, staff or other colleagues. She was particularly adept at dealing calmly and effectively with complicated academic and interpersonal issues. Her many professional, as well as personal contributions to the continuing evolution of the College will long be remembered and valued.

Lucinda Noble, Chairperson; Brenda Bricker, Henry Ricciuti

Frank Latta Fairbanks

December 16, 1884 — March 5, 1939

Frank Latta Fairbanks was born at Ithaca, New York, December 16, 1884, and died on March 5, 1939, of injuries received in an automobile accident while engaged in work for the University.

Professor Fairbanks was of a sturdy family founded in this country by Jonathan Fairbanks, who came from Somerby in the West Riding of Yorkshire, England, in 1633 and in 1636 erected a dwelling at Dedham, Massachusetts, which is standing, habitable, and owned by one of the family today. Harvey Fairbanks, great-grandfather of Professor Fairbanks, moved from Cornish, Vermont, to Homer, New York, in 1816 and cleared a farm on the Scott Road that is now occupied by a grandson. In the barn on this farm the first installation of the Fairbanks-Goodman ventilating system for dairy stables was put into practical operation in 1925.

The son of a father expert in mechanical matters from whom he gained valuable early experience, Professor Fairbanks graduated from Sibley College of Mechanical Engineering in 1910, served the H. H. Franklin Company of Syracuse as test engineer, and had a varied engineering experience in Pendleton, Oregon, from 1911 until 1915, when he was recalled to Ithaca to care for his parents. He served as librarian of Sibley College from 1915 until 1917, when he became assistant in Farm Mechanics in the New York State College of Agriculture. After 1918 he was successively instructor and assistant professor of Agricultural Engineering. The title of professor came to him in 1934.

Early teaching work was in the tractor schools given during the World War to promote food production, after which, in addition to teaching, he carried on investigations in the artificial illumination of poultry houses, farm power machinery, applications of electricity to agriculture, and air-conditioning of animal shelters. In the latter field the development of the Fairbanks-Goodman system of ventilation of dairy stables, addresses before the American societies of Agricultural Engineers and Heating and Ventilating Engineers, bulletins and other publications have given deserved national standing to work done with scientific thoroughness and with a sympathetic and informed appreciation of agricultural requirements. He was a member of Sigma Xi, of the American Society of Agricultural Engineers, and of Masonic fraternities, being a 32nd-degree Mason.

His colleagues have lost a true friend and an able associate. The farmers of the State have lost a sound and capable adviser.

Howard Newton Fairchild

November 16, 1906 — September 1, 1990

Howard Fairchild, Professor Emeritus in the Sibley School of Mechanical and Aerospace Engineering, died unexpectedly on September 1, 1990 at the age of 83.

Born in Liverpool, New York, he lived most of his life in New York State. He married Helen Brodhead in 1944 and their son, Howard Newton Fairchild, Jr., was born in 1945. Helen Fairchild died in 1989. Howard Fairchild, Jr. graduated from the Sibley School in 1967 and went on to do graduate work and pursue a career in engineering. He now lives in Fairborn, Ohio.

Howard was graduated from the Sibley School of Mechanical Engineering with the M.E. degree in 1929. He went on to fulfill the requirements for the E.E. degree in 1930. The breadth of interest and versatility suggested by these dual degrees have characterized his entire career as an engineer and as a teacher. He began his teaching career in 1930 as an instructor in Cornell's College of Engineering and continued teaching at Cornell until his retirement, except for two years as an instructor in the Mechanical Engineering Department at Pennsylvania State University. At Cornell he advanced from instructor to assistant professor, to associate professor, to professor, and to professor emeritus in 1972.

Professor Fairchild had a wealth of experience in engineering and technology. Even before entering college he had worked as a pipe fitter during a summer vacation. He was a licensed professional engineer in New York State and was generally recognized as an outstanding member of the department in the area of engineering practice. He used his sabbatical leaves and summer vacations to achieve and strengthen this diversity of engineering experience. During one sabbatical leave he served as a visiting professor of mechanical engineering in the Department of Reactor Science and Engineering of the Brookhaven National Laboratory. Following this assignment he was granted a leave of absence for a semester to serve as a mechanical engineer in the same department. He later was called upon on two different occasions to serve as a consultant for the same department of the Brookhaven National Laboratory. He was also appointed as a visiting professor of mechanical engineering in the Experimental Reactor Division of Oak Ridge National Laboratory. During his teaching career at Cornell he also served as an engineering consultant to a number of corporations including the Frankfort Arsenal in Philadelphia, the Babcock and Wilcox Company and the Westinghouse Electric Corporation.

Professor Fairchild's importance as a member of the Sibley School's faculty was never so keenly felt as during World War II. Cornell was asked to operate a Naval Midshipmen Training School and a major part was to be a Diesel School for training engineering officers. Although the Sibley School of Mechanical Engineering had professors with competence and interest in the sciences and engineering which are the basis of design and analysis of performance of engines, the scope and emphasis of this school was to be quite different. The Sibley staff would be expected to teach engine operation, engine overhaul, troubleshooting and other pragmatic aspects of propulsion engines. A laboratory of operating diesel engines would also have to be established and staffed. Howard Fairchild was the obvious choice to be in charge of this new school; he was not only an excellent teacher and a competent engineer, he was also a skilled mechanic. The Diesel School which resulted and was operated until the end of the war was generally recognized as the best in the country.

Professor Fairchild was a competent researcher and experimental investigator, and was the author or coauthor of several technical papers. However, his first love was always teaching. He taught a wide diversity of subjects including thermodynamics, heat transfer, internal combustion engines, steam power generation, and refrigeration and air conditioning. He was as much at home in the laboratory as in the classroom.

As a teacher he was patient, soft-spoken, and unassuming. In spite of this mild manner, he set high professional standards for his students as well as for himself. He was highly respected by both his students and his teaching colleagues. He always accepted teaching assignments cheerfully—even unpopular ones.

Howard Fairchild will long be remembered by his colleagues and former students. His contributions to Cornell and to his profession were many. He was a gentleman in every sense of the word and a valued and deeply respected colleague.

Richard M. Phelan, Dennis G. Shepherd, Bart Conta

David Baxter Fales

April 17, 1903 — September 15, 1974

David Baxter Fales's life was dedicated to family, community, and youth. His death in Ithaca on September 15, 1974, brought to an end a distinguished career in all aspects of youth development.

Professor Fales was reared on a dairy and crop farm in Gooding, Idaho. He graduated from the University of Idaho in 1926 and obtained a Master of Science degree from Cornell in 1944.

Professor Fales served as a county 4-H agent in Idaho and Oregon for four years prior to coming to New York State, where he held similar positions in Greene and Cortland counties until 1936, when he became a 4-H agent-at-large on the Cornell staff. In 1943 he joined the Cooperative Extension Administration staff, serving as assistant and associate state 4-H leader until his retirement in 1959. Upon his retirement he accepted an assignment as a rural youth adviser for 4-H in the Philippines under the auspices of the Agency for International Development. He later acted as a consultant for the Peace Corps and participated as a member of a youth program survey and assessment team in Vietnam for the Department of State.

As a 4-H agent-at-large, he was instrumental in establishing 4-H programs in several of the state's counties that did not have such programs. In addition, one of his great personal satisfactions was obtained from conducting the State 4-H Congress Program. This program brought thousands of young people from all over New York State to Cornell each June and gave them an introduction to the campus and resources of a great university.

A person concerned with conservation during a period when it was not as fashionable as it is today, Professor Fales's foresight and efforts led to the development of the State 4-H Conservation Camp at the University's Arnot Forest. He served as a director of this training camp for a number of years and was active in broadening the 4-H conservation program to include wildlife management and soil conservation, as well as forestry.

Professor Fales took a keen interest in creating awareness of opportunities for youth through 4-H. To accomplish this, he engaged in public information activities such as radio, news media, promotional leaflets, and exhibits. He made modifications in state fair programs, broadening their scope to increase participation by young people.

As a person concerned with his community, Professor Fales was an active Kiwanian for many years, serving as chairman of and a participant on the agricultural committee and as a member of the board of directors.

David B. Fales is survived by his wife, Stella, of Sarasota, Florida; a daughter, Mrs. Barbara Smith, of Ithaca; and a son, William, of Nappanee, Indiana.

David B. Fales was an innovative individual who never lost his interest in young people and their problems. His articulate emphasis on the dignity of work and the concept of the useful work project as a developmental tool in youth education were the hallmarks of his career.

George J. Broadwell, Fred E. Winch, Jr., Harold B. Sweet

Jennie Tiffany Towle Farley

November 2, 1932 — June 19, 2002

Jennie Tiffany Towle Farley, Professor in the Cornell School of Industrial and Labor Relations Extension Division, died on June 19, 2002 at the age of 69, after a thirteen month struggle with a mysterious auto-immune illness that defied diagnosis. It was an untimely passing that marked the end of an exceedingly rich and productive life.

Jennie, the third of four children, was born in Fanwood, New Jersey, to Dorothy Wagner Towle and Howard Towle. She earned a B.A. degree in English at Cornell (1954) and then worked as a writer for such publications as *Seventeen* and *Mademoiselle*, and later for *Punch* in London, *The Scandinavian Times* in Sweden, *La Prensa* and *The Peruvian Times* in Peru, and Cornell's Office of Public Information. In 1956, she married Donald Farley, and they started their family, which accounts for the considerable time gap between Jennie's undergraduate and graduate degrees. In 1969, Jennie returned to Cornell's classrooms for an M.S. degree in Sociology and a Ph.D. degree in Sociology and Communication (1970) and her academic career began in earnest, though, as with most women, the going was slow and often difficult.

After a two-year stint as a Research Associate and Lecturer, she became an Adjunct Assistant Professor in the School of Industrial and Labor Relations (1972). In 1976, she received a joint appointment as Assistant Professor in ILR, and in a new department known as Women's Studies, which Jennie helped found. She gained tenure and promotion to Associate Professor in the Extension Department of the ILR School in November 1982, followed by promotion to full Professor in January 1990. By then, it had become apparent that Dr. Jennie Farley's services to the university had brought that institution (over considerable resistance) into a new era of equality and justice. Some examples: Many people forget that in the early 1970s, when two members of the Board of Trustees—Adelle Rogers and Charlotte Conable—questioned why the lagging status of women at Cornell was so clearly a low to none-existent priority, they turned to Jennie, who armed herself with a then current Cornell Directory, and painstakingly counted the number of professors (including associate and assistant levels) and reported her findings to the Trustees in 1972. That report gave birth to the university's Advisory Committee on the Status of Women, and, to a great extent, the program of Women's Studies. In the fall of 1970, she served as the academic coordinator of the "Female Studies" program. When the program was formalized as Women's Studies, Jennie became its first director, serving in that capacity from 1972-76. Jennie negotiated the Program's strategy of hiring, which was to have the Program hire jointly with other units of the university. The Women's Studies Program paid half of the new professor's salary up until tenure, at which time the full line would revert to the co-hiring

department and the half line would return to Women's Studies, allowing the program to initiate new hiring. A road map of Jennie Farley's 32 years of employment at Cornell is studded with other important examples of her creative innovation: special courses for Office Professionals, so that they (mostly women) can advance through the system; lunch bag seminars on issues of special importance to women open to everyone campus-wide; and in line with Jennie's strong belief in justice, her leadership of "Friends of the Cornell 11," a group which brought suit against the university on what was basically a double standard for awarding tenure to women and men. Although the suit lost, the message it sent did not.

Jennie was also an excellent teacher! Her course, "Women at Work" is remembered by many ILR students as their first introduction to problems faced by women in the workforce. Another course, "Writing in Industrial Relations" drew on her earlier journalistic experience to help students hone their writing skills in the various formats necessary for professionals in the field of labor relations. Students from as far back as the 1980s and as recently as the year 2000 comment on Professor Farley's availability, and her kindness which helped them meet her high standards.

In Extension, she capitalized on her expertise in issues related to working women to organize a number of national conferences which resulted in widely read publications. These include: *Women Workers in Fifteen Countries: Essays in Honor of Alice Hanson Cook*; *The Woman in Management: Career and Family Issues*; *Academic Women and Employment Discrimination*; and *Sex Discrimination in Higher Education*.

Jennie Farley worked tirelessly in Cornell governance. She served as a member-at-large of the Faculty Council of Representatives and the Faculty Senate. In 1988, she was elected as the Faculty Trustee to the Cornell Board of Trustees, where she made many important contributions to university policy. As former Dean of the ILR School, David B. Lipsky put it, "She leaves a lasting legacy that will benefit future generations of Cornellians."

Jennie was the recipient of many Cornell awards including the Andrew Dickson White Professor of the Year Award, and the Alice H. Cook and Constance E. Cook Award for her efforts on behalf of women at Cornell and beyond.

In the larger Ithaca and upstate communities, Jennie's many volunteer activities included leadership in the American Association of University Women, the Delta Chi fraternity, the Women's Resource Center and the Cornell Women's Club of Tompkins County. In recognition of these efforts, Jennie received the Humanitarian Award for service from the Ithaca community, the Corinne Galvin Award from the T.C. Human Rights Commission, the Woman

of Achievement Award from the Broome County Status of Women Council, and the Unsung Heroine Award from the Central New York Chapter of N.O.W.

Jennie was a strong family person. She shared a rich 46 yearlong marriage with Donald Farley, the J. Preston Levis Professor of Electrical and Computer Engineering at Cornell. Their three children, Clair, Anne, and Peter, all of whom went to Cornell, enjoyed an exceedingly warm existence with their mother (and their father as well), as did three grandchildren, Laura, Christopher, and namesake, Jennie. The Farleys spent more than ten years living abroad, teaching, studying and learning the languages of several countries.

Jennie Farley had another extraordinary gift. Somehow she was able to make every person she knew feel special. In her supply of what seemed inexhaustible energy, Jennie was passionately engaged in supporting individuals or causes that needed her as teacher, friend, and colleague. Jennie's heart and her wonderful smile were big enough and her arms long enough to embrace the world.

Frank H.T. Rhodes said it for all of us:

"Jennie embodied all that is best in Cornell. She had a concern that reached far beyond her field, with basic fairness and generosity that she brought to every situation. She was mentor, example, and friend to so many, of whom I am one."

Susanne Bruyere, Ileen DeVault, Francine Herman, Lois Gray

William Hursh Farnham

October 28, 1896 — August 14, 1985

William Hursh Farnham, a former dean of the University Faculty, acting dean of the Cornell Law School during World War II, and a member of the law faculty from 1926 to 1964, died in Ithaca on August 14, 1985. He was eighty-eight years old.

Bill Farnham was born in Buffalo, New York, on October 28, 1896. He lived there until he came to Cornell, where he received his A.B. degree in 1920. Bill's undergraduate studies were interrupted by World War I, during which he served as a commissioned officer with the American Expeditionary Force in France. He thereafter did postwar relief work in Romania, where he was made chevalier of the Order of the Crown of Romania.

Returning to Cornell, Bill was awarded the LL.B. degree in 1922. He then became an associate in the Buffalo law firm of Kenefick, Cooke, Mitchell and Bass for four years, teaching part-time at the University of Buffalo.

Bill joined the faculty of the Cornell Law School in 1926 as an assistant professor and was promoted to full professor in 1930. In 1929-30 he was on leave of absence from Cornell to pursue graduate study in law at Harvard. While at Harvard he served as the Ezra Ripley Thayer Teaching Fellow and was awarded a Doctor of Juridical Science degree in 1930.

Bill's principal field of professional interest throughout his long teaching career was the law of property. For many years he taught the first-year course in personal property and the introductory, intermediate, and advanced courses in real property. His lectures were meticulously prepared and carefully delivered. Behind them lay years of preparation and scholarly research. Anyone visiting his office was immediately struck by the sight of shelf after shelf of loose-leaf notebooks, each crammed with the result of patient investigation into every nook and cranny of the law of property.

Bill was a splendid teacher, whose office door was always open to students who sought his assistance and advice. The esteem in which he was held is reflected in the words used by the class of 1959 in dedicating to him that year's *Barrister*, the Law School yearbook.

To WILLIAM HURSH FARNHAM:

For the example of his dignity, his kindness and thoughtfulness in and out of the classroom; his love for the law he teaches; his steadfast performance of duty and his deep and abiding loyalty to his Alma Mater throughout thirty-four years on the Cornell Faculty.

Over the years, Bill Farnham made several comprehensive studies for the New York State Law Revision Commission, some of which resulted in important remedial legislation. They dealt with such subjects as the clearing of land titles from the threats posed by long-dormant “possibilities of reverter” or “powers of termination,” and inadvertent improvements to the land of another. While the average landowner does not often encounter problems of that sort, the consequences can be devastating in terms of confusion, controversy, and cost, and the relief afforded by the corrective legislation resulting from Bill’s studies has been beneficial indeed. In addition to his work for the Law Revision Commission, he served as legal adviser to the New York State Joint Legislative Committee on Natural Resources.

Bill did not abandon his research upon retirement. Until his health forced him to call a halt, he continued to do important work on the subject of water law. As legal consultant to the Cornell University Water Resources Center, he devoted nearly ten years to an intensive study of New York State’s water law. His efforts culminated in 1974 with the publication of *Modernization and Improvement of New York’s Riparian Law*, a significant contribution to the legal literature on the subject.

In addition to his role as teacher and scholar, Bill Farnham made important contributions to Cornell in the field of academic administration. He twice served as secretary of the Law School, first from 1926 to 1929 and again from 1936 to 1940. From 1942 to 1945 he was the acting dean of the Law School. In that capacity he kept the school in session on a year-round basis, providing the foundation for managing the influx of the large number of veterans in the late 1940s. He brought qualities of openness, fair-mindedness, and efficiency to his administration in Myron Taylor Hall.

Bill’s career in academic administration culminated in 1952, when he became dean of the University Faculty. He served in that post until 1957. During that period he provided outstanding leadership in strengthening the faculty’s role in the governance of the university. He presided with care and precision over the faculty’s complex committee system. He also saw to it that the faculty viewpoint on basic questions of educational policy was clearly and effectively communicated to the president and the Board of Trustees of the university. That ability was especially important because during his deanship the fundamental question of control over student affairs came into sharp focus.

Bill was a person of broad and diverse interests. He loved to play contract bridge with his wife Bess as his favorite partner. His interest in athletics also deserves special mention. For years he was a regular user of the squash court in Myron Taylor Hall. He was also an ardent sports fan. Students accustomed to his reserved manner in the

classroom were astounded at the gusto with which he cheered a Cornell team on to victory. At home one of his favorite pastimes was following major-league baseball, and he knew the names of the players as well as he knew the titles of the leading cases in the law of property.

As teacher, scholar, and administrator, Bill Farnham was a perfectionist. Yet he remained very much a warm, courtly, and gracious human being. His great personal integrity was evident in all that he did. He was devoted to his family, and the times he spent with them at their cottage on the shores of Cayuga Lake were among the happiest of his life. The church was another important influence in Bill's life, and he was active over the years in the affairs of the Congregational Church in Ithaca. At a service held on August 17, 1985, in the church sanctuary, colleagues and friends from both the Cornell and the larger Ithaca communities gathered to pay tribute to his memory.

Bill is survived by his wife, Bessie Cowden Farnham of Ithaca, and three children—Faith Farnham Koppers of Charlotte, North Carolina; the Reverend William M. Farnham of Allentown, Pennsylvania; and Dr. Janet Irene Farnham of Ossining, New York—nine grandchildren, and two great-grandchildren.

Bill's colleagues and many friends will greatly miss him.

Harry G. Henn, Robert S. Pasley, W. David Curtiss

President Livingston Farrand

June 14, 1867 — November 8, 1939

Livingston Farrand was born in Newark, New Jersey, on June 14, 1867. He was graduated from Princeton University in 1888 and studied medicine at the College of Physicians and Surgeons in New York, receiving the degree of M.D. in 1891. Princeton made him a master of arts in the same year. He then went abroad for two years of study at Cambridge and Berlin. He was appointed instructor in Psychology at Columbia University in 1893 and was afterward promoted to an adjunct professorship. His interest in American anthropology, his participation in anthropological expeditions, and the writings which resulted, brought him a professorship of Anthropology at Columbia in 1903. It was about this time that he became deeply concerned with problems of public health. He was appointed executive secretary of the National Association for the Study and Prevention of Tuberculosis, and from 1912 to 1914 he was treasurer of the American Public Health Association.

That period of Dr. Farrand's life which was devoted to important administrative work began in 1914 with his assumption of the presidency of the University of Colorado. In 1917 he was put in charge of the tuberculosis work in France of the International Health Board. In 1919 he was appointed chairman of the central committee of the American Red Cross. And in October, 1921, he became the fourth president of Cornell University. Retiring in 1937, he continued to serve actively on various organizations for public health and public service until his death in New York on November 8, 1939.

Dr. Farrand married, on February 1, 1901, Margaret K. Carleton of New York. They had five children.

It is needless here to summarize the achievements of Dr. Farrand's busy years in the presidency of Cornell. It was a period of great material progress. The University's endowment was nearly doubled, the value of its buildings, grounds, and equipment nearly trebled.

The mark of Dr. Farrand's spirit is to be felt in the mind and temper of the University, as it is to be seen in the physical evidences of the campus. No doubt every true leader communicates something of himself to his companions. The Cornell of Andrew D. White partook of his indomitable idealism; the Cornell of Jacob Gould Schurman shared his superb, almost restless energy; the Cornell of Livingston Farrand became somehow more urbane, more kindly, more human. Some of us remember well the three: White, dressed with old-fashioned formality, musing on his journey from his home to his library; Schurman, vigorous, tense, striding quickly from duty to duty; Farrand, pausing with a word, a salute, and always with a smile, for almost every one who crossed his path.

He had a genius for friendship. The secret, perhaps, of such a genius is a readiness to give friendship without waiting to be assured of its return. Or, simply, the secret is an innate liking for people and a respect for them. So much was certainly true of Dr. Farrand. Those who visited him in his office with a troublesome request, even one that warred with presidential policy, were disarmed by his eagerness to understand and to aid. No one had his grace in making a refusal, as few had his delight in granting an appeal.

This friendliness of spirit was especially manifest in his speeches. Standing on the platform, smiling in a deprecatory way to the eulogies of his introducer, he would thrust his thumbs in his vest, and almost shyly address his audience, with the informal directness of private conversation. His voice strengthened and grew more resonant as he gave to each hearer what seemed a personal message addressed to him alone. And if the words of the message were sometimes forgotten, the essential remained; that the human spirit of Livingston Farrand conveyed its good will to his hearer, and to the humanity that he loved, for which he labored.

It was only natural that his good will should have been returned to him. Innumerable Cornellians whom he could hardly have known felt for him a personal affection. Unique in the University's history was the tribute paid to him at his retirement in 1937, when thousands of Cornellians gathered in New York to honor him, only to feel, at his leave-taking, an emotion that expressed itself unashamedly in tears.

The affection of those whom he served was surely welcome to him. But his true reward was the success of his work. The honors he received meant little to him, and the ease that may follow achievement nothing at all. Always under the menace of illness, he spent his strength freely for causes that seemed worthy of his strength.

The chief of these causes was the welfare of Cornell. He accepted and gladly bore his responsibility for sixteen years. The Cornell that we know, that living thing, is largely of his making. And not its walls and towers only; its spirit bears, and will bear for long, the impress of his kindly spirit.

Robert Thomas Farrell

November 16, 1938 — July 31, 2003

Bob Farrell, Professor of English, died in his sleep of congestive heart failure on July 31, 2003. He had been through extended and complex back surgery, and was in great pain much of the time, but he died as he would have wished, while teaching summer school and looking forward to Chaucer in the fall. Teaching was what kept him going, and we can be glad he did not have to endure the slow wasting that retirement would have meant.

Bob was born on November 16, 1938 in Bronx, New York, the son of Raymond and Gertrude Klesius Farrell. His mother died when he was eight, and from his early teens he bore an adult's share of responsibility for managing the household and contributing to its support. Endowed with a wonderful voice, he put himself through college as a professional singer, and might well have made a career as a singer had he so chosen. Many Cornellians will remember his performances with the Cornell Savoyards during the 1980s as Grand Duke Rudolph, Sir Joseph Porter, William Shadbolt, Ruthven Murgatroyd, the Pirate King, and Lord Mountarrarat, as well as his "Morning Performance" series of Renaissance concerts in the 1970s and 1980s.

Bob received his B.A. degree at Fordham in 1960, and his Ph.D. degree, also at Fordham, in 1967. The later stages of his graduate career were spent at Merton College, Oxford, where he studied with J.R.R. Tolkien, tutored undergraduates, and formed a deep attachment to the British Isles. In 1967, he accepted an assistant professorship at Cornell, where he spent his entire academic career. His courses ranged from Anglo-Saxon literature and culture to the Vikings, Chaucer, and medieval archaeology, which became the chief scholarly interest of his later years.

For Bob, to take up a role or an activity was to realize its essence. It was the secret of his best teaching: "He speaks like Chaucer!" his students wrote, "He *is* Chaucer!" "He not only taught us Anglo-Saxon, he immersed us in it," and he did so indeed, with powerful recitations of the great poems, Anglo-Saxon feasts, and slides which enabled him to dwell in loving detail on the wonders of Anglo-Saxon jewelry and stone work. And the same imaginative energy informed his scholarship. A colleague, Gary Rendsburg, writing about biblical narrative, quotes from Bob's monograph *Beowulf, Swedes and Geats*:

Beowulf is a work of heroic history. . . . A poet writing in this mode does not disregard absolute historical fact, history, that is, as we know it. He rather sees it as less important than other considerations His work will be a freely woven structure in which the characters and actions of the past will be part of an ethically satisfying narrative.

As Professor Rendsburg observes, the narrators of the Torah exercised the same heroic licence. Bob believed in the value of this kind of heroic history with all his heart, the heroic licence of the heroic poet.

Much of Bob's scholarly work is largely unknown in America, grounded as it was in on-site work in Britain, Ireland, and Scandinavia. He was a pioneer in underwater archeology, and an instrumental organizer and networker, perhaps most of all as leader of extensive and significantly innovative investigations of the many "turf islands" in Irish freshwater lakes. His work is held in very high esteem among European archeologists, and a volume of studies in his honor is in progress. The same genius for innovation informed Bob's work as a teacher of basic skills. Here again, he was a pioneer. His insight into the potential value of the word-processor as a teaching device grew into an active interest in the teaching of writing, and eventually led to his laying the foundations of what is now a nationally recognized undergraduate writing program.

Many at Cornell who have no interest in medieval studies will remember Bob as a cook of legendary prowess and a host without peer, unstinting in the bounty of his hospitality, his love of feasting in all its aspects. But it was perhaps students who came to know most fully the many forms his generosity could take—class parties, of course, and countless informal sessions of noshing and conversation in his wonderfully open office, but also mentoring of a special kind. Some of Bob's closest relationships were with students whom he saw to be lonely, isolated, and adrift in the sea of Cornell. They would become family, free to make Bob's house theirs, and to socialize on an equal footing with his friends and colleagues. He made several crucial interventions in the lives of students who had been lured into deep water by drugs, alcohol, or emotional problems, but whose problems somehow seemed to be the official responsibility of no college office. Bob would work tirelessly to ensure that the problem was clearly and unavoidably recognized, that the appropriate specialist care was made available, that parents were notified and, no less important, that the student knew that somebody was actively concerned about him or her in their crisis.

Bob never forgot his own early exposure to loneliness, poverty, family alcoholism and his own chronic physical disabilities. The same courage that permitted him to overcome these things, and to preserve his sense of humor right up to the end, also enabled him to sense and respond to other people's trouble with an unflinching directness and sympathy such as seen in very few people. That same generosity went out to family—his aunts, uncles, cousins, his brother and his family—a number of whom went through hard times. Bob was always available to them, had rich, often hilarious, redeeming memories of them, and gave them the kind of warmth that he himself had not known after his mother's death.

Bob is survived by his beloved wife, Shari, and by his daughters, Eva and Erica, and there are many others, locally and all around the world, who feel that with his passing they have lost not just a friend, but another father or brother.

Frederick Ahl, Andrew Galloway, Winthrop Wetherbee

Albert Bernhardt Faust

April 20, 1870 — February 8, 1951

Albert Bernhardt Faust, Emeritus Professor of German, died on February 8, 1951, after more than 45 years of association with Cornell University. He was born on April 20, 1870 in Baltimore, Md., where he attended the German Zions School, and where he graduated from Johns Hopkins University in 1889. There, too, he received his Ph. D. degree with a dissertation on Charles Sealsfield. This was his earliest contribution to the study of German-American relations, a field in which he was later to attain a place of great distinction. After a few years' work at German Universities he became Instructor in German at his alma mater in 1894. Two years later he was appointed Associate Professor at Wesleyan University and, in 1903 Assistant Professor at the University of Wisconsin. He was called to Cornell University in 1904, where he remained until his retirement in 1938 as Assistant Professor and, later, Professor of German. Under his energetic leadership the Department became one of the prominent centers of Germanic studies in America. His life-long membership in several learned societies—the American Historical Association, the Modern Language Association of America, the German Goethe Society, the Steuben Society, the American Dialect Society—suggests the range of his interests: they were historical, literary, and philological.

It was as the author of *The German Element in the United States* that Albert Faust established his solid reputation as a cultural historian: when that work appeared in 1909 it was almost at once recognized as the first comprehensive survey of a subject which, until then, had been regarded as little more than a matter of local, though sometimes zealous, investigation. With extraordinary attention to detail and factual evidence, Faust produced a study which has proved both indispensable and suggestive to all subsequent workers in German and American history. It was awarded the Conrad Seipp Memorial Prize, and the Loubat Prize of the Royal Prussian Academy of Sciences. This major achievement was later followed by a *Guide to the Materials for American History in Swiss and Austrian Archives* (1916), and *A List of Swiss Emigrants to the American Colonies* (1920, 1925). What was characteristic of these, as well as of his shorter and occasional writings and addresses, was Faust's deep pride in the contribution which the culture of his German ancestors had made to the American civilization to which he himself belonged. He was never happier than when he recognized evidence of this fruitful interplay, and never more deeply distressed than when (as during the World Wars) he saw it disturbed.

Although his scholarly bent was on the whole historical, no more important literary discovery has been made by an American-Germanist than Faust's of Karl Postl-Sealsfield. *Charles Sealsfield. Der Dichter beider Hemisphaeren*

(1897) is an expanded version of his doctoral dissertation in which he established the critical data upon which now rests the fame of one of the major figures of Austrian literature. What led him to this curious bilingual writer of travel fiction is indicative of Faust's work as a whole: he had a remarkable instinct for the significant and productive point of cultural interdependence. Most of Faust's writing was, therefore, in kind and intention, close to that of his teachers F. J. Turner and M. D. Learned: he was ultimately concerned with the growth of the American tradition. Even in his edition of Heine's *Prose Works*, or of J. Q. Adams' translation of Wieland's *Oberon* (1940) he was less preoccupied with questions of literary criticism than with the larger purpose of illuminating the mainstream of intercultural traffic. This ideal guided him not least in his teaching; and if he was instrumental in editing and developing one of the most influential series of textbooks for the study of German in America, his success was due, not only to the warmth of his pleading and to the textual care which he devoted to each of these many volumes, but also to his untiring faith in the efficacy of a genuine understanding between the peoples of the United States and Germany. Faust's efforts toward the establishment of the Carl Schurz Foundation were his most enthusiastic attempt at giving concrete strength to the cultural 'bridge' in which he so firmly believed. In 1929 he spoke before the German Reichstag in memory of Carl Schurz; a few years later he served as Carnegie Professor at the University of Vienna. On both occasions, and elsewhere, he affirmed his allegiance to that uncompromising political idealism by which he knew his two countries could and should be bound together now, as they had been in the early years of the American republic. When the Austrian government decorated him with the Golden Cross of Honor, or, when, in 1937 the University of Goettingen bestowed an honorary degree upon him, it was to recognize this creative conviction, as much as to distinguish him for the special achievement of his scholarship.

His many graduate students will long be grateful for his kindly and unfailing counsel, and, no less, for the hospitality of 125 Kelvin Place which he and his wife were always ready to offer. In Albert Faust the University has lost a member who, by his personality, his writings, and his teaching, has contributed much to its lasting distinction.

Victor Lange, R. M. Ogden, O. D. Von Engeln

Walter Theodore Federer

August 23, 1915 — April 14, 2008

Walter Theodore Federer, or “Walt” as he was universally known, was born on August 23, 1915 in Cheyenne, Wyoming, where his parents were homesteaders. He received his B.S. degree in Agronomy from Colorado State University in 1939 and his M.S. degree in Plant Breeding in 1941 from Kansas State University. In 1948, he earned his Ph.D. degree in Mathematical Statistics from Iowa State University and accepted a position as Professor of Biological Statistics in the College of Agricultural and Life Sciences at Cornell University, where he remained for 60 years. Walt became the first faculty member and Chair of the Biometrics Unit in the Department of Plant Breeding. In 1978, he was awarded the Liberty Hyde Bailey Professor of Statistics Chair, which he held until his retirement in 1986. Walt remained active as an Emeritus Professor for 22 more years, teaching, advising, mentoring, and inspiring his junior colleagues.

Professor Federer was Secretary and Program Coordinator for the Eastern North American Region (ENAR) of the International Biometric Society from 1950-53, President-Elect of ENAR in 1959, and President in 1960. He served as Chairman and Executive Secretary of the Committee of Presidents of Statistical Societies (1965-72), Book Reviews Editor (1964-72), and Associate Editor for *Biometrics* (1972-76), Associate Editor for *Communications in Statistics* (1972-94), and Associate Editor for the *Journal of Statistical Planning and Inference* (1976-90). He was a member of numerous national, international, university, and government panels and boards, and he was a consultant for several international agricultural research stations.

Professor Federer was a Fellow of the American Statistical Association (1958), American Association for the Advancement of Science (1962), Royal Statistical Society (1964), and Institute of Mathematical Statistics (1967), and he was elected a Member of the International Statistical Institute (1974). He was awarded the Honor Alumnus Achievement Award (1972) and Honored Alumnus Award (2001) by Colorado State University, and the Distinguished Service in Agriculture Award (1988) by Kansas State University.

Walt was a major intellectual figure in the field of statistics. He gave us somewhere in the neighborhood of 300 published articles, an uncountable number of Biometrics Unit technical reports, and nine superb books, including his pioneering 1955 *Design of Experiments*, which became a major scholarly contribution and served as a day-to-day tool of statistical practice for innumerable researchers in agriculture and other fields. Walt’s pearls of practical

wisdom on design of experiments have become an integral part of statistical theory and practice throughout the world. His work will have continuing impact in the fields of statistics and agriculture.

Walt loved to collaborate with other researchers, getting them interested in projects he was working on and getting involved in projects that others brought to him. He took enormous pleasure in pushing back the boundaries of the unknown, and his excitement was multiplied by sharing it with collaborators. He was always ready to invite others to share his intellectual voyages of discovery, and he was always generous in giving credit to others for their role in the process.

Walt traveled the world to fulfill a calling to improve the lives of others, sometimes at great personal discomfort—doing joint research and lecturing on ways to advance modern agricultural systems by using suitably designed experiments. Walt introduced design concepts into our thinking. He was a researcher whose contributions made his field both respected and admired. He received worldwide recognition for his accomplishments from the international statistics and scientific communities.

Over and above what he gave us in statistics, Walt was a force of nature: champion bull, bareback, and saddle bronc rider; Little League baseball and ice hockey coach; ballroom-, square-, and tap-dancer; golfer, gardener, and skier; philosopher of statistics and science; agitator for fairness; loving husband, father, grandfather, and great-grandfather; and friend to hundreds, probably thousands. Walt was strongly rooted in his Christian faith and always said it was a tremendous asset to a healthy, happy, successful personal and professional life.

Walt died on April 14, 2008 at the age of 92, from complications of liver cancer. Walt is survived by his wife of 26 years, Edna Hammond Federer; and her children, Sandra Harle of Jamestown, New York, Suzanne (Thomas) McUmbler of Newark, New York, and Lynn (Lagrand) Chase of Skaneateles, New York; a brother, James (Rose) Federer of Cheyenne, Wyoming; a sister, Barbara (Harry) Epler of Cheyenne, Wyoming; 12 grandchildren; 15 great-grandchildren; and one great-great-grandchild. He was predeceased by his first wife, Lillian Vasey Federer; his son, Arthur John Federer; his brothers, John Henry Federer II, Kenneth (Tuffy) Federer, Melvin (Bud) Federer; and his sisters, Frances Federer Christensen, Ruth Federer, Lydia Federer Foster, Doris Federer Morrison, Esther Federer Thiele, and Alice Federer Pace.

Walt was a loving, compassionate man with a strong desire to give to others. He enjoyed teaching and sharing his knowledge for the betterment of his students, colleagues, family, and community. He was always ready to be a

mentor when he encountered someone he could help. He was devoted to family life and he took great pleasure in playing with his grandchildren. He will be missed and remembered fondly by all who knew him.

Martin Wells, Chairperson; Steven Schwager, Shayle Searle

Harold Feldman

June 22, 1917 — May 11, 1988

Harold Feldman was born in Minneapolis, Minnesota, a son of immigrant parents, and grew up during the Great Depression. His father was a leader within his community of Jewish socialists. Harold received a B.A. in psychology and an M.A. in social work from the University of Minnesota, interrupted by four years of military service. After the war, he entered the graduate program in psychology at the University of Michigan, receiving his Ph.D. in 1952.

In 1948 Harold Feldman came to Cornell as instructor in the College of Home Economics; he retired (nominally) in 1980 as emeritus professor of human development and family studies. His active career as teacher, researcher, and advocate began while he was a graduate student at Michigan and continued without significant interruption until his sudden death while attending the convention of one of his favorite organizations — the Groves Conference on Marriage and the Family.

Three words sum up Harold Feldman's approach to college teaching: informal, innovative, and involving. He had little use for the laboratory tradition in psychology, which he regarded as a futile attempt to imitate the natural sciences. He saw psychology as the study of interpersonal relationships, and teaching as an exercise in applied group dynamics. From the beginning of his career, he excelled as a leader of discussion groups, the more controversial the topics discussed, the more Harold enjoyed the process. And his students enjoyed it too.

As a teacher, Harold saw his task primarily as one of provoking thought rather than expounding a subject. He liked to bring in living examples of whatever kind of human relationship his course concerned — people who could describe their own experiences from their own point of view. And he liked even better to expose his students directly to the life situations that shaped these experiences. One of the key features of his course on families in poverty was a weekend spent by each student in the household of a poor family.

In most of Harold's courses, students kept journals in which they recorded and analyzed their experiences while taking the course. One of his explicit goals was to encourage emotional as well as intellectual growth. Another aim was to challenge conventional ideas and conventional wisdom. He loved to tell jokes and make outrageous puns — perhaps to demonstrate that language itself can often be stood on its head.

The serious side of Harold's teaching is reflected in his choice of subjects and in his basic social philosophy. He was a tireless advocate for oppressed social groups — minorities, women, the elderly, the poor. Especially noteworthy

was his pioneering work in women's studies at Cornell. In 1953 he began offering a large introductory course called "The Modern Woman: Her Personal Relationships". Fifteen years later, he helped plan a course on the female personality taught by Joy Osofsky in what is now the College of Human Ecology.

The Cornell Women's Studies Program grew out of this course, and Harold served for a number of years as the only male on the program's board of directors.

In his research, as in his teaching, Harold was again a pioneer. His special contribution lay in the kinds of questions he chose to investigate. He continually pushed himself, his students and colleagues, and in time the entire field, to break with traditional molds and search for fresh and important new perspectives. Two decades ago, while most of his colleagues were still asking how the family situation might affect the child, Harold was asking how the children affect the marriage relationship. When most developmental psychologists were focusing on the period of childhood and adolescence, Harold's research was dealing with developmental issues throughout the entire life cycle. While much of the research in our field was focused on the "problems" of family living — probing the roots of failure and pathology, as seen in such phenomena as broken homes, mental illness, school failures and juvenile delinquency, Harold's studies focused on the "people who made it" (as he put it) with the cards stacked against them: black teenagers in inner-city broken homes who were doing well in school; mothers in poverty who managed to get off of welfare; couples who were coping successfully with problems of having to take aged parents into their homes. Much of this work was done in collaboration with his wife, Margaret Feldman, a full partner both in his research and its translation into policy and practice.

In all of his research projects Feldman was particularly effective in getting his students actively involved, in farming out interesting thesis problems to them, in inviting them to co-author publications with him, in encouraging them to present papers at professional society meetings, and in goading them to think about the policy implications of their research findings.

Harold's abilities, interests, and social philosophy made him an active participant in community affairs at the local, state, national, and international level. He served as president or vice-president of the Ithaca Family Society, Challenge Industries, and Planned Parenthood. He was local co-chairman of Shirley Chisholm's campaign for the Democratic presidential nomination. In 1965, at the request of his Dean, he organized an Interdepartmental Research Group on Poverty which laid the basis for subsequent efforts by College of Home Economics faculty members on behalf of poor families in New York City.

At a national level, Harold became most visible in 1972, when he became president of the Groves Conference on Marriage and the Family and a member of the Board of Directors of the National Council on Family Relations. In 1978, he was a visiting scholar at the American Home Economics Association's Center for the Family. In 1985, he characteristically invented a new social form as he and his wife Margaret became co-presidents of the New York State Council on Family Relations.

After his retirement in 1980, he focused on concerns of the elderly and their middle-aged children. He spent about half of his time in Washington, where, jointly with his wife, he worked with the staffs of the White House Conference on Aging, the House of Representatives Select Committee on Aging, the National Council on Aging, and the Villers Foundation.

Early in his Cornell career, Harold had developed international interests. He held a Fulbright Scholarship in 1956-57 at the University of Ceylon, and in 1964-65 he was visiting professor at the University of Ghana. During his Ghana stay, he helped home economics faculty and students at the University Training College in Winneba organize a program of research on Ghanaian family life. He participated in several international conferences on family policy and family life. At one time or another he gave talks in France, England, Sweden, Italy, Ceylon, India, Ghana, Togo, and Sierre Leone.

But whatever enterprise Harold was engaged in — be it teaching, research, or social action — his participation (indeed sometimes it seemed as if it were only his mere presence) would bring the situation to life. People would begin to talk to each other, to come up with their own original ideas, and then to move easily from words to actions, as if that was what they had intended all along.

Nowhere was his legacy more manifest than in the memorial service held in his name. It was characteristic of Harold to have left instructions that upon his death there should be no mourning, but a celebration of life. And that's what it was. In a church filled to overflowing with people from many parts of the community, a Dixieland sextet ushered in spontaneous statements from those he loved and who loved him in return. Family, friends, colleagues, students (past and present), neighbors, politicians, and mere strangers whom he had moved by a friendly greeting — all testified to his special gift of empowering others in fulfillment of their own lives.

Edward C. Devereux, John S. Harding, Urie Bronfenbrenner

Faith Fenton

January 26, 1891 — April 4, 1972

Faith Fenton, professor of food and nutrition, emeritus, was a member of the staff of the New York State College of Home Economics (now the College of Human Ecology) from 1922 until her retirement in 1959.

A native of Iowa, Professor Fenton received the B.S. degree from Iowa State College, the M.S. degree from Teachers College, Columbia University, and the Ph.D. degree from the University of Chicago.

Professor Fenton was known internationally for her research in food science and she was a pioneer in research in food freezing. She established many of the basic principles in the preparation of frozen foods in her work with Dr. D. K. Tressler of the State Agricultural Experiment Station in Geneva.

She had many “firsts” to her credit. She was the first woman to be invited to present a paper at an International Refrigeration Congress. She published a number of papers including one on the Vitamin C content of the cooking water of fresh and frozen vegetables. She was also first to publish extensively on precooked frozen foods.

Her research embraced fresh, frozen, dehydrated, and canned vegetables; dried fruits; frozen precooked foods; fresh frozen, irradiated meat, and meat from antibiotic-fed animals. Electronic cooking claimed her interest from its beginning. Her research in this area made valuable contribution to that process.

Professor Fenton was the author of twelve Cornell Extension bulletins and she contributed chapters to several books. More than eighty-five articles from her research appeared in scientific journals.

Professor Fenton was awarded a Certificate of Appreciation from the United States War and Navy Department for “an outstanding contribution to the work of the Office of Scientific Research and Development during World War II.” This research was to determine if vitamin supplements were necessary for armed service personnel. She was the recipient of the Alumni Merit Award from Iowa State College in 1947.

In 1954 Professor Fenton furnished testimony for the Federal Trade Commission on the effect of the composition of cooking vessels on the nutritive value of food. In 1950 she represented the American Home Economics Association in testifying before the U.S. Congressional Committee to Investigate the Use of Chemicals in Food Products.

In 1958 she represented the Association at a conference called by the Food Law Institute and the Food and Drug Administration on the 1958 amendment to the Food, Drug, and Cosmetic Act; and in 1959 she was the

representative at a general conference on common names for food additives sponsored by the American Standards Association.

In 1956 she spent her sabbatic leave as a technical expert for the Food and Agriculture Organization of the United Nations, assisting in the establishment of home economics at the University of Cairo, Egypt.

Professor Fenton died in Long Beach, California, following an extended illness.

E. Elizabeth Hester

Dennis H. Ferguson

February 25, 1943 — November 2, 2001

Dennis H. Ferguson, Associate Professor of Financial Management at the School of Hotel Administration, died November 2, 2001 after a battle with cancer.

Known to colleagues, students and friends as “Denny,” he earned two degrees in Hotel Administration at Cornell, a B.S. degree in 1968 and a Ph.D. degree in 1981. He also held a B.A. degree in Liberal Arts from Duke University, awarded in 1965.

From 1969-72, he served as Assistant Business Manager of Cornell’s Office of Computer Services. He was a Research Associate at the Hotel School from 1972-75, and a Lecturer from 1975-81. He was named Assistant Professor of Financial Management at the School in 1981, and in 1987 was promoted to Associate Professor.

He was the co-author, with Hotel School Professor Florence Berger, of *INNOvation: Creativity Techniques for Hospitality Managers* (John Wiley & Sons, Inc., 1990). He also co-wrote and published numerous articles in journals on hospitality management, among them the *International Journal of Hospitality Management*, *Restaurant News*, and the *Cornell Hotel and Restaurant Administration Quarterly*.

He was the program coordinator for the Hotel School’s Executive Education General Manager Program from 1994 until his death.

Hotel School Dean David Butler said:

“Denny will be remembered for his wonderful sense of humor, his dedication to the School and our students, his basketball prowess and most certainly as a wonderful friend.”

His mother, Garnet Ferguson, of Springdale, Pennsylvania, and brother, Warren Ferguson, of Maryland, survives Professor Ferguson. A memorial service was held on December 3, 2001, followed by a reception at the Statler Hotel’s Grand Carrier Ballroom.

Office of the Dean of Faculty

Jeremiah Sweetser Ferguson

May 31, 1871 — June 30, 1939

Dr. Jeremiah Sweetster Ferguson, who died on June 30, 1939, was born in Searsport, Maine, on May 31, 1871. He received the degree of bachelor of science in 1889 and that of master of science in 1892 from the University of Maine and the degree of doctor of medicine from New York University in 1892. The University of Maine awarded him the honorary degree of doctor of science in 1922.

After receiving his professional degree he joined the teaching staff of New York University as assistant in Histology and he was instructor in that subject there from 1896 to 1898. In the latter year he joined the teaching staff of the Cornell University Medical College as instructor and was advanced to the rank of assistant professor of Histology, a position which he held until 1913, when he withdrew from teaching in the pre-clinical branches.

During this period he published a rather comprehensive textbook on *Normal Histology and Microscopic Anatomy*, a subject which was inadequately covered in this country at that time. He appears to have been an expert draftsman, for many of the excellent illustrations in this book were drawn by his own hand and many of the microphotographs were of his own making. In addition he was actively engaged in research. During the early part of his career his interest was centered in the minute structure of the thyroid gland. His own work contributed to the studies of the functions and chemical composition of that organ which were being actively pursued by several of the departments of the Medical School at that time. Afterwards his attention was directed to the more basic and perhaps more difficult problems of the minute structure of reticular tissue and the relation of reticular fibers to the elastic and to the white fibers of collagenous tissue.

After he severed his connection with the teaching staff of the pre-clinical branches, his writings turned toward the clinical fields.

Throughout his professional life, extending over a period of forty-seven years, he was also engaged in the practice of medicine and held many important positions in the hospitals of New York City. He was director of Pediatrics at Gouverneur Hospital, where he was a consulting physician at the time of his death. He had also served as assistant attending physician, attending physician and consulting physician at the Willard Parker Hospital for contagious diseases and for a time was a member of the Bellevue Hospital staff.

In 1909 he became the secretary of the Faculty of the Cornell University Medical College and he held that office until his death.

Robert Harry Ferguson

December 14, 1917 — February 19, 1979

Robert Harry Ferguson, one of the first faculty members of the School of Industrial and Labor Relations, died at his home in Land O'Lakes, Florida, on February 19, 1979. He was engaged as a part-time instructor for the lone course the school offered in 1945 and was the third person to join the industrial and labor relations faculty. He was promoted to the rank of professor in 1957. For reasons of health he chose early retirement in August 1977, was named professor emeritus, and moved to Florida.

He received his Bachelor of Arts degree from Union College in 1938 and his Master of Arts in economics from Brown University two years later. He then came to Cornell where from 1940-42 he was a part-time instructor in economics while studying for his Ph.D. For the following three years his studies were interrupted by World War II, in which he served as an officer with the Army Air Force. He returned to Cornell in 1945 and received his degree in 1948. His major field was labor economics. His dissertation dealt with unionization of foremen and was written under the guidance of the late professor Royal Montgomery.

He served as the first associate editor of the *Industrial and Labor Relations Review* from 1950 to 1952, and in 1953 was named editor. He served for four years and resumed the position in 1965 for a five-year term. On his retirement as professor, an issue of the Review was dedicated to him for his extraordinary contribution to the development of the journal. The editorial board's tribute included the following passage: "During the years of his stewardship, the Review underwent many changes and came of age, its friends like to think, as the leading journal in its field. Manuscript submissions and circulation increased throughout most of that period, and the articles published reflected the major shifts that occurred in research interests and methodology in the industrial relations field. Through all shifts in tastes and techniques, however, Professor Ferguson remained a champion of the consumer-reader in his insistence that authors treat the English language with the respect it deserves/'

Bob Ferguson was active in professional and University affairs. He was one of the founders of the New York State Economic Association and a member of the American Economic Association, the Industrial Relations Research Association, the International Industrial Relations Associations, and the Society of Professionals in Dispute Settlement. At Cornell he served at various times on the University Calendar Committee, the University Library Board, and the General Committee of the Graduate School. He also served for several years as the ILR School's observer and representative on the Faculty Senate of the State University of New York. He invariably enlivened ILR

faculty and departmental meetings by his quick and often passionate intelligence and the conviction with which he expressed his views on issues.

As an active mediator, fact finder, and arbitrator, he held membership on the mediation panel of the New York State Public Employment Relations Board, and the arbitration panels of the Federal Mediation and Conciliation Service and the American Arbitration Association.

He took a special interest in the Weinberg Seminars, held annually at Cornell University (under joint sponsorship of the School of Industrial and Labor Relations and the National Conference of Christians and Jews) to bring together leaders from business, labor, and public agencies for discussions of labor and social policy issues on the current national agenda. In 1960 he served as chairman of the seminar.

Although his chief concerns were the domestic problems of industrial and labor relations, he was by no means uninterested in developments in his field abroad. In 1954 he taught in the Salzburg (Austria) Seminar in American Studies and travelled in several European countries to become more familiar with their labor-management systems. He returned to Europe in the academic year 1961-62 to teach labor economics at the University of Leicester, England. And in 1968-69 he spent a full year at the International Labor Office in Geneva, Switzerland, where he held the position of senior research economist in the research and planning department.

All these experiences contributed to the value of his courses of instruction. He was a conscientious, devoted, and versatile teacher for whom students showed deep respect and admiration, for his teaching reflected assiduous preparation. He taught a wide range of basic and advanced subjects, including business history, income distribution, labor markets, and the economics of collective bargaining. He was also a successful, innovative teacher, notably in codirecting an experimental freshman course designed as a practicum in employer-employee relations. Over the years he maintained a large correspondence with former students who showed their appreciation by awarding him one of the first alumni plaques in recognition of his contributions to their education.

His research and writing likewise covered a broad spectrum of subjects, among which special mention must be made of his studies in income distribution, unemployment, poverty, cost-of-living index clauses in collective agreements, and labor policies in the agricultural sector.

Bob Ferguson will be remembered as a generous and cooperative colleague, at times a bit tart and impatient when compelled to listen to obvious nonsense, yet a friendly and warm-hearted person, who was widely liked and appreciated by both faculty and students.

Surviving him are his wife, Mary Margaret Evans Ferguson; two daughters, Mrs. Terry Parillo of Bradenton, Florida, and Mrs. Margaret Martin of Albuquerque, New Mexico; and two grandchildren, an uncle, and several cousins.

Jean T. McKelvey, John P. Windmuller, M. Gardner Clark

Karl Herman Fernow

October 12, 1893 — March 30, 1983

Karl Herman Fernow, professor emeritus of plant pathology, died on March 30, 1983, at the age of eighty-nine, ending a seventy-one-year association with Cornell.

Dr. Fernow was born in Washington, D.C., on October 12, 1893. He enrolled in the College of Agriculture at Cornell in 1912 and received a Bachelor of Science degree in 1916. During his undergraduate years he was active in athletics, winning three letters in varsity crew. In addition, he was a great lover of music and an able musician. He was a member of the University Orchestra from his freshman year until 1931, his specialty being the cello. He continued playing the cello for many years as a member of string ensembles.

Dr. Fernow became interested in potato diseases while working as a special field assistant in Steuben County during the summers of 1919 to 1922. In 1922 he was appointed an inspector in the seed potato certification program, a joint effort between the Department of Plant Pathology and the New York Seed Potato Association. He became an instructor the following year, and after completing his Ph.D. degree in 1925, was appointed an assistant professor. He spent his entire career at Cornell, being appointed an associate professor of plant pathology in 1947, a full professor in 1957, and emeritus professor in 1961.

Dr. Fernow was a pioneer in the field of seed potato certification and potato diseases. His doctoral thesis, entitled "The Interspecific Transmission of Mosaic Diseases," was published as Cornell Memoir 96 at a time when very little was known about plant viruses. When he joined the faculty, he was placed in charge of the seed potato certification program, a position that he held until his retirement in 1961. Over his long career he lectured on virus diseases of potatoes to two generations of potato growers and 4-H clubs, prepared field demonstrations and exhibits on potato diseases, and published many bulletins and articles. He taught a short course about plant diseases to winter course students from 1925 until it was discontinued in 1942.

In 1932-33 he spent a sabbatical leave studying potato diseases in Germany and in 1948-49 worked for the Colombian government on inspection, potato diseases, and related problems. As head of the potato certification program Dr. Fernow instituted numerous innovative ideas to improve the fledgling program. He conceived the idea of growing representative samples of seed lots in a southern winter test so that disease content and other factors pertinent to seed productivity could be obtained before the next growing season. This procedure is used today throughout North America by most seed potato certifying agencies. He was one of the first agricultural

scientists to use tuber indexing as a method of detecting and controlling seed-borne pathogens. The rindite gas treatment, which he devised to break dormancy of potato tubers prior to the winter test, is widely used in present-day programs.

In the early days of seed potato certification, virus diseases and their mode of transmission were poorly understood. As different virus diseases were identified, the picture started to clarify. One of the most difficult to diagnose was spindle tuber, a disease identified by both Dr. Fernow and another scientist working independently. For many years this disease was thought to be caused by a virus. Dr. Fernow, using the tomato challenge bioassay, which he developed, established that mild strains of the causal agent gave cross-protection to severe strains on inoculated tomato plants. It wasn't until 1971 that a plant virologist, using Fernow's isolates, discovered that spindle tuber was actually incited by a previously unidentified pathogen, which was named "viroid." Other early researchers worked briefly on spindle tuber but turned to other disease problems because of conflicting and inconsistent data. Dr. Fernow, however, continued with great persistence and tenacity, conducting greenhouse and field experiments with this disease until well past his eighty-sixth birthday.

Dr. Fernow was a widely recognized authority on potato diseases, especially those caused by viruses. He made outstanding contributions to the identification and control of this broad group of plant pathogens. His keen powers of observation, accurate diagnoses, and sound judgment in making recommendations for disease control were well known throughout the country. He authored numerous papers and abstracts in scientific journals, particularly the *American Potato Journal* and *Phytopathology*, as well as many extension bulletins. He was also recognized as a leader in the development of sound seed certification policies and procedures.

A quiet, modest man with a dry sense of humor and a master of the one-liner, he was always succinct and direct. He established a potato inspection service of unimpeachable reputation, and his sincerity and integrity were never questioned by the people he served.

Dr. Fernow was elected an honorary life member of the Potato Association of America in 1955. He was also a member of the American Phytopathological Society, the American Association for the Advancement of Science, Sigma Xi, Gamma Alpha, Scorpion, Sphinx Head, Mandolin Club, and Helios.

Dr. Fernow was married in 1923 to Lucy Kephart, a native Ithacan. They had three children, David, Mary Elizabeth, and Leonard, and eight grandchildren. He was preceded in death by his wife, Lucy, and his son Leonard.

William F. Mai, Leon J. Tyler, Edward D. Jones

Emory Nelson Ferriss

July 17, 1882 — January 8, 1946

Emory Nelson Ferriss, a member of the faculty in Rural Education since 1919, passed away at the Tompkins County Memorial Hospital in Ithaca on January 8, 1946.

Professor Ferriss was born in Toledo, Iowa on July 17, 1882. He was educated in the public schools of Toledo and in 1904 received the Ph. B. degree from Coe College in that State. The State University of Iowa awarded him an A. M. degree in 1906. During the year 1907-1908 he was a Fellow at the State University of Iowa and received a Ph. D. degree from that institution in 1908 with a major in modern languages. He did further graduate work in Education at the University of Chicago in 1911 and at Columbia University in 1916-1917.

He was principal of the high school at Pocatello, Idaho during 1906-1907 and from 1908-1911; instructor in English at the University of Illinois during 1911-1912; head of the Department of English, Broadway High School, Seattle, Washington, 1911-1916. In 1917 he became an assistant professor of Education at the University of Oklahoma, resigning from there in the Fall of 1919 to accept an assistant professorship in Rural Education at Cornell University. In 1925 he was promoted to a professorship. At various times he served on the summer session faculties of the Mississippi State College and of the Universities of Washington, Virginia, and Chicago.

He was a Fellow of the American Association for the Advancement of Science and a member of the National Commission on Research in Secondary Education, the American Academy of Political and Social Science, the National Society for the Study of Education, and the National Association of Secondary School Principals.

He was a member of three honorary societies—Phi Delta Kappa, Phi Kappa Phi, and Kappa Phi Kappa. He was a former vice-president of the Department of Rural Education of the National Education Association, and had served as Chairman of the National Committee on Small High Schools and as a member of the executive committee of the National Committee on Research in Secondary Education. He was past president of the New York State Educational Research Association and had charge of a study of the small high school in the New York State Rural School Survey of 1920.

While not a prolific writer, his publications have exerted wide influence. *His Secondary Education in Country and Village*, published in 1917, is generally considered to be the standard work in that field. He was co-author of *Smaller Secondary Schools* which is Monograph No. 6 of the National Survey of Secondary Education. This study

was the first comprehensive survey of secondary education on the national level and from it has stemmed many of the reforms in that field during the last decade. He contributed to various periodicals including *Education*, *School Review*, and *Junior-Senior High School*.

Professor Ferriss' broad preparation gave him an interest in and an understanding of many phases of education. He read widely in several languages and was thus able to follow closely educational developments in various countries. This, on a trip around the world in 1934-1935 he was prepared to appraise with understanding, school conditions in France, Italy, India, and China.

Professor Ferriss was one of the really beloved men on the Cornell University Faculty. His students held him in high esteem as teacher, counselor, and friend. His kindness and his fair-mindedness endeared him to all who had the privilege of associating with him. When his determination and his sense of responsibility to his students led him, despite his growing physical infirmities, to continue his teaching almost to the very end, there was no lessening of his cheerfulness, thoughtfulness, and desire to serve. His colleagues in the School of Education and the Department of Rural Education had high regard for his judgment and for the quality of his idealism. Among his professional associates in the United States, he was recognized as one of a very small group of outstanding men in secondary education and was commonly considered to be the leader in the rural phases of that field.

Julian Butterworth, R. C. Gibbs, R. M. Stewart

Reeshon Feuer

January 11, 1917 — March 29, 1997

Reeshon Feuer, soil scientist, left his mark on the mantle of the Earth: in selecting a site for the capital city of Brazil; in guiding rice farming in the Philippines; and in directing an enlightened use of the land from end to end of New York State. His boundless enthusiasm for learning and for sharing his knowledge continued to the very end of his life.

A native of New Hampshire, he began his career as scientist by graduating in Agricultural Chemistry from UNH, and he joined the USDA Soil Survey Division that was engaged in mapping the soil boundaries in that state. After an appointment as a faculty member at UNH, he came to Cornell to study for a Doctorate. Upon receiving it, he was appointed an Assistant Professor with principal duties in extension teaching. He was promoted to Professor, served as Departmental Extension Leader in Agronomy, and for four years was Visiting Professor of Soils and Agronomy at the University of the Philippines, as Cornell faculty members assisted in the creation of graduate-level educational programs at Los Banos.

The foregoing chronicle only hints at the qualities that made Reeshon Feuer famous wherever he lived and worked. “I have not known another person with such a thirst for knowledge about all things in the natural environment as Reesh had,” wrote his former department chairman. With enormous vitality he read, observed, recorded and organized information, not only in relation to his professional endeavors but also far beyond. An example was his dissertation study of the district in which the new inland capital city of Brazil was to be established *de novo*. A newcomer to the tropics, he not only as expected characterized the previously unstudied soils as to their ability to support the capital agriculturally, but also described the landscape, geomorphic relationships, and native vegetation.

His duties at Cornell were mainly those of helping both professionals and lay people across the state understand the properties of the soils on which they lived and worked. It was a period of intense, county-by-county mapping by teams of state, federal and local soil scientists; each map they produced was accompanied by a text that indicated the merits and deficiencies of each soil series for crop production, road construction, building sites, forestry and recreation. The introduction of each new county survey report touched off a major educational effort directed to bankers, highway engineers, real estate appraisers, and local officials as well as agriculturists. In this effort, Reeshon Feuer was the state leader. It was a task for which he was ideally suited, for he combined a truly

encyclopedic knowledge of our natural resources with a warm and enthusiastic personality, and a dedication to giving the public a maximum return on its investment in the soil surveys. Concurrently he was contributing to the annual college handbook, *Cornell Recommends for Field Crop Production*, and evolving a “par yield” rating system for scores of soil types, an innovation that became part of the environmentalist’s toolbox as well as the assessor’s.

Reeshon was the sort of person about whom a host of stories (some perhaps apocryphal) grew up, and to whom remarkable powers were attributed. It was said that if he were blindfolded and transported to any part of the state, then given a spade and a few minutes to dig, he could identify his location. The maps he carried were continually annotated, to the point where all margins were filled and notations were continued on the back. Some of the maps he derived from the county surveys by lumping kindred units into “associations” employed not only the usual color coding, but also a variety of shaded and polka-dotted patterns that may never before have been known to cartography. His personal compilation of best and thriftiest places to stay and eat in New York State was so highly regarded that it was finally mimeographed for distribution. He knew where the trout lurked, and how to cook them.

In the Philippines, he succeeded in enlisting several previously uncooperative agencies in the publication of a national rice-growing guidebook, a feat many veteran observers had assured him was impossible. Colleague Shaw Reid was not surprised, knowing from long association that “Reesh did 90% of the work and gave others 100% of the credit.” Several Philippine organizations honored him for his service.

Close to home, neighbors relied on him for advice about gardening, hoping to approach his marvels of vegetable production, and when the Feuers moved to the Kendal retirement community, he was immediately selected to guide the establishment of a community garden there. Less akin to his other talents, but again remarkable, was his skill as an investor. His was a guiding voice in an investment club for many years, one so sage that the members have planted a memorial tree to honor him.

Reeshon Feuer’s legacy is in the recollections of his family, coworkers and a host of friends, and in the hands of those who examine his maps and publications. It was a zestful life of service.

Marlin G. Cline, Robert F. Lucey, Madison J. Wright

John Alban Finch

1929 — April 5, 1967

John Finch was born in London, England, the son of John Edward and Annie Elizabeth Finch. He attended the Harrow Weald School and the University College of the Southwest of England, Exeter, where he read History and received the B.A. degree in 1950. After serving two years as an infantry officer in the British Army, he taught at Ashridge College, Berkhamsted, from 1956 to 1958, when he removed to America to join the faculty of the Howe Military School in Indiana. At the same time he pursued the study of English and American literature at the Breadloaf School of English in Vermont, where he greatly impressed the late Professor Stephen Whicher, who helped him to enter the Graduate School at Cornell in 1960, on a Woodrow Wilson Fellowship. There he earned the M.A. in 1961 and the Ph.D. in 1964, and stayed on to teach as instructor, and (after 1965), as Assistant Professor of English.

His doctoral thesis, *Wordsworth, Coleridge, and "The Recluse," 1798-1814*, inaugurated the work on Wordsworth which, within remarkably few years, made him known, in the informal and international society of scholars in Romantic literature, as one of the leading Wordsworthians of his time. He made himself a master not only of the writings by and about the poet in the Wordsworth collection at the Cornell Library, but especially of the great store of Wordsworth's manuscripts in the museum at Dove Cottage, Grasmere. In addition, he was a committed and gifted teacher who won the admiration and warm affection of his students. In the fall of 1966, he was given the heavy responsibility of serving as the faculty resident in charge, at the Cornell Heights Residential Club, of the first group of forty-eight students in the new program designed to lead from college entrance to the doctorate in six years. In little more than a half-year Finch, by his unobtrusive but strongly effective guidance and example, had welded a group of young, diverse, intelligent, and high-strung students into a genuine society, with its own order and developing character. In the early morning hours of April 5, 1967, a tragic fire broke out in the Residential Club which took the lives of eight students, three of them members of the six-year program for the Ph.D. John Finch was early awakened, roused most of the students, and telephoned in the alarm. He made his way out of the building but returned to make a check of the rooms and was overcome by smoke and the gases released by the fire. He died as he lived, in an act of duty and of devotion to his students.

Finch had just published, in the *Journal of English and Germanic Philology*, an article on Wordsworth's "*The Ruined Cottage Restored: Three Stages of Composition*." He had two major works in progress. One was an edition

of “Home at Grasmere,” the opening book of the long and unfinished work, *The Recluse*, which Wordsworth intended as his masterpiece, and for which Finch completed an Introduction and most of the editorial work. The other was an Index of Wordsworth’s manuscripts, begun in collaboration with Kenneth Abrams, which was to incorporate a full account of the form and content, as well as of what could be reconstructed of the date and intention, of Wordsworth’s often perplexing documents—a task in which he had already filled sixty-odd notebooks of meticulous description and commentary. In addition, by force of his habit of perfection, Finch had kept by him a number of articles for reworking and polishing. His range of scholarly interests was wide and included especially the novel—one of these unpublished essays was on Dante’s *Inferno* and the Eumaeus chapter of Joyce’s *Ulysses*. Of the articles on Wordsworth, four will be published in a memorial volume, to be edited by Jonathan Wordsworth and to include contributions by friends and fellow-Wordsworthians in America and England—a tribute almost without precedent for a scholar so young.

John Finch was a man of wide-ranging knowledge, with a lucid and flexible intelligence, a ready wit, and a quietly distinctive grace in demeanor and speech. His stance toward life was ironic; his irony, however, was never caustic but issued from a habitual underemphasis on his own deep concerns, and a style of understatement in expressing his penetrating judgments on people and affairs. He will be sorely missed by his friends, and will be permanently remembered in the chronicles of the University.

He is survived by his parents and a sister, Miss Veronica Finch.

Stephen M. Parrish, Jonathan Wordsworth, M. H. Abrams

William Albert Finch

— *March 31, 1912*

Professor William Albert Finch, a member of the Faculty of Cornell University for a period of over twenty years, died on March 31st, 1912. At its first meeting after his death, this Faculty desires to inscribe upon its records an acknowledgement of the great loss which the University has sustained by the death of Professor Finch.

Professor Finch was graduated from this University in 1880 with the degree of Bachelor of Arts, and was the same year admitted to the bar, having been engaged in the study of the law during his undergraduate days in the office of Francis M. Finch. He immediately took up the practice of law in Ithaca, becoming a member of the firm of Halliday and Finch. Appointed in 1891 to an assistant professorship in law, Professor Finch was the first graduate of Cornell University to return as a member of the Faculty of the College of Law. He was promoted the following year to an associate professorship, and in 1895 to the full professorship which he held until his death. During the years 1896-1901 he acted as secretary of the Faculty of the College of Law, having full charge of the administrative work of the College during that time.

Specializing in the law of real property—a branch of the law requiring the closest application for that comprehensive mastery which was his—his presentation of it in classroom and through his writings was clear and illuminating. Yet he was no narrow specialist; it is an indication of the breadth of his scholarly interests and sympathies that he was accustomed to refresh and recreate his mind by constant studies in science and the classics.

Never robust, and suffering from ill health during the larger part of his life, especially during the last years, he nevertheless entered into his daily task with a spirit serene but enthusiastic, a self-sacrifice brave but unostentatious, that brought friendly cheer and inspiration to his students and his colleagues.

Frank Irvine, Chairman, C. T. Stagg, Ernest Merritt

Source: Records, p. 546, April 19, 1912

Myron Gustin Fincher

November 25, 1898 — March 2, 1981

Dr. Myron G. Fincher was born on a small farm at Corfu, New York, November 25, 1898, the youngest of five children. He began his education under the able tutelage of an older sister who was a graduate of the Brockport Normal School. His formal schooling began at the second grade level. Upon graduating from high school at the age of sixteen, he spent the next year and a half working in a machine shop and on his father's farm.

His great fondness for animals, particularly horses, brought him to Cornell and the New York State Veterinary College in 1916. He was appointed instructor in the Department of Medicine when he graduated in 1920. By 1925 he had obtained his Master of Science degree in spite of the rigorous schedule he was obliged to maintain as a clinician in the Ambulatory Clinic.

Dr. Fincher spent the academic year 1926-27 at a large horse breeding establishment in Kentucky to gain experience with the reproductive problems of this species. At the conclusion of his stay, he was offered a large salary to remain on a permanent basis, but he preferred to return to the college.

He became an assistant professor in 1926 and a professor in 1938. On the retirement of Dr. Udall in 1942, Dr. Fincher was appointed head of the Department of Medicine and Obstetrics and director of the Ambulatory Clinic, a position he held until his retirement in 1965.

In 1943-44 he served as acting dean of the New York State Veterinary College and repeated this duty for a few months in 1945. As a result, he was invited to accept the deanship at Texas A&M and later at the University of Minnesota. Both of these offers he declined. He had previously refused a professorship in medicine at Ohio State University, but in 1940 he served as acting professor of medicine at that institution.

Besides being listed in *Who's Who*, he held membership in Sigma Xi, Phi Kappa Phi, and Phi Zeta. The New York State Veterinary Medical Society selected him as the Veterinarian of the Year in 1963 because of his long and distinguished service to the profession.

He was the recipient of the Borden Award from the American Veterinary Medical Association in 1954 and served on the Executive Board of that organization from 1956 to 1965. Both the Southern Tier Veterinary Medical Association and the New York State Veterinary Medical Society honored him as president. He held memberships in many professional organizations, including the United States Livestock Sanitary Association.

During his long career of service to the veterinary profession, he published over 124 articles on diseases of domestic animals and was widely sought as a consultant. When he was called to the farm of Governor Thomas E. Dewey in 1946, he found the dairy herd severely affected with mastitis. Mr. Dewey became very interested in this disease and encouraged the legislature to appropriate money to set up the New York State Mastitis Research and Control Program. Dr. Fincher was appointed to the directorship with the authority to set up six laboratories throughout the state and to select a staff for each unit. This program became internationally recognized as the best approach to the control of bovine mastitis. For almost 20 years Dr. Fincher carried the responsibility for the directorship in addition to his other commitments.

In 1960 he spent a year in Peru, Uruguay, and Brazil as a specialist for the International Education Exchange Service for the U.S. Department of State. He had been a Fulbright lecturer at the University of Thessaloniki in Greece the year before and had received an honorary Doctor of Philosophy degree, a rather unusual honor at that university.

On January 31, 1965, he retired seventeen months prematurely so that he could accept an assignment in Nigeria. At that time he had served the college for more than forty-four years. As head of the Department of Medicine and Surgery he helped in establishing a new veterinary college at Ahmadu University in Northern Nigeria during 1965-67. On his return from Nigeria, he accepted an assignment with the Veterinary Medical Division of the United States Food and Drug Administration.

Finally, in 1973, he went to Citanova-Marche, Italy, to help organize an equine breeding farm. Here, on the shores of the blue Adriatic, he was back with his first love, horses. He wrote to a friend: "It is like a paid vacation to watch a band of young horses race down a country lane from the pasture to the box and oats."

While highly interested in research of reproductive diseases and disorders of horses and cattle, he was intensely concerned with the clinical application of the fruits of the laboratory. As a teacher and clinician, he was highly regarded by both students and colleagues. There was an aura about him best described as strictly professional. He performed his duties with dispatch and his clinical teaching with dignity, but there were no shortcuts in quality, dress, or demeanor. His code for neatness and cleanliness set a high standard for students: Colleagues will always remember him as a great gentleman.

He is survived by his wife, Evelyn Davis Fincher, whom he married June 25, 1924, and his three daughters, Joyce Coye, Esther Hays, and Myra Tennant.

Francis H. Fox, Stephen J. Roberts, Ellis P. Leonard

Donald Lord Finlayson

September 20, 1897— July 24, 1960

Donald Lord Finlayson, Professor of Fine Arts in the College of Architecture, died July 24, 1960, at his summer home in Kennebunk, Maine. Serious illness for several months preceding his death had so restricted his activities that he had retired from the faculty July 1 and had been made Professor Emeritus. He had served on the faculty for thirty-two years.

Professor Finlayson was born at Rye, New Hampshire, on September 20, 1897, the son of Archibald and Elizabeth Lord Finlayson. After his early education in the public schools at Rye and Portsmouth, New Hampshire, he entered Dartmouth College in 1915 and was graduated as Bachelor of Arts in 1919. Although majoring in geology, he had acquired a lasting interest in the fine arts, apparently the result of some inspiring teaching in that area. This led him to Brown University in 1921, from which he received the Master of Arts in fine arts in 1923. Also while studying at Brown he worked as a museum assistant in the Rhode Island School of Design. The following year was spent doing graduate work at Harvard, and the next at Princeton as a Proctor Fellow studying under Professor Frank Jewett Mather. In the fall of 1925 he started his teaching career as Assistant Professor of Fine Arts at Wells College, and during the next year or two he occasionally appeared at Cornell as a visiting lecturer. In 1928 he was appointed Assistant Professor in the College of Architecture at Cornell and was raised to full professorial rank in 1935. Since many of his students were from the College of Arts and Sciences, he was a member of that faculty also.

Professor Finlayson's specific field was the history of painting and sculpture and to this he made his main contributions, including the publication in 1935 of *Michelangelo the Man*, as well as occasional reviews and articles for professional journals. For about ten years he served as visiting lecturer on fine arts at Elmira College. Beginning in 1926 and continuing for twenty-odd years thereafter he spent his summers abroad as a lecturer for the Bureau of University Travel, thus becoming thoroughly acquainted with the galleries and art centers of western Europe.

For many years Professor Finlayson had been interested in the history and development of early American arts and crafts, quite understandable in view of his New England heritage. As a hobby he had gathered together a substantial collection of tools, utensils, and other implements, with illustrative books, prints, and photographs. He established and gave a course called "The Arts in America" for several years before he retired.

His courses in the history of the fine arts were popular and, though primarily for students in architecture and fine arts, they attracted many from elsewhere on the campus. He enjoyed his contacts with students, both academic

and social, and gave freely of his time to their affairs. For many years he served as faculty adviser for various groups such as the student organization of the College of Architecture, the Cornell swimming teams, and Alpha Phi Delta fraternity, and he was always involved in affairs at the Heller House and in the annual Festival of Contemporary Arts. During World War II he served as a member of the selective service board in Ithaca.

Professor Finlayson was a member of several professional societies, among which were the Archaeological Institute of America, of which he was a past local president, the College Art Association, and the Society of Architectural Historians; he was also a member of the student societies Gargoyle, L'Ogive, and Kefti.

H. E. Baxter, A. H. Detweiler, J. A. Hartell

Charles Clayton Fischer

February 11, 1928 — May 21, 1993

Charles (Clayton) Fischer was born February 11, 1928 in South Bend, Indiana, the son of Wilbert and Frances Stover Fischer. He attended elementary and high school in South Bend. Chuck, as he preferred to be called, served in the United States Army Corps of Engineers with stations in the United States and in Japan. He attained the rank of Sergeant. After his discharge, he worked for several years before entering Michigan State University where he obtained his Bachelor of Science degree in ornamental horticulture in 1955 and his Master of Science degree in 1956.

In 1954 Chuck married Barbara Tomlinson while he was a student at Michigan State University.

After receiving his M.S. degree, he served as assistant county agricultural agent in ornamental horticulture with the Colorado Agricultural Extension Service in Denver, Colorado from July 1956 until October 1957. He returned to Michigan to become Genesee County 4-H Agent in urban ornamental horticulture and served November 1957 through July 1959. In September 1959, he was appointed assistant professor in the Department of Floriculture and Ornamental Horticulture in the College of Agriculture and Life Sciences at Cornell University with responsibilities as state extension specialist in ornamental horticulture. He was promoted to associate professor in 1965.

Chuck rapidly attained a fine reputation throughout the State as an expert in interior plant decoration. He gave lectures and demonstrations at county and regional meetings and at statewide meetings of county extension staff and leaders held at Cornell. He was a frequent participant on radio and television programs, and his appearances at the Horticulture Building at the New York State Fair in Syracuse were very popular. He also chaired the Cornell-Rutgers educational exhibit at the New York International Flower Shows of 1963 and 1964.

Professor Fischer wrote many articles on the effects of light on the growth of ornamental plants in interior situations, and the decorative use of lighting in home gardens. He also published on landscaping mobile homes, and the use of planters in landscaping outdoor patios and living areas. He wrote many newsletters on the culture of various interior plant species and his Cornell Bulletins, *Growing African Violets* and *The Selection, Care and Use of Plants in the Home* by Professors Fischer and Raymond T. Fox have been distributed widely both within New York State and nationwide. He also produced several slide sets used for Cooperative Extension Education in and beyond New York State.

In 1970 when a colleague was on sabbatical leave, Professor Fischer took over the teaching of the basic course in floral design in the Department of Floriculture and Ornamental Horticulture. A very popular course since the inception of the Department in 1913, it draws students from across the University. Because of its popularity, it had been limited to upperclass students outside the department and to department majors, and had always had a waiting list. Professor Fischer's approach to the course was one of freedom and informality, which allowed the students to relax and enjoy themselves while learning a new design skill and coming to appreciate the beauty of natural materials.

Professors Fischer and Fox also taught a course, Judging Ornamental Plants and Flowers.

In the last several years, Chuck was forced to reduce his teaching effort because of his increasingly frail health. He involved student laboratory assistants to lessen the amount of "standing" time. In the way in which he handled it, his approach gave advanced students the opportunity to teach under his direction, thereby giving them valuable teaching experience which already has proved useful to many of them in their future careers.

Chuck spent the last few years in increasingly difficult health circumstances. He was hospitalized several times for long periods and was finally forced to discontinue his teaching. His last hospitalization ended in his death on May 21, 1993.

He is survived by his wife, Barbara Tomlinson Fischer and his son, Gregory and daughter-in-law, Susan Fischer; his parents, Mr. and Mrs. Wilbert Fischer; and his brother and sister-in-law William and Helen Fischer; and several nieces, nephews and cousins.

During all of his tribulations, Chuck was never one to complain. He related well to his colleagues and he never let his afflictions be reflected in his attitude toward his students. His students both at Cornell and in extension across the State will remember him for his caring, kind, effective and concerned manner of teaching.

Raymond T. Fox, Arthur S. Lieberman, Ernest F. Schaufler, Carl F. Gortzig

Richard B. Fischer

January 19, 1919 — August 7, 2005

Richard B. Fischer was born in Boston, Massachusetts on January 19, 1919. Soon thereafter, his family moved to Flushing, New York, where he spent his childhood and public school years. Following public school, he attended Queens College, from which he received the B.S. degree in 1942. As a child, Dick was a victim of poliomyelitis, which left his right arm partially disabled. Even so, he found ways to interact with his natural environment so that it became his playground and his lifelong laboratory, and for the rest of his life he was a dedicated, productive environmentalist.

Dick earned his M.A. degree at Columbia University in 1943, and taught secondary school science in the schools of Malvern, Lindenhurst, and Scarsdale. He entered Cornell University in 1948 as recipient of a graduate fellowship in vertebrate zoology. As a graduate student, he studied intensively the biology and breeding behavior of chimney swifts, under the supervision of one of the world's greatest ornithologists—Arthur A. Allen. He completed his doctoral thesis on that topic, and was awarded the Ph.D. degree and elected to the position of Assistant Professor of Rural Education in 1953. (Rural Education at that time included undergraduate and graduate education in Field Natural History.) He became Associate Professor in 1956 and on the basis of his outstanding teaching and a prodigious array of publications, was promoted to full Professor of Rural Education in 1965.

Over the next several decades, Dr. Fischer continued an amazing schedule of published writing as well as his schedule of popular classes in environmental education. Molded in the long Cornell tradition of natural history by superior naturalists such as Liberty Hyde Bailey, Dick Fischer became synonymous with Field Natural History, the course with which he was identified. His ever popular classes in that subject were always filled, and had a waiting list. At the same time, he seemed always pushing the limit on publishing popular works on field biology. Dr. Fischer was a prolific author and editor of natural history subjects. He was editor and senior author of McGraw-Hill's 14-volume series, *Our Living World of Nature*. He wrote many articles for *The New York State Conservationist* magazine, and served on the advisory board of *Ranger Rick Magazine*, published for children by the National Wildlife Federation. He was the natural history representative on many boards and associations, and was closely associated with policy and educational writings of such outstanding societies as the John Burroughs Society and the Roger Tory Peterson Institute. It is difficult to list any outstanding natural history periodical or organization to which Dr. Fischer was not an active contributor or didn't serve on its board in some way.

But it was as a Professor of Field Natural History that Dr. Fischer became best known. He carried on in the long-standing tradition of Anna B. Comstock and E.L. Palmer, concentrating on educating young people from public schools through university by direct experiences with living things. He could challenge and hold spellbound young audiences by hands-on experiences with goldenrod galls, the structure of a red-eyed vireo nest, or the shed skin of a garter snake. His classes were always filled, and weather was no obstacle. His students stood in the rain, snow, or glaring sun—spellbound by his clear, spirited explanations of the nature around them. He was equally in demand by schools and environmental organizations. He helped to organize, and for many years directed, the Arnot Forest Workshop for Teachers, which over a period of more than a decade, prepared public school teachers for expanding science courses to include native plants and animals and their relation to the human environment. Ever cognizant of, and committed to improving environmental quality, he labored for years to introduce legislation in the New England states and New York to limit, and then to prevent, tossing of soft-drink bottles. Roadside litter became a mere trickle because of his unyielding environmental commitment.

Dr. Fischer served as a chairman and as a committee member for many Cornell graduate students seeking advanced degrees in environmental education or conservation. He spent days and occasional nights in the field, sharing educational experiences and support. An example was a three-day trip with a graduate student research team studying reproduction in New York State black bears. Picture Dr. Fischer seated at a woodland breakfast one morning with his arm draped around a drugged adult female bear!

As with many professors, Dr. Fischer also enjoyed an array of surprising pastimes. He was an accomplished woodworker. He also thoroughly enjoyed deer hunting, and each fall for many years he went to the Adirondacks with two colleagues to hunt deer. His conversations around the campfire would have been a library treasure!

As the chairman or member of many graduate student committees over the years, Dr. Fischer was a pleasantly critical resource. The theses completed under his direction were rigorous, creative, and enlightening. He chaired a number of Ph.D. committees, and many more Masters committees. An articulate and demanding author himself, his graduate students produced impeccable theses. and later many quality publications in their own right—with knowledge and skills developed and honed by Dr. Fischer.

One might think an outdoorsman such as Dr. Fischer was a big, rough, stern man. On the contrary, he was of slight build with a big heart and a steely curiosity. Once, while accompanying a grad student on a wildlife study for the student's graduate degree, he sat in a wilderness cabin observing a white-footed mouse on a sill. The question came up about what the mouse could have been feeding on in that cabin. Dr. Fischer, ever the curious

naturalist, dispatched the mouse with a round of dust shot, opened the stomach, and found some seeds, which he proceeded to sample. His verdict: touch-me-not, or jewelweed. That was the ever-curious Dick Fischer in action! He embodied the curiosity, the dedication, the tenacity, the insight, and the educational leadership of many famous Cornell professors with whom he studied and worked: the world-famous ornithologist, Arthur A. Allen whose popularizing of ornithology led to establishing Cornell's Laboratory of Ornithology; Anna B. Comstock, founder of the Nature Study Movement in New York State and author of the *Handbook of Nature Study*; E.L. Palmer, author of many Cornell Nature Study Leaflets and author of the *Fieldbook of Natural History*; and Eva Gordon, a dedicated Nature Study proponent and author of Cornell Nature Study Leaflets for public-school children. Dick Fischer not only stood on the shoulders of Cornell's greatest natural history professors; he became one!

Retiring from his professorship in 1985, Dr. Fischer continued to be active, especially with his long-term study of bluebirds. He attached nesting boxes to posts around meadows of Tompkins and surrounding counties, keeping meticulous notes on the nesting and breeding behavior of the species. He and a colleague, Harlan Brumsted, assisted by Dr. Fischer's wife, Mary Margaret, wrote *Voices From Connecticut Hill*, detailing both the human and the natural history of this hill near Ithaca where he had led so many field trips, and conducted the Arnot Forest Workshop.

One cannot travel to the forests, streams, prairies, or mountains of the West, the Eastern Shore, Texas, the Rockies, or Alaska without bumping into someone who has studied under, read about wildlife from, or met someone who was a student of, Dr. Fischer. His "stamp" is on so many who occupy positions of classroom leadership, authorship, state or national conservation policy, or general knowledge about the world of nature!

As a living memorial to the impact of Dr. Fischer on the natural environment of the Ithaca area, his many admirers purchased and set aside through the Cornell Plantations the Fischer Old Growth Natural Forest, a 34-acre stand in Newfield, New York. It symbolizes Dick's long love of unspoiled nature, and exemplifies the natural areas of this state that thousands of citizens know more about, and appreciate more because of the dedication of this remarkable professor. Dick was one of Cornell's finest!

Plagued by a series of malignant tumors in his last years, Dr. Fischer died in Ithaca on August 7, 2005. He is survived by his wife of decades, Mary Margaret, herself an outdoorswoman of note, and three children—Peggy, now a Florida resident; Dick, a Texas attorney; and Jonathan, a language teacher in New Hampshire. At his request, Dr. Fischer was cremated and his ashes scattered above the Beaver Kill in New York's Catskills, where he carried

out his research on chimney swifts, and where he, Mary Margaret and children had spent many summer weekends camping and “naturing.” No Professor of Education will be missed more, or remembered with greater love, than this remarkable Cornell naturalist, Dick Fischer!

Dalva Hedlund, Richard Ripple, Verne Rockcastle

Pierre Augustine Fish

Dean of the N. Y. State College of Veterinary Medicine

February 17, 1865 — February 19, 1931

The University Faculty deeply deplores the death of Professor Pierre Augustine Fish, who died February 19, 1931, after a short illness. He was born at Chatham, New York, on February 17, 1865, and entered Cornell University in 1885. After a leave of absence of one year, he took the degree of B.S. in Natural History in 1890. He entered the Graduate School and was granted the degree of D. Sc. in 1894. While doing work for the advanced degree he served as instructor in Physiology and Neurology under Professors B. G. Wilder and S. H. Gage. Two different degrees in veterinary science have been conferred upon him: one from the National Veterinary College of Washington, D. C., in 1896, the other from Cornell University in 1899.

Professor Fish spent thirty-eight of the forty years of a useful and distinguished career in the service of Cornell as a teacher, investigator, and administrator. For two years he was in the service of the national government at Washington. During the year 1895-96, he was assistant to his friend and colleague, Professor V. A. Moore, in the Division of Pathology, Bureau of Animal Industry. During the year 1918-19 he was on leave from the University, having been commissioned a Major, Veterinary Corps, and attached to the Surgeon General's Department. Becoming an assistant professor in 1896, he was advanced to a professorship in 1901. When the Ithaca division of the Medical College was established he organized the courses in physiology and taught them for some years. He served for twenty-nine years as secretary of the faculty of the Veterinary College. He became Dean of the Veterinary College upon the retirement of Professor V. A. Moore in 1929. He was a member of the original faculty of the Veterinary College, having left Washington in 1896 with Professor V. A. Moore to become a member of that body.

One of the outstanding characteristics of Professor Fish was his talent for scientific investigation. Research held for him a profound interest. Such an interest in investigation led to a broad productive scholarship, which is manifest in his numerous articles and various larger publications.

He was not only interested in problems of education, research, and administration, but was also a force in the councils of the profession of veterinary medicine. He served as editor of the Cornell Veterinarian from 1912 to 1915, and of The Journal of the American Veterinary Medical Association from 1915 to 1918, was vice-president and president of the New York State Veterinary Medical Society, and a member of numerous important committees in

local, state, and national veterinary associations. He strove always for the highest possible standards of education and professional ethics. His own high personal and professional standards, his keenness of perception, his calm and judicial attitude, caused his counsel to be sought and valued above that of other men. He was a Fellow of the American Association for the Advancement of Science, a member of Sigma Xi, Phi Kappa Phi, Phi Zeta, the Society for Experimental Biology and Medicine, and local, state and national veterinary associations.

He gave himself without stint to the many problems confronting him. His sound learning and impartial fairness endeared him to his colleagues and to the many generations of students passing through his classes. Death closed too soon a most successful career of teaching, scholarship, and administration. We shall treasure the memory of his kindly and helpful personality.

Elwood George Fisher

November 10, 1916 — April 25, 1961

Elwood George Fisher, Professor of Pomology, passed away suddenly April 25, 1961, following a very brief illness. His untimely death at the age of 44 ended a relatively short career marked by numerous contributions to fruit production problems.

Professor Fisher was born in Washington, D.C., November 10, 1916. During his summer vacations from high school he worked in the fruit orchards of his uncle, Rolland Reitz, in Monroe County, New York. Here he gained an interest in fruit growing which was nurtured by the years. Later in his professional career he conducted experimental field trials in his uncle's orchards. After graduation with the B.S. degree from the University of Maryland in 1938, he worked as an assistant in horticultural research at the University of New Hampshire. In October of 1939 he was appointed junior pomologist with the United States Department of Agriculture on the Florida and Louisiana Tung Project.

In January of 1942 he started his naval career at Officer's Training School, Columbia University. He was commissioned and served on a mine sweeper (U.S.S. A.M.C. 24) based at Cape May for about thirteen months. He was then transferred to the Caribbean theater where he served on a mine sweeper (U.S.S.Y.M.S. 309) for eighteen months, the last six months of which he served as captain of the ship. After "V.E." day he was assigned to a new ship on the West Coast until "V.J." day terminated his active service with the Navy.

On June 23, 1945, he married Ruth Elsbeth Burrage at Long Beach, California. They had four children—David George, Allen Burrage, Susan Trumball, and Robert Leslie. Professor Fisher is survived by his wife, children, and mother, Mrs. Clarence G. Fisher of Washington, D.C.

With the close of World War II Professor Fisher returned to his position with the U.S. Department of Agriculture for a nine-month period before coming to Cornell in September 1946. He was a recipient of the DeWitt Clinton Scholarship in 1946-1947. During the remainder of his graduate work at Cornell he held a graduate assistantship. He had a major in pomology and minors in plant physiology and biochemistry. He was granted the Ph.D. degree in 1949 and immediately accepted an appointment as Assistant Professor of Pomology at Cornell. He advanced to Associate Professor in 1952 and Professor in 1959.

During the summer of 1950 Professor Fisher took a course in radioisotope techniques at the Oak Ridge Institute of Nuclear Studies. While on a sabbatic leave in 1955-1956 he did research and advanced study at the Institute of Agricultural Research, Wageningen, Netherlands, and at the Long Ashton Research Station near Bristol, England.

At Cornell Professor Fisher divided his time between extension and research in pomology. As an extension worker dealing with fruit tree nutritional problems he won great respect from fruit growers. His quiet, unassuming attitude, along with his patience in dealing with practical problems of farmers, won him many friends. He was a very productive scientist in his research specialty—the application of biochemistry and plant physiology to the solution of practical problems in mineral nutrition of deciduous fruits. The Soil and Leaf Analysis Service offered by Cornell as a guide to orchard fertilization was an outgrowth of his special interest and research in this field. The pioneer effort has proved to be of considerable economic importance to the fruit industry in improving the yield of high-quality fruit. His work with radioactive isotopes contributed valuable information on the absorption of various compounds by the foliage of trees and their transport to other parts of the tree. He also made valuable contributions on the control of soil nematodes attacking sour cherry trees and on the use of herbicides as a substitute for orchard cultivation.

While he did no formal teaching, Professor Fisher served as major and minor adviser to a number of graduate students. His careful and critical approach to their problems gained their respect, and his pleasing personality and sympathetic understanding won their affection.

He was a member of the American Society for Horticultural Science, Sigma Xi, Phi Kappa Phi, and Alpha Zeta. He was author or co-author of some twenty technical papers and numerous popular articles and extension bulletins.

His many close friends, including colleagues and fruit growers throughout New York State, share with his family a deep sense of personal loss.

O. F. Curtis, Jr., M. B. Hoffman, R. M. Smock

Gordon P. Fisher

July 26, 1922 — January 22, 1993

Dr. Gordon P. Fisher, professor emeritus of civil and environmental engineering, of Warren Road, Ithaca, New York, died unexpectedly at Tompkins Community Hospital on Friday, January 22, 1993 after a sudden collapse that morning. He was 70 years old.

Dr. Fisher was born July 26, 1922 in Baltimore, Maryland, the son of the late Frank and Harriet Fisher. He graduated from The Johns Hopkins University with a Bachelor of Engineering degree in 1942. He then worked for the predecessor of NASA a short while before enlisting in the U.S. Army Corps of Engineers. As a 1st Lieutenant he served his country in the Pacific Theatre during WWII. Beginning in New Guinea, he fought from Leyte, Luzon, and Manila through Corregidor, Mindoro, and finally Mindinao, where he was wounded and awarded the Purple Heart.

After recuperating he returned to The Johns Hopkins University where he earned his Dr. of Engineering degree in structural engineering in 1948. He then joined the faculty of Cornell University where he taught for 42 years. He retired in 1990 as professor emeritus.

Initially he taught structural theory and design, optimization of structural systems, foundations, and steel and concrete design. In 1965, he shifted his professional interest and activities to transportation systems planning and design. He pursued those interests into his retirement.

During his long and distinguished service to the University he held a number of significant administrative positions.

From 1962-64 he served as the first director of the Cornell Water Resources Center, coordinating all water-resource-related activities on campus. He was associate dean of Engineering between 1960 and 1966. Appointed head of the Department of Environmental Systems Engineering in 1966, he was principally responsible for the conception, formation and development of the Department. In 1973 he became director of the Cornell Program in Urban and Regional Studies, holding that position until 1978.

Dr. Fisher distinguished himself early in his career when he received the Outstanding Civil Engineering Student Award from The Johns Hopkins University in 1942. He was the recipient of the prestigious Norman Medal of the American Society of Civil Engineers in 1962. He was past president (1971-72) of the Sigma Xi (honorary research

society), a member of Tau Beta Pi (honorary Civil Engineering society), and an honor member of Chip Epsilon (honorary Civil Engineering society). He was a registered Professional Engineer in the states of New York and Maryland.

He was a member of the American Society of Civil Engineers, the American Concrete Institute, the Transportation Research Board, the Operations Research Society of America, the Comite European du Beton, the Structural Stability Research Council and the Paleontological Research Institution.

Most noteworthy among his international activities were his visiting professorships at Chalmers University of Technology in Gothenburg, Sweden (1962); UN AM in Mexico City, Mexico (1975); and twice at Kyoto University in Kyoto, Japan (1983 and 1989).

He was a leader in the Engineering Foundation in New York City until his untimely death. He was Vice President of its Board of Trustees and held many offices over the years in his work with its Conferences Committee. He was considered an outstanding organizer of leading edge, interdisciplinary, international engineering conferences.

Dr. Fisher played football in college at Hopkins and later sang lead tenor with the Ithaca Opera. He was a scout leader and volunteered with the Special Children's Center for many years. He was an avid scuba diver, a gourmet chef, and an intrepid world traveler.

Gordon is survived by his wife of almost twenty years, Mimi Ann, at home; daughters Linda Fisher of Ithaca and Jennifer Morrison of San Jose, California; sons Jeffrey Fisher of Naples, Florida, and Christopher Fisher of Orlando, Florida; and grandson, Marshall Fisher of Orlando.

He is also survived by his step-sons, John Uzmann of Millbury, Ohio, and Steven Uzmann of Spencer, New York, step-grandchildren, Michael and Erika Uzmann of Millbury and Thomas Alexander Uzmann of Spencer.

William McGuire, Jery R. Stedinger, Arnim H. Meyburg

Douglas B. Fitchen

June 8, 1936 — February 9, 2008

After an assault by cancer over a period of several months, Douglas B. Fitchen, Professor of Physics, Emeritus, died on February 9, 2008 at his home.

Fitchen was born June 8, 1936, in New York City. Many of his earlier roots were in Ithaca, where his great-grandparents and grandparents were active members of the Ithaca community. After graduating from Harvard College in 1957, he moved to the University of Illinois in Champaign-Urbana for graduate work in physics, completing his Ph.D. degree in 1962, working with Professor David Lazarus. He came immediately to Cornell as an Assistant Professor of Physics, thus beginning a 45-year career devoted to research, teaching and departmental leadership.

Doug, as leader of an active and productive research group in the Physics Department over a period of 25 years, mentored and inspired some 30 graduate students and worked with nine post-doctoral associates and senior visitors to produce over 70 papers and conference reports. His research was recognized by the award of an A.P. Sloan Fellowship and by Fellowship in the American Physical Society. His scientific program profited from sabbatical leaves at the Clarendon Laboratory, Oxford; the Laboratory of Solid State Physics at the University of Paris-South at Orsay; the Los Alamos Laboratory; and Oregon State University.

Upon arrival at Cornell, he joined the program in the Physics Department involved with elucidating the properties of alkali halide crystals. Supported by grants from the Alfred P. Sloan Foundation, the AEC (now the DOE) and the NSF, through the Cornell Materials Science Center (now the Cornell Center for Materials Research), he used optical absorption and emission spectroscopy to carry out extensive studies of the influence of pressure and of magnetic and electric fields on the properties of point defects (color centers and chemical impurities) in these systems. He helped develop the initial explication of the narrow features, “zero-phonon lines” as they are termed, which appeared in the low-temperature optical spectra of these defects, and then exploited them in studies that revealed the defect structures and their dynamics. The development of LASER technologies led to further studies using time-resolved photoluminescence and excited state absorption spectroscopy. Doug published an extensive review of his own and related work in 1968.

In the mid 1970s, as the research in the alkali halides matured, Doug recognized the potential for application to problems in biology of LASER techniques, including Raman spectroscopy, pulsed photo-luminescence and

transient absorption spectroscopy. He was a member of an ad hoc committee appointed to explore the possibilities of developing an interdisciplinary program to link Cornell programs in the physical and biological sciences and engineering. A program was subsequently established, and Doug, as member of the Biophysics Advisory Committee, joined with others from several departments in developing a number of instrumentation proposals and research projects. Supported by NIH grants and Cornell's Materials Science Center, he engaged in Raman studies of the structure and vibrational dynamics of various biomolecules: for example, heme proteins, cytochrome-c, and chlorperoxidase. In the final years of his research program, his focus was on LASER studies of the vibrational and electronic dynamics of pure and doped electrically conducting polymers, primarily polyacetylene.

In 1977, in the midst of his personal research and teaching, Fitchen took on the chairmanship of the Physics Department, initially for a five-year term. Thus began a major leadership role for the department and the University. With interludes of department management by other colleagues, he again served as Chair in the periods 1986-91 and 1994-99. The confidence that his colleagues and University administration had in his leadership is evident.

Fitchen's long service as Chair was marked by a number of accomplishments stemming from his strong personal leadership. (1) In each of his three terms, he worked personally and continually to upgrade the quality of Physics courses, particularly those at the introductory level. (2) In the late 1970s, as the potential for major renovation of Rockefeller Hall came into view, he became a central figure in leading the departmental input to the renovation process, working effectively with architects, College of Arts and Sciences administration and Cornell buildings and properties people. The result was an academic building whose interior is visually striking and whose service to the College and the University is significantly broadened. A plaque on the ground floor of Rockefeller acknowledges Doug's great contribution, and directs the viewer to a tree, the "Fitchen tree" planted outside as a tribute. (3) A third special contribution was providing personal leadership in breaking the gender barrier in the department's professorial faculty. In the latter part of his first term as chair, he helped pave the way for appointment of Barbara H. Cooper in 1983 as the first tenure-track female member of the faculty. He also provided special support for succeeding appointments of women: Persis Drell in 1988, Ritchie Patterson in 1994, and Michelle Wang in 1998. Each has proceeded on to a tenured appointment and has made strong contributions to the department and the University.

Doug's contributions to the quality of the introductory physics courses lay in his personal teaching, as well as in support of the work of others. In the period of the early 1990s, between his final two terms as Chair, he worked with

several colleagues in the redesign of Physics 207-208, a course designed to give physics background to students concentrating in other sciences, primarily chemistry and biology.

Doug's public service to the physics community also extended to the national scene. In the wake of the "opening" of the People's Republic of China, a special national program to connect promising Chinese physics students to physics graduate programs in the United States was established. The so-called CUSPEA ("China-U.S. Physics Examination and Application") program ran from 1981-89. Doug and his wife, Janet (an anthropology faculty member at Ithaca College at the time), served in three summers as one of several teams that went to China to interview Chinese student applicants to the program. The idea was to ascertain their overall level of preparation for graduate work in physics in the U.S. as well as their competence in use of the English language. The program brought a number of talented Chinese students to Cornell during the 1980s.

Many of his extracurricular activities centered around enjoyment of the outdoors, with activities such as hiking and cross-country skiing, as well as amateur study of nature's flora and fauna. The Fitchen family enjoyed and shared with others the wooded land they purchased in 1975, located in the Town of Caroline. They have maintained the land in its undeveloped state, in early resonance with twenty-first century concerns about taking care of Mother Earth.

While in graduate school in Urbana, Doug and Janet Mathews were married. They raised their three children in Ithaca after their arrival in 1962. Janet taught anthropology for many years at Ithaca College, concentrating her studies on the world of rural poverty in New York State and the wider U.S. She authored a 1991 monograph drawn from these studies, *Endangered Spaces, Enduring Places*. At the time of her untimely death from cancer in 1995, she had been appointed Chair of the Department of Anthropology at Ithaca College and soon thereafter as a member of the faculty of Cornell's Department of Rural Sociology (now Development Sociology). Doug and Janet's sister, Nancy, were married soon after Janet's death; unhappily Nancy was also a victim of cancer in 2000. In 2002, Doug and Karen Brazell, now Professor Emeritus of Japanese Literature and Theatre, were married. They enjoyed travels, and life with their greatly extended family until Doug's death.

He is survived by his children, John Fitchen of Portland, Maine; Katherine Nisbet and son, Stephen, of Bozeman, Montana; and Sylvia Fitchen of Tucson, Arizona.

Robert H. Silsbee, Chairperson; Neil W. Ashcroft, Donald F. Holcomb

Harry Morton Fitzpatrick

June 27, 1886 — December 8, 1949

Harry Morton Fitzpatrick was born in Greenwood, Indiana, on June 27, 1886. He attended high school in Crawfordsville, Indiana, where he became acquainted with the late Professor H. H. Whetzel, then a student at Wabash College, who stimulated his interest in mycology. He entered Wabash College in 1905 and there came under the influence of Professor Mason B. Thomas, a great teacher of botany, who developed his early interest in that science. Encouraged by Professor Whetzel and aided by Professor Thomas, he came to Cornell in 1908 as an assistant in the Department of Botany and received the A. B. degree in 1909. He then entered the Graduate School at Cornell and, continuing as an Assistant and later as an Instructor in Plant Pathology, studied mycology under Professor George F. Atkinson. He was awarded the Ph. D. degree in 1913 and was immediately appointed Assistant Professor in the recently organized Department of Plant Pathology, and began the work of teaching mycology to which he devoted the remainder of his life. He was raised to a full Professorship in 1922.

He was highly regarded as a mycologist and in recognition of this fact held several responsible positions. He was Editor of the Mycological Section of Botanical Abstracts for many years, Associate Editor of *Mycologia*, Executive Secretary of the Mycological Section of the Fourth International Botanical Congress and a member of the Sectional Committee on Fungi and Fungous Diseases of the Third International Congress of Microbiology. While on leave of absence from the University, he served as Instructor in the Summer School of the University of Michigan and as Visiting Lecturer at Harvard University. Professor Fitzpatrick took an active part in the establishment of the Mycological Society of America and served that organization with distinction. He was the first Secretary, later President, and finally served as Historian until his death.

His interest in research was primarily in the field of taxonomic mycology and he was a recognized authority on certain groups of the Ascomycetes. He made numerous contributions to scientific journals and his book on the Lower Fungi is a standard text and reference work on the Phycomycetes. He was a member of the American Association for the Advancement of Science, the Botanical Society of America, the American Phytopathological Society, the Mycological Society of America, the British Mycological Society, Sigma Xi and Phi Kappa Phi.

Professor Fitzpatrick will be best remembered as a teacher of mycology. His course for advanced students in that subject will long be held in memory by Cornell graduates in Plant Pathology. His meticulously prepared lecture notes, issued in mimeographed form, were models of completeness and accuracy. It is greatly to be regretted

that, save for the part on the Phycomycetes, he could not be persuaded to record this valuable work in a more permanent form. He taught mycology in the tradition of the Atkinson school and his former students, of whom he was justly proud, have carried these teachings to many parts of the world.

In spite of the severe and impersonal discipline of his subject, he recognized students as human beings and had always a friendly interest in them and their affairs. To many generations of Cornell students he was known affectionately as "Prof. Fitz," teacher and friend.

Charles Chupp, W. C. Muenscher, D. S. Welch

Earl Alvah Flansburgh

September 6, 1891 — August 30, 1943

Earl Alvah Flansburg, Professor in the Extension Service of the College of Agriculture and County Agricultural Agent Leader, died suddenly on August 30, 1943. His death was another “casualty of the war,” being directly attributable to the greatly increased duties which he had so willingly assumed as his personal contribution to aiding farm people in their war efforts.

Professor Flansburgh was born at North Easton, in Washington County, New York, and grew up on a farm in that county. He was graduated from the College of Agriculture at Cornell in 1915 and then taught vocational agriculture at Castile, New York, in 1916 and 1917. He entered agricultural extension work in 1917 when he became the first County Agricultural Agent of Strafford County, New Hampshire. In 1918 he returned to New York State as County Agricultural Agent in Livingston County and in 1921 came to Cornell as Assistant County Agent Leader. He was appointed County Agent Leader in 1912, which position he held at the time of his death.

Earl Flansburgh devoted his life to the improvement of agriculture and farm life in New York. He was a pioneer in the development of agricultural extension work. His keen appreciation of the value of careful research and sound teaching methods, coupled with the close contact which he always maintained with farm people made him admirably adapted to the job of supervising agricultural extension programs. His practical knowledge of agriculture and his understanding of farm people and their problems enabled him to lay sound democratic foundations for agricultural extension work in New York State. Both as a County Agricultural Agent and as a supervisor of county agent work he urged that the major leadership and the determination of policies in extension work should rest within the communities and with farmers themselves.

He was a kindly person who took sincere pleasure in being helpful to others. For him, his job was an opportunity to express a strong desire to be of real service. This led him to seek guidance in careful study not only along agricultural lines, but also in the field of human relationships. His success as an agricultural teacher and leader was built on his genuine interest in human welfare, his intimate knowledge and close association with the problems of farm people, and his willingness to study and strive for an understanding of both agricultural subject matter and human behavior. He thus came to be more than usually helpful to those he served in ways quite apart from the technical problems with which he dealt officially.

The health and happiness of the large group of County Agricultural Agents whose work he supervised were as important to him as the successful handling of their official duties. With the increased mental and physical strain put upon extension workers by war conditions, he sought to protect his fellow workers by carrying an ever increasing load himself and did this right up to the time of his death.

In the death of Professor Flansburgh, the faculty of Cornell University and the farm people of New York lost an excellent teacher and a most valued friend. In the years he served he not only built a monument to the memory of his own contributions and accomplishments but, what is of far greater importance, he established in the hearts and minds of many others that desire and ability to be of service for which his own life will be remembered.

Edward S. Flash

February 23, 1921 — January 27, 1987

Edward S. (Ned) Flash was a modest man who contributed greatly to the university community. It was a measure of his modesty that during his lifetime those of us who knew him only in particular roles could not fully appreciate the magnitude of his contribution. That began to become clear at his memorial service at Sage Chapel. Cornellians, Ithacans, and others came in such large numbers that one could not help being awed by the outpouring of love and respect from so many of such different ages and such diverse backgrounds. They paid tribute to a man who was unique.

Ned Flash (B.A., 1949; M.P. A., 1950; Ph.D., 1961—all from Cornell) was a Cornellian through and through. He was a gentleman, personifying grace, elegance, and dignity in all that he did. His accomplishments flowed daily from his being Ned—in his concern for students, in his commitment to fair play, and in willing participation in the uncelebrated tasks that made the living and working of others easier.

After he had earned his first two Cornell degrees, Ned worked for six years in Washington, D.C., first with the Department of the Navy, aiding in its relations with Congress; then on a personnel task force for the second Hoover Commission; and finally as director of training for the District of Columbia government. Then, returning to Ithaca for doctoral studies in public administration, he worked part-time as director of admissions, placement, and student and alumni affairs in the Graduate School of Business and Public Administration. After receiving his Ph.D. in 1961, he became a member of the faculty of the school, now the Samuel Curtis Johnson Graduate School of Management, and was a member of that faculty for the rest of his life.

Ned was exceptionally conscientious in all his undertakings. Whether it was a brief task force, a long committee assignment, or very long service as library adviser, he was willing to undertake the study and detail work necessary to do the job well. He was truly exceptional in his treatment of colleagues. Every kind thought and generous impulse was acted on immediately. One staff member recalls how he not only said thank you when receiving help, but that months later he would write a note or make a call to repeat the thanks and to say again how much he had been helped. Inevitably he was called on to do more than his share of committee work for the university. His work as chairman of the Faculty Committee on the Professional and Economic Status of the Faculty was particularly important.

From 1966 through 1982 Ned directed Cornell's Education for Public Management program, a continuing education program for midcareer federal government officials. He was active in consulting, including doing an analysis of long-range planning for the *Apollo* and post-*Apollo* programs of NASA's Manned Spacecraft Center. His doctoral study of the President's Council of Economic Advisers and the relationship between knowledge and power grew into a book, *Economic Advice and Presidential Leadership*, published by Columbia University Press. His growing concern with the conflict between environmental issues and economic development is reflected in a significant case study, *The Battle of Cow Green*. At the time of his death he had almost completed a book on the cause-and-effect relationships in the development and execution of public policy.

Since his primary professional interests were in public administration, Ned was deeply disappointed when his school decided to drop the formal degree program in that field. That decision went against his firm conviction that those who aspire to leadership in government need specialized education in the administrative methods peculiar to the governmental process. Nevertheless, to no one's surprise, his dismay at that decision did not diminish his love for Cornell, his contributions to the school, or his sense of humor, although the latter continued to surface as a deluge of outrageous puns.

Ned developed some of the most innovative courses at the Johnson School: "The Management of Governmental Systems," studying the manner in which legislators, political executives, bureaucrats, and judges interact to make decisions, and "Effective Management Consulting," in which students undertook real-life consulting tasks. Building on his governmental experience, he assembled teams of students to work as consultants with local businesses and public offices as well as Cornell offices. This course was enormously time-consuming but very valuable and well regarded by the participants.

In a quiet way Ned was a sincerely religious man—one who practiced his faith in the acts of daily living, turning his whole life into a continuous affirmation of his faith. He was active in Cornell United Religious Work, especially with the Episcopal group. To those who knew him it was not surprising that the Episcopal group had a fall-term project to help him prepare for a new course on ethics in the Johnson School. Such interweaving of academic work, religious life, and social activities was typical of the fabric of the life of this man.

Ned's last class was the first lecture in that new course, "Ethics of Managerial Power," an appropriate epitaph for a man whose entire life was a course in ethics, and who, at sixty-five, was still eager to grow and contribute in new ways to his university and his school.

Ned was unsurpassed in his devotion to Cornell. He maintained close ties throughout his life with many of his friends from undergraduate days and added to that group the generations of students who regarded him as a friend as well as a teacher. Ned was an oarsman at Tabor Academy as well as at Cornell, exhibiting the intense loyalty peculiar to that sport. He was an avid cruising sailor with a strong preference for saltwater rather than fresh. Although his sloop, *Fanfare*, bore Ithaca on her transom, her home port was in Maine, and Ned loved that beautiful, if often foggy, coast. He served in the U.S. Marine Corps in the South Pacific in World War II and after the war as a captain in the Marine Reserve.

Ned's sailing companion, navigator, and wife was Dora Grabfield Flash, a senior lecturer at Cornell's School of Hotel Administration. They have two children, Dorothy and Stephen, both Cornellians married to Cornellians, and one granddaughter, not yet a Cornellian.

Elizabeth Florence Focht

November 7, 1914 — July 26, 1969

Elizabeth Florence Focht, Ph.D., attending radiation physicist to The New York Hospital and assistant professor of radiology at Cornell University Medical College, was killed in a tragic accident July 26, 1969, at the age of 55 years. Doctor Focht, an experienced rider and well known horse fancier, was killed instantly when a horse she was exercising suddenly reared and fell backwards, crushing her beneath.

Doctor Focht was born November 7, 1914, in Hoboken, New Jersey. She received a B.A. degree from Barnard College in 1935 and a Ph.D. from Columbia University in 1964. Soon after graduation from college Doctor Focht became associated with Dr. Edith Quimby and Dr. Leonidas Marinelli in the physics department of the old Memorial Hospital, which was located at 106th Street and 8th Avenue. She was a member of the physics department of that institution until January 1, 1958, when she became a full-time member of the staff of the Department of Radiology of The New York Hospital, where she held the title of attending radiation physicist. She was a diplomate of the American Board of Radiology in radiological physics, a consultant to the Hospital for Special Surgery, a consultant to the Space Radiation Study Panel of the Space Science Board, and she held membership in the American Physics Society, American Radium Society, New York Roentgen Society and the American College of Radiology.

Doctor Focht was a highly respected radiation physicist who was a world authority on the effects of ionizing radiations on the structures of the eye. This was the subject of a long-term research program in collaboration with Dr. George Merriam of the Ophthalmology Institute of the Columbia-Presbyterian Medical Center and it resulted in a number of significant publications dealing with experimental cataract induction. Her work on survival from whole body radiation, an analysis of 575 patients and accident victims, was incorporated in *Evaluation of Potential Radiation Hazards in Manned Space Flight Operations*, published by the National Academy of Sciences, National Research Council.

Doctor Focht for many years had competed in horse shows, frequently riding her own entries. She was an annual participant in the Madison Square Garden show and was the recipient of numerous prizes both in New York City and in other regional events.

Betty Focht had a warm friendly personality and was always ready to help in any problem within her particular sphere of competence. She helped many generations of radiology residents understand the physical foundations of radiology and generously devoted many hours of her time to tutorial sessions on this subject. Her untimely death

came as a shock to her many friends and professional colleagues and is a sad loss to the Radiology Department and to the entire scientific community of this Center.

She is survived by Mr. Eugene Cahill, an uncle with whom she lived for many years.

John A. Evans, M.D.

Ephim Fogel

November 15, 1920 — June 13, 1992

Ephim Fogel's colleagues in the English Department remember and honor him for the energy, skill, and wisdom with which he chaired the department during four crucial years, 1966-1970. Ep not only steered it through the political crises of those years, but at the same time he successfully negotiated with an expanding College and University for the means necessary to bring to his department much of the strength, flexibility, breadth, and distinction that it enjoys today. His students during his forty years' service at Cornell are grateful to him for the searching and sensitive rigor with which he trained them. His fellow philologists acknowledge his many published contributions to the methodology of resolving cruxes of interpretation and documentation. He collaborated in editing two Cornell University Press books, *Evidence for Authorship* (with David V. Erdman, 1966), and *A Concordance to the Poems of Ben Jonson* (with Mario A. DiCesare, 1978), and at the time of his death he was revising his book-length study of Sir Philip Sidney's poetry. The audience of Ep's work as poet, both his original verse and his translations from Russian and German, admires it for its rich precision. His family and his friends throughout the University and beyond will profoundly miss his good counsel and the warm humanity of his presence.

Born in Odessa, Russia, Ep Fogel emigrated with his parents to the United States at the age of three. He was educated in the New York City schools, and was elected to Phi Beta Kappa in course at the City College of New York and was graduated *magna cum laude* in 1941. That June, he and Charlotte Finkelstein were married. Ep immediately started graduate study in English at New York University, but in July of the following year he enlisted in the Army of the United States. Indeed, both his love for pedagogy and, in particular, his devotion to Russian literature began while he was assigned to ASTP duty. During much of his service until his discharge in early 1946 as sergeant, Ep put to use his talent for teaching, first as an instructor in the Signal Corps and then as instructor-in-charge of educational therapy in the Army hospital at Camp Shelby, Mississippi. His experience at the hospital inspired one of his earliest and finest poems, "Convalescents." He completed residency requirements for his M.A. (NYU, 1947) by fall term 1946, when he entered the doctoral program in English at Ohio State University. Completing his course work there, in 1949 Ep accepted appointment as Instructor in English at Cornell, attracted to the institution at which his younger brother Robert had completed undergraduate study only the year before.

Ep's appointment was one of a notable series that renewed a department left greatly weakened during the war. Ep was promoted to Assistant Professor in 1955, received his Ph.D. in 1958, and was promoted to Associate Professor with tenure in 1961 and to Professor in 1966. Immediately before taking the chair that year, Ep had served for three years as Director of Graduate Studies; in 1970 recurring health problems obliged him to withdraw from what would have been his eighth year of uninterrupted administrative duty. For 1974-75 he was appointed Faculty Fellow in the Society for the Humanities. He retired as Professor Emeritus in 1990.

Certain qualities of mind and sensibility characterized Ep Fogel's scholarly writing from the outset of his career: toughness in assessing a hypothesis, scrupulous clarity and control in articulating it, trenchant curiosity, a resolutely independent critical imagination, exhaustively thorough learning, style, humor, depth. In conversation the Ep we remember also exhibited a prodigious memory—the envy of us all, and to every task he brought an absorbing interest and belief in what he did. He read and published numerous papers on the life and work of Sir Philip Sidney, on William Shakespeare, on the Elizabethan and the European renaissance more generally, on computer-assisted analysis of literary texts, and on modern poetry. He published his own poetry and his translations in such periodicals as *Atlantic Monthly*, *Granite*, *Poetry*, *Prairie Schooner*, *Voices*, and *Slavonic and East European Review*, and in *Cross Section*. His poem "Shipment to Maidanek," one of the earliest literary responses to the Holocaust, appears in several anthologies. The work that perhaps best displays the rich variety of Ep's talents as scholar-poet, and the work to which he increasingly turned in his later years, is his exemplary verse-translation from Russian of some hundred poems by Osip Mandelstam, with annotation and a critical introduction—a volume that in many ways constitutes Ep's *chef-d'oeuvre*.

The accomplishments of Ep Fogel's years of departmental administration were many and notable. Both undergraduate and graduate curricula were wholly revised. The Cornell Creative Writing Program, now generally recognized as one of the finest in the country, benefited greatly from Ep's sponsorship and strong support. Ep obtained a reduction of the far too heavy teaching-load in English. With the close collaboration of his dear friend, the late David Novarr, he oversaw the appointment of twenty-five tenured or tenure-track colleagues, fully half the membership of the department at the time he retired from the chair, and Ep involved that membership much more widely than before in the management of departmental affairs. The administrative achievements of which Ep remained proudest were the initiatives he undertook by which the first woman and the first African-American became full professors of English at Cornell. His leadership of the department he thus built was marked by a

patient fairness to which even dissenters within it paid tribute. Ep Fogel was painstaking, and at a time when it was most required, he devoted himself to virtually unintermitted labor at his desk.

Although Ep often felt that he was at his best working late at night to deadline, he ultimately found that his health could no longer sustain all the demands of his administrative regimen. When he returned to full-time teaching and his own writing, a new generation of students was able to enjoy the deeply engaged and sympathetic mind Ep brought to classroom and conference. Ep was, first to last, an extraordinarily fine teacher, one who exercised his every skill—and innumerable kindnesses—to encourage his students, graduate and undergraduate, in the life of learning.

Ephim Fogel leaves his wife Charlotte; their four children, in whom he took immense pride, Daniel, David, Rebecca, and Jessica, two of whom followed him into the professoriate; four grandchildren; his brother Robert; and us, his colleagues, students, and friends.

Dan McCall, Edgar Rosenberg, Charles S. Levy

Felician F. Foltman

July 31, 1918 — September 7, 1993

In certain respects, Felician Foltman was different from most Cornell professors. Those differences helped him contribute importantly to his colleagues and to the School and University he loved and served. For example, he was a first generation American from a working class background. Born sixth in a family of eleven children, his Polish immigrant father was a skilled worker in the Amsterdam, New York carpet industry. From his family, Fel (pronounced Phil) learned to get along with others, to work hard and to respect work done well.

Academically outstanding in high school, he was encouraged to attend college. He enrolled at Oswego State Teachers College in 1936, majoring in Industrial Education. Like most first-generation in-college youngsters, he worked his way through. He spent two summers as a production worker in carpet mills. His last summer, he managed a service station/garage, an unusual responsibility for one so young. After graduating, Foltman taught Industrial Arts for one year at Mineville (New York) High School. Part of his job assignment was to supervise a “work experience” program for disadvantaged youth at the National Youth Administration’s Resident Work Center at Mineville.

Fel joined the Army in July of 1941 as a private in the Ordnance Corps. After basic training, he went to Non-commissioned Officer’s School, and later to O.C.S., served in the U.S., North Africa, and Europe as company officer, company commander and Battalion Training Officer. He was discharged in February 1946 with the rank of major, a truly extraordinary achievement in four and a half years. Another difference! Energized by that record, he raised his career goals from high school to college teacher.

To sum up, Fel Foltman approached graduate school with: a spectacularly successful military record; a wide knowledge of occupations and how to analyze, perform and teach about them; great respect for competence; and the conviction that he could achieve excellence in anything he attempted.

As luck would have it, he was admitted to the Industrial Education program at Cornell, where the subject had just moved from its “natural habitat” in the Education Department to the newly established School of Industrial and Labor Relations. In this new setting, the I.E. program was less concerned with training high school shop teachers, and more with how work organizations should train working adults to perform the job demands of plants, mills and offices. Although not what he had expected, it fit his aptitudes and interests very well.

Adaptation to Fel's novel situation was helped by two faculty mentors, Lynn Emerson and Kenneth Beach. While taking a "cram course" in labor economics, statistics, theory, collective bargaining, and trade union history, he got insights about job training from two experts in that familiar area. In return, Foltman had much to offer the School. As a grad assistant in Industrial Education courses he helped undergraduates. Even more, as an experienced teacher (another salient difference), he helped fellow assistants get a handle on *their* new tasks.

Each mentor left a lasting impact on Fel's career. Expertise in applying Emerson's training methods to a variety of work settings and technologies helped him as a management consultant and later as adviser to work-readiness programs of the War on Poverty. Skills in small group-discussion teaching, learned from Beach, affected his own development as a teacher. (Beach called Foltman, "the best student I ever had.") Throughout a long teaching career, Fel's students of all ages, in the university and in adult programs, agree that he excelled as teacher, and, where appropriate, as mentor.

Upon receiving his Ph.D. degree in 1949, he was appointed to the ILR faculty. Along with teaching duties he was made undergraduate Placement Counselor. He developed a co-op work program, placing students in summer training jobs with unions, businesses, and government agencies around the state. This project succeeded so well that for many years, ILR required students, as a condition of graduation, to have one summer's experience each, in a trade union, a business, *and* a government agency. He taught students about job search behaviors to good effect.

While teaching and counseling in Ithaca, the fledgling Professor Foltman was used extensively by the ILR's Extension Division to teach classes of practitioners around the state. Capable and congenial, he made a great hit with adult audiences. He enjoyed working with practitioners, "where I can teach and learn at the same time". For more than thirty years, he was *the* major contributor from the resident teaching faculty to ILR's Extension program.

Early in his career, Foltman inherited Ken Beach's course, "Industrial Occupations and Processes", which introduced freshmen to the work world by busing them weekly to work sites close to Ithaca, where they observed workers at their jobs, learning which tools and machines they used, and what the end products looked like. His background was ideal for transmitting this kind of instruction to the uninitiated! And to the graduate assistants watching Foltman teach this course, he gave master classes in how to excel at the job.

Early in his teaching years, Fel entered on the other serious preoccupation of his life, his family. Early in 1951 he married Christina Steinman, a fellow worker at Cornell. By that summer, he began building their house. As his

own contractor, he did all the skilled work (carpentry, wiring, plumbing, painting etc.), but cajoled kin and friends into contributing occasional help. First, a daughter, Laurie, and then two sons, Philip and Michael, joined the household. Fel was admired by his colleagues for being both family-oriented, and a father figure who could pass on useful domestic skills.

Most of his hobbies had a domestic aura. He became a finished cabinetmaker. He raised grapes and learned to make wine. As befits one who grew up near the Adirondacks, he became a deer hunter, but with a special twist—using bow and arrow rather than gun. In these pursuits, he symbolized the “good provider/” combining practical with mythical/romantic aspects of paternity. More down to earth was his passion for golf. He was founder and “guru” of ILR’s golf team which competed for many years in the University league. After retiring, he traveled the U.S. enthusiastically sampling of the nation’s links.

An important theme in Foltman’s personal history was upward mobility, e.g. moving from his skilled worker origins, through high school teaching to university teacher. Another mobility “dimension” is *lateral* crossing over from one branch of activity to another one.

His mastery of American research about highly skilled manual workers made him a pre-eminent scholar in this field. Emblematic of this is a major review monograph: *Apprenticeship Research: Emerging Findings and Future Trend*, (co-edited with Cornell colleague Vernon Briggs, Cornell/ILR Press, 1980). This was a first and lasting interest of his. But his academic career contains successive “crossovers” into other areas, each one denoting growth.

An early crossover was into *management* Education. He became a key figure in ILR’s ambitious management development program for American Airlines’ senior managers in 1953. In 1955, he took a one-year leave to work for Shell Oil’s management training program. Returning from Shell, he played a major role in a joint Business School/ILR “Executive Training Short Course”. In a few short years, Foltman was a nationally recognized leader in executive training. *Effective Supervisor of People* (Dun and Bradstreet, 1971) testifies to this. Even more significantly, two ‘leading edge’ monographs: *Collecting and Managing Employee Information*; and *Skills Inventories and Manpower Planning* were pioneer treatments of computing applied to human resource management.

Moving from workplace problems to concern with public policy issues is another major “crossover”. Community concerns are treated in his *White and Blue Collars in a Mill Shutdown* (Cornell Press, 1968). At the *state* level, his *New York State’s Economic Crises: Jobs, Incomes and Economic Growth* (Cornell ILR Press, 1977) addresses problems still plaguing his birthplace. At the *national* level, one would put all the special reports, conference minutes, and published testimony submitted to various Congressional Committees, growing out of his membership on

presidential committees and task forces, and assignments to AID (the Agency for International Development), Federal and State Labor department committees and the ILO (International Labor Office).

Some of the latter dealt with apprenticeship and other programs at the high end of the skill ladder. Increasingly, however, they dealt with serious national problems of underprepared, virtually unemployable, youth facing a labor force no longer hospitable to unskilled job candidates. An expert on training manual workers, Foltman was asked by state and Federal agencies to advise them how to think intelligently about these complex issues.

Back home, he was busy persuading academic colleagues to study these issues. Rather than publish extensively in this area, he became a “teacher of teachers”. Due to his efforts, the Department name of Human Resource Studies continues this emphasis on social policy.

A further comment on Foltman “crossovers” deals with his moving beyond departmental boundaries. He joined Professor Donald Cullen from the Collective Bargaining department to co-teach “Manpower and Collective Bargaining in the Construction Industry” several times. He also taught a course in “Plant Shutdowns and Job Loss” with Professor Robert Aronson of the Labor Economics department. When he co-taught courses, it was usually in addition to his normal teaching load. He was always experimenting with teaching. Well into his career he started courses based on “field studies”, a new modality for him. And as late as three years before his retirement, he developed a new course, based completely on case studies, once more a new approach for him.

Finally, a personal/professional crossover that still astounds his colleagues. At first, Fel’s consulting related to his departmental specialty: training; management development, and personnel practices. Mediation and arbitration “belonged” to other ILR departments. In the 1960s, Foltman took a course offered by the School to train professionals to implement the Taylor Act (which regulated labor relations in public sector employment in New York State). After completing the course, he established himself as a “third party” who could work with union and management representatives of school districts, prisons, fire departments, etc., around the state. He then “crossed over” into *private* sector union management dispute settlement, including the most competitive and lucrative activity, *arbitration*. Emblematic of his approach to life and work, he not only entered a new challenging field but took on its most demanding aspects.

We can say finally that Fel was first and foremost a teacher. He showed love and respect for his craft by excelling at it. True to his roots, he followed the credo of a skilled worker: “Be a journeyman in everything you do, in the *important* things, be a master.”

Loved and respected by his family, liked and respected by his colleagues, admired and respected by his students, he left a mark on all of us. He will be remembered.

Vernon Briggs, Lee Dyer, Frank Miller

Nathan Chandler Foot

July 27, 1881 — September 4, 1958

Dr. Nathan Chandler Foot, Professor Emeritus of Surgical Pathology, Cornell University Medical College, and consultant in surgical pathology at The New York Hospital, died September 4, 1958, at the New Rochelle Hospital of pulmonary embolism. He is survived by his wife, Emma May Cobb Foot; his daughter, Mrs. John C. Besson; a sister, Valeria D. Foot; and four grand-children. Another daughter, Dr. Ellen B. Foot Neumann, died in 1945.

Chandler Foot was born in New York City on July 27, 1881. He received his A.B. from Harvard College in 1903 and his M.D. from the College of Physicians and Surgeons, Columbia University, in 1907, following which he had resident training at The New York Hospital and then spent two years in Germany studying pathology. He was on the staff of the Department of Pathology at Harvard from 1912 to 1915 and subsequently was on the faculty of the College of Medicine, University of Cincinnati, becoming Professor of Pathology at that institution in 1928. In 1932, he came with George Heuer to the newly created New York Hospital-Cornell Medical Center to assume the dual post of Professor of Pathology in Surgery and head of the Laboratory of Surgical Pathology. In this capacity, he served with great distinction for 16 years. In 1948, he became Professor Emeritus and thereafter, until his death, engaged in cancer research in the Papanicolaou Cytology Laboratory of Cornell University Medical College, successively in the Departments of Anatomy and Pathology.

He was a member of numerous medical societies, including the American Association of Pathologists and Bacteriologists, the Harvey Society, and the American Association for the Advancement of Science. For several years, he served on the American Board of Pathology and was in due course its president; he was also a consultant to the Armed Forces Institute of Pathology in Washington, Fellow of the College of American Pathologists, a member of the New York Pathological Society, of which he was president in 1936-1937, and a Member of the New York Practitioners' Society. His many scientific papers dealt mainly with the diagnosis of cancer, and so, too, did his textbooks *Pathology in Surgery* and *Identification of Tumors*.

Chandler Foot was loved and esteemed by his associates and by the long succession of medical students who came into his classes, as much because of his charm and wit and varied interests as for his wide learning and compassion. His geniality made it easy for him to pass on to others the things he knew. In music, he was not only an avid student and listener—he took his own scores to concerts and followed these closely—but also an accomplished piano and accordion player; many a student-faculty gathering, which might otherwise have been formal and stiff, was made

warm and lively by his playing and presence. Admiring art in all its forms, he painted as well, first in oils and later in water colors, particularly ocean and beach scenes; numbers of his works won the critical acclaim of experts and not a few of them now adorn the homes and offices of his friends. His proficiency in cowboy pool, together with his large measure of what the Scots call innerliness, endeared him to such of his friends as also found this game interesting and relaxing, and with these—artists, writers, and architects, as well as lawyers and physicians—he spent many hours in the clubhouse of the Century Association. A bird-watcher, Chandler Foot knew well the forms, colors, songs, and habits of those creatures, and the outlook and language of those of his companions who shared this interest with him. Woodworking and metalworking also gave him pleasure, a beautifully mitered joint no less than the finished product; an example of the latter was the elaborate miniature railway station, replete with furnishings, ticket offices, and a motor-driven elevator with stops on three levels, which he designed and made to complement the electric trains of his grandson. So, too, with foreign languages, he was not content to be a mere learner: in addition to reading widely in French, German, and Italian literature, he spoke Hungarian fluently and also had knowledge of Chinese. He once posted a directive on the door of the refrigerator in his laboratory telling orderlies and nurse's aides in seven languages where to place specimens!

The content of his scientific papers and books, the wealth of carefully studied material which he left for his successors in the Laboratory of Surgical Pathology and the memories and notes of the thousands of medical students whom he taught provide of course the tangible measure of Chandler Foot's achievements as physician, teacher, and scientist. But quite as surely it can be said that his most enduring influence as a teacher was exerted upon those of George Heuer's resident surgeons who were fortunate enough to have periods of training in his laboratory during the years 1932-1948. Few of these outstanding men, now mature surgeons, failed to respond to his geniality and enthusiasm, or to respect and learn from his careful clinical judgments, and many would say with gratitude that his guidance largely determined their outlook upon medicine and life. How fortunate he was to have found wide scope for his talents, and happiness besides! How fortunate too are those of us who knew him; for we can recall with pleasure what he was and what he did, and, what is more, can note with admiration the reflections of his influence in the lives of those who share his memory with us.

J. G. Kidd

Robert Hutchinson Foote

August 20, 1922 — October 27, 2008

Dr. Robert H. (Bob) Foote, Jacob Gould Schurman Professor of Physiology at Cornell University and preeminent reproductive physiologist, is acknowledged for major contributions to his field through basic and applied research, innovative teaching, mentoring trainees, and professional service. His research significantly impacted diverse areas of gamete and embryo biology and related reproductive technologies for over 50 years beginning with his pioneering efforts in the development and use of semen extenders that were critical to the early success and commercial use of artificial insemination in dairy cattle.

Born on a dairy farm in Gilead, Connecticut, Foote graduated from Windham High School, Willimantic, Connecticut in 1939. He graduated with Honors and a Bachelor's degree in Animal Husbandry from the University of Connecticut, Storrs, in 1943.

World War II interrupted his academic career when Foote served as a lieutenant in the famed "Go For Broke" 442nd Regimental Combat Team, a unit formed of Nisei. The 442nd became among the most decorated units in the war. Lt. Foote was awarded a Bronze Star and a Purple Heart for heroic actions in France where he was seriously wounded, yet he returned later in the war to lead his unit again.

After the war, Foote earned his Master's degree (1947) and his doctorate (1950) at Cornell in the field of animal breeding and physiology and was appointed Assistant Professor in Animal Science, where his illustrious career began. Bob rose through the ranks of Associate Professor, Fulbright Scholar, and Professor, and was named the Jacob Gould Schurman Professor of Physiology in 1980.

Bob's early work in sperm physiology and cryopreservation was extended to many domestic, companion, and exotic animals. His first laboratory and cold room facility were within the semen-processing laboratory of the New York Artificial Breeding Cooperative (predecessor to Eastern A.I. Cooperative and Genex Cooperative, Inc.) in Ithaca, New York, an organization with which he maintained a close working relationship throughout his career. An important early discovery was that treating bull semen with a combination of antibiotics controlled bacterial growth and ultimately helped to wipe out *Vibrio fetus*, a disease that causes abortions in livestock, and until then had cost the cattle industry millions of dollars. He developed effective procedures for use of non-frozen semen by formulating Cornell University Extender, which was later refined for cryopreservation of bull semen and continues to be the basis for successful semen preservation protocols for many mammalian species. Numerous

other aspects of semen processing and cryopreservation now in routine use throughout the world have their basis in Dr. Foote's research.

Bob's research interests expanded to related areas in male reproductive physiology, including qualitative and quantitative aspects of spermatogenesis, semen quality measurements, evaluation of male fertility, and sperm capacitation. He also made major contributions to female reproduction, with the early observation that germ cell content of the mammalian ovary was finite. Improvements in the detection of estrus and the importance of insemination of cattle at the optimum time were investigated. Dr. Foote continued to work closely with the animal breeding industry, especially with cattle, using well-designed field trials and tens of thousands of artificial insemination records to effectively evaluate factors affecting semen quality and fertility in cattle.

As in vitro fertilization and other assisted reproductive technologies began to emerge in laboratory animals and human medicine, Foote's efforts included studies on in vitro oocyte maturation, fertilization, and early embryo development, with emphasis on optimizing culture media and other in vitro techniques. Later, he recognized the potential of cloning in livestock and provided an impetus for research that was a prelude to somatic cell cloning in domestic animals.

Bob was a stickler for attention to experimental design, detail and analysis, and he insisted on expedient publication by his students and trainees. He was driven by an exceptional work ethic and highly competitive nature, which perhaps originated in his early childhood or war experiences, and seemed to demand that he exceed the physical limits of most mortals. It was not, for example, unusual for him to be seen at work in his office or laboratory until 1:00 a.m. and back on the job at 6:00 a.m.; and he frequently extended his workweek to seven days. As a result of his diligence, Bob was the author or coauthor of more than 500 peer-reviewed articles as well as numerous book chapters, and he contributed many invited reviews.

Bob inspired, encouraged, and supported hundreds of trainees at various levels from undergraduate research and Honor's students to research associates and visiting scholars. He mentored over 100 Ph.D. and post-doctoral trainees from the United States and internationally. In addition to his research accomplishments, Dr. Foote was also recognized as an exceptional teacher and mentor of thousands of students and trainees. He taught a variety of courses in the animal and biological sciences, but is best remembered for his very popular animal reproductive physiology course (known by students as "Barnyard Sex"), which he offered for over 30 years. His courses in animal breeding techniques and, later, embryo technology were very popular.

Beyond his extraordinary commitment to and achievements in research and teaching, Bob is recognized for his exceptional professional service throughout his career. He was actively engaged in at least 13 professional or honor societies, serving in leadership positions on many committees and as president of the Society for the Study of Reproduction. In addition, Dr. Foote served on the editorial boards of five major journals and served as program manager, panel member, ad hoc reviewer, and advisor for innumerable agencies and organizations related to the field of reproductive physiology.

For his pioneering research, excellence in advisement and teaching, and his extensive professional service, Foote's local, national, and international awards spanning 4 decades are "legion", including the American Association of Animal Science Animal Physiology and Endocrinology Award and L.E. Casida Award, American Dairy Science Association Upjohn Physiology Award, American Society of Andrology Outstanding Andrologist Award, Society for the Study of Reproduction Hartman Award, IETS Pioneer Award (A.I., E.T. and cloning), Pioneer Award from National Dairy Shrine, National Animal Breeders Association Research Award, S.U.N.Y. Chancellor's Award for Excellence in Teaching, and the Edgerton Lifetime Teaching Award at Cornell University.

In spite of his extraordinary dedication and demanding schedule, Bob was extremely generous and always found time to entertain students and staff in his home, acknowledge birthdays with cake and ice cream, keeping in touch with former members of his program, and offer assistance whatever the need.

Perhaps Bob's greatest legacy was his investment of time, energy, and resources in those he taught and trained, who have emerged as leaders in their own right to further advance the areas of reproductive research that he championed for over half a century. Certainly a titan in the field of animal reproduction has passed from our midst.

Dr. Foote was predeceased by his first wife, Ruth Parcells. He is survived by his sons, Robert W., of Connecticut, and Dale, of Philadelphia and by his second wife, Barbara Johnson Foote.

John E. Parks, Chairperson; W. Ronald Butler, J. Murray Elliot

William Trowbridge Merrifield Forbes

April 23, 1885 — April 12, 1968

William Trowbridge Merrifield Forbes was born in Westborough, Massachusetts, on April 23, 1885, the son of William T. and Harriet Forbes (nee Merrifield). He was the elder brother of the late author, Esther Forbes. His father served for many years as Judge of the Probate Court of Worcester.

He attended Westborough and Worcester schools and was graduated from Amherst College in 1906 with a Bachelor of Arts degree. He was a student at Cornell during 1908-09, and he obtained his Doctor of Philosophy degree from Clark University in 1910, with William Morton Wheeler as the chairman of his examination committee. Between 1906 and 1908 he was an instructor in biology at Roberts College in Constantinople; in 1910-11 he was an instructor in zoology and entomology at Rutgers College, working with Professor John B. Smith. After his retirement from Cornell he was, for a semester, a Visiting Professor in the Department of Entomology of the University of Arizona. This gave him the opportunity to see the deserts and mountains of the Southwest and to work with material from the area.

In 1915 he joined the staff of the Department of Entomology at Cornell as an assistant; in 1921 he became an instructor; in 1943, an Assistant Professor; in 1950, an Associate Professor; and in June of 1953, Professor Emeritus. During World Wars I and II he served as an instructor in the Department of Physics in the S.A.T.C. programs. He stayed on at Cornell until the fall of 1954 at which time he moved to Cambridge, Massachusetts, to continue his research studies at the Museum of Comparative Zoology of Harvard University and to be near the members of his family who reside in and near Worcester. In 1964 his health began to fail, and in January 1966 he entered the Hermitage Nursing Home in Worcester. There he had the freedom to come and go, and thus could indulge in the long rambles that he so used to enjoy. He died at the Hermitage on April 12, 1968.

During his long association with Cornell and the Entomology Department, he made many contributions, especially to the departmental library. He spent a considerable sum of his personal money on building the Lepidoptera Collection. His final contribution upon leaving Cornell was a substantial gift to the Department to be used for graduate students and projects related to their work.

Dr. Forbes made two long collecting trips to the American tropics in 1920 and in 1927. The 1920 trip was made with Dr. J. Chester Bradley and started in Peru, ending at the mouth of the Amazon in Brazil. The 1927 trip was made to Surinam and British Guiana. He also made a short trip to the island of Puerto Rico. He visited the British

Museum of Natural History three times in conjunction with attendance at some of the international congresses of entomology.

Although he described himself as a “biologist interested in the Lepidoptera,” he was really the last of the great general workers in the order, and his command of the field was unrivaled. He was perhaps most interested in the geographical distribution and classification of butterflies, but there was no area in which he had not read or on which he had not formed, as he called them, “impressions.” He published approximately 150 scientific papers on insects; the majority are on the morphology and classification of butterflies and moths. His most outstanding contribution, the only one of its kind on the North American Lepidoptera, was the *Lepidoptera of New York and Neighboring States*, published in four parts. This will remain for a long time the definitive work on Lepidoptera of the northeastern fauna, and it will stand as a monument to his knowledge of the group.

His accomplishments and interests outside the field of entomology were many: the main ones were in the psychology of vision on which he published; the Near Eastern archaeology, especially the written record of past cultures.

He was a member of a number of scientific societies and served as president of the Lepidopterists' Society in 1953. Later he was elected an honorary life member of that Society.

He was a critic of the Cornell administration and especially of those administrators having jurisdiction over the grounds in their approach to the management of the areas of potential value as biological reserves on and near the campus. His demand was that some of the areas should be left “natural,” that is, “unmanaged.” His most pungent remark on the conditions was that the shield of the University should show a “steam-shovel rampant”; today it would be a bulldozer.

Dr. Forbes's rapport with students was excellent, and he was much sought after for advice and for comments on work in progress. He could often suggest some reference work that should be consulted or some points that should be considered. He always had time for a discussion. Some of the most delightful times during graduate study were those spent with him in late evening discussions which ranged over many subjects. He was a kindly man, considerate, friendly, and gentlemanly. He was without affectation, modest, and approachable to all, regardless of rank.

He is survived by two sisters, Miss Cornelia B. Forbes and Mrs. Katherine Erskine; a brother Alan W. Forbes; and nieces and nephews.

William L. Brown, Jr. Robert L. Clausen, John G. Franclemont

Mary Elizabeth Ford

March 23, 1907 — August 11, 2002

Mary Ford was born in Fostoria, Ohio, the only child of Mary Nestlerode Ford and William H. Ford. She graduated from Wellesley College in 1932, and received a Master's Degree from the University of Toronto in 1933. She spent a year as a school psychologist in the Toronto Department of Public Health, and then moved to the University of Minnesota to pursue a Ph.D. degree in Child Clinical Psychology. During her years at Minnesota, Miss Ford held several different professional positions. For three academic years, she was a Research Assistant in the university's Institute for Child Welfare, and then spent a year as a teacher in the Institute's nursery school. In 1937–38, she was Director of the Nursery School and Kindergarten and School Psychologist at the Northrup Collegiate School in Minneapolis. In 1938, she moved to Cornell as Instructor in the Department of Child Development and Family Relationships in the New York State College of Home Economics. Five years later, she completed her doctoral dissertation, "The Application of the Rohrschach Test to Young Children," and was promptly promoted to Assistant Professor.

Professor Ford entered with energy and enthusiasm into the varied activities of a rapidly changing department. In her best-known published work, *Youth, Marriage, and Parenthood*, she collaborated with a senior member of the department, Lemo D. Rockwood, on a questionnaire study of the attitudes of 364 Cornell University juniors and seniors toward sex education, premarital sex behavior, marriage, parenthood, and divorce. Two thirds of the students were enrolled in the course on Marriage and the Family taught by Professor Rockwood; roughly half were men and half were women. With its 28 tables and extensive discussion, the book provides a snapshot of the attitudes of a select group of young people at the beginning of World War II.

After promotion to Associate Professor in 1946, Mary Ford was primarily occupied with teaching. At the undergraduate level, she taught courses on Methods and Techniques of Research, Methods of Child Study, Advanced Child Development, Behavior Problems of Children, and Participant Observation of Children enrolled in the Cornell Nursery School. Her course on Exceptional Children became an immediate favorite with undergraduates—so much so that she was forced to limit its enrollment. At the graduate level, she served as thesis director and chairperson of many special committees. Although the department offered no formal training in clinical child psychology, Professor Ford maintained her interest in this area. She was certified as a Clinical

Psychologist in New York State and approved as a diplomate in clinical psychology by the American Psychological Association. She was promoted to full Professor in 1953.

Within her department, Mary Ford became recognized both for her consistent fair mindedness and as an advocate for gradual institutional change. Home economics, for 60 years a bastion of higher education for women, was coming under attack for its preoccupation with preparation of women for their role as homemakers. Her background and training in psychology provided no basis for a commitment to home economics as a professional discipline. So she supported many faculty appointments that gradually changed the character and the interests of the department. Almost none of the professorial faculty appointed during these two decades had any previous association with home economics.

Mary Ford's professional life changed dramatically in 1964 when she became chairperson of her department. The previous chairperson, Alfred L. Baldwin, had served as its institutional leader for eleven years. His departure left many faculty wondering: Where do we go from here? With almost no exceptions, they chose Mary Ford as their best guide to an uncertain future.

The 1960s were an exciting time for everyone concerned with early childhood education. Professor Ford provided administrative support for her colleagues who were enthusiastically taking part in the national Head Start program and helped ensure that her department established a position of leadership in this field. At the time of her retirement in 1967, Dean Helen Canoyer wrote of her:

“Although the Department of Child Development and Family Relationships is composed of ‘prima donnas,’ Dr. Ford not only was able to win their cooperation and respect, but was actually able to motivate them toward more production than previous Heads were able to do.”

Nevertheless the challenges to home economics as a component of higher education had not diminished. At Cornell, President James Perkins appointed a high-level college study committee to examine the place—if any—of home economics in the university. Mary Ford, at the request of Dean Canoyer, served as chairperson of a steering committee charged with coordinating faculty responses to some of the recommendations of the president's study committee. Dean Canoyer tried, unsuccessfully, to persuade her to continue as an active faculty member beyond the age of 60; however Mary Ford was adamant and became Professor Emeritus in 1967.

In retirement Professor Ford devoted herself to many philanthropic activities. She had been a member of numerous college and university committees as a faculty member. Now she had more time for community service and, among other positions, became a board member of HOMES and the Tompkins County Health Planning Council.

She was a member of St. John's Episcopal Church. In later years, Mary Ford's health declined. She moved to Kendal at Ithaca shortly after it opened in 1995 and died there in August of this year. There are no known survivors.

John S. Harding, Jean Failing

William Ray Forrester

January 14, 1911 — February 16, 2001

William Ray Forrester, Dean of the Cornell Law School from 1963-73, died at the age of 90, two months after finishing his last semester of twenty-five years teaching at Hastings College of Law in San Francisco. This fact reveals the love for teaching, particularly constitutional law that proved to be his fountain of youth. As chance would have it, he was the last active member of the Hastings “Over 65” club whereby that school had, during the years of mandatory retirement elsewhere, recruited nationwide an elite of law teachers who, their minds sharp as ever, were not ready to quit the forum.

A graduate of the University of Arkansas, Ray earned his law degree from the University of Chicago Law School in 1935. After working for a Chicago law firm, he was invited to join the Tulane law faculty in 1941. He became Dean of Vanderbilt’s Law School in 1949, returning to Tulane as Dean of that school in 1952. He then came to Cornell and presided as Dean of the Law School for a decade, and then as the Robert S. Stevens Professor until his “retirement” to Hastings in 1978. The author of casebooks in constitutional law and federal jurisdiction, as well as numerous law review and legal periodical articles, he compiled a remarkable resume of participation in arbitration. A charter member of the National Academy of Arbitrators, he exercised his skills at various times on boards seeking to maintain the peace between United States Steel and the United Steel Workers or the International Harvester Company and the United Automobile Workers. His diplomatic skills served him well when leading Tulane’s Law School through the heady and oft-times acrimonious days of the civil rights movement in Louisiana.

Facts reveal Ray to have been a persuasive peacemaker, a superb classroom teacher, a considerable scholar and a successful law school dean. Facts portray him quantitatively as a noteworthy figure in American legal education: they do not reveal the unique inner quality of the man. Soft spoken and wont to speak directly to the matter at hand, there was never any doubt but that he dealt with all and sundry with whom he came in contact, honestly and forthrightly. He might shake his head sometimes when colleagues took positions that seemed to him extreme or impractical, but he never held it against them. Rather, he had a way of laughing it off and proceeding calmly to reason the matter at hand to a sensible result. The laughter, moreover, was not of the mordant variety, but rather had an infectious quality that helped maintain a tranquil atmosphere in which reason could prevail. If one had to sum up the man in a single word, there would be no doubt that those who knew him would invoke: integrity.

Ray's family was always an important part of his life. He is survived by his wife, Celine, now living in Baton Rouge, Louisiana; three sons, William and Stephen, both of New Orleans, and David, of Baton Rouge; a daughter, Catherine Cleland, of Kensington, Maryland; and four grandchildren.

Roger C. Cramton, W. David Curtiss, E.F. Roberts

Edward W. Foss

December 4, 1914 — January 28, 1988

Edward Wilbur Foss, professor emeritus of agricultural engineering, died on January 28, 1988 at the age of 73. He retired from Cornell in 1980 after thirty-two years of active and dedicated service to Cornell.

Professor Foss was born in Laconia, New Hampshire and received a bachelor's degree from the University of New Hampshire. Ed earned a master's degree from Cornell in 1947. He was on the staff at the University of New Hampshire from 1942-45 and the University of Maine from 1945-1948. In 1948 he became professor of agricultural engineering at Cornell.

Ed came to Cornell to teach the farm shop and woodworking courses. In this capacity he served as teacher trainer for vocational agricultural teachers emphasizing teaching farm mechanics. He quickly broadened his interests and became involved with research and extension activities. His deep and abiding interest in forestry and the development of logging equipment for the small woodlot owner was paramount. He and his graduate students developed many labor saving devices to mechanize the woodlot operations. These included the logging arch, fence post sharpener, a small portable sawmill, firewood bundler and a combination log delimeter and debarker. Ed and forestry professor Fred Winch became involved in extending valuable information to the woodlot owners by preparing extension publications and conducting meetings, demonstrations and exhibits.

Professor Foss was given additional responsibilities in agricultural engineering extension when he was assigned the rural housing program. This was an appropriate program area for Ed because of his background in farm shop, forestry and in having had the experience of building several houses. Ed's boundless energy, dedication, foresight, and prolific mind produced many practical publications to help homeowners with sound housing decisions. When many of the responsibilities of the agricultural engineers in rural housing were transferred to the College of Human Ecology, Ed's interest turned to new programs. One of these areas was community resource development. This was uncharted territory for agricultural engineering and it was necessary to explore new ways of applying engineering knowledge to the development of resources in local communities. The development of recreational facilities was one area where Ed produced many educational publications and programs. Another area of Ed's interest was in the preparation and dissemination of educational materials for the civil defense and disaster relief programs.

Ed was also very active in the farm safety program with the New York State Rural Safety Council. One of his important programs with the Safety Council was to organize and conduct workshops for members of the central

Organization of Farm Mutual Cooperative Fire Insurance Companies. He developed and for several years taught one of the first agricultural engineering safety courses ever offered in the United States. He also served as a consultant in farm safety.

Professor Foss anticipated the problems with the disposal of sewage and other waste from small communities, recreational parks and camps, rural housing developments and with the disposal of solid wastes. He innovated new programs by developing program materials to help groups and community leaders in making important decisions with regard to these problems.

Another of his strong interests was youth development programs. He contributed greatly to the revision of the New York State 4-H Fire Safety Program and the initiation of a Farm Tractor Certification Program for youth.

Ed was always concerned with the improvement of community educational facilities. He served as an active member of the Ithaca Board of Education, the Board of Cooperative Educational Services, and was very effective in promoting economical and well designed building projects. Ithacans can be grateful to him for the tax money saved by his careful review of building ideas and plans.

Professor Foss was awarded lifetime membership in the American Society of Agricultural Engineers and was active for many years with the National Fire Protection Association, the National Safety Council and Alpha Zeta and Phi Sigma honorary societies. He was honored with several citations and commendations for his civic and professional services by New York State, Tompkins County and communities in Florida.

Ed was a very active, energetic and dedicated person and a prolific writer. He seemed to have a compulsion to be “involved”. His interests were very broad and he contributed to many program areas in agricultural extension with his drive, determination, expertise and inexhaustible energy. He was a tireless worker who always had plans for more work than he ever had time to complete. Above all Ed was an excellent co-worker, very active in civic affairs and an ideal Rotarian — service above self.

In retirement the Fosses moved to Florida to be near their son. Ed is survived by his wife of forty-nine years, Elizabeth Peabody; two daughters, Joan Elizabeth, and Linda Foss Ecker; and a son, John.

Edward O. Eaton, Everett D. Markwardt, Wesley W. Gunkel

Edward Whiting Fox

June 28, 1911 — May 19, 1996

Edward Fox was a gentleman and scholar. Born in Spokane, Washington and afflicted from his early teens by arthritis, he began study at Harvard University as an undergraduate in 1931. There he met Professor William L. Langer as well as his wife to be, Elizabeth Simon, who was Langer's research assistant and whom he married in 1935. Langer's fascination with European diplomacy interested Fox, but he decided it offered too narrow an intellectual compass. In contrast to Langer's German focus, Fox concentrated upon French history but did not thereby neglect classical and oceanic history or the link between domestic and international affairs. His study of world geography with Derwent Whittlesey also began at this time. Fox proceeded directly from his A.B. degree in 1935 to his Ph.D. degree six years later. He served as Assistant Dean at Harvard during World War II. Because of his international skills, he was appointed to the State Department by President Franklin Delano Roosevelt and continued to work in the Truman Administration as Assistant Secretary of State for Policy Analysis (1945-46). He had direct contact with Secretary James F. Byrnes and developed an astute and abiding grasp of postwar diplomacy. From 1946 until his retirement in 1978, he was a member of the History Department at Cornell University. From 1950-52, he was a Fellow of the Institute for Advanced Study at Princeton when Arnold J. Toynbee was in residence.

Fox's contribution to historical thought was not fully appreciated during his lifetime. He offered new and general theories about French political development at a time when the "Annates" school concentrated upon the microcosm of everyday life. He combined an interest in geography with a deep passion for history in a period when academic specialization had reached an all-time high. His research on France held enormous implications for other countries, especially 17th century England and colonial America. That "trading states" might behave differently from political-military and administrative monarchies was a paramount insight. These new historical syntheses were initially more to the taste of social science colleagues than to historians.

Briefly and synoptically, Fox held that geography— particularly the ease of oceanic or riverine communication— ultimately determined the political type of a society. Societies like England's in which few places are more than ten miles from a waterway which leads to the sea, are bound to engage in commerce as their major vocation. In contrast, France, more landlocked and with few easily navigable rivers, was predestined to develop an administrative culture and tradition depending upon resources from the political center. Only around Bordeaux and a few other trading cities like Nantes, would one find a rugged independence of administrative edicts from Paris. In principle, this

doctrine applied to other countries as well, illuminating liberal movements located in riverine constituencies, and administrative centralization in countries not interpenetrated with waterways.

Fox's view of historical development influenced his attitudes toward policy. Russia, that vast landlocked continent in which rivers ran the wrong way for trading purposes, was the logical embodiment of administrative centralization. The United States, penetrated with internal waterways and canals and increasingly dependent upon long distance and oceanic trade with Europe and other continents, was likely to be the exemplar of liberal and market forces, eschewing centralization. The Atlantic alliance of trading nations was in one sense a modern representation of the league of Hansa towns. Moscow could hardly join such a grouping. Could Russia become democratic? That depended upon developments in communications and transport technology that are only now emerging.

If Russia was likely to be centralized and authoritarian, Fox devoted much of his non-professional life to the promotion of understanding of Israel, a nation founded upon trade. Through his presidency of American Professors for Peace in the Middle East, he brought many American academics to Israel to learn about its problems and successes. He also was a founding member of the Society for French Historical Studies in the United States.

In between periodic bouts of arthritis, he was an avid squash player, with a well-nigh unreturnable serve. A keen oenophile, he found and savored underappreciated wines of the Rhone region, a testimony to his breadth of taste. Academically, he was equally at home with the ideas of Marxist social history as with religious studies, perspectives represented in the work of his children as well as of his sons-in-law. He was a charter member of the Willcox Group, a Thursday luncheon colloquium that fostered and embraced new intellectual currents from some of Cornell's best known professors. When his *Festschrift* was published in 1989, it was a veritable mosaic of historiography, written by individuals influenced by Foxian theory. These essays ranged from Greek philology through the anthropology of high altitude Andean societies, to commodity production in Malawi, to a geographic analysis of post-capitalist transportation in all modern states.

He was a brilliant teacher of Western Civilization and students learned much more than history from his classes. His extensive syllabus discussed required texts, reference works, how to take notes, and how to write an essay. His grading standards were exacting. He believed that an "A" paper could be read by a student to perfect strangers as an exemplary piece of writing and research. A "C" paper, on the other hand, would be read with some embarrassment in the privacy of one's dorm room to a roommate. Fox's influence is due to seminal publications like (in 1971) *History in Geographic Perspective: the Other France* and most recently, *The Emergence of the Modern European World* (1991). He edited the *Oxford Atlas of European History* (1957) and the *Oxford Atlas of American*

History (1962). He also was General Editor for the series, *The Development of Western Civilization* (Narrative Essays in the History of Our Tradition from its Origins in Ancient Israel and Greece to the Present) published by Cornell University Press. In 1989, Basil Blackwell issued a volume of essays in his honor under the title *Geographic Perspectives in History* edited by Eugene Genovese and Leonard Hochberg.

Walter LaFeber, L. Pearce Williams, Richard Rosecrance

John George Franclemont

April 15, 1912 — May 26, 2004

Professor Emeritus John George Franclemont, known to his family, friends, and colleagues as Jack, always let it be known that he was born on the day the Titanic sank—April 15, 1912. For Cornell, the balance sheet for that day was immensely meliorated by Jack's lifetime of contributions. Early on, he focused on insect natural history, collecting moths and butterflies in his native Buffalo, as well as in the Adirondacks. He enrolled as an undergraduate at Cornell University, studying under the tutelage of Professor W.T.M. Forbes, the dean of American lepidopterists, and earned his Baccalaureate degree in 1935. He began his graduate program at Cornell, but World War II, during which he served as a commissioned officer in the U.S. Army Medical Corps, interrupted that. He served as a mosquito eradication specialist in the Pacific, moving from Bougainville and New Georgia in the Solomons, to the Philippines as the war progressed. In addition to his official mosquito duties, Jack made extensive collections of moths, which were sent home to Professor Forbes. At the end of the War, he was honorably discharged from active duty with the rank of Captain.

Returning to civilian life, Jack was an Assistant Entomologist at Cornell University (1946-47), and then an Entomologist with the Bureau of Entomology and Plant Quarantine, U.S. Department of Agriculture, stationed at the Smithsonian Institution, Museum of Natural History, Washington, D.C. (1947-53). During this time, he was responsible for identifications of noctuid and geometroid moths, at the same time completing his doctoral dissertation from Cornell University, which awarded him the Ph.D. degree in 1953. Upon completion of his doctorate, Jack returned to Cornell to serve as Associate Professor of Entomology, being promoted to Professor in 1959. He retired officially in 1977, although he continued to teach a course in advanced insect systematics and advising graduate students for several years.

During his tenure at Cornell, Jack mentored over 20 doctoral students in insect systematics, and served as minor member for nearly 30 more. His students populated university professorial positions across North America. At one point, six curators at the U.S. National Museum of Natural History were Franclemont students. The first loves of his life were insect natural history and his succession of West Highland or Cairn terriers (Cho, Duffy, Angie, and Belle), and so he could focus his efforts on being available to students nearly whenever they needed assistance. His large office on the southwest corner of Comstock Hall, lined from floor to ceiling with his incomparable entomological library and working specimens, served as an oracle of entomological knowledge for those taking

the time to seek it. His patient demeanor and understated approach to explaining the vagaries of artificial human systems developed to describe nature's wonders helped make all of us better taxonomists.

Jack's life work revolved around the development of resources necessary to answer questions of species circumscription, life history, and infraspecific variability for moths residing in North America. To this end, he spent numerous summers collecting moths in Montana, Texas, and across the various mountain ranges of southern Arizona. He specialized in collecting large series of specimens to adequately uncover natural variation in wing pattern coloration. He took this endeavor to an experimental level by rearing large numbers of individuals from various females, permitting a view to the levels of natural variation present within single localities and broods. He understood that novel techniques and character systems—sex pheromones, chromosomes, protein analysis, and behavioral studies were available during his working period—were essential for uncovering the cryptic species that comprise in many cases those biological entities we now take for species. Jack involved many of his students in these field seasons, and therefore many active biodiversity surveys run today can be traced to Jack's acumen in field biology. Working with Lepidoptera, most of which are herbivorous as caterpillars, he called upon his interests in botany to document the suitability of various hosts for larval development. His collecting activities resulted in a personal collection of more than 350,000 spread moths and butterflies, an extensive collection of preserved and photographed caterpillars associated with the adult stages, and about 9000 Canada balsam mounted microscope slide preparations of the internal genitalia of moths. This immense resource was donated to the Cornell University Insect Collection, where it joins the collection of his mentor, W.T.M. Forbes, forming the most significant Lepidoptera collection housed by any university worldwide.

Jack joined his love of natural history specimens with the traditional means to access information about them; books. Throughout his life he built a personal library focusing on moths and butterflies and their larvae, but also including a broad array of historical works fundamental to the field of entomology. The John G. Franclemont Library of Entomology was donated to the Department of Entomology, with his wish to have the proceeds of its sale support a future Cornell Lepidopterist. The university conferred on him the title of "Builder of Cornell" for his several generous donations.

Jack taught insect taxonomy courses to both undergraduates and graduate students throughout his time as a Professor. These courses always benefited from Jack's amassing of specimens to be used as teaching material. Jack's course materials, many collected on numerous nights along Six-Mile Creek in Ithaca, were often better prepared

than those seen in most other university collections, yet their fate was to be broken and glued by a succession of neophyte entomologists. Like his graduate students, these many budding entomologists were able to take away from Cornell the ability to deal knowledgeably with insect diversity through direct observation of natural history specimens, backed up by Jack's deep understanding of insect natural history.

Jack was both a mentor and friend to his students. He felt that he was extremely lucky not to have to choose between his hobby and his work. Nonetheless, he was a multidimensional personality with interests in music, literature, and cinema. His homes on Williams Street and then in Ellis Hollow were the sites of social evenings with graduate students, leavened with visits from neighbors and friends such as Vladimir Nabokov, the aspiring lepidopterist. His students spent much time interacting with him during their times here, and at least in part through those interactions, they developed into leaders in the field of insect systematics. Observing how some of them operate as mentors during their own careers, it is clear that lessons learned from Jack have been carried on to future generations. In closing, one of Jack's former and first Ph.D. students, Ron Hodges, stated in "A remembrance of John G. Franclemont," as part of a "Contributions from former students in honor of his 80th birthday" (April 15, 1992), the following which accurately captures the essence of Jack Franclemont:

"Above all, Jack is highly ethical, honest, positively forthright, helpful, humorous in a subtle, non-destructive way, and caring. All of his students benefited from these qualities."

E. Richard Hoebeke, Richard B. Root, James K. Liebherr

Allan Cameron Fraser

June 4, 1890 — September 17, 1941

Allan Cameron Fraser, Professor of Plant Breeding, died on Wednesday, September 17th, after 27 years of distinguished service in the College of Agriculture. In his death the College has lost a teacher and scientist of outstanding loyalty and ability.

Born on June 4, 1890, at Brockport, New York, he attended the grade schools of that city. His family moved to Buffalo during his youth, and he completed his preparatory school training at the Buffalo Central High School, being graduated from that institution in June, 1909. In the fall of the same year he registered in the College of Agriculture at Cornell University and in 1913 received the Bachelor of Science degree. During the year 1913-1914 he studied and instructed at Columbia University and was also an assistant at the New York Botanical Gardens. In the fall of 1914 he returned to Cornell for graduate study and in 1918 received the degree Doctor of Philosophy.

Serving continuously in the College of Agriculture, he held an instructorship during the years 1914 to 1919, an assistant professorship from 1919 to 1934, and a professorship from 1934 to the time of his death.

On September 5, 1917, he was married to Helen Parker Myers, of Buffalo, New York. Miss Myers was graduated with the class of 1916 from the College of Arts and Sciences at Cornell. Two daughters were born, Helen Margaret, on June 4, 1922, and Janet Louise, on June 18, 1926. During the period August, 1918, to February, 1919, he served with the military forces of the country as Regimental Sergeant Major of the 36th Field Artillery at Camp McClellan.

In 1928-1929 he was granted a sabbatical leave of absence and spent fifteen months in Scotland and England and on the Continent, having been awarded a Fellowship by the International Education Board. During this period he studied for eleven months at the University of Edinburgh in the field of animal genetics and physiology, the balance of his time being spent in visiting research institutions and in general travel.

A second sabbatical leave during the period July, 1936, to February, 1937, was spent in a trip around the world. His particular interests during this trip were in the study of experimental work in pineapple and sugar growing and in the production of crops native to Hawaii, Japan, China, and other countries visited.

Professor Fraser was a Fellow of the American Association for the Advancement of Science, a member of Sigma Xi and Gamma Alpha, of the Genetics Society of America, and of other professional associations. Primarily interested in teaching and research in the field of plant genetics, he also found time for additional scientific efforts. For years

he systematically banded birds and kept records for the United States Biological Survey. His investigative work in the field of genetics dealt primarily with corn and roses.

Professor Fraser was uniquely successful as a teacher of genetics. The basic reason for this was his exact and thoroughgoing knowledge of his subject matter as a science and of its application as an art. Coupled with this was high facility in devising apt and attractive methods of presentation. He was able accurately to estimate student capacities as well as limitations. Graduate students sought him not only as a teacher of courses in advanced genetics but as an adviser in the solution of research problems. Many of his students who later became teachers in other colleges and universities still sought his counsel and to many he supplied laboratory outlines and teaching materials. By all of them he was held in the highest respect and esteem. Letters received from former students of Dr. Fraser, as news of his passing spread, bear eloquent testimony to the high regard and to the sense of shock and personal loss sustained by them. The apparently universal feeling seems to be well expressed by one who wrote as follows: "Professor Fraser's brilliant and enthusiastic teaching undoubtedly inspired many of his students to make the study and teaching of genetics their life work."

It is by his colleagues and fellow associates that the sense of loss and sorrow at his passing is most keenly felt. It is they who knew him best, the keenly humorous and always generously cooperative person, the quiet, efficient scholar. Their affectionate regard and the respect of his many friends in near and far places throughout the world are for him a living and enduring monument.

Chester H. Freeman

October 4, 1915 – September 9, 2008

Chet Freeman was almost always a Cornellian. He died September 9, 2008, having spent more than 40 of his 92 years as a Cornellian, both as a student (B.S. '39, M.S. '45) and a member of the faculty. He retired and became Professor Emeritus in 1980.

Chet was born in West Leyden, New York and grew up on a dairy farm in Constableville, New York. He enrolled in the College of Agriculture in 1935, completing the B.S. degree and then moving on to a Master's degree at Cornell. While a student, he was editor of the *Cornell Countryman*, the College of Agriculture's signature journal founded by Liberty Hyde Bailey in the early 1900s. He was also Chancellor of Alpha Zeta fraternity.

In 1940, Chet was employed by the Extension Service in Cayuga County. Then in 1941, he joined the New York State Department of Commerce as a planning research assistant. His career changed sharply as America entered the Second World War. He enlisted in the Army Air Corps where he trained as a B-29 pilot. During the war, Chet was stationed in the South Pacific where he flew 21 missions without losing a plane or crew. In later years, one of his memorable experiences was attending the reunion of the 58th Bomber Wing on Tinian in the Northern Marianas Islands where the unit had been stationed 50 years earlier. He attended many such gatherings around the United States, sharing stories of his experiences with many others. Flying was to be part of his life long after his military experience but at the more peaceful East Hill Flying Club, where he was a member and a civilian pilot and instructor.

In 1945, immediately after his war service, Chet joined the Department of Extension Teaching and Information (later to become the Department of Communication) as an Assistant Professor. For the next 35 years, he was to contribute to the College of Agriculture and Life Sciences and to the University in a variety of ways. He provided strong leadership from 1965-75 as head of the Oral Communication program that provided basic and advanced speech training for generations of students in the College as well as students throughout the University. He introduced a course in Parliamentary Procedure, something he himself practiced as the Parliamentarian for both the Faculty Council of Representatives and the University Constituent Assembly. He also wrote a self-instruction manual entitled *Parliamentary Procedure – Teach Yourself*, which received national acclaim. Chet taught Photography to undergraduate and graduate students in an era when photography involved film, labs and negatives. In recognition of his excellence in teaching and advising, he received the College's Professor of Merit Award in 1956.

Chet collaborated with Cooperative Extension conducting many in-service training sessions. He was instrumental in the planning and in the success of the department's "Communicating with Your Public" series of summer workshops that were attended by many people from public service organizations and local governments.

In 1961-62, he served as acting head of the department. Then in 1975, he was appointed chairman of what had been renamed the Department of Communication Arts. It was one of those critical times in the College's history when budgets were greatly endangered. In 1976, when a cut in department funds was proposed that would have eliminated Communication as a field of study at Cornell, he stood firm announcing he would resign as chairman if the proposal became a reality. The Communication teaching program survived and Chet served out his term until his retirement in 1980.

In retirement, Chet remained active in the Ithaca community. He was an avid wine maker and belonged to the Ithaca Wine Society. He also participated in City Club and volunteered as a driver for Gadabout, the community organization that provides rides for senior citizens.

Professor Freeman's influence continues in today's Department of Communication through the Chester Freeman Communication Leadership Fund Award. According to the intention of a grant in his honor, "the award is presented [annually] to a junior who best exhibits the interdisciplinary character of the department's program and who best reflects the spirit of Professor Freeman's contribution to the Communication Department and the Cornell community."

Royal D. Colle, Chairperson

Frank S. Freeman

October 11, 1898 — December 4, 1986

In his essay on “The Cornell Tradition,” the eminent historian Carl Becker, characterized a Cornell professor as “a man who thinks otherwise”; Frank Samuel Freeman, a member of the faculty for almost four decades, was such a man. In the sphere in which he did most of his scholarly work, the study of individual differences in human abilities, Freeman was also a man ahead of his time. Thus he could not know that, in a volume recently published presenting new approaches and findings in research on human intelligence, his name appears among those acknowledged as the forerunners of the recent scientific advances in this domain.

Born in St. Louis on October 11, 1898, Freeman received both a bachelor’s and the doctorate degree from Harvard University. While in college, he married Esther E. Worthington, who only briefly survived him. After studying with Kurt Lewin in Berlin, and working as a psychologist in a children’s hospital in Massachusetts, Freeman came to Cornell in 1925 as an instructor in the Department of Education in the College of Arts and Sciences. In those days of E.B. Titchener, psychology was a pure science that had no place for anyone tainted by applied interests.

While in education, Freeman began a close association with Robert M. Ogden, who was influential in introducing Gestalt psychology and psychologists to America. During this time, Freeman collaborated with Ogden in the second edition of the latter’s book, *Psychology and Education*, which applied the principles of Gestalt psychology to education and learning.

Although Freeman did not become a member of the Department of Psychology until some years after Titchener’s death, it was in that discipline that he made his major scholarly contributions. His pioneering book on *Individual Differences*, published in 1934, still stands as a classic in the field and anticipates present conceptions of psychological development as a process of ongoing interaction between an active organism and its environment. A text on *Development and Learning* (1942) was a masterful and lucid compendium of research on development from birth through adolescence, integrating cognitive, emotional and social domains. Perhaps his best known work reflected his enduring interest and ability to move from science to application. Entitled *The Theory and Practice of Psychological Testing*, it presented its subject matter not merely as a technology but as an implementation of theoretical ideas evolving over time. The work went through several editions and translations, including Japanese.

Freeman’s writing was distinguished by its clarity, grace of style, and ability to make complex ideas readily understood. These same qualities characterized his teaching, but there he added a rarer and richer gift: any student

who showed a sign of curiosity or intellectual commitment might soon discover that he or she had acquired a wise, generous, albeit somewhat gruff and exacting mentor who opened new doors to learning through a delicate balance of challenge and support, seasoned by a redeeming dash of humor.

As a psychologist, Frank Freeman was also a leader in the development of his profession. Because of his experience as an accomplished clinician as well as a scholar, he was appointed as the first chair of the New York State Board of Examiners in Psychology. In recognition of that service, he was awarded Certificate No. 1 for the practice of psychology in New York State.

In addition, Freeman was an active participant in the workings of the University Faculty, serving on a number of boards and committees. He was also one of the founders of a teachers' union for Cornell faculty.

But those of us who had the good fortune to have known him as colleagues and students will remember him most for his commitment to scholarship, disciplined thought, and their dedicated transmission to the next generation.

Paul M. O'Leary, T.A. Ryan, Urie Bronfenbrenner

Harrop A. Freeman

November 7, 1907 — October 28, 1993

Harrop A. Freeman, Emeritus Professor of Law since 1974, died shortly before his 86th birthday at his retirement home in Port St. Lucie, Florida. Freeman was an active member of the University Faculty for 29 years (1945-74). His writing on social issues, especially those relating to peace and civil rights, led to national and international recognition. He was a peace activist, a life-long crusader for good causes and a familiar presence at Cornell.

Freeman was born in Elyria, Ohio, on November 7, 1907. His early years were spent at Kalispell, Montana in the foothills of the Rockies. In 1916, his family moved to Cortland, New York, where he received his elementary and secondary education. In 1925, he was valedictorian of his class at Cortland Central High School.

Freeman earned three degrees from Cornell University: an A.B. degree from the Arts College in 1929 (Phi Beta Kappa); an LL.B. from the Law School in 1930; and a J.S.D. (doctor of juridical science) degree in 1945.

He was admitted to the New York bar in 1930 and practiced law in Niagara Falls and Buffalo until the early 1940s. A dedicated conscientious objector, he then moved to Philadelphia to work for the Pacifist Research Bureau of the Society of Friends (Quakers). Here he directed and conducted extensive research on peace and post-war problems, and served as the Bureau's Executive Director, a position he continued to hold on a part-time basis until 1948.

Freeman began his academic career in 1943 with an appointment as Acting Professor of Law at the Marshall-Wythe School of Law of the College of William and Mary in Williamsburg, Virginia. In Williamsburg, the Freemans lived in quarters occupied at an earlier time by Thomas Jefferson.

In 1945, Freeman joined the Cornell faculty as an Associate Professor of Law, winning rapid promotion to Professor of Law in 1948. In addition to teaching and research, he served for a period as Secretary of the Law School, a position which included responsibility for admissions and other administrative assignments from the dean. An able and productive legal scholar, Freeman was a tireless worker with an inquiring mind.

Freeman taught and wrote in a number of legal fields: Administrative Law, Constitutional Law, International Law, Federal Taxation, Jurisprudence, and Interviewing and Counseling. He was an innovative teacher. In 1945, he designed an Administrative Law course for first-year students, a development subsequently copied in a number of other law schools. Toward the end of his career he was a forerunner in the teaching of lawyer skills in law school. His publications and teaching materials on *Interviewing and Counseling*, especially a book written with Henry Weihofen, had a national influence.

Dean Erwin N. Griswold of the Harvard Law School wrote a foreword to Freeman's initial book of teaching materials on *Interviewing and Counseling* (1964). Griswold said in part:

Preparing this book has been a novel task. It required great imagination, great energy, and much capacity to persuade the persons involved to make their material available. In a very real sense, this is almost as much a pioneering book as was Dean Langdell's Cases on Contracts...Many people will have occasion to be grateful to Professor Freeman, for the concept which is embodied in this book, and for the skill and imagination with which it has been carried out.

Freeman's writing on First Amendment issues stressed the theme that a free society depends upon citizens exercising the responsibilities of stating dissenting opinions. Only by the expression of dissent would public authority be checked and citizen control ensured. In a series of books and articles on peace issues, he advanced concerns relating to the third world that have become a commonplace of subsequent writing: The real issues of foreign policy in the future, Freeman argued, would be between the Northern and Southern hemispheres, the haves and have nots of the world. Freeman argued that it was wrong and dangerous to conceive of foreign policy solely in terms of East versus West (U.S. v. U.S.S.R.).

Freeman was an activist committed to international peace, civil liberties and other causes. As a peace activist, he helped found the Emergency Peace Campaign, the Pacifist Research Bureau, the Central Committee for Conscientious Objectors and the War Resisters League. Throughout his life he was active in the Society of Friends (Quakers) both in Ithaca and nationally.

Freeman represented students at Cornell and other colleges protesting university policies such as those dealing with military research, investments in South African businesses, closed meetings of the Board of Trustees, and similar issues. Outside the Cornell community, he represented Japanese-American evacuees from the West Coast, a professor who refused to name names before the McCarthy Committee, certain tribes of American Indians, and a number of well-known peace figures. During later years he was attorney for the People of Micronesia in their effort to gain independence.

In 1962, Freeman ran unsuccessfully for Congress from the district including Ithaca (then New York's 33rd Congressional district) as the Liberal Party candidate. Freeman was a Senior Fellow and Consultant at the Center for the Study of Democratic Institutions, then headed by Robert Hutchins, in Santa Barbara, California from 1964-71.

On Freeman's retirement in 1974, former President Deane W. Malott expressed the following in a letter to Freeman:

You and I have often been poles apart in our thinking but I have always respected your forthright sense of justice and certainly you have contributed a point of view of importance in a free university.

President Dale R. Corson wrote on the same occasion:

I am writing just to express my personal appreciation for your service to Cornell. The University has benefitted especially, I think, from your efforts to provide legal counsel for those for whom it has not traditionally been readily available. Your work on behalf of those about whom society has cared very little has enhanced Cornell's reputation as an institution where the human side of learning is also important.

Freeman remained active in university and national affairs for many years after becoming an Emeritus Professor. He and his family established the Freeman Award for Civil Human Rights, an annual prize of \$500 given to the law student "who has made the greatest contribution during his or her law school career to civil-human rights."

Freeman's life-time companion was Ruth St. John Freeman, whom he married in 1930. Both were active members of the Religious Society of Friends (Quakers). They were a distinctive Cornell family. Ruth Freeman held two Cornell degrees and was the first woman instructor in the Cornell Arts College (Geology); Harrop held three Cornell degrees; and their son, Norman, two.

Harrop and Ruth Freeman travelled widely, attended many international conferences, and taught and lectured throughout the world. They visited a great many countries in the world in one capacity or another. They continued this activity after Freeman became Emeritus Professor in 1974.

Freeman was predeceased by his wife, Ruth St. John Freeman. Survivors include a son, Norman D. Freeman of Stuart, Florida; a brother, La Verne Freeman of Elmira, New York; two grandchildren, Cheryl Baker of Ithaca, New York and N. Douglas Freeman of Ft. Lauderdale, Florida; and three great-grandchildren, William J. Rich, Samantha Baker and Caitlen Baker, all of Ithaca.

W. David Curtiss, Gray Thoron, Roger C. Cramton

Orval C French

January 3, 1908 — March 30, 1999

Orval C French was born in Geneseo, Kansas, raised on his father's farm, and attended a one-room school. Orval enrolled in Electrical Engineering at Kansas State University, took leave in 1927 to help on his father's farm, returned to Kansas State University in 1928, switched to Agricultural Engineering and received a B.S. degree in 1930 and an M.S. degree in 1931. Orval then joined the faculty of the Agricultural Engineering Department at the University of California, Davis. In 1932, he married his college sweetheart, Helen Pembleton, from Ness City, Kansas

At Davis, his career was directed toward teaching and research. He quickly became an authority on methods and equipment for weed and pest control, including aerial chemical application. He prepared many widely read publications on pest control, spray equipment and chemical application.

From 1942-45, Orval was "borrowed" as a research engineer on the Manhattan Project at the University of California's Radiation Laboratory in Berkeley. While at the University of California, he was promoted to Assistant Professor in 1943 and to Associate Professor in 1947.

Shortly after that, he was invited to Cornell University to interview for the position of Professor and head of the Agricultural Engineering Department, which he accepted beginning in the fall of 1947. Orval came into a department that was teaching and extension oriented and housed in several buildings. He oversaw the design and construction of the finest Agricultural Engineering building in the country, Riley Robb Hall. Under his tutelage, the already growing department moved into these fine new quarters in February 1956, here he began to develop a strong research program while expanding and strengthening the teaching and extension areas. Building a good research faculty made it possible to develop a graduate faculty and a strong graduate program, which now draws students from all parts of the world.

He made many personal visits to farmers and agribusiness people all over New York State to learn firsthand their needs and problems. He quickly earned the respect of industry for his good judgment, sound advice, frank suggestions, progressive ideas and willingness to work on any project that helped the farmers.

Under Orval's leadership, Agricultural Engineering at Cornell blossomed. He convinced many in the university, the state, and the nation of the importance of agricultural engineering. He attracted funds and assistance for

research activities. Under his guidance, a five-year professional undergraduate degree program was initiated in 1953 and accredited in 1958.

Early phases of research efforts under Professor French included a strong pest control program in cooperation with the Entomology Department. Excellent programs were developed in mechanizing fruit and vegetable production, in agricultural waste management, and in bioengineering. Much of that pioneer research has been translated into commercially available machines and methods.

A great deal of Orval's success at Cornell came from his ability to develop each staff member to his or her full potential. His warm, friendly manner made him easy to meet. He enjoyed talking to students, staff members, farmers, businessmen and women, and government officials. Orval was a sincere, dependable, honest, forthright person with high moral standards. He would gladly counsel with anyone on problems of any sort at any time. He was the kind of man people would choose for a referee, whether for a ball game or a word battle. All knew of his fairness.

From February 1958 to February 1959, Professor French was a Visiting Professor in the Cornell-UP Contract Program at the University of Philippines, College of Agriculture at Los Banos.

Since joining the American Society of Agricultural Engineering in 1932, Orval has been Chairman of the former College Division; Chairman of the North Atlantic Region; and was ASAE national President in 1966-67. During his presidency, a new organizational structure was adopted, the Food Engineering Division was organized, and ASAE became a full member of the Engineering Committee for Professional Development. He served on many committees, programs and special assignments. French was elected an ASAE Fellow in 1964. He received numerous other recognitions and awards, including an Extension Service award in 1970 for meritorious service to 4-H and to the 4-H Tractor Program in New York State. Perhaps the most prestigious award was The Cyrus Hall McCormick Gold Medal for "Exceptional and Meritorious Engineering Achievement in Agriculture" in 1975, the highest honor in ASAE.

In addition, Orval ably represented ASAE in the American Society for Engineering Education and the Engineering Joint Council. He served on several ECPD accreditation teams. He was a longtime member and Fellow in the American Association for the Advancement of Science.

Orval served as Elder and held many other church offices in the First Presbyterian Church of Ithaca. Here too, he was most anxious that others receive credit, even if the work was entirely his own. In the quarter century that

Orval attended his church, the pastor claims he never once heard a derogatory remark about Orval. He classified Orval as “a leader who developed the finest of leaders.”

When the first fire department was organized at the University of California, Davis about 1938, Orval was Assistant Chief and later served as Chief until 1942. In 1955, when a fire department was organized in his community of Cayuga Heights, Orval was the only member qualified to serve as Chief, which he did for the first year. He continued as an active volunteer fireman until after his retirement from Cornell University.

Following retirement, Orval and Helen moved to Florida, where he continued contact with colleagues and former students. Orval will long be remembered by his many friends and colleagues.

His wife of 66 years, Helen; daughter, Nina L. French Glover; son, Byron; five grandsons; and two great grandsons survive him.

Everett D. Markwardt, William F. Millier, E. Stanley Shepardson

Tracy W. French

May 22, 1951 — March 3, 2009

Dr. Tracy W. French, Associate Professor in Clinical Pathology at the College of Veterinary Medicine, was a beloved teacher, mentor and friend. Tracy passed away peacefully at his home in Freeville, New York on 3rd March 2009, after a long and courageous struggle with illness.

Born in Indiana, Tracy obtained a Bachelor's degree in Biological Sciences from Indiana University in 1973 and became a Doctor of Veterinary Medicine from Purdue University in 1977. Soon after, Tracy followed his calling into Clinical Pathology with a three-year residency at the University of Florida. During his residency, Tracy developed a serologic test for the diagnosis of *Ehrlichia platys*, a rickettsial organism that causes severe infectious thrombocytopenia in dogs. Upon completion of his residency, Tracy remained at the University of Florida as a Visiting Professor of Clinical Pathology, before joining the faculty at Cornell University as an Assistant Professor in 1982. Tracy then spent his professional life in the College of Veterinary Medicine at Cornell University, where he dedicated himself to teaching clinical pathology to veterinary students, interns and residents, assisting with collaborative research projects, and performing professional diagnostic service.

Tracy was an outstanding clinical pathologist and diagnostician. He spent many hours at the microscope, diagnosing diseases in sick animals and helping veterinarians make crucial decisions regarding patient care. He had a gift for identifying strange structures, pigments or organisms in blood and cytology smears and for providing plausible explanations of confusing laboratory results. He was always available and armed with a smile and words of encouragement to trainees and colleagues alike. His gems of wisdom will be remembered and used by those he taught over the years. All of those who worked with or for Tracy, including the medical technologists in the laboratory, held him in the highest regard. All appreciated his patience, wealth of knowledge, fairness, mellow personality and caring nature. He served both the University and his profession by participating on various educational committees, serving as President of the American Society of Veterinary Clinical Pathology and functioning as Director of the Clinical Pathology Laboratory for many years. His collaborative efforts yielded numerous publications and contributed to advancing the field of veterinary clinical pathology.

Tracy was an outstanding teacher. He was dedicated to the education of veterinary students, interns, and residents, and continuing education of veterinarians in clinical practice and academia. He readily embraced new teaching methods and was one of the first clinical pathologists in the country to use the web for clinical pathologic

education. He had an eye for good web design and would spend hours perfecting images for web display and publication. To facilitate self-driven student learning in a new case-based curriculum introduced in Cornell's College of Veterinary Medicine in 1995, he helped create web-based clinical pathology laboratories, teaching cases, and modules on hematology, clinical chemistry and urinalysis. Indeed, his enduring legacy to Cornell University was the creation of these web-based modules, now known as eClinPath at Cornell University. This phenomenal resource remains one of the few educational veterinary clinical pathology sites available on the worldwide web. It has been used, and will continue to be used for years to come, by veterinary students, veterinarians, veterinary technicians and teaching institutions worldwide.

Tracy also had a rich and fulfilling life outside of work. He liked nothing better than driving those beemers (particularly the roadster) around upstate New York, playing guitar, sailing in the high winds and rough water on Cayuga lake, or riding his catamaran in Florida.

He had a hotlink to the webcam on the lake, so he could continuously monitor wind conditions and know when it was just right to go sailing. He was totally free and fearless on the water, no matter what the conditions. Above all, he loved his family and placed them first. He was a devoted, loving and committed husband to Mica, father to Trevor and Hannah and stepfather to James, Wesley, Joshua and William. He only wanted happiness and good health for all of his family.

Tracy was a quiet, gentle and compassionate person, who treated everyone equally and with good humor and respect. He will be remembered for his kindness, thoughtfulness and concern for others, for his unfailingly positive outlook, his tremendous zest for life and his incredible reserves of courage. He was a valued and beloved colleague, mentor and friend and will be missed by those who had the pleasure to work or interact with him.

Tracy Stokol, Chairperson; Julia Blue, Linda Chapman, John Randolph

Walter Hoyt French

June 19, 1897 — November 20, 1980

Walter Hoyt French was born on June 19, 1897, in Oak Park, Illinois, and first came to Cornell as an undergraduate. He received his Bachelor of Arts degree in 1920, remained for his Doctor of Philosophy degree, which he received in 1924, rose through the ranks to become professor of English, and continued to teach at Cornell until his retirement. His deep attachment to his department and to Cornell is suggested by his description of himself in *Who's Who* as having been a member of the Cornell English Department since 1917, when one presumes he must have chosen to become an English major.

Professor French's main area of interest and research was medieval studies, and his chief publications were in that field. His *Middle English Metrical Romances*, which he edited in 1930 with Charles Brockway Hall, held the field for many decades as the only scholarly collection of Middle English romances. Reissued in 1964, it is still regarded by many scholars as the best. His *Essays on King Horn*, published in 1940, a study of various aspects of that Middle English poem, made suggestions about its nature and origins that contemporary medievalists still find exciting. Others of his publications explore problems in Chaucer and in Old English as well as in Middle English poetry.

Professor French's academic interests and activities ranged well beyond his area of specialization, however; he taught courses and published articles on modern American poetry, and taught and supervised courses in expository writing. Although he viewed much modern writing with considerable suspicion, he cast a more benevolent eye than many on the then still fledgling program in creative writing. In addition, he for many years administered the Graduate Program in English, virtually single-handedly supervising the selection and admission process, assigning students to advisers, keeping student records, and the like. Apart from his literary pursuits, Professor French maintained an intense interest in music. He is reported to have had such knowledge and keenness of ear as to enable him to listen to entire Beethoven symphonies in his head. And it is further reported that he not infrequently preferred such listening to the sounds of scratchy recordings. Professor French was a member of the Medieval Academy of America, Phi Beta Kappa, and Phi Kappa Phi.

In public, Professor French was generally formal, serious, and reserved, a man admired chiefly for his high principles and fair-mindedness. He is remembered as well by people who worked closely with him and under him for his courtesy and human concern.

Robert E. Kaske, Walter J. Slatoff, Stephen M. Parrish

Richard Felix Fricke

June 28, 1896 — September 21, 1976

Richard F. Fricke was a pioneer in agricultural extension work in New York State and, before his retirement, had worked thirty-nine years in agriculture. On December 31, 1956, he became professor emeritus, Extension Service.

Born in Buffalo, New York, Professor Fricke attended high school in Gardenville and was graduated from the College of Agriculture, Cornell University, in 1917. He started his extension career as an assistant agent in Chautauqua County under the World War I Food Supply Commission. He was an agricultural agent in Niagara, Clinton, and Erie Counties, successively. In the fall of 1934, he enrolled at Cornell University for graduate study in agricultural economics and vegetable crops.

During his seventeen years of service as a county extension agent, he accomplished outstanding and pioneering achievements. It was his leadership that established the Niagara Frontier Farmers' Market in Buffalo. He was responsible for organizing the first cooperative potato spraying in New York State and for developing and launching the state's most effective potato seed program. His organizational skill made possible the early eradication of tuberculosis from the dairy herds of Erie County. As further testimony of his resourcefulness, he developed one of the first county agricultural agent radio programs.

Richard Fricke's twenty-one years as assistant state leader and associate state leader of county agricultural agents began at Cornell in September 1935. Over those years he was involved in a variety of programs and projects.

He served as supervisor of county agricultural agents in most of the counties of the state and was a counselor to agents and farmer extension committees. During World War II, he carried the important responsibility of clarifying for county agents and farm families the government regulations pertaining to priorities, price supports and ceilings, and rationing procedures.

He developed a system of filing adopted by many county extension offices in the state. He was a charter member and organizer of the New York Association of County Agricultural Agents. On leave in 1946 and 1947 he studied extension administration in twenty-six states. In 1950 he served as a consultant in the development of extension work in Germany.

He was a charter member of Epsilon Sigma Phi, the national extension honorary fraternity, and served as its chief, secretary, and annalist of the New York State chapter. He was a president of the alumni association of the College of Agriculture. After his retirement, he served for ten years as treasurer of the Cornell Credit Union.

Professor Fricke will be remembered for his skill in dealing with fiscal matters in county and state extension, for his keenness in discerning farm and organization needs and priorities, and for his personal service to farmers, county agents, and specialists. He was a highly motivated extension worker, and his contributions were effective and noteworthy.

Richard Fricke is survived by his widow, Mrs. Julia Cooper Fricke of Ithaca, by one son, Richard I. Fricke of Burlington, Vermont, and by four grandchildren and five great-grandchildren.

Fred B. Morris, S. Reuben Shapley, Clifford R. Harrington

James Nathan Frost

October 5, 1885 — October 28, 1949

James Nathan Frost suffered a fatal heart attack at his home, Hanshaw Road, Cayuga Heights, Ithaca, New York, on October 28, 1949. Born at North Evans, New York, October 5, 1885, he was completing his forty-second year of uninterrupted service as a member of the faculty of the Veterinary College. This record has never been equalled by any other member of this faculty.

Doctor Frost attended the public schools of North Evans and Angola, New York, and graduated from Masten Park High School in Buffalo. He entered the Veterinary College in 1904 and received the D.V.M. degree in 1907 after which he engaged in general practice in Hamburg, New York, for a few months before being appointed Assistant in Surgery at the Veterinary College. He was made an Instructor in 1908, and Assistant Professor in 1913. He became Acting Head of the Department of Surgery and Director of the Surgical Clinic in 1916.

He was appointed Professor of Surgery in 1918, and served as Acting Superintendent of the Ambulatory Clinic that year in addition to his duties in his own department. Doctor Frost had previously worked for the greater part of eight years in the Ambulatory Clinic. From its founding in 1908, the late Doctor W. L. Williams relied upon the unusual ability and energy of Doctor Frost to develop the first Ambulatory Clinic in this country. The difficulties and hardships involved in establishing this clinic, such as the use of horse-drawn vehicles and trains, and developing the confidence of the farmers made this experiment in clinical teaching an important achievement in veterinary education.

The success of Doctor Frost in the development of clinics is undisputed but is emphasized by the case records. During the first year of the Ambulatory Clinic there were 351 cases and 130 cases in the Surgical Clinic. Ten years later, during the last year that he supervised the Ambulatory Clinic it covered 1910 cases. His Surgical and Consulting Clinic handled 4552 patients last year.

Doctor Frost was a member of the American Veterinary Medical Association, the New York State Veterinary Medical Society, the Western New York Veterinary Medical Association, and the Southern Tier Veterinary Medical Association. He was president of the last mentioned organization in 1921. The clinics of the state and local associations for many years centered around his surgical demonstrations. He was frequently active in clinics of the American Veterinary Medical Association as well as those of many states in this country and of provinces in Canada. While on his only sabbatic leave in 1935, he traveled with his family in central Europe and the British

Isles, observing methods in the clinics of the veterinary colleges. He gave a demonstration at the National Meeting at Belfast, Ireland.

Doctor Frost held membership in the honorary societies of Phi Zeta and Sigma Xi and was a loyal supporter of the undergraduate professional fraternity, Alpha Psi.

His research included collaboration with W. L. Williams in 1908 to 1909 in the perfection of the operation for roaring in horses. He succeeded in popularizing the technique by which the patient was operated on while in the normal standing position and under local anesthesia. He was the first in this country to record a successful rib resection for traumatic pericarditis.

Doctor Frost became an outstanding authority throughout the United States on the diagnosis and treatment of lameness in all breeds of light horses, through his research regarding methods of diagnosis and corrective shoeing based on sound anatomical principles.

He contributed to current veterinary journals upon a great variety of subjects related to the fields of medicine, surgery, and obstetrics. He collaborated with Doctor W. L. Williams in 1919 in the fourth edition of the text, "Surgical and Obstetrical Operations," and with Doctor A. G. Danks in the revision in 1943 of "Williams' Surgical Operations."

In his career as a teacher, Doctor Frost gave instruction to forty-five graduating classes in which 1315 alumni of the Veterinary College received his wise counsel on personal and professional problems. In spite of the fact that his assistants were kept very busy in routine surgical teaching, some completed their work for graduate degrees. Several of the leading practitioners, surgeons, teachers, and others in the veterinary profession in this country had the rare privilege of being associated with him as his assistants. It is difficult to estimate the value of his contributions to agriculture and to the veterinary profession.

Practitioners and their clients frequently called on Doctor Frost to investigate unusual problems and outbreaks of disease in large animals. Through this work he associated with persons of prominence in this and other states. He accepted an assignment in January 1948, as Consulting Veterinarian for the Thoroughbred Racing Protective Bureau, Inc., New York.

Doctor Frost will be long remembered for his genial and magnetic personality, his keen sense of humor, as well as for his professional skill. He undertook many seemingly impossible and thankless tasks because they provided good teaching material or because they appeared to be something unusual or new.

His colleagues and students admired his sound judgment and keen diagnostic skill. His long clinical experience in handling clients and patients qualified him to give to his students a side of veterinary practice that was not recorded in text books. His friends and associates in Ithaca and on the campus recognized his sterling character and high ideals. Students, alumni, and faculty found him a sympathetic listener when they came to him for consultation and advice. In common with other great teachers, his influence upon the veterinary profession will prevail for many years.

D. W. Baker, M. G. Fincher, A. M. Mills

Wolfgang Fuchs

May 19, 1915 — February 24, 1997

Wolfgang Fuchs, Professor of Mathematics, Emeritus, died February 24, 1997, at his home in Ithaca, surrounded by his loving family. His life was celebrated at a remarkably joyful memorial service on March 8, 1997 in the chapel of Anabel Taylor Hall, with more than 200 people in attendance.

Wolfgang was born on May 19, 1915 in Munich, Germany. His parents foresightedly sent him to England in 1933. He enrolled at Cambridge University, receiving his B.A. degree from St. John's College in 1936 and his Ph.D. degree in 1941, under the supervision of A.E. Ingham. Between 1938-50, Wolfgang held academic positions in Aberdeen, Swansea, and Liverpool. He came to the Cornell Mathematics Department as a Visiting Associate Professor in 1948 and returned as a permanent member of the faculty in 1950. Except for leaves, he stayed at Cornell for the rest of his life. He received a Guggenheim fellowship in 1955, was promoted to Professor in 1958, and served as department chair from 1969-73. He was a Fulbright-Hays Research Fellow in 1973-74 and a Humboldt Senior Scientist in 1978-79. Although he officially retired in 1985, he remained active in the Mathematics Department until his death.

Wolfgang's mathematical training was in complex function theory, but he had broad mathematical interests and often applied sophisticated function theoretic techniques to questions from other areas of mathematics. For example, his 1946 paper in the *Journal of the London Mathematical Society* definitively settled a question in the theory of approximation that had been studied by several mathematicians. One of them, Ralph P. Agnew, was then chairman of Cornell's Mathematics Department. Agnew's admiration for this paper played an important role in bringing Wolfgang to Cornell in 1948.

Wolfgang's joint paper with the world-famous number theorist, Paul Erdős, published in 1956, was one of his favorites. Applying complex function theory to number theory, the authors showed that a certain property of the sequence of squared whole numbers (1, 4, 9, 16, etc.) is in fact a "law of nature" and is shared by all increasing sequences of positive whole numbers.

Wolfgang's best known mathematical research was concerned with the value distribution of meromorphic functions, whose modern theory began with Rolf Nevanlinna's work in the 1920s. In 1955, Wolfgang's friend Albert Edrei, a professor of mathematics at Syracuse University, attended a Cornell mathematics picnic and, with Fall Creek Gorge as backdrop, encouraged Wolfgang to undertake a joint research program in Nevanlinna

theory. In a collaboration lasting nearly twenty years, Edrei and Fuchs raised the theory to a new level, developing techniques that have become the standard way to handle the subject, and bringing it to another generation of students and colleagues. When Nevanlinna died, Wolfgang was the obvious choice to deliver the address devoted to Nevanlinna theory at the memorial conference in Zurich.

While the classical Cambridge tradition could be seen in most of Wolfgang's work, he was always looking for new talent and encouraging a broad view of mathematics. His three monographs, which have already been influential for decades, include significant topics that he did not often use in his own work but have been useful to many others. He made early and important contacts with complex analysts in China, Armenia, Russia and Germany. He brought many visitors to Cornell, and his mentoring led to much collaborative work. Until the last several months of his life, Wolfgang was always at the center of conversation at conferences, where in later years his talents were often used to give surveys and even to write poems (one of which is now in a second printing).

While Wolfgang was usually a gentle and genial colleague, he was not afraid to speak out when so moved. He helped to organize a large group of mathematicians to protest the 1989 situation in China, and for many years tried to provide support and publicity for oppressed mathematicians there, in Eastern Europe and elsewhere. He warmly supported Amnesty International.

In 1943, Wolfgang married Dorothee Julie Rauch von Trautenberg. She survives him, as do their children, Annie, John, and Claudia; and their grandchildren, Storn and Cody Cook and Lorenzo and Natalia Fuchs McClellan.

Wolfgang and Dorothee's home was always a special place to visit. They created a warm and enthusiastic atmosphere that reached far beyond the mathematical or academic communities. One of its key ingredients was Wolfgang's exceptionally positive attitude toward life.

Wolfgang's life was a celebration. He was interested in everything, read avidly, traveled eagerly, and concerned himself deeply with friends and family. Times spent together with him and Dorothee were always fascinating. One always learned from him. He enthusiastically shared historical information from periods ancient to contemporary, related travel adventures, told life stories of relatives and friends from his past. In discussions relating to difficult tomes, such as *Tristram Shandy*, he would politely listen without patronizing, and then proceed to quote esoteric passages that he had probably not seen for at least fifty years. When he traveled to a country whose language was unfamiliar to him, he would study it in order to be able to converse directly with colleagues and acquaintances.

Even towards the end of his life, when he was not well, he was undaunted in his zest for living. On a cruise from Amsterdam to Vienna, one stop was a beer hall where the noise level was, for some of the assembled tourists, painful. Wolfgang was the first person on the dance floor. He invited the tour director to some vigorous turns, accompanied by a raucous German band. He enjoyed the music, the clowning of the floor show performers, the beer — everything. On that same trip, lunch and dinner always seemed to include a course with whipped cream, which his prescribed diet forbade. He would initially push the cream aside, and then little by little it disappeared with whatever else was on his plate. Chocolate was also not allowed. But he loved it and even hid chocolate bars from Dorothee. The first thing he offered a friend after he returned home from heart surgery was a chocolate bar! He had an impish, happy-go-lucky attitude — along with a serious, inquiring mind that retained everything he read or heard. During his last illness, and his last stay in the hospital, he wrote from memory, and gave to Dorothee, a note containing the following passage from Book Five of Spenser's, *Faery Queen*.

What if some little pain the passage have
That makes frail flesh to fear the bitter wave
Peace after Warre, Port after stormy seas
Death after life do greatly please.

Wolfgang made his death as joyous an experience as his life. He is often quoted by his family, which came together to celebrate his life as he lay dying, "I did not know that dying could be so much fun."

David Drasin, Sonya Monosoff Pancaldo, Clifford J. Earle

Delbert Ray Fulkerson

August 14, 1924 — January 10, 1976

Delbert Ray Fulkerson's tragic and unexpected death at the age of fifty-one dealt his many friends, colleagues, and students a severe blow. He was one of the pioneering giants in the development of modern operations research, and his fundamental contributions in network flow theory and combinatorial analysis have had and will continue to have a major and lasting impact on the field.

Over and above his scientific abilities, Ray was a man of outstanding personal qualities. He was warm, kind, and friendly, with great compassion for the needs of his fellow man. He was a person of great integrity, a strong and constant advocate of justice and fair play, but always modest and unpretentious. At the same time he was an active and skillful competitor, whether it was at tennis or kriegspiel or in the dogged pursuit of the solution of a difficult mathematical problem. Those who had the privilege of knowing Ray greatly respected him for his outstanding human attributes as well as for his intellectual talents.

Born in Tamms, Illinois, Ray was the third of six children of Elbert and Emma Fulkerson. Elbert Fulkerson was the high school principal in Tamms, and later in Carterville, Illinois, where Ray attended grade school and high school; the family subsequently moved to Carbondale where Ray's father taught mathematics and served as the secretary of the faculty at Southern Illinois University. Ray's parents, particularly his father, appeared to have had a strong influence on their children: all six graduated from high school as class valedictorians, the three boys earned Ph.D. degrees, and each became a teacher.

In September 1941 Ray enrolled in Southern Illinois University. His studies were interrupted by World War II, and in January 1942 he joined the U.S. Army Air Corps where he received training as a meteorologist. In June 1946 he received an honorable discharge from the Air Corps as a first lieutenant and returned to S.I.U. from which he was graduated, first in his class, in 1947 with a B.A. in mathematics. He received his M.S. and Ph.D. degrees in mathematics at the University of Wisconsin in 1948 and 1951.

Ray obtained his Ph.D. at an ideal time in the history of mathematics. The subject was entering an era of unprecedented growth and prosperity. This period included the time that he was to spend at the Rand Corporation in Santa Monica, California. Ray joined the Mathematics Department of Rand in March 1951. He would spend more than twenty exciting and extremely productive years there during which time he created and developed the field of network flows and made fundamental contributions to combinatorial theory and mathematical programming.

Initially he worked on studies in logistics and systems analysis, particularly on algorithms for the solution of transportation and assignment type problems. When Dr. George Dantzig moved to Rand from the Air Force in June 1952, he and Ray became close personal and professional friends, a relationship that would last throughout the years. The resulting collaboration led in 1954 to Ray's first two published papers: the first written with Dantzig solved the problem of finding the least number of tankers required to meet a fixed schedule, and the second, with Dantzig and Dr. Selmer Johnson, solved a forty-nine-city, "traveling salesman" problem; the latter paper received honorable mention for the 1954 Lanchester Prize given by the Operations Research Society of America (ORSA). The interaction between Fulkerson, Dantzig, and later Dr. Lester R. Ford, Jr., led to some fundamental contributions to mathematical programming. In 1956 they developed a primal-dual algorithm for solving linear programs, and later the Ford-Fulkerson work on the column generation technique for multicommodity flow problems led Dantzig to formulate the decomposition principle for linear programming. The celebrated Ford-Fulkerson book on *Flows in Networks*, which appeared in 1962, was an outgrowth of their earlier collaboration, while Ford was at Rand, on a project to evaluate the capacity of the Eastern European rail network. The original problem they solved had been formulated as one involving network flows. The book contains basic research that extended and generalized their earlier work on this problem and is considered the classic in the field; it received honorable mention for the Lanchester Prize of ORSA and has since been translated into French, Japanese, Polish, and Russian. In 1967 Ray was the recipient of one of the Lester R. Ford Awards of the Mathematical Association of America for an expository paper on flows in networks (the award being named for his colleague's father who was also a mathematician).

After the publication of *Flows in Networks*, Ray's research took a turn toward the pure. He wrote more about "graphs" and less about "networks" and began to work on matroid theory and general blocking systems, an abstraction of the dual notions of flows and cuts in a network. This led him to develop the theory of blocking pairs of polyhedra that served to unify a variety of mathematical results involving discrete phenomena and, later, the concept and theory of antiblocking polyhedra.

While at Rand, Ray maintained a variety of contacts with the business and academic world. He consulted at various times for different industrial corporations. In 1958 he taught what was probably the first course in network flow theory, at the University of California, Los Angeles. In 1963 he was visiting professor at the University of California, Berkeley, and in 1966 at Stanford University. In 1968 he was appointed distinguished visitor at the University of Waterloo, Canada, and in 1971 he returned as visiting professor.

In the fall of 1971, Ray joined the Department of Operations Research in the College of Engineering at Cornell as the Maxwell M. Upson Professor of Engineering and professor of operations research and applied mathematics. In his quiet and unassuming way he quickly became the intellectual leader of the department. He taught a popular sequence of courses in network flows and extremal combinatorial problems designed to bring research students to the frontiers of knowledge in these areas. Ray was a superb and inspiring teacher. He set very high standards for his graduate students as he did for himself; in his relationships with them he was always fair and compassionate. His door was open to faculty and students alike, and he was a font of knowledge in his areas. He was a scholar in the true sense of the word and continued to produce outstanding research at the frontiers of his field.

At the time of his death he was a member of the American Mathematical Society, the Mathematical Association of America, the Mathematical Programming Society, the Operations Research Society of America, the Society for Industrial and Applied Mathematics, and the Institute of Management Sciences. He was a member of the council of the Mathematical Programming Society as well as associate editor of its journal, *Mathematical Programming*. He was also associate editor of the *Journal of Combinatorial Theory* and the *Journal of Optimization Theory and Applications*, and advisory editor of *Mathematics of Operations Research* and of *Networks*. His last major project, a two-volume collection of papers, which he edited for the Mathematical Association of America, took four years to complete. His own published papers and books numbered more than fifty.

A memorial service was held in Ray's memory and honor in the Chapel of Anabel Taylor Hall at Cornell. Alan Hoffman, a close friend and professional colleague of Ray's spoke at this service and closed his remarks concerning Ray's professional accomplishments with the following sentences: "His greatest honor is simply that network flows exists as a subject of such importance that all over the world now and in the future, it is and will be a fundamental tool in economic and industrial planning. It was Ray's great good fortune or perhaps the reward of his talent and energy to create mathematics that contribute to life where art and nature imitate each other." The scientific world has lost an outstanding mathematical research worker, and we have lost a close and warm friend.

Ray is survived by two sons, Guy Emmet of La Jolla, California, and Lee Alan of Santa Monica, California; his former wife, Eleanor, of Santa Monica, California; his mother, Mrs. Elbert Fulkerson of Carbondale, Illinois; two sisters, Mrs. Merle Guthrie of Belleville, Illinois, and Mrs. June Todd of Skokie, Illinois; and two brothers, Richard Fulkerson of Commerce, Texas, and Glen Fulkerson of San Diego, California.

Louis J. Billera, William F. Lucas, Robert E. Bechhofer

Simon Henry Gage

May 20, 1851 — October 20, 1944

Simon Henry Gage was born at Crumhorn Lake, Otsego County, New York on May 20, 1851. In a prayer meeting that he attended as a youth he first heard of Cornell University from a clergyman who urged his young listeners to have nothing to do with “that godless institution.” Gage was not one to let such an indictment pass without a study of the facts. Convinced by his inquiries of the injustice of the charge, and persuaded that Cornell was the place for him, he matriculated in the fall of 1873—and for seventy-one fruitful years his place it turned out to be.

Gage’s enthusiastic interest in biology immediately attracted the attention of Professor Burt Green Wilder, whom he assisted throughout his undergraduate years. Upon receiving the degree of B.S. in 1877 he was appointed Instructor in Microscopy and Practical Physiology. His subsequent titles were: Assistant Professor of Physiology and Lecturer in Microscopical Technology, 1881; Associate Professor (as above), 1889; Associate Professor of Anatomy, Histology, and Embryology, 1895; Professor of Microscopy, Histology, and Embryology, 1896; Professor of Histology and Embryology, 1902.

In 1896 he organized in the newly established Veterinary College an independent department of histology and embryology which in 1902 was transferred to Stimson Hall, then the new home of the Ithaca division of the Medical College. He retired from teaching in 1908 on a pension provided by the Carnegie Foundation for the Advancement of Teaching, in order to devote his whole time to the research which he prosecuted with vigor and enthusiasm until his last illness. His final visit to his laboratory was made only ten days before his death.

In 1893 he joined Professor Comstock in establishing the Comstock Publishing Company, which, through the bequest of Comstock and the gift of Gage, became the property of Cornell in 1931 when Professor Gage became president of the company, an office he held until his death. The profits of this enterprise continue to be one of the major sources of the support of the Cornell University Press.

Professor Gage was ever most generous to the university of his affections. In 1915 he and his son, Henry Phelps Gage, presented a fund in memory of his first wife, Susanna Phelps Gage, herself an able biologist. This endowment, now amounting to almost \$7000, will eventually be used for a room in a new dormitory for women. Three years later they established the Susanna Phelps Gage Endowment of \$10,000 for research in Physics. These larger gifts were supplemented by many others, including valuable books, sets of periodicals, and apparatus.

In 1921-22 Professor Gage was a faculty member of the University Board of Trustees. From 1923-40 he was Librarian ("Responsible Librarian," he chose to call himself) of the Van Cleef Memorial Library, now the library of the Department of Zoology. It was, indeed, Professor Gage who persuaded Mynderse Van Cleef to found this memorial to his brother, Charles Edward Van Cleef.

Professor Gage was a prolific contributor to professional journals. Microscopy was perhaps his dominant interest, stemming probably from his earlier interest in photography, but he also made notable additions to our knowledge of the biology of the lamprey in a series of fundamental researches published over a period of fifty years. The Southern Brook Lamprey has been named in his honor *Ichthyomyzpn Gagei*. His studies of the fat particles of the blood and of the rate at which fat is deposited in the tissues are also noteworthy.

Of his books the most characteristic is "The Microscope," first published in 1881 and probably the most widely used American text on the subject. The seventeenth edition appeared on his ninetieth birthday in 1941. With Burt G. Wilder he was co-author of "Anatomical Technology," 1882; with B. F. Kingsbury of "Vertebrate Histology," 1899; and with his son, Henry Phelps Gage, of "Optic Projection," 1914. In 1893, he and John Henry Comstock edited "The Wilder Quarter-Century Book," said to be the first American collection of researches published in honor of a university teacher. Shortly before his death he completed a history of the Comstock Publishing Company, and he leaves the nearly completed manuscript of a history of microscopy in America, a work which is being edited for publication by his wife, Clara Starrett Gage, and his son, Henry Phelps Gage.

Gage was long a member of the American Society of Zoologists, one of the original members of the American Association of Anatomists, and a member of the first board of editors of the American Journal of Anatomy, which he assisted in establishing. He was also a Fellow of the American Association for the Advancement of Science and twice presided over the meetings of its Zoological Section; a member of the New York State Science Teachers Association (President, 1896), American Microscopical Society (President, 1895-96, 1906), American Society of Naturalists, Royal Society of Arts, Philadelphia Academy of Natural Sciences, American Fisheries Society, Optical Society of America, and the National Association for the Prevention of Tuberculosis.

He was a man whom his students and colleagues delighted to honor. At his sixty-fifth birthday dinner there was announced the establishment of a fund in support of the Simon Henry Gage Fellowship in Animal Biology. By his ninetieth birthday this had reached the sum of \$10,000 and the first fellow was then appointed. His seventy-fifth birthday was observed by a dinner given in his honor by the American Association of Anatomists in New Haven, and his eightieth by a dinner given in Philadelphia by the Advisory Board of the Wistar Institute of Anatomy, of

which he had been a member since its organization in 1905; and on this occasion he was presented with a copy of volume 48 of the American Journal of Anatomy, which was dedicated to him.

But no mere statement of the positions he occupied, or of the honors accorded him can convey the true qualities of the man; to know these was the high privilege only of those who worked near and with him. He was a lover of life, and with him life and work meant the same thing. He had an infectious enthusiasm for work which age never affected. To the end he lived in the future; no one was ever readier to discard the outworn or outmoded, to adopt what was new if it were better than the old. In the classroom and out he was a great teacher, for his whole life was a pattern that provoked emulation, exemplifying as it did the best traditions of the profession. His laboratory was a magnet that drew a constant stream of inquirers and of those who felt the need of refreshment and inspiration. His sincere and youthful enthusiasm, his fresh and forward-looking point of view, his fine sense of humor, his hearty, refreshing laugh, and his kindly interest in men and their problems struck a responsive chord in all with whom he came in contact. His many friends and this University that he loved so well and served so long and devotedly are the richer for his life; as with all great teachers, his influence will continue to be felt for generations.

Victor Raymond Gage

November 12, 1882 — January 12, 1955

Victor Raymond Gage, Professor Emeritus of Mechanical Engineering, died in Ithaca, New York on January 12, 1955 after a long illness.

He was born in Vineland, New Jersey, but soon moved with his family to Wilmette, Illinois where he spent his early life.

He attended Cornell University as an undergraduate and was awarded the degree of Mechanical Engineer in June 1906. After graduation, he spent a year in commercial life. He returned to Cornell in the fall of 1907 as an Instructor in the Department of Experimental Engineering. While instructing he did graduate work on “Heat Transfer in Boiler Tubes” which he presented as a thesis for the degree of Master of Mechanical Engineering in 1912. He was elected that year to the Society of Sigma Xi in recognition of the excellence of his graduate work.

The next year he was advanced to the rank of Assistant Professor in the same department and in 1923 he attained the rank of Professor of Experimental Engineering. This rank he held until his retirement in 1950. However, during a reorganization of the College of Engineering in 1942, his title was changed to that of Professor of Mechanical Engineering. For over thirty five years he was in direct charge of the Senior Mechanical Laboratory. He was an excellent teacher, an exacting task master, who required a high standard of work from his students. Those who taught under him found him an ever ready and sympathetic source of inspiration to hold to high scholastic standards. Both those who studied under him and those who had the privilege of teaching under him felt the power of his personality.

While he was a member of the Cornell University Faculty, he found time to do much technical writing and research work. During the summer months and sabbatical leaves he broadened his technical knowledge by doing research work with the North Shore Electric Company of Evanston, Illinois, the White Motor Company of Cleveland, Ohio, and the Western Electric Company of Chicago. During the first world war he served with the National Advisory Committee on Aeronautics at the Bureau of Standards in Washington, D. C. Here he was in contact with the early development of aeronautical fuels and power plants and was the author or coauthor of nine of the Committee’s reports. During the second world war he acted in an advisory capacity to the Office of Fuel Administration for Ithaca. During his later years he developed an intense interest in photography and contributed many papers on

the technical aspects of that subject to such important publications as Camera, American Photography, and the American Annual of Photography.

Victor Gage was an ardent Mason. He belonged to and was active in Hobasco Lodge AF and AM which he served as Master in 1938 and in the Eagle Chapter, R. A. M. of which he was High Priest in 1920. He was a member of long standing in the Cornell Chapter of the Acacia Fraternity.

He served his community as a member of the Ithaca Municipal Civil Service Commission for a term of years starting about 1920 and was later a member of the Zoning Board of the Village of Cayuga Heights. He was also a member of the American Society of Mechanical Engineers and Society of Automotive Engineers.

In 1908 he married Miss Helen Morton Heath. A daughter, Miss Helen Victoria Gage, was born of this marriage. Miss Gage is a member of the research staff of the Hercules Powder Company of Wilmington, Delaware.

A loyal husband and devoted father, Victor Gage was also an inspiring and provocative teacher, whose unique service to the University places him naturally among that august company to whom Cornell owes its enviable leadership among the major Universities of the United States.

C. D. Albert, W. C. Andrae, B. S. Monroe

Walter Galenson

December 5, 1914 — December 30, 1999

Walter Galenson, the son of Russian immigrants, was born in New York City. He graduated from Columbia University in 1935 and joined his father's accounting firm. But coming of age during the depression had given him a concern of the problems of workers and he returned to Columbia for a Doctorate in Economics, which he received in 1940. He then devoted his career to studying how workers fared in both rich and poor countries, advising governments and unions on how to improve labor conditions and teaching about the role of labor in economic development.

After working as principal economist in the War Department and Office of Strategic Services during World War II and serving as American labor attaché in Norway and Denmark during 1945-46, he returned to academia. He taught at Harvard and the University of California at Berkeley before moving to Cornell in 1966 where he was appointed the Jacob Gould Schurman Professor in the Department of Economics and the School of Industrial and Labor Relations. He spent the next 14 years on the faculty at Cornell and became a Professor Emeritus in 1980.

During his career, Professor Galenson held a number of visiting positions, including the Pitt Professor of American History and Institutions at Cambridge University. He was a Fulbright and Guggenheim Fellow, served as president of the Association for Comparative Economic Studies and was an advisor to the International Labor Organization's World Employment Program.

Former Secretary of Labor and Harvard Professor John Dunlop, a longtime friend of Professor Galenson, described him as "a prolific scholar of industrial relations, labor movements in Scandinavia, and American labor unions and their federations." His 28 published books included four volumes on American labor history, four on Scandinavian labor movements, three on labor in communist economies, six on comparative labor movements, and five on labor and economic growth in less developed countries.

His 1955 book, *Labor Productivity in Soviet and American Industry*, has been described by Professor Abram Bergson of Harvard as a "pioneering work, the first careful and systematic assessment of Soviet labor productivity." Another co-authored book of his, published in 1964 with Professor F.G. Pyatt of Cambridge University, was the first empirical study to demonstrate the importance of caloric intake, housing quality and other conditions of life for workers' productivity in developing countries.

Professor Galenson's scholarship was matched by his teaching. He was a popular and influential teacher. Labor economics underwent a transformation during his years at Cornell and in his last five years as an active faculty member at Cornell, he also played an important role in recruiting a new generation of scholars, many of whom remain on the faculty today.

Professor Galenson had a lifetime commitment to what his good friend, former President Clark Kerr of the University of California, called "social democratic" politics. He was proud to have sided with Professor Sidney Hook in the successful challenge to the Communist dominance of a teachers' union in New York City during the post World War II period. While in California, he was active in Democratic politics and the loss of a primary by a Democratic congressman to a member of what he perceived to be the "New Left" was a bitter blow to him. The disorders and the collapse of ordinary academic life that occurred at Berkeley when the New Left challenged the leadership of President Kerr in the 1960s disturbed him greatly and he welcomed the chance to come to Cornell.

Of course, Cornell was not immune to the events of the 1960s. Professor Galenson played an active role in resisting what he saw as trends destructive of academic values at Cornell. At the very end of President Perkins stay, he was a member of the committee that sought the President's ouster.

After his retirement from Cornell, Professor Galenson divided his time between Ithaca and Washington and he continued to do research. His last book, a study of Scandinavian labor markets, was published in 1998. His last article, on the Taiwan labor market, was published in 1999.

Professor Galenson loved music and was an avid opera and concert attendee. He resumed the study of the violin during his retirement years. One of the curious conjunctures between his musical and economics interests lay in exchange with one of the Soviet Union's top economists during the Cold War era. The Soviet economist could not easily obtain information on the prices of various U.S. goods. Professor Galenson regularly sent his Soviet colleague copies of the Sears catalog and in return his colleague sent him what is now a unique collection of Soviet recordings of classical music.

Professor Galenson is survived by his wife Marjorie, herself a retired Cornell Human Ecology Professor; three children, Emily Schneider, Alice Galenson, and David Galenson; and three grandchildren.

Isadore Blumen, M. Gardner Clark, Ronald G. Ehrenberg

Foster Lee Gambrell

October 31, 1900 — April 27, 1967

On April 27, 1967, Foster Lee Gambrell, Professor of Entomology at Geneva, suffered a stroke while at the LaGuardia Airport in New York City and died several hours later. Earlier that day he had presented a paper before the Eastern Plant Board.

Dr. Gambrell was born at Pendleton, South Carolina, October 31, 1900. He was reared on a farm. From his farm experience he learned of the hard work, long hours, and problems that are associated with farming, but he also learned of the satisfactions that come from growing things. This interest in plants and in their growth and protection appears to have been deep-seated; it saw specific application throughout his professional career.

Dr. Gambrell received his undergraduate education at Clemson Agricultural and Mechanical College, now Clemson University. Upon graduation in 1923, he registered for graduate work in the field of entomology at Ohio State University. He was awarded both the M.S. degree in 1925 and the Ph.D. degree in 1930 from Ohio State University. Dr. Gambrell was appointed to the staff of the New York State Agricultural Experiment Station in 1925 as an assistant in research. Subsequently, he advanced through the grades of associate in research in 1938—with a title change to Assistant Professor in 1942—Associate Professor in 1946, and Professor in 1956. At the time of his death, Dr. Gambrell had completed forty-two years of continuous service with the University on Cornell's Geneva campus. Scheduled to retire July 1, 1967, he had asked for and had been granted a one year's extension of his active-duty status.

Early in his career at Geneva, Dr. Gambrell assisted senior members of the staff in their research on pests of tree fruit. With his appointment to the research associateship, however, he was asked to assume research responsibilities for pest problems of nursery crops, cultivated turf, and woody ornamental plants. In this field he soon became the respected consultant of nurserymen, arborists, park officials, state and federal plant-regulatory officials, homeowners, and others. For many years he served as the unpaid consultant to the Boards of Public Works of Geneva and Penn Yan on the pest-control program that should be carried out to protect the shade trees of these cities.

An event took place in 1942 which did much to shape his professional career. This was the discovery of an infestation of the European chafer at Newark, New York—the first for North America. Dr. Gambrell was a codiscoverer of this infestation. The new pest presented problems not only of how to control it in established situations but also of

how to prevent or slow its spread to other areas. Dr. Gambrell became deeply involved in devising ways and means of meeting both of these objectives. Informed persons would agree that from about 1955 he became the leading authority on the European chafer. Certainly he was always a central figure in the innumerable conferences which were held to devise means of containing this introduced species.

An active member of the Entomological Society of America, he also claimed Membership in the American Association for the Advancement of Science, Sigma Xi, and Gamma Alpha. He published some sixty professional papers. These dealt principally with pest problems of nursery and ornamental plants and with the European chafer.

Perhaps Dr. Gambrell's fine personal qualities were best displayed in his handling of visitors who had a large or small pest problem in their lawn, shrub, or shade tree. For a research worker, such assignments fall into the extracurricular area, but Dr. Gambrell never gave a visitor that impression. He was invariably courteous, sympathetic, and attentive; and he was able to provide either a workable solution to the problem or to satisfy the individual that he should allow nature to take its course. From the amount of "repeat business" he received, his advice must have been sound, and his manner of imparting it, effective. He made many friends for the Geneva Station through this fine public service.

Dr. Gambrell's personal interests, aside from those concerning his immediate family, were largely in nature study. He shared this interest with his wife, a professional biologist in her own right. Their specific areas of interest were botany, ornamental horticulture, ecology, and ornithology. They took many trips and treks in pursuit of these interests, locally, in other parts of this country, and abroad. Dr. Gambrell was a skilled amateur ornithologist. He was long a member of the local bird club, the Eaton Bird Club and served several years as its president. Dr. Gambrell's other hobbies included gardening and photography.

He is survived by his wife, Dr. Lydia Jahn Gambrell, head of the Department of Biology at Keuka College; two sons, Foster Lee Gambrell, Jr., of Owings Mills, Maryland, Kenneth Carl Gambrell of Auburn, New York; two grandchildren and a brother, Fred M. Gambrell of Pendleton, South Carolina.

Dr. Gambrell will be missed by his many friends and colleagues, inside and outside Cornell.

S. E. Lienk, F. L. McEwen, P. J. Chapman

Horace T. Gardner

August 29, 1913 — December 15, 1970

Horace T. Gardner, M.D., died on December 15, 1970, in Puerto Rico.

Dr. Gardner was born in Albuquerque, New Mexico, on August 29, 1913. He received his B.A. degree from the University of New Mexico in 1935 and his M.D. degree from Yale University in 1941. After interning in medicine at the New Haven Hospital, Dr. Gardner served with the United States Medical Corps from 1942 to 1946. He rose to the rank of major and saw combat in the Far East.

He returned to Yale upon his discharge from the Army and there he finished his medical house staff training as an assistant resident. From 1946 to 1947 at Cornell University Medical College and from 1947 to 1950 at Yale University, Dr. Gardner held joint appointments as instructor in both medicine and preventive medicine. In 1950 he moved to Brookhaven National Laboratory where he was senior physician.

Dr. Gardner was appointed visiting lecturer in medicine at the Shiraz University Medical School in Iran in 1954. He was also named physician-in-chief of the Nemazee Hospital of the Iran Foundation in Shiraz. After five years in the Middle East, Dr. Gardner returned to the United States and entered private practice in New York City.

He was appointed assistant professor of clinical medicine at Cornell University Medical College and assistant attending physician at The New York Hospital in 1960.

Dr. Gardner was a member of Alpha Omega Alpha and a diplomate of the American Board of Internal Medicine.

Dr. Gardner was deeply interested in liver disease and wrote rather extensively about viral hepatitis.

Dr. Gardner never married. He is survived by his sister, Mary Gardner Warden, who resides in Carlsbad, New Mexico.

George W. Gorham, M.D.

Clara Louise Garrett

February 16, 1882 — August 14, 1964

Clara Louise Garret was born in Knox, Pennsylvania, and attended school in Oil City. She obtained a B.S. degree from Teachers College, Columbia University, in 1915 but did advanced work at many places and continued to study throughout the years. Two years were spent at the Pennsylvania Academy of Fine Arts where she later became a Fellow. She also studied at the Buffalo Art Students League, at the Art Students League in New York and took advanced work at Cornell University. Summer schools were attended in Chatauqua, Ogunquit, and Provincetown.

Miss Garrett spent two sabbatic leaves in Europe studying drawing, painting, and art history. During her last sabbatic leave she made a survey of art schools and drawing courses in the northeastern United States with special attention directed toward scientific illustration as taught at the Medical Schools of Johns Hopkins University and the University of Maryland.

Summers were utilized for travel, sketching, and painting in Jamaica, Costa Rica Bermuda and in many sections of our own country. One summer vacation she taught painting in the Panama Canal Zone.

Although she was skilled in the use of both watercolor and oil paints, water-color was her favorite medium and the one for which she is best known. Her work has been exhibited in New York, Philadelphia, Washington, Buffalo, Rochester, and in many regional art exhibits.

After three years of experience in commercial illustration early in her career, Miss Barrett came to Cornell in 1913 as an illustrator and assistant to Professor W. C. Baker in the New York State College of Agriculture. Upon Professor Baker's retirement in 1938 she assumed full responsibility for the freehand drawing courses offered by the Department of Floriculture and Ornamental Horticulture. In 1923 she was made Assistant Professor and in 1946 Associate Professor of Freehand Drawing.

The drawing courses in the College of Agriculture were established to aid students in illustrating their own reports and publications. Miss Garrett's insistence that thoughtful, analytical observation is the first step in drawing made her classes a training ground for careful observation. Under her guidance many students in the natural sciences discovered the value of drawings as a helpful tool in their laboratory problems and research. Also her love and appreciation of art were infectious. She considered interpretive response to experience to be the ultimate goal of artistic expression, and the standards she set in the advanced courses were challenging. Her own professional skill,

her energy, the warmth of her personality, and her wide knowledge of art and its history commanded respect and made her a stimulating teacher. Clara Garrett will be remembered by her many students and friends as an alert, responsive person with extensive knowledge in an unusually large number of fields. History vied with art for her attention. Next came travel, literature, drama, music, and natural history. She read widely in all of these areas. Since she was articulate, had a remarkable memory, and was a thinking individual, she opened new channels of thought for many students whose contacts with the humanities were necessarily limited by the pressure of work in vocational subjects. Her lively curiosity about the world and its inhabitants kept her mental horizon expanding all her life. As a consequence, many of her friends found their own views broadened by their association with her. As part of her teaching duties Miss Garrett organized and taught a rural art group for residents of Brooktondale and Slaterville, a new venture in the College extension courses. She was also chairman of the first Cornell Rural Art Exhibit held during Farm and Home Week and a member of the Ithaca Art Week Committee. From the time of her retirement in 1949 Miss Garrett was handicapped by impaired eyesight, but her spirit was indomitable and she continued to be active within the Ithaca community. She was a member of the League of Women Voters. She gave generously of her time and skill as a leader in the Art Study Groups of the American Association of University Women, the Ithaca Women's Club, and the Cornell Campus Club. The book clubs, music groups, and the drama groups of these organizations also profited from her active participation. Miss Garrett's death leaves a void in the community that will be hard to fill. The solidity of her educational background, the integrity of her character, her alert and inquiring mind, the thoroughness with which she delved into each new subject, and the spontaneous enthusiasm with which she shared the results of her inquiries all combined to make her teaching and her community leadership in the arts memorable and outstanding.

R. J. Lambert, E. L. Burckmyer, L. H. MacDaniels

Seymour Stanton Garrett

May 24, 1880 — February 13, 1947

Seymour Stanton Garrett, World War Memorial Professor of Industrial Economics, died suddenly at his home on February 13, 1947 after thirty years of distinguished service in the College of Engineering.

Born on May 24, 1880, at Knox, Pennsylvania, he attended public schools there as well as South Trenton, New York and Oil City, Pennsylvania. Upon graduation from high school, he spent two years with the City Engineer of Oil City, Pa., before entering the College of Civil Engineering at Cornell University in September, 1900. After graduating with the degree, Civil Engineer in 1904, he spent a half year as a surveyor on the Mississippi Rivet Improvement Project and a year and a half as a designing engineer for the Great Northern Portland Cement Company, at Marlboro, Michigan.

He returned to Cornell in 1906 as an instructor in Civil Engineering. Except for the two years, 1908-1910, when he was Assistant Professor of Civil Engineering at Swarthmore College, he served Cornell until his death. He was Assistant Professor of Mechanics of Engineering from 1910-1919, Professor of Mechanics of Engineering from 1920-1932, and was appointed World War Memorial Professor of Industrial Economics in 1932. He carried on considerable graduate work at Cornell and Columbia Universities largely in the field of economics which finally became his major interest.

During the first World War, he served as a Captain first in the Engineers Corps and later in the Tank Corps which at that time was very new. He maintained a constant interest in military matters. During the second World War, he organized and directed a training program for civilian ordnance inspectors given at Cornell. The Civil War was one of his side interests and he was a diligent student of the many campaigns.

Since 1932, he was a tower of strength in shaping the program leading to the B.S. in A.E. degree. A man of wide interests, well read in many fields, with a lot of imagination balanced with good common sense, his counsel and judgment were sought on many problems. He served as Acting Head of the Department of Administrative Engineering from 1943-1946, even though failing health would have made it more prudent to forego some of the administrative chores.

His colleagues always sought his advice and valued highly his sound appraisal of economic conditions. He was always the willing worker. No job was too big nor the task too long. Regardless of the demands on his time, he

would take on more work. Although he took his work seriously, he had that needed sense of humor to break monotony and drudgery.

Professor Garrett was very sincere and earnest. A true scholar who would stand by his convictions, his companionship and fellowship was a joy to all who knew him. His contributions to his department and school were many, for he had an active interest in education and in the personal interests of his students. He was always striving for ways and means of improving our educational methods. His passing was a genuine loss to his many friends, associates and former students.

G. R. Hanselman, H. J. Loberg, H. L. Reed

Carl Witz Gartlein

November 13, 1902 — December 20, 1965

It would have been fitting had the northern sky been aglow over Connersville, Indiana, on November 13, 1902, when Carl Witz Gartlein was born. For the boy who humbly watched and pondered the soft and undulating northern lights over his native Indiana was to become one of the outstanding authorities on the aurora borealis.

But his active interests were far broader than auroral research. He was a warm and generous colleague in any endeavor. He loved ideas, and he loved to help make things work. His interests included whatever anyone around him was doing or wanted to do. Especially it may be said fondly that the work of hundreds of graduate physics students in Rockefeller Hall, from the late 1920's to the mid-1950's, would have been less effective and far less fun were it not for the calm, cheerful, companionable assistance freely given at any time by Carl Gartlein.

After graduation from DePauw University in 1924 he came to Cornell and in 1929 was awarded the Ph.D. degree. He then joined the Cornell physics faculty where he remained, refusing many enticements to greener pastures, until his death at age 63.

His doctoral thesis was a study of the arc spectrum of germanium (i.e., optics, light, and spectroscopy) and rather well encompassed the dominant area of experimental physics research at Cornell at that time. However, to this extensive expertise he quickly added a broad pioneering knowledge of electronics and its application to Cornell research both within and beyond the bounds of Rockefeller Hall. But more, he was fascinated with, and made it a point to be knowledgeable about, all sorts of new and expanding techniques in experimental research in general—note the variety of official titles he held: Instructor, Curator, Superintendent of Technical Service Personnel, and Technical Advisor for Research and Facilities, all before his final title of Associate Research Professor of Physics and Director of the World Data Center A for Visual Aurora.

Highlights of his auroral research: In the middle 1930's he organized the first systematic observations of aurora, using the volunteer help of dedicated amateurs (including airline pilots who observed the upper sky when the lower sky was overcast). In 1939 he designed, built, and put into operation the world's fastest auroral spectrograph. This instrument, installed in the upper reaches of his spacious barn at his farm home north of the Cornell campus, was enthusiastically manned at all hours of the night by himself, his wife Helen, and later by his son Christopher.

Gartlein's barn, away from the sky-scattered light of the City of Ithaca, was to become an internationally famous auroral observatory. To the fast spectrograph was soon added another innovation, the all-sky camera, for continuous photography of the aurora. About this time he also set up and coordinated the simultaneous observations from several strategically located stations in New York and Canada; with the spectrographic triangulation measurements that this network of simultaneous observations provided, he carried out the breakthrough-proof that hydrogen atoms do enter the earth's atmosphere during an auroral display. When the International Geophysical Year was proposed for 1957, his pre-eminence in auroral work led to the establishment at Cornell of the World Data Center A for Visual Aurora. Finally, in his last five years, he developed a television pickup camera for studies of extremely faint auroral displays, a device that significantly extended the power of his arsenal of auroral instruments-

For about ten years he operated at Cornell a training program for observers throughout the world in the use and maintenance of the fast spectrograph, the all-sky camera, and then the television camera extension. Responsibilities as trainer and as the Director of the Center for systemization and codification of World-wide observations were his main activities at the time of his death.

He was a member of the Phi Beta Kappa and Sigma Xi honorary societies, and of these technical societies: the American Physical Society, the Optical Society of America, the American Geophysical Union, and the American Association of Variable Star Observers. He served on numerous national and international committees: the Optical Standards Committee of the National Bureau of Standards, the subcommittee on the Upper Atmosphere of the National Advisory Committee for Aeronautics, the Aurora and Airglow subcommittee of the U.S. National Committee for the IGY, the Auroral Atlas subcommittee of the International Association of Geomagnetism and Aeronomy, the Aurora and Airglow Advisory Committee to the Arctic Institute of North America, the Aurora Committee of IAGA, and the Upper Atmosphere subcommittee of the Committee on Polar Research of the National Academy of Sciences. And he was the Auroral Reporter for the U.S.A. for the International Quiet Sun Year. As expected, he traveled extensively in pursuit of his investigations and in his committee representations; he is as well known in New Zealand, Russia, Alaska, Antarctica, and Norway as he is in New York State and Washington, D.C. He wrote numerous technical papers and received numerous honors, including an honorary D.Sc. degree in 1965 from Colgate University where one of his network auroral stations is located.

This account, preponderantly concerned with his professional life, would be amiss were it not to include mention of at least three of his other life-long interests: his church—he was senior warden in St. John's Episcopal Church in

Ithaca; the public schools—he was a member of the South Lansing School Board; and fishing—he knew intimately how best to live with the local lakes and streams.

Brief mention was made above of his wife, the former Helen Hart, who is on the staff of the Cornell Auroral Data Center, and of his son, Christopher C, who continues to live at the farm home and to help operate the auroral observatory. He is also survived by two daughters, Mrs. Geoffrey (Caroline) Cook of Thornhill, Ontario, and Mrs. Jonathan (Delight) Bosworth of Marlboro, New Hampshire, and by six grandchildren.

Paul L. Hartman, R. William Shaw, Lyman G. Parratt

Charles Donald Gates

November 22, 1914 — July 6, 2004

Charles Donald Gates, Professor Emeritus of Environmental Engineering, died July 6, 2004 in Williamsburg, Virginia, at the age of 89.

Professor Gates, whose special field of research was water quality phenomena, received a presidential citation in 1971 for his “efforts to combat water pollution on Cayuga Lake.” He was commended for giving of his time and talent as a member and vice chairman of the Cayuga Lake Basin Planning and Management Board. As a board member, the citation said, Professor Gates had “guided the planning for the future development of Cayuga Lake.”

A native of Ashburnham, Massachusetts, Don was born November 22, 1914. After earning a Baccalaureate degree at Williams College and a Master of Science degree at Harvard University, he worked as a civil engineer with the U.S. Army Corps of Engineers in New Hampshire until he entered the U.S. Army in January 1942.

Don spent four years on active duty at the Army Chemical Center in Maryland, where he did research and development work in the detection and removal of toxic agents from water. He returned to civilian engineering activities as the head of the Distillation Test Section of the Engineering Research and Development Laboratories in Norfolk, Virginia, where he carried out desalination studies.

Don came to Cornell in 1947 as an Assistant Professor of Sanitary Engineering and was promoted to Professor of Environmental Engineering in 1959. He served as head of Sanitary Engineering from 1957-66, chairman of Water Resources Engineering from 1967-72, and chairman of Environmental Engineering from 1972-74. He was instrumental in overseeing the extension of the scope of Environmental Engineering within the School of Civil Engineering by championing its role in environmental and water resources systems engineering. For many years, he played a primary role in providing summer short courses for training water treatment plant operators in New York State. He directed the Center for Environmental Research from 1976-77. Within the College, Don supported the implementation of the undergraduate “college program,” and the teaching of economics with the College. Don retired as Professor Emeritus in 1980.

Professor Gates was active in Ithaca community water and wastewater planning and management as a member of the Tompkins County Water Supply Committee and as chairman of the Greater Ithaca Sewerage Study Committee.

He worked and consulted with the New York State Department of Health, United States Public Health Service, the Federal Water Quality Administration and the Tennessee Valley Authority.

After 33 years in Ithaca, Don and his wife Shirley moved to Virginia in 1980 to enjoy life on the shores of the Chesapeake Bay, but they both maintained an active interest in Cornell and Ithaca and visited many times over the years.

In addition to his academic interests, Don was an enthusiastic gardener, well known for his magnificent garden at his Ithaca home on Texas Lane. He continued to enjoy his hobby in Virginia for many years much to the benefit of his neighbors who were the recipients of his garden's bounty. Don was fond of his high-fidelity audio equipment and for a time participated in wine-tasting events with a definite leaning toward New York State vintage. Don's well-known love of his family was reflected in his compassion, nurturing and fatherly advice to the many students whom he helped to succeed at Cornell. He will be long remembered as a dedicated teacher and advisor, a respected colleague and a good friend.

Don's wife, Shirley; three daughters, Nancy Gates, Karen Konefal, and Betsy Dahlke; and five grandchildren survive him.

James J. Bisogni, Louis M. Falkson, Simpson Linke, Walter R. Lynn

Paul W. Gates

December 4, 1901 — January 5, 1999

Paul Wallace Gates, the John Stambaugh Professor, Emeritus, of History, was born in Nashua, New Hampshire, the son of a Baptist minister, grew up in Maine, and graduated from Colby College in 1924. He received his Master's degree at Clark University, and his Ph.D. degree at Harvard University in 1930, after a year at the University of Wisconsin.

Gates taught at Cornell for thirty-five years, coming to Ithaca from Bucknell University in 1936 as an Assistant Professor and retiring in 1971. He was Goldwin Smith Professor of American History from 1950-59, before occupying the Stambaugh chair. During his Cornell career, he also taught as a Visiting Professor at Harvard and the University of Wisconsin, among other universities. He also held a number of distinguished national fellowships, and spent a year as a visiting scholar at the Henry E. Huntington Library.

Gates focussed his research on the development of the American west, particularly the nation's land distribution policies. He wrote ten books, edited four others, and published seventy-five articles, book chapters, and other scholarly essays, attracting much attention, and then renown, as his generation's leading historian of his subject. His first book, *The Illinois Central Railroad and its Colonization Work* (1934), based on his doctoral dissertation, won the David A. Wells Prize at Harvard. This was followed by studies that are classics of their genre: *The Wisconsin Pine Lands of Cornell University: A Study in Land Policy and Absentee Ownership* (1943); *Fifty Million Acres: Conflicts Over Kansas Land Policy, 1854-1890* (1954); *The Farmer's Age: Agriculture, 1815-1860* (1960); and others, culminating in his *magnum opus*, the 828 page, *The History of Public Land Law Development* (1968), a work undertaken at the behest of the Public Land Law Review Commission, an agency of the federal government seeking to evaluate and plan the course of America's future land distribution and conservation policies. As recently as October 1998, a panel of scholars at the Annual Meeting of the Western History Association extolled the merits of this magisterial volume before an enthusiastic audience of both young and mature scholars.

Gates's publications spanned the years from 1931-96, when he contributed an autobiographical sketch to a collection of his writings. His work fundamentally reshaped our understanding of how the western United States developed within the orbit of free wheeling capitalism that had little sentimentality or commitment to what Gates believed was originally intended to be a "democratic system of land disposal." In a recent review, Professor Walter Nugent of Notre Dame wrote that "Gates's corpus is one of the greatest in American historical scholarship in this century."

Gates was a single minded professional whose work habits were extraordinary. He frequently was the first person in Olin Library in the morning and often among the last to leave at night, Saturday, and usually, Sunday, included. He appeared there each day well into his nineties, working away in his fifth floor study. His productivity and increasing recognition brought him many professional honors including the Presidency of the Mississippi Valley Historical Association, the national professional society of American historians, in 1961-62. He was also the President of the Agricultural History Society, and held high office in a number of other professional organizations.

In the classroom, Gates taught well attended undergraduate courses on the American West with a booming voice that at first frightened everyone within earshot, but he particularly excelled as a graduate teacher and mentor. His seminars were famous for their intensity, rigor, and the superb work produced in them. He encouraged his students to take interdisciplinary graduate fields ranging from agricultural economics and rural sociology, to government, and city-regional planning. He directed 23 doctoral dissertations at Cornell and many of his students went on to distinguished careers of their own; several, like their mentor, attained the highest reaches of the profession.

Professor Gates chaired the History Department for ten years, from 1946-56, (and served again, as acting chair in the Spring of 1963). He took an active role then, and subsequently, in the buildup of the department from a quite small group pursuing a limited range of subjects to its eventual much larger size and command of a much broader field of historical knowledge. He also played a vigorous role in expanding the Cornell library's collections in American history and led the efforts to establish the regional history research collection in Olin.

Although he preferred the classroom and the library to any other venue, for years Professor Gates participated in an interdisciplinary lunch with colleagues from across the campus, seated daily in a large alcove at one end of the old Faculty Club. They always found, he later remembered, a great deal to disagree about. He served a term as Secretary of the University Faculty (1957-60), and was asked to be a candidate for the Dean of the Faculty, an honor that he declined in order to return to his teaching and research.

Always interested in public affairs, Gates was a life long political activist, civil rights advocate, and ardent civil libertarian. He served in the Agricultural Adjustment Administration during the New Deal, testified as an expert witness in Indian land claim cases, helped lead the New York State branch of the Progressive Party in 1948, and spoke out in the cause of conservation. He took the lead in the founding of a consumer cooperative in Ithaca and served for many years as Secretary of the Varna volunteer fire department.

Gates was married for more than sixty years to Lillian Cowdell Gates whom he met in graduate school and who pursued a scholarly career of her own, publishing several books and articles, alone and in conjunction with

her husband. They had four children and seventeen grandchildren. Lillian Gates died in 1990. Professor Gates subsequently married, in 1991, Olive Lee, a retired college librarian, who survives him. He died in Oakland, California where he lived in brief retirement.

Joel H. Silbey, Walter F. LaFeber

Jack Charles Geary

September 29, 1920 — February 18, 1992

Jack C. Geary, Professor Emeritus in the College of Veterinary Medicine, died at home in Ithaca on February 18, 1992 at the age of 71.

Born in Hornell, New York, he lived most of his life in New York State. Jack married Dorothy Gibson in 1943 and they have two sons, David of Ithaca and Richard who lives in St. Thomas, Virgin Islands with his wife Denise and their two daughters.

During World War II Jack served as an instructor pilot in the U. S. Army Air Corps and was honorably discharged a Captain in 1945.

Professor Geary received his veterinary training at Ohio State University, graduating in 1951. While a student he worked as an assistant and following graduation as an associate of Dr. J. H. Knapp, one of Ohio's outstanding veterinarians. Following this he came to Cornell University where he served as Director of the New York State Veterinary Diagnostic Laboratory. Dr. Geary had a deep and enthusiastic interest in radiation medicine; and following graduate studies in radiology at Cornell, he was appointed to the faculty as Assistant Professor of Radiology in the Department of Large Animal Medicine, Obstetrics and Surgery. He left Cornell in 1960 to serve as Associate Professor of Radiology at Kansas State University and, subsequently, a similar position at Auburn University, Auburn, Alabama.

He returned to Cornell in 1966 as Associate Professor of Radiology and became a Full Professor on July 1, 1969. He retired in 1976, but returned to serve half-time as a faculty member from 1981-1983. Until one month before his death Dr. Geary served as an active consultant to individual practitioners and to the Orthopedic Foundation for Animals and the American Animal Hospital Association. His work was a major factor in reducing the incidence of hip dysplasia in dogs. He authored over 25 scientific papers on subjects related to radiology. Subsequent papers reflected his interest in linear tomography and imaging of spinal diseases, particularly traumatic injuries. Professor Geary was a meticulous worker who accumulated an extensive collection of radiographic slides that cover all subjects of veterinary radiology. These remain as a priceless teaching library for today's students.

Jack Geary was a keen, personable, experienced radiologist. He was an excellent teacher who liked students and was deeply interested in their welfare. He was a well-liked, cooperative team member with a ready wit, a broad smile and a willingness to be helpful to all.

Jack was a skilled craftsman who was admired by colleagues as a master technician-engineer in addition to his attributes as a professional radiologist. When the Section of Radiology was in its infancy, Jack as its head went beyond ordinary expectations of a faculty member by building, repairing and improvising until funds were available to select the state-of-the-art equipment he needed.

He was a talented artist, photographer, radio ham (WA2SYW), cabinet maker and inventor.

Professor Geary was elected to membership in Sigma Xi, Phi Kappa Phi and Phi Zeta honor societies. He was a diplomate of the American Board of Veterinary Radiology and served as its president in 1971. He was also a member, and president of the American Veterinary Radiology Society and the Educators in Veterinary Radiologic Science. Reflecting wider interests, he was also an active member of the Southern Tier Veterinary Medical Society, the New York State Veterinary Medical Society and the American Veterinary Medical Association.

Jack Geary was a pioneering radiologist who will be missed by his many friends and colleagues.

Nathan L. Dykes, Francis H. Fox, Robert W. Kirk

John C. Gebhard

May 18, 1898 — August 11, 1992

Jack Gebhard, professor of civil engineering, emeritus, died on August 11, 1992 at McLean, Virginia. He had enjoyed good health and mental vigor until a few days before his death. His wife, Jean Hall Gebhard, Cornell '19, died in 1986.

Jack's father immigrated to the United States from Germany, his mother from Hungary. They settled in New York City where his father became a stationary engineer. Jack was born in Manhattan, attended Stuyvesant High School, and received a four-year scholarship to Cornell in 1915. In 1919 he graduated with the degree of Civil Engineer, finishing first in his class and winning the Civil Engineering School's coveted Fuertes medal.

Jack had two careers. He spent the first two-thirds of his professional life as an officer in the United States Navy and the last third as a member of Cornell's Civil Engineering Faculty.

In 1921, after an engineering apprenticeship in the Bethlehem Steel Corporation, he competed for, and received, a commission as Lieutenant (jg) in the Civil Engineer Corps of the Navy. There followed tours of duty in Naval installations throughout the United States, the Virgin Islands, and the Philippines. His work was in planning, design, construction, and operation of the Navy's shore establishment. During World War II, as a senior Captain in the Corps, he supervised the construction of the vast Sampson Naval Training Center, airfields, docks, and submarine base in Puerto Rico, and a network of airfields for the Pensacola Naval Air Training Base. After the War he had a tour as design manager in the Navy's Bureau of Yards and Docks.

Jack retired from the Navy in 1949 and in the same year returned to Ithaca to join the faculty and teach construction engineering and administration. He retired as professor emeritus in 1965.

The post World War II years in the Engineering College were a time of change. The five-year undergraduate program was being developed in all its schools. In Civil Engineering the character of the faculty was changing as older men retired and were replaced by young ones of a different breed, and the School was moving to revitalize graduate and research programs that had languished in the war years. Jack was the oldest of the new men, and both old and new were fortunate to have him for he soon proved to be a voice of reason and maturity in the clash of academic generations and cultures. His professional credentials were impeccable. And he had the qualities that the best military officers seem to have: knowledge and respect for order and rules, and the wisdom to know when to overlook the rules.

He was a true teacher, both for his students and younger colleagues. He spent long hours in personal talks with each. But he instructed and helped without forcing his will, ideas or methods. His calm and assured approach to problems inspired them to try to set their own goals for personal progress.

Jack always stressed the need for both “specialists” and “generalists” in the practice of civil engineering. The group in Construction Engineering and Administration that he headed was charged with helping students understand elements of the general business of civil engineering that are essential to the success of any specialized technical project. When he came, the group was behind the times. Much of his Cornell career was devoted to trying to find ways to make it responsive to evolving professional needs and, at the same time, to maintain a respected place for it in a faculty of increasing specialization. Time ran out on him however. After he retired the effort ceased, victim of changing educational objectives. His group was disbanded at about the same time, but twenty years later the void left by its absence was apparent and the case was again taken up by the establishment of an Engineering Management program in Civil Engineering. As in many cases, the vision and the contributions of an individual become clear only in retrospect.

Jack was a successful man. The features which accounted for his success were his orderly mind, scholarly bent, devotion to duty and gentility in his relations with people. But he was also a keen, energetic individual who moved decisively. His accomplishments in the differing roles of naval officer and university professor are a tribute to his adaptability and reasonableness. He was capable of great institutional loyalty. The National Anthem and the Cornell Alma Mater held great meaning for him.

Jack had strong convictions about community responsibility. He was at heart an environmentalist before the movement gained public support. His service as chairman of the Cayuga Heights Zoning Board of Appeals drew accolades from Mayor Marcham. His neighbors knew him as an individual of great warmth once his natural reserve was laid aside. He had a green thumb and his lawn was second to none. The squirrels and blue jays at his bird feeder offended his sense of fair play. He was for the little guys, the chickadees and nuthatches that frequented the rhododendrons in his back yard. Hence the electric grid he devised to study the conditioned reflex of animals in response to electric shock. This was the sum of Jack’s inconsiderateness.

Even simple neighborhood matters were deserving of careful deliberation. Jack concluded that in a friendly neighborhood not everyone need own a wheelbarrow, extension ladder, and the like. His were available, always in good order, and neatly stored. Upon moving to Virginia in 1970, he left the barrow and appointed a neighbor

its custodian, to continue it in neighborhood service. Over the years this came to represent and symbolize Jack's spirit of sharing and of being a good neighbor, always with modest reserve and gentility.

Throughout both careers, Jack had the steadfast support of his wife Jean, a wise, charming, considerate person. Their devotion to each other found expression in many ways including poems and love notes that continued until her death.

Jack was not a church goer, but he left one with the feeling that here is a spiritual man. At his request, the only service for him was a family one at the Arlington National Cemetery. But two years before his death he wrote the rector of New York's Saint Georges Church to express appreciation for the help the church school had given him to "get started in this world" seventy five years earlier.

Jack is survived by his son John, Cornell '51, three grandchildren and seven great-grandchildren. He rendered over four decades of distinguished service to the Navy and to Cornell. The tradition of both institutions has been enriched by Jack's influence as have a host of friends. He will be remembered for his accomplishments and his integrity, inquiring mind and warmth of personality.

Jack Rogers, Edward Smith, William McGuire

Roger Loran Geer

June 10, 1906 — April 11, 1979

Roger Geer served the Sibley School of Mechanical and Aerospace Engineering zealously for over thirty years. His discipline, materials processing, altered very markedly in direction and emphasis during that time but he never failed in thoroughly and cheerfully adjusting his teaching and technical involvement to the extensive curricular changes that were occasioned.

Professor Geer was a “nearby” boy if not exactly a local one, being born in Marathon, New York, and graduating from the town high school in 1924. He entered Cornell and was awarded his Master of Engineering degree in 1930, having studied industrial engineering within the mechanical engineering program. For a number of years following graduation, he worked in Cleveland and Chicago in the areas of production control and methods engineering until in 1939 he returned to Cornell with the post of instructor in engineering drawing. During the war years he created a gage laboratory and organized and taught courses in workshop procedure and inspection methods for trainees. He became assistant professor in 1943 and was promoted to associate professor in 1946. In the years immediately following the war, he continued his development of inspection and gaging techniques, and presented several papers to national societies. In addition he contributed a chapter on these topics to a handbook on measurement organized by the Instrument Society of America.

The 1950s saw a drastic change take place in the concept of materials processing in the engineering curriculum. Complete automation and numerical control of machine tools became commonplace in industry and the necessity for the engineer to have a detailed and practical knowledge of metal-forming techniques gave way to a requirement for a deeper knowledge of the basic mechanisms of processing materials of all kinds and the application of atomic and molecular physics and chemistry to the whole field. Professor Geer was kept busy in what seemed to be a continuous reforming of curricula, laboratories, and experimental techniques, and these he handled in his customary meticulous and painstaking manner.

During the later years of his career, Roger Geer was in demand by industry as a consultant. He developed and taught courses given to such nearby plants as those of the General Electric Company in Johnson City, the Universal Instruments Corporation in Binghamton, and the Ingersoll Rand Corporation in Painted Post. He designed, built, and tested several novel machines and devices, notably a machine for testing mineral artifacts for cutting capabilities, a milling dynamometer for use in torque-thrust drilling and tapping experiments, a numerical

simulator for use as a teaching aid, and a mechanical dynamometer for planer-type cutting. In 1968 he was made professor of mechanical engineering.

Professor Geer was very active in technical societies within his professional field: the Instrument Society of America (ISA) of which he was national chairman of the Inspection and Gaging Committee from 1946 to 1950; the American Society of Mechanical Engineers (ASME), which he joined as a student and later as a member of the Southern Tier Section when he returned to Cornell; and the American Society of Tool and Manufacturing Engineers (ASTME). His membership in this last-named organization demonstrates very clearly his dedication to unselfish service in his participation for more than twenty years in promulgating and promoting the objectives of the society, particularly its educational aspects through publications and advice to student chapters in New York State. He joined the Elmira chapter in 1949 and was a charter member of the Ithaca chapter and instrumental in its formation in 1959. He served as chairman of the chapter in 1961. From 1962 to 1964 he was a member of the national education committee and field editor of the ASTME journal. He served as chairman of the Technical Publications Committee and as editor and publisher of a monthly newsletter for thirty chapters of Region II of the society. This by no means exhausts a list of his services to the society, and he was recognized for his efforts with a National Award of Merit in promoting manufacturing engineering; with his name on a plaque at society headquarters for his personal contributions; and at the end of his career in the year of his retirement, with the 1971 Education Award.

One of his special professional interests was in the program for materials processing at Hampton Institute, where over a period of three years in the late 1960s he acted as consultant in organizing curricula in manufacturing and materials and lectured to students and to faculty. His outside interests were in environmental concerns such as conservation, reforestation, and ornithology, but most particularly in mineralogy (especially in locating rocks and gems which he worked and polished into a variety of delightful pieces of jewelry and ornamentation). He was active in the Tompkins County Gem and Mineral Club and the local Paleontological Research Institution, particularly in devoting much time and effort in encouraging and helping young people in getting started in rock collecting.

Roger Geer was characterized by his meticulous manner of carrying out his duties and by his lifelong willingness to help people in any way he could, either through his professional knowledge or simple goodwill. After his retirement in 1971, he was occupied by a multitude of volunteer activities, varying from using his engineering

ability to aid handicapped people and advising on courses in the local vocational schools to simple telephone-sitting and transportation of the elderly.

Roger Geer will be missed by a great many people both within and without the Cornell community.

George R. Hanselman, Kuo K. Wang, Dennis G. Shepherd

Harrison A. Geiselmann

January 11, 1920 — September 3, 2003

Harrison A. Geiselmann, Professor Emeritus of Education, was born in New York City on January 11, 1920, eight minutes after his identical twin brother, John. He attended elementary and part of junior high school in New York City where, at age eleven, he and his twin brother played the violin at a concert in Carnegie Hall highlighting promising young musicians. Later, he would woo his girlfriend, Audrey Rowell, by serenading her family with that same violin. His family moved to Franklin, New York where he graduated from high school in 1938, lettering in basketball, football, baseball, and track. It was in this beautiful region of upstate New York where he learned to love trout fishing in the many nearby streams. A teacher, recognizing Harrison's artistic and academic potential, encouraged him to take another year of high school, where he completed all of the necessary college preparatory classes, then applied for and received a full tuition scholarship to Syracuse University's School of Architecture. Three weeks into his senior year at Syracuse, he was called into "Uncle Sam's Army". He was selected for the Army's Specialized Training Program (APST) at Fordham University; but the Army was in such great need of infantrymen that it terminated the program, and Harrison became a parachute rigger. He was transferred to the European Theater as a medic, where he later was wounded, then recovered and resumed active duty. After V-Day, during a furlough before being transferred from the European Theater to the Pacific, he went home and married his high school sweetheart, Audrey Rowell, with whom he enjoyed a fifty-eight year love affair and friendship, until his passing.

After his honorable discharge in 1945, he returned to upstate New York and entered Hartwick College, where he completed a Bachelor of Science degree in Mathematics in 1947. He began teaching high school mathematics and coaching basketball at Unadilla Central School in nearby Unadilla, New York. He and his twin brother, John, played town team basketball, outwitting the competition with skill and look-alike confusion. He began working on his Master's degree at Syracuse University, completing it in 1962. Unbeknownst to Harrison, the chairman of his Master's program at Syracuse recommended him for a Ph.D. fellowship at Cornell University with the responsibility for developing a Mathematics and Mathematics Education curriculum for the College of Agriculture, now known as the College of Agriculture and Life Sciences. In the fall of 1952, he moved his wife, Audrey, and newborn baby, Nancy, to Ithaca, where he began the doctoral program at Cornell's School of Education, completing his Ph.D. degree in three years. Once again, a teacher recognizing his potential led him to a

wonderful opportunity, and a long and satisfying career at Cornell. He joined the faculty as an Assistant Professor, rose to the rank of Professor, and was awarded Emeritus status in 1985.

Harrison was an active member of the Association of Mathematics Teachers of New York State (AMTNYS), serving as editor of the New York State Math Teachers journal from 1968-72, the organization's president from 1972-73, and long-time contributor of a regular journal article entitled "Have you tried this?" At Cornell, he oversaw the publication of several handbooks and study guides in mathematics and served as Graduate Faculty Representative. In 1985, he won the prestigious SUNY Chancellor's Award for Excellence in Teaching. He never lost his love of sports, being a dependable fan at Cornell sporting events, especially football, basketball, and hockey. He started canoeing and cross-country skiing at age 52 and, after a forty or fifty year hiatus, once again began playing tennis and violin at the age of 70.

Professor Geiselman had a keen sense of humor, and loved to bring humor into his mathematics classes, which resulted in an unforgettable incident. One day his identical twin brother, Johnny, visited the campus on a day when Harrison taught a large class at 8:00 in the morning. Soon after the students took their seats, Professor Geiselman began his lecture. After a few minutes, another Professor Geiselman walked through the door and up to the podium. Two Professor Geiselmanns! The class was in hysterics, having no prior knowledge of his identical twin. Many of the Cornell hockey team players took his class, so he enjoyed following the careers of the former students who continued to play pro hockey. In the last year of Harrison's life, he had the pleasure of watching Joe Niewendeik, his former student, play his last year of pro hockey—a long and rewarding career for both.

In his retirement, Harrison and his wife, Audrey, began spending increasing amounts of the wintertime in Englewood, Florida, and left Ithaca completely in 1994. They spent summers in Lancaster, Pennsylvania near their daughter, son-in-law, and granddaughter, and eventually moved to Florida full time in 2000. While in Florida, Harrison started a "new career" at Park Forest in Englewood. He developed a Henny Youngman-style comedy/violin routine that he performed in the yearly Park Forest Broadway show for nine years. He and Audrey also sang in the show's chorus every year. After the success of the routine, he was always asked to tell a joke, wherever he was, so he prepared by studying joke books regularly, and memorizing a litany of jokes so he could always be prepared. He became the most well-known and beloved person at Park Forest. His truly was a life well lived. He passed away on September 3, 2003; he would have liked the mathematical relationship between the numbers in the date, $9 = 3 \times 3$.

Harrison is survived by his wife, Audrey, who lives in the Highlands Retirement Community in Wyomissing, Pennsylvania, and his daughter, Nancy Geiselman Hamill (B.A., Arts '74), and granddaughter, Karen Hamill, in Reinholds, Pennsylvania.

Mark A. Constas, Verne N. Rockcastle, Susan Piliero

Sidney Gonzales George

August 8, 1878 — July 21, 1940

The sudden passing away of Professor George at his home, 118 East Falls Street, on July 21, 1940, was a severe shock to his many friends and associates, since few knew that all was not well with him. Succeeding the late Professor Irving Porter Church, Professor George had been head of the Department of Mechanics of Engineering since 1916 and his death is a heavy loss to the School of Civil Engineering, the more so because it follows so closely the death of Professor Ernest Rettger of the same department.

Sidney George was born in Astoria, Oregon, on August 8, 1878, the son of Thomas Crosslett and Anna Christine George. He was educated, however, in the East and began his career as a teacher at the age of seventeen after completing three years of academic and teacher's training at the Frewsburg Union School at Frewsburg, New York. He taught two years in country schools at Sherman, Dentons, and Oak Hill, New York, and then took four years at the Fredonia (New York) Normal School, including two and one-half years more of teacher's training with practice teaching. He then entered Cornell University as a freshman in the College of Arts and Sciences, in 1901, but after one year transferred to the College of Civil Engineering, from which he was graduated in 1905 with the degree of Civil Engineer.

Appointed instructor in Civil Engineering upon his graduation in 1905, Professor George served Cornell continuously until his death, except during the year 1907-08, when he was engaged in active practice as an engineer. He was made Assistant Professor of Civil Engineering in 1908, and Professor of the Mechanics of Engineering in 1916. He also taught in summer sessions and in summer camps conducted by the School of Engineering.

His practical experience included one summer, 1905, as draftsman on the New York State Barge Canal at Delta and Hinckley, New York; part-time estimating for the late Professor Charles Lee Crandall on the construction of Goldwin Smith and Rockefeller Halls during the two years of his instructorship; one summer, 1906, on inspection for the United States Reclamation Service at Corbell, Wyoming; one year, June 1907 to January 1908, and April to October 1908, as resident engineer on sewerage works at North Olean, New York; and one summer, 1909, on surveys at Painted Post and Rome, New York, with Knight and Hopkins, Consulting Engineers; and another two months, February and March 1908, as draftsman on the New York State Barge Canal at Rochester, New York.

He was consultant on the design of piers for a bridge at Elmira, New York, and on the sewerage works for North Olean, New York. With the late Dr. Rettger, he designed the Warfield Web Plate Car and wrote the book "Mechanics

of Materials,” which was published in 1935. He also wrote occasional articles for the “Cornell Civil Engineer” and other engineering magazines.

On June 14, 1906, one year after his graduation, Sidney George married Miss Lou Hovey of Ithaca, who, with two of their three children, survives him.

Professor George was an excellent and valuable teacher. His methods naturally followed those of Professor Church under whom he was trained as student, instructor, and assistant professor; both men were noted for clarity of presentation and for getting students to do their own thinking. Professor George was strongly conservative but always courageous in the presentation of his opinions, and will be sorely missed as a wise counselor by both his colleagues and students. He will also be missed as a citizen, especially in Masonic circles in which he was active. But, of course, most of all will he be missed in his own family circle in which he took such quiet comfort and pleasure.

Professor George was a member of the Society for the Promotion of Engineering Education, of Tau Beta Pi, and the local civil engineering society Rod and Bob; and an honorary member of the Cornell Society of Engineers.

John Randolph Gepfert, Jr.

August 26, 1906 — November 16, 1965

Dr. Gepfert was born in Augusta, Georgia, August 26, 1906, and died of a cerebral hemorrhage in The New York Hospital, November 16, 1965, at the age of fifty-nine.

He was the son of Dr. John Randolph Gepfert and Georgia Collins Gepfert. His early education was in Augusta, Georgia. He graduated from the University of Georgia at Athens in 1925 and from the University of Georgia Medical College at Augusta in 1929 at the age of twenty-two. After a year's internship in Macon, Georgia, he spent a year as resident in surgery in Macon.

Dr. Gepfert married Meryl Culpepper in 1929 soon after finishing medical school. His wife and two children, John Randolph Gepfert III and Mrs. Richard G. Kopff, survive him.

He came to New York in 1931, spent a year as resident at the New York Lying-in Hospital and two years as resident in Gynecology at Bellevue Hospital. Entering private practice of gynecology and obstetrics in 1933, he continued successfully in this field until his untimely death. He was Attending Obstetrician and Gynecologist at Bellevue Hospital from 1933 to 1941. In 1941 he became associated with The New York Hospital, where he remained until his death, at which time he was an Attending Obstetrician and Gynecologist at the Lying-in Clinic of The New York Hospital and Clinical Associate Professor of Obstetrics and Gynecology at Cornell Medical College.

Dr. Gepfert served in the Medical Corps of the United States Navy from 1943 to 1946, being discharged with the rank of Lieutenant Commander. He was a member of the A.M.A., American College of Surgeons, American Fertility Society, American College of Obstetrics and Gynecology, Lying-in Alumni, Bellevue Alumni, and the Union Club.

An early interest in postoperative adhesions and postoperative complications led to Dr. Gepfert's writing several papers on the intraperitoneal use of bovine amniotic fluid and on the allantois membrane at the time of tuboplasty. He was also the author of several other papers. Throughout his life he was interested in tuboplasties and utilized many different techniques in his endeavor to restore tubal patency.

Dr. Gepfert spent endless hours teaching and training the resident staff in all aspects of infertility and obstetrics, always taking advantage of the newer knowledge available or of his own original thinking. Just before his death

he became interested in folic acid deficiency in relation to repeated abortions and had secured a gift to undertake research on this problem. A project of this nature is now being carried out in honor of Dr. Gepfert.

Charles M. McLane

Peter Gergely

February 12, 1936 — August 25, 1995

Peter Gergely, Professor of Structural Engineering in the School of Civil and Environmental Engineering, died at his residence on August 25, 1995, after a long and courageous battle against cancer. Peter was born in Budapest, Hungary, on February 12, 1936, a son of the late Maria and Istvan Gergely. He grew up there and entered the Technical University of Budapest in 1954. He was a freedom fighter during the Hungarian Revolution of 1956, and left Hungary on New Year's eve, 1956, to come to North America. He soon became a student at McGill University, where he completed an undergraduate degree in civil engineering (Applied Mechanics Honors) in 1960. He then entered graduate study in structural engineering at the University of Illinois. Immediately after receiving his Ph.D. degree in 1963, Dr. Gergely began his distinguished 32-year career at Cornell University. He held two prominent leadership positions at Cornell—Chairman of the Department of Structural Engineering (1983-88) and Director of the School of Civil and Environmental Engineering (1985-88).

Peter Gergely had an exceptional zest for life and a strong interest in science and the arts. He often spoke about his early school years in Budapest and how lucky he was to have had wonderful, inspirational teachers, especially in mathematics and literature. In his personal writings he stated:

These giants taught us the joys of learning and infused into us a thirst for knowledge. They were noble, conscientious, and tireless teachers and educators. They implanted into us the germs of talent, which we otherwise were not blessed with, and also self-confidence.

Surely these early experiences with great teachers had much to do with his own superb ability to teach and to inspire students to reach for the stars and to achieve their very best, not only while at Cornell but also after they launched their engineering or business careers. He set a very high example for his students; those who came to know him soon understood the nature and depth of his personal qualities—rigor, innovation, integrity, professionalism, and a continual quest for excellence.

He was instrumental in the training and development of thousands of young engineers through his inspired teaching and advising of undergraduates and graduate students. He consistently ranked in the top group of Cornell Engineering faculty, and in 1995, he received a Dean's Prize for Excellence in Teaching. He will be remembered by his many students for his constant examples of technical and professional excellence and for his strong support of student activities. His legacy is captured in the following quote from a letter sent to Peter by 17 engineers (16 with

Cornell CEE degrees) from the firm of Leslie E. Robertson Consulting Engineers in New York City: “There is no way that we can sufficiently thank you for that which you have so freely given to us. Our only form of payment to you is to do our very best, intrepidly, to use the skills and wisdom that you have bestowed upon us in creating beautiful buildings and structures and to otherwise contribute to the world around us.”

Peter co-authored a three-volume undergraduate textbook series published by John Wiley in the 1970s, and his notes for a book on structural dynamics and earthquake engineering have become widely recognized and used all over the world. Peter Gergely made major contributions to a wide variety of structural engineering problems, ranging from design procedures that have been adopted by national building codes to complex seismic analyses and consulting work on numerous nuclear reactor facilities and other structures.

His research led to many important advances in understanding the mechanics of reinforced and prestressed concrete, with strong emphasis on using research results to improve building codes. He also made pioneering contributions in structural dynamics, earthquake engineering, and earthquake hazard mitigation, particularly for structures and facilities built in regions of moderate seismicity. He was one of the founders and leaders of the National Center for Earthquake Engineering Research. He played key roles in developing new seismic provisions for eastern states and in working with national agencies in developing new and improved seismic design philosophies and codes. He reported his research in more than 100 technical papers.

Peter Gergely was exceptionally generous in volunteering his time and talents to professional societies and groups, including the American Concrete Institute, the American Society of Civil Engineers, the International Association for Bridge and Structural Engineering, the International Committee on Tall Buildings, the National Research Council, the Transportation Research Board, the Applied Technology Council, the Building Seismic Safety Commission, and the National Committee on Property Insurance. He was an enthusiastic and valued participant in each of these important professional groups and his many contributions and ability to make meetings enjoyable will be sorely missed by his engineering colleagues around the world.

Peter also participated fully in the life of Cornell University. He was a valued member of numerous committees at the school, college, and university levels. He was one of those rare faculty members who “always showed up” at all school and college events, be they faculty gatherings, student activities, or alumni events.

In recognition of his outstanding contributions to the advancement of the understanding of concrete structures under severe static and dynamic loadings, and for applying these advancements to design and to design codes,

Peter Gergely was honored with numerous national and international awards, including co-recipient of the State of the Art of Civil Engineering Prize (ASCE, 1974) and the Raymond C. Reese Research Prize (ASCE, 1976); election to Fellow of ACI (1974); Delmar Bloem Distinguished Service Award (ACI, 1981); and co-recipient of Wason Award for Most Meritorious Paper (ACI, 1993) and Structural Research Award (ACI, 1994). Of all his honors, the one that meant the most to him was the Honorary Doctorate he received in 1992 from his beloved alma mater, the Technical University of Budapest, given “for his outstanding international activities in advancing the development of his profession of mechanics and reinforced concrete.” Cornell University honored Peter with the Gergely Symposium in August 1995, which was attended by colleagues and friends from around the world.

Peter had a life-long dedication to his beloved native Hungary, and returned there for visits on many occasions. His automobile license plate was H-56, selected to serve as a constant reminder of the Soviet suppression of the Hungarian revolution in 1956. He delighted in telling stories about Hungarians and was particularly fond of the definition of a Hungarian as someone who can go into a revolving door behind you and come out in front. And, as he said in his honorary doctorate acceptance speech in 1992:

The 1956 Revolution obliged and inspired us. We were representatives in foreign lands. We had to succeed and could not fail and could not abandon the ideals of the nation. We have had to keep up the momentum.

This same love for Hungary extended to his feelings about the United States. He was a strong champion for free enterprise and for the American way of life.

Peter was a great lover of classical music and the arts, and an avid chess player who often spent his lunch hours at Cornell playing chess with other faculty and students. He had a wonderfully dry sense of humor and was particularly fond of telling lawyer jokes, sometimes almost too fond considering that many of his students had lawyers in their families.

Peter’s family meant so very much to him—he was a dedicated and proud husband, father, and grandfather. He married Kinga Mecs in 1964 and they had two children: a son, Zoltan; and a daughter, Ilia. Ilia and her husband, David Burbank of Ithaca, have one son, Istvan, who was Peter’s pride and joy. Kinga was Peter’s constant source of strength and inspiration, particularly during the final year of his life, when he struggled so valiantly against overwhelming odds. Peter and Kinga never wavered, even in the face of great difficulties, and their ability to face life with exceptional levels of grace, courage and dignity provided a lesson to all who knew them.

Peter Gergely always gave his best, he lived life to the fullest, he made a difference, and we have been blessed to share in the life of this remarkable individual.

John F. Abel, William McGuire, Richard N. White

David Henry Geske

August 25, 1931 — December 4, 1967

To all who knew him, David Geske's tragic death at thirty-six brought shock and sadness. He will be sorely missed by both his colleagues and his students.

David Geske was born in Hartley, Iowa, and attended Wartburg College in Waverly, Iowa, where he received the degree of Bachelor of Arts in chemistry, summa cum laude, in 1953. He received the Master of Science degree in 1955 and the Doctor of Philosophy degree in 1957, both at the State University of Iowa. He joined the Harvard University Chemistry Department as an instructor in 1957. He came to Cornell in 1960 as Assistant Professor and became Associate Professor in 1962 and Professor in 1966. His research concerned electrochemistry in nonaqueous media and electron spin resonance spectroscopy of organic free radicals in solution. He had pioneered the technique of electro-chemical generation of free radicals for electron spin resonance investigation.

The honors bestowed upon David Geske reflected the high esteem in which he was held by his peers. He held an Arthur Becket Lamb Memorial Fellowship at Harvard, was an Alfred P. Sloan Research Fellow at Cornell and, most recently, held a National Science Foundation Senior Postdoctoral Fellowship while on sabbatic leave. At the time of his death he had written twenty-six scientific publications. In addition to his research, he was sincerely dedicated to quality teaching and felt particular concern for undergraduate education. He was active in the Lutheran Church of Ithaca.

Surviving David Geske are his wife, Anna Diers Geske, son Mathew, and daughter Elise, all of Ithaca; his parents, Rev. August Geske and Mrs. Geske of Hildreth, Nebraska; and a sister Mrs. Dorcas Hueners of Bruning, Nebraska.

None of us who survives can escape the fact that in illness and depression David Geske took his own life. Hard as it is we must try to understand what David did. If there be any way to understand, it lies in David's own view of life. He once wrote:

In order to be honest with himself a mature man must perform everything he does in exactly the manner he desires. Such a principle can be extended to a general scheme for life—to have yourself completely in hand at all times, to plan what you do and do what you plan.

When he believed that illness had permanently impaired his ability to live by these high standards, he could no longer continue.

Jack H. Freed, Wilson M. Gulick, Jr., W. Donald Cooke

Roswell Clifton Gibbs

July 1, 1878 — October 4, 1966

The death of Emeritus Professor Roswell Clifton Gibbs brought to an end a long and distinguished career of service: service to his university, to his profession of physics, and to the nation. During almost fifty years of formal association with Cornell, he played almost every possible role: student (undergraduate and graduate), teacher, research worker, and administrator. After his retirement in 1946, the roles included administrative work on the national level and adviser to the nation's scientific agencies.

Professor Gibbs first came to Cornell in 1903 after having attended public schools in Hume, New York (his birthplace) and in Pike, New York. He received the Bachelor's degree in 1906, the Master's degree in 1908, and the doctoral degree in 1910. His teaching appointments began in 1906 with an instructorship. He became an Assistant Professor of Physics in 1912 and Professor of Physics in 1918. During his career as a professor, he filled many administrative positions: Acting Dean of the College of Arts and Sciences, faculty member of the Board of Trustees and, most notably, Chairman of the Department of Physics from 1934 to 1946.

It would be hard to single out the area of Professor Gibbs' greatest enthusiasm. Certainly he had a great love for teaching and, during his long career, he had a hand in almost every course given in the Physics Department. He was a frequent lecturer in the large introductory physics courses and had a real flair for explaining and demonstrating the abstract concepts of physics. Perhaps his greatest love was the "sophomore lab"—a course for potential physics majors designed to give them an experience in the real problems of experimental physics. Long before such phrases as "open-ended" and "research-oriented" experiments had entered the jargon, he was using the ideas.

As a research worker, Professor Gibbs concentrated in the area of spectroscopy. At the time, this was the major area of research in physical science. The problem was the interpretation of the emission and absorption of radiation, in terms of a coherent picture of atomic structure. It was exciting work since the new theory of quantum mechanics was evolving, and theory and experiment were leapfrogging over each other. In all, Professor Gibbs was author or coauthor of over forty research papers, the topics including such matters as the extreme ultraviolet spectra of isoelectronic sequences, multiple and hyperfine structure of spectra, determination of the charge-to-mass ratio of the electron from the interval between the hydrogen and deuterium alpha lines, and the absorption spectra of organic compounds in solution.

Most of us remember Professor Gibbs most clearly in his role of department chairman. He brought to this task an extraordinary amount of patience and understanding. He was a master of detail, but with a clear understanding of the big problems. In recruiting new staff members, he carefully planned to have Cornell in the forefront of the newly developing areas of physics research.

World War II brought his greatest problems and greatest achievements. As the war clouds gathered, it became clear that while World War I was, in a sense, a “chemists’ war,” the coming conflict would be a “physicists’ war.” There would be insistent demands that key faculty members leave their academic work and join national laboratories for research and development. The prospects for maintaining a viable instructional and research program in physics at Cornell became darker and, at times, almost hopeless. Nevertheless, Professor Gibbs recognized clearly the need for continued training in the physical sciences at all levels. To maintain this training, Professor Gibbs did everything possible and a good deal more: he converted colleagues from the fields of entomology and physiology and psychology into physics instructors so that the underclass courses could continue; he arranged for visiting faculty members on a commuting schedule; he brought in small defense projects as a nucleus for graduate work; he became perforce a nationally recognized expert on some of the legal and procedural aspects of the selective service system; and he made many dreary trips to Washington under the worst of travel conditions. When, in 1946, the war was over and he was permitted to retire, he left to his successors a going organization—an amazing achievement.

The retirement period, however, was no idle time for Professor Gibbs. In 1946, he moved to Washington to assume the chairmanship of the Division of Mathematical and Physical Sciences of the National Research Council. Later, he also took on the position of chairman of the advisory committee to the Army Office of Ordnance Research. He was also consultant to the Nuclear Data Project of the National Research Council and supervisor of its exchange-visitor program. For several years, he was a coeditor of the *Directory of Nuclear Data Tabulations*.

Professor Gibbs had many professional affiliations: a Fellow of the American Physical Society and member of the American Association of Physics Teachers (president in 1942 and 1944-46), member of the Optical Society of America (president in 1937-39) and the American Association for the Advancement of Science (vice-president in 1945). One of his lifelong pleasures was his association with the honor society of Phi Kappa Phi, and he served for a time as the society’s president.

To all of his many tasks, Professor Gibbs brought vigor, wisdom, and devotion to duty. To those of us who remember him, he brought thoughtful advice and the warmth of real friendship.

George Gibian

January 29, 1924 — October 24, 1999

On October 24, 1999, George Gibian, the Goldwin Smith Professor of Russian and Comparative Literature, died suddenly in the home that he shared with his longtime and beloved partner, Karen Brazell. His life was unusually rich. George was born in Prague in 1924. With the Munich Agreement and its guarantee of a German takeover of Czechoslovakia, he was sent to England, for safety and for his studies. In 1940, after a harrowing journey across the Atlantic, the Gibian family settled in the United States. A Europe at war, however, beckoned George to return. He did so as a member of the 94th Infantry Division, which landed in Normandy in 1944. He participated in the Battle of the Bulge, and at the end of the war he was assigned to occupy the southern part of Czechoslovakia. George was decorated with the Bronze Star with the V device for Valor.

After the war, George received his Ph.D. degree in English from Harvard University. He taught at Smith, Amherst, and the University of California at Berkeley before joining the faculty at Cornell in 1961. In the process, he shifted his specialization from English to Comparative Literature and Russian Literature. His contributions to Russian literature were foundational. Indeed, George, who was appointed to the position at Cornell that had been held by Vladimir Nabokov, founded the current Russian Literature Department. Students and faculty alike will remember him for his Norton “Critical Editions” of the classics of Russian Literature. He made a major and permanent contribution to the history of Russian literature with the publication in 1971, by Cornell University Press, of his translations of the absurdist Oberiu writers, whose works had been suppressed and nearly forgotten for fifty years in Soviet Russia. He wrote and edited twenty-four books and published ninety-five articles on, among other things, Russian and Soviet literature; Czech literature; comparative literature; intersections of literature with history and politics; Russian nationalism. He kept an active interest in Czech cultural life, returning regularly to Prague and maintaining contacts with Czech writers and artists there and here. Among his last publications was a 1998 volume of verse and prose by Jaroslav Seifert, with introduction and prose translations by George.

While an undeniable part of his story, however, these facts do not capture adequately the George Gibian we knew and valued. Here, what stand out are four characteristics. One was his sheer level of activity, intellectual and physical. Just as he was always ready to develop new courses that explored aspects of Russian and East-Central European culture, so he was until his death an ardent traveler, hiker, and tennis-player. This was a man who was most comfortable when his body or his mind—or both—were on the move. Another characteristic: George always

managed to make things around him more interesting. His engagement with people and ideas was infectious. Another, perhaps most rare, was his humility. He was too fair-minded and too full of curiosity to pull rank. He was a good listener and a ready student. He enjoyed his life and those lucky enough to know him. He was as interested as he was interesting. Finally, George was a devoted family man, with some or all of his five children and two step-children and multiples of his grandchildren almost always around—especially in summer, when the entire clan would gather at the cottage on the lake, to George’s perpetual delight and even, occasionally, exhaustion. George was an inspiring and beloved teacher and an irreplaceable colleague. We will miss him.

Anson Wright Gibson

October 31, 1892 — February 19, 1977

Anson Wright Gibson, who referred to himself as Wright Gibson, but who invariably was called Gibby by his many friends, died in Ithaca, New York, on February 19, 1977, at the age of eighty-four. For almost half a century, both prior to and subsequent to retirement, he had served Cornell University, and particularly the New York State College of Agriculture, with devotion and distinction.

Professor Gibson was born in Atlantic City, New Jersey, on October 31, 1892. When he was two years old, his family moved to a small farm in Greenville, New York, a short distance from Albany. Here his father was engaged for a number of years in small-scale farming and in a wholesale egg business: in addition, he served as secretary of the Farmers' Fire Insurance Company.

Following his graduation from high school in 1911, Wright worked for two years on the home farm and for neighboring farmers. For three months during this period, he attended Albany Business College. In September 1915, he enrolled in the New York State College of Agriculture as a special student, and on completing two years of study in this category, he returned home. But, after being at home for only two months, he was asked by Professor Asa King to return to Ithaca to teach a newly organized course in farm practice. During the next two years, he combined responsibilities as instructor in farm practice with enrollment as a student, both during the regular terms and in summer school. In June 1917 he was graduated with the B.S. degree.

Wright spent the next four years in Virginia, first as a farm manager, then as operator of his own farm. In 1921, he was again asked to return to Cornell, this time to conduct a study of former students of the College of Agriculture. This study was concerned both with the location and with the occupation of these alumni, and it resulted in December 1923 in the publication of the alumni directory of the New York State College of Agriculture.

Although he undoubtedly did not then realize it, the publication of the alumni directory marked the beginning of a lifetime of sincere concern and effort directed by Wright Gibson toward more adequate selection and preparation of students and toward appropriate placement of and continued interest in graduates. During the next few years, he conducted further studies concerning course selection by students, faculty advising, and forces that had a bearing on student success. At the same time, he took courses in the field of education both at Cornell and in the 1927 summer session at Harvard; in June 1928, he was awarded the Master of Science degree from Cornell.

On July 1, 1928, Wright Gibson was transferred from the Office of Farm Practice to the Office of Resident Instruction and was given the title of associate secretary in charge of former student relations, vocational guidance, and placement. In 1934, he was appointed assistant professor in personnel administration, and in 1937 he was promoted to full professor. In 1940, when Dr. Cornelius Betten moved from the Office of Resident Instruction to become dean of the University Faculty, he was appointed director of resident instruction. He served in this capacity until his retirement on June 30, 1960.

Throughout his tenure as director of resident instruction, Professor Gibson devoted his energies toward implementing within the College of Agriculture policies and procedures that would reflect his educational philosophy. He was convinced of the need to recognize individual differences in students and of the importance of providing curricula that were sufficiently flexible to allow students considerable latitude to devise individualized programs. At the same time, he recognized that students needed help in making wise decisions; and to this end, he worked untiringly for a strong faculty advisory system that would provide sound guidance and be well received by students. He had excellent rapport with the faculty of agriculture and worked with its members toward improving teaching and toward promoting the college's service to agriculture in particular, as well as to all citizens of New York State and elsewhere. As secretary of the faculty of agriculture, he provided carefully written minutes that reflected accurately, but concisely, the deliberations of the faculty. Each year he was responsible for the preparation of the college *Announcement*, and he edited accurately departmental contributions to this publication.

Professor Gibson accepted a number of responsibilities outside the immediate purview of the Office of Resident Instruction. Within the University, he was armed services representative of Cornell University and chairman of the University Committee on Student War Service during World War II; he served on the board of directors of the *Cornell Daily Sun* and on the board of managers of Willard Straight Hall; he was a faculty trustee on the Board of Trustees; and he was on a number of committees. Within the college, he was secretary-treasurer of the Alumni Association for forty years, a member of the board of directors of the *Cornell Countryman*, and on several occasions, acting dean of the college. Outside the University, he was secretary-treasurer of the local Alpha Gamma Rho Corporation Board and national president of the fraternity for two years; he was president of the local Boy Scout Council and recipient of the Silver Beaver Award; and he was elected to important offices in the Association of Land Grant Colleges and Universities.

After his retirement when he was named professor in personnel administration emeritus, Wright Gibson was appointed to an interim contract team that visited Liberia during the summer of 1961 and helped to negotiate an

AID-supported contract between Cornell University and the University of Liberia. Subsequently, from 1962 to 1968, he served as campus coordinator for Cornell University for this Cornell-University of Liberia Project. In this capacity, he arranged for the assignment of staff and materials toward developing the University of Liberia.

At the time of his death, Professor Gibson was survived by his wife, Dorothy McCabe Gibson, whom he had married on April 23, 1919, and who died in Ithaca on, May 5, 1977; by two sons, A. Wright Gibson, Jr., and Philip B. Gibson; by a daughter, Mrs. Lionel M. (Sally) Noel; and by eleven grandchildren.

Throughout his life, Wright Gibson contributed much to Cornell University, and his educational philosophy continues to be reflected in the operation of the New York State College of Agriculture and Life Sciences, particularly in those areas that relate to resident teaching, faculty advising, and student and alumni relations. His outstanding accomplishments came about as a result of his friendly manner, dynamic personality, keen sense of humor, and his firm stand for any principle or procedure he believed to be right.

S. Reuben Shapley, Howard S. Tyler, John P. Hertel

Audrey Jane Gibson

October 5, 1924 — June 10, 2008

Professor Audrey Jane Gibson was born in Paris, France on October 5, 1924, and grew up in Devon, England, and Switzerland. She attended the Maynard School in Exeter, England and was then a scholar at Newnham College, University of Cambridge, England, from which she graduated in 1946 with a first class honors degree in Biochemistry. She obtained her Ph.D. degree in 1949 at the Lister Institute, University of London, England, under the supervision of Dr. D. Herbert, where she was the first to discover a specific role for selenium in bacterial growth, revealing that it was required in *E. coli*, along with molybdenum, for the formation of formate dehydrogenase.

Jane was awarded a Commonwealth Fund Fellowship to study with C.B. Van Niel at the Marine Biological Laboratory, Pacific Grove, California, where she became interested in photosynthetic organisms. After two years in California, Jane returned to England to Sidney Elsdon's laboratory at the University of Sheffield where she isolated and characterized c-type cytochromes from green sulfur photosynthetic bacteria. In Sheffield, she met and married Quentin H. Gibson, and after the birth of their four children she worked part-time.

In 1963, Jane and Quentin Gibson moved to the University of Pennsylvania, where she was appointed an Assistant Professor of Microbiology and Physical Biochemistry. In 1966, Jane and Quentin moved to Cornell University, where they both remained until their retirement in 1996.

At Cornell, Jane was initially appointed in the Section of Microbiology, being promoted to Associate Professor in 1970, and serving as Acting Chairman from 1968-72. Upon dissolution of the Section of Microbiology in 1972, Jane was appointed in the Section of Biochemistry, Molecular and Cell Biology, and then promoted to full Professor in 1979.

Jane's scientific interests were centered on green photosynthetic bacteria, in particular the transport and utilization of ammonia and of small organic compounds. She was very proud of her isolation and description of *Chloroherpeton thalassium*, a flexing and gliding green sulfur bacterium isolated from marine sediments near Woods Hole, Massachusetts. Later in her career, Jane used the purple nonsulfur phototroph *Rhodospseudomonas palustris* to investigate anaerobic benzene ring degradation, a process important for the breakdown of hydrocarbon pollutants. She also studied the growth physiology of cyanobacteria and was a co-author on a paper with Carl Woese showing that many common Gram-negative bacteria like *E. coli* are evolutionarily related to purple photosynthetic bacteria. As this short description implies, Jane was a master at the culture of these difficult organisms.

At Cornell, Jane's commitment to teaching was legendary. Starting in 1975, she played a central role in the teaching of cell biology. In addition to contributing initially to teaching an upper level cell biology lecture course, Jane taught a very popular Laboratory in Cell Biology every year from 1975-96, except during sabbatical leaves. The effort she put into this spring course was phenomenal—rather than using the same set of lab experiments year after year, she developed a large new component each year. Moreover, after selecting new experiments in the fall, she would test all of them herself before incorporating them into the course. During this period, one of us (AB) remembers her coming each fall seeking suggestions for new projects. One year we had just described a simple purification of a contractile protein from smooth muscle. The lab course the following spring revolved around purifying the protein, making antibodies to that protein, and then localizing it by immunofluorescence microscopy in smooth muscle cells—a wonderful exercise for the students and a remarkable achievement for any teacher! It is not surprising that Jane's faculty colleagues, students and staff came together to nominate her for the Edith Edgerton Career Teaching Award, which she received in 1994. Among the comments in letters in support of this award is a common thread—as one student wrote:

“No other professor that I have ever had has taken such great pains to make sure that his or her students actually know and understand the course material. There was always one thing that I was sure I wanted to do with my life: teach. Now, with my convictions even stronger to go into education, I find myself with a perfect model of how to teach. Dr. Gibson has served above and beyond the role of professor.”

As a consequence of her devotion to teaching, Jane happily chaired the department's curriculum committee for about ten years.

In addition to teaching at Cornell, Jane was an Instructor in the summer Microbial Ecology Course at Woods Hole from 1974-77, and again in 1980. Jane also served on the Editorial Board of *The Journal of Bacteriology* from 1983-91, and as Editor of *Applied and Environmental Microbiology* from 1989-95. Even in “retirement,” she continued as a Visiting Scientist in others' laboratories, especially in Carrie Harwood's laboratory at Cornell, then at the Universities of Iowa and Washington, and most recently in Deborah Hogan's laboratory at Dartmouth. At the time of her death, she had a paper submitted to *Applied and Environmental Microbiology* that has subsequently been accepted for publication.

Jane was always very independent and full of energy, not only for her students and teaching, but also for almost any aspect of life. As examples, she was an avid gardener, she walked the two miles from the Gibson house on

Dodge Road to her laboratory every day, rain, snow or shine, and she was adept at working on her car. Jane was devoted to her family. Her husband of 57 years, three children and six grandchildren survive her. To the many faculty, students and staff who were fortunate enough to know Jane, she was an inspiration.

Anthony Bretscher, Chairperson; James Blankenship, Volker Vogt

Charles Langdon Gibson

May 5, 1864 — November 25, 1944

Charles Langdon Gibson was born on May 5, 1864 at Boston, Massachusetts, the son of Charles Langdon and Margarette Carter (Smith) Gibson. He received his early education abroad, particularly in France and under private tutors. From this arose his most intimate knowledge of the French language and the French people. His mother and sister had been presented at the Court of St. James and they wished him to enter Oxford but he rebelled, returned to the United States and after a course of study at Adams Academy, Quincy, Massachusetts, entered Harvard University, where he obtained his A.B. degree in 1886 and his M.D. in 1889.

Doctor Gibson served an internship at St. Luke's Hospital, New York, from 1890 to 1892, following which he went abroad for postgraduate work at Heidelberg and Vienna. On his return he entered private practice as an assistant to Dr. Robert Weir, a famous surgeon of that time, and shortly joined the staff of St. Luke's Hospital and was quickly advanced to be a full Attending Surgeon. He became a Clinical Instructor in Diseases of the Genito-Urinary System in 1900 at Cornell Medical College. In due time he was made Associate Professor of Surgery and on the death of Dr. Lewis A. Stimson he became a full Professor of Surgery in 1918.

Doctor Gibson became a member of the New York Hospital Surgical Staff in 1907 and full Attending Surgeon in charge of the Cornell Division from 1913 until his death. He also served in the House of Relief of the New York Hospital and was consulting surgeon at the General Memorial Hospital. At the time of his death he was Consulting Surgeon at the New York Hospital, St. Luke's, Memorial, State Hospital for Deformed and Crippled Children, Vassar Bros. Hospital, Poughkeepsie, and Southside (Babylon) Hospital.

Doctor Gibson was a member of the New York Academy of Medicine and the New York Surgical Society, Fellow of the American Surgical Association, Member of the Society of Clinical Surgery, American Association of Genito-Urinary Surgeons, International Surgical Association, Practitioners Society, New York Clinical Society, Associate Member Academie de Chirurgie, Paris, Corresponding Member Academie de Medicine, Paris, and of the Union-Inter-Allie. He was a member of the Sons of the Revolution, Society of Colonial Wars, Military Order of Foreign Wars, University Club, and a former member of the Century Association.

Doctor Gibson had spent nearly all of his summer vacations in France and at the outbreak of the first World War he evidenced his great love for France by his personal efforts and visits, by organizing Surgical Relief for France and Belgium, and probably, although he was far too modest to ever mention it, by more direct contributions to

his beloved foster country. In February 1915 he obtained leave of absence to visit his friend, Dr. Antonine Depage, who was in charge of a Red Cross Hospital at La Panne just behind the lines of the Yser, in that small portion of Belgium not actually occupied by the Germans. He was instrumental in obtaining money and supplies for this hospital and later was decorated for his work by King Albert of the Belgians, who made him "Commandeur de l'ordre de la Couronne." Other close friends were Doctors Henri Hartman, Thierry de Martel, Tuffer, Walther and Lambotte.

In April 1917 Doctor Gibson was commissioned a Major in the Medical Corps of the Army. He organized Base Hospital #9, the New York Hospital Unit, and was eminently successful in establishing this hospital in France. His wonderful organizing ability and his complete knowledge of the French people and especially their language were invaluable to the successful development of a great new hospital in a foreign land. With infinite tact and ready sympathy he placed his magnificent talents at the service of all, great or small, American or French. He was especially considerate of our nurses, who responded by an undying devotion to him. All the members of the Unit have the kindest recollections of his helpfulness, his courage in tight spots, his generosity, and his genial companionship on many trips to Paris.

On the professional side Doctor Gibson kept the organization at a high level of efficiency and was instrumental in developing the debridement of wounds, the treatment of severe compound fractures, perforating and penetrating wounds.

A most interesting and instructive article by Doctor Gibson entitled "A Visit to Belgium and France in 1916" was published in the General Bulletin of the New York Hospital, March 27, 1917. It is of real historical value and well worth reading, not only for its medical knowledge but from human interest; particularly to be valued for its calm courage is a letter written by Nurse Cavell to her pupils, two days before her death. In this article Doctor Gibson expressed clearly his feeling for the French and Belgian people, his admiration for their great surgeons and physicians and his horror of war. Here too he speaks of many other American Surgeons, especially of Dr. H. H. M. Lyle, with highest praise.

Doctor Gibson returned to his professorship and to the service of the New York Hospital in 1918. This was at the crux of the most difficult and trying times of World War I. There was an increasing and menacing shortage of men, of funds, of space and facilities. Our present war time difficulties are real indeed but they can hardly compare with those of 1918. In this field Doctor Gibson's extraordinary abilities shone. In spite of almost insurmountable difficulties the work was carried on and continued to improve rapidly as peace time conditions allowed. Toward

the end of his active career the great benefactions of Payne Whitney allowed the planning and building of the present magnificent plant.

Doctor Gibson with the aid of Dr. Lewis A. Conner and a renowned laboratory group carried on the work bequeathed them by the pioneers Polk and Stimson and added to the lustre and fame of Cornell and helped to bring it into the very forefront of medical activities. Perhaps two of Doctor Gibson's outstanding contributions to surgery were his fundamental work in gastric surgery and, above all, an accurate and complete follow-up system—one of the earliest and best in the country.

As a man Doctor Gibson was extremely reserved, quiet, and conservative yet always with an open mind for the new. Skeptical and hard-headed, he had a warm heart. He welcomed young talent and was greatly pleased at any efforts toward research on the part of his staff. These may seem insignificant in comparison with the present but again time, funds, and space were lacking.

After retiring from the chair of Surgery Doctor Gibson was made Professor Emeritus, and Consulting Surgeon to the New York Hospital. He continued his interest in medicine and became superintendent of the Burke Foundation in White Plains. In November 1944, after a long illness, Doctor Gibson succumbed to the very disease to the study of which he had devoted so much of his time and strength—the disease which had caused the death of his friends Ewing and Stockard. He was buried in the family plot in Mt. Auburn Cemetery, Cambridge, Massachusetts.

Eleanor J. Gibson

December 7, 1910 — December 30, 2002

Eleanor J. Gibson was the most distinguished developmental psychologist of her generation. Her early work on the “visual cliff” is still described in virtually every textbook. Gibson showed that young mobile animals of many species will avoid a visually specified drop-off even if they have had no prior visual experience, and that human infants do the same as soon as they can crawl. This was only the first of many empirical and theoretical contributions. Gibson’s path breaking 1969 book, *Principles of Perceptual Learning and Development*, was organized around the assumption that perceiving becomes more differentiated as well as more efficient as learning proceeds. This assumption represented a fundamental challenge to then-dominant theories of learning, but it has stood the test of time. *The Psychology of Reading*, published in 1975 (with Harry Levin), applied the same principles to the practical problems of reading and learning to read.

In 1973, Eleanor Gibson established a laboratory for the study of infant perception and action in the basement of the new social science building, Uris Hall. There she explored new concepts—intermodal invariants, affordances for locomotion, and others—that have since been widely accepted in developmental psychology. As the study of infant perception and learning became more and more popular, the Uris Hall laboratory became a model for other labs around the country. Many of those labs were established by—and are still directed by—Gibson’s former students. All her students cherish the memory of her unfailing kindness, warm friendship, and wise mentoring.

Eleanor Gibson came to Cornell in 1950 when her husband, James J. Gibson, was offered a professorship in the Psychology Department. So-called “nepotism rules” prevented her from receiving an academic appointment in her own right; for fifteen years she was only allowed to work as a Research Associate. Those were awkward times for women scholars: when Eleanor Gibson finally became Professor of Psychology in 1965, she was the only female full professor in the College of Arts and Sciences. In 1972, she became Susan Linn Sage Professor of Psychology—the first woman ever to hold an endowed chair at Cornell.

In Gibson’s later career, honors came thick and fast. A member of the National Academy of Sciences since 1971, she was made a Fellow of the American Academy of Arts and Sciences in 1977. Recipient of many awards and honorary degrees, she was awarded the National Medal of Science in 1992. Gibson remained intellectually active for many years after her official retirement from Cornell in 1979—developing new ideas, working with new students, writing new books. Scientifically, professionally, and personally, she will be sorely missed.

James Cutting, Barbara Finlay, Ulric Neisser

Ida V. Gibson

September 21, 1893 — September 16, 1956

Ida V. Gibson, Assistant Professor of Food and Nutrition, died September 16, 1956 at the Tompkins County Memorial Hospital in Ithaca after a short illness. She had been a member of the faculty for three years.

Professor Gibson was born in Atlantic City, New Jersey. She was the daughter of Mrs. Isora V. Gibson and the late Alton D. Gibson. From 1913 to 1915 she taught in a rural school in Green County, New York after which she entered Skidmore College. She was the first person to receive a degree from that institution. After graduation in 1919, she remained at Skidmore as an instructor in chemistry. Later she attended Teachers College, Columbia University, where she received the M.S. degree in 1925. Professor Gibson remained at Teachers College, first as an instructor in chemistry and later in nutrition. In 1933 she went to Middlebury College, Vermont, as an associate professor and head of the Home Economics Department.

She came to the New York State College of Home Economics in 1953 where she taught advanced courses in food preparation. Students in Miss Gibson's classes will always remember the vitality and inspiration of her teaching and the high standards which she set for them and for herself. She was always a wise counselor and many students turned to her for advice with their problems. Through her, others learned devotion to a profession.

Miss Gibson gave unstintedly of her strength and energy to help with anything that needed to be done in her department. Her friendly cheerfulness and staunchness of spirit will long be remembered. Her integrity and forthrightness of character engendered respect and confidence among all who knew her.

In addition to her full and arduous professional life, Miss Gibson found time to contribute to other activities. For many years she had been a member of the Board of Trustees of Skidmore College. She was a member of the American Home Economics Association and the New York State Home Economics Association. She was also a member of the Executive Board of the Ithaca Branch of the American Association of University Women. She was active in the Skidmore College Club of Ithaca and in church work.

Her memory will live on in the hearts of her family, friends, students and colleagues.

Miss Gibson lived with her mother at 303 Comstock Road. The devotion of mother and daughter was notable. Surviving besides her mother is her brother, Professor A. W. Gibson, Director of Resident Instruction at the New York State College of Agriculture.

Faith Fenton, Marie Harris, Nell Mondy

James J. Gibson

January 27, 1904 — December 11, 1979

In an autobiography published in 1967, James Gibson wrote: “What I have most wanted to do all my life is to make a contribution to knowledge. If you feel you are doing this it is much more fun than running things, or being a military commander, a departmental chairman, a participant in the brotherhood of workers, a mountain climber, or even an actor. And it seems to me that one can contribute to knowledge without being very bright (which I am not) but merely by being stubborn about it. Such a contribution, of course, has to be expounded and clarified, and this is where teaching comes in. It is a two-way process, and no one does it for himself. One must listen as well as talk; read as well as write. Knowledge is not knowledge until it is preserved in dusty libraries for the future. But despite all that, the big satisfaction comes from the thinking that first went into it, the satisfaction of seeing old facts and new data fall into place.”

Gibson grew up in the midwest; his father was a right-of-way man for the Northwestern Railroad. He went to college for a year at Northwestern University and then went to Princeton University, where he majored in philosophy. He remained at Princeton for graduate work in psychology, studying with the behaviorist E. B. Holt. On receiving his Doctor of Philosophy degree in 1928, he took his first academic position at Smith College. The famous Gestalt psychologist Kurt Koffka had recently come to Smith from Germany and exposed Gibson to a conceptual system very different from Holt's; much of his later work showed the Influence of these two men. At Smith he taught what must have been one of the very first courses in social psychology, but his primary commitment was to the teaching of experimental psychology and to experimental research, which he conducted with the help of a dedicated group of undergraduate students. He later married one of them: Eleanor J. Gibson, herself a psychologist of great distinction, is now Susan Linn Sage Professor of Psychology Emerita at Cornell; Their two children are Dr. James Jerome Gibson, a physician, and Dr. Jean Gibson Rosenberg, an economist; both are also following academic careers.

Gibson entered the Army Air Force in 1942 as a captain and was discharged in 1946 as lieutenant colonel. He was attached to a psychological unit where his education was actually used: he worked on the training of gunners, the use of films in training flight personnel

and the recognition of enemy aircraft. These experiences convinced him that traditional theories of vision had little application to everyday seeing. After the war he began to work his insights into a book, *The Perception of*

the Visual World; it was published in 1950 just after he had left Smith to take up a professorship at Cornell where the study of perception was already a strong tradition. This book introduced the description of the information available for vision in terms of gradients of optical texture and gradients of motion, descriptions that have now been generally accepted.

Graduate students soon began coming to Cornell expressly to work with Gibson, and those already here were attracted by his ideas. The Thursday afternoon seminar on perception became a permanent institution, which continued until shortly before his death. Almost every week Gibson prepared a short dittoed paper, a “purple peril,” to summarize his thinking and start what was always a lively and stimulating discussion. The discussion continued during the rest of the week in the laboratory, which he and Eleanor Gibson maintained in a temporary building at the airport until the construction of Uris Hall in 1972. In this as well as in his undergraduate teaching—he taught perception for many years, and took his turn with the introductory course—Gibson made significant contributions to the Department of Psychology. He chaired the department from 1961 to 1964, when a senior career award from the National Institute of Mental Health enabled him to concentrate fully on research.

Honors came to Gibson in full measure. He was a senior Fulbright Fellow at Oxford University in 1955-56, a fellow at the Institute for Advanced Study at Princeton in 1958-59, a fellow of the Center for Advanced Study in the Behavioral Sciences at Stanford University in 1964-65. He was elected to the National Academy of Sciences and to the American Academy of Arts and Sciences; he received the Warren medal from the Society of Experimental Psychologists and the Distinguished Scientific Contribution Award from the American Psychological Association; he served as president of the Eastern Psychological Association and of two divisions of the American Psychological Association as well. His reputation was international: he received honorary degrees from the University of Edinburgh in 1974 and the University of Uppsala in 1976. None of these honors ever turned his head, affected his habitual modesty, or spoiled his sense of humor.

Gibson's contributions to the study of perception span half a century. Even some of his earliest papers are still cited, especially those dealing with the aftereffect of looking at curved lines that is often called the “Gibson effect.” But his most important work came later, when he began to study the rich optical information that is available in the natural environment (as opposed to the minimal stimulation that is usually presented in laboratory studies). In his years at Cornell He gradually developed these ideas into an entirely new and radical approach to perception, one that redefined the nature of the problem itself. He rejected the prevailing assumption that the eyes receive only fragmentary and meaningless inputs of light, which must then be interpreted by higher

centers. On the contrary, he insisted that the visual system resonates directly to patterns of optical structure that always exist in the ordinary illuminated environment. Though much of what is seen changes whenever the perceiver moves, there is also a type of structure that is invariant during movement. These invariants specify the real characteristics of the environment so precisely that perceivers rarely make mistakes. Gibson was impatient with the psychological study of illusions, and insisted that natural perceiving was direct and veridical.

Gibson called his theory *An Ecological Approach to Visual Perception*; this was the title of his last book, which appeared in 1979 a few months before his death. It was an ecological approach as opposed to a mentalistic or mechanistic or neurological one. He felt that the proper study of vision must begin with an analysis of the light available to the eye, with an “ecological optics” not with the postulation of hypothetical mental processes and not with extrapolation from fragmentary neurophysiological findings. This position put him increasingly at odds with prevailing trends in his field. In his last years he occupied a peculiar position in that field, being simultaneously its most eminent and most dissident member. But he was not alone: a “Gibsonian” intellectual movement has been gathering strength for more than a decade. It is now recognized in both psychology and philosophy as a major alternative to established views of the nature and acquisition of knowledge. If the leaders of that movement are to follow].]. Gibson’s example, they will have to be intellectually unyielding and yet unfailingly courteous to those of other persuasions, highly imaginative and yet closely attentive to the most ordinary experiences of daily life, at once determinedly experimental and deeply theoretical. A reviewer of his last book called Gibson “. . . our one original, irreplaceable creative genius/’ And so he was.

Harry Levin, Thomas A. Ryan, Ulric Neisser

Helen Hager Giff

July 14, 1908 — June 19, 1979

Helen Hager Giff, professor emeritus of human nutrition and food, was born in Waukon, Iowa. She received her Bachelor of Science degree in food and nutrition at Iowa State University in 1929 and her Master of Science in 1944 at Cornell. From then until 1957 she worked part-time, first as an assistant in the Department of Food and Nutrition and, subsequently, from 1948 to 1957 as a lecturer in the School of Hotel Administration. After the death of her husband, Howard Giff, then dean-elect of the faculty at Cornell, Mrs. Giff was appointed to the position of assistant professor in the Department of Food and Nutrition. She was promoted to associate professor in 1961.

Professor Giff was initially appointed to teach two undergraduate-level courses in food preparation, one of them offered to students outside the College of Home Economics. The second, "Cultural Aspects of Food Preparation," was a junior-level course for majors in food and nutrition. Mrs. Giff brought to her teaching, as she did to all her activities, a lively personal perspective, a sense of history, and scholarly curiosity. Under her leadership, both courses acquired dimensions far broader and more theoretical than their original emphases on food preparation and applied nutrition. Mrs. Giff was intensely interested in the influences of cultural and social settings on food preparation and consumption patterns. As this interest evolved, "Cultural Aspects of Food Preparation," became "Socio-cultural Aspects of Food and Nutrition," a lecture course on the cultural, social, and psychological factors underlying food consumption and acceptance. Eventually this interest led Mrs. Giff to coauthor a book with Marjorie Burns Washbon and Gail Harrison. The book, *Nutrition, Behavior and Change*, was published in 1972 and has had wide acceptance as a teaching text and as a reference book for nutrition education at a variety of scholastic levels. It is now undergoing its second revision.

Professor Giff's commitment to nutrition education led her to active participation in extension and public service activities. She contributed significantly and, at times, took leadership in the preparation of extension bulletins. She and Marjorie Burns Washbon developed the script for a program, "Man's Search for an Elixir of Life," which they presented several times during the 1960 Farm and Home Week. Later on they used the script as the basis of a movie, "Nutrition Sense and Nonsense," which was used in the extension program and presented to many audiences.

Mrs. Giff's charm and outgoing personality made her a popular and effective committee worker. During her tenure at Cornell, Helen Giff served as coordinator for undergraduate advising, representative for the human

nutrition and food honors program, and coordinator of recruitment. She served as the College of Human Ecology representative to the Faculty Senate of the State University of New York. In 1971-72, Mrs. Giff was chairman of the dean's committee on the field study programs for undergraduate students. She also made major contributions to several college ad hoc committees. After her retirement, Mrs. Giff worked on the Tompkins County Comprehensive Health Planning Council, where her judgment and writing ability were greatly appreciated in developing proposals for the reorganization of Tompkins County Hospital.

Mrs. Giff died on June 19 after a brief illness. She is survived by a daughter, Sarah E., and son, Thomas H. Giff. Her many friends, colleagues, and acquaintances deeply sympathize and share their loss.

Lois N. Post, Ruth Schwartz

Howard Merrill Giff

June 19, 1908 — December 20, 1956

Howard Merrill Giff, Professor of Civil Engineering at Cornell University, and Dean-elect of the University Faculty, died unexpectedly on December 20, 1956, at his home in Cayuga Heights, Ithaca, New York. His death brought to an end a promising and productive career in the teaching and practice of Sanitary Engineering.

Professor Giff was born in Muskogee, Oklahoma, on June 19, 1908. A graduate of the Boone, Iowa, High School, he entered Iowa State College where he distinguished himself as a student leader and was awarded the degree of B. S. in Civil Engineering in June 1932. After spending six years with the Iowa State Conservation Commission he returned to Iowa State College as a graduate student and instructor in Civil Engineering. He was awarded the degree of Master of Science in Sanitary Engineering and the professional degree of Civil Engineer in 1941.

In September of 1941 he joined the staff of the School of Civil Engineering at Cornell as Assistant Professor in Civil Engineering. Upon the retirement of Professor C. L. Walker, he became Head of the Sanitary Engineering Department. His promotion to the rank of Associate Professor came in 1944, and to Professor in 1948. Professor Giff served as Assistant to the Acting Director of the School of Civil Engineering during most of 1948.

Much of his time was devoted to the improvement of the curriculum of both the School and College through his membership on many committees. Perhaps his greatest service was on the Civil Engineering School Executive Committee and the Graduate Committees of both the Engineering College and the Civil Engineering School.

Professor Giff was an active member of the American Society of Civil Engineers. He was also a member of the American Society for Engineering Education and the American Water Works Association. He was a Licensed Professional Engineer of the State of New York as well as the State of Iowa, and broadened his knowledge of civil engineering with a considerable amount of consulting. Professor Giff was a member of Sigma Xi and Chi Epsilon. His fraternal affiliation was with Kappa Sigma.

Professor Giff was highly regarded and well liked by his colleagues and students, being held in high esteem by all those who knew him for his unfailing kindness, thoughtfulness, and warmth. He possessed a delightful sense of quiet humor.

At the time of his death he had just been appointed Dean of the University Faculty by the Cornell Board of Trustees. His clear, practical point of view will be sorely missed by the University Community.

Professor Giff is survived by his wife, Helen Hager Giff, and their two children, Sarah Ellen Giff Korf and Thomas Hager Giff.

His loss is felt not only at Cornell but wherever people knew him and worked with him.

Marvin Bogema, Carl Crandall, H. T. Jenkins

Perry Webster Gilbert

December 1, 1912 — October 15, 2000

At the time of his death, Perry Gilbert had been continuously affiliated with Cornell for 64 years. He was an inspiring teacher and lecturer, an internationally recognized expert on sharks, a gifted administrator, and a master of public relations. His death brought to an end a long career, which saw him achieve distinction in each of these areas.

Perry was born and brought up in North Branford, Connecticut, the only son of Scott and Hester Gilbert. After graduation from high school he entered Dartmouth College in 1930. There he formed an enduring friendship with Harlan Banks, his college roommate who was eventually to become the Liberty Hyde Bailey Professor of Paleobotany at Cornell. At Dartmouth, Perry came under the tutelage of Professors William Ballard and Norman Arnold, who sparked and nurtured his interest in their respective disciplines of Vertebrate Anatomy, and Histology/Embryology. After two postgraduate years as an Instructor at Dartmouth, Perry began a program of graduate study at Cornell in 1936 with mammalogist William J. Hamilton as chairman of his committee. With his doctorate in hand in 1940, and an unexpected vacancy at Cornell as the new school year began, Perry was immediately hired as an Instructor in the Department of Zoology by Chairman Benjamin Young. His principal duties from the beginning involved teaching the course in Comparative Vertebrate Anatomy. This course had a large enrollment because, along with Organic Chemistry, it was required for entrance to most Medical Schools. Perry was to continue teaching this course with dedication and distinction, often in Summer Session as well as in the Fall and Spring terms until 1967. The constant need for Teaching Assistants in this popular course provided his graduate students with a role model and the first-hand experience they needed. Most of his graduate students became college teachers. Perry was tenured as Associate Professor in 1946, and became Professor of Zoology in 1952. With the establishment of the Division of Biological Sciences and the elimination of departmental designations, Perry elected to affiliate with the then Section, now Department of Neurobiology and Behavior, and assumed the title of Professor of that specialty.

Soon after arriving at Cornell, Perry met his future wife, Claire Rachel Kelly, and they were married in 1938, with Harlan Banks, who was also here as a graduate student, serving as Perry's Best Man at the wedding. The young couple began married life on Linden Avenue in Collegetown, later moving to a farm on the Coddington Road, and ultimately settling down in a spacious home on the Parkway. Claire and Perry's union was blessed with eight children: five sons and three daughters. In addition to being a busy, caring mother, serving as an always

gracious hostess, and enthusiastically performing all other duties of a faculty wife, Claire served as Perry's "keel and rudder" in his endeavors, editing or often co-authoring his many publications.

As a teacher, Perry was noted for the excellence and clarity of his lectures; his prowess at the chalkboard was legendary for his ability to produce symmetrical drawings using both hands simultaneously. As thesis advisor to his graduate students, he was a rigorous and demanding mentor, but always kind and helpful. His Ph.D. students, well prepared, entered the teaching profession imbued with a love for books and academic excellence as well as compassion for students. One of Perry's outstanding attributes was introducing his graduate students and junior colleagues to his wide circle of professional friends, both at scientific meetings and in his home. He enjoyed a good story and could tell one as well.

In the 1950s, the Gilberts bought a farmhouse in the Danby Hills surrounded by considerable acreage with a view of the valley. Through the years, they improved the property, known as "The Nob," modernized the house, and built a deep pond. It was a seasonal vacation retreat for the family, as well as the site of many social gatherings of Perry's colleagues and students, and his and Claire's many friends. The property remains in the family, much of it enrolled in the Finger Lakes Land Trust.

As a scientific investigator, Perry ranged widely. His doctoral dissertation (1940) had dealt with the anatomy of burrowing squirrels, the woodchuck in particular. On his first sabbatical leave (1949), he was appointed as a Carnegie Fellow in Embryology, working with Dr. George Corner in Baltimore. Several publications resulted, among them a beautifully illustrated monograph on the origin and development of the human extrinsic eye muscles. A subsequent sabbatical (1957) found him studying sharks at the Lerner Marine Laboratory on Bimini, with a Guggenheim Fellowship. In 1963, he was continuing shark studies with a fellowship at the Scripps Institution of Oceanography, La Jolla, California. When Cornell established the Isles of Shoals Marine Program in 1966 on Star Island in the Gulf of Maine, Perry was one of the founding faculty. He continued for the next several years as a Visiting Lecturer on the anatomy and behavior of sharks and rays.

By 1967, various aspects of the biology of sharks had become the focus of his future research endeavors. His reputation for expertise in this subject attracted the interest and support of governmental funding agencies, notably the Office of Naval Research, which encouraged and supported his experimental studies of ways to protect people in the water (downed aviators and shipwreck survivors) against attacks by sharks. Building on his interest in these matters, he established the National Shark Attack File, which focused attention on experiences of many survivors of encounters with aggressive sharks. During these years, he traveled widely to coasts of the world where

sharks were a problem and he served as editor of two authoritative publications: *Sharks and Survival* (1963), and *Sharks, Skates, and Rays* (1967).

In the 1960s, Perry carried on research as a Visiting Fellow at the Cape Haze Marine Laboratory in Placida, Florida, which was then under the direction of Eugenie Clark. He continued this relationship after the laboratory's move to Siesta Key and in 1967, while on leave from Cornell, he was invited and agreed to become its Director. Under Perry's leadership, the name of the laboratory was changed to the Mote Marine Laboratory, in recognition of the generous financial support provided by William R. Mote and the Mote family. The Gilberts moved from Ithaca to Sarasota, and through an ingenious arrangement, Perry retained his Cornell Professorship, becoming in essence a Professor in absentia. Each year he spent some weeks in Ithaca, giving lectures and consulting with students and colleagues. The university gained from policies established at the Mote Lab providing no-cost access to research equipment and teaching facilities for Cornell faculty and students. Perry, of course, treasured the distinction of his Cornell title, which also lent prestige to the Mote laboratory.

Under Perry's leadership, the laboratory flourished and became known as a center of excellence in a broad variety of disciplines in marine research. During these years, he demonstrated his rare talents as an administrator, in addition to continuing his own active research. In the mid-1970s, it became obvious that for a variety of reasons, chiefly resulting from problems of coastal erosion at the Siesta Key site, the Laboratory needed to be moved once again. Perry directed the planning, design, local politicking, and fund-raising leading to the construction of an elaborate new facility on City Island in Sarasota. Following the laboratory's successful move to this vastly superior location in 1978, Perry retired as Director and at the same time he was also named Professor of Neurobiology and Behavior, Emeritus, at Cornell.

Throughout his retirement, he continued his work at the laboratory as Mote Senior Scientist and as a member of its Board of Trustees. Upon the occasion of his retirement from Cornell, his friends honored him with a symposium of distinguished speakers, a banquet, and the establishment of an endowed "Perry Gilbert Lectureship in Comparative Anatomy and Behavior". Likewise at the Mote Laboratory, in recognition of his devoted service and successful leadership, the new Education Building was named in his honor. For the continuation of studies he had initiated, the Mote Marine Laboratory established an endowment for the "Perry W. Gilbert Chair in Shark Research". Perry is survived by his wife, Claire; and seven of his eight children.

Kraig Adler, John Anderson, Samuel Leonard, Howard Evans

Adam Capen Gill

Professor of Mineralogy and Petrography

August 22, 1863 — November 8, 1932

Death came suddenly in the evening of Tuesday, November eighth, 1932, to Adam Capen Gill, Professor of Mineralogy and Petrography. Earlier in that day he had engaged in animated discussion of the issues of the national election with some of his colleagues. It is thought that a minor physical strain suffered in the afternoon induced conditions that caused his death a few hours later.

Professor Gill was born at Chesterville, Maine, August 22, 1863. He received the degree of Bachelor of Arts from Amherst College in 1884, and, in 1893, the degree of Doctor of Philosophy from the University of Munich where he studied with Groth who later spoke of Gill as his most brilliant pupil.

In 1894 Adam Capen Gill was called to Cornell University as assistant professor of mineralogy and petrography, and in 1910 he was promoted to the full professorship. In June of the academic year 1931-32 he was retired with the title of Professor Emeritus, after thirty-eight years of service.

Professor Gill had outstanding ability as a teacher and devoted himself without reservation to his pupils. Both undergraduate and graduate students who had work with Professor Gill often declared that he was the most competent and inspiring of the instructors with whom they had come in contact. Although his teaching was primarily directed to give an understanding of the branches specifically in his charge, he also maintained that a division of knowledge into branches was mere convention, and that a teacher should be free to use the content and interpretations of other fields in serving the general cause of education.

Professor Gill kept abreast of the advances in his own subjects and on many topics his ideas were ahead of investigations in progress. Such ideas he gave freely to his students and colleagues, and in consequence he gained wide recognition outside Cornell University and was known as an authority in his field. His chief legacy to science is the considerable group of pupils who, as investigators and teachers, are doing significant work in mineralogy and petrography.

Those who were intimately acquainted with Professor Gill found him a friendly, genial, sympathetic man with whom they could always advise to advantage. He was actively engaged in the preparation of a book on Crystallography, a cherished project, during the months following his retirement from teaching. The loss caused through his death will be deeply felt by the University community.

Retirement: Faculty Records, p. 1748

David Clinton Gillespie

Professor of Mathematics

— *October 31, 1935*

In the sudden death of David Clinton Gillespie on October 31, 1935, Cornell University lost an able scholar and teacher, and his colleagues lost a beloved friend. He had served the University for twenty-nine years, first as Instructor and later as Assistant Professor and Professor.

The significance of Professor Gillespie's influence as a scholar and teacher can be fully appreciated only as one understands his concept of the subject to which he devoted his interest and intellectual activity. To him, mathematics was a mode of thinking; and for each individual mathematics must consist of only such truths as were inevitable consequences of his own rational thought; there could be no acceptance of authority. For him the vast accumulation of mathematical knowledge became knowledge only when his mind had followed through the reasoning and found the conclusion to be inescapable. He was essentially a critical scholar in the best sense. He was not only unable to give assent to fallacious reasoning on the part of others, but he had the rarer type of intellectual honesty that made it impossible for him to delude himself.

His colleagues in his department profited by his keen, but always kindly, criticism. If he could not follow their reasoning they found it wise to examine it more critically for themselves, and thus he helped to set a high standard for clear, straight thinking. It was probably inherent in his concept of mathematics that his own published contributions should be few and fundamentally important rather than numerous or lengthy, and that they should have to do with the strengthening of the foundations of the subject rather than the development of new systems and theories. For the service which he rendered on the editorial staff of the *American Mathematical Monthly* and later on that of the *Annals of Mathematics* he was particularly well qualified.

Naturally the teaching of such a man could never be perfunctory or formal. His students found, often to their surprise, that he was not asking them to learn rules from a textbook, but was trying to encourage them to do their own thinking. Utterly sincere himself, he expected sincerity in others. The disingenuous student found his patience short and his classroom uncomfortable, but the sincere and earnest student learned in time that his patience was really inexhaustible.

David Gillespie's personal character was outstanding. To those of his colleagues who came to know him well outside of the formal relationship of the campus, he revealed a side of his character which endeared him to them by

the closer ties of friendship. True, faithful and dependable, he was incapable of any meanness or jealousy. He was not only quick in his sympathies with all that concerned his friends, but he had a rare sense of humor combined with the innate charm and courtesy of the true Virginian. Hospitable himself, he was always a welcome guest in the home of a friend. On the golf course he was the ideal companion in a foursome. To Cornell undergraduate activities he gave loyal and enthusiastic support, and was always ready to help and advise in the affairs of the local chapter of his fraternity. Towards his students he was, naturally, reserved. He did not go out of his way to win undergraduate popularity, but students recognized his friendliness and came often to consult him. At reunion time, and, indeed throughout the year, the Gillespie home was the goal of the visit of many an alumnus to Ithaca. To them he epitomized the best traditions of Cornell.

David Gillespie will be long remembered by a host of friends for his quiet effective life. In his passing the University, the community, and his personal friends have suffered a great loss.

Herbert Lester Gilman

October 26, 1895 — October 27, 1982

Born on October 26, 1895, at Woodbury, New York, Herbert L. Gilman received his early education in the Brooklyn schools and graduated from Richmond Hill High School in 1913. During the summers of his boyhood he frequently rode in a horse and buggy with his uncle, who was a country practitioner. These experiences led to his choice of veterinary medicine as a lifelong career.

He entered the New York State Veterinary College at New York University in the fall of 1913. After one year he transferred to the New York State Veterinary College at Cornell and received his D.V.M. degree in 1917.

Upon graduation he was commissioned as a 2d lieutenant in the Veterinary Corps, United States Army, and stationed at Headquarters Staff, 77th division, at Camp Upton, New York. Later he was moved to the Auxiliary Remount Depot and promoted to 1st lieutenant in April 1918. He was also stationed at Camp Greenleaf, Georgia, and at the Veterinary Base Hospital at Camp Lee, Virginia. In January 1919 he was discharged from the service and began practice in Glen Cove, Long Island. But practice did not offer the challenge he had expected, so he turned to research.

He had married Edwina Julian Haggard of Cleveland, Tennessee, on December 27, 1918, and they moved to Ithaca in the fall of 1919, where he began his graduate work under W. L. Williams, V.A. Moore, B. F. Kingsbury, and R. R. Birch. A Master of Science degree was awarded in 1920 and a Ph.D. in 1922. During this time he held the position of instructor in obstetrics. In 1922 he was made assistant professor of research, in 1938 professor of research, and in 1949 professor of bacteriology.

In the early years he was associated with Dr. W. L. Williams. Later he became a researcher with Dr. R. R. Birch. Dr. Gilman conducted the laboratory work and Dr. Birch supervised the fieldwork. Nearly forty papers on brucellosis were produced as a result of this collaboration. An orderly and systematic worker, Dr. Gilman controlled the accuracy of the state laboratories for the blood testing of cattle for brucellosis from the time the work was begun. He also manufactured the official antigen for New York State without receiving a single complaint. In addition, he was one of two referees for the standardization of brucellosis testing for the Official Research Workers in Animal Diseases of North America.

During his professional career Dr. Gilman investigated most of the reproductive diseases of cattle and published over sixty papers bearing on this work. He is credited with much of the pioneering laboratory work on brucellosis, vibriosis, and trichomoniasis. As a result of his extensive research on reproductive diseases and sterility in dairy cattle and specifically for his investigations regarding bovine brucellosis, trichomoniasis, and vibriosis, he was the recipient of the Borden Award from the American Veterinary Medical Association in 1956.

He was an active member of several professional and honorary societies, serving as president of the Southern Tier Veterinary Medical Association in 1954 and as chairman of the section on research of the American Veterinary Medical Association for a number of years. He was also active in the New York State Veterinary Medical Society and in the Official Research Workers in Animal Diseases of North America. Besides being a Past Master of Hobasco Lodge No. 716 F. and A.M., he held membership in the honorary societies of Phi Zeta and Sigma Xi.

Dr. Gilman retired in June 1962 after devoting forty-five years to the New York State Veterinary College and the veterinary profession. Because of his great love of the Thoroughbred horse and “the sport of kings,” his friends and colleagues helped him celebrate with an outing and dinner at the Finger Lakes Race Track.

The Gilmans moved to Miami, Florida, for their sunset years and were able to enjoy about twenty years in retirement together. At the time of his death Herbert was eighty-seven. He is survived by his wife, Edwina.

Dorsey W. Bruner, James H. Gillespie, Ellis P. Leonard

Robert M. Gilmer

December 10, 1920 — July 17, 1999

Robert M. Gilmer, 78, Professor Emeritus of Plant Pathology and former chair of the Department of Plant Pathology at Cornell University's New York State Agricultural Experiment Station, Geneva, New York, died unexpectedly on Saturday, July 17, 1999, at his home in Brooksville, Florida.

Professor Gilmer was born on December 10, 1920 in Lawrence, Kansas. He attended Emory University, Atlanta, Georgia, for two years before going into the service during World War II. Following the war, he received his B.S., M.S., and Ph.D. degrees in 1947, 1948, and 1950 respectively from the University of Wisconsin. He joined Cornell as an Assistant Professor in the Department of Plant Pathology at Geneva in 1950. He was promoted to Associate Professor in 1954, and to Professor in 1959.

Bob was an outstanding plant pathologist. He established a worldwide reputation for his knowledge of virus diseases of deciduous fruit crops. But, for those who worked closely with him and became his friends, he will be remembered foremost for his intelligence, his great breadth of knowledge of plant diseases, and being a free-thinker who challenged our conventional views. Bob was also known for his broad experiences in different areas, for being a voracious reader, for his photographic memory, and for helping younger members of the Geneva faculty develop their careers. He was an engaging raconteur and conversationalist. Several of his colleagues also appreciated him as an astute bridge and poker player.

In addition to an outstanding career as a researcher, Bob served as acting chair and then chair of the Department of Plant Pathology from 1967 to 1972. He retired from Cornell on December 31, 1975.

Most of his research efforts were concentrated on virus diseases of deciduous fruit trees and grapevine. He found that several leafhopper species were efficient vectors of X-disease of stone fruits. The agent that caused this disease, which was first believed to be a virus, was later demonstrated, using electron microscopy, to be a mycoplasma. This led to the use of chemotherapy to treat the disease.

Bob also investigated the sour cherry yellows disease. This disease was widespread in sour and sweet cherry orchards throughout New York State. The virus involved in the disease complex brought about severe reduction in fruit production. At the time, sour cherry yellows disease was the most important virus disease in cherry. Bob conducted an extensive search for a source of resistance to the disease, but was unable to find any. However, during this research, he was able to identify and separate two commonly occurring cherry viruses — prune dwarf and

necrotic ringspot — and implicate them in the disease. He also demonstrated that healthy cherry trees can become infected by pollen that are carrying these viruses. This discovery helped to explain the rapid spread and common occurrence of sour cherry yellows disease in commercial orchards.

Bob's pioneering research on grapevine virus diseases in eastern North America resulted in significant contributions. A disease caused by the tobacco ringspot virus was initially found in 1967. It had not been previously reported to infect grapes. However, as a result of this research, surveys in vineyards in New York State and Canada revealed widespread occurrence of this disease. In 1974, a program was initiated to identify resistant scion and rootstock varieties and evaluate methods to control the nematode vector. Largely because of Bob's persistence, official rules and regulations were developed in 1973 for a grapevine virus disease certification program. This program provided growers protection against purchasing virus-infected grape plants as well as trueness to variety type. Eventually, the Nursery Inspection Unit of the New York State Department of Agriculture and Markets took over the program as part of its regulatory and detection duties.

In his 26 years at the Geneva Station, Bob published 90 scientific articles and numerous abstracts of talks presented at scientific meetings. He was a member of the Association of Applied Biologists and the American Phytopathological Society. In the latter, he was Secretary-Treasurer of the Northeastern Division in 1965, Vice President in 1966, and President in 1967. He was conferred the Distinguished Achievement Award of the Northeastern Division in 1976.

In 1957, he spent a six-month sabbatical leave as a Visiting Plant Pathologist at the East Malling Research Station, near Maidstone, Kent, England. In 1972-74, he was a Visiting Professor at the Department of Agricultural Biology, University of Ibadan, Nigeria, under the auspices of the Rockefeller Foundation. Bob was a member of the Alpha Epsilon Upsilon, Alpha Zeta, and Sigma Xi honorary societies.

In retirement, Bob and his wife, Eleanor, lived in Brooksville, Florida. However they returned annually to Geneva, usually coinciding with the annual dinner of the bridge group, when reminiscences were in full flow. It was only days after the bridge dinner in 1999 that Bob succumbed to a heart attack while cutting wood in his yard. We have acutely missed their presence at the last two dinners.

Bob established a special trust fund that will eventually provide funding for support of Cornell graduate students in Plant Pathology at Geneva.

Bob is survived by his wife, Eleanor, and sister, Joanne (Robert) Hammond, both of Fort Walton Beach, Florida.

Frank F. Gilmore

June 6, 1911 — January 1, 1992

Frank Gilmore taught in Cornell's Graduate School of Business and Public Administration (now the S.C. Johnson Graduate School of Management) from 1955 to 1974. Previous to 1955 he taught at Washington University and the Harvard Graduate School of Business. In his early years he taught production, but his interests evolved into business policy and strategy.

Coincident with his arrival at Cornell University he became the Director of the School's highly successful Executive Development Program and was one of the most appreciated teachers in that program. After becoming Emeritus he continued to teach in the program for many years after his retirement. Much of Cornell's success in executive education can be attributed to Frank's dedicated efforts.

Frank was one of a group of senior professors who believed in treating junior professors as equals and students as being the School's most important concern. He worked hard to teach effectively and was successful in his efforts.

But all was not smooth as the above implied. To illustrate production operations, Frank had the School buy a large machine tool which was placed in an upper floor classroom in McGraw Hall (the initial home of B&PA). The floor began to tilt, the building and grounds department insisted that the machine be moved to the basement, and Frank shifted his teaching interests to business policy.

Then there was the afternoon party thrown for Bill Carmichael, newly appointed dean, by Frank and his wife, Mary Lee. The day was very hot and everyone drank heartily of the "fish-house punch". Unfortunately, it became apparent later in the afternoon that this was not a fruit punch as the innocents had assumed. It was an impressive welcoming for our new dean.

And then there was the time Frank went to Trinidad to help the University of the West Indies initiate a management development program. The Pro-Vice Chancellor (Dudley Huggins) took Frank for a picnic and a swim in the Caribbean. Frank swam out past the diving raft, and Dudley waved frantically from the beach. Frank's companion swam in to determine Dudley's concern. It seems that where Frank was swimming was the home of unfriendly sharks and, in addition, in a few minutes the tides would sweep him to sea, if he survived the sharks. His exhausted companion (a poor swimmer) swam out to Frank who then started to argue that the swim was perfectly safe. Out

of compassion for his companion (now about to drown), he reluctantly abandoned his exercise and returned to safer waters. Yes, the executive programs conducted in Trinidad were big successes.

Frank was a loyal, generous friend and an outstanding teacher of business policy. He devoted a large percentage of his career advancing the well-being of B&PA (the Johnson School) and he is remembered by his former colleagues with affection and admiration.

Alan McAdams, Seymour Smidt, L. Joseph Thomas, Hal Merman

John Daniel Gilpatrick

February 24, 1924 — March 3, 1982

The untimely passing of John Daniel Gilpatrick on March 3, 1982, evoked the following appropriate tribute by an internationally known plant pathologist in Great Britain: “Besides his scientific wisdom and his broad, yet detailed knowledge of apple diseases and their control, his quiet friendliness and concern for others has greatly impressed us. He will be greatly missed both as a scientist and as a man.” All who knew John and worked with him professionally concur in this appraisal.

John D. Gilpatrick was born February 24, 1924, in Rumford, Maine. His family moved to Canada, where, in addition to his public school education, he earned the Bachelor of Science degree in agriculture at McGill University, MacDonald College, Quebec, in 1946 and his Master of Science degree at the University of Alberta in 1948. He earned the Doctor of Philosophy degree in plant pathology at the University of California, Berkeley, in 1961-

Prior to joining Cornell University, Dr. Gilpatrick had more than fifteen years of professional experience in applied agricultural research through his associations with Shell Development Company in California, the Squibb Institute for Medical Research in New Jersey, and the Chemagro Corporation in Kansas. As technical representative for Chemagro, John resided in New York State and became involved with many Cornell scientists at Ithaca and Geneva in cooperative research on chemicals for disease, insect, and mite control. He was appointed assistant professor in the Department of Plant Pathology at Geneva on January 1, 1968, and was promoted to associate professor with tenure in 1971.

Dr. Gilpatrick accepted his responsibilities to promote research for the benefit of the fruit-growing industry in New York State with serious dedication. His research integrated the impacts of climatic conditions, fruit tree development, fungus inoculum pressures, and fungicidal modes of action in special protective and eradicated spray programs for the most effective control of major fruit diseases. In New York State these included apple scab, apple powdery mildew, cedar-apple rust, cherry leaf spot, fire blight of pears and apples, and brown rot of peaches, cherries, and prunes. Evaluation of fungicides and programs was made with varied ground-spray equipment and with aircraft. The underlying aim of the research was the most effective commercial control of orchard diseases with the least number of sprays through the growing season. With a colleague, Dr. Gilpatrick initiated the single application treatment (SAT), whereby a single orchard spray of the fungicide difolatan in the spring, as the first

leaf tissue became visible from apple fruit buds, gave effective control of apple scab until after bloom. Usually four or five sprays are applied during this period.

In 1969 there was a dramatic and unprecedented failure of the widely used fungicide dodine to control apple scab in New York State. Dr. Gilpatrick and a colleague developed specialized techniques in proving the cause to be the unusual development of resistance on the part of the apple scab fungus *Venturia inaequalis* to the fungicide. In the history of plant pathology this was the first proven case of a crop-destroying fungus developing resistance to a major fungicide used in agriculture. This, together with later discoveries at Geneva and elsewhere of resistance of disease-causing fungi to benzimidazole fungicides, opened a major new area of concern and studies for plant pathologists worldwide.

Dr. Gilpatrick's contributions from research on disease control were well recognized by fruit growers and by extension personnel and industry representatives whose concern it is to advise people in agriculture on improvements in food production. Added to this, his great efforts aimed at the prevention of further erosion of a diminishing reservoir of fungicides needed for plant disease control brought him further national and international recognition. Dr. Gilpatrick's research on fungicides provided valuable information for annual updating of official state recommendations on disease control.

The extensive research program conducted by Dr. Gilpatrick at Geneva was possible only through the infusion of more than \$300,000 in grant funds that he secured to augment statutory support. Much of the funding came from cooperating chemical industries, from federal (CIPM—Consortium for Integrated Pest Management) support for research on apple diseases and pests, and from BARD, a cooperative United States-Israel project dealing with fungus resistance to fungicides.

Dr. Gilpatrick was a longtime member of the American Phytopathological Society (APS) and an aggressive worker on the society's Chemical Control Committee. He was chairman of an APS-sponsored symposium, "Resistance of Plant Pathogens to Chemicals," in 1976 in Kansas City; served on the editorial committee of the APS-sponsored publication *Fungicide and Nematicide Tests*; with colleagues prepared a comprehensive report, "Integrated Pest Management for Northern Deciduous Tree-Fruits," for inclusion in *Pest Management Strategies in Crop Protection*, volume 2, compiled by the Congress of the United States, Office of Technology Assessment; and chaired a committee that prepared a unique treatise entitled *Contemporary Control of Plant Diseases with Chemicals—Present Status, Future Prospects, and Proposals for Action* for the Environmental Protection Agency (EPA) under contract with APS.

On the international scene, Dr. Gilpatrick served as a member of the Panel of Experts on Pest Resistance to Pesticides and Crop Loss Assessment in the Food and Agricultural Organization (FAO) of the United Nations World Health Organization. He participated in their meetings in Washington, D.C., in 1976 and in Rome, Italy, in 1978. Valuable information was made available to scientists worldwide through publication of the panel deliberations and conclusions in the *FAO Plant Protection Bulletin*.

Because of his expertise and the research conducted by Dr. Gilpatrick, he was invited to lecture and teach laboratory techniques on resistance at a special school convened at the Agricultural University at Wageningen, the Netherlands, in August 1980 and 1981. He also participated in the third International Congress of Plant Pathology in Munich, Germany, in 1978; the ninth International Congress of Plant Protection in Washington, D.C., in 1979; and the 1981 British Crop Protection Conference in Brighton, England, in November 1981.

Dr. Gilpatrick took his first sabbatic leave in 1974 to conduct research on apple and pear diseases at the Volcani Center of the Agricultural Research Organization in Israel. In 1980 he spent another sabbatic leave with the Ciba-Geigy Corporation in Basel, Switzerland. Here, his research was focused on the mode of action under certain environmental conditions of a new family of fungicides whose activity against disease-causing fungi is through vital inhibition of ergosterol synthesis.

In 1946 John Gilpatrick married Kathleen E. Weiss, affectionately nicknamed Twink. John was a devoted family man, always ready to meet the many challenges as the family grew to nine children. He set an enviable example of providing all the ingredients necessary for the health and well-being of the family and, additionally, for their formal education and character development. He and his wife became enthusiastically involved in the many extramural interests of the children; this included years of participation with their sons' and daughters' athletic pursuits, particularly in baseball and basketball. John is survived by his wife; six daughters: Sally Wash, Nancy Greenstreet, Leslie Wood, Rebecca, Jennifer, and Amy; three sons: Robert, Steven, and Thomas; one brother, Claude; one sister, Laura Gates; and six grandchildren.

George S. Abawi, Rosario Provvidenti, Michael Szkolnik

Judith Ruth Ginsburg

October 18, 1944 — December 28, 2002

Judith Ruth Ginsburg, Associate Professor of Classics, died at home on December 28, 2002, with Miri Amihai, her partner of twenty-four years, at her side. Born on October 18, 1944 and raised in Omaha, Nebraska, Judy had been, since her appointment in 1976, one of Cornell's most beloved teachers and colleagues.

From family through those who knew her only in recent years, a consistent picture emerges. Her cousin Liz remembers her "gentle ways," her "subtle and surprisingly wicked sense of humor," and her "loving generous soul." An early baseball fan whose arm is remembered fondly by intramural teammates, Judy was recently photographed in a Giants uniform at Cooperstown's Baseball Hall of Fame. Her brother Jim—who says Judy taught him to throw and defended him from neighborhood bullies—credits his life today to her "tough love." As a child, he was amazed at Judy's ability to say, simply, "I don't know" (surely a source of her students' respect for her). But what inspires him now is the fact that "in her entire life [he] never knew one time she ever caused harm to anyone."

Judy quickly won the respect of her own teachers: Ralph Johnson at Berkeley—where she earned an A.B. degree in Classics, an M.A. degree in Latin, and a Ph.D. degree in Ancient History—describes his experience:

Berkeley, in the late 60s: Outside, as usual, all hell is breaking loose. Here inside where the blinds are drawn and the noise is muffled, the students in my Latin Prose Composition...are staring at their Ciceronian versions of a passage from Henry Clay. I ask the shyest member (having carefully refrained from calling on her till now) to put her translation 'on the board.' As the chalk begins to click and Judy's clauses begin to flower beneath her hand, my astonishment gives way to sullen envy, which dissolves into admiration and joy. It is now no longer clear here who is teaching whom - or rather, it is suddenly all too clear.

But "the shyest member of the class" also went outside. She protested the war in Vietnam and participated in the free-speech movement, landing in jail alongside Mario Savio, who took the spotlight while Judy did her homework. These are early examples of her constant quiet but courageous activism. While still untenured, she protested the Israeli incursion into Lebanon; and her support for the Jewish-Arab Center for Peace at Givat-Haviva never flagged. As with people she loved, so with countries she loved, Judy did not shy away from frank but always fair and good-willed criticism.

Judy generously served both Cornell and her discipline. She was elected to Cornell's Humanities Council; served for sixteen formative years on the Executive Board of Women's Studies; for twenty-two years as Cornell's representative to the American Academy at Rome (where she also spent several semesters as a Visiting Fellow);

and was, at the time of her death, co-chair of the American Philological Association's Nominating Committee. But Judy was especially involved in committees devoted to the interests of vulnerable peoples: for example, the APA's Committee on the Status of Women and Minority Groups (which she chaired from 1985-87). At Cornell, she helped write procedures for handling charges of Sexual Harassment; served on the AIDS advisory Committee; the Committee on Professional Ethics; and the University Benefits Committee (which, during her term, extended benefits to partners of gay and lesbian employees). But Judy did not just serve on committees: she is, for example, remembered as one whom, in the early days of AIDS paranoia, was not afraid literally to extend a loving hand to those afflicted.

Throughout her service, Judy excelled as a teacher and made important contributions to Roman historiography. Her dissertation—published in 1981 as *Tradition and Theme in the Annals of Tacitus*—asked and answered a fruitful question: how did Tacitus adapt the traditional annalistic format, associated primarily with Roman Republican historiography, to shape and add meaning to his narrative of a transformed political system, the principate? Erich Gruen wrote:

She demonstrated brilliantly and convincingly that Tacitus utilized the annalistic form of composition to his own ends, remaining within its framework to give the illusion of conventionality, while manipulating it so as to provide a vehicle for his idiosyncratic reconstruction.

When Judy's book appeared, Tacitean studies were strongly historical in emphasis; since then readings of Tacitus as a historiographer have blossomed, thanks largely to the seeds sown by her.

Judy followed up with several historical and literary studies, steadily developing skills that afforded sharper and more nuanced readings drawing not only on the tools of the historian—epigraphy, numismatics, portraiture—but also on critical insights from her work in Women's Studies. She worked increasingly on figures marginalized by dominant historical traditions and was, at the time of her death, completing an imaginative and methodologically sophisticated reading of Tacitus' depiction of Agrippina. (In her weakened state, she discussed the changes she intended with former Cornell colleague Elizabeth Asmis, who is helping to prepare the manuscript for publication.) Agrippina—the daughter of Germanicus, wife of Claudius and mother of Nero—is the flashiest and most alluring of Roman women, most often discussed with a sensationalism that might have embarrassed even Tacitus. She is thus all the more suited to Judy's approach: a skeptical examination not only of Tacitus' narrative, but also of depictions of Agrippina in sculpture and oratory. Like Judy's first book, this one aims not to uncover lies but to reveal patterns of cultural and social understanding; but unlike the first, which opened up an exciting new field,

this book shows how a frequently read —and misread—historical narrative can be revisited with greater depth, subtlety and insight.

Judy's positive impact on her students was enduring: from the high-school students in Telluride's Summer Program; through undergraduates in History, Classics, and Women's Studies; to the advanced graduate students who wrote outstanding dissertations under her loving but always tough direction. Her goals were to teach the skills students needed to enrich their own readings of ancient texts and to relate those texts to their present personal and political lives. Former graduate student Leslie Collins Edwards said:

As she approached Sallust and Tacitus, so Judy read the texts we produced for her. Of course...our texts not quite so worthy; her efforts caught our errors and extraneous tangents. But Judy's criticism was always positive, always contributing to the healthy delivery of a new argument.

Judy treated her undergraduates with the same respect. Lauren Donovan ('03) said:

[Judy] never provided me with her own answers to my questions...Instead, she asked more questions, listened to my concerns and ultimately showed me how to find my own answers. She helped me learn to trust myself.

Adam Cooper ('03) added:

Her courses...remained mutable and thus drew strength from the interests and talents of her students, and so became personally engaging for each. Every student felt as if the class had been personally designed for him or her, and that each in turn had something unique to contribute.

Judy's career was in some sense the fruition of her characteristically modest high-school ambition – “to teach Latin”. But, according to former student Don McGuire, “to say Judy taught Latin is like saying Bernini built buildings.”

Pietro Pucci traces Judy's success as a teacher largely to her ability to admire her students:

Most teachers try to win the admiration of their students...I think Judy tried to find a student to admire. She knew that the talents of students do not appear...as flashing things, but are hidden, sometimes covered. So she looked hard; she would not trust bureaucratic papers...she would like to see deeper; and when she would find that student, she would be helpful, helpful, helpful, because she knew how precious this student is, and what a chance this student gives to us the teacher and the values which we want to transmit to the younger generations, values of scholarship and understanding, of passion for research, passion for understanding the world.

Pucci also traces Judy's lifelong reserve, together with her ability to laugh, to deep wisdom.

Throughout her life, Judy had a keen sense of what really mattered. She was, according to her friend Patti Jacobson, a deeply observant Jew, not in terms of following rituals but in the sense that “her life was defined by the observance of the ethical mitzvot: she believed strongly in performing acts of tikkun olam (repair of the world) and tzedakah (justice).” This sensibility contributed to controversy surrounding the ritual of her burial; she is thus buried in the part of Lakeview Cemetery where her sympathies no doubt lie, with various marginalized members of her faith. But Judy—whose career was dedicated to the lives and memories of marginalized peoples—would surely be among the first to appreciate this little irony. We shall miss her laughter and the deep wisdom that informed it.

Lynne Abel, Jennifer Whiting, Jeffrey Rusten

Bernard Gittelman

October 28, 1932 — November 25, 2006

Bernard Gittelman, Cornell Professor Emeritus of Physics, died November 25, 2006 at age 74. The cause of death was amyotrophic lateral sclerosis (also known as ALS or Lou Gehrig's Disease).

Gittelman earned his Bachelor's and Ph.D. degrees at the Massachusetts Institute of Technology, and then worked as a Research Associate at Princeton University from 1958-66 and Stanford University from 1966-69. At Stanford, he collaborated with Burton Richter, Gerard O'Neill and W.C. Barber to construct the first colliding beam device, a storage ring pair that scattered electrons on electrons. These physicists used the storage ring in a unique experimental test of quantum electrodynamics and in novel searches for new particles and phenomena. When the Stanford Linear Accelerator came on line, he participated in a definitive series of experiments that measured the production of elementary particles by the highest energy photons available at the time.

Gittelman joined the Cornell faculty in 1969. He led a series of experiments exploiting photon and electron beams produced by the Wilson Laboratory 10 GeV Synchrotron to investigate the production and decay of elementary particles. These experiments included measurement of the lifetime of particles called neutral pions, which have a very short lifetime that is notoriously difficult to measure. This measurement utilized a subtle effect (called the Primakoff effect) in the production of neutral pions by photons. Today, over 30 years after Gittelman and his colleagues published their result, this measurement remains competitive with other more recent measurements.

In addition to his leadership in the experimental elementary particle physics program at Cornell, Gittelman participated actively in important experiments at Fermilab (near Chicago) and DESY (Hamburg, Germany). At Fermilab, he was involved in early and often-cited measurements of the scattering of a variety of high-energy particles on protons. At DESY, he participated in early studies of the properties of the J/ψ meson.

Gittelman was a pioneer in the design and development of the electron-positron storage ring facility at the Wilson Synchrotron Laboratory. He was one of the founders of the CLEO collaboration, the large multi-university collaboration devoted to exploiting the Cornell Electron Storage Ring (CESR) for the study of the production and decay of new particles containing heavy quarks. He was a leader in the design and construction of the CLEO detector and its later-year upgrades. He served as elected run manager and analysis coordinator, and was the collaboration expert on high-energy electron detection. The Cesium-Iodide electromagnetic shower detector array that he pioneered has since been copied in many other laboratories. He was a participant in the discovery

of the B meson, the first-known particle containing the heavy b (or “bottom”) quark, and he contributed to the discovery of many more properties of the b quark. Gittelman’s contributions were one of the key reasons why Cornell and the CLEO collaboration led the world in heavy quark physics during the 1980s and 1990s. In 1987, Gittelman was elected a Fellow of the American Physical Society:

“for contributions to the design of storage rings and detectors as well as for contributions to the understanding of the physics of the production and decay of B mesons.”

Beyond his research effort, Gittelman was an enthusiastic and devoted teacher at Cornell. He especially enjoyed teaching laboratories in introductory physics courses and he designed new experiments for them. He was an excellent team worker in these courses and he was dedicated to ensuring the quality of the materials prepared for students.

Gittelman lived life to the fullest; he was a tenacious tennis player and he enjoyed skiing, windsurfing, music, theater, and dancing, especially swing and square dancing.

After his retirement in 2002, and in spite of his illness, Gittelman continued his involvement with the CLEO research program and the intellectual life of the Laboratory for Elementary-Particle Physics. Only a few days before his death, he visited the laboratory to discuss the latest developments in the CLEO experimental program.

His wife Sandra; brother, Joseph; daughter, Jan; sons, Arye and Joshua; and four grandchildren survive Gittelman.

Karl Berkelman, Chair; David G. Cassel, Ahren Sadoff

Fred Elmer Gladwin

September 3, 1877 — November 16, 1940

Fred Elmer Gladwin was born in New York Mills, near Utica, New York, on September 3, 1877, but spent most of his boyhood days in Rochester. He attended the Brockport Normal School and was graduated from the University of Rochester in 1904. Soon after his graduation he was appointed head of the department of biology in the Dallas (Texas) High School. He filled this position until 1907, when he became a nursery inspector for the Western New York district for the New York State Department of Agriculture and Markets. In 1909, he was appointed special agent of the New York Agricultural Experiment Station and put in charge of the Vineyard Laboratory at Fredonia, New York, which came into being that year. Later he was made associate in research at the New York State Agricultural Experiment Station, and in 1936 was made chief in research in pomology, a position he held at the time of his death. His entire period of service with the Station, however, was spent at the Vineyard Laboratory which now occupies an important place in the grape industry. Professor Gladwin was also a veteran of the Spanish-American War.

Although Professor Gladwin had not taken any advanced university work, he had a broader training and a wider experience than most men. At the university he secured a general education, while at the normal school he learned the fundamentals of pedagogy. This training, combined with his experience in teaching biology in Texas, and his association with farmers and nurserymen while an inspector in the State Department of Agriculture and Markets, fitted him well for his contact with the public. Professor Gladwin was industrious, keen of observation, conscientious, and sensitive, and very discerning of all natural phenomena. No one in the country had a broader grasp of the grape industry and its problems than he. His work with fertilizers, cover crops, green manure crops, rootstocks, and pruning, and his thorough acquaintance with general cultural practices made him an authority in his field. He was much in demand as a speaker before audiences of growers in every grape growing region in the country. He was also the author of many popular and technical publications on grape growing. One of his greatest contributions to the grape industry was his demonstration, in 1914, that nitrogen deficiency was the most important limiting element in the growing of grapes in Chautauqua County soils. In his study of winter injury of the grape he demonstrated his ability to correlate and interpret miscellaneous facts. In the breeding of grapes, Professor Gladwin was able to combine a rare understanding of grape varieties with a practical appreciation of what the grape industry needed, so that from a relatively limited seedling population there appeared through his

efforts the now popular Fredonia, Van Buren, and Westfield varieties. Several other of his seedlings are showing considerable promise and these will be named and introduced if further tests prove them worthy of trial.

Merely to enumerate his professional attainments would be to overlook the fact that he had a warmth of personality and sincerity and modesty of purpose which gained him countless friends and admirers and innumerable believers in the soundness of his recommendations and opinions. His advice and sound counsel were sought not only in the agricultural field but in the community in which he lived. For many years he was a member of the school board of Fredonia. He was interested in every worthwhile undertaking in the community and was willing to serve in any way he could. This he did until the day of his untimely death.

Cornell University has lost an able worker, the grape growers a wise counselor, Fredonia a good citizen, and his hosts of friends a genial, loyal, and lasting friendship which they will always cherish.

Hugh Glasgow

November 17, 1884 — July 17, 1948

Hugh Glasgow, Head of the Division of Entomology, New York State Agricultural Experiment Station, Geneva, died at his home July 17, 1948. He was born in Tennessee, Illinois, November 17, 1884, and was married December 28, 1935 to Dr. Beulah Ennis, who survives him.

Dr. Glasgow received from the University of Illinois the A.B. degree in 1908 and the Ph.D. degree in 1913. He served as Nursery Inspector for the Illinois State Natural History Survey during the summers of 1908 to 1910, inclusive. He held the position of Assistant Entomologist at the University of Illinois from 1910-12 and was Instructor in Entomology from 1913-14. He was appointed as Assistant Entomologist at the New York State Experiment Station at Geneva in 1914, where he served continuously until the time of his death. During this period he advanced in rank with the following titles: Associate in Research, 1919-29; Chief in Research, 1929-38; Chief in Research and Head of the Division, 1938-41, when the title was changed to Professor of Entomology and Head of the Division, 1941-48.

Dr. Glasgow was a member of Sigma Xi; a fellow of the American Association for the Advancement of Science; a member of the Entomological Society of America; and a member of the American Association of Economic Entomologists, serving as Vice-president and Chairman of the Eastern Branch from 1944-45.

Dr. Glasgow's investigations from 1914 to about 1925 were divided about equally between important insect pests of fruits and vegetables. His later contributions were mostly on insects affecting vegetables, especially those injuring canning crops. He was a keen observer; his experiments were made with great care and thoroughness and are described in about 40 bulletins and professional papers. He was very popular with fruit and vegetable growers and with those connected with the canning industry because he made every effort to solve their insect problems as quickly as possible. Not only did he devise practical remedies but with some pests he also developed methods whereby the field men of the canning industry were able to predict insect conditions to such a nicety that they could advise growers when treatment was necessary or when it could be eliminated. Accomplishments of this nature are very important in popularizing the investigations of the university with the agricultural public.

Dr. Glasgow continued active in field research while Head of the Division, even though it required many extra hours of work. As an administrator his aim was to build a strong Division by aiding the less experienced men, even assisting them in the field at critical times, thus setting an excellent example to those under his direction.

Everyone who came to him for advice and suggestions was aided. His helpfulness to others was an outstanding characteristic. Companionable, unassuming, and free from all pettishness, he endeared himself to all who knew him. In his passing, fruit and vegetable growers have lost a devoted worker, Cornell University a keen investigator and his associates a faithful and highly esteemed friend.

F. Z. Hartzell, J. D. Luckett, C. E. Palm

Edward Hadley Glass

February 19, 1917 — January 6, 2005

Edward Glass, Emeritus Professor of Entomology, was a noted fruit entomologist at the New York State Agricultural Experiment Station at Geneva. His research, which spanned more than six decades, focused on the control of crop pests, and saw the goals of crop protection change from conquest to sustainability.

Ed's youth was spent in the small town of Lexington, Massachusetts, scene of a pivotal battle in the Revolutionary War. His family was industrious middle class, dedicated to education and community service. His experience on the family farm introduced him to Yankee ingenuity and the tribulations of farming, which included control of insect pests. Ed was conditioned by these aspects of his youth as he embarked on his formal training in entomology. He earned degrees from three prestigious institutions: a B.S. degree from University of Massachusetts, 1938; an M.S. degree from Virginia Polytech Institute, 1940; and a Ph.D. degree from Ohio State University, 1943. His formal training was followed by employment with American Cyanamid Co., a leader in production of agricultural chemicals, including insecticides.

While appreciating the opportunity to gain experiences in the industrial arm of agribusiness, Ed was drawn to academics, joining the Cornell faculty in the Department of Entomology at Geneva in 1948, where he was assigned to research the biology and control of insect pests of fruit.

No list of his accomplishments would be complete without commenting on the team of Ed and his wife, Nell. Nell's striking beauty was accompanied by the grace and gentility of her southern heritage acquired in Boydton, Virginia. Ed, in striking contrast, was a Yankee stalwart through and through. He was deliberate, taciturn, with a rock-ribbed sense of duty and decorum. While Nell was the gracious hostess of the social scene, Ed was master of the manly arts —building boats and houses, sailing, swimming, and making fine furniture. All this was done in a deceptively “laid back” manner that belied his leadership potential. Their attractive, and well-appointed Cape Cod home provided the setting for gracious entertaining. For many couples, such a contrast in personalities would spell trouble. Not so with Ed and Nell. “They grew not in each others shadow.” Instead, they both subscribed to that altruistic concept: “Let my love, like sunlight, surround you and yet give you illuminating freedom.” (R. Tagore, *Fireflies*, 1928.)

Ed's wife, Nell and their son, Ted, survive him. Their daughter, Anne, predeceased her father in 2000 and is survived by her husband, Professor Terry Acree, Food Science and Technology at Geneva. Anne had a deep commitment to

the well being of children. This passion enabled her to touch the lives of a generation of young people through her leadership at Head Start in Geneva. Ted, with artistic interests, followed his own bent. He pursued a career in TV and artistic film production. Like his sister, he was drawn to the human drama and social justice. Ted and his wife, Debra, have two children, Edward H. and Samuel. Like two pots of gold at the end of the rainbow, they became the highlights of their grandparent's lives.

Ed appreciated the importance of congeniality between town and gown—the Cornell Experiment Station and its host city, Geneva. He assumed a leadership role in support of the civic and cultural institutions of the city, including the Presbyterian Church, Rotary, Community Chest, Geneva Concerts, Geneva General Hospital, Seneca Yacht Club, Planned Parenthood and Finger Lakes Forum. Ed budgeted his time wisely, “peeled one potato at a time” and despite his many activities projected the image of an orderly purposeful leader.

Little did Ed realize when he joined the Cornell faculty that he would soon be in the eye of a storm, one that would greatly influence the course of his career. He immediately plunged into the urgent post World War II process of “beating swords into plowshares,” adapting and applying scientific and technical breakthroughs to peaceful ends. The challenge to the field of entomology was clear. DDT had gained wartime recognition as the “silver bullet” by its spectacular control of lice-borne typhus epidemic in Naples in 1943-44. Other compounds soon followed, and a new age of insect control had dawned. Caution was thrown to the wind. Enthusiasts predicted eradication of the traditional scourges of medical and agricultural pests, such as malarial mosquitoes and the cotton boll weevil.

The euphoria of magic insecticides was short lived, as Ed and other perceptive investigators observed disturbing side effects. These included disruptions to ecosystems, and threats to both workers who applied pesticides and consumers of treated products. All this changed in 1962 when Rachel Carson's *Silent Spring*, written with grace and passion, galvanized the public overnight. Public pressure led to the establishment of a new agency in 1970, the Environmental Protection Agency (EPA). Its first target was DDT, the “silver bullet” of the new pesticide era. Following two years of acrimonious debate, EPA banned DDT. With bruised pride, but staunch resolve, pest control specialists embarked on an intense, intellectual reassessment of control strategies. The outgrowth of this was a new concept, Integrated Pest Management (IPM). IPM placed pest control in an ecological context, and assigned a role to each of the various plant protection disciplines. The objective was to integrate a number of control factors whose accumulative effect would keep pest populations to acceptable levels. Entomologists marshaled old methods like cultural control, biological control, and plant resistance, and new ones, such as sex attractants and genetic modification.

This unprecedented crisis called for bold leadership. It was as if all of Ed's previous experience had groomed him for such a role. In 1955-56, he had taken sabbatic leave in Europe where he studied pest control practices in eleven countries. This experience was followed in 1966-67 by appointment as Visiting Professor to the Cornell project at the University of the Philippines, Los Baños. In addition, he served as a consultant to agricultural programs in eight countries of Southeast Asia. He then played a major role in establishing, and then serving as the first project leader (1975-80) for the Integrated Pest Management (IPM) Unit at Cornell, which now is considered among the best in the world.

Ed was appointed Chairman of the Department of Entomology, Geneva, in 1969, a position he held until his retirement in 1982. Another challenge to his leadership came in 1978, when he was elected President of the Entomological Society of America (ESA). Additional honors followed. He was made an honorary member of ESA in 1985 and elected a Fellow in 1992. The capstone of his career came in 1991, almost a decade after his retirement, when he was appointed Executive Director for the Consortium of International Crop Protection, the oversight body for coordination of IPM.

In assessing the life and times of our worthy colleague, a few months of retrospect place his image and his accomplishments in bold relief. He brought to bear the best of family values, a rich heritage of American history, good education, wise parental guidance, and six decades of service to Cornell, an institution that commanded his devotion and respect. He had traveled far from historic Lexington to the third world countries where insects threatened the essential food, fiber and health of millions of people. In seeking a just tribute to Ed, we can perhaps do no better than to quote his esteemed mentor, Professor Emeritus Paul Jones Chapman, (deceased). At Ed's retirement 'Chappie' commented, "Ed just never stopped growing. He took the highroad and he walked the world with dignity."

Joe Ogradnick, Edward Smith, Wendell Roelofs

Marvin D. Glock

November 19, 1912 — September 15, 2000

Professor Glock was born on a farm near San Jose, Illinois, on November 19, 1912. He was farm-trained early in discipline and hard work. The decisiveness and independence he developed during those early years were sources of strength throughout his life. His school days began in the elementary grades in San Jose, where he lived with his grandmother and aunt. Unlike most other country children, who attended one-room country schools, his parents opted for the town school where there was a teacher for each of two grades rather than one teacher for all eight grades.

He graduated from the high school in San Jose where he was president of his class and valedictorian. After high school, he attended Blackburn College in Carlinville, Illinois. All students worked two and one-half hours every day, doing custodial work, caring for the milk cows, preparing and serving food, and so on. Tuition was lowered with this work input.

After graduating from this two-year school, he was slated to teach at a one-room country school near his home, but he declined this opportunity when he received an invitation from an aunt and uncle to live with them and attend the University of Nebraska. There, he completed all course work for entrance to medical school, and majored in Mathematics. Scholarships for medical schools were unavailable at that time. Lacking financial help, he accepted a position as science/math teacher and athletic coach at the Edison, Nebraska High School.

After two years, he was offered the position of science teacher in the high school at Mason City, Illinois. This school was only a short distance from his hometown of San Jose. It was also near the University of Illinois, where he earned his Master's degree by attending classes on Saturdays. After two more years, he was employed as the Principal of the Mason City High School. Another vacancy occurred on his staff, and his future wife applied. Upon his recommendation, she was hired. Two years later, they were married.

World War II was in progress and he volunteered for the U.S. Navy. After serving two years overseas in the South Pacific as a communication officer, he was assigned to the University of Iowa to teach English to Dutch cadets. When he was discharged from the Navy, he remained at the University to earn his Ph.D. degree in Educational Psychology. His next employment was as Assistant Professor at Michigan State University. He remained there for two years and then accepted a position as full Professor of Educational Psychology at Cornell University and

Director of the University Testing and Service Bureau. He had over one thousand students on his class rolls for a number of years, with the help of only one part-time graduate assistant.

At that time, veterans of the war were enrolling in large numbers, and they were having serious difficulty in reading and studying assignments. They requested a reading improvement program. Again, under the leadership of Professor Glock, a program was established. In a preliminary meeting, one thousand students signed up for the course.

Students registered for his courses in great numbers, even though they weren't necessarily training to be teachers. His sparkle and fresh approach captivated them. They recognized that his teaching materials reflected the ideas of an original mind. His civility, generosity of spirit, work ethics, and moral values were hallmarks of his character. He was a gentleman of impeccable taste and sense of propriety and had an infectious humor as well as rare insight into the problems of college youth. He conveyed to them his overall objective, to help them become the best they could be. Students of his last regular class in the Spring of 1983 presented him with a plaque engraved with this message, "For continued devotion to your students at Cornell. The Last Class at Cornell, 1983."

In addition to his professorial duties at Cornell, he held visiting professorships at both the University of Chicago and the State Teachers College at Cedar Falls, Iowa. He was also active in consulting and facilitating workshops in schools, professional organizations, and business groups around the country. He spent one year on a Fulbright Fellowship in Sri Lanka.

Professor Glock published a number of books, papers, and programs in measurement, evaluation, psychology and developmental reading. One very important contribution of his research, supported by the U.S. Navy, was how best to optimize the use of pictures and text for giving directions to accomplish a task.

Professor Glock belonged to the following professional organizations: Fellow, American Psychological Association; American Educational Research Association; National Society for the Study of Education; Phi Delta Kappa; Phi Kappa Phi; and Sigma Xi. He was certified with a Life State Supervisory Certificate in the State of Illinois, and as a Psychologist in New York State. He was elected to: Who's Who in America; Who's Who in the East; Who's Who in Medicine and Health Care and Behavioral Sciences; and the Writer's Directory.

Professor Glock retired in 1983 as Professor Emeritus. However, he continued to conduct workshops and seminars at Cornell and around the nation until January of 2000. His motivation resulted from the feedback of his students.

In an advertising brochure for Cornell Adult University, a course description was the following: “Getting the Job Done”, led by Educational Psychologist, Marvin D. Glock. The course received uniformly enthusiastic reviews: “the best of the six courses I’ve taken at CAU. The group was cohesive and fun. I can’t begin to tell you how much I learned. Marv Glock was extraordinary.” He also contributed to the schools of Ithaca, advising them on many problems relating to teaching and learning. He was active in the First Presbyterian Church, serving as an elder for many years. He was a family man, devoted to his wife of almost 60 years, Ruth Snell Glock; his daughters, Carol Glock Corruccini (Linton) of Davis, California, and Sandra Glock Ritchie (Douglas), of Ottawa, Ontario, Canada; and grandchildren, Rebecca Kay and Sara Ruth Corruccini, and Blair Douglas Ritchie. Secretaries in his department will long remember the many rose bouquets, which he shared from his garden at home.

William E. Drake, Verne N. Rockcastle, Richard E. Ripple

Walter Oscar Gloyer

January 29, 1886 — September 28, 1960

Walter Oscar Gloyer, Professor Emeritus of Plant Pathology at the New York State Agricultural Experiment Station at Geneva, died unexpectedly at his home in Geneva on September 28, 1960

Born in Milwaukee January 29, 1886, Professor Gloyer graduated from Wisconsin University in 1909 and received his Master's degree in 1910. He entered upon a career of research in botany and plant pathology as related to agriculture and was one of a group of pioneers in those fields of endeavor. He was appointed a member of the Department of Botany, which later became the Department of Plant Pathology, at the Experiment Station in April 1912. He retired as Associate Professor of Plant Pathology May 31, 1946, and was made Professor Emeritus June 24, 1946.

In his early years at the Experiment Station, Professor Gloyer dealt chiefly with apple diseases, notably apple blotch and blister canker, and later with crown gall and hairy root. Other investigations in these early years included seed potato treatment for control of *Rhizoctonia* and potato leaf roll. He also studied diseases of clematis, delphinium, gladiolus, and aster.

Professor Gloyer's studies on cabbage seedbed diseases and the control of *Rhizoctonia* and club root of cabbage with mercuric chloride were among the first to be conducted along these lines.

In later years, Professor Gloyer turned his attention to cherry and prune diseases, apple scab, hard shell of beans, and the development of improved varieties of red kidney beans. An exhibit in the Station museum depicts some of the findings in his bean breeding project, as well as other phases of his research on cabbage and aster diseases.

Toward the close of his professional career, Professor Gloyer devoted much of his time to investigations of cabbage yellows and particularly to the development of yellows-resistant varieties of cabbage.

Professor Gloyer published the findings in his wide range of research projects in Experiment Station bulletins and scientific journals. His experience and practical approach to control practices proved of immense value to New York farmers in the control of plant diseases with consequent improvement in the yield and quality of many agricultural products in the state.

Professor Gloyer was a kindly man and at the time of his death was referred to in the local newspaper as a "good neighbor and friend to neighborhood children." In fact, one of his major projects after retirement was teaching

the boys in the neighborhood the rudiments of baseball and football, and the heart attack, which resulted in his unexpected death, was thought to have been due possibly to overexertion in removing, for the safety of the children, a damaged tree from a play area in the neighborhood.

Professor Gloyer is survived by his wife, Alice May Sinclair Gloyer, and a daughter, Mrs. Elizabeth Skuta. He will long be remembered as a dedicated and untiring scientist and as a good neighbor.

James M. Hamilton, Richard Wellington, J. D. Lockett

Frank H. Golay

July 2, 1915 — August 31, 1990

Frank Hindman Golay, former president of the Association for Asian Studies and foremost economic historian of the Philippines, died in the Veterans Hospital, Oxford, New York, on August 31, 1990, after a long illness. Born in Windsor, Missouri, on July 2, 1915, he served as a submarine officer in the U.S. Navy in World War II and received his Ph.D. degree in economics from the University of Chicago in 1951. After working in the international division of the Federal Reserve Board, he came to Cornell in 1953 as an assistant professor of economics and Asian studies. He became a full professor in 1962 and remained at Cornell until his retirement in 1981. He was chair of Cornell's Department of Economics from 1963 to 1967 and director of the Southeast Asia Program from 1970 to 1976.

During the 28 years of his service, Frank Golay was a rock of dependability within the Department of Economics. The chairman could count upon him invariably for staunch support; and as chairman, he demanded the same kind of responsible service as he himself was always prepared to give. In addition to his own specialties, in particular the fields of economic development and the economics of Southeast Asia, he regularly taught basic departmental courses—elementary economics, money and banking, international trade and finance. His work on the Philippines exhibited the same kind of soundness, thoroughness, and excellence of judgment as he could always be depended upon to provide in his service to the University.

As director of the Southeast Asia Program's Philippine Project (1967-73) and London-Cornell Project (1968-70), Frank contributed much to strengthening Southeast Asian studies at Cornell. He was appointed to visiting professorships at London University's School of Oriental and African Studies (Fulbright-Hays) in 1965-66 and at the University of the Philippines (Rockefeller Foundation) in 1973-74. For his scholarship on the Philippines, Frank was awarded an honorary L.L.D. degree by the Ateneo de Manila in 1966. He was awarded research fellowships by the Guggenheim and the Luce Foundations, the Social Science Research Council, the National Endowment for the Humanities, and the United States Educational Foundation (Fulbright). He served as chairman of the Philippines Council of the Asia Society of New York (1964-67) and as a member of the Southeast Asia regional committee of the Association for Asian Studies (1963-65).

His major publications include *The Philippines: Public Policy and National Economic Development* (Cornell University Press, 1961) and four coauthored books: *The United States and the Philippines* (Prentice-Hall, 1966), *Land and Man in 1990: Philippine Rice Needs in 1990, Output and Input Requirements* (Agency for International

Development, 1967), *Underdevelopment and Economic Nationalism in Southeast Asia* (Cornell University Press, 1969), and *Diversity and Development in Southeast Asia* (McGraw-Hill/Council on Foreign Relations, 1977). Shortly before his illness he was close to completing a comprehensive study of United States-Philippine economic and political relations before Philippine independence.

It was not only through his many publications that Frank contributed to the development of a formal program of Southeast Asian studies at Cornell; he accepted leadership roles that significantly defined the scope and character of Cornell's teaching and research on that area. It was during his service as the third director of the Southeast Asia Program, from 1970 to 1976, that Frank Golay made his crucial contribution. The war in Vietnam was winding down, area and language programs were fading, and the government and foundations began to question the costs and the value of such programs. To such questions Frank Golay, with his financial and management sagacity and skills, added to his impressive scholarship, could provide persuasive answers, and he did. An official of one of the foundations called him his "best client." The U.S. Department of Education and several foundations began or continued their aid to Cornell's funding of the program.

A climax of Frank Golay's preeminent career in the field of Asian scholarship came with his 1984 election to the presidency of the Association for Asian Studies. In his presidential address, he noted that over time he found that "the outside world considered my role to be that of a Filipinist." It was certainly that and very much more.

So Frank Golay lived—serving extraordinarily well his university, his profession, and the peoples, students and others, common and uncommon, of both his country and of Southeast Asia. What Thucydides said of his friend can well be said of him: "The whole earth is the tomb of heroic men and their story is not graven only in stone over their clay, but abides everywhere, without visible symbol, woven into the stuff of other men's lives."

George McT. Kahin, Alfred E. Kahn, Lauriston Sharp, Tom E. Davis

Thomas Gold

May 22, 1920 — June 22, 2004

Thomas Gold died in Ithaca, New York, on June 22, 2004 from heart complications. He was Professor Emeritus of Astronomy at Cornell. Gold was the founder and first Director of Cornell's Center for Radiophysics and Space Research. A member of the United States National Academy of Sciences, and a Fellow of the Royal Society in the UK, Tommy was a theoretical astrophysicist and one of the great original thinkers of the 20th century. His audacious ideas frequently challenged established explanations. He had a vast physical intuition and worked on subjects as diverse as the nature of the lunar surface, the dynamics of planetary rings, interstellar dust and the origin of the universe.

Born in Vienna, Austria, on May 22, 1920, he moved with his family to Berlin, Germany, when he was 13 years old. As Hitler gained power, the family moved to London, England, but Tommy was sent to boarding school in Zuz, Switzerland. In 1938, he became a mechanical engineering student at Cambridge University. Soon World War II started and Tommy, being an Austrian citizen, was sent to a camp in Canada as an enemy alien. When released, he was sent back to England and was appointed to the British Admiralty, where he designed radar detection systems for the war. During this period, he worked with Hermann Bondi and Fred Hoyle. Shortly after the war, they developed the Steady State Theory of the universe according to which the universe has no beginning and no end and remains always about the same by creating small amounts of matter to compensate the observed cosmic expansion. Later observations did not support this elegant theory that had no adjustable parameters.

In 1957, Tommy left England and accepted a Professorship at Harvard University. He moved to Cornell University in 1959 where he founded the modern Department of Astronomy and obtained funding for the construction of the Space Sciences Building. In 1971, he was appointed to the John L. Wetherill Endowed Professorship. He retired from Cornell University in 1986. He earned his B.A. and M.A. degrees in 1942 and 1946 respectively, from Cambridge University, and was awarded a D.Sc. degree in 1969, also from Cambridge. During his early years at Cornell, he supervised the Arecibo Observatory and guided its research in radio astronomy.

The breadth of his work was immense. While in Cambridge, England, after the war, he developed a model of a positive feedback mechanism in the inner ear. At first this theory was ignored, but recently it has been proven essentially correct. He worked on the properties of the lunar soil and devised a stereoscopic camera that the Apollo astronauts used to take close up pictures of the lunar surface. Soon after the discovery of the enigmatic

pulsating radio sources in 1967, he presented the correct explanation: rapidly rotating magnetized neutron stars. Tommy also made important contributions to studies of the thermodynamic “arrow of time”, the alignment of interstellar grains, the nature of quasars, plasmas and magnetic fields in the solar system, the origin of solar flares, interstellar molecular masers, the instability of the earth’s axis of rotation, the dynamics of narrow planetary rings and resonances in the solar system. He was always ready to challenge established theory and thus stimulated many scientists to think more carefully about accepted paradigms.

His most recent ideas explored the possibility that primordial methane and other hydrocarbons are working their way up through the earth’s mantle. He wrote two books on this subject: *Power from the Earth* and *The Deep Hot Biosphere*, which as Tommy expected created controversy but stimulated more detailed studies of the origin and evolution of the Earth’s hydrocarbon inventory.

He was the author or co-author of more than 200 publications and had received many honors, including the Gold Medal of the Royal Astronomical Society in the United Kingdom and membership in the prestigious American Philosophical Society. Tommy was a competitive sportsman who excelled in snow and water skiing, and he was a master carpenter.

He is survived by his wife, Carvel (Beyer); four daughters: Lindy (Bruce) Bryant, Lucy (Norman) Gold/Brown, Tanya Vanasse and Lauren Gold; and six grandchildren.

Edwin Salpeter, Joseph Veverka, Yervant Terzian

Rose K. Goldsen

May 19, 1917 — August 2, 1985

Our colleague Rose Goldsen grew up in pre-World War II Newark, New Jersey, in a warm, supportive family that propelled her into a community life with an outgoing and gregarious personality. Her freshly extroverted manner probably aided in satisfying and also in arousing Rose's curiosity about interpersonal and sociological matters. Certainly it was the basis of her gifts as an interviewer and as an artist in the use and interpretation of the sample survey.

She received a B.A. degree from New York University in 1943, an M. A. degree at Yale University in 1944, and her Ph.D. degree (again at Yale) in 1953. Her doctorate was delayed in part because she began her long career at Cornell in 1949 as a research associate (and, later, senior research associate) and in part because in 1950 she wanted to finish a book, *Puerto Rican Journey*, which she co-authored with C. Wright Mills and C. Senior. The collaboration began a long association and debate with Mills that lasted until his death. At Cornell she was promoted to associate professor and then to full professor.

Her first Cornell-based book was *Occupations and Values*, co-authored with Morris Rosenberg in 1957, followed in 1960 by *What College Students Think*, written with Morris Rosenberg, R. M. Williams, Jr., and Edward A. Suchman, which contains, among other things, a serious study of the values of the Cornell students of the period.

Rose had a long and fruitful career as a consultant and was particularly active as a program adviser in the social sciences to the Ford Foundation in Latin America from 1968 to 1972. During that period she also taught at the University of the Andes and at the National University of Colombia. The careers of a generation of Latin American students were aided and shaped by Rose's work. She became a warm friend and delighted observer of Latin American people and an admirer of Latin cultures, just as she had earlier enthusiastically adapted herself to lecturing at the Universities of Rennes and Bordeaux in 1957-58 as a Fulbright scholar and at the University of Buenos Aires as a visiting professor in 1962-63. Her longest consultancy was related to a career-long interest in public opinion (on which she lectured brilliantly at Cornell) and the mass media. From 1978 to the time of her death Rose served on the Academic Advisory Board of the National Citizens Committee on Broadcasting.

Rose became a national and local activist on the issues of educating citizens to the promise and perils of television. This led to her book *The Show and Tell Machine* (published in 1978)—also the title of her newspaper column. She

also conducted a long-running and lively weekly radio program, “Blowing the Whistle on Broadcasting.” She reported that her field had become the analysis of “the institutions that form human consciousness.”

Rose wrote short stories that were published in *Praxis* and *Cornell Review*. Her strong interest in writing also emerged in her regular teaching of a well-received freshman writing seminar.

In recent years Rose’s intellectual interests broadened and moved away from her early emphasis on, and faith in, social science education and method. She returned to earlier personal religious practices and was a lively and stimulating member of her congregation.

As her colleagues, we felt the criticism (but enjoyed the debates and discussions) that Rose in later years came to direct toward systematic social science. Her sudden and early death was all the more sad to us because it occurred when her lifelong interest in broad policy issues and social analysis was being newly ignited by working in the Cornell-in-Washington program.

We miss Rose. We miss her as a deeply liberal and caring colleague and as a fellow citizen with whom we shared so much of the history of this brutal and exciting century. We often resonated to those events with a shared sympathy.

Her many friends, who saw her lovingly and personally to her rest, have put it rather well:

Rose made everyone feel more alive. She often said she had the best job in the world. Students flocked to her classes, to her office, to her afternoon sherry hour. After being exposed to her probing questions, her buoyant laugh, and her deeply personal concern, students wandered away smiling, challenged, touched. And back they came, especially in the last months of her life, to tell Rose how much she had meant. Rose was a person of strong moral and intellectual convictions strongly expressed, but the warm blast of her affection overwhelmed mere differences of opinion. For her students, colleagues, and friends Rose Goldsen stretched horizons and warmed hearts. We rejoice in having been part of her remarkable life.

William W. Lambert, Bernard C. Rosen, Robin M. Williams, Jr.

George Lawrence Good

December 14, 1940 — December 24, 2007

George Lawrence Good, Professor of Ornamental Horticulture and authority on nursery crop, landscape, and pesticide management in the College of Agriculture and Life Sciences (CALS), died unexpectedly at home the morning of December 24, 2007. He was universally liked and respected, and will especially be remembered for his knowledge, compassion, integrity, humility, enthusiasm, and humor.

He was born on December 14, 1940, to George and Florence Good of Cincinnati, Ohio. After the untimely death of his father, his mother married William Sparrow, who helped raise him and whom George greatly respected. He received his elementary and secondary education in Cincinnati, and during the summers from 1958-62, was employed by John P. Shay Landscape Company, an experience that fueled his life-long interest in landscape plants.

In fall 1959, he enrolled at Ohio State University, majoring in ornamental horticulture. Among the faculty members who influenced his career were Professors L.C. Chadwick, D.C. Kiplinger, as well as Robert O. Miller who encouraged his entry into graduate studies at Cornell University. Graduate study began in fall 1963, under the direction of Professor Harold B. Tukey, Jr. George studied leaching of nutrients from plants by mists of water applied during rooting of cuttings, a component of crop nutrient management. He received his Master of Science degree in 1965 and Doctorate in 1968. George fondly remembered his graduate experience, relating stories involving Professors F.C. Stewart, David W. Bierhorst, Robert E. Lee, A.M.S. Pridham, and others, and activities with colleagues, including bowling, softball, and fishing.

It was during graduate studies that he met department employee, Carolyn McFall. They married in 1965, and raised two children, Matthew and Jennifer. George greatly enjoyed his family and in recent years his grandchildren, living in the country, reading, learning about historic events, fishing, hunting, gardening, barbequing, spending time with his Brittany Spaniels, Lacey and Buster, and baking his wonderful bread.

In 1968, he was invited to join the Cornell faculty in the Department of Floriculture and Ornamental Horticulture launching a research and education career related to production and management of landscape plants. He rose to Associate Professor in 1974 and Professor in 1980. Early collaboration with colleague, Professor Peter Steponkus, and graduate students, led to pioneering studies of woody plant root hardiness, demonstrating that roots often are less cold tolerant than shoots, and revolutionizing methods of over-wintering container nursery stock in northern climates.

George worked tirelessly on behalf of the state nursery, landscape, and arboriculture professions, and the Cornell Cooperative Extension field staff enormously valued his knowledge, wisdom, and mentorship. His outreach in ornamental horticulture extended to weed and fertilizer management practices as well as organizing training for safer application of pesticides. He also collaborated with public sector horticulturists to further sound horticultural practices in state, municipal, and educational institution plantings, including Cornell Plantations.

At the national level, he served as state liaison to the federal government's interregional research program, member of the oversight committee of the rhododendron-breeding program at Holden Arboretum, Mentor, Ohio, and pesticide coordinator for CALS with the American Association of Pesticide Education. Within the state, he was member of the Plant Industry Advisory Board of the New York State (NYS) Department of Agriculture and Markets, and committee chair for many years of the NYS Gold Medal of Horticulture, an annual award presented jointly by the NYS Nursery and Landscape Association and NYS Department of Agriculture and Markets. He was a member of the Board of Directors of Preferred Commerce, Inc.

During his academic career, George served at the University level on the Physical Education Committee and as department representative to the University Senate. Within CALS, he served on the Academic Achievement and Petitions Committee, Extension Scholarship Committee, Cornell Integrated Pest Management (IPM) Operating Committee, Ornamentals IPM Committee, eight ad hoc Promotion to Tenure or Full Professor Committees, CALS Policy Committee, and the Plant Science Curriculum Committee. He was Department Extension Leader for many years, CALS Nursery/Landscape Industry Program Leader through most of his career, and a member of the Horticulture Teaching Committee.

His courses in Nursery Management and Landscape Management were well subscribed for the depth of conceptual insights and practical experience gained as well as for the many stories George told. Described by one student, the courses were "extremely informative, practically oriented, relaxed, personal, and definitely the best and most fun of those I have taken at Cornell."

He served as faculty advisor to the undergraduate Hortus Forum from 1997-2005, faithfully attending meetings and helping to plan study tours, often serving as tour leader. From 2001-05, he was advisor to the Alpha Chapter of the honorary floriculture/ornamental horticulture society, Pi Alpha Xi. He identified qualified undergraduate and graduate students each year, invited each to membership, and read insightful excerpts from the minutes of the society, from as early as 1923, at the annual student recognition ceremony.

During his career, George advised hundreds of undergraduate students, and served on the committees of 22 graduate students, for whom he was major professor for 14. He was a constant source of wisdom and nurture to faculty members.

He served as Acting Chair of the Department of Floriculture and Ornamental Horticulture for six months in 1980-81, and from 1988-97, chaired the unit, skillfully guiding it with sensitivity, humor, and insight through an exceptionally difficult period of shrinkage of public funding and downsizing.

George authored more than 34 scientific publications, 20 scientific meeting presentations, and 38 extension/public service bulletins, crop profiles, and other publications. Throughout his career, he edited the Production and Maintenance of Trees and Shrubs portion of the annually produced CALS Cornell Pest Management Guidelines series. He was a respected and sought after speaker at industry-related workshops and seminars.

After relinquishing department chair responsibilities, he took his only sabbatical leave. While on leave, he was asked by the College of Agriculture and Life Sciences, to, when he returned, assume the role of Director of the Cornell Pesticide Management Education Program, which he did with distinction in a half-time capacity from 1998-2005. During this period, he also collaborated with Richard Weir, retired Cornell Cooperative Extension educator from Long Island, to teach his Nursery Management and Landscape Management courses and to rewrite Cornell Information Bulletins for the nursery and landscape professions.

George was active in professional societies: American Society for Horticultural Science, International Plant Propagators' Society, International Society of Arboriculture, and American Association of Pesticide Safety Educators, as well as honorary societies: Sigma Xi, Gamma Sigma Delta, and Pi Alpha Xi.

He retired December 2005 and was appointed Professor Emeritus, teaching his course in Nursery Management for the last time during the fall semester of that year. He also continued to be involved with some research and Cornell Cooperative Extension activities. At the time of his death, he was actively collaborating with Professor Leslie Weston to develop management strategies for difficult to control broadleaf perennial weeds in nurseries and Christmas tree farms, a NYS Farm Viability Program funded initiative.

Among many recognitions and awards he received were:

- 1977 - Award of Merit of the NYS Arborists' Association; Award of Merit of the NYS Nurseryman's Association
- 1978 - NYS Nurseryman's Association Hall of Fame Award
- 1979-1980 - Ho Nun De Kah (CALS student honorary society) Professor of Merit, chosen by the 1980 senior class
- 1984 - American Society for Horticultural Science's Nursery Extension Award in appreciation for dedicated service to the nursery industry
- 1985 - American Association of Nurserymen's Norman J. Coleman award for achievements in horticultural research
- 1989 - Certificate of Appreciation by the Eastern Region of American Association of Nurserymen
- 1993 - Senior Scholar Award by the NYS Arborists' Association
- 1995 - Hortus Forum planted and dedicated in George's honor one of his favorite trees, a scarlet oak, on the east lawn of Risley Hall
- 1997 - NYS Gold Medal of Horticulture Award; received a Cornell chair from the NYS Turfgrass Association during their summer field day;
- 2000 - Arborist of the Year Award of the NYS chapter of the International Society of Arboriculture
- 2001 - Outstanding Alumnus of the College of Agriculture and Natural Resources at The Ohio State University
- 2005 - Friend of the Green Industry by the NYS Turfgrass Association; the Environmental Award and Friend of the Industry Award from the Nassau/Suffolk Landscape Gardener's Association; Hortus Forum planted and dedicated in George's honor another of his favorite trees, a red oak, on the north lawn of Roberts Hall.
- 2008 - posthumously, the Department of Horticulture dedicated a grove of selected compact oak trees near the Plant Science Building in his memory; through a gift from the NYS Arborists' Association, a red oak was planted in George's memory near the top of Newman Meadow at Cornell Plantations; Cornell's Long Island Horticultural Research and Education Center staff planted a paper bark maple at its annual industry field day, remembering George as a beloved teacher, listener, researcher, and friend of the Long Island ornamentals industry; the NYS Nursery and Landscape Association honored him with the planting of a golden chain tree at the entrance of Cornell's Plant Science Building; and the annual NYS Gold Medal of Horticulture Award, established in 1982, was renamed the George L. Good Gold Medal of Horticulture.

Nursery and landscape practitioners have summarized best the stabilizing and nurturing influence of George Good on the profession. Early in George's career, George Schichtel, nurseryman, industry leader, and 1978 NYS Nursery

Association Awards Committee chairman, at the NYS Hall of Fame Award presentation noted, “George Good is a concerned, cooperative, and productive person, and he does it all with enthusiasm and a smile.” Posthumously, in 2008, Thomas Corell, a leader in the landscape professions, commented,

“George listened, put things in perspective, analyzed the situation and supplied thoughtful, considered responses. His humanness and consideration were always in the forefront in his relationships with his industry contacts. He talked to people with respect for them and the work they do. They felt they had a friend at Cornell and a connection to the college through the professor at Cornell University with whom they could talk.”

*A song to the oak, the brave old oak,
Who hath ruled in the greenwood long!
Then here's to the oak, the brave old oak,
Who stands in his pride alone!
And still flourish he, a hale green tree,
When a hundred years are gone!*

Henry Fothergill Chorley, from “The Brave Old Oak”

Thomas C. Weiler, Chairperson; Carl F. Gortzig, Joann Gruttadaurio

Henry P. Goode

January 1, 1909 — February 14, 2004

Henry P. Goode lived at 115 Mitchell Street, Ithaca, New York, for 45 years. For the 19 months previous to his death, he lived at Oak Hill Manor Nursing Home in Ithaca. He was 95 years old.

Professor Goode was born to Joseph and Mary Goode in Lenexa, Kansas, and grew up on a farm near Overland Park, Kansas. He was educated at the University of Kansas, earning both a Bachelor's and Master's degree in Industrial Engineering. After working in industry both at the Western Electric Company in Chicago, and the American Can Company in Kansas City, he began his higher education teaching career at Stanford University where he was a member of the Mechanical Engineering faculty for 11 years. He then became Professor of Industrial Engineering at Southern Methodist University for five years prior to joining the faculty at Cornell University as Professor of Industrial Engineering and Operations Research in 1957. He taught at Cornell until he retired in 1974, whereupon he was named Professor Emeritus.

He was the author of a number of publications including a pioneering text in his specialty field, *Sampling Inspection by Variables*, with A.H. Bowker.

Professor Goode enjoyed traveling, reading, music and painting. Following his retirement at Cornell, he audited some 70 courses at the university in almost a 30-year span of time. He was skilled at building furniture including two harpsichords, which he played for many years. In 1996, the Tompkins County Office for the Aging named him "Senior Role Model of the Year." In addition to volunteering at the First Unitarian Church of Ithaca and at Cornell's Center for Religion, Ethics and Social Policy, he was, for over 28 years, a volunteer worker at the Friends of the Tompkins County Library annual book sale. He was a kind and tolerant man, had many valued friendships, and enjoyed each day of his life.

He was predeceased by his wife, Margaret; daughter, Erika (Goode) Saltzman; and granddaughter, Jennifer Goode. His son and daughter-in-law, David and Mary Goode, of Minneapolis, Minnesota; a grandson, Michael Goode, of Portland, Oregon; and granddaughter, Laurel Saltzman, of Eureka, California survive him.

A memorial service for family and friends of Professor Goode was held at the First Unitarian Church of Ithaca on April 24, 2004, followed by a reception. Memorials in his name may be made to the Friends of the Library

(attention Larry Denison, 34 Horvath Drive, Ithaca, NY 14850), or to Hospicare of Ithaca (172 E. King Road, Ithaca, NY 14850).

Office of the Dean of Faculty

Alpheus Mansfield Goodman

January 29, 1885 — May 29, 1956

Alpheus Mansfield Goodman, Professor Emeritus of Agricultural Engineering died unexpectedly on May 29, 1956 while making a field survey near the Cornell campus at Ithaca, N. Y.

He was born at Salisbury Mills, N. Y. on January 29, 1885 to Eunice and Alpheus Goodman.

He attended the Bethlehem Rural School at Cornwall, N. Y. and the Cornwall Union School, Newburg Academy.

He was graduated from Cornell University in February 1912 with the degree of B. S. in Agriculture.

On July 12, 1916 he married Clara Witmer Browning of Buffalo, N. Y. To this union were born four children, Clara, Robert, Eunice and Eleanor. At his death there were 11 grandchildren

Immediately after graduation from Cornell, he was successively a Dairyman for the USDA at Washington, a County Agricultural Agent in New Jersey, Superintendent of the Denison Dairy Demonstration Farm at Denison, Texas, and Herdsman at the USDA Experiment Station at Beltsville, Maryland.

In 1919 he came back to Cornell as an Extension Agricultural Engineer specializing in the subjects of land drainage, water supply, sewage disposal, gasoline engines and ventilation of farm structures. From his experience in ventilation he developed an interest in farm structures in general which in turn led to his starting a residence course on the subject for undergraduates in 1935.

By means of hard work in the field and special study at home, he soon became a licensed land surveyor and was made a member of the New York State Society of Professional Engineers. He was also a member of Sigma Xi, Epsilon Sigma Phi, American Society of Agricultural Engineers and was a founding member of the Cornell Extension Club.

After 16 years as a full time Extension Specialist he was appointed to half time resident teaching in 1935, and in 1946 he became a full time resident Professor offering courses in Farm Structures, Surveying, Drainage and Irrigation. In this latter capacity he served until his retirement on August 1, 1952.

From 1926 to 1952 he authored and co-authored 21 extension bulletins and 9 mimeo bulletins for distribution to farmers of the state. He also wrote numerous articles for leading agricultural papers.

During his periods of sabbatical leaves and on special leaves, Professor Goodman was called upon to serve in a professional capacity in many parts of the world. Beginning in 1927, working with the Rockefeller Foundation, he spent two years setting up a drainage project for malaria control and agricultural production in Puerto Rico. He returned there periodically during the next 8 years to supervise and inspect the project. From 1942 to 1947 he did similar work for the Rockefeller Foundation in Haiti, Trinidad, Tobago, Cuba, British Guiana, and the Dominican Republic.

In 1935 he served as a member of a party named by the Alaska Rehabilitation Administration to visit and to make recommendations on the development of the Matanuska Valley Colony in Alaska.

Immediately after retirement, in August 1952, he went on a two year assignment as a member of a party of specialists to the University of the Philippines to engage in teaching and research and to promote better methods in Philippine agriculture.

Since his return from the Philippines and to the day of his death, he was busy practicing his profession for the benefit of his fellow men.

As an Agricultural Engineer, Professor Goodman was well known throughout the state, the nation and in many other parts of the world. His numerous and valuable contributions to the welfare of rural people both at home and abroad have earned for him an enviable reputation. He was loved and respected by all with and for whom he worked. In his widespread activities he acquired many close friends in all walks of life. His parting from our midst leaves a void that no one else can fill. He was a devoted husband and father and took great pride in building for his family a fine home in every sense of the word. The devotion of his family to him and to each other is evidence of how well he succeeded in this respect.

His family, the University, the State and the Nation have lost a faithful and valuable friend.

J. H. Bruckner, B. A. Jennings, F. B. Wright

Dana C. Goodrich, Jr.

January 1, 1928 — December 10, 1994

The faculty of the Department of Agricultural, Resource, and Managerial Economics lost a distinguished emeritus professor when Dana C. Goodrich, Jr. died on December 10, 1994, at Shands Teaching Hospital in Gainesville, Florida. Dana had received a heart transplant on April 19, 1994. By November it appeared as if there was a chance for complete recovery, but while in Gainesville for tests at the University of Florida Medical Center, an unexpected rare form of rejection caused his death.

Dana was born in Ilion, New York, son of the late Dana C. Goodrich, Sr. and Olive Dillenbeck. He is survived by his wife, Elizabeth (Betty) Luttgens Goodrich, of Melbourne, Florida; two daughters: Susan of Bedminster, New Jersey, and Karen and husband Thomas Lerario of Reston, Virginia; two sons: Dana C. III and wife Sue of Arnold, Maryland, and Kendall of Boca Raton, Florida; one sister, Jeanette Burnett of Hyde Park, New York; and four grandchildren. Although Dana grew up in the suburban areas of Northern New Jersey and Albany, New York, his chosen profession of agricultural economics was a natural result of his summer visits to an uncle's farm and hatchery in Webster, New York. He received a B.S. degree in Poultry Husbandry in 1954 from Rutgers University; and he received M.S. (1956) and Ph.D. (1958) degrees from Cornell University.

Dana's professional career began at Cornell in 1958 as an Assistant Professor of Marketing and Extension Economist. Promoted to Associate Professor in 1964 and to Professor in 1970, his research focused on marketing of poultry and egg products, horticultural marketing, and marketing of fish products. He taught courses in Accounting, Managerial Accounting, Prices, and Marketing; and he developed and taught an upper level course in Marketing Management.

During his career he taught over 7,000 students and was faculty adviser to over 500 undergraduates. To give his students an opportunity to participate in commodities trading, he developed one of the first Futures Market Games to be used as part of his marketing class. For several years, he was Chair of the Department's Undergraduate Program Committee. He was known as a compassionate faculty member who always had his students' interests at heart. Dana had strong feelings about the importance of undergraduate teaching when that was not a popular career path. His outstanding teaching was recognized by the very positive comments of his students and through many teaching awards—most important are the 1983 Professor of Merit Award, presented by Ho-Nun-De-Kah,

the agricultural honorary society, and the 1986 prestigious Edgerton Career Teaching Award, given by the College of Agriculture and Life Sciences for an outstanding career in teaching.

Professor Goodrich spent sabbatic leaves at the University of Florida (1965-66) and at The Technical University of Hannover, West Germany (1975). During his career, Dana became a recognized national and international expert on the economics and marketing of ornamental horticultural products. This resulted in a book, *Floral Marketing*, published by Lebhar Friedman Books. He was appointed Professor Emeritus December 31, 1986.

His greatest work satisfaction came from teaching and counseling students. Dana really listened and cared, and he gave quiet advice and counsel in a non-judgmental way. He was well respected and was known for his high ethical standards and values. He touched the lives of hundreds of students by his lectures and as an advisor. During his several years of illness, students continued to maintain contact. He was most pleased that in recent years the University has recognized the need for excellence in teaching at the undergraduate level.

He was a member of Alpha Zeta, Delta Sigma Phi, and Phi Kappa Phi. His professional affiliations included the American Agricultural Economics Association, American Marketing Association, American Society for Horticultural Science (chair of the Marketing and Economics Committee), and International Society of Horticultural Sciences. He served as a consultant to the U.S. Department of Agriculture on the development and execution of research relating to the economics of marketing horticultural crops.

Dana's activities in the Ithaca community included serving on the Board of Directors for the Cornell Federal Credit Union and as its President. He was also a past chair of the Cornell Division United Way Campaign, and past member of the Board of Directors for the Student Management (Purchasing) Corporation. After moving to Florida in 1987, although limited by health problems, Dana served on several church committees and sang in the church choir. He also served on the Board of Directors, Literacy Council of South Brevard and published their monthly newsletter.

His other interests included fishing, reading—especially books about the Civil War and WWII—listening to classical music, studying Florida wildlife, and watching football and hockey. While at Cornell, Dana was an avid hockey fan, and in the heyday of Cornell's Big Red hockey team, you could hear his whistle throughout the rink.

Joseph F. Metz, Jr., Shirley L. Soule-Redmond, Olan D. Forker

Dr. Malcolm Goodridge

February 28, 1873 — July 16, 1956

On July 16, 1956, Malcolm Goodridge, consulting physician to The New York Hospital, an honorary member of its Board of Governors, and for many years Professor of Clinical Medicine at Cornell University Medical College, died in his home at the age of 83.

He was one of that group of illustrious physicians who at the Second Medical Division of Bellevue Hospital made Cornell a medical Mecca. He was a guiding spirit in the formation of the Medical Center on 68th Street. For many years he was an active and influential member of the Medical Board of the Hospital. Although he retired from fully active practice in 1939, his interest in the affairs of the Center never flagged. He found his chief pleasure in participation in rounds on the pavilions, and in encouragement of young men and women in medicine. No one will ever know how many students and house officers at New York Hospital owe their inspiration to his guidance and example. He was a wise consultant whose advice was constantly sought by his colleagues; a persuasive teacher whose instruction at the bedside and in clinical and pathological conferences was the ideal of those who shared it.

Malcolm Goodridge was born in Flushing, N. Y., the son of a physician. He received his A.B. degree from Princeton University in 1894 and his M.D. from the College of Physicians and Surgeons of Columbia University in 1898. He began to practice in Manhattan in 1899. He was consulting physician to Bellevue Hospital, the Neurological Institute and the Mercy Hospital in Hempstead, Long Island. He was a trustee of the Home for Old Men and Aged Couples in New York City. He was the author of many chapters in textbooks of Medicine.

In 1941 before our entry into World War II he appealed to President Franklin D. Roosevelt to prevent a shortage of American physicians by deferment of drafting of students in medical schools and of interns until they had completed their medical training. He endorsed President Roosevelt's plea for 1,000 volunteer physicians to serve in Great Britain.

He was one of the most active workers in the development of the New York Academy of Medicine, of which he was a fellow for fifty years. He was its president from 1939 to 1942. He was the tireless chairman of its Committee on editing of its influential reports. In 1956, shortly before his death, he received from the Academy its plaque for distinguished service.

In the Medical Center the memory of Malcolm Goodridge is treasured not more for his contributions in education and clinical medicine than for his magnetic and genial personality, his kindness and his sympathetic understanding.

The Executive Faculty of Cornell University Medical College records his death with sorrow and with the realization that its members have lost one of their best friends and the Medical Center one of its staunchest supporters.

D. P. Barr

Eva Lucretia Gordon

June 26, 1891 — October 27, 1962

Eva Lucretia Gordon, Professor Emeritus of Nature, Science, and Conservation Education, died October 27, 1962, following a long illness. Her death ended a notable career of teaching, writing, and friendly professional counseling.

Professor Gordon was born in Austin, Minnesota, June 26, 1891. She began her teaching career in 1910 in a rural school in Barron County, Wisconsin. After graduation from the Milwaukee, Wisconsin, State Normal School in 1913, she taught for seven years in Iron Mountain, Michigan, and Racine, Wisconsin. She came to Cornell in 1927 from the public schools of Minneapolis, where she had been a primary grade teacher for seven years. She obtained the Bachelor of Science degree at Cornell University in 1929.

Professor Gordon became associated with the New York State College of Agriculture as an assistant in 1929. During her years as an assistant she completed a Master of Science degree (in 1931) and began work on the requirements for a Doctor of Philosophy degree, which she completed in 1947 while she was serving as an instructor. She served in the Children's School of Science at Woods Hole for two successive summers in 1933 and 1934. Since 1929 most of her summers and all the academic years were devoted to assisting and teaching in the University. Miss Gordon served as an Assistant Professor from 1947 to 1951, and as an Associate Professor from 1951 to 1956. She was advanced to a full Professor in 1956. During the 1952-1953 academic year, she served as the chairman of the Section on Nature, Science and Conservation Education. From 1952 to 1956 she prepared the Cornell Rural School Leaflet and produced a notable series of publications, in addition to her regular teaching and graduate student advising. Eva Lucretia Gordon retired from the Faculty of the New York State College of Agriculture September 1, 1956.

As a teacher, Miss Gordon attained a unique and enviable stature. Her students recognized her superb teaching, and they encouraged their friends to enroll in her courses. There they came to know science and they also became ardent enthusiasts for the nature-study approach, long a tradition at Cornell University. Many of the teachers in her classes discovered that science studies could be the basis for most of the regular elementary school work and that idea has over the years continued to be evident in their teaching. For many years, as a service to teachers in the elementary schools of the area, she taught off-campus courses. Going directly to the schools, applying the principles of excellent teaching in the schoolrooms, she was responsible for creating an interest and enthusiasm for science in many elementary schools. Many of these teachers and many other friends came to her home in Brooktondale

to study and enjoy both nature and nature literature. She continued some of this extramural teaching with an increasing number of visits with friends in her home, following her retirement.

Her own research, and the research of graduate students working under her direction, have added much knowledge to the field of nature study and elementary school science as well as to effective ways of teaching science. Her research studies were concerned with the Ephemeropter Genus *Leptophebia*. That was the subject of her Master's thesis in 1931, and it brought her membership in the Society of the Sigma Xi. Her studies at Cornell also brought her the Phi Kappa Phi and Sigma Delta Epsilon honors. But Miss Gordon was always very modest in the midst of her expertness and among her students and friends. She provided immeasurable understanding, guidance, and encouragement to the students who sought her help. Nevertheless, very few persons knew about the honors that had come her way.

Her special interest grew to be in children's science books. The problem of reviewing and evaluating such books served as the subject for her doctoral study. Her competence in this area brought national recognition. She co-authored two supplementary nature readers for children in 1926 and 1927 before she came to Cornell. When she started her assistantship at Cornell, she began to help with the preparation of the Cornell Rural School Leaflet. Soon she was accepting as her unselfish task the rewriting and editing of rough manuscripts prepared in preliminary form by others. Many of these manuscripts became outstanding leaflets through such unselfish efforts. She became sole author and producer of several Leaflets; the most notable of her earlier efforts were *Fruits of Woody Plants* (1934), *The Elementary Science Library* (1938), *Wild Foods* (1943), and *The Elementary Science Library* (1949). During this time she also prepared a bibliography of nature study for the 1939 edition of Mrs. Comstock's *Handbook of Nature Study*. She prepared other bibliographies of nature and science books for periodicals and participated in conferences where the selecting, reviewing, and writing of science materials for children were under discussion. Her final contribution was to prepare in 1961-1962 a number of sections, mostly in the area of botany, for the *Encyclopedia Britannica Junior*.

Her more recent writings were confined almost entirely to the preparation of the Cornell Rural School Leaflet. Since 1952, when she became the author and editor for the Leaflet, she brought together in convenient form many ideas that had, over the years, been greatly appreciated by teachers. Some of the titles are *Outdoor Nature Studies* (1953), *Indoor Nature Studies* (1954), *The Schoolroom Science Center* (1955). The teacher's number for the fall of 1956 entitled *Cornell Nature Study Leaflets 1896-1956* brought together a concise history of sixty years of nature study publishing by the New York State College of Agriculture. Recent Leaflets for children include such titles

as *Sky Laboratories* (1953), *Insect Homes* (1954), *Science With Toys* (1954), *Woodlands in Spring* (1954), *Summer Nature Explorations* (1955), and *Green Factories* (1956). These titles give a vivid picture of the broad competence and unusual versatility of Professor Gordon.

Professor Gordon was an active member of such science teaching societies as the American Nature Study Society, the National Council on Elementary School Science, and the National Science Teachers Association. She had also been a member of the American Association for the Advancement of Science. Her official duties were most often in the American Nature Study Society, which she served as vice president and as member of the Board of Directors. The Society honored her by a Life Membership.

In the passing of Eva Lucretia Gordon the University has lost a distinguished teacher and educational leader. Her friends have lost a valued adviser and appreciated co-worker who, with quiet humor and astute counsel, gave the best of herself to all who came to know her. This friendliness combined with a depth of scholarship will continue to influence many elementary education leaders in their striving for constructive educational developments.

William J. Hamilton, Jr., Helen L. Wardeberg, Philip G. Johnson

Paul A. Gottschalk

April 12, 1939 — June 11, 1977

When Paul A. Gottschalk died at the age of thirty-eight, he had been a member of the Department of English for twelve years. Except for a year of teaching at Chicago Teachers' College South while he was still a graduate student, he did all his teaching at Cornell. His devotion both to teaching and to Cornell seems almost to have been inevitable. He was born in Chicago, the younger son of Louis R. and Fruma Kasdan Gottschalk. His brother, Alexander, is a professor of nuclear medicine at Yale. His mother is a professor of Russian language and literature at the University of Chicago. His father, who was the Swift Distinguished Professor of History at the University of Chicago at his retirement in 1965 and who continued his teaching at the University of Illinois at Chicago until the year before his death in 1975, was an authority in the field of French history and a great scholar of the career of Lafayette. Louis Gottschalk was an eminent Cornellian, A.B., 1919; M.A., 1920; Ph.D., 1921—at the age of 22; visiting professor of history, 1961-62. He kept alive and transmitted to his students, his colleagues, and his sons the spirit of his teacher, Carl Becker.

Paul did not, however, get his formal education at Cornell. He did his undergraduate work at Harvard, where he studied with professors Douglas Bush and Alfred Harbage, among others, and where he took his A.B. degree *magna cum laude* in 1960 and was awarded the Winthrop Sargent Shakespeare Prize for his honors thesis. He received the M.A. in 1961 and the Ph.D. in 1965 from the University of Chicago; here he worked in the Renaissance with Professors R. C. Bald, William Ringler, and Ernest Sirluck. Professor Bald, who had spent the largest part of his own distinguished career at Cornell, became Paul's thesis adviser and supported his already strong desire to teach at Cornell.

Paul came to Cornell as an instructor in 1965; he became assistant professor in 1967 and associate professor in 1973. His contribution to the intellectual life of the Department of English was impressive. He loved books and ideas, and he loved talking about them. His scholarly interests were wide-ranging; colleagues respected his knowledge and trusted his undogmatic and responsible judgments. His teaching reflected his grasp of the greatest writers in both the English and Continental traditions. He was as much at home in the survey from Chaucer to Shaw as he was in the comparative literature survey from Petrarch, Erasmus, and Rabelais to Stendhal, Chekhov, and Ionesco. With a colleague in the Department of Philosophy he developed an innovative course in existentialism and literature that considered the major issues of a philosophy and their embodiment in aesthetic structures.

Most of all he enjoyed teaching Shakespeare, and he taught the plays at every level from freshman humanities seminar to graduate seminar. Always sensitive to the needs and capacities of his students, he was as effective in teaching Shakespeare to beginners as he was with honors students and with graduate students, and as resourceful in the dialogue of a seminar as he was in the lectures in his large undergraduate course. Young as he was, he had a firmly established reputation as a teacher for whom students willingly did their best work and as a thesis director whose advice and encouragement helped graduate students to develop their skills and to discover and exploit their strengths.

Paul's scholarship is distinguished by its literary sensitivity, fidelity to fact, and philosophic breadth and impartiality. To the vast and often tangled domain of Hamlet scholarship he brought acute intellectual analysis and scrupulous objectivity. As a result, his book *The Meanings of Hamlet* (1972), a study of modes of literary interpretation of Hamlet since A. C. Bradley, is the best of its kind; the integrity of Paul's style is as luminous as the integrity of his evidence and inferences. Paul's later essays, one of which, on Henry V, was written in the fall of 1976, when he was seriously ill, indicate that his premature death has deprived us of a major study of internal mimesis—the creation of fictive worlds within fictive worlds by such devices as the play-within-the-play and by such processes as the madness of King Lear. His essay on *Lear* (published in the *Bucknell Review* in 1971), one on Macbeth, and another that provided the theoretical justification for his ideas on the “world within the play” were to be part of this new study. But Paul was more than a specialist in Elizabethan drama. He published an essay on Dickens, was engaged in studies of his beloved Dostoevsky (he had learned Russian in recent years in order to interpret more accurately), and he had come to terms with such philosophers as Heidegger by mastering their works in the original languages. He was a sensitive reader of poetry in French and in Russian as well as in English. In everything he touched as a scholar or a critic he was original, cogent, and just.

Paul took special pride in being part of the Cornell community, and he served the University well and variously. He was a member of the University Committee on the Preparation of Teachers, directed for the Department of English its Master of Arts in Teaching Program, and taught the department's course in methodology for prospective secondary school teachers of English. For several years he was a member of the Admissions Selection Committee of the College of Arts and Sciences, and he served, too, on the committee that set policy on admissions. At the inception of Cornell's freshman summer start program, he served as director. He and his wife, Katherine, shared a particular interest in the musical life of Ithaca, and both contributed immensely to it. Paul was a member of the Faculty Committee on Music, and he chaired the committee in 1972-73. A great admirer of Russian liturgical

music, he was a cofounder of the Cornell Russian Choir. At his request, the choir sang at the memorial service for him Chesnokov's "Salvation" and his own composition, "Cherubic Hymn" (*Heruvimskaya Pesn'*). That he wanted the hymn's closing Alleluia to stand as his final declaration to his family and friends is the justest evidence of the magnanimity of his spirit.

In all his relations—with students, colleagues, and others—Paul endeared himself by his politeness and his gentleness, by his warmth and his tact. Only his lectures and publications reveal how tough-minded and rigorous he could be. Constantly he made demands on himself in order to make things easier for others.

Paul is survived by his mother and his brother; by his wife, Katherine Kiblinger Gottschalk; by his children, Sarah and Alexander; and by a host of friends who found in his short life a rare example of humane achievement and an equally rare example of courage and dignity in his death.

Ephim Fogel, Daniel R. Schwarz, David Novarr

Guy Everett Grantham

February 1, 1886 — September 8, 1970

For two generations, the students entering Cornell's College of Engineering learned of the wonders and difficulties of physics at the hands of a master teacher—Guy Everett Grantham. Those fortunate students came to know a warm friend who was devoted to the task of helping them to learn, who insisted that they do their utmost to learn well, but who was infinitely Patient with their difficulties. In short, they learned that universities really do care about excellence in teaching. While we record Professor Grantham's Passing with sorrow, we can be confident that his life will have served as an aspiration, both to his colleagues and students at Cornell and to the many physics teachers throughout the country who served their teaching apprenticeship with him.

Guy Grantham was born in Ladoga, Indiana. He received the bachelor's degree from Indiana University in 1909 and the master's degree from the same institution in 1913. During the years 1909-15 he served as an instructor in physics at Purdue University. One of his students at Purdue, Miss Margaret Paul, became in due time Mrs. Grantham. He entered Cornell to work for the doctorate in 1915, but World War I interrupted his training. He was commissioned a captain in the Army Signal Corps and saw service in France, mostly in the training of experts in the new science of radio communication. (It simply must be recorded that he really couldn't qualify for a commission because of his color blindness. With the help of some ingenuity, some friends and some determination, he got around that problem.) After the war, he resumed his graduate work at Cornell and received the doctor's degree in 1920. Thereafter followed teaching positions at the Agricultural and Mechanical College of Texas and at the Post Graduate School of the United States Naval Academy. When, in 1927, Cornell's College of Engineering and Physics Department felt the need for a special introductory physics course for students of that college, and for a new faculty member to organize and teach that course, it was natural to think of Guy Grantham. He became an assistant professor in 1928 and professor in 1936. While his primary responsibility continued to be the introductory physics course for engineering students, he assumed other responsibilities as well. After the experience of World War II, it seemed clear that a curriculum combining the fundamentals of physics and the engineering sciences was desirable and so Cornell's Department of Engineering Physics came into being, with Professor Grantham as one of the planning group and a member of that new department's faculty. During the last five years of his active career, Professor Grantham served as executive officer of the Department of Physics. With his retirement in 1955, he became professor of physics, emeritus.

While Professor Grantham's professional career included many activities outside the lecture room and the laboratory, he will surely be remembered most for his devotion to and love for teaching. He was a brilliant lecturer and spent much effort on the development of new demonstration experiment and techniques. During a sabbatic leave in 1936 he visited many universities in Europe, looking especially for ideas for lecture demonstration experiments. Later, when closed-circuit television equipment began to appear, he was among the first to use it in illustrating physics concepts that had previously been inaccessible to demonstration. While he insisted that every demonstration should have the prime aim of clarifying a point in physics, he was delighted if the point were illustrated spectacularly. And so, while some of his former students may now be a little fuzzy about the law of conservation of energy, few will forget a massive pendulum ball starting from Professor Grantham's nose, swinging far out over the audience and returning to within a hair's breadth of that nose. While he enjoyed lecturing, he felt that his most effective teaching was with smaller groups where he could ask and answer questions and where he could stimulate lively debates. In fact many of his hours were spent with the smallest possible group: one student. A mental picture that many of us will always carry is that of Professor Grantham in his office with a student seated beside him, with the patient and thoughtful questions guiding that student through the subtleties of Newton's laws of motion.

Not the least of Professor Grantham's legacies is the small army of college and university physics teachers who first learned their trade as one of "Granny's boys." These former teaching assistants are now scattered all over the country, bringing to their students and to their teaching assistants the same high standards of teaching excellence that they learned from him. It is worth noting that two of Professor Grantham's former teaching assistants are now college presidents.

While Cornell was fortunate in enjoying a major share of Professor Grantham's thoughtfulness, warmth, and devotion to duty, he gave his time freely to many other activities: to innumerable United Fund campaigns, to his church, to the Shriners' lodge, and to the Rotary Club.

He is survived by his wife, his daughter, and two grandchildren.

Trevor R. Cuykendall, Howard G. Smith, Herbert F. Newhall

Professor Alexander Gray

Professor of Electrical Engineering

March 9, 1882 — October 14, 1921

The Faculty of Cornell University desire to express their great sorrow at the death of their colleague Alexander Gray, to record their appreciation of his services to the University, and to extend their sympathy to his family in their bereavement.

Professor Gray was born in Edinburgh, Scotland, on March 9, 1882 and died in Ithaca on October 14, 1921. He graduated from Edinburgh University in Civil and Mechanical Engineering in 1903. On graduation, Edinburgh University awarded him a Whitworth Scholarship at McGill University, Montreal, where he spent two years, graduating in Electrical Engineering. After several years of practical work he returned to McGill University as an Assistant Professor of Electrical Engineering. In 1915 Professor Gray was chosen to fill the position of head of the electrical engineering department of Sibley College, and at the time of his death he was Director of the School of Electrical Engineering in the College of Engineering.

From the very beginning of his work at Cornell, Professor Gray made a warm place for himself with both students and faculty. A man of fine personality, a charming companion and an exceptionally gifted teacher, he was quickly recognized as a great addition to the teaching staff of the College and to the social life of the community. His wide and unflinching interest in all matters pertaining to his profession and to the University, and his great desire to be helpful to all, made a combination of qualities found only in the true teacher.

Professor Gray contributed largely to the literature of electrical engineering. Though still a young man his books on electrical machine design and on other subjects had already made him well and favorably known to his profession, and had reflected much credit on the University. In 1918 he was the recipient from the Franklin Institute of the Howard A. Potts Medal for his paper on Modern Dynamo Electric Machinery. Professor Gray was a member of several national scientific and honorary societies, and was especially active in the work of the American Institute of Electrical Engineers.

In his death the profession of electrical engineering loses a brilliant engineer of great promise and a writer of established reputation; and the teaching profession loses a teacher of rare ability whose place will be difficult to fill.

In Cornell University, 1915-1921

Director of The School Of Electrical Engineering, 1921

James Lawrence Gregg

August 26, 1899 — July 16, 1986

Jim Gregg came to Cornell in 1948, after having had a distinguished career in industry. He joined the then School of Chemical and Metallurgical Engineering as a professor of metallurgy. The metallurgical engineering program later became a part of the larger Department of Materials Science and Engineering, from which he retired in 1967.

Jim was born in Belton, Missouri, on August 26, 1899. He was a direct descendant of Daniel Boone. In 1923 he graduated from the Missouri School of Mines with a degree of Bachelor of Engineering and a major in engineering metallurgy. The various companies for which he worked include Illinois Steel Company, Gary, Indiana, as a metallurgical observer (1923-24); Western Electric Company, Chicago, Illinois, as a metallurgical engineer and then department supervisor (1924-29); Battelle Memorial Institute, Columbus, Ohio, as a research metallurgist (1929-34); and Bethlehem Steel Company, Bethlehem, Pennsylvania, as a research engineer (1934-44) and assistant to the vice president (1944-48).

His most important area of specialization was in the development of ferrous and nonferrous alloys. He continued to contribute in this important area by serving as a consultant to the Atomic Energy Commission (later the Department of Energy) during his Cornell days. Although technical publications were not particularly emphasized for the career of an engineer before World War II, he managed to author and coauthor five books in the area of his specialty while continuing his responsibilities in large projects. Those books are *The Alloys of Iron and Molybdenum* (McGraw-Hill); *The Alloys of Iron and Tungsten* (McGraw-Hill); *Arsenical and Argentiferrous Copper* (Chemical Catalog Company); *The Alloys of Iron and Copper*, with B. N. Daniloff (McGraw-Hill); and *Metallurgy*, with C. G. Johnson and R. S. Dean (American Technological Society). Even by today's standards the volume of his effort is impressive.

Jim came to Cornell because of his interest in teaching. At that time research was not carried out on a large scale in the College of Engineering. He was able to draw on his broad industrial experience and became a well-liked and admired teacher. His devotion to undergraduates was well known, and an undergraduate scholarship has been established in the department in his memory. The metallurgical program had only a small number of students, and before the death of his wife, Ada, it was his custom to invite the entire class to his home for dinner several times a year. One of the writers (Che-Yu Li), then a graduate student, was also invited.

The forming of the Materials Science Center at Cornell in 1960 represented the beginning of expanded research activities in the area of materials science. After several departmental reorganizations, Jim became a member of an enlarged Department of Materials Science and Engineering. During the period of reorganization much debate as to the goals and the structure of the department went on. Although Jim was not personally active in research at that time, he participated effectively in the transition process by providing a balanced perspective from both the industrial and educational viewpoints. He recognized that research and graduate education were going to be increasingly important in engineering at Cornell and other major institutions, and he provided important advice on how best to implement that transition while still maintaining a strong and dynamic undergraduate program. He was completely unselfish and worked well with all of us who were much junior to him in age. Often he had to listen to us patiently, and he always gave his full support. The success of the department today owes a great deal to his wisdom and his contribution during those formative days.

Jim loved the outdoors and was an avid fisherman and hunter. He enjoyed life and was always considerate of his colleagues and friends.

After his retirement Jim moved to Sarasota, Florida, and lived there until his death on July 16, 1986. He was active during his retirement and was a member of the board of directors of the Sarasota Harbor Condominium Association and the Sarasota Yacht Club.

Jack Blakely, Arthur Ruoff, Che-Yu Li

Kenneth I. Greisen

January 24, 1918 — March 17, 2007

Kenneth I. Greisen, Professor of Physics, Emeritus, and former Dean of the Faculty, died on March 17, 2007 at age 89, at the Hospicare of Ithaca residence.

Ken was born in Perth Amboy, New Jersey, January 24, 1918. After graduation from Franklin & Marshall College in 1938, he came to Cornell for graduate work in physics, completing his Ph.D. degree in 1942, working with Professor Bruno Rossi. A 1941 article in *Reviews of Modern Physics* by Greisen and Rossi entitled, “Cosmic Ray Theory,” became a standard reference in the field.

In 1943, with his new wife, Betty, he joined the large team of physicists working for the Manhattan Project at Los Alamos, New Mexico. He was a member of the team that worked on the detonation system for the first atomic bomb. After observing the “Trinity” test in 1945, he wrote an eye-witness report that has become part of the historical record of that event. His immediate comment: “My God, it worked!” provides a pungent summary of this watershed event in human history.

His two children, Eric (1944) and Kathryn (1946), were born in Los Alamos.

Ken returned to Cornell in 1946 as Assistant Professor of Physics. Thus came the beginning of a long and distinguished career as research physicist, physics teacher and mentor, and University leader, prior to his move to Emeritus status in 1984.

Ken was mentor and colleague to 21 physics Ph.D. students, six post-docs and many undergraduate physics major students. Ken’s relationship to his students and research associates was based on mutual respect, caring, and encouragement. His students remember his brilliance as well as his generosity, great patience, and unfailingly calm demeanor. He taught them to have confidence in themselves. Always practical, he saw to it that they had sufficient financial support. At a time when very few women attempted careers in physics, Ken was exceptionally encouraging to those whose lives he touched.

Greisen’s physics research activities centered in a deep and extended study of cosmic rays—those high energy particles and radiation that come to the Earth from outer space—and the showers of secondary particles produced in the atmosphere by the incident cosmic rays. With his collaborators, he installed arrays of cosmic ray activated scintillators on top of Cornell buildings, as well as 600 m below ground in salt mines near Ithaca. The data from

these detectors gave information about intensity, particle composition, and direction of the cosmic rays and their secondary air showers.

In the 1960s, he and his students and research associates installed an array of fluorescence detectors on the hills around Ithaca to study the extensive but rare showers of particles that are initiated by incoming cosmic “rays” with very high energies. Descended from this initial, so-called “fly’s eye” configuration of detectors, were more fully developed systems at the University of Utah in the 1970s, and a present day, large-scale international project located in the Andes mountains in Argentina, known as the “AUGER” experiment.

Remarkably, his contributions to the study of cosmic rays continue to influence contemporary research activities. In 1966, Greisen had postulated that cosmic rays from distant sources could not reach the Earth if their energies were above a certain limit. He realized that such particles, over their long paths, would lose their excess energy via interaction with the background microwave radiation that fills all of space. Two Russian scientists, Kuzmin and Zatsepin, made the same prediction independently, and the postulated energy limit of about 6×10^{19} eV became known as the “GZK Limit.” In a striking near-coincidence with Ken’s death in March 2007, the physics journal, *Physics Today*, reported strong evidence, collected by the HiRes research group at Utah, for suppression of cosmic-ray intensity above the GZK limit.

Growing out of the strong interactions of his research group with nearby activities in the Department of Astronomy and Space Sciences, he served as Chair of that department from 1976-79.

Following his personal role in helping to form a High Energy Astrophysics Division of the American Astronomical Society in the early 1970s, Ken served as the first chair of that Division. He was elected to the National Academy of Sciences in 1974.

Ken was a strong participant in efforts to improve the effectiveness of physics education at Cornell and elsewhere. Along with Philip Morrison and Hans Bethe from Cornell, he participated in the work of the Physical Science Study Committee in the late 1950s. Their work, based at the Massachusetts Institute of Technology, instigated a major review of the content of high school science courses in the U.S. He served for a period of years as chair of the major advisors group of the Physics faculty, as well as himself acting as major advisor to numbers of physics major students in the College of Arts and Sciences. A number of these major students participated in his cosmic ray research program.

In the late 1960s, Ken acted as leader of a team comprising faculty and graduate students from the Physics and Science Education Departments that engineered a complete redesign of one of the introductory physics courses at Cornell—that teaching pattern has continued to this day in 2007.

Beyond his physics research and teaching activities, Ken made significant contributions to the wider university life. He served as University Ombudsman, 1975-77. His service to the University community culminated in his leadership as Dean of the University Faculty from 1978-83.

Ken's wife Betty died in 1976. His equally happy second marriage, to Helen Wiltberger, ended with her death in 2007.

Ken greatly enjoyed the outdoors and music. Golf and canoeing were favorite recreations. He played the flute for his own pleasure, and joined several Ithaca singing groups—successively the Unitarian Church choir, the Ithaca Community Chorus in its early days, and the Presbyterian Church choir. Following his retirement in 1986, his persistent concern for the welfare of others led him to volunteer work with various Ithaca organizations that served people in the community who were marginalized by age or economic circumstance.

In the wake of Ken's death, Saul Teukolsky, a Cornell colleague and present chair of the Physics Department, responded,

“Ken was a wonderful, gentle person. It's no wonder he was so successful as University Ombudsman. Yet, at the same time, he was at the top of the field of cosmic ray physics, and the field today continues to be shaped by his work.”

Kenneth Greisen leaves a remarkable legacy.

Donald F. Holcomb, Chair; David G. Cassel, Edith Cassel

H. Victor Grohmann

January 3, 1903 — November 27, 1981

H. Victor Grohmann graduated from the School of Hotel Administration in 1928 and was an ardent supporter, friend, and contributor to Cornell and the hotel school for the rest of his life.

Vic's accomplishments and involvements over the years since graduation have truly been legendary among hotel school graduates, and a discussion of him and his efforts on behalf of the school was to be expected whenever Hoteliers gathered. He personally helped hundreds of graduates in job searches; in fact, his interest in assisting fellow alumni, young and old, resulted in the establishment in New York City of a placement service for hotel school graduates. He provided the office space and paid for the salaries and administrative costs associated with this office for thirty-five years, in addition to giving thousands of hours of his own time.

Professor Grohmann taught for forty years at the School of Hotel Administration, including the Center for Professional Development sessions during the summer periods. He was the first Howard B. Meek Visiting Professor and was able to teach and to counsel students with an intense commitment that was truly extraordinary, considering his other interests and responsibilities.

Vic liked teaching and was very impressed with the students he met over the years. They, in turn, appreciated being taught by an active, successful businessman. Vic's ability to combine careers and to be accepted as a very successful, contributing member of each group was one of the most remarkable aspects of his personality. He was always able to get things done. His willingness to help others was so ingrained that he took it for granted that others would also want to help worthy causes. Without Vic's telephone calls to general managers of hotels situated where Cornell athletic teams needed lodging, the Athletic Department budget would have had to bear thousands of dollars more in lodging costs.

Vic always felt he owed a great debt to Cornell. He had transferred from Rutgers to study agriculture but soon became interested in the curriculum offered by the School of Hotel Administration and switched his course of study. His interest in entrepreneurial activities can best be described by a note from him: "My last two years I worked in the student union, and I sold programs at athletic events, cereal, stationery, flowers, and used cars. I was holding so many jobs, when I graduated and got a nine-to-five position, I didn't know what to do with all the time off."

After graduation he worked in several hotels but always had a yearning for creative work. He therefore switched jobs and joined an advertising agency. Just a short while later, in 1931, he and a coworker decided to open their own agency. The fact that the country was in the throes of a deep depression didn't deter them; they believed the agency of Needham and Grohmann would have something special to offer clients. The agency grew steadily and has for many years been one of the preeminent agencies in the hotel, resort, and travel field. Housed at 30 Rockefeller Plaza, in New York City, it has long represented Rockefeller family properties such as Rock Resorts and Rockefeller Center, in addition to some of the most prestigious hotels in the world.

His identification with Cornell was constant throughout his lifetime. He was the founder and first president of the Cornell Club of Bergen County, he was president of the Cornell Club of New York, and he was president of the Cornell Society of Hotelmen.

Vic's devotion to his alma mater and his willingness to do so much was brought to bear as a member of the University Board of Trustees. He served ten years on the board and was awarded the Presidential Cornell Medal for distinguished service.

A brief statement of Vic's accomplishments in areas other than his business and Cornell activities may serve to assist H. Victor Grohmann's many friends and associates to fill in their own portrait of this remarkable individual. He was a trustee of the United States Travel Data Center and chairman of the United States Travel Data Fund. He served on the board of Discover America Travel Organization for twelve years and was an official of the American Hotel and Motel Association. In addition to his other activities, Vic always found time for local community affairs and served on an amazing array of committees. He was president of the Community Chest in New Jersey, chairman of the Tenafly, New Jersey, Senior Citizen's Housing Committee, and a member of the Mayor's Advisory Committee.

Many readers may associate Vic more with sports than with any of his other activities. He was certainly deeply committed to sports, both as a participant and a fan. He played football in high school and swam at Rutgers. When he transferred to Cornell, he played football, and since there was no swimming team, he organized one and acted as coach. He later played semiprofessional quarterback and halfback for the Atlantic City Tornados. Vic served on the athletic board at Cornell and spent many years with promising high school athletes, extolling the virtues of a solid education at Cornell. Among those he recruited was Ed Marinaro, who went on to all-American and professional football fame.

Vic was a fine, forthright gentleman who believed in hard work and commitment and who adhered to principles that some may regard as traditionally, perhaps uniquely, American. At his retirement gathering—at age seventy-eight—he said of his life, “It’s really been the American dream.”

He is survived by his wife, Margaret Elizabeth (née Haver), of Sussex, New Jersey; a daughter, Gwendolyn DesCognets ‘56, of Lincoln, Massachusetts; and two sons: H. Victor Jr., of Lakeville, Connecticut, and William, of Amherst, Massachusetts.

Robert A. Beck, Vance A. Christian, Paul L. Gaurner

Donald Jay Grout

September 28, 1902 — March 9, 1987

From 1945 to 1970 Donald Grout guided Cornell's music and musicology. He still inspires our combinations of performing, composing, investigating history and theory, relating music to other arts and sciences, and teaching all these activities together. His excellence in each of them was as extraordinary as his energy and versatility. His books keep bringing Cornell recognition from readers around the globe, and they remind many scholars and teachers of distinctive ways of combining musical practice and theory. For example, although Professor Grout had retired from teaching before our graduate program in historical performance of eighteenth-century instrumental music began, he had provided the necessary nourishing environment with his farsighted strong support of the library, of the modest collection of musical instruments, and especially of young faculty members and their diverse interrelated interests. The best students in the program find in Grout's writings characteristic helpful hints toward the dynamic equilibrium they seek.

When Donald was born, his family was living in Rock Rapids, Iowa, but in 1906 they moved back to Skaneateles, New York, where they originated. About that time his mother began to teach the four-year-old boy to play the piano. By the age of twelve he was a good musician: for the next four years he was organist of the Skaneateles Methodist Church. In 1919 he entered Syracuse University. He became the organist of the First Universalist Church of Syracuse and occasionally in the next years also played at the Strand Theater, accompanying silent films. After he graduated in 1923, as valedictorian of his class and with philosophy as his major subject, he went to Boston for further study at the Boston University School of Theology. In about six months he dropped that program to concentrate on music.

Through the 1920s Grout taught piano and played organs at various churches in Boston, carrying his study of performance to the point of a second prize in the Naumburg Competition in 1932. Meanwhile he began graduate work in music at Harvard, which led to a master's degree in 1932 and the Paine Travelling Fellowship for 1933-35.

Grout's scholarship was thus founded on his thorough musicianship together with a philosophical training. He liked to define *musicologist* as "a musician with an education."

On his first trip abroad he pursued studies in the history of opera at Strasbourg, Paris, and Vienna, particularly with Théodore Gérold, J. G. Prod'homme, and Robert Haas. But he always gave greater credit to Archibald T.

Davison, the Harvard choral conductor, and Otto Kinkeldey, the first American professor of musicology (at Cornell 1930-44) as his models of teaching and scholarship in music.

He traveled westward in 1936 to be visiting lecturer at Mills College in Oakland, California. Then he returned to teach at Harvard and Radcliffe (and occasionally to play the organ at the Memorial Church). With his dissertation, “The Origins of the Opéra Comique” (1939), he won the doctorate, and for three more years he was instructor, tutor, and director of graduate studies in music. By 1942, when he left Harvard for a brief tenure at the University of Texas at Austin, he had begun writing *A Short History of Opera*.

This major work on opera, published in 1947 by Columbia University Press, he revised and enlarged for a second edition in 1965, and he left a third edition under way. Though concise, it needed at least two volumes to coordinate its dauntingly comprehensive critical array of specialized research. Not only is this Short History continually cited by scholars of opera, it stands as a model, unique in America up to its time, for handbooks of other genres—sonata, oratorio, and perhaps eventually symphony, concerto, quartet, and even jazz.

In 1944, again in 1949-50, and many times thereafter through 1976, Grout served on the Executive Board of the American Musicological Society (AMS). From 1948 to 1951 he was editor in chief of the society’s Journal. His devoted skill and energy enabled the society to bring out volumes two through four with speed, tact, and elegance.

On his second European sojourn, in 1951-52 with Fulbright and Guggenheim fellowships, Grout collected films of all extant Renaissance sacred music in choirbooks, planning a systematic study of text underlay. Though he never brought this study to publication, it contributed to his teaching and to his perspectives as historiographer, consultant, and impresario of international collaborations.

During his first term as president of the AMS (1952-54) Grout began planning to bring to America the Congress of the International Musicological Society—a bold plan fulfilled during his second term (1960-62). The International Musicological Society elected Grout president in 1962-64, then vice president in 1965-67, permanent member of its directorium, and honorary president of the Répertoire Internationale des Sources Musicales. His concerns extended to the music of continents around the globe: he was an active trustee of the Institute for Comparative Music Studies and Documentation in Berlin. Almost as a matter of course he joined the national musicological societies of France, Holland, and Italy and became a member and honorary fellow of the Central Institute for Mozart Research in Salzburg, a corresponding fellow of the British Academy, and a member of the Royal Academy of Belgium. These memberships indicate the extent to which he represented American musicology abroad.

In 1960, almost as a by-product of Grout's teaching and editing and organizational work, he completed his *History of Western Music*, the monument that makes him probably the most well known of all historians of music writing in any language. Published by W. W. Norton, the book has renewed its use in a second edition in 1973 and a third in 1980. Readers of any chapter of this book are grateful for Grout's skillful organization of vast ranges of learning, here even more vast than in the opera volumes. At the same time, readers sense the depth and warmth of his love for a great deal of music, old and new—songs he sang, all kinds of instrumental music he played at the piano or organ, and choruses he conducted.

His last book was another by-product, this time of an enterprise of scholarly teamwork that he organized to edit from manuscripts all the extant operas of Alessandro Scarlatti. These operas, almost unknown since the early eighteenth century, are often referred to as essential links in the development of techniques and styles between Monteverdi and Mozart, and a closer knowledge of them will illumine understanding of the whole development. From 1970 to 1986 the Harvard University Press published two of these operas edited by Grout himself and seven more edited under his supervision by scholars, including William C. Holmes, a Cornell colleague of the years 1962-68. The slim book with the modest title *Alessandro Scarlatti: An Introduction to His Operas* records the lectures Grout gave in 1976 as the Ernest Bloch Professor at the University of California, Berkeley.

Grout's writings include more than twenty essays, lectures, articles, and reviews. Although the musicological topics are mostly too specialized for a wide audience, an exceptionally alluring one is *Mozart in the History of Opera*, the Louis Charles Elson Memorial Lecture at the Library of Congress, 1971, published as a booklet at the library in Washington. Grout's wit and wisdom shine in this lecture on a topic central to all his work, radiating to all the world.

At Cornell Grout directed the Sage Chapel Choir from the time he came in 1945 until 1952, and after that he often conducted choral performances and open readings, in some of which an orchestra joined. On such occasions he amazed everyone with the efficiency of his rehearsals and the excitement of the performances. The most elaborate production, for the Bach bicentennial year 1950, was the *Passion according to Matthew*, with its double choir and orchestra, soloists, and children's chorus.

He served as chairman of the Department of Music in 1947-51, 1953-58, and 1961-62. As a matter of course he represented the Field of Music in the Graduate School and presided over the Special Committees of nearly all doctoral candidates. When the professional programs in composition, leading to the Master of Fine Arts and Doctor of Musical Arts degrees, were established, he was ordinarily an important member of those Special

Committees, representing musicology as a minor subject for composers like Richard Monaco and Paul Chihara. From 1962 on he was the Given Foundation Professor of Musicology.

He gladly taught at every level. He welcomed students with no previous study of music into courses he invented for them. He contributed to the progress of every undergraduate for whom music was a major subject. He inaugurated the Collegium Musicum. He provided graduate students with strenuous introductions to bibliography and paleography, as well as advanced seminars. In one term he taught four courses, and in many terms three, while presiding, conducting, editing, and writing his *History*. Later, as the faculty grew and matured, he enjoyed teaching interdisciplinary courses such as one on the operas of Wagner with Professor Eric Blackall. In 1970 he appeared as guest pianist and lecturer on Chopin in another course. His expectations could be scary, but he made allowances for the weaknesses of any student who worked steadily with honest effort. He helped several learn to write about music with clarity and grace. He inspired many to surpass all they had supposed they could do before they encountered him. In the first years after retiring he often joined small groups of students at lunch for informal but serious discussions of many kinds of music in contexts of general history and literature. Even in the last decade of his life, when illness slowed him down, he welcomed students and colleagues who came to visit him at Cloudbank, his home overlooking Skaneateles Lake. On some of these visits he played piano duets or accompanied a singer: his precision and style kept partners doing their best.

Donald died peacefully at Cloudbank, where his wife, Margaret; their daughter, Martha; and her husband and children were all close by. At the funeral service on March 12 the family and the Skaneateles congregation were joined by many devoted friends from Cornell and further away. The greetings of Professor Thomas A. Sokol, current chairman of the Department of Music, were read. Then, on April 26, a service of homage at Sage Chapel brought the family and Cornell together again. Here Professor H. Peter Kahn's ink drawing "Recollections of the Grout home on Dodge Farm Road," printed on the program cover, reminded us of many similar collaborations. Professor Donald R. M. Paterson, the university organist, offered a prelude and postlude by Bach. The Cornell Chorale, conducted by Tom Sokol, sang the kyrie from Ralph Vaughan Williams's Mass in G Minor. Readings from the Bible by the Reverend Richard Strauss were followed by remarks by William Austin, Harold E. Samuel, Susan Davenny Wyner, and Don Randel. Dr. Samuel, returning from Yale, where he is the music librarian, recalled the generosity of Donald and Margaret in the years of his graduate studies. Susan Davenny Wyner, now a professor here, recalled Donald's part in her undergraduate program with a double major in English and music. Among others joining this homage were Robert Palmer, professor emeritus, and Sir Keith Falkner, a professor at Cornell

for a decade before he returned to London as director of the Royal College of Music, where he often brought Grout, Hsu, Sokol, and other Cornell musicians to help him propagate the kinds of practical scholarship and scholarly performance that Grout cultivated at Cornell.

At the time of his retirement Donald and Margaret Grout gave the Cornell Music Library over two thousand books, scores, and films. These have been kept, with a few other rare items, in the “Grout Room” of the Library, where Grout himself used to hold seminars.

A new gift by Margaret Grout in 1987 established the Donald Jay Grout Memorial Scholarship Fund for graduate students in musicology. With the collaboration of other donors this fund will speed many students’ scholarly travels as well as their reading and writing, singing and playing, and teaching and endless learning—a most appropriate tribute to Donald’s enormous influence.

John Hsu, Don M. Randel, William W. Austin

David L. Grunes

June 29, 1921 — April 19, 2009

David L. Grunes, 87, died April 19, 2009 at Kendal in Ithaca, New York, following a long illness. He was born in Paterson, New Jersey to Gussie and Jacob Grunes, a silk weaver. Following the death of his mother when he was three, his two aunts and his stepmother raised him.

He was awarded a scholarship by Rutgers University and his World War II draft board deferred him until he graduated because he was the only man from his neighborhood attending college. He earned a B.S. degree in Preparation for Agricultural Research, followed by service in the U.S. Army prior to attending graduate school at the University of California, Berkeley on the G.I. Bill. While earning his Ph.D. in Soil Science, he met and married Willa Freeman, a graduate student in psychology.

Professor Grunes, in 1950, accepted a research position with the U.S. Department of Agriculture at the Northern Great Plains Field Station in Mandan, North Dakota. He published many papers on basic soil chemistry research and spent an academic year working at Colorado State University, and another year in Israel with the International Atomic Energy Agency of the United Nations. He joined the U.S. Plant, Soil, and Nutrition Laboratory on the Cornell campus in 1964, where he worked even after retiring in 1996.

His honors included a courtesy appointment to Cornell's Department of Agronomy, retiring as Professor Emeritus. In 1991, the U.S. Agricultural Research Service named him Senior Scientist of the Year for work that significantly reduced cattle deaths from grass and wheat pasture tetany. He traveled to many countries to cooperate with other scientists; he was respected internationally and was noted for exceptional integrity, kindness, and sweetness of disposition.

Professor Grunes is survived by Willa, his wife of nearly 60 years; sons, Lee of Portland, Oregon and Mitchell of College Park, Maryland; daughter, Rima of Ithaca; and granddaughter, Julie Grunes of Tigard, Oregon. In addition, he was the unofficial "Grandpa" of the family of Michael and Virginia Griffin and their children, Paige and Samuel, all of Fairport.

A celebration of his life was held at Kendal on May 28.

Office of the Dean of Faculty

Henry E. Guerlac

June 14, 1910 — May 29, 1985

Henry Guerlac was a born Cornellian. His maternal grandfather, Francis Miles Finch, was a distinguished Ithaca jurist, who drew up the charter for Cornell University and served on its first board of trustees. His mother, Helen Finch, was an accomplished pianist, who fostered her only child's considerable musical talent by forbidding him to touch her piano. His father, Othon Guerlac, a French journalist sent from Paris to cover the Klondike, sensibly stopped when he reached Ithaca and became a professor of French at Cornell. Although Henry's grandfather had gone to Yale, there never seemed to be any doubt that he would go to Cornell. He was, in fact, to spend almost all his life in Ithaca and most of his professional life as a teacher at his beloved alma mater.

As a youth Henry took full advantage of the many joys of Ithaca. He was an enthusiastic Boy Scout, studying birds with Louis Fuertes and entomology with Chester Bradley and learning to identify poison ivy in the winter. His early schooling was in Ithaca, but a year in a French lycée helped revive the French that had been his first language. It was in France that he first made contact with the great thinkers of the Enlightenment, whose literary style, liberal values, and inquiring minds were to serve him ever after both as models and as subjects. In 1982 the French government awarded him the Legion of Honor for his contributions to the understanding of French science and culture.

In 1928 Henry Guerlac entered Cornell as a premedical student, partly as a gesture of independence from a humanistic background. When he was elected to Sigma Psi, the honorary science society, in his senior year, his father was mildly impressed but predicted, "You'll be back."

In 1932 Henry received his B.A. degree and stayed on at Cornell to take a master's degree under James Sumner, Cornell's first Nobel laureate. In the intervening summer he went to Woods Hole, Massachusetts, where he extended his biological knowledge and sharpened his experimental skills. His master's thesis marked his first excursion into the history of science, for he wrote a small history of narcosis, beginning with the researches of Claude Bernard, as background for his own work. Another summer at Woods Hole followed, during which he read and was excited by L. J. Henderson's *The Fitness of the Environment*.

Determined to study under Henderson, he hitchhiked to Cambridge, knocked on Henderson's door, presented his first reprint, and offered himself as a graduate student. In autumn 1933 he became an assistant in Harvard's Fatigue Laboratory, acting, somewhat to his surprise, more often as a subject than original investigator. Gradually

he moved into biochemistry and then into history. Election to the Harvard Society of Fellows gave him the freedom to make the final jump. It was, again, Cornell, acting upon him at a distance, that provided the decisive impetus. As he later wrote: "A love of European history had been instilled in me by my father, whose closest friends on the Cornell faculty were men like Preserved Smith, George Lincoln Burr, M. L. W. Laistner, and Carl Becker. I wanted to be trained in the historians' craft."

In 1941 Henry Guerlac was awarded the Ph.D. degree in European history (not history of science, although he took some courses from George Sarton), having written a dissertation on the Engineering School of Mézières, France, under the Old Regime. That August he married Rita Carey, another Ithaca Cornellian and a classicist, whose Latin and scholarly training was occasionally useful to his own researches.

The course of those researches for the next twenty years had been set during a trip to Europe in 1939 to gather material for his thesis. While in Paris, he learned of unpublished Lavoisier manuscript material and determined to bring it to light and use it in the study of Lavoisier's work. He arrived back in New York the day after World War II began, so that work had to be deferred until after 1945.

In 1941 Henry took up an appointment at the University of Wisconsin as an assistant professor, charged with setting up the first independent Department of the History of Science. After Pearl Harbor he tried, unsuccessfully, to enlist and then accepted the position of historian with the Radiation Laboratory at Massachusetts Institute of Technology. He spent the war years there, where he was author-editor of the official history of United States radar, soon to be published as *Radar in World War II*.

As he was finishing his radar history, Cornell offered him a new position in the Department of History; his primary responsibility would be to teach a required course in the history of science for all junior and senior engineering students. In 1946 he came back to Cornell as a full professor. In 1964 he was named Goldwin Smith Professor, a title he held until his retirement in 1975, when he became professor emeritus.

These bare outlines of Henry Guerlac's career cannot begin to do justice to his eminence. A few words must be said about his achievements as scholar, as teacher, and as devoted supporter of the humanities and of learning.

It is given to few scholars to found a new field of intellectual endeavor. Henry Guerlac was one of those fortunate people. He and the Russian émigré Alexandre Koyre, in Paris, raised the history of science from an uncritical chronicle to the stature of intellectual history. Koyre showed that science was deeply involved with philosophical questions that could not be ignored if the modern world was to be understood. Henry insisted upon and illustrated

the necessity of placing these ideas in real historical context. Henry was the first historian of modern science systematically to use manuscript and other archival materials to reveal the backings and fillings and turnings, the hesitations, the downright errors, of scientists. Unlike Sarton, who saw the history of science as the steady forward march of reason, Guerlac knew that scientists were and are human, subject to all the foibles and defects of humanity.

In some seventy beautiful and lapidary articles and five books on Lavoisier and the chemical revolution and on Newton's physics, Henry taught the whole profession of historians of science how to do real history, using manuscripts, published articles, philosophy, technology, and all other subjects that could cast light upon his subject. Someone once wrote that God is in the details. Henry knew this was also true of history. It was in recognition of his scholarly leadership that he was twice elected president of both the History of Science Society of America and the Académie Internationale d'Histoire des Sciences.

Henry Guerlac was a brilliant teacher of both undergraduate and graduate students. It is no mean feat to hold an audience of 350 reluctant engineers, dragooned into a required course, enthralled day after day. To many of those who took History 165-166, this was their favorite subject, to be remembered with admiration and affection years later at reunions.

For graduate students, working with Henry Guerlac was like living on the slopes of Mount St. Helens. Ideas flashed through his head like lightning around a volcano, and a half hour with him left one almost exhausted from the intellectual stimulation he provided. After an evening seminar in his library at 3 Fountain Place, his graduate students found it impossible to sleep for hours afterwards, as they mulled and considered all the insights and criticisms that had accompanied their presentations. One of his older students recently remarked that a talk with Henry left her eager to go out and write the four or so books that his ideas had suggested to her in ten minutes. These students have gone on to hold major positions at Imperial College, London; Vassar; Johns Hopkins University; the University of Washington; the University of California at Berkeley; York University in Toronto; the New School in New York; Cornell; and the Institute for Advanced Study.

Henry's intellectual energies could never be confined to the classroom. At Cornell he was a founding and active member of a faculty group called the Vicious Circle, devoted to intellectual discourse and penetrating mutual criticism of one another's ideas. One of the cofounders recalls Henry as a reincarnation of an Enlightenment *philosophe*, knowledgeable in an incredibly wide range of subjects, careful in his discourse, and thoroughly in love with the cut and thrust of intellectual debate.

Henry's concern for the intellectual world was manifest in two important innovations at Cornell. When former president James Perkins was trying to discover a way of honoring academics that would not break the Cornell tradition of not conferring honorary degrees, Professor Max Black and Henry and Rita Guerlac put together the plan that led to the creation of the Professors-at-Large program. This program is unique, for both the elected professors and the whole Cornell community benefit from it.

One of Henry's most lively concerns was the Society for the Humanities, of which he was director from 1970 to 1977. He was instrumental in bringing many distinguished humanists, senior and junior, to Cornell, either as Fellows or for individual lectures or as participants in conferences. His own range of interests, his concern for interdisciplinary studies, and his international distinction made him an ideal selection for this important position. During his directorship the Society's international reputation grew markedly, and Cornell's visibility increased as a center of humanistic studies. Important conferences were organized—on humanistic aspects of the problems of the city, on historical thought in America, on Petrarch, on the Scottish Enlightenment—with speakers from off campus as well as from Cornell.

Perhaps the most important event during Henry's directorship was the Society's move, in fall 1973, from Wait Avenue to its present location, an event made possible by an immense amount of work on Henry's part, first to save the house from demolition and then to use it most efficiently and, with Rita's help, to furnish it in a manner appropriate both to its past traditions and its present uses. In this he was assisted by a group of loyal alumni that he called the "Friends of the Andrew D. White House." The general plan of activities inaugurated by the first planning committee and the first director, Max Black, was continued by Henry and expanded in various directions. He instituted a new category of Visiting Fellow, for scholars supported by outside funds who wanted to spend time at Cornell; he established the annual Invitational Lecture given by a Cornell humanist; and he inaugurated a freshman humanities course, "Science as Literature," which developed into a popular and highly appreciated course. Above all, he created an ambiance of warmth and vitality in which ideas could thrive and be freely exchanged. At times he worried about the financial future of the Society and how long it could last. The present flourishing slate of the Society, soon to embark on its third decade, is a tribute and memorial to his devotion, hard work, and imagination.

Finally, Henry was influential in creating at Cornell a center for research in the history of science. By great good fortune, his arrival in 1946 coincided with that of Felix Reichmann, one of the finest acquisitions librarians Cornell has ever had. Together they built up a fabulous collection that brings scholars to Ithaca from all over the world.

Henry Guerlac was born in the last year that Halley's comet appeared and died just as it began its next close passage to the sun. It was, of course, Isaac Newton who provided Halley with the astronomical science that permitted the determination of the comet's period, and it was on Isaac Newton that Henry spent the last years of his scholarship. We may, therefore, perhaps be permitted to paraphrase Newton and suggest that those who follow Henry Guerlac in the history of science at Cornell will indeed be standing upon the shoulders of a giant.

Eric Blackall, Milton Konvitz, L. Pearce Williams

Othon Goepp Guerlac

World War Memorial Professor of the Romance Languages and Literatures

— *January 16, 1933*

The death of Professor Othon Goepp Guerlac, January 16, 1933, deprived the University faculty of a beloved colleague, the students of a friendly, inspiring teacher, and the community of Ithaca of a distinguished citizen. Professor Guerlac was born of French parentage at St. Louis in 1870, was educated in France, and received from the University of Paris the degree of Master of Arts in 1893 and the degree of Bachelor of Laws in 1897. In 1900 he was appointed to be Instructor in Cornell University, was promoted, in 1904, to the rank of Assistant Professor, and in 1919 to the rank of Professor of Romance Languages and Literatures. During the war he served in France as *Attaché* to the Foreign Office, and was a member of the French High Commission to the United States. In 1919 the French government conferred upon him, in recognition of his services, the badge of the Legion of Honor, and in 1920 the University conferred upon him the title of World War Memorial Professor.

Professor Guerlac was at once a high class journalist and a scholar of distinction. For ten years he was the American Correspondent of *Le Temps*; and at the time of his death he had for many years contributed monthly articles on contemporary French politics and history to *Current History*. He translated into French Booker T. Washington's *Up From Slavery*. He edited for use in college classes a number of French works, including Anatole France's *Le livre de mon ami*, and a volume entitled *Selections from Standard French Authors*. He published, in 1931, *Les citations françaises*, a scholarly manual of French quotations, the result of many years of research, which received wide and favorable recognition.

Although a clear and trenchant writer, both of French and English prose, Professor Guerlac was best known for his skill and originality as a teacher, his sound sense as an administrator, and his varied and fruitful activities in the every day life of the community and the University. His salient qualities were a clear, precise, alert intelligence, a genial and engaging manner, a very genuine and generous interest in people, and an ever ready impulse to unite with his fellows in every sort of useful common enterprise. It is perhaps safe to say that he knew, and not by name merely, more students, university colleagues, and people in Ithaca than any other member of the faculty. He had a genius for friendship. He was indefatigable in promoting human intercourse; and, by enriching every personal contact, even the most casual, with the felicity of his greeting and the sincerity of his good will, he made it his avocation in life to cultivate and to promote the fine art of sociability.

Of Professor Guerlac it may be said, without any reservations, that his death leaves a place vacant, a place in the private lives of innumerable friends and in the public life of this community that no one else can ever fill.

Richard William Guest

July 7, 1932 — February 24, 1997

Richard William Guest was born in Oklahoma City, Oklahoma on July 7, 1932. He grew up on a grain and beef cattle farm near Menoken, North Dakota. Dick attended North Dakota State University, where he received both his B.S. (1954) and M.S. (1958) degrees, and was a Second Lieutenant in the US Air Force (1955-56). He met Myrth J. Weiser while in college, and married her in 1959.

Dick was appointed Assistant Professor in the Department of Agricultural and Biological Engineering (ABEN) of the College of Agriculture and Life Sciences on September 1, 1958; promoted to Associate Professor with tenure on July 1, 1964; and to Professor on April 1, 1983. He retired September 1, 1991 and was appointed Professor Emeritus. Following retirement, he continued part-time to develop a comprehensive publication on dairy manure management for the Northeast Regional Agricultural Engineering Service. During his thirty-three years with the Department of Agricultural and Biological Engineering, Dick participated in the department's teaching, research and extension functions, but by far his first love was extension and the continuing challenge of applying engineering to the solution of problems associated with the dynamic world of production agriculture. Here, he developed principle specializations and expertise in the areas of Farmstead Engineering and Mechanization, and Animal Waste Management, during a time when rapid change was taking place in farming and solutions to attendant problems was in short supply. Dick loved a challenge and he met them head-on with his eternal optimism and wry smile.

His professional work covered a wide range of topics, the major areas being animal manure management, land application of wastes, milking systems, feeding systems, housing for livestock, energy conservation in livestock production systems, and mechanical fruit harvesting. He was one of the early leaders in developing solutions for the proper handling, utilization and disposal of wastes from dairy and other animal production systems. He attracted a wide national following for this work, well beyond the borders of New York State, and received requests from both national and international agencies for assistance as well.

Dick served as Interim Department Extension Leader and Consultant to the World Health Organization on farm sanitation practices. He was the recipient of several Blue Ribbon Awards from the American Society of Agricultural Engineers for exemplary publications, as well as designs for agricultural systems, and received an early award (1963) for the college's "Project M" milking systems over-the-road educational demonstration unit that traveled

throughout New York State to educate the dairy industry on proper milking system operation, practices and their influence on animal health. He helped design, build and test a successful mechanical cherry harvester, and was co-leader in the design and development of a mechanical harvester for processing apples. He taught Household Mechanics to hundreds of women in the fields of Human Ecology and Agriculture. His consulting activities, both overseas and domestic, have had a marked influence on practices that relate to the maintenance of environmental quality for agricultural production systems, as well as reduce labor tedium and increase production efficiency.

Always concerned with practical innovations and new challenges, in his role as Extension Agricultural Engineer, he advised several thousand farmers about free-stall dairy systems, milking parlors, swine housing, grain drying, ventilation systems, materials handling equipment and related facilities. He also helped many colleagues with the development of research facilities, especially at the Cornell Animal Science Teaching and Research Center, the Swine Barns, and at the Miner Institute in Chazy, New York. For two decades, he taught certified milk inspectors, and was a participant in Empire Farm Days for a decade. Dedicated to improving engineering in agriculture, his efforts and skills cannot be replaced. Dick spent his sabbatical leaves as a research and development engineer with Sperry-New Holland, in New Holland, Pennsylvania; as a consultant engineer with Alfa-Laval in Tumba, Sweden; as well as the Martin Manufacturing Company in Myerstown, Pennsylvania; and the Institute für Landtechnik in Weihenstephan, West Germany. He especially favored the hands-on practice of engineering and getting solutions into the mainstream of application utilization as soon as possible.

Dick was always a faithful supporter of the ABEN family, both professionally and socially. He also gave of himself generously in community activities beyond the university's doors, and most notably as a dedicated member of the Trinity Lutheran Church in Ithaca, New York. In 1995, the Dryden Sertoma Club honored him with its Sertoman of the Year Award. Sertoma stands for Service to Mankind, and for thirty-five years, in both the professional and non-professional worlds, Dick was truly Mr. Sertoma. He was a member of the American Society of Agricultural Engineers, the New York State Association of Milk Sanitarians, the Northeast Dairy Practices Council, Tau Beta Pi, Sigma Xi, both the Ithaca and Dryden Sertoma Clubs, a 4-H Leader, and a member of the 4-H Acres Development Committee. Beyond this, over the years Dick also found some time occasionally to fish, hunt, fly a plane, bowl, play some golf, put on a benefit pig roast, and grow a rose or two in his home greenhouse. He truly enjoyed it all and remembered to "smell the roses" as well as share them with his friends.

Dick and his wife, Myrth, had three daughters: Katrina, Sheryl, and Linda; and four grandchildren, Adam, Nathen, Kyle, and Keirsten. He was understandably proud of them all, and will be long remembered and sorely missed by his family, friends, and colleagues. We can speak for them all by simply saying, “Mr. Sertoma, we salute you”.

Joseph K. Campbell, Wilmot W. Irish, Everett D. Markwardt, William F. Millier, Ronald B. Furry

Connie M. Guion

August 29, 1882 — April 29, 1971

When Connie Guion died at the New York Hospital, she had enjoyed for many years the undisputed title of “dean of American women physicians.” She achieved this eminence in spite of the fact that she had entered medicine later in life than most. For Connie Guion’s career, though a brilliant one, was not easy.

Born near Lincolnton, N.C., she was graduated from Wellesley College and then taught chemistry at Vassar and Sweet Briar Colleges, deferring her lifelong ambition to become a doctor to help put a younger sister through school.

She was the head of the chemistry department at Sweet Briar when she entered Cornell University Medical College, graduating in 1917 at the top of her class. She interned at Bellevue Hospital, practiced briefly in Columbia, S.C., and moved to New York in 1926.

Her large private practice included some of New York’s most distinguished families, and at 80 she was still making house calls and working twelve-to-fourteen-hour days.

Cornell University Medical College named her a professor of clinical medicine in 1946. The first woman doctor to achieve that rank, she was also the first woman to win the college Alumni Association’s Award of Distinction, to become an honorary member of the New York Hospital Board of Governors, in 1952, and to serve on the hospital’s Medical Board.

She was named medical woman of the year in 1954 by the American Medical Woman’s Association. Dr. Guion was a trustee of the Vincent Astor Foundation, the Joseph Collins Foundation, and the Helen Hay Whitney Foundation.

When Connie Guion’s life ended, she met death as she had lived her life, directly and with equanimity. It was like the final act in a theatre; as the lights were dimmed, her firm handclasp relaxed, a bow, a curtsy, and she left the stage. She was magnificent.

As a fellow physician, I was closely associated with her for some forty years in a wide range of endeavors. She opened the door of clinical medicine to students in the outpatient clinic and at the bedside. Many graduates of Cornell University Medical College can recall this initial and exciting experience with patients. House officers in the resident system of training gained much not only from her clinical acumen based on years of practice, but also from her approach to the individual patient, penetrating to the core of the circumstances upon which therapy

might depend. Her contributions to the training of many of this country's outstanding clinicians are well known to the profession at large.

Her relationship, the participation in the day's work, with the senior staff and their residents throughout the New York Hospital is legend. Benevolent and tolerant to her juniors, she was firm and demanding of her peers just as she was of herself. She was articulate and an evaluator of extraordinary facts relative to the patient, and little was ever left undone to establish the diagnosis and select the therapeutic measures that were most promising. Well demarcated differences of opinion may have at the moment tensed the atmosphere that was soon diffused by the security of knowledge that comes from diligence and integrity. Confronted by a clinical problem with which she was unfamiliar, she was frank to say she did not know but would seek out someone who did—she always carried through. This in particular was the basis for her being so often the doctor's doctor, being requested equally by her closest peers and her most able antagonists.

Perhaps that which immortalizes best the life of Connie Guion as an individual and a physician rested in her capacity to penetrate into the hearts and lives of patients, to know their trials and tribulations, and to understand their successes and their failures. She helped them. In physical ailment and mental apprehension she, in the true tradition of a member of a great profession, assumed the burden that overwhelmed them.

She was a physician for all seasons of the life span, from the bewilderment of childhood to the anxiety of old age. One example of this that I observed was her explanation to a boy of ten whose mother had had a major abdominal operation. He was perplexed and worried. Questions he had asked members of the family had brought forth deflecting replies, adding to his concern. Connie Guion, with pencil and paper, drew a diagram of what had been done with the assurance that what had been removed would not interfere with her life. That then small boy is now a member of the House of Commons. He has never forgotten her or her explanation.

In another instance, a patient with many responsibilities was found to have an incurable disease with a short life expectancy. Some in attendance felt the information should be withheld or glossed over on the basis it would crush his spirit. Connie Guion knew her patient. The facts were presented No one was ever more grateful. He moved quickly to put his affairs in order and provide for those involved. Fulfillment of obligations gave him peace of mind that did much to make his remaining days tolerable.

Knowledgeable, patient, understanding, and having great good common sense, her decisions were superb. Energy, ingenuity, and persistence rendered these quickly actual and effectual. She gave generously of her intellect and spirit to all.

There is for all heritage from the life of Connie Guion, an immortality of works, an attainment prompted by affection for her fellowman. We physicians who knew her, and we are many, join a far greater number that includes patients, friends, and co-workers in extracurricular projects, in proclaiming that by her being our lives have been enriched.

Dr. Guion is survived by two sisters, Mrs. O. E. Hunt of El Cerrito, California, and Ridie Guion of Wilton, Connecticut.

Frank Glenn, M.D.

Cedric Hay Guise

July 25, 1890 — November 23, 1982

Cedric Guise, professor emeritus of forestry, was a native of Findlay, Ohio, the son of Perry and Carrie Hay Guise. After attending the University of Michigan for two years, he came to Cornell in 1912 to start a forty-eight-year association as student, teacher, writer, and administrator.

Professor Guise studied in the Department of Forestry, receiving a B.S. degree in 1914 and a Master of Forestry in 1915. Immediately he assumed some of the extension duties as the successor to Frank B. Moody, one of the first extension foresters in the country.

After a two-year stint as instructor for the U.S. Army School of Military Aeronautics during World War I, Guise returned to the department in 1919 to start a teaching career in forest management. He became professor of forestry in 1933 and continued teaching until 1937. With discontinuation of professional forestry instruction, Guise spent the next seven years as professor of personnel administration for the College of Agriculture but returned in 1944 to head the reorganized department. Many forestry alumni returning to Fernow Hall recall Guise's great interest in forest management and his concern with the demise of professional forestry education at Cornell. Nevertheless, he gave wholehearted support to the new Department of Conservation from its inception in 1948 until his retirement in 1954. He taught a course in farm forestry, the forerunner of today's woodland management, and he helped teach the first general conservation course, now known as principles of conservation. Students recognized his teaching with the Professor of Merit award in 1954.

Professor Guise was the first director of the Arnot Forest and served intermittently in that position for seventeen years. He was responsible for obtaining a boundary survey, acquisition of new parcels, and planning work projects for a Civilian Conservation Corps camp. The latter included building and improving the excellent road and bridge network that remains in use today. Finally, he was responsible for hiring the first resident manager in 1952. Thus Guise provided the fundamental necessities for making the forest a viable research and teaching area.

The college took advantage of Guise's administrative ability, calling him from retirement to help coordinate the Cornell-Los Baños Project on a part-time basis from 1955 to 1960. This project eventually culminated in rebuilding the war-ravaged and poorly administered University of Philippine's Colleges of Agriculture and Forestry. Guise personally inspected the forestry situation and documented the need for a strong forest administration unfettered by politics, a new and improved physical plant, a curriculum directed more toward professional than technical

training, and better research. His efforts led to an eventual contract with the College of Forestry at Syracuse for implementation of reforms.

In furtherance of forestry education Professor Guise made numerous other contributions. He compiled forest school statistics on enrollments and degrees. They were published for sixteen years in the *Journal of Forestry*. He authored the text *The Management of Farm Woodlands* and coauthored two other texts. He collaborated with Dean Graves of Yale as cochairman of the Forest Education Inquiry, which led to closer ties with European foresters and educators. He was an active member of the Ostertag Committee, which had a broad impact on New York forestry. As one of his major goals he helped establish forest instruction areas as a part of the developing Cornell Plantations.

A lifelong bachelor, Guise had numerous civic and other interests. He helped in the development of the Village of Cayuga Heights and served many years as treasurer. He was a member of the First Presbyterian Church. An avid and very good golfer, he was a charter member and, for many years, president of the Ithaca Country Club. He was fond of dogs and collected oriental rugs.

Age was slow in catching up with Ced Guise. He lost most of the sight from one eye and eventually gave up golf, but he walked his spaniels daily through the Heights. It was a pleasure to meet him on some byway a mile from home and reminisce. He was a gentleman and a friend.

William J. Hamilton, Jr., Fred E. Winch, Jr., Robert R. Morrow

Wesley Winnfred Gunkel

October 17, 1921 — May 12, 2000

Professor Emeritus Wesley W. Gunkel was a dedicated Agricultural Engineer, serving Cornell for a half century and helping numerous students, colleagues and clients find pathways to inventive solutions. His intense concentration on practical engineering problems and his high spirits during adversity are memorable. The corridors of Riley-Robb Hall still echo with his cheerful whistle.

Wes was born in Hope, North Dakota, where daily farm chores helped establish his work ethic. One of his early exploits was skiing on a towrope behind his older brother's truck. Snow covered roads across the plains were wind-swept and snowbanks on either side gave added thrills. During one nasty spill, a ski hit him in the throat and he could not talk for a week. This did not stop his inquisitive mind. He graduated from high school at the top of his class, and entered North Dakota Agricultural College in Fargo, now North Dakota State University. He was honored with induction into Alpha Zeta and Phi Kappa Phi.

Pearl Harbor and World War II changed plans for many young men. Private Gunkel entered military service in April 1943, and left active duty in October 1945 as First Lieutenant. He qualified for the rigorous Student Training Program in the Army Air Corps. As a navigator in U.S. 8th Air Force, he flew from England on a B-17 Flying Fortress. His squadron was one of the busiest in WWII, but Wes only told his experiences when pressed. One mission with several thousand bombers targeted fuel storage outside of Berlin. While flying towards the target, Wes could not see his wingman because of smoke from nearby exploding shells. Although his plane returned from this mission, more than one-third did not.

Returning from another mission, they landed the damaged bomber at a Nazi occupied field in Belgium to make repairs. While racing around to fix the plane, a large number of Belgium citizens arrived. So they packed the plane with these refugees, and were able to get airborne and return to England without any loss of life.

When flying home across the Atlantic, several squadrons of B-17s met high headwinds and an approaching storm. With limited fuel and reduced ground speed, the airfield in Labrador was nearly out of range. As lead navigator, Wes calculated a new course through less severe winds. Although some continued on the original course, all planes that diverted to the new course did reach the airfield.

Like many of his generation, Wesley Gunkel was first in his family to graduate from college, receiving a Bachelor of Science degree in 1947 from North Dakota State University. He continued studies in Agricultural Engineering at Iowa State University, earning a Master of Science degree in 1948 and a position as Instructor. That summer, O. C French persuaded Wes to join an expanding faculty in the Department of Agricultural Engineering at Cornell as Assistant Professor. Within five years, he was promoted to Associate Professor and there were new challenges to face. In 1957, Professor Gunkel earned the Ph.D. degree in Agricultural Engineering from Michigan State University, and returned to Cornell, becoming Professor in 1960.

Three sabbatic leaves interrupted teaching and research in agricultural machinery design and applications. In 1962-63, the Gunkel family went to the University of Nigeria in Nsukka where Wes was Chairman of the Agricultural Engineering Department. In 1969-70, the Gunkel family went to Hawaii where Wes was a Consultant with Dole Pineapple Co. and designed one of the first mechanical pineapple harvesters. Their last sabbatical in 1976-77 was in the Philippines at the International Rice Research Institute where Wes was a Visiting Scientist designing machines to reduce human drudgery and improved food production.

One of Professor Gunkel's first research projects at the College of Agriculture was a sprayer for pesticides, but his interests and achievements include bean harvesters, onion drying, wind powered water heating, coated moldboard plows, a robotic grape pruner, automotive pollution and fuel efficiency. Two unique projects explored vacuuming beetles from potato plants, and the "snap-back" of nylon towropes. Cooperating with colleagues and graduate students, he produced more than one hundred technical publications and articles, and received a Technical Paper award from the American Society of Agricultural Engineers in 1974. Major contributions included, "Energy Requirements for New York Agriculture, Part I Food Production" (1974); "Part II Indirect Energy Inputs" (1976); and "Bioconversion of Agricultural Waste for Pollution Control and Energy Conservation."

Wes was very helpful to all students, and of his 70 graduate students between 1959 and 1997, eighteen earned Doctoral degrees. He urged several students to enter the James F. Lincoln Arc Welding competition, and a half dozen received substantial prizes for their projects. He was recognized as an outstanding teacher by Agricultural Engineering students and his department in 1976 and in the top 10% by Tau Beta Pi in 1982.

Wes was proud of his colleagues, and an active leader of the departmental awards committee. Many members of his department were recognized with honors because he prepared the rigorous documentation, especially for the American Society of Agricultural Engineering (ASAE). These results contributed to the high national ranking for Cornell's Agricultural and Biological Engineering Department.

Professor Gunkel was a member of the American Society for Engineering Education, American Association for the Advancement of Science, Society of Automotive Engineers, Council on Agricultural Science and Technology, National Safety Council, Human Factors Society, Fluid Power Society, and American Wind Energy Association. He was most active with the American Society of Agricultural Engineers where he served on committees for Research, Graduate Education, the Division of Power & Machinery, Agricultural Chemical Application, and Nursery and Greenhouse Mechanization. Also a representative of ASAE to the Engineers Joint Council, he was elected Fellow of ASAE in 1980.

Professor Gunkel consulted with many American firms and the Ministry of Agriculture in Ghana. He was an expert witness in more than forty cases, developing reports and testifying where litigation involved product liability and accidents with farm machinery. Safety for operators of farm machinery was part of his teaching, his design philosophy, and his life, perhaps originating from those boyhood accidents on the farm in Hope, North Dakota.

In northeast Ithaca, Wes joined the Cayuga Heights Fire Department, and was a Deacon at the First Congregational Church. He was a charter member of the Ithaca-Cayuga Rotary Club, and its president in 1973-74. In 1979, a severe operation and treatment for stomach cancer were successful. Nearly twenty years later another cancer was found and treated. In spite of this, Wes remained active and cheerful, participating fully in faculty meetings and informal coffees until two days before his death. His ready smile, hearty greetings, and warm friendly personality raised our own spirits under all conditions.

Wesley Winnfred Gunkel is survived by his wife of 54 years, Lucille Peterson Gunkel; his daughter, Sharon, of Ithaca; his son, Gerald, of Tampa, Florida; and two sisters, Eleanor Cornelius and Edith Munter, of Fargo, North Dakota. He is remembered by many more as a stalwart individual, a cheerful survivor, and a compassionate mentor dedicated to Agricultural Engineering and Cornell.

William F. Jewell, Norman R. Scott, Wilmot W. Irish

Axel Ferdinand Gustafson

November 24, 1880 — March 10, 1949

Axel Ferdinand Gustafson, Emeritus Professor of Soil Technology, passed away March 10, 1949 as a result of an automobile accident. The tragic event shocked the community beyond measure and brought to his bereaved family sympathy and condolences from far and near. Professor Gustafson had been enjoying the best of health and was pursuing objectives that not only would have further enhanced his professional reputation but also would have redounded greatly to the benefit of agricultural science. He was a man of many interests and his niche in life will be hard to fill.

Professor Gustafson was born near the village of Aledo, Mercer County, Illinois on November 24, 1880. Here he received his early education and here he imbibed the sympathetic understanding of rural folks that later distinguished his extension teaching and the more formal duties of college instruction. In 1907 he was graduated from the University of Illinois with a Bachelor of Science degree and until 1918 was a member of the staff of the College of Agriculture of that institution, attaining the rank of assistant professor. It was during these years that his knowledge of farm life and its technical problems was broadened and humanized and his interest in teaching and research stimulated and matured. He was one of the first to sense the dangers of soil erosion and he immediately prescribed methods by means of which such waste could economically be checked. In this respect he was a pioneer and he lived to see the complete vindication of his prophetic vision.

In 1912 he was granted a Master of Science degree by the University of Illinois after which he zealously applied himself to the investigation of methods of soil fertility maintenance. The results of this experimentation and research may be found in the publications of the Illinois State College of Agriculture and elsewhere. In 1918 Professor Gustafson, feeling the need of further professional study, entered the Graduate School of Cornell University as a candidate for Ph.D. The work for this was done in soil science, geology, and chemistry, and the degree was granted in 1920.

So favorable was the impression made by Axel Gustafson during his graduate studies at Cornell that he was retained in the Department of Agronomy as an assistant professor in Extension. And so outstanding was his subsequent work, that he was promoted, after two years, to a full professorship. As an extension specialist, Dr. Gustafson worked in every county in the State and it was during these busy years that he made his greatest contribution to the betterment of New York agriculture. In 1931 Professor Gustafson began his resident teaching and his soil and field

crop surveys. It was during this latter interval, a span of 17 years, that he did much of the writing, both of bulletins and books, which has contributed so much to his reputation. In respect to Cornell bulletins, Professor Gustafson is author of 17 and senior or co-author of 12 others. This is an enviable record. His Extension Bulletin, "Liming New York Soils," has been in print since 1924 and has gone through six revisions. Dr. Gustafson's Experiment Station bulletins include his "Soil and Crop Management" series which covers practically all of the important agricultural areas of New York. This set of publications has been of inestimable value in many ways and is a testimonial of his energy and of his field ability.

As to books, Professor Gustafson was author and co-author of seven. The first was "Soil Physics", published in 1917 in association with Professor J. G. Mosier of the University of Illinois. It was written while Dr. Gustafson was assistant professor of soil physics at that institution and indicates clearly his ability to organize and present technical ideas in such a manner as to stress properly their practical applications. Of the six other books that followed, the last entitled "Using and Managing Soils" appeared in 1948.

Throughout his professional career, Professor Gustafson was especially interested and active in soil conservation. As already stated, he was one of the first soil scientists in the United States to study soil erosion losses and to suggest methods of regulation. In 1935 he was chief erosion specialist and chief agronomist with the United States Soil Conservation Service in New York. Later he served as Chairman of the Empire State Chapter of the Soil Conservation Society of America. These activities and his books on conservation are ample evidence of his leadership in this field.

Professor Gustafson was a charter member of the American Society of Agronomy, the Soil Science of America and the Soil Conservation Society of America. He also was a member of the American Association for the Advancement of Science and the American Forestry Association. Two honorary Societies, Sigma Xi and Alpha Zeta, have placed his name on their rolls. Genial in disposition, cooperative in spirit, and conscientious in the face of duty, Axel Ferdinand Gustafson exerted a wholesome and helpful influence wherever he went. His sincerity and earnestness of purpose inspired confidence and his kindly interest in people won him a host of friends. To lose such a man while in vigorous health and still capable of contributing much to society is indeed a tragedy.

H. O. Buckman, Richard Bradfield, C. H. Guise

Carl Edward Frederick Guterman

October 27, 1903 — March 27, 1957

Carl Edward Frederick Guterman, Director of Research, Director of the Cornell University Agricultural Experiment Station, and Professor of Plant Pathology, died in Ithaca on March 27, 1957. In his passing, Cornell, especially the New York State Colleges of Agriculture and Home Economics, and the Experiment Station, lost one of its most effective and esteemed faculty members and leaders.

Coming to Cornell University in 1925 with a B.S. degree from what was then the Massachusetts Agricultural College, he was appointed to a part-time assistantship in Plant Pathology. Among the adjustments to be made in this change from undergraduate to graduate student, was that of a nickname, “Gus”, given him by Professor Herbert H. Whetzel, that was to stay with him throughout his professional career. The occasion of the nickname arose from his expressed concern over some possible disadvantage in the formal “Carl Edward Frederick”, with World War I so recently terminated.

While holding the assistantship, Director Guterman was enrolled in the Graduate School, with his major subject, Plant Pathology. He was granted the degree of Doctor of Philosophy in 1930. On July 1 of that year he was advanced to an Assistant Professor in Plant Pathology, and two years later served as Acting Head of the Department. During this early period in his career he showed a marked aptitude in research and administration. With his next appointment in 1933, he was made Assistant to the Director of Experiment Stations. From 1936 to 1942 he served as Assistant Director of the Cornell University Agricultural Experiment Station and Professor of Plant Pathology, and from 1942 until the time of his death he was Director of Research, Director of the Cornell Agricultural Experiment Station and Professor of Plant Pathology. Thus within 11 years following his arrival at Cornell University for Graduate work he became Assistant Director of the Experiment Station, and was on his way to a career of administration. Had he elected to continue in the Department of Plant Pathology, it seems certain that his career would have been equally distinguished.

Director Guterman had a good mind, and the urge to use it, not only for his own advancement but for the good of others. He was a keen observer, quickly sizing up a situation, or problem, as to its character and logical approach for a solution. He had the drive to follow through and see that the findings of research were given to the growers in a way to assure their use in effective application. He encouraged joint meetings of growers and researchers to assure the full understanding of what the problem was and what might reasonably be expected by way of solution.

He was an indefatigable worker, and continuously sought self improvement. Problems that led into the laboratory and methods of so-called "fundamental research" were accepted as such; but they were not lost sight of, and at the earliest possible moment were brought into the field for further testing and application.

Born in West Springfield, Massachusetts, October 27, 1903, Director Guterman was not a farm boy, insofar as living is concerned. He did spend considerable time working on farms during his high school and college days, and his background in agriculture was extended by his attendance at the Massachusetts Agricultural College where he majored in the biological sciences. When he arrived in Ithaca for graduate work his mind was made up to major in Plant Pathology. His attachment to administration by accepting an appointment as Director of Research was a logical one since it gave him an opportunity to be more effective in the agricultural interests of the State. Over 500 research projects in agriculture and home economics regularly came under his scrutiny, and were his to coordinate. They involved contacts with farmer cooperatives, commercial companies and other project sponsors, and university members. He discharged this task with great ability and distinction, and took well-merited satisfaction from doing it.

Because of his broad experience and good judgment Director Guterman was widely known and respected. He was called upon continually for advice, cooperation, and assistance by many groups and organizations. He had been a member of the New York State-U.S.D.A. Council since 1948 and was elected chairman in 1954; a member of the New York State Agricultural Mobilization Committee since 1951; and a director of the Cornell Research Foundation since 1950. From 1950 to 1953 he was a member of the Food Protection Committee of the National Research Council. He was a member of the Scientific Advisory Committee of the Boyce Thompson Institute for Plant Research, Yonkers, New York. In June, 1955, he was given the honorary degree of Doctor of Science by his alma mater, the University of Massachusetts.

In the Association of Land-Grant Colleges and Universities, Director Guterman had been a member of the Experiment Station Legislative Committee since 1951; a member of the Committee on Pesticides since 1952; was chairman of the Experiment Station Section and secretary of the Division of Agriculture in 1952-53; and was a member of the Experiment Station Committee on Organization and Policy from 1942-45.

Director Guterman was easy to work with, due to his outstanding human qualities. He was well liked by all, along with being respected for his ability. All who knew him loved his keen sense of humor, his ready wit and infectious smile. Sincerity and the urge to help were innate qualities that could not be hidden by his modesty. He radiated

enthusiasm and kindness, and never resorted to dictation to carry his point. He was tolerant and understanding. To have met him was to have confidence in him as a friend or as a counselor when pressed by some problem.

A. W. Gibson, L. M. Massey, Charles E. Palm

Edward Sewall Guthrie

December 27, 1880 — December 11, 1964

The Eleventh of December, 1964, marked the passing of one of Cornell's most distinguished professors and one of the true pioneers of America's great dairy processing industry. Edward Sewall Guthrie, who joined the staff of the College of Agriculture in 1908 and who worked in his laboratory until a few days before his death, gave more than sixty years to study, research, and teaching in the dairy industry.

Born on a farm in Iowa and with a B.S. degree from Iowa State, Dr. Guthrie came to Cornell as a graduate student and instructor in buttermaking. He taught this and other courses in dairy processing to several generations of Cornellians both in the "winter course" and in the regular college program.

His contributions were many and lasting. His interest in teaching and research led him to help organize what is now the American Dairy Science Association, and he served in its highest offices. As one of the last two surviving founders of that Association, he was most highly honored by it. It is probable that he did not miss more than two meetings from the date the society was founded.

He helped organize the first student chapters of the ADSA and the first national dairy products judging contest. For many years he was coach of the highly successful dairy products judging teams of the University.

His *Book of Butter* was long the standard text in his field, and he was recognized as America's foremost authority on cultured cream. He published several scores of papers on various phases of the dairy industry.

Professor Guthrie was probably best known in Ithaca for his many community activities. He served the Forest Home Chapel long and faithfully as treasurer, trustee, steward, and for 26 years, church school superintendent. Since 1932 he had been a member of the board of directors of the Reconstruction Home in Ithaca and for 15 years conducted Sunday morning Protestant services there.

Dr. Guthrie never retired in the sense that he gave up any of his work. He maintained his office and his laboratory after his retirement in 1948, and spent a part of almost every day at his beloved research. He often appeared in the dairy barn before the early morning milking in order to gather samples of milk from particular animals or samples taken under particular conditions.

Until his death he took an active interest in students and alumni. Former student visitors were sure to inquire first about Dr. Guthrie, and he was sure to recognize and remember those alumni he chanced to encounter on the

campus or in his travels. So great was his interest that he took the time in his later years to collect the scattered records of former students and publish accurate and useful lists of their whereabouts and doings. The alumni responded at the time of his retirement by commissioning a portrait of him which now hangs in Stocking Hall.

No student or colleague called him "Ed." Yet all knew the warmth, consideration, and humor of the man. Always dignified but never pompous, he was readily approached at any time with any problem.

In his long career in the dairy industry, countless people came to know and love Dr. Edward Sewall Guthrie. He has carved a deep niche in the history of the dairy industry, his community, and the University. He richly deserves to be remembered as a Christian gentleman, a fine teacher, and a friend.

Robert F. Holland, Harold E. Ross, James C. White

Hiram Samuel Gutsell

Assistant Professor Emeritus of Architecture

1856 — Sept. 29, 1927

The Trustees and Faculty of Cornell University record their grief at the death of Professor Gutsell, a man whose unassuming manner all but concealed his outstanding qualities of mind and heart. Those who knew him well had frequent occasion to admire and profit by his remarkable erudition in more than one field of knowledge, to respect deeply his steadfast character, and to enjoy with him the manifestations of the arts of which he was so keenly appreciative. Gentle of disposition, impatient only with sham, he made more friends than he realized, persons who valued the essential honesty of all his utterances, and who feel that in his passing the University has lost a man difficult indeed to replace.

George Gordon Gyrisco

March 25, 1920 — July 14, 1989

George Gyrisco was born in the town of South Hadley in western Massachusetts. He was the son of immigrant parents, and the first member of his family to obtain a college degree. The American dream was very real to George. He never took for granted a system that provided an opportunity for study in an area of one's passionate interest. Motivated by this outlook, he entered Massachusetts State College and earned the Bachelor of Science degree, *summa cum laude*, in 1943. At that time, his alma mater enjoyed preeminence in entomological training at the undergraduate level, a staging area for promising graduate students. George was greatly influenced by several members of this distinguished faculty. His devotion and respect for them continued undiminished as a positive force throughout his professional career. Years later, as a mature faculty member, he enjoyed reminiscing on his undergraduate experience with a freshness of events as if they had transpired only recently.

George was awarded the Ph.D. degree by Cornell in 1947, and joined the entomology faculty following graduation. He advanced rapidly through the ranks to full professor in 1954. In 1962 he was appointed department head. His early professional career coincided with the surge of agricultural technology following World War II. He became a leader in the newly emerging subdiscipline of forage entomology, a specialization in support of the livestock industry, the largest component of the state's agricultural enterprise. He addressed the complex challenge of evaluating new insecticides for use in control of forage insect pests. This involved intricate research into the food chain of the dairy cow, with special attention to the metabolic fate of pesticide residues as potential contaminants of dairy products. George was relentless in his efforts to provide experimental data as a basis for formulating sound programs of insect control. In the sensitive areas of public safety, pesticide use, and the environment, George was committed to the fullest sharing of data as a matter of public trust.

George was an early advocate of biological control. His pioneering research in this area provided alternatives to the intensive use of insecticides in forage insect control. His innovative leadership in the subdiscipline of forage entomology laid the foundation on which current concepts and technologies have been developed.

George was unusually effective in the dual role of training students and advancing research. His training style involved close partnership between professor and student in the research experience, and the rigor, enthusiasm, and institutional loyalty to the Cornell tradition. George supervised the graduate studies of thirty-five students, a number virtually unequalled in the annals of the department. Many of his students have taken their place as

leaders in the field and continue to feel a bond with fellow students who shared the Gyrisco training experience. As one student remarked: “George shared with us. He shared his enthusiasm, his intellect, his philosophy, his home, and on occasion, his wallet. What more could a student have asked?”

To many graduate students Thanksgiving in Ithaca came to mean turkey at “GG’s.” His home was always open to them. In this giving, as in all his dedication, he had the unflagging support of his wife, Valerie.

George was an avid sports fan, one who rooted for the Big Red as a joyful expression of institutional loyalty. His interest beyond the campus included the community youth program, his home, and his garden. He served for many years as scoutmaster of Ithaca Troop 5, BSA. His green thumb was evident in the success of his flower and vegetable garden. His pride and joy was his extensive planting of daffodils. The slopes of their property on Twin Glens Road abounded in spring color. Through George’s characteristic modesty and generosity, bouquets of gorgeous daffodils graced the desks of his departmental associates each spring. His sense of sharing went beyond his graduate students. It included all those who joined with him in advancing the cause of Cornell.

For many years George waged a courageous struggle against a debilitating illness. It was commitment to students and institutional loyalty that evoked his Herculean effort. He disdained disability retirement, and persevered to the normal retirement schedule and emeritus status in 1985.

George seemed never to have lost the awe or enthusiasm of an undergraduate discovering academic freedom as a way of life, and the university as a unique institution in support of those seeking to discover and to share. And on the lighter side, there was the Big Red athletic program. All of this and heaven, too!

George will be remembered for his passionate devotion to Cornell, his professional contributions (two hundred publications), his loyalty to family and youth of the community. His most enduring legacy is the group of students who fell heir to his philosophy. They are the worthy guardians of their mentor’s commitment to intellectual honesty, civility, and academic freedom.

George is survived by his wife, Valerie; daughter, Jill; sons, Geoffrey and Glenn; a sister, Betty; and several nieces and nephews.

Edward H. Smith, Haruo Tashiro, Arthur A. Muka

William Arthur Hagan

October 14, 1893 — February 1, 1963

Professor Emeritus William Arthur Hagan died at the age of sixty-nine while on a plane traveling from New York to London. He was associated with Cornell University for over forty-six years as a graduate student, teacher, Dean, and Professor Emeritus. He retired from active service as Dean of the Veterinary College June 30, 1959, and became director of the National Animal Disease Laboratory at Ames, Iowa, a position that he held at the time of his death. His name is inextricably linked with the marked advancement of veterinary medicine during the past half-century.

Born at Fort Scott, Kansas on October 14, 1893, William Arthur Hagan received his preparatory education in Kansas schools and studied at Kansas State College, Manhattan, where he received the degree of Doctor of Veterinary Medicine in 1915. He remained there for one year as an assistant in pathology and then came to Cornell in 1916 as an instructor in obstetrics. In 1917, he received the M.S. and was appointed instructor in pathology and bacteriology. He became Assistant Professor of Bacteriology in 1918 and Professor in 1919. In 1926, he was selected to head the Department of Pathology and Bacteriology. Then in 1932, at the age of thirty-eight he was made Dean of the Veterinary College just sixteen years after he arrived at Cornell.

In addition to his exceptional mental endowment, Dr. Hagan possessed abundant energy and a great capacity for work. Not only were his regular duties more than adequately performed, but he successfully dealt with many other commitments. He was an assistant in the Department of Animal Pathology of the Rockefeller Institute in 1921-1922. He was a member of the American Veterinary Medical Association Committee and Council on Education 1938-1950. During the year 1943-1944 he was special assistant to Dr. A. W. Miller, United States Department of Agriculture. He served on the executive board of the American Veterinary Medical Association for five years and was chairman in 1944-1945. Following World War II, in 1945, he was appointed to membership on the United States Control Council in Germany, to aid in the rehabilitation of German veterinary colleges. In 1946-47, he was a member of the Secretary of Agriculture's Advisory Committee on Foot-and-Mouth Disease and contributed to the establishment of a United State Department of Agriculture center for research on this disease at Plum Island, New York. He was elected president of the American Veterinary Medical Association for 1947-1948. In 1947, Governor Dewey appointed him to the New York Food Commission to recommend measures "to meet the present critical situation with respect to food and proper nutrition." In 1949, he became a member of the executive committee of

the Association of Land Grant Colleges and Universities. He served for many years as the United States member of the Permanent Committee of the International Veterinary Congresses. He was a delegate to the fifteenth International Veterinary Congress held at Stockholm in 1953 and Chairman of the United States Committee to the sixteenth International Veterinary Congress held in Madrid in 1959. In 1954, he was made Civilian National Veterinary Consultant to the Surgeon General of the United States. Two years later he was selected by the Secretary of Agriculture as Chairman of the Advisory Committee to Eradicate Brucellosis. In 1958 he headed a delegation of six veterinarians who visited the Soviet Union to study its livestock industry. During the following year he served as trustee of the Morris Animal Foundation, represented the American Veterinary Medical Association on the Ralston Purina Research Fellowship Awards Committee, and was elected vice president of the World Veterinary Association. He was also a member of many professional organizations.

His many activities, in addition to the administration of the New York State Veterinary College, did not occupy all of Dr. Hagan's time, for he achieved a notable record in research and writing. He published more than 126 scientific articles. He was a contributor to Stedman's *Medical Dictionary* and to numerous other professional books. He was author of the textbook, *The Infectious Diseases of Domestic Animals*, which appeared in 1943 and is now in its fourth edition. A co-author, D. W. Bruner, was enlisted beginning with the second edition.

The many accomplishments of Dr. Hagan did not go unrecognized, and numerous honors were awarded him. As early as 1925 the International Education Board designated him a European Fellow with the privilege of attending the Robert Koch Institute for Infectious Diseases in Berlin for one year. In 1938, he was granted the honorary degree, D.Sc., by Kansas State University. In 1941, he was presented with the Silver Beaver award, the highest mark of recognition in the scout movement, by the Louis Agassiz Fuertes Scout Council. In 1948 he was made Veterinarian of the Year on the basis of a nationwide poll conducted by Gaines Dog Research Center. Ten years later the New York State Veterinary Medical Association chose him as their Veterinarian of the Year. Honorary memberships were conferred upon him by the Royal College of Veterinary Surgeons, Great Britain; the Royal Veterinary Society, Sweden; the Hellenic National Veterinary Society, Greece; and the Veterinary Academy, France. In 1959, he was cited by the New York State Conference Board of Farm Organizations for outstanding services to agriculture. He was the winner of the Twelfth International Veterinary Congress prize in 1960 and of the American Veterinary Medical Association annual award in 1962. The honorary degree, LL.D., was conferred on him by the University of Toronto in 1962. His name appears in *Who's Who in America*.

The modern veterinary buildings at Cornell are a testimonial to his foresight, planning, and efforts. As memorials to Dr. Hagan, the New York State Veterinary Alumni Association in 1960 established the Hagan Student Loan Fund at Cornell, and in 1962 the faculty meeting room in the Veterinary College was designated “The Hagan Room.”

Dr. Hagan’s reputation as an international figure in the field of veterinary education was based on solid ground. In the area of research he made important contributions to our knowledge of brucellosis and paratuberculosis. He was an excellent lecturer, writer, and teacher. He continued to teach a course in infectious diseases in the New York State Veterinary College until he retired. He was in constant demand everywhere as a lecturer and as an authority on all matters pertaining to veterinary medicine.

The interests of this truly educated man were not limited to veterinary medicine. He was amazingly well informed in many fields. Regardless of the demands on his time, he was never too busy to discuss any problem with a student, staff member, or with anyone else who wished his counsel. He possessed an engaging personality, a great love of life, a keen sense of humor, and an interest in everything. He had a large circle of friends who will forever miss him.

He married Esther Grace Lyon August 29, 1917, in Nickerson, Kansas. Their children are a son, William L. Hagan of Norwalk, Connecticut, and two daughters, Miss Janet Ann Hagan of New York City and Mrs. John L. Hyde of Southold, Long Island. Other survivors are five grandchildren; a brother, James S. Hagan of Los Altos, California; two nieces; and a nephew.

Donald W. Baker, Myron G. Fincher, Dorsey W. Bruner

Tor Hagfors

December 18, 1930 — January 17, 2007

Emeritus Professor Tor Hagfors collapsed and died of a heart attack while walking on a beach in Puerto Rico during a visit to the Cornell-run Arecibo Observatory, an observatory to which he devoted a substantial portion of his remarkable career, a career that spanned half a century, several countries, and directorships at three major observatories and a Max Planck Institute.

Born in Oslo in 1930, Tor received his education in Oslo and Trondheim, finishing with a Ph.D. degree in Physics from the University of Oslo in 1959. His first employment, from 1955-63, was with the Norwegian Defence Research Establishment, interrupted by a position as Research Associate at Stanford University in 1959-60. During this period, Tor began the research that would engage him for the remainder of his life, the study of electromagnetic scattering from planetary surfaces and the Earth's ionosphere. He made major contributions to the field of Planetary Radar Astronomy during its fledgling years in the 1960s, deriving the still widely applied Hagfors Scattering Law and co-editing the book, *Radar Astronomy*, published in 1968. Tor also formulated the theory of incoherent scatter of electromagnetic waves by the ionosphere in a paper published in 1961, one of four papers at the time that independently provided the theoretical underpinnings for this new technique to measure the properties of the ionosphere. In addition to his many scientific results in these two areas, Tor played a major role in the engineering design of two very large radar facilities, and he was a talented scientific administrator who successfully navigated the intricacies of scientific funding and politics in both the United States and Europe.

In 1963, Tor returned from Norway to the United States, this time to the MIT operated Lincoln Laboratory, where he spent 1963-67 and 1969-71, working on incoherent scattering theory (particularly the effect of collisions between charged and neutral particles) and radar scattering from plasma waves generated by ionospheric currents associated with the aurora. It was at this time that he also made his major contributions to the field of planetary radar astronomy, deriving Hagfors' law and carrying out innovative studies of the properties of the lunar surface, studies of high interest during the Apollo era.

In between his two stints at Lincoln Laboratory, Hagfors served as the Director of the Jicamarca Radio Observatory, located near Lima, Peru. Jicamarca was the first of two huge radars (the second was Arecibo) built in the early 1960s to explore the properties (e.g., densities, temperatures, ion composition, velocities) of the ionosphere, using

incoherent scatter, at altitudes ranging from below one hundred kilometers up to several thousand kilometers. While at Jicamarca, Tor made very accurate measurements of vertical plasma drift velocities (driven by natural electric fields) in the ionosphere and also continued his studies of the Moon.

After leaving Peru in 1969, and following his second stint at Lincoln Laboratory in 1971, Tor was appointed Director of Operations of the Arecibo Observatory, the enormous radar built by Cornell in Puerto Rico. This was Tor's first association with Cornell, but it would not be his last. His research highlights during this period included contributions to the theory of "heating" of the ionosphere using very powerful radio waves, the development of clever radar techniques for observing the effects of this heating and, with one of us (DC), studies of the properties of the surface of Venus.

In 1973, Tor moved yet again, returning to Norway to become Professor of Electrical Engineering at the University of Trondheim, a position he held until 1982. He taught courses there in communication and information theory, radar techniques and technology, and antenna theory. His main reason for returning to Scandinavia, however, was to explore the possibility of building a major, second generation incoherent scatter radar observatory in Europe. The contemplated size and cost of the project was such that an international collaboration was required. After much negotiation, six nations (Norway, Sweden, Finland, Germany, France, and the UK) reached agreement to build a tri-static radar observatory (named EISCAT, for European Incoherent SCATter) in northern Scandinavia, with tightly coordinated facilities in Norway, Sweden, and Finland. Hagfors was the founding director from 1976-82. Besides his role as midwife to the birth of EISCAT, Tor also contributed heavily to its unique engineering concepts. EISCAT research has greatly improved our understanding of the high latitude ionosphere, a region of fascinating "space weather," where charged particles streaming from the Sun interact with the Earth's magnetic field to produce auroral displays and many other important but less visible effects on our upper atmosphere.

Tor's wanderlust never allowed him to stay in one place too long, and so in 1982, just as EISCAT was beginning to operate smoothly, he returned to Cornell for a ten-year stay as a Professor of both Astronomy and Electrical Engineering and also as Director of the National Astronomy and Ionosphere Center (NAIC), which manages the operation of the Arecibo Observatory. Besides his administrative duties, Tor continued his work on the theory and observations of Langmuir waves driven by radio wave "heating," as well as various radar astronomy projects. Perhaps his most important contribution to the Observatory was the engineering design for an ambitious second upgrade of the antenna system, adding two additional reflectors (producing a so-called Gregorian feed) to eliminate the distortion produced by the main spherical reflector. This huge project substantially increased the sensitivity

and frequency range of the telescope. Tor oversaw the detailed design of the Gregorian system and shepherded the major proposal through the funding process. During this period, he also spent a sabbatical year (1988-89) at the Max Planck Institute for Aeronomy in Lindau, Germany—a precursor to the next step in his career.

In 1992, as the construction of the upgrade was getting underway, Tor again pulled up stakes and moved back to Europe, becoming simultaneously Professor of Astronomy at the University of Oslo (until 1998) and one of the three co-directors of the Max Planck Institute in Lindau until 1999, when he reached the mandatory retirement age of 68. During this period, he had to deal with numerous vexing political and funding issues associated with German reunification, but he managed to stay active scientifically, especially with EISCAT and various satellite projects, and he began working on a textbook on incoherent scattering with one of us (DF).

During his “retirement” from 1999 until his death, he continued his research, collaborating with colleagues at MPI, the University of Tromsø, Norway, the University of Nagoya, Japan, the University of Lancaster, UK, EISCAT (with its new radar on Svalbard), and the Mars express and CONSERT satellite missions.

Professor Hagfors was a member of a long list of professional societies, research councils and advisory committees, both in Europe and the United States, and he also received numerous honors. Among the latter are the URSI Van der Pol Gold Medal (1987), the EISCAT Sir Granville Beynon Medal (2002), memberships in the Royal Norwegian Academy of Science and Letters (1996) and the Royal Astronomical Society (UK, Associate Member, 1998), and honorary doctorates from the Universities of Oulu (2002) and Tromsø (2003). He delivered major, invited, named lectures in 1999 (Penn State University), 2002 (U. Tromsø), and 2003 (Arecibo). He published well over 150 papers (many after retiring), mostly on radio wave scattering of various kinds, but also on engineering topics such as antenna design and pulse coding. He was a versatile theorist, a creative engineer, and a scientific leader. He freely gave credit to others for joint work and was a pleasure to work with. He was also a man of grace and wry humor, which he demonstrated as an after-dinner speaker on frequent occasions!

Tor is survived by his first and second wives, Gillian Patricia Hart and Hanna Halina Zofia Repa, and his four children John, Toril, Martin, and Vivien.

We close with some remarks delivered by one of us (DC) at a memorial service for Tor at the Max Planck Institute in Lindau, Germany:

“In his slightly formal way, Tor liked to enjoy himself and was always ready for a party, and some of the parties in Arecibo were memorable. He was spontaneous, once diving into the Observatory’s pool fully clothed on a dare from our young daughter. We went sailing in the Virgin Islands on several occasions...These trips were great opportunities for relaxation, swimming, and, without fail, a few rum and cokes.”

“I want to finish by saying how much Tor was admired as a scientist and teacher by the people who worked with him. He had a passion for doing science, clearly derived great enjoyment from it, and communicated this to all of us who worked with him as students and colleagues. Rather than being remembered for the many awards and medals he received, I think that Tor would want to be remembered primarily as someone who loved to do science.”

Donald T. Farley, Chair; Robert Brown, Donald B. Campbell

Emilie Towner Hall

December 11, 1910 — November 9, 1981

Emilie Towner Hall brought a wealth of newspaper experience to Cornell when, in 1953, she accepted the position of editor in the New York State College of Home Economics, now the New York State College of Human Ecology.

In this position she was responsible for developing journalistic material for the extension, teaching, and research audiences interested in home economics. In 1962 she became assistant professor on the college faculty and taught a course titled Preparation of Publications to undergraduate students. Professor Hall suffered a stroke in the fall of 1967 that forced her to retire at that time.

She was born in New York City on December 11, 1910, and shortly thereafter moved with her parents to Avoca, New York, Steuben County, where her father owned and edited a weekly newspaper. She graduated from Miami High School in 1928 and subsequently attended Piedmont College, Demorest, Georgia. She later received her baccalaureate degree from Ithaca College.

Emilie Towner's marriage to A. James Hall took place in 1930 in Tampa, Florida, where the couple lived until 1933. From 1933 to 1944 she published, with her husband, the *Avoca Herald* in Avoca, New York. She was also a freelance correspondent and photographer for five Gannett newspapers in Elmira and Rochester and for two Buffalo newspapers, the Associated Press, and the United Press as well as for two photographic syndicates. Most of her feature articles were focused on agriculture and rural life.

When her husband entered the United States Navy in 1944, Mrs. Hall moved to Ithaca as associate editor of the *Cooperative Digest* and helped establish the *Co-op Power*, magazines owned and published by Roy H. Park, now President and owner of the Park Communication Group.

She then became a writing associate of the late Howard E. Babcock, former general manager of the GLF Cooperative Exchange. He was also a Cornell trustee and chairman of the Board of Trustees. She later wrote an extensive biography of Mr. Babcock, which was used in connection with the establishment in 1951 of the H. E. Babcock Professorship of Food Economics in the Graduate School of Nutrition at Cornell. Professor Hall has the distinction of being published under her own by-line in *Life*, *Time*, the *Christian Herald*, *Good Housekeeping*, *Country Gentleman*, and several other well-known professional and popular magazines. She had a special versatility in adjusting her editorial material to her audiences, and her unique background in journalism was unusual for a woman of her generation.

Professor Hall was a member of the New York State Home Economics Association, the American Home Economics Association, Epsilon Sigma Phi, American Women in Radio and Television, the American Association for the Advancement of Science, the American Association of Agricultural College Editors, and the International Society of General Semantics.

One cannot conclude this memorial statement without referring to the personal characteristics that contributed to her many professional achievements. She possessed a charming, cultured manner, an ever-patient disposition, and a sincere interest in the overall objectives of the college with which she was associated. These attributes, together with her devotion as wife and mother, were reflected in her outstanding personality and in the integrity of her writing.

In 1977 Professor Hall's husband retired from his position in Ithaca as president and publisher of the *American Agriculturist* magazine, with which he had been associated for thirty-one years. The couple then moved to their condominium in Cocoa Beach, Florida. It was in the hospital there that Professor Hall died on November 9, 1981.

She is survived by her husband of fifty-one years, who will remain in Florida, and two sons: A. James Hall, Jr., vice president of a printing press manufacturer in Seattle, Washington, and Lt. Col. Michael S. Hall, Ithaca, who is air commander of the 174th Tactical Fighter Wing, New York Air National Guard, in Syracuse. Both sons are Cornell graduates. Professor Hall also leaves a sister, Mrs. Charles Palmer, of Bath; five grandchildren; and one great-grandson.

Vera A. Caulum, Mary B. Wood, Mary K. Bloetjes

Goldan O. Hall

June 11, 1897 — June 15, 1981

Professor Hall was born in Parkersburg, West Virginia. After serving in the U.S. Army as a lieutenant from 1917 to 1919, he graduated from the University of West Virginia in 1921 with the degree Bachelor of Science in Agriculture. For about a year afterward he held an appointment as instructor in poultry husbandry at that university until he came to Cornell in 1922 for post-graduate study.

Here, his qualifications and ability were soon recognized. He was appointed as instructor in 1923 and assigned to teach a course in poultry breeding and judging, at the same time pursuing his post-graduate studies. A Master of Science in Agriculture degree was followed by a Doctor of Philosophy degree in 1926. By that time he had established a reputation as an excellent teacher and was appointed an assistant professor. Thereafter he climbed the academic ladder by the usual rungs and was appointed to a full professorship in 1944.

Professor Hall was affectionately known in his department simply as "G.O." Because of his ability as a teacher, other courses were pressed upon him, including those in judging, marketing, and farm poultry. G.O. loved to work with students. No adviser ever took the responsibilities of that role with a more gladsome heart.

One of his specialties was the coaching of poultry-judging teams. At that time, teams of student judges from several eastern agricultural colleges competed annually at some central place. The fine art of estimating from external characteristics which hens had laid the most eggs had been highly developed. In some classes, the birds were also judged for perfection in conformation, plumage, and other standards of their breed. During G.O.'s years of training the Cornell teams, they competed in twenty-five contests, placing first in fourteen of them and second in six. In two of these contests, members of the Cornell team ranked first, second, and third in individual scoring.

In 1942 G.O. was awarded the prize for excellence in teaching and extension by the Poultry Science Association. He was faculty adviser to the Poultry Club from 1939 until his retirement. He also served on four faculty committees of the College of Agriculture. He was elected an honorary member of Ho-Nun-De-Kah, the honor society of the College of Agriculture. In West Virginia he had helped in the development of camps for members of 4-H clubs, an interest which he maintained after he came to New York.

Professor Hall's interests in research were chiefly in breeding and marketing. These were combined when it was found that variations in the quality (firmness) of albumen in eggs were partly genetic in origin. With his graduate

students and others in the department, he published some forty scientific articles on variations in egg production and in egg quality. In his high-fecundity strain of White Leghorns, one hen established what is probably still a world's record by laying (in trapnests) 1,515 eggs in eight years.

G.O. was coauthor of two books: *Judging Poultry for Production* (1930) and *Poultry Management* (1952). He was a member of the American Association for Advancement of Science, Poultry Science Association, World's Poultry Science Association, and Sigma Xi. At Cornell he belonged to Scabbard and Blade, Lambda Gamma Delta, and Kappa Sigma.

Professor Hall was predeceased two years earlier by his wife, Melissa. Old-timers will recall that both were loved for their unfailing assistance with departmental parties and picnics.

G.O. retired in 1955 and moved to Orlando, Florida. He is survived by two daughters: Nancy (Mrs. D. Rosenberg) of Washington, D.C., Berta (Mrs. F. M. Chupp) of Binghamton, New York; a son, James H. Hall of Bay City, Michigan; nine grandchildren; and five great-grandchildren.

Randall K. Cole, Edward A. Schano, Frederick B. Hutt

Robert Anderson Hall, Jr.

April 4, 1911 — December 2, 1997

Robert A. Hall, Jr., world-renowned specialist in Romance linguistics, one of the early representatives of American structuralism and descriptive linguistics, and one of the founders of the Division of Modern Languages at Cornell, died on December 2, 1997, at the age of 86. He is survived by his wife, Alice M. Colby-Hall; his three children, Philip A. Hall, Diana K. Goodall, and Caroline Erickson; six grandchildren; and six great-grandchildren.

Although he was born in Raleigh, North Carolina (April 4, 1911), he spent most of his childhood in the north, first in Minnesota, then in New England. He received his higher education at Princeton University, the University of Chicago, and the University of Rome. At Princeton (B.A. 1931) he majored in French and German literature. He became acquainted with the budding discipline of linguistics when he began his graduate studies at Chicago that year, taking courses with Harry Hoiyer and later with Leonard Bloomfield. He continued his studies in literature and expanded his studies in the classical Indo-European languages (Greek, Latin, Sanskrit, Avestan, Old Persian) with Carl Darling Buck and George Bobrinskoy.

He interrupted his graduate work at Chicago by going to Italy, where he studied Italian literature and historical linguistics, the latter in a European version whose distortion of neo-grammarians theory he was critical of throughout his scholarly career. He received the Dottore in Lettere from the University of Rome in 1934. He finished up the few remaining requirements for the M.A. degree upon his return to Chicago in 1935 and did further course work, but, having received what he considered to be the equivalent of the Ph.D. degree from Rome, chose not to pursue that degree at Chicago.

In 1936, he married Frances L. Adkins, with whom he later collaborated on the preparation of materials for the teaching of reading and writing to English-speaking children and on an Italian-English and English-Italian dictionary of idioms. In that same year, he got his first academic job teaching at the University of Puerto Rico. While there, he worked on the rewriting of a Hungarian grammar and started work on his *Bibliography of Italian Linguistics*. In 1939, he obtained an instructorship at Princeton, and in 1940, began teaching Italian language and literature at Brown where his acquaintance with Hans Kurath and Bernard Bloch further stimulated his interest in linguistics. In the following year, he was elected to the editorial board of the *Linguistic Society of America*. That was also the year in which Leonard Bloomfield moved to neighboring Yale, whose Linguistics Club served both Yale and Brown.

It was during this first decade of his scholarly life that Bob Hall began his many disputes with a number of European scholars. He developed what can only be called an antipathy toward a European style of academic behavior. He has sharp words in his memoirs for the prideful arrogance of some. He hated pretension and had none of his own. But this did not affect his love for Europe, European tradition, and respect for many European scholars, thus freeing him, in the eyes of at least some, from the charge of bias and prejudice. In fact, he characterized some of his American colleagues' reaction to the influx of European scholars into the U.S. in the 1930s and 1940s as "xenophobic". Like H.L. Mencken and others of an earlier day, he was in the habit of identifying people by their ethnic or cultural background, and he was accused of bias against one nationality or another, but judging from the language of his memoirs, no nationality was spared. In speaking of Professor Jakob Jud, whom he met in Zurich, he says, "He was a fine, honorable, upright gentleman, far above the petty quarrelling of the Italians and equally far removed from the grandiose but empty verbiage of many of the Germans". He was not impressed by those Europeans who insisted on "the inherent superiority of European culture", because, he says, "My parents and, indeed, our whole culture had always taught me that people coming to America and settling permanently owed it to themselves and their adopted country to discard older customs or attitudes which might conflict with those prevailing in their new home-land"—a stance he never retreated from and one which would not endear him to the modern multiculturalist.

Bob Hall shared with Bloomfield and many other American linguists a dislike of academic "schools" of thought, with their gurus and sycophants, dogmas, and unwillingness to entertain opposing viewpoints. This is certainly one of the many sources of Hall's antipathy to Chomskyan linguistics. Nevertheless, he always treated people with whom he disagreed with utmost civility and never allowed his scholarly predisposition to interfere with respectful treatment of students holding differing views. In his later career at Cornell, for example, he served as chairman of graduate examination committees of students whose theses were written on generative principles; his attitude toward prospective scholars was that all they had to do was to demonstrate competence in their research, no matter what linguistic theory they were operating under.

World War II entailed a need for language teaching research and research on the structure of many of the world's languages, and that need was met in part by the cooperation of the Linguistic Society of America with the American Council of Learned Societies to develop such materials. Hall's first significant contribution in this effort was the description and teaching of Melanesian Pidgin, later in Haitian Creole and Taki-Taki. Hall was a pioneer in the

study of Creoles and pidgins, in devising orthographies for them, and in attempting, particularly in Australia, to convince politicians that Pidgin was a language in its own right and should not be stamped out.

In 1943, Hall went to Washington to work in the U.S. Armed Forces Institute (USAFI), where he joined in the production of textbooks on French, Spanish, Italian, and Portuguese, 4 of the 50-odd language textbooks of the Spoken Language series, a project that effected a significant change in the teaching of languages in this country by emphasizing the spoken language and by introducing linguistic principles into pedagogy. He also worked in the ASTP (Armed Services Training Program). During the war years, Bob Hall became more closely acquainted with many of the figures who were or would become prominent in the field of linguistics—Leonard Bloomfield, Edgar Sturtevant, Franklin Edgerton, Isadore Dyen, George Trager, Bernard Bloch, and many others.

It was during these years also that he got to know many of his future colleagues at Cornell, where he went in 1946 at the invitation of J Milton Cowan to join Charles F. Hockett, Frederick B. Agard, Gordon H. Fairbanks, and in 1947, William G. Moulton, in the founding of an academic unit—the Division of Modern Languages—which would introduce the new approaches to language teaching into the academic world, along with the then novel discipline of linguistics. There he spent the rest of his life of scholarship and teaching, both of which he found gratifying.

In 1975, he retired from teaching, becoming Professor Emeritus of Linguistics and Italian, but continued his research as actively as ever. He was then in the midst of working on his *Comparative Romance Grammar*. In that year, his wife Frances died. He subsequently married Alice M. Colby-Hall, Professor of Romance Studies.

For most of his life he believed—naïvely, he would himself confess—that the academic world was the rare place one could express one's views freely, however unwelcome they may be, without untoward consequences of the sort one might encounter in normal life. At one point toward the end of his academic career, he expressed politically incorrect views on the Holocaust. Although this was in fact a demonstration of his strict adherence to an unprejudiced scholarly approach to any matter to which he turned his attention, his interdisciplinary conversation companions at the faculty cafeteria excluded him from their luncheon table, and generally shunned him thereafter, much to his distress.

Robert A. Hall, Jr. is remembered by the colleagues of his that remain among the living as an incredibly prolific writer on a wide variety of topics. One can recall him back in the 1950s in a corner of the hectic main office of the department busily typing away on one of his books during the 10-minute breaks between classes of the 5 courses

he normally taught per semester, using the only departmental typewriter that had the proper array of phonetic symbols for his purposes.

He published over fifty books and over five hundred and fifty articles and reviews in learned journals on: structural linguistics; the history of American Linguistics; graphemics; the application of linguistics to language teaching; Italian linguistics; the history of Italian literature; the life and works of Antonio Fogazzaro; Pidgin and Creole languages; the external history of the Romance languages; proto-Romance phonology and morphology; English linguistics; Hungarian grammar; cultural symbolism in literature; and the genuineness of the Kensington runestone. He also wrote fiction, and composed some music, for his own amusement and was a prolific contributor to the Letters to the Editor department of various newspapers.

Bob Hall's sense of humor ran to puns, limericks, the apt quotation (often in Latin), and an appreciation of the work of P.G. Wodehouse, on whose comic style he wrote a book appreciated in turn by Wodehouse himself. He took delight in Wodehousean phrases such as "His finely-chiselled features were twisted with agony and what not". He was as serious about his avocations as he was about his profession. In addition to his book and articles on Wodehouse, he traveled the world over to ride trolleys and trains, keeping close track of train schedules and writing pieces on electric railways. In addition to singing in various local choral groups, he was an extremely knowledgeable listener and wrote a number of pieces on music, including a demonstration that the origin of the term *tierce de Picardie* had nothing to do with Picardy.

His writings include much of what might be called popularizing, though for him, writing for non-academic audiences was very much a duty. In his book, *Leave Your Language Alone*, an attack on correctness and normative grammar (although elsewhere he confesses his quickness to correct others' errors in English grammar, and woe betide an interlocutor who failed to pronounce Wodehouse Woodhouse) he has this to say: "The contribution of linguistics is simply a part of the effort of all science in modern democratic society to find out the truth and to act upon it".

Although, while appreciative of good administrators such as J M. Cowan who left him free to pursue his scholarly work, he eschewed administrative work, and he was active in many professional organizations. He served as Vice President of the American Association of Teachers of Italian in 1945, Vice President of the Linguistic Society of America in 1961, President of the Wodehouse Society in 1983-85, and President of the Linguistic Association of Canada and the United States in 1983-84, and in 1984-85. He was a Guggenheim Fellow in 1954 and 1970 and a Fulbright lecturer in linguistics at the University of Rome in 1950-51 and 1957-58. In 1978, he received

a Professional Achievement Award from the University of Chicago, and in 1992, a Distinguished Achievement Award from the Alumni Association of Poly Prep Country Day School in Brooklyn, New York, where he had completed his secondary education in 1927.

Bob Hall felt it his civic duty not only to apply linguistics to social problems, but also to speak out forcefully on other social and political issues. Although usually labeled a conservative (a true characterization in some respects), it would be just as fitting to label him an American socialist, one of his favorite and oft-cited books being Thorstein Veblen's, *Theory of the Leisure Class*. He was a great respecter of tradition and at the same time an ardent iconoclast.

Robert A. Hall, Jr. was an old-fashioned man from his earliest years and clung to ideals that became rather unfashionable in the course of his life (honor, duty, temperance, civility, decency, piety, integrity, intellectual honesty, love of country, and what not). Some found this ridiculous, others admirable.

Richard L. Leed, Charles F. Hockett

George Livingstone Hamilton

July 24, 1874 — September 25, 1940

The sudden death of Professor George Livingstone Hamilton on September 25, 1940, removed from the academic family of the University one of its most striking figures. Born in Boston on July 24, 1874, he was educated in the Roxbury Latin School, and received the degree Bachelor of Arts from Harvard in 1895, and the Master of Arts in 1897. He studied at the University of Paris, and gained the degree Doctor of Philosophy from Columbia in 1903. After teaching Romance languages in the University of Cincinnati, in Trinity College, North Carolina, and, for eight years, in the University of Michigan, he came to Cornell in 1911 as Assistant Professor of Romance Languages, and was made Professor of Romance Languages in 1916. He was a fellow of the Mediaeval Academy of America, and sometime vice-president of the Modern Language Association.

When, in 1921, he was appointed Curator of the Fiske Dante and Petrarch Collections in the University Library, he assumed a task which was peculiarly sympathetic to him and which he fulfilled with eminent success. His profound knowledge of everything which concerned his two poets, his bibliographical acumen, and his patience and tenacity in searching booklists, catalogues, and journals for items to add to the collections brought great advantage to the Library, to the University, and to the learned world. Beyond his special subject his interest extended to many fields, especially folklore and general bibliography. He was a founder and continually active member of the Cornell Research Club.

He was a great character. Though he had no purpose of differing from the common run of men, or of professors, he was unique. As he took his rolling-gaited way across the campus, reading steadily, he caught the eye of the most casual visitor. And when he stopped to talk to a colleague, his generous and heedless scorn of all the world's mediocrities expressed itself in thunderous invective, to be much and gleefully quoted.

He was severe upon his fellow-scholars, and his severity made him some enemies. But his eloquent vituperation, mingling Dante with Rabelais, was directed mostly at careless work, at the cheap and shoddy, at the pretentious article based on others' labor, at the book written for the author's advancement and not for the advancement of learning. His ideal of scholarship was austere, almost monkish. It was his very respect for scholarship in its shrine of purity that restricted his own production. His vast and varied knowledge never was sufficient; he felt always that the scholar must be sure, and all his study taught him the dangers of assurance.

He was an example of the scholar who has given himself totally to the intellectual life. And he was more, a great character, a dominating and unconventional character, in the tradition of an elder day. He was a product of the humanism of the 1890's. That humanism has passed, and now its great representatives are disappearing. And who can take their places?

James Morton Hamilton

June 26, 1901 — February 20, 1987

James Morton Hamilton was born in Sutton West, Ontario. He received his B.S. A. degree from the University of Toronto in 1924. In 1929 he was awarded his Ph.D. degree from the University of Wisconsin, where he majored in plant pathology. He became an American citizen in 1934.

Jim joined the Department of Plant Pathology as an associate in research at the New York State Agricultural Experiment Station in Geneva in 1930. From 1930 to 1936 he was in charge of fruit disease control investigations at the Poughkeepsie Laboratory in the Hudson Valley. He was transferred to Geneva in 1936 and was promoted to chief in research (professor) in 1939. He served as head of the Department of Plant Pathology from 1951 until shortly before his retirement. He was made professor emeritus of plant pathology on his retirement in 1967.

While headquartered in the Hudson Valley, Jim developed fungicide programs for the control of apple scab, black rot, and cedar-apple rust. After his transfer to Geneva he continued his field experiments on the control of apple diseases and initiated research on fungal and bacterial diseases of pears, peaches, and cherries.

In the 1930s Jim pioneered the development of greenhouse-laboratory facilities and techniques for research on fungicide action in relation to disease control. With great persistence and detail he formulated and developed many of the major concepts of how and why fungicides control plant diseases. His investigations established the parameters of fungicide activity: protection, eradication, redistribution, and systemic action.

Jim and his colleagues established that particle size was critical to the effective performance of fungicides and that retention and redistribution of fungicides on the plant foliage and fruits were important for obtaining maximum disease control. He also discovered that certain fungicides were capable of killing disease organisms after they had become established in the tissues of the host plant, a phenomenon later to become known as the “after-infection” phase of disease control.

Jim developed rapid, inexpensive methods of evaluating possible new fungicides and bactericides in the laboratory and greenhouse, thereby eliminating the need for more-expensive field testing of materials that were ineffective or phytotoxic. Those accomplishments brought him worldwide recognition in the field of fungicide evaluation.

His research findings in the 1930s made major contributions to the development of the organic fungicides that replaced the highly injurious lime-sulfur and Bordeaux mixture fungicides. His research resulted in the discovery

of ferbam, which in laboratory and field tests was found to be effective for the control of apple scab and cedar-apple rust. He later demonstrated it to be highly effective for the control of Botrytis of stone fruits, peach leaf curl, and cherry leaf spot. His researches were responsible for the introduction of the dithiocarbamates, dodine, and glyodin. These findings have led to more-effective disease control in orchard fruits and resulted in increased yields of superior-quality fruits worth millions of dollars to the fruit industry of New York and neighboring states.

Jim was extremely critical and objective about his fungicide evaluations and was often unusually frank in his remarks about their effectiveness, or lack thereof, in his presentations of his research findings at the pesticide conferences held annually at Ithaca and at grower and scientific meetings. Although much of his grant funds for fungicide evaluations came from commercial companies, he did not hesitate to lambaste new fungicide candidates that showed little or no promise.

During his tenure Jim published 103 scientific papers and numerous popular articles on fungicides and disease control. He frequently delivered his research findings directly to the growers at extension meetings, which were usually well attended.

In 1967 he received the Award of Merit, the highest honor the Northeastern Division of the American Phytopathological Society can confer on one of its members. On his retirement Jim was cited by the New York State Horticultural Society for a “lifetime of productive research in solving orchard disease problems.” Jim was a member of Phi Sigma, Sigma Xi, Gamma Alpha, the New York State Horticultural Society, the American Association for the Advancement of Science, and the American Phytopathological Society.

He is survived by a sister, Mrs. Blaine (Jean Ann) Moore of Gananoque, Ontario, and several nieces and nephews.

Rosario Provvidenti, Michael Szkolnik, Alvin Braun

William J. Hamilton, Jr.

December 11, 1902 — July 27, 1990

To reduce a highly accomplished, multidimensional life, such as Bill Hamilton's, to a few pages of text is a challenge. The statistics of accomplishment are relatively easy. Professor William J. Hamilton, Jr. studied the natural history of organisms, primarily small mammals, but also fishes, amphibians, insects, disease organisms, and plants. His bibliography (which will be published by two of his students in the *Bulletin of the Ecological Society of America*) extends from 1928 to 1988 and includes 225 papers on animals, another ten on plants, and three books that have appeared in five editions to date. *Mammals of Eastern United States* published by Cornell University Press, was a pioneering effort that remains indispensable even now, almost fifty years after it first appeared. Bill Hamilton was a member of many scientific societies, but was most devoted to two, the American Society of Mammalogists and the Ecological Society of America. He was a founding member of the latter and he served both in several offices including that of president, and as zoological editor of *Ecological Monographs*. Bill Hamilton was a fellow of the American Association of Arts and Sciences, the New York Academy of Science, and the Royal Horticultural Society of England and his biography appears in *Who's Who in America*. Special honors include the prestigious Marcel LePinec Award of the American Rock Garden Society, the Outstanding Alumni Award of the New York State College of Agriculture and Life Sciences, and the establishment of the William J. Hamilton, Jr. Lecture Series at Cornell Plantations, where he served on the advisory board for years. Bill Hamilton was also instrumental in the founding and later direction of the Edmund Nyles Huyck Preserve and Biological Laboratory in Rensselaerville, New York. He is further honored and will be remembered in the scientific name *hamiltoni* applied to one fish, four invertebrates, and one black bear.

Bill Hamilton's remarkable, extended relationship with Cornell University is also easily delineated. He entered as a student in 1922, progressed without break through B.S., M.S., and Ph.D. degrees, the last as a student of Albert Hazen Wright. He was then immediately appointed an instructor and thereby commenced a steady progression through the ranks of faculty, interrupted only by military service of three and one-half years during the second world war. Bill was awarded professor emeritus status in 1963. At his death, this close Cornell relationship was just two months shy of 68 years' duration.

Bill Hamilton married a Cornell student and native Ithacan, Nellie Rightmyer, a collector and connoisseur of stamps and sea shells who has donated her shell collection to Cornell. They had three children all of whom

graduated from Cornell. Their son, William J. Hamilton, III, is now a professor of zoology at the University of California at Davis.

Among 150 graduate students on whose committees he served, and in his undergraduate courses, Bill taught at least seven students who themselves were later chosen as faculty members at Cornell. Others are also now sprinkled through a host of distinguished American colleges and universities.

To capture in a few words the man whose character and soul are behind this remarkable record is the real challenge.

As a child growing up in Corona, Queens County, (greater New York City), Bill Hamilton exhibited an entrepreneurial instinct and an urgent curiosity about the organisms, both plant and animal, that populated the world about him. He trapped muskrats in the Flushing Meadows and sold the pelts. He caught timber rattlesnakes in the Ramapo Mountains, a short distance away, for the Bronx Zoo. He speared carp for local fish markets. He dug and peddled soft-shelled clams from the mud flats where within a decade appeared the New York World's Fair, and later, Laguardia Airport. He vended packets of flower seeds door to door. He trapped specimens of local wildlife for the museums of New York City. In all these endeavors it appears that Bill Hamilton made a good profit.

When the time came, young William J. Hamilton, Jr. applied, and was admitted at Harvard College. He chose to come to Cornell instead when he saw that Cornell had the better array of courses dealing with organisms of all kinds.

In the years that followed, any incompatibility of Bill Hamilton's entrepreneurial instinct with the life of a scholar had to be subjugated to the strictures and mores of academia. That he did this successfully is indelibly certified by his attainment of the Cornell Ph.D. degree. Signs of incomplete subjugation were, however, visible throughout the remainder of Bill Hamilton's life. He eschewed administrative responsibilities, acting as department head only briefly and on an interim basis. His character was not comfortably compatible with the academic granting system that developed over his lifetime. Bill wrote few if any grant applications. His remarkable record of research publication was built largely on materials at hand in his own backyard. His investigations were accomplished mostly in a research laboratory based on a sink. A razor blade was his chief exploratory instrument. A trickle of Hatch Act funding requiring little paperwork and his own salary provided investigator Hamilton's principal financial support.

In a word, Bill Hamilton was impatient. He was goal-directed and impatient of any artificial impediment. He was focused and impatient of any unnecessary diversion. He was direct and impatient of any dissimulation. He

was particularly impatient with the customary veneer of human civilization, thin though it sometimes is, and preferred the unvarnished reality of the natural world. The clichés of ordinary human life were anathema to him. Consciously or unconsciously he aimed to provoke a reaction from those around him that exposed the genuine individual. His principal tool was a sharp wit often used outrageously but never caustically. His famous tall stories regularly progressed from the false but believable to the patently ridiculous, to which the auditor was eventually forced to react.

At the same time Bill Hamilton was a warm, engaged, helpful friend to students and colleagues who got beyond a superficial reaction to him. Fundamentally a shy person, he allowed his enthusiasm for his subject to transcend his shyness when teaching. He attracted serious students easily and he led them carefully, but he minced no words. He insisted not only on meticulous recording of observations, but additionally on developing the habit that made such record-keeping second nature. He, himself, kept a detailed daily journal throughout his life, and drew from it heavily in his publications.

Bill Hamilton believed deeply that the public should be better informed about the natural world of animals and plants. All of his publications were written in a style intended to be easily accessible and functionally useful. In addition to purely scholarly articles, he wrote frequently for general-circulation publications. All inquiries from the public that reached his desk were answered carefully and immediately. In his classes, Professor Hamilton showed especial concern and compassion for floundering students, helping them without stint.

Professor Hamilton came to Cornell to study with the first generation of Cornell greats in biology. He was among the second generation of those greats, and he taught a large number of persons who were chosen into the third academic generation of Cornell faculty in biological sciences. He saw the subject evolve around him, and he experienced the shifting organization that characterized Cornell's need to refine the roles of the Medical College, the Veterinary College, and the basic science of biology as taught in the College of Arts and Sciences and the New York State College of Agriculture and Life Sciences. Over those long years he was required to move from building to building, and department to department with each new restructuring. Eventually he balked at a final move into the Division of Biological Sciences and retired at age 60 instead.

Retirement allowed Bill Hamilton to refocus a lifelong interest in plants. He had already turned the three-acre plot around his suburban home into a genuine botanical garden which often attracted visitors literally by the bus load. Now he gave increased attention to techniques and "tricks" based on an intimate knowledge of fundamental growth requirements often derived from his own observations, for establishing tender southern species outdoors

in Ithaca. He added almost one hundred new names to the list of plants demonstrated as winter-hardy in upstate New York. He also competed annually to be the top supplier in an informal seed exchange of the American Rock Garden Society, and in recent years usually won.

William J. Hamilton, Jr. served Cornell splendidly and long with a humility rare in the academic world. When visited by friends and former students during his final illness the twinkle in his eye showed that while death would consume his body, nothing will quench his spirit. May it live on in all who knew him.

Howard E. Evans, Ray T. Oglesby, Perry W. Gilbert, John M. Kingsbury

Edwin Woodworth Hamlin

July 21, 1905 — April 27, 1948

Edwin Woodworth Hamlin was born in New York City on July 21, 1905, the son of George E. and Elizabeth Woodworth Hamlin. He spent his childhood and was given his early schooling in Connecticut, where he later married Verna Doris Gunther on June 21, 1931. Because of his scholarly achievements as an undergraduate student at Union College, he was awarded the C. P. Steinmetz Honor in his junior and senior years. After receiving his B.S. in Electrical Engineering in 1926, he remained at Union College as Instructor in Electrical Engineering and within the next few years completed his graduate study. He received his M.S. in 1928 and his Ph.D. in 1932. After three more years on the staff of Union College, he continued his teaching career at the University of Kansas where he was appointed Assistant Professor in 1935 and Associate Professor in 1937. He went to the University of Texas as Professor of Electrical Engineering in 1939 and later became the first Director of the Electrical Engineering Research Laboratory. He accepted an appointment as Professor of Electrical Engineering at Cornell in the fall of 1947.

Dr. Hamlin's broad command of his chosen field was demonstrated by the variety of his activities beyond the immediate responsibilities of his teaching career. He took active part in the numerous honorary and professional societies of which he was a member. At the University of Kansas he was counselor of the Student Branch of the American Institute of Electrical Engineers, and a member of the Executive Board of the Kansas City Section in 1937 and 1938. At the University of Texas he assisted in the organization of an Engineering Faculty Seminar, was counselor for Eta Kappa Nu and Representative of the Institute of Radio Engineers. He, also, was a member of the National Committee on Communications of the American Institute of Electrical Engineers. During his tenure at Cornell, he served as Secretary of the Technical Program Committee for the Annual Meeting of the Institute of Radio Engineers in 1948 and was elected Secretary of the Electrical Engineering Section of the American Society for Engineering Education. The publication of several original papers resulted from Dr. Hamlin's wartime research on microwave radio propagation close to the earth's surface. A basic textbook on electrical engineering, of which he was co-author, will soon be published by the Ronald Press.

Dr. Hamlin's primary attention at Cornell was devoted to his advanced courses and to the Radio Astronomy Project which he directed. His competence, his sincerity and his willingness to expend himself as a teacher and as a colleague were reflected in his work and in his growing friendships at Cornell. The daily lives of all who came

in contact with him were enriched by his friendliness and his quizzical sense of humor. As his professional career reached its full maturity, he remained an eager student and a keen observer, a respected colleague and a modest man.

Professor Hamlin died at his home on April 27, 1948. His loss is felt not only at Cornell but wherever people knew him and worked with him.

C. R. Burrows, C. L. Seeger, Martha Stahr

William Alexander Hammond

Professor of Ancient Philosophy

— May 7, 1938

The Faculty records with sorrow the death, on May 7, 1938, of one of its most distinguished members—William Alexander Hammond.

After graduating from Harvard in 1885, teaching for three years at King's College in Canada, and studying at Leipsic where he received the doctor's degree in 1891, Professor Hammond came to Cornell as instructor in philosophy in 1891. In 1908 he was appointed to the Professorship of Ancient Philosophy which he held until his retirement. He was one of the editors of the *Philosophical Review*, from 1924. From 1920 to 1930 he served as Dean of the University Faculty. After retiring, he continued useful activity as Consultant in Philosophy at the Library of Congress.

Professor Hammond was an outstanding member of the remarkable group of men who guided the destinies of the University through a critical period of its history—a period in which it grew from a position of uncertainty and experiment to an established and honorable place among the universities of America. During his long term of active service he influenced the University for good in many ways, combining in high degree the three functions of the university professor—of scholarship, teaching, and administration. Since his retirement the memory of his example has continued to exert its influence and inspiration.

As a scholar he did valuable service in his translations of the *Characters* of Theophrastus and the *De Anima* of Aristotle, in his work as editor of the *Philosophical Review*, and, even after his retirement, in his *Bibliography of Aesthetics and the Philosophy of the Fine Arts*. As a teacher he inspired his advanced students in philosophy by his zeal for learning and pure scholarship, and his large classes of undergraduates in the Fine Arts by his enthusiasm and his humanity. Probably even more valuable was his contribution to the wise government of the University through his long service as Dean of the University Faculty and Chairman of the Committee on Student Affairs. Here his tact, his refined and lofty ethical outlook, his worldly wisdom and shrewdness, and his knowledge of men and women, both young and old, fulfilled their highest functions. He saved many a critical situation in council and government by his good humor and his gentle methods of conciliation and intermediation. At the same time he was always sturdy and outspoken in the defense of principles which he thought popular sentiment or false expediency threatened with defeat.

For his high standards of scholarship, his refinement of taste and conduct, his kindly sympathy, his breadth of mind and magnanimity, his memory will be long honored by all friends of the University.

Retired: June, 1930 Fac. Rec. p. 1635

David Birney Hand

November 24, 1905 — January 22, 1998

Dr. David B. Hand, Emeritus Professor of Biochemistry and former chairman of the Department of Food Science and Technology at the New York State Agricultural Experiment Station in Geneva, died in Annapolis, Maryland on January 22, 1998, at the age of 92 years.

Professor Hand was born in Berkeley, California on November 24, 1905. His career in science developed from an early interest in nature and experimentation. He received the B.A. degree majoring in Chemistry from Pomona College in 1926, and the Ph.D. degree from Cornell University in 1930. While obtaining the Doctorate, he held a position as Instructor of Biochemistry and assisted Professor Sumner in his Nobel Prize winning work on urease. From 1930-32, he did postdoctoral work in enzyme chemistry at the Kaiser-Wilhelm Institute, Heidelberg, as a National Research Council Fellow. Upon his return to the United States in 1932, he rejoined Cornell as an Instructor of Biochemistry, becoming Assistant Professor in 1936 and Associate Professor in 1940.

As a teacher in the classroom and laboratory, Dr. Hand was known for his clear and well-prepared lectures. His command of the field of Biochemistry stimulated and inspired his students. During this time, he became increasingly interested in the application of chemistry to the study and improvement of foods, particularly dairy products. In 1942, he became Technical Director for Sheffield Farms, Inc., a position he held for five years. He was elected to the Board of Directors of Sealtest, Inc.

His appointment as Professor of Biochemistry and head of the Department of Food Science and Technology, Geneva, came in 1947. He continued as department head until December 31, 1966 and retired in December 1967 after 39 years association with Cornell. During his 20 years as head of the Department of Food Science and Technology, he helped guide that department to a position of strength and depth in food research. Highlighting his tenure as department chairman, was the construction of the Food Research Laboratory in 1960 housing laboratories, offices and support services for twenty faculty. It was equipped with the most advanced scientific instrumentation and featured an outstanding fruit and vegetable processing pilot plant.

Dr. Hand had an abiding interest in the use of food technology to improve nutrition in America and in developing countries. He served as a member of the Food and Nutrition Board of the National Research Council, a member of the Advisory Committee on Research of the Food and Drug Administration, and a member of the Council

on Foods and Nutrition of the American Medical Association. He was a consultant to the Interdepartmental Committee on Nutrition for National Development of the U.S. Public Health Service and engaged in nutrition surveys in Iran, Pakistan, and Lebanon. He was a member of the Technical Advisory Committee of the Institute for Nutrition for Central America and Panama and the Pan American Health Organization. In 1953, he spent six months in Taiwan as a food-processing specialist for the U.S. Agency for International Development. He designed the food technology program for the Cornell University of the Philippines collaborative program in Los Banos in the 1960s.

Much of his extracurricular activity, all of his sabbatic leaves, and a large share of his working time and talents were devoted to establishing the importance of food technology to human nutrition and to the economic progress of non-industrial nations. His keen, penetrating mind, coupled with a warm and generous personality, made him a successful ambassador in carrying this idea from the American food technologists to those in other lands. At the same time, he impressed American nutritionists, biochemists, and government officials with the role that food technology can play in the progress of developing nations at a time when international outreach activities were not assigned the high priority they enjoy today.

Dr. Hand strongly believed in the importance of international exchange of knowledge and backed that belief by inviting visiting professors, postdoctoral fellows, and graduate students from other lands to serve temporary appointments on the staff at Geneva. At the same time, he encouraged his own faculty to participate in international professional activities. This philosophy is still evident in the Geneva Food Science and Technology Department where there is always a large number of visiting scientists and graduate students from other lands. His effectiveness in generating international interests among his faculty is attested to by the fact that four faculty (Hand, Kertesz, Steinkraus and Bourne) have received the prestigious Institute of Food Technologists International Award. No other institution can match this number of awardees.

Dr. Hand's research was directed toward the processing and nutritive value of plant proteins including soybean protein, measurement of food quality, and use of food additives. He had more than 80 publications. His research combined both basic and applied aspects of food science and technology and made him well known and respected by both the scientific and industrial communities. His work was acknowledged by two prestigious awards from the Institute of Food Technologists. In 1970, he received the International Award for international exchange and ideas in food technology, and in 1977, he received the Babcock-Hart Award for significant contributions to food technology resulting in improved public health through some aspect of nutrition.

He foresaw the importance of soybeans as an economic resource of high grade protein and that the objectionable flavor of foods such as soymilk was a major barrier to its widespread acceptance. His keen interest in this work was spurred by his first-hand knowledge of the world protein deficit and his conviction that food technology research must play a major role in the battle for Freedom from Hunger. Under his leadership, a group of scientists in his department studied this problem and discovered that the terrible flavor was caused by the enzyme lipoxygenase. They worked out a commercial process to manufacture soy-based food free from this bad flavor. This process and spin-offs from it are now used worldwide. As a result, the consumption of soy-based foods has sky rocketed.

As a scientist and humanitarian, he firmly believed that education and rational thinking could resolve most of the world's problems. In a radio talk in November 1966, he said:

“Through education, man learns to seek out the evidence, sift facts from fantasies, and weigh the alternatives. Rational thinking is a vital necessity in times of crises. Never before in history has there been a greater need for the application of reason. Rational thinking leads to self-confidence and peace of mind. The educated man is not disturbed by controversies nor is he upset by imaginary dangers. Mankind can build a better world if he can develop the power of reason through education.”

Professor Hand was a member of a number of societies including the American Chemical Society, Institute of Food Technologists, which made him a Fellow in 1970, Society of Biological Chemists, and American Institute of Nutrition. He was elected a member of two honorary scientific societies, Phi Kappa Phi and Sigma Xi.

Dave Hand was a strong department head. He not only guided the individual faculty members, but he was able to fight for the rights of the department in his contacts with the Dean, the Director, and other members of the Cornell Administration. He and his wife, Eleanor, had frequent social evenings in their home that developed a friendliness and camaraderie among the faculty and led to a high degree of “team” research which contributed to a high degree of productivity in the department.

David Hand married Eleanor Foote in 1929. They had two children; Clifford Hand of Tuscaloosa, Alabama and Sylvia Pott of South Orleans, Massachusetts; and six grandchildren. Eleanor died in 1996, ending a marriage that lasted 67 years.

An active sportsman, Dave Hand excelled at tennis as a young man winning many trophies. As he grew older, he devoted his athletic skills to sailing and golfing. After his retirement, he and Eleanor moved to Annapolis, Maryland and purchased a 30-foot sailboat, which they used frequently.

Professor Hand was a consummate gentleman whose high expectations for himself extended to others as reflected in his tactful but firm leadership of the Food Science and Technology Department. For those of us who worked with him, he was a mentor and a friend. The Food Science and Technology Department at the New York State Agricultural Experiment Station is a lasting tribute to his vision and leadership.

Donald Barton, John Stamer, Malcolm Bourne

Elton K. Hanks

March 2, 1904 — January 4, 1973

A native of Allegany County, New York, Professor Elton K. Hanks attended public schools in the community of Portville and was graduated from Cornell University in 1926. After a few years of association with the Sand Hill Farm Business he commenced his career as an educator and administrator in the position of assistant county agricultural agent in Delaware County, New York, in 1931. His field work for the Cooperative Extension Service continued until 1944, during which time he served as county agricultural agent in Delaware, Seneca, and Rensselaer Counties.

Professor Hanks came to the State College of Agriculture at Cornell University in 1944 to assist with the supervision of the Emergency Farm Labor Program, and in 1946 he was made supervisor of the program. His knowledge of rural people, the agricultural industry, the food needs of a nation at war, and his organizational ability were the basis for his distinctive service during this critical period.

He was appointed an administrative specialist on the extension director's staff in 1948. One of his responsibilities was the coordination of the work of extension faculty in the subject matter departments of the College. He pioneered in establishing the first course to be offered for extension faculty in the Cornell Regional Extension Service Summer School. Practical experience gained through his earlier field work and his comprehensive knowledge of the extension function of the College were effectively utilized while teaching the course. In 1951 Professor Hanks was appointed chairman of the State Interdepartmental Committee on Farm and Food Processing Labor, by Governor Thomas E. Dewey, an appointment he held until 1955. Also during this period he edited and published *Current Episodes*, the monthly Extension Service house organ. Another of his roles was state distribution officer for U.S.D.A. publications, which are widely used by college faculty and extension field staff. He also served as general chairman of the College's Farm and Home Week for many years.

Professor Hanks understood and loved rural people and had a keen insight into the nature of their aspirations, needs, and problems. He possessed that rare talent of being able to instill confidence and motivations in those with whom he worked and served. A skillful teacher of agricultural technology and business management, he was never satisfied until his teachings had been put into practice by those whom he taught. He was a man of action and high energy output and expected no less from his associates and the recipients of his teaching and counsel. His strong leadership was tempered by kindness toward people. He became known as a master organizational

strategist during these years of living and working with the people served by the extension function of the College of Agriculture. He exercised great skill in helping people to organize and to use their organizations effectively for solving problems and satisfying their needs.

Professor Hanks retired in 1961 and until his death spent his winters in his Sarasota, Florida, home. During the summer he lived in the small community of South Schodack, New York, among the rural people he loved so well.

He is survived by his wife, Beulah D. Hanks, of Sarasota, Florida; two sons, Kenneth Hanks of Gaithersburg, Maryland, and Dr. Richard L. Hanks of Anchorage, Alaska; a daughter, Mrs. George Mesick, Jr., of South Schodack; fourteen grandchildren; and a brother, Harold Hanks, of Blasdell, New York.

Robert J. Ames, Samuel T. Slack, John C. Swan

Lawrence W. Hanlon

November 15, 1914 — September 25, 1970

Doctor Lawrence W. Hanlon, associate dean of Cornell University Medical College, died at the New York Hospital after a prolonged struggle with cancer. For more than twenty years he was the academic administrator most directly involved in the careers of the students. He supervised admissions, directed internship applications, and helped students with their difficulties, both personal and financial. Beyond Cornell, Dr. Hanlon was known as an articulate spokesman on the subject of medical college admissions procedures and methods of evaluation.

Born in Ridgebury, Pennsylvania, in 1914, Dr. Hanlon was graduated from Cornell University with an A.B. degree in 1935 and an M.D. in 1938. He took his internship and residency training in medicine at the Rochester General Hospital, before serving as a U.S. Army medical officer in Africa and Italy. He was discharged in 1946 with the rank of lieutenant colonel. Dr. Hanlon then returned to Cornell Medical College to work as investigator in the basic sciences at the Second (Cornell) Medical Division at Bellevue Hospital until 1949. In 1949 he was appointed assistant professor of Anatomy and was also named assistant dean of the Medical College. From 1953-55 he was acting chairman of the Department of Anatomy; in 1955, he became associate dean.

In this position, Dr. Hanlon was a member of the Medical College Executive Faculty. He was also chairman of the Admissions and Internship Committees as well as the faculty adviser of the Beta Chapter of Alpha Omega Alpha, the national medical honor society.

Among procedures developed by Dr. Hanlon to aid students were two sets of evaluations: one from Cornell graduates assessing the internship programs they have participated in at various hospitals, the other from hospital supervisors commenting on the preparation and performance of Cornell graduates as interns.

Dr. Hanlon had been active in the Association of American Medical Colleges. He served on the Association's Medical Education for National Defense Committee and was coordinator of that Committee's program at Cornell Medical College for several years. In 1959 he joined the AAMC Northeast Region Continuing Group on Student Affairs. He also belonged to the Harvey Society and the New York Academy of Sciences.

Lawrence W. Hanlon was by his own declaration one of the last general practitioners of medicine. But this definition of the man fails to recognize that Larry Hanlon was also one of the most widely read and scholarly members of our community. He was particularly well informed as a naturalist, geologist, and conservationist, and he was at

home in the world of arts and letters as he was in the field of gourmet cooking. As a medical educator he was better known and his advice more widely sought than most Cornellians ever appreciated.

The last years of Larry Hanlon's life were completely dedicated to Cornell and it was he who was most responsible for the extraordinary balance of academic and personal attributes reflected in the student body of the Medical College. Larry Hanlon was wholly committed to the egalitarian principle that there was room in medicine for people from all backgrounds and with widely varying special interests and capabilities. He was, on the other hand, an elitist in the best sense of that word. He was unswervingly committed to excellence and the notion that leadership belonged to those who excelled. He accepted the fact that the world needed those to follow as well as those to lead but he strongly believed that Cornell should be the kind of school that is known for the superior performance of all its graduates and should be given special recognition for those graduates who assumed leadership roles. None of this, however, portrays adequately the enormous warmth of this humble and understated personality. In the best tradition of a peace-loving humanitarian, Larry Hanlon defended his rigid standards with intellect, gentleness, and good humor. We will never be able to assess fully what Larry Hanlon has meant to Cornell but it is clear that he is amongst those who have had the greatest influence on this school during the past twenty-five years. It is for this reason that his memory will be honored everlastingly in this school.

He is survived by two sisters, Mrs. Inez Stirton of Wellsburg, New York, and Mrs. Kathryn Hall of Nichols, New York, and two brothers, Howard, of Odessa, New York, and George, of Fort Pierce, Florida.

J. Robert Buchanan, M.D.

George Raymond Hanselman

January 5, 1901 — January 1, 1993

George Raymond Hanselman was associated with Cornell for just over fifty years and lived in the Ithaca area for seventy-five years. He was born in Dunkirk in 1901 and graduated from high school in 1918. He moved to Ithaca for the rest of his life. He died in 1993 following a prolonged illness. He was survived by his wife of 69 years, Hazel M. Hanselman. There were no children.

From high school he entered the Sibley School of Mechanical Engineering and received the degree of mechanical engineer in 1922. During academic vacations, he gained practical experience at the American Locomotive Company, the Goodyear Tire and Rubber Company, and the American Creosoting Company. The first-named company gave him a total of 9 months in drafting, checking, assembly, etc., the second a training in the company's proceedings, and the third six weeks operation of retorts. Following graduation, although it is said that he declared that he did not intend to make teaching a life-time profession, he did accept an offer of a position as instructor in the Department of Engineering Drawing in the Sibley School. Here we recognize that seventy years ago, engineering drawing was a very important branch of mechanical engineering. This factor, together with his exposure to steam engines, automobile tires, and tar, may have led him to consider an academic career. This was fortunate for Sibley, as shown by his distinguished service in the years to come.

In 1931 George was made instructor of administrative engineering. Here he could start to build his lifetime career and prepare for it by studying business law, accounting, and factory cost control. He studied law assiduously in order to teach business law and with that as his minor subject and accounting as his major subject, he gained a master's degree in 1936. At the same time, he was promoted to assistant professor of administrative engineering. He wrote *Cases on Business Law* (1934 and 1935) and, with J.R. Bangs, *Principles of Accounting* and a problem book (1941).

As if to make up for the lengthy initial period of instructor of engineering drawing and because of his resolute studying for teaching business law and engineering accounting, he was promoted to associate professor in 1941 and to professor of administrative engineering in 1945.

At war's end in 1945, there was a time of confusion engendered by the rapid demobilization of the armed forces and the re-establishment of the system of past years. He was made the first assistant director of Sibley. He had shown the capability for administration in the sorting out of the post-war growth of admissions, of veteran's problems,

of counseling of individual students, of record keeping, of pre-registration, etc. Typically, he would seldom make a quick decision of any magnitude but would take his time to work all around a problem before establishing a satisfactory solution—he had seen too many ill-considered effects on others. Not long after being made assistant director of Sibley, he braved this opening answer to the office of the dean of the College of Engineering: “You have repeatedly asked me for specific recommendations as to the re-organization of the office of the School of Mechanical Engineering. I have given this matter a great deal of consideration and am now ready to report”. There followed two pages of tightly-spaced administrative recommendations. His appointment was changed to professor of mechanical engineering in 1949.

A new five-year undergraduate program was introduced in 1946 with quite a different curriculum and this raised some scheduling difficulties because of its concurrence with students returning to complete their baccalaureate. There were choices and restrictions, a four-year curriculum and a five-year curriculum, and several points-of-entry. As the *College Announcements* of those times quoted optimistically, “such minor modifications have become necessary”. George was invaluable in the difficult task of reorganizing the administration of mechanical engineering to accommodate these problems.

George had about a score of years from his assistant directorship in 1946 to his nominal retirement in 1967, nominal because the dean requested that he remain for some part-time work, which he did for another three years. In that twenty years, he was able to develop and refine his ideas, his own as well as those which were thrust upon him. Engineering education changed from being mostly one of tutelage and representation to one of systematic analysis and exploration. The teaching of accounting grew less important as the years passed by. The subject matter had simply worn down and what remained was absorbed by others for their own special uses. Professor Hanselman, however, was in considerable demand across the campus for his knowledge and experience in scheduling and for his willingness to share them. For many years he coordinated the scheduling requirements of the College as chairman of the Engineering Scheduling Committee and also served as chairman of the University Faculty Committee on Registration and Schedules. Other University committees on which he served were those of the Faculty on Student Activities and on the Scheduling of Public Events. He also served as chairman of the College Faculty Committee on New York State Community Colleges and Technical Institutes, and was a member of the Joint Faculty Committee on Agricultural Engineering. In the early 1960s several changes within the College of Engineering were made that increased greatly the value to the Sibley School of George’s detailed knowledge of the operation of the various units within the University. In 1961, a Division of Basic Studies was set up within the College of Engineering.

This division effectively removed the first two years from the control of the individual schools and departments. Then in 1962 the Department of Industrial and Engineering Administration within the Sibley School of Mechanical Engineering became the Independent Department of Industrial Engineering and Administration in the College. Finally, in 1965 the five-year bachelor's degree program was eliminated and all programs had to be restructured to fit into four years.

Professor Hanselman was a member of the Atmos Society, Kappa Tau Chi, Pi Kappa Phi, the Cornell Society of Engineers, the American Accounting Association, the National Association of Cost Accountants, and the American Society for Engineering Education.

Yes, George Hanselman did indulge in some recreation but one finds that much of it was given to its literal meaning, re-creation as help for others. He was a Rotary Club member and held the position of the director in charge of work for crippled children and was active in making arrangements to bring Cornell dramatic productions to the infantile paralysis center. He served from 1955 to 1979 with the Cayuga Heights Volunteer Fire Department and the Fire Police, with many valuable volunteer actions for which he was recognized. For outside hobbies, he played golf regularly and grew fine flowers, but perhaps he would say his favorite pastime was attracting the birds and the small animals to his garden. Where many gardeners try to discourage the squirrels from eating the bird seed, George tried to get them eating from his hand and he made friends with a pair of raccoons.

He was always to be seen at the annual alumni reunions up to the time his health would no longer allow him. He knew many alumni and they knew him and appreciated his help in their student days.

Professor Emeritus George was the right man at the right time: self-assured but not self-opinionated; self-relied but not self-serving. Well did he serve his School. Well did he serve his College. Well did he serve his University.

Bart Conta, Richard M. Phelan, Dennis G. Shepherd

Kurt Loewus Hanslowe

October 15, 1926 — July 7, 1983

Kurt L. Hanslowe was born on October 15, 1926, in Vienna, Austria. He died of cancer on July 7, 1983, at his home. He is survived by his wife, Nannette Reese Hanslowe, and three children, David, Nicholas, and Theodora.

At age thirteen, on the eve of World War II, Kurt left Vienna and came to live in the United States in Greenfield, Massachusetts. He became a United States citizen in 1948. He was a graduate of Mt. Hermon School in Massachusetts; of Yale University (Calhoun College), with the degree of Bachelor of Arts, in 1947; and of Harvard University, with the degree of Doctor of Jurisprudence, in 1951. From 1951 until 1958 Kurt served as assistant general counsel of the International Union of United Automobile Workers in Detroit. During this latter period he also completed courses at Wayne State University Graduate School. He came to Cornell in 1958 and for the next twenty-five years served as a member of the faculties of the New York State School of Industrial and Labor Relations and the Cornell Law School.

During his distinguished academic career Professor Hanslowe served as a visiting professor at the Salzburg Seminar in American Studies, at the University of Texas, the University of Utah, the University of Vienna, and the University of Michigan. He was also a consultant to several agencies of the State of New York, including the Department of Labor, the Law Revision Commission, and the Public Employment Relations Board.

In addition to his academic commitments as teacher and scholar, Kurt Hanslowe was a highly respected and successful labor mediator and arbitrator. The impressive list of labor arbitration panels of which he was a member included the American Arbitration Association; the Federal Mediation and Conciliation Service; the New York State Public Employment Relations Board; and several New York State panels, including the Civil Service Employees Association, the American Federation of State, County, and Municipal Employees, and the United University Professions.

Professor Hanslowe was an outstanding classroom teacher and a productive legal scholar. The subjects he taught included administrative law; equity; criminal justice; law and psychiatry; science, technology, and law; jurisprudence; and his first love—labor law. His courses were popular and widely elected by the students, and he

generously shared with them his own exceptional professional knowledge and skill, as well as his rich practical insights and experience. Professor Hanslowe brought to teaching a deep and caring concern for his students. The generations of students, drawn from both the School of Industrial and Labor Relations and the Law School, who studied under him will long remember him with admiration and affection.

Professor Hanslowe's published writings were characterized by thorough research, careful documentation, and a lucid and graceful style of presentation. *Cases and Materials on Labor Law: Collective Bargaining in a Free Society* (2nd ed. 1979) with 1982 Case Supplement, which he co-authored with Walter Oberer and Jerry Andersen, is one of the country's leading casebooks in its field. His books, monographs, articles, and book reviews, totaling some fifty in number, constitute an impressive treatment of important issues and developments in industrial and labor relations and represent a significant contribution to the literature in this field.

Kurt Hanslowe's success as a labor arbitrator rested in large part on the fact that both parties to a dispute—employers and employees alike— recognized that he was an eminently fair and open-minded individual. Management and labor equally trusted Kurt to consider and weigh carefully their respective claims and positions and then to render a balanced and reasonable decision in the matter. As a result of his broad academic as well as practical involvement in the field of industrial and labor relations, Kurt had an unusual capacity to penetrate to the heart of a case. His opinions and awards were models of clarity and objectivity.

Finally, any recounting of Kurt Hanslowe's life would be incomplete if it failed to recognize the breadth of his interests and the outstanding personal and human qualities that he possessed. His colleagues generally regarded him as one of the best-read members of the law faculty. His love of music, particularly opera, deserves special mention. He had an excellent bass voice and loved to sing. He shared his interest in music with his wife, Nan, herself an accomplished musician.

Personal integrity ranked high among Kurt's human qualities and characterized everything he did. He was warm and compassionate in his relations with others. He was always willing to take time out of his own busy schedule to help a colleague or friend or to support a worthwhile cause. He had a wonderful sense of humor. As Dean Peter Martin recalled at the Sage Chapel service in Kurt's memory: "Kurt's seriousness and caring and good judgment were all enhanced by his great good humor. He used it not against individuals but against such proper enemies as pomposity, pettiness, bureaucracy, narrow vision. And he turned it liberally on himself, as illustrated by the following memorandum that he sent to an earlier dean of the law school:

“I am advised [it reads] that the fire marshall has determined that the occupant of my office (me) is remiss in his housekeeping practices and that a report [must] be made of action taken to correct [the] situation. I am here-with taking such action by requesting a housekeeper, and you are hereby requested to treat this memorandum as my petition for such assistance.”

On October 15, 1983, Kurt’s birthday, his family and friends gathered in the courtyard of Myron Taylor Hall, where a silver linden tree was planted in his memory. Dean of students John Lee Smith spoke not only for those present but for all who had known Kurt, when he said: “It is singularly appropriate then that we honor him today. . . for his courage in the face of suffering, for his dedication and devotion to excellence, for his deep sense of duty, for his profound moral integrity, and for his love of all living things. . . by dedicating this tree as a living memorial to his life. His life surely will transcend his lifetime, and this tree will be for us and those who follow a constant reminder of who he was, and is, and ever will be. We shall never pass this way without being reminded of him and that special grace he bestowed upon all those whose lives he touched.”

Kurt Hanslowe was indeed a man for all seasons.

James A. Gross, Robert S. Summers, W. David Curtiss

C. Arnold Hanson

April 24, 1913 — June 29, 1983

When C. Arnold Hanson left Cornell in 1961 to become president of Gettysburg College, a tribute from his colleagues described him as having “played a conspicuous role in the New York State School of Industrial and Labor Relations.” In retrospect that description was, and remains, true on a number of levels.

The son of working-class Swedish immigrants, Hanson took nine years to earn his B.A. degree from the University of Akron while working full time as production worker, then as supervisor, for B.F. Goodrich and Company. He taught for three years at Akron while pursuing graduate work at the University of Chicago. For the next three years he served as executive officer of a minesweeper in the Pacific.

Having enrolled in 1945 as the first graduate student in Cornell’s newly established field of industrial and labor relations (ILR), Hanson was awarded its first Ph.D. degree in 1948. He was among the first scholars to examine labor arbitration awards as a means of understanding labor relations problems. To early generations of ILR graduate students, many of whom went on to teaching posts around the world, he was a model of academic achievement. He demonstrated the respect for higher learning and for the institutions that support it that is often found in those who had to struggle for their right to be participants.

Upon receiving his doctorate Hanson was appointed to the school’s expanding faculty. In 1949 he became director of the ILR school’s Office of Resident Instruction, graduate field representative, and professor—posts he retained until his departure in 1961. In meeting the demands of this formidable array of positions, Arnold Hanson helped shape the decisions that determined the nature and composition of the school’s undergraduate and graduate student bodies and curricula. His success as an academic policy maker and administrator was the result of an enormous outlay of hard work and the respect of his colleagues. Their acceptance, in turn, was earned by consistent demonstrations of wisdom, courtesy, and personal integrity.

In 1957 Hanson was appointed dean of the University Faculty in the context of high tension between president and faculty regarding their respective orbits of authority. He proved a true and effective representative of faculty interests, a well-organized administrator of the dean’s office, and a creative force contributing to campus comity. His departure for Gettysburg was a loss to all elements at Cornell.

He served with distinction as Gettysburg's president until he retired in 1977. His life was a model of service to American academe, and Cornell is richer because so much of his service was performed here.

John McConnell, John P. Windmuller, Frank B. Miller

Joseph Mellor Hanson

December 10, 1900 — July 2, 1963

J. M. Hanson, painter and draftsman, was born on the family farm in the West Riding of Yorkshire, England. Art claimed him early; he began at fifteen. Evening drawing classes prepared him for the Halifax School of Art which he entered, as beneficiary of a McRae Scholarship, at nineteen and from which, a highly successful student, he graduated in 1924.

The years from 1925 to 1935 were spent in Paris, where he was first student and then assistant in the atelier of Othon Friesz. There were poverty and early frustration, but also there was personal development, and by 1928 he had progressed far enough to participate in the Salon des Indépendants and to present a one-man exhibition at the Galerie "Mots et Images." This was the beginning; he continued to paint and to exhibit throughout his life.

During these years in Paris Hanson was associated in one way or another with several of the more important men of the period, Andre L'Hôte, Fernand Léger, Jean Hélion, as well as Othon Friesz, and he formed friendships some of which lasted through the years. He was particularly closely associated with Amédée Ozenfant, acting from 1927 to 1935 as his assistant in the execution of murals and, as well, helping with the instruction of pupils in his private art academy.

In 1935 Hanson returned to England, and after a year in London he taught until 1938 in a small grammar school in Shropshire. In 1939 he settled in New York and from there, in 1945, came to Cornell. He was made Associate Professor in 1949 and was, at his death, Professor of Art in the College of Architecture.

Hanson painted from the beginning in a disciplined and highly controlled style the apparent simplicity of which is deceiving. His aims and his methods precluded a large output, but he worked unrelentingly and left behind him a body of distinguished works of art. Professor Paul Ziff has reviewed and appraised this work sympathetically and with great understanding in a monograph on the artist published by the Cornell University Press in 1962. Here one may find a record of exhibitions, which includes fourteen one-man shows and participation in many group exhibitions including, in the U.S.A., those of the Art Institute of Chicago, the Carnegie Institute, the Corcoran Gallery, and the Museum of Modern Art. The collection of the Museum of Modern Art includes a Hanson, and he is also represented in the permanent collections of the William Rockhill Nelson Galleries, the National Gallery of Wales, the Bankfield Museum, Halifax, England, and the Andrew Dickson White Museum of Art at Cornell.

Those at Cornell who knew and worked with Hanson must surely find it gratifying that the major portion of the White Museum's collection of his works came to it as bequest of the artist through the terms of his will.

Hanson's presence meant, in itself, a great deal to his colleagues and to his students. He had a gift for friendship and a gentle and considerate understanding of the problems of the student. He had a great fund of technical knowledge and the ability to impart it, but he had also read widely, traveled far, known many people, listened with a cultivated ear to a great deal of music; and he was a modest man with inflexible standards. His students, though few knew any details of his life, became somehow aware of his value; they loved him and they learned.

John A. Hartell, Thomas W. Mackesey, James O. Mahoney

Leigh H. Harden

June 22, 1907 — May 3, 1989

Leigh H. Harden served twenty-five years as admissions director for the New York State College of Agriculture and Life Sciences and Cornell University prior to his retirement in July 1970. In recognition of his outstanding contributions to the College's Office of Admissions, Professor Harden was awarded the title of professor in personnel administration emeritus. Harden was a key contributor in the development of a unique admissions process in which each entering student is matched to an individualized curriculum.

Other admissions areas which received significant help from Harden included improved procedures for pre-registration in courses; development of detailed profiles and statistical reports about entering students; preparation and teaching of students in an orientation course; and, of utmost importance, patient and objective private counseling of hundreds of perspective students and their parents, many of whom subsequently expressed personal gratitude for this help.

Harden was born in Lane, South Dakota, farm-reared and rurally educated. The Harden family traveled widely and Leigh was attracted to the strong agricultural program at the University of Minnesota. He entered the baccalaureate program and received his B.S. degree with distinction in 1932. After a stint as a high school teacher of vocational agriculture and after marriage to Melba Webster, Leigh returned to the University of Minnesota as a graduate student and later as an assistant to the dean of the College of Agriculture, Forestry, and Home Economics. He obtained his master's degree in 1938 and continued work in the Ph.D. program, completing all course work and passing qualifying and language examinations. Harden's interests in college and university administration were broad as evidenced by his appointment in 1944 as Director of the Bureau of Veterans Affairs for the entire University of Minnesota. In this role, he worked on a project of educational adjustment for servicemen returning home during the latter stages of World War II.

An opportunity to join the administrative faculty in the College of Agriculture at Cornell University materialized in 1945. At the urging of a Minnesota colleague who had attended Cornell, Harden accepted an invitation to become Director of Admissions and quickly initiated several innovative programs in the admissions area. His initial appointment was that of assistant professor in personnel administration. Leigh was promoted to the rank of associate professor in 1949 and to full professor in 1955.

Harden authored several articles dealing with problems in agricultural education, guidance, and student counseling at the college level. He was a member of the New York State Personnel and Guidance Association, the State Association of College Deans and Personnel, the American College Personnel Association, the State University of New York Admission Officers Association, Alpha Gamma Rho, Alpha Zeta, Phi Delta Kappa, and Gamma Sigma Delta.

In all his professional activities, Leigh Harden was known as a fair, yet exacting, administrator. His complete integrity in dealing with the diverse demands of college admissions was never in question. His fellow faculty members, the athletic administrators and coaches, and the university's administrative staff held Leigh in high esteem. Certainly his 25 years of service bore strong testimony to his important role as a molder of the entering classes and, ultimately, of the outstanding alumni of Cornell's College of Agriculture and Life Science.

In his retirement, Harden found comfort and pleasure in his family, his gardening, and his church. In his garden, gladiolus was his particular favorite. He was a member of the Enfield Valley Grange, a former 4-H Club leader, a participant in the Tompkins County Senior Citizens Council, and a member of the American Association of Retired Persons. Especially close to his heart was his longtime membership and Trustee activities in the Bethel Grove Bible Church.

Leigh is survived by his wife Melba Webster Harden, of Ithaca; one son, Gary; one daughter, Beth; seven grandchildren; two nephews, several nieces; grandnieces, grandnephews; and cousins.

Russell Martin, S. Reuben Shapley, Herbert L. Everett

Earle Volcart Hardenburg

November 30, 1889 — December 4, 1950

Earle Volcart Hardenburg, Professor of Vegetable Crops at Cornell University, died at his home in Ithaca on December 4, 1950. Though he had suffered a severe illness in 1946, his passing was unexpected. After dinner with his family, he was at his desk with work before him when the end came, which, we may believe, was as he would have wished it. He is survived by his wife, the former Aline Crandall of Brocton, and by five children and four grand-children.

Professor Hardenburg was born November 30, 1889 and grew up on the farm of his parents F. Denton and Elizabeth Burroughs Hardenburg at Brocton, New York. A devoted Cornellian for over forty years, he graduated from the College of Agriculture in 1912, received the Masters degree in 1915 and the Doctorate in 1919. Upon graduation he became instructor in Farm Crops with special interest in potatoes and dry beans, which engaged his major attention throughout his career. He was appointed assistant professor in 1919. In 1921 he was transferred to the Department of Vegetable Crops where he was advanced to professor in 1926.

Quiet and unassuming in manner and never assertive of self, Professor Hardenburg diligently mastered the knowledge of his chosen field. By reading and experimentation, by visits with farmers and by work with his own hands, he combined in unusual degree the qualifications for research and for teaching both in class room and in extension service. His broad knowledge and tempered judgment won wide respect and he was called upon frequently to speak at meetings and to judge exhibits in many states and in Canada. His thinking was orderly and his writing was clear and helpful as evidenced in his own books "Potato Production" and "Bean Culture" as well as in "Land for the Family" of which he was a joint author and in his many bulletins, scientific papers and popular articles.

Always ready to serve his colleagues and the farmers of the state, he was one of the founders and first secretary of the Empire State Potato Club. He served as treasurer and president of the American Potato Association. Only a few days before his death he was elected an honorary life member of this society. He was affiliated with Alpha Zeta and Sigma Xi fraternities and the American Society for Horticultural Science and was a fellow of the American Association for the Advancement of Science.

But it was in personal relations that "Hardy" will be best remembered. On an occasion when he received special recognition from the Empire State Potato Club, one of our leading growers said of him "There is hardly a farmer

in the state who has not benefitted from Dr. Hardenburg's efforts or who cannot count him as a friend." Setting for himself the highest of standards, he was always ready to be helpful to students and to colleagues, to farmers and to his community. He gave himself unstintingly to his church and had served almost constantly on its boards. He was long an officer of the Wesley Foundation, serving students on the Campus. He was active in Masonry and had served as district chairman for the Boy Scouts of America.

Those who knew Professor Hardenburg will not soon forget his sterling integrity, his utter sincerity, his gentle kindness. He has left us a priceless heritage to be cherished and to be passed on to those who follow.

A. J. Heinicke, R. G. Wiggans, Paul Work

James Davis Harlan

December 23, 1885 — November 18, 1961

James Davis Harlan, Professor Emeritus of Pomology at the New York State Agricultural Experiment Station at Geneva, died November 18, 1961, as the result of injuries received in an automobile accident on November 9. Professor Harlan would have been seventy-six years of age on December 23, 1961.

Born in Mt. Holly, Pennsylvania, Professor Harlan received the Bachelor of Science degree in agronomy from Pennsylvania State College in 1912. He also engaged in graduate study in plant breeding and plant physiology at Cornell University in 1921-1922.

Professor Harlan began his professional career as an assistant in research at Pennsylvania State College where he served from 1912 to 1914. From 1914 to 1915 he engaged in agricultural research for the American Vanadium Company and, in 1916, for the Frick Coke Company, both of Pittsburgh, Pennsylvania. In 1917 he joined the faculty of the Long Island School of Agriculture at Farmingdale and in 1918 was appointed assistant agronomist at the New York State Agricultural Experiment Station at Geneva. With the transfer of agronomic work from Geneva to Ithaca in 1928, Professor Harlan was made assistant pomologist and later advanced to Associate Professor of Pomology, a position he held at the time of retirement on March 31, 1954. The Board of Trustees of Cornell University elected him Professor Emeritus of Pomology effective April 1, 1954.

During the earlier years of his association with the Experiment Station, Professor Harlan engaged primarily in investigations relating to orchard soil fertility and was the author or joint author of several Station publications in this field. He also conducted studies and published at least one Station bulletin on the production of high-nicotine tobacco in New York State at a time when fruit growers were seeking more economical sources of insecticides.

With a revival of interest in hop growing in certain areas of the state, Professor Harlan, in 1934, was assigned to a special project on hop production. His studies of cultural practices, varietal performance, and, in cooperation with other members of the Station staff, the development of control measures for insect pests and diseases of hops, were productive of numerous technical and popular articles. Economic readjustments and basic changes in the brewing industry resulted in the termination of the hop investigations in 1950.

In 1919 Professor Harlan married Anna F. Charles of DuBois, Pennsylvania, who survives him, together with a brother.

During his term of employment at the Experiment Station, Professor Harlan was active in the Geneva chapter of the New York State Civil Service Employees Association. He also took an active interest and held office in the Geneva Camera Club and the Kanadasaga Kennel Club, continuing his association with these activities after retirement. For a while he was employed in the local Camera Shop. More recently he served as soil chemist for the Jackson and Perkins Company of Newark, New York, and it was when he was enroute to his laboratory on a stormy day that the accident occurred, which resulted in his death.

A quiet, reserved person with a friendly interest in all with whom he came in contact, Professor Harlan was held in high regard by growers and his colleagues alike.

P. J. Chapman, Richard Wellington, J. D. Lockett

Samuel Willard Harman

February 24, 1894 — March 17, 1948

S. Willard Harman, Associate Professor of Entomology in Cornell University, died peacefully in his sleep at his home at Kashong-on-Seneca Lake early in the morning of March 17, 1948. His decease was most unexpected, for the day before he died he showed no indication of illness either in his home or at the New York State Agricultural Experiment Station, the place where he worked. His untimely death was a great shock and loss to his wife, Mary Covert Harman, his son, 11 years in age, Wilson Nelson Harman, his parents and two brothers, his many friends, associates and numerous fruit growers.

Bill Harman, as he was known by all of his friends and associates, was born in Geneva, February 24, 1894. He graduated from the Geneva High School in 1913 and from the Michigan State College in 1917. From 1917 to 1919 he served in the United States Navy and rose to the rank of Ensign. After he was discharged from the Navy he became manager of the Southern Branch of C. S. Powell Lumber Company, Portsmouth, Va., and later he worked for the Davey Tree Expert Company, Kent, Ohio, and the Department of Parks, Brooklyn, New York.

In 1922 he was appointed as Assistant in Research at the New York State Agricultural Experiment Station. Three years later he obtained his M. S. degree at Cornell University. In 1929, he was promoted to the position of Associate in Research, in 1942 to an Assistant Professor of Entomology and in 1945 to an Associate Professor of Entomology, the position he held until his death. Nearly one-half of his life and the greater part of his productive years were thus devoted to the control of insect pests in the orchards of New York State.

Professor Harman possessed many attributes which contributed to his success. He was approachable no matter how busy he might be, cooperative and thoroughly unselfish. He never considered any personal inconvenience and enjoyed being of service to others. He appreciated the difficulties of the fruit grower and gave him the greatest possible aid. The many fruit growers who became acquainted with him followed his recommendations and advice closely for they knew he understood their problems and would not hesitate to tell them whether he could or could not aid them. Director A. J. Heinicke aptly said, "He was not easily discouraged in research by insurmountable obstacles. He was always conservative in his conclusions to the end that his opinions were valued as practical by the fruit grower."

Professor Harman was in constant demand as a speaker at gatherings of fruit growers and was a regular speaker on the programs of the New York State Horticultural Society of which he was an honorary member. He was the

author of more than 75 scientific papers relating to his work at the Experiment Station. He was a member of Alpha Zeta, Gamma Alpha, and Sigma Xi honorary societies, the American Association of Economic Entomologists, the Lambda Chi Alpha fraternity, the Geneva Lodge of F. & A. M., and the Winnek Post of the American Legion.

Hugh Glasgow, C. B. Palm, Richard Wellington

Merritt Wesley Harper

October 24, 1877 — May 9, 1938

We record with deepest regret the death of Professor Merritt Wesley Harper on May 9, 1938. Born on a farm in Grove City, Ohio, October 24, 1877, his entire life was spent in close relation to agriculture. He received a genuine and thorough fundamental training in farm life and farm economics under his father, James Harper, while living at home. Owing to his father's close association for many years with agricultural banking in Ohio, and his own early training in it, few men had a better knowledge of farm economic conditions and the value of land than Professor Harper. He put this knowledge to good use as a farmer in Ohio all his adult life, even while teaching in our College of Agriculture. Until his death he was successfully operating a 700-acre wheat and corn farm in Ohio.

He studied at the Ohio State University, where he was graduated in 1901, received the M.S. degree at the University of Illinois in 1902, taught for three years at the University of Missouri, and then was called to Cornell University as an assistant in Animal Husbandry. He was appointed instructor in 1906 and served as assistant professor from 1907 until 1912, when he received his professorship. He was a quiet, hard-working, clear-thinking man. He was always ready to fight for anything that he thought was right and he never hesitated to do the right thing without thought as to how it might affect him or his position. His friends and colleagues were in the habit of visiting him in his office to get his advice and comment on their problems and he will be greatly missed among them.

Professor Harper will be remembered longest as a careful writer. This is evidenced by his five books, *Manual of Farm Animals*, 1911, revised in 1924; *Practical Horse Training*, 1911; *Animal Husbandry for Schools*, 1913, revised in 1924; *Management and Breeding of Horses*, 1913; *Breeding Animals*, 1914. Through his animal husbandry books in the secondary schools, his influence has been excellent on thousands of young students in the nation. In addition to these books he has to his credit several bulletins on the feeding, training, and judging of horses. His work in the University was in the horse division of the department of Animal Husbandry, and he did considerable teaching in advanced animal genetics.

Among his former students Professor Harper is well remembered for his painstaking work and leadership in the Round-Up Club. This club was one of his main interests for many years.

James A. Harrar

August 5, 1877 — January 26, 1970

James Aitken Harrar was born in Williamsport, Pennsylvania, on August 5, 1877. He received his A.B. and M.D. degrees from the University of Pennsylvania in 1899 and 1901, respectively. He spent two and one-half years as a house surgeon at the Episcopal Hospital in Philadelphia and became resident surgeon in the Private Patients' Pavilion of the New York Hospital on April 1, 1904. In December of that same year he was appointed attending surgeon to the Outdoor Department of the Lying-in Hospital. He remained associated with this hospital until his retirement in 1950. The Lying-in Hospital, although it proudly claims to have been founded in 1799, led a very sketchy and sometime existence until 1890, when Dr. James W. Markoe and Dr. Samuel W. Lambert established the Midwifery Dispensary at 312 Broome Street. The Lying-in, which at that time was merely a board of governors, associated itself with the dispensary and became a stable and going institution. Dr. Harrar joined the staff two years after the building (still standing at Second Avenue and 17th Street) was opened.

Dr. Harrar married Florence Humiston of Cleveland, Ohio on October 30, 1909. Two children, a son and a daughter, survive.

Dr. Harrar was for many years in charge of the Outdoor Delivery Service at the Lying-in and spent many hours teaching and instructing the medical students and young attendings. He was an expert with the Kielland forceps, did pioneering work in the use of "twilight sleep," and was unusually clever in doing version and extraction, the latter a very necessary procedure in the first quarter of this century. He was a very gentle, somewhat bashful man (who hated controversy and unpleasantness) but was possessed of an acerbic tongue. He contributed frequently to the Bulletin of the Lying-in Hospital, published continuously from 1904 to 1932, and was the author of many papers in other journals.

He earned steady promotions on the attending staff and at the death of Asa B. Davis in 1930 was made chief surgeon of the Lying-in, the third and last man to have this title. When the hospital was merged with the New York Hospital-Cornell Medical College Center, Dr. Harrar became an attending in obstetrics and gynecology at the New York Hospital and clinical professor of obstetrics and gynecology at Cornell Medical College, posts he held with distinction until he retired. He was associated in the 1920s with Dr. Ralph Lobenstein at the York House Sanitarium, a private obstetrical pavilion, on 74th Street. In 1938 he wrote a very interesting book entitled *The Story of the Lying-In Hospital of the City of New York*.

Dr. Harrar spent the last twenty years of his life in Brookfield, Connecticut; Delhi, Ontario, Canada; and Williamsport, Pennsylvania, his birthplace, where he died January 26, 1970, at the age of 92.

He was a member of the New York Obstetrical Society, the Hospital Graduates Club, the Lying-in Alumni, the American College of Surgeons, and the American College of Obstetricians and Gynecologists.

Charles M. McLane, M.D.

Clifford R. Harrington

May 16, 1915 — May 11, 1986

Clifford R. Harrington had a long and distinguished professional career in cooperative extension work. After graduating from Cornell in 1936, he served as an agent in several New York counties. In 1947 he joined the Cornell faculty as an assistant state leader of county agricultural agents and associate professor in extension. He was made a full professor in 1950 and associate state leader of county agricultural agents in 1954. Cliff became state leader of county agricultural agents in 1958 and was named associate director of cooperative extension in 1963. He retired in 1972 and was designated professor of extension administration emeritus by the Board of Trustees of Cornell University.

As a county extension agent, Cliff was outstanding in the programs he developed and conducted, in the training he provided to new staff, and in the way he developed leadership in individuals, communities, and organizations he worked with.

As an extension administrator, he provided inspiration, support, and leadership to agents and faculty members in their endeavors to strengthen their educational programs. Through the 1960s he devoted his skills to addressing some of the major social problems on the American scene, always striving to improve social and economic opportunities for people. He continued his efforts after retirement by serving many of the agencies and organizations of the area—FISH, Hospicare, Planned Parenthood, Friends of the Library, Ithaca City Club, and his church.

Public affairs education was strong among Cliff's interests. He took a leading role in developing the "operation advance" approach to public affairs education, which differed from other efforts of its kind. Educational materials were prepared to increase the confidence and competence of local leaders and citizens as they sought to alleviate the many public problems with which they were faced. To accomplish that goal, printed reference materials were provided to small discussion groups that were organized throughout the state.

Because of his objective and understanding nature, Cliff was sought out for advice and counsel by all kinds of people—young and old, male and female. He had the ability to propose various solutions to a problem and to ask the right questions at the right time, which assisted others in reaching an acceptable decision of their own. His position brought him in contact with people from many walks of life—farmers, homemakers, bankers, lawyers,

legislators. He was at ease with all of them and they with him. He was held in high regard by all with whom he came in contact. If one were to characterize his style, one would say, “low-key, easygoing, but most effective.”

Cliff’s views and philosophy of life were broad. While his professional interests were in agriculture, his activities and concerns expressed deep interest in other areas. He had a great love for reading—reading to broaden his perspective and outlook on life, reading to open up areas unknown to him, reading to learn the ways of other people. He was never content with the status quo. He liked to travel and see new places. Life offered many challenges to Cliff, and he made the most of each one.

He is survived by two daughters, two sons, seven grandchildren, a sister, and four brothers. His wife, Olga, died in 1968. His passing leaves a huge void in many of the agencies, the organizations, and the church that he so ably served, but the results of his efforts in cooperative extension and elsewhere will long be reflected in the many lives he so profoundly influenced during his distinguished career.

C. A. Bratton, R. D. Martin, W. E. Worth

Helen Harrington

February 25, 1891 — May 19, 1967

Professor of Clinical Pediatrics, Emeritus, of Cornell University Medical College, Attending Pediatrician of The New York Hospital, Pediatrician in Charge at the Hospital for Special Surgery, died on May 19, 1967, at the age of seventy-six. She was born in Denver, Colorado. Her father was Judge Harrington of Denver. In 1916, she received the M.A. degree from the University of Denver and the M.D. degree in 1920 from Johns Hopkins Medical School. After completing an internship at New Haven Hospital and a residency at Cincinnati General Hospital, she came to New York Nursery and Child's Hospital in 1924 as Assistant Pediatrician. Her dedicated and devoted service continued without interruption for forty-one years as a member of the Pediatric Department until 1965.

Before coming to Cornell, she served as an instructor in pediatrics at Cincinnati Medical School. From the time she was appointed in 1924 as instructor in pediatrics at Cornell University Medical College until she retired, she always participated enthusiastically and regularly in the outpatient teaching program. In 1944 she was promoted to Assistant Professor of Clinical Pediatrics, in 1956 to Associate Professor, and in 1959 to Emeritus Professor. Besides The New York Hospital, she was affiliated with Gaylord Farm Tuberculosis Sanatorium, Cincinnati General Hospital, Floating Hospital, Bellevue Hospital and Willard Parker. As Attending Pediatrician in charge at the Hospital for Special Surgery from 1952 to 1965, she provided pediatric supervision to thousands of children who were admitted for surgery.

Her compassion for children was also revealed by her long-term service for the New York State Charities Aid Association. She was a member of the Medical Society for the County of New York, the American Medical Association, and the New York Academy of Medicine.

Dr. Harrington was not only a competent clinician, she was quite active in medical investigation, together with Dr. Oscar M. Schloss and Dr. Nathan Chandler Foot. She published quite a few papers in infectious diseases, especially the epidemiology of encephalitis and poliomyelitis. In 1950, she presented a very helpful and interesting paper on the role of the pediatrician in adoption. Her interests also included malignant thymoma and standard metabolism of adolescence. Collaborating with Dr. Josephine B. Neal, she wrote the chapter on neurological complication following acute infections and vaccination in the book, *Encephalitis —A Clinical Study*, by Josephine B. Neal (1942).

In spite of poor health and discouraging circumstances, Dr. Harrington was always very independent and courageous. Her devotion to and sincere interest in her patients, as well as young physicians, was beyond mere professional duty.

Her students, colleagues, friends, and patients will always remember her as a kind and capable physician.

Wan Ngo Lim, M.D.

George William Harris

— *Oct. 11, 1917*

(Retired: June, 1915, Fac. Rec. p. 675)

The following resolutions, presented by the Secretary, were adopted by rising vote:

In the death of Librarian Emeritus George William Harris, a graduate of the class of 1873, connected with the University as student and library official for nearly half a century, Cornell loses one of its most useful, loyal and valued servants. The 42 years from 1873 to 1915, during which he was Library Assistant, Acting Librarian and Librarian, were years of service unbroken by ill health or leave of absence. A Nova Scotian by birth, on transferring his legal residence to this country he identified himself whole heartedly with its political, social and educational life.

His association with academic or vocational organizations included membership in the Phi Beta Kappa Society, the American Librarians' Association, and the Bibliographical Society of London. He edited the Ten Year Book of 1888 and the Library Bulletin. He saw the Library outgrow its little home in Morrill Hall and its more extended quarters in McGraw, and almost overflow its present spacious building erected in the early part of his administration. When he began his work the Library contained 34,000 volumes and had no endowment; at the time of his retirement it contained upwards of half a million volumes, including the priceless and almost incomparable, special collections on Dante, Petrarch and Icelandic, and was endowed with funds amounting to over \$800,000.

With this immense variety of material, his devotion to work and his unusual memory made him extraordinarily conversant. He was a master of all the details relating to the acquisition and administration of books, a conscientious steward of funds and a skilful buyer. Not only was he a scrupulous guardian of what was in the Library, but he was insistently careful as to what got into it. Many a faculty member will recall his censorship of lists of books submitted for purchase.

His way of living and thinking was Spartan-like, and his speech laconic,—brief, decided, but well considered. He spared no toil in the scrutiny of minutiae, even his handwriting and every document prepared by him exhibiting that regard for exactitude which made him an exemplar for us all. No one who knew him will forget that stoic figure, without overcoat, in the coldest days of a campus winter energetically crossing to the Library. He was a lover

of nature and of poetry. To him the Library owes the foundation for the purchase of the works of the Victorian poets, a collection which his constant care made noteworthy.

The University Faculty records its grateful appreciation of his services to the University and its deep sense of loss in the passing of a beloved colleague.

Gilbert Dennison Harris

October 2, 1864 — December 4, 1952

Gilbert Dennison Harris, Professor of Paleontology and Stratigraphic Geology, Emeritus, died Thursday December fourth, 1952, at 88 years of age, after an illness of almost a year. Previous to that time he remained active, and his scientific contributions continued through the many years following his retirement from teaching on his 70th birthday, October 2, 1934. He is survived by a daughter, Rebecca S. Harris. His wife, nee Clara Stoneman, who was a real helpmeet during her lifetime, and remained a cherished memory until his own demise, died in 1932.

Professor Harris was born near Jamestown, New York, where he attended several terms of high school. By further independent study he secured the Regent's credits necessary for entrance to Cornell University in 1883. He received the Bachelor of Philosophy degree in 1886 and stayed at Cornell through 1887 as a graduate student. Between 1887 and 1893 he was a member of the United States, Texas, and Arkansas geological surveys. Part of 1894 was spent in personal investigation of the Tertiary deposits of southern England and northern France. In 1894 he was appointed Assistant Professor of Paleontology and Stratigraphy in Cornell; in 1909 he was made professor with the same title. Between 1899 and 1909 he also held the post of State Geologist of Louisiana. His theory of the origin of the Louisiana salt domes, though superseded since, was long held the most satisfactory explanation of these occurrences.

This formal outline of the life and professional career of Professor Harris needs to be filled in by much else of a personal nature in order that a true and more adequate appreciation may be had of the man and his life work. Professor Harris was above all a completely dedicated devotee of science and by competence and application became a world authority on his paleontological specialty, Eocene mollusca, and of the Tertiary stratigraphy of the Mississippi embayment area. His status in these fields was recognized by election to Fellowship in the national geologic societies of France, Germany, and Switzerland; honors, in those years, not lightly bestowed on foreigners. In America he was elected a Corresponding Member of the Academy of Natural Sciences, Philadelphia; in 1936 was made President of the Paleontological Society of America, and became Vice President of the Geological Society of America in 1937.

These honors were accorded solely for scientific achievement. Although he was a genial friendly person Professor Harris deeply scorned political maneuvering and assiduous contact-making as means to attainment of fame and office, and despised the brash effrontery of those in the field of geology who sought to secure recognition

primarily by such activities. He was indulgent of undergraduate students who manifested a real interest in his courses and is known to have given grades of 110 per cent on preliminary examinations to a few outstanding pupils. From graduate students he expected the same intense devotion to their work that he himself demonstrated. He steered them toward the appropriate goals but demanded that they apply their own knowledge and talents to the attainment of those ends. The care and zeal with which he did all his work was inspiring and exerted a lasting influence on the professional careers of his students. He won their deep respect and enduring loyalty.

It was characteristic also of Professor Harris that early in his teaching career he personally acquired in succession four power launches of varying size and design. These were affectionately named for key fossils or favorite molluscs. His favorite formations, the Tertiary beds, are remarkably accessible from water routes along the Atlantic seaboard from New Jersey southward. In New York, along the then Erie Canal and the Hudson River the classic Paleozoic sections that were his teaching environment were similarly right at hand. Consequently, for a number of summers, boat loads of advanced students collected enthusiastically under the guidance of the Professor in his dual role of skipper and academic mentor. In term time these craft were used to take undergraduates on field trips along the Cayuga shores. In the early 1900's Professor Harris also conducted summer-school geologic camps in the Trenton Falls and Helderberg regions. These camps were open to all enthusiasts in the science; undergraduates and graduates for credit, amateurs, teachers, professionals. The day's work ended with campfire song led by the Professor's ringing tenor. Persons who knew him intimately said he held those days to be the happiest of his life.

It must not be thought that Professor Harris's activities were governed solely by the need of the moment. Actually he planned and built shrewdly. As early as 1895 he began publication of *The Bulletins of American Paleontology* which have continued serially to date. He had the foresight to make certain, by sufficiently large overruns of each issue, that an anticipated perennial demand for sets from institutional and oil-company libraries could be met and by such sales provide funds for continuance of the periodical.

In the same spirit he bought a flat-bed press (of which he was the chief operator) in order to reduce printing costs and permit larger editions and so insure the publication of a greater volume of paleontological material. The *Bulletins* were supplemented by a monograph series entitled *Palaeontographica Americana* which is also current. These serials were established before the numerous paleontologic journals of the present day had come into being; hence were a pioneering enterprise.

In anticipation of his retirement from teaching when he knew he would be deprived of the use of his university laboratory and collections, he founded, in 1932, the Paleontological Research Institution, and provided for its

housing with rooms for collections, photography, study, and conference. The Institution early enlisted the support of a number of eminent paleontologists; was shortly recognized and chartered as an educational institution by New York State; its building has been several times enlarged, and by gift and bequest it now has an endowment of much over a hundred thousand dollars, and valuable added collections.

Professor Harris did not cultivate wide social contacts. Modest in all that pertained to his own fame he had unfailing delight in the merited success of others. There are also many who will recall his help given in illness, in building a home, in the rescue of a business. He kept in close touch with affairs, civic and national, and his intimates found him an amiable and informed conversationalist with sound and discerning views on the problems of the times.

His monument will be the contributions he made, as researcher and author, to paleontological science, his work as editor, and the sagacity manifested in the founding of the "Institution." His Christmas Greeting in his 85th year was: "We are happiest when our hobbies and our 'life's work' become identical."

G. W. Herrick, O. D. von Engeln, A. H. Wright

Katharine Wyckoff Harris

October 30, 1899 — October 20, 1954

Katharine Wyckoff Harris, Professor and Head of the Department of Institution Management in the New York State College of Home Economics at Cornell University, died unexpectedly on October 20 at the age of 54. She had been ill at intervals for two years but was active in the department until the day before she died. She had been a member of the Faculty of the University for 27 years.

Miss Harris was born in Hackensack, New Jersey, where she received her elementary and secondary education. She entered Cornell as a student in the fall of 1918 and was graduated from the College of Home Economics in 1922. Miss Harris was a dietetic intern at Presbyterian Hospital, New York City; then head dietitian at Harling Loving Hospital, Ohio State University, for nearly four years. In 1926 she returned to Cornell as an instructor and in 1927 was made acting head of the Department of Institution Management and manager of the Home Economics Cafeteria. In 1933 she was appointed Professor and Head of the Department of Institution Management. She did graduate work at the University of Chicago, and at Teachers College, Columbia University, where she received the Master of Arts degree.

Miss Harris was known throughout the country for her part in developing work in institution management at the university level. She started an extension program in Institution Management which was the only one of its kind for many years. She was also a pioneer in the introduction of a research program in this field. She was closely associated with Professor H. B. Meek during the development of the Cornell School of Hotel Administration when it was a department in the College of Home Economics. She was coauthor of many articles and reviews in various areas of quantity food preparation and in institution organization and administration. Two of these which have been outstanding contributions in the field are: "Emergency Mass Feeding" and "Meals for Many" which has been condensed and edited as "Quantity Recipes."

Miss Harris was an active member of the American and New York State Dietetic Association, Home Economics Association, School Food Service Association, Regents School Lunch Advisory Committee and the Advisory Committee on Standards and Grades of the Poultry Marketing Administration, U.S.D.A. She served as technical adviser for the American Red Cross on the revision of Canteen courses and preparation of supplementary teaching materials. She was appointed to represent the New York State College of Home Economics on the State University

of New York's Provisional Council and was a member of the first Faculty Senate of the State University. She was a member of Omicron Nu, Phi Kappa Phi, and Sigma Delta Epsilon.

In addition to her work in State and National organizations, Miss Harris always found time to serve her community. She was an active member of the First Presbyterian Church. She worked with the Red Cross and served as an adviser on the local Civil Defense Committee. Miss Harris also served on the Board of Directors of Tompkins County Memorial Hospital and on the first Board of Directors of the Statler Faculty Club. She was an active alumna of her sorority and was Faculty Adviser for the Fraternities Cooperative.

Miss Harris's greatest contribution to the University and to her profession was made through her influence on the many students and members of the staff with whom she worked. She inspired her staff and students to strive for superior standards of personal and professional conduct. People looked to her for quiet, thoughtful and intelligent advice. Her friends were legion. In their hearts, in the hearts of her students and staff, her memory will live forever.

A. M. Burgoin, H. B. Meek, Grace Steininger

Richard L. Harris

1896 — November 23, 1955

Dr. Richard L. Harris, who was Manager of the Montrose V. A. Hospital from its inception in 1950 until his death in November 1955, is perhaps best remembered by his former staff and members of the community as one who helped to lift the curtain of fear and misunderstanding regarding the field of mental illness.

During his six years as head of the 1,965 bed veterans hospital, he brought the knowledge and experience of 35 years in Psychiatry to thousands of community citizens through his enjoyable and illuminating talks to innumerable civic, welfare and veterans organizations over a wide area.

As an amateur anthologist of many phases of humor, Dr. Harris utilized this hobby to excellent advantage in his many addresses, with an amusing story to fit nearly every allusion to mental illness, psychiatry and the operation of his large and well-run institution.

Although he was born in Wrightsville, Georgia, and retained his distinctive gentle southern accent throughout his lifetime, Dr. Harris came from a direct line of ancestors emigrating from England in early 1600. Thomas Harris, Jr., in 1636, was one of Roger Williams' company which left the Plymouth Colony to found Providence, R.I. and Rowley, Mass. Dr. Harris was a direct descendant of this distinguished forbear through eight generations.

Born in 1896, he was educated in Georgia schools and received his M.D. in 1920. After a year in general practice, he entered the service of the U. S. Government in 1921 in Augusta, Ga. Then followed increased responsibilities and greater administrative duties as he became Clinical Director in 1931, transferring in that capacity to V. A. Hospital, Canandaigua, N. Y. Three years later he became Chief of Neurological Service at the V. A. Diagnostic Center, Washington, D. C. In 1939, he returned to the southland as Chief Medical Officer (Neuropsychiatry) at the Murfreesboro, Tenn. V. A. Hospital. In 1941, he spent a year as Clinical Director at the Los Angeles, California V. A. Hospital, followed by three years' service as Manager in Sheridan, Wyoming. He returned in 1945 to Los Angeles as Chief Medical Officer of the 2,000 patient NP Section at that V. A. Center, remaining there until his appointment in late 1949 at the Montrose V. A. Hospital.

Throughout his long and distinguished career, Dr. Harris made his teaching influence felt wherever he served. He was for ten years instructor and subsequently Assistant Professor of Medicine in Neuropsychiatry at the University of Georgia, 1922-1932. He conducted post-graduate courses given by the V. A. at the Washington, D. C. Diagnostic

Center, 1935-1938. During his last appointment at Montrose, he was Assistant Professor of Clinical Psychiatry at Cornell University Medical College.

Although he maintained a constantly busy schedule, Dr. Harris found relaxation and pleasure in spending time with his wife and stepdaughter, and tending his lovely garden at their Montrose home. He was also frequently in touch with his son, Richard L. Jr., a resident of Los Angeles. Another early diversion was the game of golf, and though he was relatively inactive as a participant in later years, he would expound on the merits of this recreational activity by the hour. As a substitute for not strolling the links, he became extremely interested in motion pictures, and became an informal authority on many phases of the cinema.

His untimely death, after a month's illness, was felt in every area in which he served the interests of medicine and psychiatry. At his funeral services, he was mourned not only by his many professional colleagues, but by the many community friends he had made, whose better understanding of mental illness he had helped to instill.

Dr. Richard L. Harris has left behind a rich legacy in the field of psychiatry, which has been inherited by countless friends, colleagues and citizens, who were privileged to be touched by his profound knowledge and gentle humor.

Frederick A. Huggins

Edward W. Hart

January 14, 1918 — December 22, 2004

With the passing of Ed Hart, Cornell lost a great teacher and the world lost a distinguished, internationally recognized scientist. In a career that spanned more than a half-century, Ed combined talents that few people possess. He was both a brilliant theoretician and a superb experimentalist, who used his deep understanding of theory to design and carry out sophisticated experiments on the inelastic behavior of metals. In his research, he sought to achieve a holistic view of nature and its principles. He communicated this through clear speaking and writing.

The formal connection between Edward W. Hart and Cornell began in 1975. He had previously established himself as a pre-eminent scholar in the broad area of theoretical materials science. His focus was on understanding and quantifying global deformation phenomena in metals, and using this understanding to carry out fundamental measurements.

Ed's early work at the General Electric Research and Development Laboratory on solid-state diffusion was followed by pioneering work on a mechanical theory for the deformation of metals. His theory incorporated time dependence into existing equations of state in an appropriate, material-specific way. In doing this, Ed provided a clear understanding of global deformation processes in metals. This permitted the prediction of their long-term deformation behavior when subjected to different loading and environmental conditions.

Ed's breakthrough article on the constitutive behavior of metal deformation appeared in 1970. By the mid-70s, his work had drawn worldwide attention and formed the basis of an international conference held at Cornell in 1975. This led to a burst of research activity at a number of laboratories and institutes around the world. It was at that time that Ed was invited to join the faculties of Materials Science and Engineering and of Theoretical and Applied Mechanics, a position he held until his retirement in 1988.

His presence at Cornell provided the nucleus for a broad program in the study of material deformation that involved numerous Cornell colleagues and a number of notable researchers from around the world. A cadre of graduate students and post-doctoral researchers were exposed to Ed's approach to metal deformation and, three decades after he proposed his theory, aspects of it, expressed in terms of "Hart's Equations" are providing insight into materials processing phenomena. His work has clearly stood the test of time. His formulation is still the best available tool to test and evaluate materials under pressure and/or radiation in the power-generating industry.

Ed was a Fellow of the American Physical Society and served as the Battelle Visiting Professor for Distinguished Service at Ohio State University in 1973. In 1982, he was awarded an Alexander von Humboldt Senior Scientist Award and in 1989 he returned to Germany to conduct research at the Nuclear Research Center in Karlsruhe. His biographical sketch appears in *Who's Who in America*.

Those who have crossed Ed Hart's path realize that he was an extraordinarily gifted person, and far more than an excellent scientist. A true Renaissance man, he was as dedicated to the arts as to the sciences. While young, Ed studied composition under Aaron Copland. He played guitar, viola and piano and, at one time, directed a choir and a chorus. He also studied modern dance with Welland Lathrop and was founder and president of the Schenectady Civic Ballet Company. He loved nature, mountain climbing, and camping and was a long-time member of the Adirondack Mountain Club.

Ed Hart was a gentle person with what some might refer to as "old fashioned" courtesy. He was also extraordinarily generous and a loyal friend. His Cornell colleagues consider themselves fortunate for the experience of having known so exceptional an individual.

James T. Jenkins, Wolfgang H. Sachse, Arthur L. Ruoff

James Morgan Hart

— *Apr. 18, 1916*

The following resolutions on the death of Professor James Morgan Hart were adopted by a rising vote:

“In recording the death of James Morgan Hart, Professor Emeritus of the English Language and Literature, the Faculty wishes to bear witness to the scholarly and manly qualities of the colleague whose passing is a loss to Cornell University.

Professor Hart was one of the earliest members of the faculty and gave to the university his first and his last years of service. During his long life he devoted himself with absolute unselfishness to the cause of learning as represented by his chosen field, in which he attained national distinction, and as represented by the institution to which he was so deeply attached. He administered his department with far-seeing discretion, and brought into the faculty councils a mature wisdom which went to the core of the questions at issue. He trained students to hold dear the things which were dear to him, and had the satisfaction of seeing his own men in positions of responsibility all over the country. The first insistent lesson he taught was accuracy, which he consistently termed the one pre-requisite of scholarship. As far as humanly possible he sought to impart to his students some measure of his own wholesome and abounding common-sense. A man of deliberate and well-considered carefulness in forming opinions, he manifested impatience only in the presence of the inane, the self-seeking, and the pedantic. Of honest error of judgment or to mistaken action he was sympathetically tolerant. His interest in young men was perennially fresh, and he apparently gained from them something of the inspiration which he assuredly gave. Best of all in a teacher and leader, it should be said of him that with every opportunity to impose his authority and his methods, he never tried to make disciples. A student whom he had made courageous enough to differ with him was sure of a keen, friendly, and thoughtful response; a mere echo he counted futile. Here was a man who left behind him the memory of a personality greater and finer than is common, and who established by his example a precious ideal.

(Signed) Edw. L. Nichols, Frank Thilly, Martin W. Sampson, Chairman

Retried: June 1907 Fac. Rec., p. 389

Van Breed Hart

October 5, 1894 — April 30, 1976

The death of Van B. Hart brought to an end a long period of service to agriculture in New York State and the nation. During forty years of this period he was an active member of the staff of the Department of Agricultural Economics, College of Agriculture.

Professor Hart was born and brought up on a crop and dairy farm near McLean in Tompkins County, New York. He attended the New York State College of Agriculture and received the Bachelor of Science degree in 1916. After graduation he served as a commissioned officer and pilot in the United States Naval Dirigible Service during World War I. He entered the Cornell Graduate School in 1920 and served as a graduate student and instructor in farm management. He received his Doctor of Philosophy degree in 1923 when he was appointed assistant professor. He was promoted to professor in 1927.

His major responsibilities were in agricultural extension. He had a large part in developing the role of the subject-matter specialist in extension work. This was recognized in 1950, when he received the United States Department of Agriculture Superior Service Award “for exceptional ability and zeal in developing and maintaining a well-balanced farm management program with special foresight in adjusting to changed conditions, and for his pioneering efforts and accomplishment in the field of farm finance.”

When the Federal Farm Credit Administration was organized in the early thirties, he was granted a year’s leave of absence from Cornell to serve as president of the Springfield Production Credit Corporation. In 1946 the Bankers’ School of Agriculture at Cornell was organized with Professor Hart as academic director. These schools are continuing today. The officers and staff of many New York commercial banks are knowledgeable in the field of agriculture. If this is due to one man, Professor Hart must be awarded the distinction.

With changes in income tax laws and regulations, tax management became increasingly important. Professor Hart, recognizing the changes early, played a leading role in tax education for farmers, on both state and national levels. He was a consultant to both the New York State and Federal Internal Revenue Services.

During World War II he served as agricultural advisor in the War Finance Division of the United States Treasury. While on leave from Cornell in this capacity Professor Hart helped organize the farm War Bond Program in the country, and he prepared a considerable portion of the farm War Bond literature used in various bond drives. He

was given the United States Treasury Award and silver medal by Secretary of the Treasury Vinson and a special citation “for distinguished services rendered in behalf of the War Finance Program.”

Among the many publications written by Professor Hart was a 1944 bulletin titled *Suggestions to Persons Who Plan to Farm or to Live in the Country*. The publication stressed the advantages and pitfalls of country life, and its popularity resulted in several reprintings and revisions. Early in its beginning Professor Hart recognized the back-to-the-land movement, a sometimes Utopian idea that is still popular in the minds of many nonfarm people.

Professor Hart was a joint author of the books, *Farm Management Manual*, *Agricultural Credit*, and *Farm Management and Marketing*. The latter was widely used in the forties and fifties in the Northeast as a text in teaching vocational agriculture to high school students. He was also the author of numerous bulletins on farm finance, farm management, farm income taxes, farm accounting, and land use.

Professor Hart was a member of the board of directors of the Tompkins County Trust Company and served two terms as an alderman for the City of Ithaca. Early in 1975, following the death of his wife, the former Helen Berdina Clark whom he married in 1922, he moved to Ithacare, a minimum care facility for the elderly. He became popular with other residents and was elected a member of the resident council. He remained active and rarely missed attending church, the bank board, or other meetings of the many fraternal organizations of which he was a member. On Easter Sunday he enjoyed a family gathering. A few days later he suffered a severe stroke, and death came within a week.

He is immediately survived by a sister, Mrs. George Scofield, a grand-daughter, Donna Hart Staples, and a grandson, Richard Hart.

Lowell C. Cunningham, Robert S. Smith, Clifton W. Loomis

John Hartell

January 30, 1902 — October 12, 1995

John Hartell, an artist and teacher of artists and architects for forty years, died of congestive heart failure at his Ithaca home on Thursday, October 12, 1995. He was 93. Born in Brooklyn in 1902, he was the beloved husband for 67 years of Sylvia Muller Hartell.

In addition to his wife, he is survived by his daughters: Mari Hartell Quint of Baltimore, and Karin Hartell Cattarulla of Dallas; and grandsons, John Cattarulla of New York City, and Matthew Quint of Washington, DC.

Professor Hartell had a distinguished association with Cornell for over half a century which began in 1920 when he enrolled as an architecture student. His drawings were published in the *Cornell Widow* and he received a Bachelor of Architecture degree in 1925. In 1926, he was awarded the prestigious American-Scandinavian Foundation fellowship for graduate work in architecture at the Royal Academy of Fine Arts, Stockholm. He subsequently taught architecture at Clemson University and the University of Illinois and spent two summers as a fellow at MacDowell Colony in New Hampshire.

In the mid-twenties, he also worked as a draftsman and designer in various New York City architectural firms and later worked on buildings for the 1939 New York World's Fair. He designed or remodeled several residences in Ithaca.

Professor Hartell joined the faculty of Architecture at Cornell in 1930 and served as a first-year architecture design critic, a position he held for the next thirty-eight years. In 1940, he was appointed Professor of Art and served as the Chairman of the Department of Art from 1939 through 1959. He directed the graduate program in fine arts for ten years, until his retirement. In 1968, he was designated Professor of Architecture and Art Emeritus.

In 1982, the College of Architecture, Art and Planning and many friends, colleagues, and former students honored him by naming the John Hartell Gallery in Sibley Hall.

As Chairman of the Art Department, John carried on the enlightened pedagogic concepts of his predecessor, Olaf Brauner. He hired practicing artists as teachers, provided them with private studios, gave them carte blanche freedom to pursue their own aesthetic goals, and assigned them schedules that allowed for a sensible balance of time for teaching and creative work. He taught a design class for freshmen architects and conducted a seminar for graduate art students that became a model of professional skill. For his students, he maintained his own high

standards of quality, yet dealt with them in a tactful and sensitive way that brought out the best in them. Many of his charges moved on to distinguished careers as artists and professors.

While carrying on his academic duties, John found time and energy for a successful career as a painter. Starting in 1943, he produced fifteen, one-man exhibitions for the Kraushaur Galleries, one of the long established and most respected galleries in New York City. He participated in important national group shows at major American museums such as the Whitney Museum, the Metropolitan Museum, and the Chicago Art Institute. And in addition, he held one-man shows at other museums and university galleries.

Upon his retirement in 1968, he began a second career as a full-time painter and soon produced some of his best pictures. Working in his home studio, he created large and small scale works for which he designed and built frames that became part of a typically well-crafted ensemble.

John's painting was founded on the great formal and tactile tradition of Western art. His primary creative passion was the love of color and he used that element in a highly individual way. Starting out with carefully planned color programs that ran a wide gamut of tonal possibilities, he developed subtle nuances of color that sometimes dared to stretch the relationships to unusual limits of sweet or sour dissonance. He employed the conventional content of European painting, still life, figure and landscape and brought to these subjects his own poetic vision.

During an era of radical changes in the art world, he maintained his sense of serene independence, combining in his work the classic vertical and horizontal structure that derived from his architectural training with his own sensuous and romantic bent. This conjunction of seeming opposites gave his work a special character, and while he was well aware of significant currents in contemporary art, he incorporated them into his own style and in the process, produced a body of important 20th century painting.

Kenneth Evett, Norman Daly, Jack Squier

John Daniel Hartman

August 21, 1909 — June 1, 1993

A man who thrived on controversial issues. Professor John Daniel Hartman will be remembered by colleagues and friends for his dedication and the countless hours he spent researching, substantiating and writing lengthy reports in support of his beliefs and convictions regarding university and public issues.

John was born in Orwigsburg, Pennsylvania. He graduated with a B.S. degree from the Pennsylvania State College University in February, 1930. He took great pride in the fact that he attained the highest grade point average at the college for five of the seven semesters he was in residence. John's humble nature would not allow this fact to be expressed with qualification, "of course at that time there were only 4,500 students on campus". He completed his M.S. and Ph.D. degrees at Cornell in 1931 and 1933 respectively.

Upon completion of his degrees at Cornell he accepted a position at Purdue University and remained at Purdue for eleven years, attaining the rank of full professor. In 1948, John returned to Cornell as professor of vegetable crops.

His major research activity for 20 years centered around research on vegetable handling and marketing. His special interest was the objective measurement of color, texture and flavor of vegetables and the correlation of those measurements with the subjective evaluation of quality as perceived by the consumer. Color and texture was measured by adapting devices used in other scientific areas but flavor was an elusive factor. Many of the volatile compounds contributing to flavor are joined only after the cell membranes are damaged. However John and his graduate students demonstrated that their ephemeral compounds could be identified with suitably sensitized microelectrodes.

At Cornell he taught a course in post-harvest handling and quality grading and measurement with vegetables for 20 years. During his career he served as chairman of special committees of approximately 30 graduate students, seventeen of which were awarded Ph.D.'s.

His research at Purdue and Cornell resulted in more than 50 technical, scientific papers and a number of experiment station bulletins.

The decade of the sixties saw John actively involved with Cornell issues and the list of activities which directly or indirectly resulted in major legislative changes at Cornell is indeed an enviable one.

In 1965, as a member of an Ad Hoc Graduate School committee, he produced an extensive analysis (45,000 word discussion) of the then current status of the general foreign language requirements for the Ph.D. at Cornell, and a survey of some of the practices associated with the administration of these requirements. The study formed the basis for an informational campaign which culminated in 1966 in Graduate Faculty Legislation which abolished the general requirements for most departments.

A 27 page, 14,000 word document provided the rationale for a change of faculty government at Cornell. John tediously held to his view and campaigned diligently with a small group of faculty who shared his viewpoint. Their efforts resulted in the formation of the Faculty Council of Representatives.

When impending faculty action threatened the fraternity/sorority system at Cornell, John, although not a fraternity alumnus, took up the cause. The campaign was successful, most fraternities and sororities at Cornell were not forced to give up their national affiliation.

In the late sixties the military, and in particular ROTC, was not a welcome sight on campuses. Faculty resentment threatened the abolishment of ROTC on the Cornell campus. John again donned his Don Quixote armor and took up the crusade. Once again the effort was successful and ROTC remains a viable and active part of the University.

In his retirement years, John continued his quest for answers to controversial issues. He traveled from the east to the west coast in an attempt to document the need and value of solar radiation as an alternative to fossil fuels. Laetrile, a controversial drug proposed as a cure for cancer, intrigued John. His curiosity took him to the southwest and Mexico seeking answers regarding this "miracle cancer drug."

The combination of being a prolific reader, an individual interested in the philosophy of authorities in other fields, a master of detail and a prolific writer resulted in a personal library of over 500 books in which John took great pride.

John held membership in the honorary societies of the Sigma Xi, Phi Kappa Phi, and Gamma Sigma Delta, Sigma Phi Sigma, Potato Association of America, American Society of Plant Physiologists, Institute of Food Technologists, American Statistical Association, and American Association of University Professors. John was also very active in the Rotary Club.

John was active in an organization involved in vegetable crop production. For years he held office in one of the vegetable, or potato marketing advisory committees for the northeast region of the U.S. During this same period he was active in affairs of the American Society for Horticultural Science.

He was elected a Fellow of the American Association for the Advancement of Science, and a Fellow of the American Society for Horticultural Science.

William C. Kelly, Roger F. Sandsted, Leonard D. Topoleski

Paul Leon Hartman

July 13, 1913 — May 20, 2005

Paul Leon Hartman, a pioneering researcher and Professor Emeritus of Physics, and of Applied and Engineering Physics, died on May 20, 2005, at home at Kendal at Ithaca. Paul had been associated with Cornell for 71 years!

Born in Reno, Nevada on July 13, 1913, he was the eldest son of a physicist father, Leon W., and an astronomer mother, Edith K. Hartman. Paul earned a B.S. degree in Electrical Engineering at the University of Nevada, where his father was chairman of the Physics Department. Paul came to Cornell in 1934 to start graduate study in physics. (His father had come to Cornell as an undergraduate in 1895. Paul's lifelong interests in science, the West, and Cornell were set early.) Paul did his thesis work here on an early linear accelerator with Professor Lloyd P. Smith, a fellow Nevadan, receiving his Ph.D. degree in 1938. After a year as Instructor of Physics, Paul left to work for the next seven years at the Bell Telephone Laboratories in New York City. There he was actively involved in developing centimeter-wave generators for airborne radar during World War II. Most of his work was carried out at the laboratory bench level, but occasionally he was flown to an air force base to trouble-shoot these early radar units.

He returned to Cornell and academic life in 1946 as an Assistant Professor with a joint appointment both in Physics and in the brand new program in Engineering Physics. This new program recognized the need for a stronger physics component in the engineering sciences. Paul was an active charter member in formulating and guiding this program. The underlying philosophy envisaged a heavy dose of physics and mathematics mixed in with traditional engineering, but coupled with careful student advising. The program attracted very good students and quickly developed a strong reputation, which it has to this day.

In teaching, Paul quickly moved into the leadership position in the venerable Advanced Laboratory Course at Cornell (the famous "410/510 Lab"), required of all physics and EP undergraduates and graduate students, experimentalists and theoreticians alike. Paul's energy and wide-ranging skills as an experimentalist enabled him to interact strongly and effectively with students working on any of the more than 60 experiments. He loved the challenge and satisfactions of teaching in this course, which strongly influenced so many future physicists. He continued in this role for nearly 40 years during which many former students went on to set up similar courses elsewhere.

Paul's research focused on the physics of ultraviolet electromagnetic radiation and its interaction with matter, especially on photoemission from ionic crystals and on the formation of excitons. But he was probably best known for his pioneering investigation, carried out with colleague Diran Tomboulian, of the spectrum of electromagnetic radiation emitted by electrons circulating in a synchrotron. The measurements were performed in 1953, on the 300 MeV synchrotron at the Laboratory of Nuclear Studies at Cornell. A vacuum ultraviolet spectrograph was connected directly to the synchrotron to record the intensity of the emitted light in the wavelength range 5 – 40 nm (i.e. from soft x-ray to far ultraviolet) without intervening windows.

The results were dramatic and far reaching: "It was a gorgeous piece of physics," says Dale Corson, President Emeritus, former Chair of the Physics Department and a close friend of Hartman's for many years. "The spectrum had been calculated by (Schwinger) at Harvard, but Hartman and Tomboulian essentially confirmed the calculation. It really was a tour de force."

Most importantly their results demonstrated the potential of synchrotron radiation as a new broadband source of x-rays and ultraviolet radiation. Until then, this radiation had been viewed mostly as a nuisance and an inevitable cause of energy loss for the particle physics experiments. It was not until the next decade that synchrotron sources began to appear to actually exploit this radiation for studies of atoms and molecules and solids. In his later years, Paul was an active participant in developing the Cornell High Energy Synchrotron Source (CHESS). This now provides an extremely bright source of hard x-rays, which are used to study such things as the molecular structure of proteins.

Paul spent three sabbatic leaves and many summers at the Los Alamos Scientific Laboratory in New Mexico, working on measurement of the light emitted by electron bombardment of the atmosphere, and also exploring the Southwest with his family.

Paul enjoyed all parts of the traditional academic life, including advising students and patiently building faculty consensus for new programs. He served as Associate Director of the School of Applied and Engineering Physics from 1971-83. He also served as Secretary of the Cornell University Faculty for three years in the late 1970s. Colleagues came to recognize and enjoy his unpretentious, direct, and highly personal style of writing and many looked forward to the regular appearance of the *Chronicle* to read his faculty minutes.

After his retirement in 1983, Paul turned to writing a memoir and informal history of the Cornell Physics Department. Blending his own clear recollections of the pre-World War II days with nuggets from the early archives, and his impressions of the rapid post-War expansion, Paul produced a very readable "history of sorts."

He continued in this vein with a similar history of the School of Applied and Engineering Physics, and yet another of the founding of the Materials Science Center at Cornell.

In 1993, Paul put together a similar informal history of the early years of the leading physics journal, the *Physical Review*, which, remarkably, was started at Cornell in 1893 and spent its first 20 years in Ithaca before being taken over by the American Physical Society. Paul's history was published on the occasion of the centennial of the *Physical Review*.

Throughout his life, Paul enjoyed many extracurricular interests. An amateur astronomer (but with considerable expertise), he built and owned numerous telescopes. He also pursued photography, baked bread weekly, grew grapes and made wine, gardened, painted, was a blood donor of note, and volunteered for the Red Cross. He camped and hiked with family and friends throughout the United States.

His wife, Margaret (Peggy), survives him as do three daughters: Barbara H. Freeman of Cape Elizabeth, Maine; Laurel L. Hartman of Ithaca; and Sara W. Hartman of Maynard, Massachusetts; two grandchildren and their spouses; and four great granddaughters.

We will miss a warm and enthusiastic colleague who loved experimental physics.

Neil W. Ashcroft, John Silcox, Douglas B. Fitchen

Charles Frederick Hartt

Professor of Geology

— *March 22, 1878**

“Whereas Death has removed from our Faculty, a most esteemed associate and friend, Charles Frederick Hartt late professor of geology.

“Resolved: That we do hereby record our high appreciation of his lofty ambition, varied attainments, and success as a teacher and investigator in more than one field of research, and particularly as a Professor in this University.

“Resolved: That we mourn the loss of one who had endeared himself to us by the possession and liberal exercise of strong personal qualities of a high order, and that it is our sincere regret that the man as well as the scholar has been thus separated from our counsels

“Resolved: That we do most heartily sympathize with the stricken family of the deceased, and assure them of our tender regard, rendered all the more deep and lasting by this sudden bereavement

“Resolved: that these resolutions be engrossed on a separate page of the Minutes of this Faculty, that a copy be sent to the family of the deceased, and that they be published in Ithaca and Buffalo journals.

* Died at Rio de Janeiro, Brazil

John Augustus Hartwell

September 27, 1869 — November 30, 1940

Ordinarily it is a distressing undertaking to write about a close friend who has passed away. In the case of Josh Hartwell it is uplifting, rather than depressing. His departure was a glorious finale to the life of a great soldier, an outstanding citizen. He had been a sufferer for years; he worked for months while prostrated and in bed. He recovered sufficiently to renew active life and to indulge in his favorite sport. He died suddenly, as he would have wished, on entering a duck blind, looking forward to a morning of sport. It is typical of Hartwell that his widow announced his wish that flowers be omitted at his funeral and that, instead, contributions might be made to the British War Relief.

John Augustus Hartwell was born in Sussex, New Jersey, on September 27, 1869. He was the son of Samuel S. and Clarinda (Stiles) Hartwell. Having worked his way through college by coaching during the summer vacations, he was graduated from the Sheffield Scientific School in 1889 at the age of nineteen. He was assistant to Professor R. H. Chittenden for one year and then entered the Yale Medical School from which he was graduated in 1892.

During his college career he was a notable athlete, in fact one of Yale's great athletes. He was a famous end in football and a leading oarsman and captain of a winning crew. His love of sport continued throughout his life. He was an enthusiastic hunter and fisherman and was devoted to conservation of bird life. President Theodore Roosevelt appointed him one of the organizers of the North American Wild Life Conference and he was first president of the organization known as "Ducks Unlimited."

But Dr. Hartwell's real life was centered, first, in the practice of surgery; second, in elevating the ideals and practices of his profession. He was identified with many hospitals and societies and became one of the outstanding members of his profession. He was closely identified with the Cornell Medical School in which he held the following appointments: Instructor in Physiology, 1898-1900; Demonstrator in Anatomy, 1900-02; Assistant Professor of Physiology, 1902-09; Assistant Professor of Surgery, 1911-18; Associate Professor of Surgery, 1918-32; Professor of Clinical Surgery, 1910-38; and Professor of Clinical Surgery, Emeritus, 1938-40. He took an active part in the organization and administration of the Cornell "Pay Clinic" which was planned to provide medical facilities at moderate cost for the "white collar class" which has always received the worst medical attention. The clinic proved a notable success and is accepted as such by the profession which at first opposed it vigorously.

Dr. Hartwell served in various capacities on the Second Surgical Division of Bellevue Hospital from 1904 to his death; he was Director from 1916 to 1928 and after that served as consulting surgeon. In 1916 he was one of a committee to reorganize the House Staff. During the winter of 1917-18, at the request of Surgeon-General Ireland, he conducted a course in war surgery for medical officers of the United States Army. At this time he held the rank of major in the Medical Corps.

Dr. Hartwell served as President of the New York Academy of Medicine for four years, 1929 to 1933, and as full time Director from 1934 to 1939. During that decade the effectiveness and influence of the Academy were markedly increased and broadened. It was written of him when he was president: "Probably few men in the country have Dr. Hartwell's pre-eminent qualifications to discuss the problems of present day medical practice. His seniority gives him the authority of experience, his position at the head of a great institution has brought him in close contact with current problems, his vitality makes him a first rate speaker."

He was consulting surgeon to a number of hospitals, including Presbyterian, General, Memorial, Lincoln, and the United Hospital of Port Chester. In February 1939 he was appointed associate director of the American Society for the Control of Cancer. He was a member of the leading medical societies such as the American Surgical Association, the American College of Surgeons, Society of Clinical Surgery, American Medical Association, and the New York Surgical Society. His clubs were the Century, Links, South Side, Graduate Club of New Haven, and the Army and Navy Club of Washington.

As a tribute to a life crowded with activity and accomplishments, the New York Herald Tribune on December 4, 1940, carried the following editorial appreciation of Dr. Hartwell:

"The death of Dr. Hartwell, the distinguished surgeon, removes from the New York scene a rare and many sided personality—Hartwell always had a sense of social responsibility. He made his influence felt with great vigor and clarity, on many issues. He fought fee splitting. He warned against overspecialization. He denounced the senseless raid on the Birth Control Clinical Research Bureau in 1929. He prevented legislation which he felt might hamper surgical research. He was effective in stopping the exploitation of unproved cancer 'cures.' He advocated hospital care for everyone regardless of financial status. Moreover he was a singularly attractive man."

In Dr. Hartwell's death on November 30, 1940, at the age of seventy one, the profession lost a great leader, the community a great force, his associates a great friend.

"The soil out of which such men as he are made is good to be born on, good to live on, good to die for, and good to be buried in."

Herbert Bertsch Hartwig

July 8, 1898 — September 16, 1967

Plants and animals were lifelong interests of Herbert Bertsch Hartwig. Born on a farm in Wayne County, Michigan, he attended Michigan State College, graduating in 1921. In the following year he was a graduate teaching fellow at Iowa State College and received the M.S. degree there. He subsequently earned the Ph.D. degree from Pennsylvania State College in 1939, fulfilling the requirements during leaves and a sabbatic year.

His professional career began in 1923 with appointment as instructor in the College of Agriculture at Syracuse University. He was successively Assistant and Associate Professor there. He came to Cornell in 1927, first as Assistant Extension Professor, and then as Assistant Professor of Field Crops. In 1937, he was appointed Professor of Field Crops and served until retiring as Professor of Agronomy, Emeritus, June 30, 1966.

Professor Hartwig's first appointment at Cornell combined extension responsibilities with studies of field crops. During this period he wrote half a dozen extension bulletins, over 100 articles for Farm Bureau News, and others for the farm press. His subsequent research and observations led to four memoirs and technical articles, and two widely used illustrated teaching manuals on grasses and legumes.

But Professor Hartwig's great love was teaching. For him teaching was an accomplishment, a career, a passion, and he gave it his full energies, sternly disciplined through periods of ill health. Bliss Perry's autobiography title, from Chaucer, "And Gladly Teach," is likewise an apt summation of Herbert Hartwig's career at Cornell. Probably more than 3,000 students passed through his formal courses. All were exposed to vigorous, superbly well-organized lectures, and to laboratory work founded on close study of a great wealth of plant material. Each year saw revised lecture notes, new visual aids, new stores of live and dried plants, and pungent comments on both current fads and outmoded notions. He taught as an inspired schoolmaster, with scant patience and no sympathy for the dilettante or idler, however clever. His students learned plant morphology, physiology and ecology in a new context, but additionally they were stamped by an unequivocal philosophy of what the world and Professor Hartwig expected of them. Both influences are mentioned repeatedly in a volume of memorial letters from former students, presented upon his retirement. A surprising number of students from all backgrounds found a first realization of their role in a technological society through his firm conviction that rational applications must be based on scientific knowledge of plants and methods, but that such knowledge was profitless until utilized.

It is pleasant to recall that his stern fondness was recognized by his current students as well as alumni. Painted slogans on the sidewalk and a banner renaming Caldwell Hall as “Hartwig Hall” greeted him on the day of his last lecture before retirement, and the lecture ended with a prolonged ovation.

The interest in poultry which he had acquired as a farm boy remained as a hobby throughout his life. He was well informed in the practical and technical phases of the poultry industry and rarely missed any on-campus conference pertaining to this subject. One of his proudest possessions was a collection of old and current books dealing with poultry. Immediately upon retirement he set to work to develop a small poultry farm where he might put some of his theories to the test. He had made only a beginning in this new career when his last illness occurred.

J. H. Bruckner, Stanley W. Warren, Earl L. Stone

Frederick Zeller Hartzell

December 11, 1879 — June 13, 1958

Following several years of steadily declining health, Frederick Zeller Hartzell, Emeritus Professor of Entomology, died on June 13, 1958, at Geneva, New York, in his seventy-eighth year. He had been a member of the staff of the New York State Agricultural Experiment Station since 1909. He retired in 1948.

Professor Hartzell was born on a farm near Easton, Pennsylvania, December 11, 1879. He received a classical education at Lafayette College where, in 1905, he received the AB degree. During his junior year at Lafayette he became afflicted with tuberculosis. While his case was mild, and responded successfully to treatment, he decided that with a susceptibility of this nature it would be best to prepare for a career in a field that would keep him outdoors as much as possible. Also he saw in this plan an opportunity to pursue his then newly awakened interest in science.

Consistent with these earlier decisions, he accepted, in 1906, a position as Field Assistant in the Zoology Division of the Pennsylvania Department of Agriculture. His first assignment was scouting for the San Jose scale. This much-feared pest of the tree fruits had only recently been introduced to Pennsylvania. Hartzell's mission was to seek out, inspect, and record the scale-status of host trees wherever they might occur in the western half of the state. This quest took him into many remote and little traveled districts. Much of the time he relied on his own two legs to get from one farm to the next, although, on some expeditions, he made use of a bicycle.

In 1907, he was assigned to a federal-state field research station at North East, Pennsylvania. Here he came under the influence of the federal entomologist A. G. Hammar who convinced him he needed more formal training in Entomology if he was to carry out his plan of a career in this field. This led him to Cornell University where, in 1909, he was granted the MA degree. That same year he was appointed to the staff of the New York State Agricultural Experiment Station as Assistant Entomologist and was assigned to the Station's Vineyard Laboratory at Fredonia. This remained his headquarters until 1928 when he moved to Geneva. Professor Hartzell attained his full professorship in 1938. For several months in 1948, following the death of Doctor Hugh Glasgow, he also served as acting head of the Station's Department of Entomology. He retired December 31, 1948.

Professor Hartzell was well and favorably known in various agricultural circles of the State. Best known to fruit growers, he was held in especially high esteem by the grape growers of Chatauqua and Erie counties where, during the first two decades of his career, he worked so diligently and effectively in their interest. Much of our present

knowledge of the biology, ecology, and control of the many pests of grape, pear, apple, and cherry is based on Professor Hartzell's research. He also was active in the introduction and development of certain insecticides, notably the dinitro compounds and the tar oils. In the area of contributions to his profession, Professor Hartzell will possibly be remembered best for the pioneering role he played in the application of statistical and biometrical principles to entomological field experimentation. In all, he authored some 95 technical or semi-technical papers.

In addition to Entomology, Professor Hartzell was well informed in the fields of Ecology, Ornithology, Biometry, Geology, Astronomy, Botany, Meteorology, and in several branches of Mathematics. It can be said he attained professional competence in the first four fields. However, of all titles the one that perhaps fit him best was that of Naturalist. Professor Hartzell was a member of the following scientific societies: the American Association for the Advancement of Science (fellow), Entomological Society of America, American Association of Economic Entomologists, American Chemical Society, Ecological Society of America, and American Statistical Association.

Professor Hartzell was highly respected by his colleagues and associates for the breadth and depth of his knowledge. In venturing into fields outside their own specialization, many found it quicker and easier to "ask Hartzell" for the information sought than to dig it out themselves. His knowledge was truly encyclopedic. An inveterate reader, his curiosity knew no bounds. Professor Hartzell was at his best in the role of instructor and counselor. Many can look back with gratitude to the help they received as graduate students or as new staff members from this patient, kindly man. His aid was constantly being sought in such diverse fields as writing, instrumentation, the layout and preparation of graphs, design of field experiment, the statistical analyses of data, and others.

Modest and unpretentious, Professor Hartzell was invariably courteous and thoughtful of others. There was no malice in the man. It was rare indeed to hear him speak unfavorably of anyone—of anyone that is, except himself. His intimates derived much amusement from this habit of self-criticism. Professor Hartzell allowed himself few indulgences. One of these was the acquisition of books; his personal library, composed largely of treatises on scientific subjects, exceeded a thousand volumes. He also received pleasure from the possession of such equipment as cameras and field glasses of which he owned a half dozen of each item. These he put to good use in the frequent excursions he made afield to view birds and to photograph various objects and scenes of interest.

Professor Hartzell always exhibited pleasure and enthusiasm for his work and interests. One gained the impression he found living in this world a great and exciting adventure; his interest in learning more and still more about it all never flagged.

Professor Hartzell married Edith M. Rupp in 1910. She died in 1933. He is survived by a brother, Dr. Albert Hartzell of Yonkers, New York; by a sister, Mrs. Martha W. Clagett, a half-brother, Wilson E. Hartzell, and a half-sister, Mrs. Verna Krissinger, all of Lebanon, Pennsylvania; and by several nieces and nephews.

In Professor Hartzell's passing the world has lost a true scholar and gentleman.

P. J. Chapman, E. F. Taschenberg, C. E. Palm

Eugene Elwin Haskell

Dean of the College of Civil Engineering and Professor of Experimental Hydraulics

— *January 28, 1933*

RETIREMENT STATEMENT

On the retirement of Eugene Elwin Haskell, Dean of the College of Civil Engineering, from administrative and educational work in the University, the members of the Board of Trustees and of the University Faculty desire to record their appreciation of the services he has rendered to the University, and their regret at the loss of his courteous, gracious personality in the community's life.

Professor Haskell became Dean of the College of Civil engineering in 1906, giving up his position as Director of the U.S. Lake Survey to fill the office left vacant by Professor Fuertes in 1902. His long experience in executive work, his capacity for detail and his uninterrupted adherence to the duties of his position, have made themselves plainly felt in the growth of the College. Under his direction the energies of the Civil Engineering Faculty have been centralized, the course of study improved and the equipment of the College renovated and greatly increased. His final contribution to the progress of Technical Education at Cornell has been his assistance in bringing about the union of all the Colleges of Engineering in the University.

Few members of the Faculty have devoted their lives so generously to State and Nation. As a member of the International Waterways Commission to which Professor Haskell was appointed by President Roosevelt, he participated in the delicate matter of establishing accurately the boundary line between the United States and Canada from its intersection with the St. Lawrence River through the Great Lakes and communicating waters to the mouth of the Pigeon River, Lake Superior, a task finally settled to the mutual satisfaction of both countries in 1915.

As one of the Consulting Engineers of the New York Barge Canal Board, Professor Haskell passed judgment on such matters as the dam and power development at Seneca Falls, the repairs to the serious break in the canal prism at the Lockport Basin, the possibility of ice control at the Schenectady lockgates, and the failure of the canal banks at the Morrison Swamp.

As a member of the Board of Public Works of the City of Ithaca, he gave freely of his experience and engineering judgment to such problems as were involved in the improvement of the inlet, the construction of the dykes along Six Mile Creek and the dredging of the Lake Front.

His term of office as director of the American Society of Civil Engineers, 1912-1916, reflected honor on the College of Civil Engineering and the University.

The Ritchie-Haskell Current Meter, invented and constructed for the special needs of his work on the Great Lakes, is well known in engineering work for the precise measurement of sub-surface currents.

As head of the Lake Survey, long before coming to Cornell, Dean Haskell had made for himself a place deep in the hearts of such Cornell students as were then working under him. As their personal benefactor, through whose aid a college course was made possible, many other Cornell students have for him grateful memories. During these past fifteen years his earlier opportunities for giving help to young men have been multiplied many times, and his constant and invariable interest in all his student relations has been unwearied.

The trustees and Faculty wish Dean Haskell health and happiness as he takes up a new field of work, hoping that he may through many more years continue his valuable services to his fellow citizens.

Cornell: 1906–1921

ANNOUNCEMENTS OF DEATHS OF STAFF MEMBERS

Records p. 1778, February 8, 1933

The President announced the death of Leon Reynolds Streeter, Professor and Chief in Research at the Geneva Experiment Station on December 26, 1932; of Professor Othon Goepp Guerlac, World War Memorial Professor of the Romance Languages and Literatures, on January 16, 1933, and of Emeritus Professor Eugene Elwin Haskell, one-time Dean of the College of Civil Engineering, on January 28, 1933.

Fac. Records, p. 1195, 1778

Robert Anthony Hatcher

February 6, 1868 — April 1, 1944

Robert Anthony Hatcher died suddenly of angina pectoris at his home on the evening of April 1. For the preceding nine years, 1935-1944, he had been Professor of Pharmacology, Emeritus, but despite his retirement from active teaching and research, his wise counsel was often sought and freely given; his death at the age of seventy-six is, therefore, a serious loss.

Born in New Madrid, Missouri, Robert Anthony Hatcher was the son of Richard Hatcher, an attorney and clerk of the County Court, and Elizabeth Marr Hatcher. His paternal uncle was a member of the House of Representatives of the United States, and the uncle on his mother's side was Judge Robert Marr of the Louisiana Supreme Court. When only eleven years old, Hatcher lost his father and went to New Orleans to live with Judge Marr, who at about the same time had lost his judgeship as the result of a political upheaval, leaving the family virtually penniless for several years. At the age of fourteen, Hatcher found it necessary to stop school, taking a job in a box factory where he worked ten hours daily six days a week; next he went to work for the drug firm of I. L. Lyons, with which firm he remained until 1887, when he entered the Philadelphia College of Pharmacy; he was graduated in 1889. Upon obtaining the degree of Ph.G. he returned to Lyons' where he remained for several years, during a few of which he also ran a pharmacy of his own. Thereafter he studied medicine in the School of Medicine of Tulane University of Louisiana in New Orleans, obtaining his medical degree in 1898. From 1899 to 1904 he was professor of *Materia Medica* at the Cleveland School of Pharmacy. He was also demonstrator of Pharmacology at the Western Reserve University School of Medicine in Cleveland in the years 1901-1903, where he was associated closely with Dr. Torald Sollmann, with whom he wrote a *Textbook of Materia Medica* (1904).

In 1904 Hatcher was called to Cornell as instructor in pharmacology and *materia medica*. He became assistant professor in 1906 and from 1908 to 1935 was professor of pharmacology. His effective teaching and extensive researches won him recognition as one of America's foremost leaders in his chosen field. His work on digitalis and its allied drugs is recognized throughout the world. Together with Dr. J. G. Brody he developed a method for the assay of the digitalis bodies which, in a modified form, is the official method of the current Pharmacopoeia of the United States, and is the basis of the International Standard of the League of Nations. Through his investigations of the actions of digitalis he became interested in the physiology of emesis, to which he and his students and colleagues made many fundamental contributions. He regarded this work as his most important accomplishment

in the field of research. Other of his pharmacological investigations were studies on the absorption and elimination of drugs from the animal body, more especially with reference to strychnine and the local anesthetics. He also made extensive studies on the synergistic and antagonistic actions of many drugs.

In 1915, he, together with Martin I. Wilbert, published the *Pharmacology of Useful Drugs*. Later he edited *Useful Drugs* published by the American Medical Association. During his long professorial life he inspired several of his students and staff to enter the research and teaching fields in which they have held fast to the rigid standards of integrity and truth that were always his. Among those was the late Soma Weiss, Hershey Professor of Physics in the Harvard Medical School.

Hatcher was an indefatigable worker, as was so well demonstrated during his struggles for an education, and he retained this unflagging energy and interest in his work until well after his retirement from active teaching duties. He was a member of the Council on Pharmacy and Chemistry of the American Medical Association from its establishment in 1905 until his retirement in 1943 at the age of seventy-five. The Board of Trustees of the American Medical Association paid him the tribute of making him a life member of the Council, the first man ever to receive that honor. Among other honors that of Master in Pharmacy was conferred upon him by his Alma Mater in 1928 and Columbia University made him Doctor of Science one year later.

Besides being a fellow of the American Medical Association, he was a member of the American Pharmaceutical Association, the Association for the Advancement of Science, the American Society for Pharmacology and Experimental Therapeutics, the American Physiological Society, the Society for Experimental Biology and Medicine, the American Society of Biological Chemists, the Harvey Society, and the New York Academy of Medicine. From 1915 to 1916 he was chairman of the Section on Pharmacology and Therapeutics of the American Medical Association.

He married Mary Q. Burton of Lewes, Delaware, on December 28, 1904, who survives him, together with their only son, Robert Lee Hatcher.

His many colleagues of the Faculty and of the Council on Pharmacy and Chemistry will miss Hatcher's outstanding soundness of judgment and great wealth of pharmacological knowledge which, coupled with his unswerving devotion to the truth, made him a man with whom association was a highly prized privilege.

Baxter L. Hathaway

December 11, 1909 — March 29, 1984

In 1946, when he was thirty-six, Baxter Hathaway left the security of an associate professorship at the University of Montana to accept the risks of an untenured assistant professorship at Cornell and the challenge of developing a creative writing program within the English department. By the fall term of the following year, the new program had been approved and instituted; the series of courses that Baxter taught or supervised in 1947 still constitute, both in philosophy and structure, the undergraduate creative writing program. A nationally distributed magazine of new fiction and verse was such a key element in Baxter's plans that he and his wife, Sherry, and other members of the Cornell community launched the magazine with their own money and kept it going with various fund-raising events.

During his early years at Cornell, Baxter had to struggle against pedagogical resistance to creative writing courses within the department. At one point, in 1953, the popular success of the writing courses brought a reaction that threatened the program's very existence. In that year, the program, with only one member of the faculty (Baxter himself) with a rank above instructor, attracted half of the major students in the English department. Ultimately the problem—Baxter referred to it as “a bad situation all around”—was resolved through curricular reform and a general strengthening of staff. When Baxter retired from teaching in 1976, he left to the University the legacy of a nationally respected writing program, composed of undergraduate seminars in the sophomore, junior, and senior years and a graduate component leading to the M.F.A. degree, as well as *Epoch*, a magazine recognized by editors of the annual prize anthologies and readers of contemporary literature for its ability to discover talented new writers and for the general quality of its contents.

Soon after his retirement from Cornell, Baxter, always an innovator, began a new career as publisher, editor, and indeed as printer; he and Sherry established Ithaca House, a venture in publishing and in exhibiting and selling paintings and other works of art. Like *Epoch* and the creative writing courses at Cornell, Ithaca House quickly became an important means for the encouragement of talent in the visual arts as well as in the fields of poetry and fiction. In addition, Baxter for several years edited *The Cornell Review*, a quarterly of essays and creative work published by the College of Arts and Sciences. The editorial offices were on the second floor of the Ithaca House quarters on Plain Street, in downtown Ithaca, and he divided his time among the flatbed press and fonts of type in the basement, his desk in a corner of the gallery on the first floor, and *The Cornell Review* offices on the floor above.

Devoted for nearly four decades to the written work of others (at Montana he had taught creative writing and been in charge of the composition courses), Baxter still managed to engage in research that resulted in significant contributions to scholarship, for the energizing tension between scholarly or critical endeavor and creative writing that came to characterize the Cornell English department was part of his own nature. His published works include *A Transformational Syntax* (1967), a study of the grammar of modern American English; and *The Age of Criticism* (1962), a major investigation of sixteenth-century Italian philosophers and literary theorists who were influential in later critical discourse. He also wrote a rhetoric and experimental grammar, *Writing Mature Prose* (1951), and he edited, among other volumes, two books of stories written by Cornell students and a selection of stories from the first fifty issues of *Epoch*, published in 1966 under the title *Stories from Epoch*. Although his support of emerging writers and his study of critics of the past often took precedence over his own creative interests (in 1936, as a graduate student at the University of Michigan, he won Hopwood awards in both fiction and poetry; the novel that won the fiction award, *The Stubborn Way*, was published the following year), Baxter wrote poems for most of his life without striving much for their publication. A small selection of them, *The Petulant Children*, appeared in 1978.

Whatever his achievements, Baxter seemed to have an eternity of time at his disposal; always he was ready to go off to the Straight, to the Johnny Parsons Club, to Noyes Lodge, and later to the Temple of Zeus for a cup of coffee, to talk about serious and frivolous matters with students and colleagues. He delighted in taking an opposing position in such talks, simply for the sake of the argument. At the weekly *Epoch* editorial sessions, Baxter had the patience to consider the value of a metaphor in a poem or the dimension of a character in a story until the subject was properly disposed of. *Carpe diem* sentiments never had applicability to Baxter; for him, life seemed to flow on forever—which must have meant that on some level the extinguishing of his own life was something he didn't fear. Meanwhile—and here's the miracle—he not only wrote his books and poems, fought for his program, edited manuscripts, talked at length with students in conferences, prepared his lectures, and attended nearly every reading given by Cornell students and visiting poets, but had time left over for some fancy humming or for looking at birds and other aspects of the natural world that delighted him.

In an issue of the *Ithaca Times* published shortly before Baxter's death and largely devoted to his life and accomplishments, A. R. Ammons, a longtime member of the Cornell writing staff, gives a succinct description of what the founder of the program was like:

*Baxter named his own way in the title of his early novel **The Stubborn Way**. If conviction, persistence, determination, and courage are the good sides of stubbornness, then Baxter was commendably stubborn and faithful in his work at Cornell. Carrying on many pursuits at once—teaching, writing, editing—he fashioned a creative writing program much ahead of its time and one of the models for the creative writing courses now offered in almost every English department in the country. But programs as such were not Baxter’s chief end: programs were for him instruments by which to announce values that he admired in persons. These values he found in mastery of knowledge, flexibility of thought, innovative dissent, and any changing that seeks out and defines what endures.*

Baxter is survived by his wife, one daughter, two sons, an elder brother, and nine grandchildren. We want them all to know that we, too, miss him deeply.

James McConkey, Walter Slatoff, Scott Elledge

Hazel Marie Hauck

July 15, 1900 — April 23, 1964

The death of Dr. Hazel M. Hauck, Professor Emeritus of Food and Nutrition, brought to a close the active career of a distinguished member of the Cornell University Faculty. Miss Hauck served in the Department of Food and Nutrition in the New York State College of Home Economics for twenty-nine years, and was a member of the Faculty of the Graduate School of Nutrition from the time of its establishment in 1941 until her retirement in 1961. Her scholarly teaching, her contributions to research in human nutrition, and her international services in Thailand and Nigeria are widely recognized. She was a member of many college and University committees and a member of the board of Cornell United Religious Work; she was secretary of the University Faculty for three years.

Miss Hauck came to Cornell as Assistant Professor in 1932 from the University of Wisconsin, where she had received her Ph.D. degree in 1932 with a major in nutrition and a minor in medical science. She was promoted to the rank of full Professor in 1936. Before her appointment at Cornell she taught at the universities of Oregon, North Dakota, Washington, and Tennessee. She was a fellow of the American Public Health Association and of the American Association for the Advancement of Science, and was a representative of the American Dietetic Association in the latter organization. She held membership in Sigma Xi, Phi Kappa Phi, Omicron Nu, and Pi Lambda Theta.

Soon after her appointment to the Faculty Miss Hauck began the first human dietary studies conducted at the College of Home Economics. These studies contributed significantly to the understanding of human requirements for ascorbic acid, and were used by the National Research Council in establishing recommended dietary allowances.

Her nutrition and diet therapy courses were of major importance in the undergraduate teaching program, and her graduate courses were among the first taught at the College. Graduate students who worked under her direction held positions of leadership in many countries. Though Miss Hauck's standards were high, she never failed to recognize the potentialities of her students and always won their respect. In 1961 the students of the College voted her the distinguished professor of the year. She followed the careers of her students with genuine interest and was the first of the College Faculty to be elected to honorary membership in the College of Home Economics Alumnae Association in recognition of her continuing friendship with graduates.

Miss Hauck always sought to put the fruits of her scholarship to practical use in furthering human welfare, and her talent in finding means to do so was apparent in her own work in foreign countries and in the training of others for this same work. Especially noteworthy was her work with missionaries who came to Cornell under the auspices of Agricultural Missions Incorporated. In the spring of 1961 this organization presented her with a certificate for distinguished service in recognition of her twenty-eight years of Christian service to rural people. The citation read in part: "The hundreds of rural missionaries who profited by your friendship and your professional knowledge so graciously shared are serving in over forty different countries."

She was one of the first of the Faculty of the College of Home Economics to take a foreign assignment. In 1952-1953, under a Fulbright grant, she served as nutrition specialist for the Cornell-in-Thailand project under the leadership of Lauriston Sharp. Her work involved a systematic investigation of the food habits of the people in Bang Chan, a rural rice village. The study she conducted of the food supply and nutritional status of the people resulted in dietary recommendations of particular help to mothers and children, and led to further research in ways to improve the health of rural Thai.

In 1959-1960 she served as field consultant with the village improvement and leadership training program of the Unitarian Service Committee in Awo Amamma, Eastern Nigeria. In her experiments with 125 Ibo families, she was instrumental in demonstrating how they might incorporate into their diet a native and inexpensive food, the groundnut, which would increase the supply of those nutrients most lacking in the foods they normally consume. Her way of working with women as they prepared meals for their families demonstrated an effective technique for others to use in continuing education in nutrition.

Miss Hauck felt the importance of making her research findings available to others in the fields of nutrition and health. Her many articles appeared not only in American professional journals but also in such publications as the *Journal of Tropical Pediatrics and African Child Health*, the *West African Medical Journal*, and the *Journal of Obstetrics and Gynecology of the British Commonwealth*.

Soon after her return from Nigeria she became ill. Most of the data she had collected had to be prepared for publication under health restrictions, which would have made the task impossible for the average person, but with the valiant courage that was evident throughout her illness she brought her studies to completion.

In the memorial service held for Miss Hauck a young Nigerian educator from Awo Amamma, now studying in Ithaca, paid tribute to her as a worker among his people. As he described her work in remote villages, one realized again her courage, her understanding of how to work with groups struggling to develop better practices in nutrition, sanitation, and family welfare, her natural and unassuming empathy with these people. “Know you not,” he said, “that a great person has passed away from us.”

Helen H. Giff, Esther H. Stocks, Kathryn E. Walker

Charles Ernest Hayden

April 9, 1881 — January 25, 1948

Dr. Charles E. Hayden died at the Tompkins County Memorial Hospital in Ithaca on January 25, 1948. He was born in Syracuse, Ohio, on April 9, 1881. Dr. Hayden's illness was brief. He suffered a heart attack following the shoveling of snow from the sidewalk at his home and died a few hours later. All fall he appeared to be in his usual good health and was at his regular work the day before his death.

Dr. Hayden attended the public schools in Nelsonville, Ohio, and received the A.B. degree from Ohio University in 1909. He came to Cornell in 1909, entered the Veterinary College as a student in 1910, and received the D.V.M. degree in 1914. During his first year at Cornell he was assistant in veterinary physiology. From 1910 to 1914 he was instructor in that subject and from 1914 to 1929, assistant professor. He was promoted to the full professorship in 1929. On two occasions during his long career in the Veterinary College he was acting head of the Department of Physiology.

Dr. Hayden was a member of the American Veterinary Medical Association, the New York State Veterinary Medical Society, and the Southern Tier Veterinary Medical Association. He was secretary-treasurer of the New York State Veterinary Medical Society for 14 years and treasurer for an additional 7 years. He was a fellow of the American Association for the Advancement of Science and a member of the Society for Experimental Biology and Medicine. Dr. Hayden held membership in the honorary societies of Phi Zeta, Sigma Xi, and Phi Kappa Phi. He was business manager of the Cornell Veterinarian.

Dr. Hayden's research work on the normal constituents of the blood and urine of animals and on the metabolic disorders of animals made him an internationally recognized authority in these fields. He was one of the first veterinarians in this country to apply the modern methods of blood analysis to the blood of animals in health and disease. He published many scientific papers as an outgrowth of this work.

As a teacher Dr. Hayden was held in the highest esteem by his pupils. His long experience in and wide knowledge of his subject, his phenomenal memory, his kindness and fair-mindedness, made lasting impressions on his students. In spite of his impairment of hearing, he was a master of the art of classroom recitation at the college level. The eagerness with which alumni visiting the College sought him out for personal greetings and to obtain his advice on difficult cases involving particularly the metabolic disorders, attests to the high regard in which he was held.

For many years Dr. Hayden applied with great skill and insight the technics of clinical chemistry to the diagnosis of animal diseases. Not only did the clinicians of the Veterinary College frequently call on him for this important service but many practitioners of this and other States are indebted to him for help in this special area. In this work Dr. Hayden was unequaled in experience, knowledge, and ability in the veterinary colleges of this country.

In January, 1948, the Alumni Association of the New York State Veterinary College authorized the painting of a portrait of Dr. Hayden to be placed in the College library. At the time of Dr. Hayden's death plans were being made to [begin] the portrait.

Dr. Hayden will be remembered by his co-workers not only for the solid scientific achievements just mentioned but also for his quiet friendliness, his unfailing courtesy, his high ideals, his loyalty to his institution, his colleagues and his work, his deep integrity of character, and his constant willingness to be of service to others. When he undertook a task or obligation of any sort, large or small, it was known without question that he would give it careful, efficient attention to the last detail. Such was the character of Charles Hayden.

D. W. Baker, H. H. Dukes, J. N. Frost

Donald Pearce Hayes

November 30, 1927 — October 17, 2006

Donald P. Hayes, Professor Emeritus of Sociology, died at his home in Cayuga Heights on October 17, 2006. Professor Hayes was born in Baltimore, Maryland in 1927, the son of missionaries working in the vicinity of Foochow (now called Fuzhou) in China. He lived in China until the family's continued stay was made impossible by the outbreak of the Sino-Japanese War in 1937. His family settled in South Pasadena, California, where Don attended public schools.

Don left home at 15 to work on an orange ranch owned by family friends in nearby Claremont. At 16, he worked as a dorm counselor and bus driver at the Norton School in Claremont, where he graduated in 1946. He then enlisted in the U.S. Army, serving with the 88th Division on a peacekeeping mission at the Italian-Yugoslav border.

After completing his military service in 1948, Don enrolled at Pomona College, where he earned a B.A. degree in 1952. His freshman year, he met Florence (Lolly) Colburn, also a freshman at Pomona, whom he married in 1950. Attracted by the science-oriented graduate program in Sociology at the University of Washington, he enrolled in 1952 and received his degree in 1959, studying under George Lundberg and Frank Miyamoto. He then spent a year as a Postdoctoral Fellow at the Department of Social Relations at Harvard, followed by another year back in Seattle.

He joined the faculty of the University of California in Riverside in 1962 as Assistant Professor of Sociology. The following year, 1936, he came to Cornell, where he spent the rest of his academic career, retiring as Professor Emeritus in 1998. At Cornell, he served as Director of the Social Psychology Laboratory, Director of Undergraduate Studies, Director of Graduate Studies, Department

Chair, Secretary of the Graduate Faculty, and member of the University Senate. He served on the Undergraduate Admissions Committee for the College of Arts and Sciences for over 20 years, and the College's Human Subjects Committee for over 25 years. In his positions of academic leadership, he advocated for a natural science orientation for the social sciences, with an emphasis on quantitative measurement and analysis.

Don and Lolly had five children. All four daughters graduated from Cornell and went on to earn doctorates in law from Cornell (Peggy and Judy), and Harvard (Leslie and Louise). His son, Bruce, graduated from Harvard and earned a doctorate in linguistics from MIT.

Don's research reflected his belief that the methods of the natural sciences, particularly the use of objective measures and controlled experiments, can be successfully applied to the study of social life and human interaction. His work influenced the direction of the discipline and made lasting interdisciplinary contributions to social science. With Leo Meltzer, Don showed that experimental subjects can make accurate judgments of affect in a three-way conversation by attending only to a panel of lights that were illuminated during the time the participants were speaking. Long before it became fashionable, he emphasized biological influences on human behavior. In a research collaboration with Loren Cobb supported by the NIH and NSF, Don monitored subjects living in isolation for long periods in the Social Psychology Laboratory. They found that biological rhythms with a range of periodicities governed the subjects' propensity to engage in spontaneous speech.

The impact of his research extended beyond the scientific community. In a study with Judith Grether, he found that summer vacation plays an important role in differences in student achievement, with at-risk students falling behind their peers more during the summer months than during the academic year. He developed a replicable measure of lexical difficulty (LEX) by gathering thousands of texts from libraries, archives, and human subjects (<http://www.soc.cornell.edu/hayes-lexical-analysis/schoolbooks/>). Using the LEX measure, he tracked changes in the intelligibility of scientific articles, with the results published in *Nature* in 1992. Working with Margaret Ahrens, he also applied LEX to the "motherese" hypothesis in child language acquisition. In work that dominated Don's Emeritus years, he gathered hundreds of American textbooks and dozens more schoolbooks from Canada, France, Sweden and New Zealand, and compared their LEX scores with time series verbal test scores. He concluded that simplification of schoolbook vocabulary over the decades correlated to students' declining vocabularies and general knowledge. Although he formally retired from Cornell as Professor Emeritus in 1998, he actively continued his research on language. His principal publications included:

Hayes, Donald P. and Leo Meltzer (1972) Interpersonal judgments based on talkativeness: fact or artifact? *Sociometry* 35: 538-561

Hayes, Donald P. and Loren Cobb (1979) Ultradian biorhythms in social interaction. In Siegman, A. & Feldstein, F. (eds.) *On Time and Speech*. Hillsdale, New Jersey: Erlbaum, pp. 57-70.

Hayes, Donald P. and Judith Grether (1983) The school year and vacations: When do students learn? *Cornell Journal of Social Relations* 17: 56-71.

Hayes, Donald P. (1988) Speaking and writing: distinct patterns of word choice. *Journal of Memory and Language* 27: 572-585.

Hayes, Donald P. and Margaret G. Ahrens (1988) Vocabulary simplification for children: a special case of 'motherese?' *Journal of Child Language* 15: 395-410.

Hayes, Donald P. (1992) The growing inaccessibility of science. *Nature* 356: 739-740.

Hayes, Donald P., Loreen T. Wolfer, and Michael F. Wolfe (1996) Schoolbook simplification and its relation to the decline in SAT-Verbal scores. *American Educational Research Journal* 33: 489-508

Michael Macy, Chair

Irving Samuel Haynes

August 29, 1861 — October 9, 1946

Irving Samuel Haynes was born on August 29, 1861 in Saranac, N. Y. the son of Samuel and Phoebe Ayre Haynes.

He received the degrees of Ph.B., in 1885, and Sc.D. in 1915, both of them from Wesleyan University; and the degree of M.D. in 1887 from the New York University Medical College.

After graduation in medicine, he served an internship in Bellevue Hospital and later became Attending Surgeon at the Harlem Hospital, the Red Cross Hospital and the Reconstruction Unit of the Post-Graduate Hospital, all in New York City.

He joined the teaching faculty of Cornell University Medical College as Professor of Practical Anatomy from 1898 to 1909, and as Professor of Clinical Surgery from 1910 to 1926, when he was made Professor of Clinical Surgery, Emeritus.

Some years ago he removed his practice to Plattsburg, N. Y. where he was appointed Attending Surgeon to the Physicians Hospital, which later he served as Medical Superintendent; also, he acted as Consulting Surgeon to the Glens Falls (N. Y.) Hospital.

Throughout these years he continued to hold the position of Consulting Surgeon to the Harlem and the Reconstruction Hospitals of New York City.

He was a Fellow of the New York Academy of Medicine, a member of the New York Surgical Society, and a Fellow of the American College of Surgeons.

He was author of a "Practical Guide for Beginners to the Dissection of the Human Body," also, of a "Manual of Anatomy." In addition to these books, he made contributions to the activities of the New York Surgical Society by writing and delivering papers on surgical subjects and presenting interesting surgical cases. He was an eminent teacher of anatomy and a surgeon of ability and originality and possessed of excellent surgical judgment.

In the early days of brain surgery, he developed the technic of surgical approach for the "Exposure and Drainage of the Cisterna Magna in Meningitis"; also, he devised an original operation for the "Repair of Large Ventral Hernias."

Of a naturally quiet and unassuming disposition, he nevertheless possessed the qualities of character and kindness and a sense of dry humor which endeared him to his colleagues and students and to his patients, by all of whom he was highly regarded.

There was no ostentation, no aggressiveness about him, but everyone felt the underlying strength of character and integrity beneath the calm exterior.

His unselfish devotion to his patients and students and his service to the communities in which he dwelt, exemplified the highest ideals of the medical profession which he adorned by a life of greatest usefulness to humanity.

Seward Erdman

George Harris Healey

May 10, 1908 — November 16, 1971

The death of George Harris Healey, professor of English and curator of Rare Books, was a severe loss to Cornell. His deep loyalty to the University over a period of thirty-one years, and the value of his many and varied contributions to its work earned him an enduring place in the roll of dedicated Cornellians.

He was born in Wellsville, New York, the son of Edmund James and Annabelle Harris Healey. After graduating from high school, he worked for a year before going to college. At West Virginia University he was awarded his A.B. degree with a major in philosophy in 1932, and his M.A. degree in English in 1935. As an undergraduate he was a member of Phi Delta Theta fraternity and was elected president of the student body. In 1934-35 he was an instructor in English at West Virginia and from 1938 to 1940 an assistant professor at Judson College in Alabama. In 1938 he married Rita Mae Slaughter of Buckharmon, West Virginia. She and their three children, Anne, George, Jr., and Linda, survive him.

He came to Cornell as a candidate for the Ph.D. in English in 1940, and served as a part-time instructor for two years, before enlisting in the Army Air Force in 1942. As an intelligence officer, he rose to the rank of captain, and in 1946, the year of his retirement from the service, he was awarded the Legion of Merit.

He returned to Cornell as the Martin Sampson Fellow in English and was awarded his doctorate in June, 1947. For the rest of his life he was a member of the Department of English: assistant professor, 1947-53; associate professor, 1953-57; professor of English and curator of Rare Books, a joint appointment with the University Library, 1957-71. He was a member of the Bibliographical Society (London), of the Bibliographical Society of America, and of the Grolier Club.

No summary of his career, however, can adequately describe the extent to which George Healey contributed to the life of Cornell — as a master teacher, a distinguished scholar, a successful administrator, and a magnanimous colleague. His survey course in British Literature, deservedly popular with undergraduates from every college in the University, was the most heavily enrolled course in English. His work as scholar and editor was always definitive. His books included: *Wordsworth's Pocket Notebook* (Ithaca: Cornell University Press, 1943); *The Meditations of Daniel Defoe* (Cummington: Cummington Press, 1946); *The Letters of Daniel Defoe* (Oxford: Clarendon Press, 1955); *The Cornell Wordsworth Collection: A Catalogue* (Ithaca: Cornell University Press, 1957); *The Dublin Diary of Stanislaus Joyce* (London: Faber and Faber, 1962); the last was republished with added material

in 1971 by Cornell University Press. During his fourteen years as the University's first curator of Rare Books, the Library greatly improved its famous Dante, Petrarch, and Wordsworth Collections — thanks to his scholarship, imagination, and love for learning, for books, and for Cornell. Even more remarkable, perhaps, was his success in enlisting the support of generous donors who made possible the purchase of the books and papers which now constitute Cornell's twentieth-century collections: the superb Joyce Collection, the Wyndham Lewis Collection, the Ford Madox Ford Collection, the Shaw Collection. Under George Healey's curatorship Cornell's collection of rare books and manuscripts became one to be reckoned with by literary scholars everywhere.

Apart from performing his professional duties so admirably, he was always generous of his time in serving the University community. For many years he was secretary of the local chapter of Phi Beta Kappa, and also of the Library Associates, which grew and flourished with his assistance. He helped to found and was the first editor of the *Cornell Library Journal*. For years he served on the University's Commencement Committee, and for many years he proudly bore the mace at the head of academic processions. In 1964-65 he was chairman of the committee which planned Cornell's highly successful Centennial celebration. A superlative speaker and lecturer, he was in constant demand for appearances before alumni gatherings both on and off campus.

The generous response to a posthumous appeal for funds for a Memorial Book Fund amply testified to the respect, admiration, and affection that alumni, colleagues, and students felt for George Healey. The success of that appeal was due in good part to the recognition of him not only as a distinguished scholar, teacher, colleague, and Cornellian, but also as a man, a warm and generous person who made many friends. He was not only a humanist, a bookman, and a gifted musician, but a human being with a contagious zest for the good things in life. Most of all he enjoyed people. As one colleague wrote: "His booming welcomes to those who entered his office or called him on the telephone were joyous occasions. His quiet excitement when he examined a newly arrived book or manuscript was equally intense." His voice was unforgettable; it was distinctively his own, evident in his writing as in his speech. After his death, another wrote: "No more those wonderful, affectionate, witty, ironic, compassionate letters, no more that warm voice full of levity and learning. We shall not hear its like again."

Scott Elledge, Arthur Mizener, Francis E. Mineka

John William Hebel

Professor of English

April 1, 1891 — February 7, 1934

John William Hebel was born in Auburn, Indiana, April 1, 1891. He graduated from the University of Indiana in 1912, and received his Doctor's degree at Cornell in 1920. He had also studied at the University of Jena in 1910, and at the Sorbonne in 1919.

When the United States entered the World War, he enlisted as a private in the 151st Infantry of the National Guard. He attained the rank of Captain, served in various Divisions, went to France with the American Expeditionary Force and, after the Armistice, to Germany with the Army of Occupation.

Beginning as Instructor of English at Cornell in 1914, he became Professor of English in 1929.

His great interest was in English poetry, particularly that of the spacious times of Elizabeth and of the Seventeenth Century. He edited Drayton's *Endymion and Phoebe*, 1915; and (with Hoyt Hudson), *Poetry of the English Renaissance*, 1929; John Donne's *Biathanatos*, 1930. His finest and most scholarly work was an edition in five volumes of *The Works of Michael Drayton* which he prepared for the Shakespeare Head Press in England. Of this four volumes have been published and have established Professor Hebel's reputation as a scholar both in England and America. His future held great promise.

His loss to the University is both professional and personal. He was an allround man, a scholar without being a pedant. He loved life, and he knew how to make wise use of its good things. It was because of this combination of humanness and true scholarship that he was a fine teacher. Students found in him a man helpful and sympathetic; one who made them feel that literature was not a mere dust of words but a thing vital, joyous, inspiring. Hence his large following, and his effectiveness as a teacher.

Although burdened with his own work he was never too busy to give time to his Department and to committees of the Arts College and the University. In all this his energy, his geniality, and his sanity made his opinions valuable and his influence great.

This work outside his Department made him known to men in his own and other colleges, and whoever knew him became his friend.

In his passing the University has lost an able and lovable figure. As Professor Hebel he will be greatly missed in the world of scholarship and in this institution. But it is Bill Hebel whom those who knew him will chiefly mourn.

Glenn Wilbur Hedlund

June 11, 1909 — June 24, 1976

Professor Glenn W. “Swede” Hedlund died at age sixty-seven at his home, 110 Homestead Road, Ithaca, following a brief illness. He had joined the staff of the New York State College of Agriculture in 1933 and was associated with Cornell until retirement in 1974, except for five years, 1941-46, when he was professor and head of the Department of Agricultural Economics and Rural Sociology at Pennsylvania State University. During sixteen of the thirty-one years that he spent on the Cornell faculty, he was head of the Department of Agricultural Economics.

Professor Hedlund received his B.S. degree from the University of Nebraska in 1930 and his Ph.D. from Cornell University in 1936. Reared on a wheat farm in Nebraska, he had a deep interest in extension education essential to the growth and development of agriculture. At Cornell his teaching responsibilities were focused on agricultural cooperatives, farm finance, and marketing. He was an effective teacher, interested in students and their problems, and provided the same quality of leadership in research and extension in his field of business management and marketing.

Hedlund’s positive influence on agricultural cooperatives was one of his most important professional contributions. Over four decades his leadership directed cooperatives toward improved business management and was of tremendous importance in building the strong cooperative institutions that serve the agricultural economy of the state and nation.

Instrumental in the formation of the New York State Council of Farmer Cooperatives, he provided program leadership for the organization from its inception. He served both as secretary of the council during most of its existence until his retirement in 1974 and as a trustee of the American Institute of Cooperation for some years, participating in many of the educational programs of the institute.

Professor Hedlund served mankind and Cornell in many ways, acquiring depth, knowledge, and understanding of people, situations, and conditions far beyond the Cornell community. While a graduate student he participated in extension education in Nebraska and New York State. As an agricultural economist on the faculty of the University of Nanking, China, during 1936-37, he traveled in the Near East and Far East. Over the next sixteen years, Hedlund served on various committees, engaged in studying the agriculture of Bermuda for the Bermuda Government in 1939, studying and reporting on the organization and operation of the Farm Credit System for the

Farm Credit Administration in the 1940s and acting as chairman of a group studying cooperatives in relation to the milk marketing orders during 1952-53.

During the academic year 1956-57, Professor Hedlund worked in the Philippines on the University of the Philippines—Cornell contract (ICA-AID) toward the rehabilitation of the College of Agriculture at Los Banos. He served as chairman of Governor Nelson Rockefeller's Committee on Milk Marketing from 1961 until 1964, when he became a consultant for the Ford Foundation relative to education for employees of cooperatives in India. His sabbatical leave in 1972 was spent lecturing, consulting for the Agricultural Development Fund of Iran, and traveling in Europe and the Mideast. In the fall of 1975, Professor Hedlund served as a member of a five-man team (U.S. AID) requested by the government of Bangladesh to evaluate the total plant protection program of that country.

In 1953, Professor Hedlund was cited by the Farm Credit Banks of the Northeast in Springfield, Massachusetts, for his "outstanding service to agriculture in the Northeast." Upon his retirement from Cornell, the cooperative organizations concerned with agriculture in New York State initiated the establishment of the Glenn W. Hedlund Scholarship Fund in recognition of Dr. Hedlund's contributions to agriculture in the state and nation.

To his colleagues and to agricultural leaders with whom he worked, Professor Hedlund was not only a trusted and loyal friend but also an objective and honest observer and critic, able to separate educational activity from giving advice or proposing decisions for others. He thought first of the welfare of the Department of Agricultural Economics and the College of Agriculture as a whole and of their service to commercial agriculture and its institutions. His selflessness and concern for the welfare of his colleagues was one of his lasting legacies to those with whom he worked.

Professor Hedlund is survived by his wife, Helen Howard Hedlund; a son, James Howard of Washington, D. C; two daughters, Mrs. John (Jean) Sullivan of Seattle, Washington, and Mrs. Peter (Mary Beth) Marks of Brooktondale, New York; and three grandchildren.

Olaf F. Larson, Robert S. Smith, Maurice C. Bond

Jay Eldred Hedrick

July 17, 1909 — June 10, 1981

Jay Hedrick, professor emeritus of chemical engineering, died on June 10, 1981. He was born in 1909 in Meredosia, Illinois; he received his Bachelor of Arts degree in chemistry from Illinois College, and his Master of Science and Doctor of Philosophy degrees in chemical engineering from the State University of Iowa at Ames. Jobs were scarce in 1934, even for a Ph.D. chemical engineer, but Jay found employment with the Iowa Coal Laboratory, with the Iowa Public Health Department, and then, for five years, as instructor in chemical engineering at Kansas State College, where he directed research projects on petroleum and coal. Many of the present-day proposals for coal utilization were studied and evaluated by Jay in the late 1930s.

A few months before Pearl Harbor, Jay left Kansas to join Shell Oil in San Francisco as technical supervisor (and later as senior engineer and senior technologist). For eight months in 1944-45 he was on leave from Shell to work at the War Production Board in Washington. At the end of the war he was very happy to return to San Francisco; so when Shell moved its offices to New York City in 1949, Jay reluctantly went along but began to look for something new—preferably an academic position in a semirural area.

At this time, Fred H. “Dusty” Rhodes, director of the School of Chemical Engineering, was looking for a senior professor with industrial experience. Once Jay learned of this, things moved quickly. In September 1949 he joined the chemical engineering faculty, bought a house in Cayuga Heights, and became an Ithacan for the rest of his life. Jay claimed that what Dusty really wanted was someone to join (and be fleeced at) his weekly poker sessions: “I fitted right in,” said Jay. “I was a lousy poker player.”

Jay taught a variety of chemical engineering courses during his twenty-six years at Cornell, mostly in process economics, commercial development, and chemical product marketing. He served on numerous committees of the school, college, and University, among them the Centennial Planning Committee, the University Council, and the University Lectures Committee. For some years he was faculty adviser to the student chapter of the American Institute of Chemical Engineers. From 1953 to 1956 he was assistant dean of the College of Engineering (“I was a mouse,” he said, “learning to be a rat.”); but when Dean S. C. Hollister retired, Jay elected to leave administration and return full-time to the less rodentlike world of teaching.

For many years Jay was a consultant to Shell Oil and other organizations, chiefly on matters of product development, commercialization, and marketing. He retired in July 1975 and was named professor emeritus, but he continued to

come to his office in Olin Hall nearly every day and kept up an active program of consulting and research. He was a member of the American Institute of Chemical Engineers, the American Chemical Society (chairman, Cornell Section, 1952), Alpha Chi Sigma, Phi Lambda Upsilon, Sigma Xi, and Tau Beta Pi; and a fellow of the American Institute of Chemists. He is listed in *Who's Who in America*.

His first wife, Mary Ellen, died in 1957, leaving him with four children— a boy and three girls. A few years later he married Betty Cook and had another daughter when he was fifty-five. He once threatened to write a book called “My Fifty Years in the PTA.” When he died he had eleven grandchildren, all girls.

Phrases that come to mind in describing Jay are warm-hearted, friendly, informal, helpful, knowledgeable, and keenly interested in current affairs. He went out of his way to help young professors get started. He always tore up his lecture notes when a course was over, to insure that next year's would be up to date. He never lost interest, even after retirement, in the condition and potential developments of chemical commodity markets. Toward the end of his life he assembled detailed genealogical information about his family for presentation to his children. He was an excellent conversationalist; he loved to talk, and did so with authority, on a wide range of subjects. He was also noted for his delightful sense of humor.

But most outstanding of Jay's qualities was his courage. Beset by cancer even before he retired, he endured four major operations and recovered remarkably from them all. He was always cheerful and forward-looking, never gloomy; he exercised faithfully and, with his wife Betty, rode his bicycle several miles a day around the streets of Cayuga Heights. His attitude toward his illness was extraordinary.

Jay Hedrick was an effective teacher, a knowledgeable researcher and consultant, a respected colleague, a truly good neighbor, and a beloved and loving husband and father. We will all miss him greatly.

Blanchard L. Rideout, Charles C. Winding, Julian C. Smith

Ulysses Prentiss Hedrick

January 15, 1870 — November 14, 1951

Ulysses Prentiss Hedrick died in the Clifton Springs Sanitarium on November 14, 1951, following a long illness. He was born on a farm near Independence, Iowa, on January 15, 1870. He married Amy Willis Plummer, who survives him, in Corvallis, Ore., on June 27, 1898. Other survivors include a son, Major Ulysses Prentiss Hedrick, Jr., a daughter, Mrs. Guy S. Greene; four grandchildren, and two great grandchildren.

Doctor Hedrick graduated from Michigan State College in 1893 with the B.S. degree and received the M.S. degree from that institution in 1895. Hobart College conferred the Sc. D. degree upon him in 1913 and Utah State College in 1938. He was the recipient of many honors in the field of horticulture, including the George Robert White medal bestowed upon him by the Massachusetts Horticultural Society in 1925 for “eminent service in horticulture” and the Wilder medal awarded by the American Pomological Society in 1929 for his publications and fruit breeding work.

Doctor Hedrick was a member of Sigma Xi, the American Association for the Advancement of Science, the American Society for Horticultural Science of which he was president in 1913, the American Pomological Society, a fellow of the Royal Horticultural Society of England, and a director of the New York State Fruit Testing Cooperative Association since its initiation in 1918. He was the first president of the New York State Horticultural Society upon the formation of that society by the union of the New York State Fruit Growers Association and the Western New York Horticultural and of the State Historical Association. In 1930 the National Grange, at its annual meeting, made him a seventh degree member of the Order of Patrons of Husbandry.

Following various appointments with Michigan State College, Oregon State College, and the Utah State College, Doctor Hedrick came to the Experiment Station at Geneva in 1905 as head of the Department of Horticulture. In 1921 he was named Vice Director of the Station and in 1928 Director. He served in that capacity until his retirement in 1938, when he took up residence in Geneva and devoted his time to writing.

Active in many phases of horticultural research, Doctor Hedrick was best known for his contributions to the breeding of new fruits and for his writings on horticultural subjects. He supervised the preparation of monographs on grapes, plums, cherries, pears, and the small fruits and on sweet corn, peas, beans, and the cucurbits. He edited “Sturtevant’s Notes on Edible Plants” and was the author of “Cyclopedia of Hardy Fruits”, “Manual of American Grape Growing”, and “Systematic Pomology”. He was also the author of numerous articles in scientific journals

and of several Experiment Station bulletins. From 1922 to 1937 he served as Associate Editor of the *Journal of Pomology and Horticultural Science*, published in London. In 1933 he was commissioned by the New York State Agricultural Society to write "The History of Agriculture in the State of New York".

Since retirement his writing included a partly biographical account of his early life in Michigan under the title of "The Land of the Crooked Tree", "Grapes and Wines from the Home Vineyard", and "Fruits for the Home Garden". His last work, published shortly before his death, is entitled "A History of Horticulture in America to 1860."

At Geneva, Doctor Hedrick's memory is enshrined in "Hedrick Hall" by action of the Board of Trustees of Cornell University which authorized the naming of the building which houses the Divisions of Pomology, Vegetable Crops, Plant Pathology, and Seed Investigations, following Doctor Hedrick's retirement. Much of the landscaping around the Station grounds is also tangible evidence of his interest in things horticultural, for the beautification of the grounds was of major concern to him during his term as Director.

In his writings and his scientific contributions, Doctor Hedrick has left a lasting impression on fruit growing in New York State and in the United States. His colleagues at Geneva and Ithaca and throughout the nation will remember and honor him as a distinguished scientist, scholar, historian, and gracious gentleman.

J. D. Lockett, L. H. MacDaniels, Richard Wellington

Arthur J. Heinicke

October 23, 1892 — February 2, 1971

Arthur John Heinicke was born in St. Louis, Missouri. His early education was in Missouri, where he received his B.S.A. in 1913 and M.A. in 1914 from the University of Missouri at Columbia. In 1914 he came to Cornell University as an instructor in pomology. This initiated a period of forty-six years of exceptionally dedicated service to the University. After receiving his Ph. D. from Cornell in 1916, he was appointed an assistant professor of Pomology. He became professor in 1920 and head of the Department of Pomology on the Ithaca campus in 1921.

It is rare, indeed, to view a career of service to Cornell that covers such a long span of years and with the degree of dedication and contribution.

In the period between 1914 and 1942, he gained stature as a world-renowned leader of pomology teaching and research investigations. One of his greatest gifts was in the development of student pomologists. Many of his graduate students went on to become great teachers, researchers, and university administrators. There is no doubt that the examples set by Professor Heinicke as a leader, and his encouragement and constructive criticism for colleagues and students, had a lasting effect on those with whom he was associated.

In research, too, he was a pioneer. His published observations on seed effects on fruit abscission were helpful in explaining the growth substance concepts that evolved years later. He initiated perennial plant photosynthesis studies on apples that were unique for his era of research. He published numerous scientific articles covering these research findings.

In 1942 Professor Heinicke was appointed director of the New York State Agricultural Experiment Station at Geneva, succeeding Professor P. J. Parrott. At the same time, he assumed the position of head of the pomology departments on both the Geneva and Ithaca campuses.

During his directorship, Dr. Heinicke emphasized the role of the Geneva Station in conducting research on the production and development of horticultural crops and the processing and utilization of fruit and vegetable products. Since then, the Geneva Station has been regarded as one of the most important horticultural research institutes in the world. During the war years, Dr. Heinicke took a personal interest in developing a research program that would provide proper guidance to growers and food processors faced with a heavy demand for foodstuffs but handicapped by shortages of labor, machinery, and supplies. Under his leadership, this was accomplished, retaining the essential scientific framework.

During his tenure as director, Dr. Heinicke was responsible for obtaining a central heating plant for the Station, new greenhouses, a controlled plant growth facility, and the most modern food research laboratory in the country, which was dedicated just two months before his retirement.

He always stressed to the research staff the importance of maintaining a comprehensive research program that was scientific, as well as providing the answers to pressing agricultural problems in New York State.

Professor Heinicke was a member and active participant in the American Society for Horticultural Science, the International Society for Horticultural Science, Sigma Xi, Alpha Zeta, and the New York State Horticultural Society. In 1937 he served as president of the American Society for Horticultural Science. He served on many regional and national committees important to the development of research programs at experiment stations.

Following his retirement as professor emeritus in 1960, Professor Heinicke and his wife moved to Ithaca, where he continued his interest in research in apple physiology. Until his death, he was a regular visitor to his office in the Department of Pomology in the Plant Science Building. It was characteristic of him to continue to attend meetings of horticultural groups to exchange views on subjects relating to fruit culture.

Professor Heinicke is survived by a son, Arthur John, who resides in Ontario, New York; a sister living in Syracuse, New York; and a brother living in Missouri.

For his many friends on the Ithaca and Geneva campuses, it is rewarding to know that many of Professor Heinicke's personal observations on the early history of the College of Agriculture, the Experiment Stations, and the two great Departments of Pomology are stored for future study in the oral history archives of Cornell.

W. T. Schroeder, N. J. Shaulis, D. W. Barton

Frederick E. Heinzelman

1894 — March 6, 1964

Service to young people marked the life of Frederick Emil Heinzelman. He devoted 31 years to 4-H Club Extension Work in New York State, including 20 years as Assistant State 4-H Club Leader.

His career in 4-H leadership began in 1923 as a County 4-H Club Agent in Onondaga County, which post he held for eleven years. He was appointed Assistant State 4-H Club Leader in 1934 and continued to serve in that capacity until retirement. In 1939 he was awarded the rank of Associate Professor in the New York State College of Agriculture, and became a full Professor in 1942. Following his retirement in 1954, he was honored with the title of Professor Emeritus in the Extension Service.

Bringing organized 4-H Club work to counties not having it was one of his special duties while at Cornell. He was instrumental in getting 4-H Club work organized in eighteen new counties throughout the state.

Professor Heinzelman directed the New York State 4-H Club Congress from 1937 through 1954, providing annually at Cornell several days of educational programs for approximately one thousand club members. He served as treasurer of the Club Agents' loan fund for 4-H Club members and often handled the details for New York's annual participation in the National 4-H Club Congress at Chicago, Illinois. Among his many other duties was to act as adviser to the State 4-H Club Council and three district councils composed of older 4-H Club members. His deep personal interest in these young people was shown by his arranging to share his home each year with several of them who were entering Cornell as freshmen.

In 1942-1943, Professor Heinzelman was asked to assist in procuring kitchen equipment for the wartime farm labor camps in New York State, and he achieved excellent results in spite of shortages of materials.

In 1948, at the National 4-H Club Camp in Washington, D.C., he was presented with a 25-year service award by the Federal Extension Director, and in 1955 he received the national award of the Citation and Medallion for 4-H Club leadership.

Born in Warwick, New York, Mr. Heinzelman attended public schools there; later he attended the Mt. Hermon Preparatory School. After serving in the Army during World War I, he attended Cornell University, receiving a B.S. degree in 1923.

He was a member of Epsilon Sigma Phi, honorary extension fraternity, and Phi Delta Kappa, honorary education fraternity.

He was a deacon in the First Presbyterian Church of Ithaca for three years, and served as an elder and president of the Board of Trustees in the Presbyterian Church of Liverpool, New York. Since retirement, he had been a member of the Encinitas, California, Community Methodist Church.

He was affiliated with the Masonic Lodge in Liverpool and became a charter member of the San Diefuito Lodge in 1957.

As a member of both the Syracuse and Ithaca Kiwanis Clubs for forty years, he was instrumental in promoting the interest of New York Kiwanians in 4-H Club work. He was president of the Ithaca Kiwanis Club in 1941 and served several times as chairman of the agricultural committee.

Following his retirement in 1954, he and his wife Wilma moved to Encinitas, California, where he pursued his hobbies of trailer travel, stamp collecting, and gardening.

Harold Sweet, Harold Willman, Albert Hoefler

Charles Roy Henderson

April 1, 1911 — March 14, 1989

Charles R. Henderson came from Iowa to Cornell in 1948 as associate professor of animal breeding. Three years later he was promoted to professor and head of the Animal Breeding Division of the Animal Science Department. Under his leadership the Division soon grew to be of outstanding renown, with Professor Henderson (“Chuck” to all who knew him) himself publishing some 171 papers during his 29 years up to retirement, and training some 70 graduate students who came to him from all round the world. The attraction was not experimental work on planned breeding programs. It was Chuck’s own prowess at using statistical analysis of (usually dairy) production records for identifying animals from which to breed successive generations that are likely to be superior in terms of the yield of economically important products such as milk, meat, wool, and eggs.

Charles Roy Henderson was an Iowan through and through, born and raised on a farm in Coin, Page County, Iowa. He obtained his three degrees from Iowa State College (now University): a B.S. in animal husbandry, 1933; an M.S. in animal nutrition, 1935; and the Ph.D. in 1948. From 1935 to 1940 he held a series of positions of increasing responsibility with the Iowa Extension Service. Then in 1941 he became an instructor at Ohio University, and in 1942 he joined the U.S. Army, rising to major and Commanding Officer of the Army Medical Nutrition Laboratory in Chicago before ending his term of duty in 1946. He then went back to Iowa State College and in two years, before coming to Cornell, earned his Ph.D. in animal breeding, with a minor in statistics.

Chuck’s arrival at Cornell coincided with the early growth of the technique of artificial insemination in dairy cattle. The idea that this technique could be a means of increasing milk production per cow was Professor Henderson’s. It depends upon selecting those bulls for use in artificial insemination (by means of which they will each sire thousands of cows) which can be expected to sire cows that will be high producers of milk, indeed preferably higher than their dams. Professor Henderson’s forte was his outstanding and lifelong ability at developing reliable methods for using dairy cow production records to this end. This involved developing (and continually improving) new statistical procedures, the mathematics underpinning them, and the techniques for adapting them to an ever-changing array of computers. The result was a series of constantly-improving methods for establishing numerical evaluation of the genetic worth of animals as parents of a next generation, be they dairy cattle, beef cattle, sheep, swine, or poultry. Chuck Henderson’s prime interest was in dairy cattle, and the resulting world-wide increases in per cow milk production that can be attributed to his methods. Nevertheless, his methods are also applicable to

increasing the productivity of all agricultural livestock and are widely used throughout the world. In this work he was a young and rising star when he came to Cornell in 1948. His first lecture one fall began with the remark that “When I see a herd of cows I don’t see horns and hooves, I see a mean and standard deviation.” He quickly grew to be the shining light that blazed around the world insofar as improving livestock production through breeding was concerned. Moreover, although he formally retired from Cornell in 1976 and became professor emeritus, he never retired from being innovative and developing new ideas. In the succeeding 13 years he published a book and more than 50 papers.

Professor Henderson was highly successful not only in applying statistical procedures to the genetic problems that interested him, but also in developing new statistical procedures themselves, notably in the extension of analysis of variance that is known as variance components estimation. Indeed, his landmark 1953 paper in “Biometrics” on this topic has been designated by the Institute for Scientific Information as being one of the most frequently-cited papers in the scientific literature. Perhaps even more important than this was his single-handed development in the early 1950s of a prediction procedure that has come to be known acronymically as BLUP — best, linear, unbiased prediction. It is the backbone of his achievements in evaluating genetic merit, which is widely known throughout all the animal breeding world. Along with Henderson’s “mixed model equations,” which are so convenient for calculating it, BLUP is equivalent to, and came long before, equivalent procedures in statistics in the framework of Bayes, Stein and shrinkage estimation that are now so widely recognized. In this context, Henderson the statistician, through his intense interest in animal breeding problems, was years ahead of his time.

Chuck’s statistical expertise also attracted numerous faculty and students seeking help in the analysis of research data, especially data from which many intended observations were missing or were unobtainable in the first place. Many biologists, engineers, and social scientists were numbered among his Cornell clientele in his capacity (but by no means his official duty) as a consulting statistician.

Numerous awards came to Charles R. Henderson: among them were Senior Fulbright Research Scholar to New Zealand 1955-56; from the American Dairy Science Association, the Borden Award (1966), the National Association of Animal Breeders Award (1977), and the J.L. Lush Award (1982); from the American Society of Animal Science, the Animal Breeding and Genetics Award (1966), the Morrison Award (1971), and Fellow (1981); Fellow of the American Statistical Association (1968 – one of only four people with Ph.D. degrees in animal science to have received this award, the other three all being his students); The Herman von Nathusius Medaille of the German Society of Animal Production (1981); and election to the U.S. National Academy of Science (1985). He also received

the Henry A. Wallace Award for Service to Agriculture from the College of Agriculture (1984), and the Alumni Research Award of the Animal Science Department (1985) of Iowa State University.

Over the years and particularly after 1976, Professor Henderson accepted many invitations to present seminars, conference papers, and short courses in all corners of the globe: Australia, Brazil, Denmark, France, Germany, Ireland, Japan, the Netherlands, New Zealand, Norway, Portugal, Scotland, Sweden, and Switzerland as well as all over the U.S.A. In what was an active and productive retirement he had two long visits to the University of Guelph in Canada where his book was published; and he held visiting professorships at the University of California, Davis (1981), Kyoto University, Japan (1985), and Ohio State University, (1987); and he had five lengthy sojourns on the faculty of the University of Illinois at Urbana, where he was at the time of his death.

Although Chuck was an enthusiastic and veteran supporter of Cornell hockey, his lifelong interest in athletics was in track and field. This started, perhaps, when he won all three of the 12-and-under, the 14-and-under, and the 16-and-under races at a Page County Farm Bureau picnic; the next year's races were for 10-12, 13-14 and 15-16 year olds! Subsequently, when on the Iowa State College track team, he was part of the 4 x 220 yards relay team that set an indoor (6 laps to the mile) world record of 1 minute 31.8 seconds in 1932, and in 1933 he set an Iowa State College field house record of 51.7 secs, for the indoor 440 yards that stood for more than thirty years. Also, his best time for the outdoor 440 yards was 48.6 sec. when the world record stood at 47.4.

Charles R. Henderson is survived by his wife, Marian; two sons, Charles Jr. and James, all of Ithaca, New York; and by his daughter, Elizabeth Henderson of Cambridge, Massachusetts.

Robert W. Everett, E. John Pollak, Shayle R. Searle

James Courtenay Hening

May 11, 1891 — February 17, 1955

James Courtenay Hening, Associate Professor of Chemistry in the Department of Food Science and Technology at the New York State Agricultural Experiment Station at Geneva, died February 17, 1955, at Geneva, New York.

Professor Hening was a specialist in dairy products and carried on research for many years on physio-chemical problems of dairy manufacturers. In recent years he developed the “taste panel” technique as a tool for evaluating the quality of food products. He made notable contributions in developing of new fruit products.

Professor Hening was born May 11, 1891, at Stillwater, Minnesota. He received his B.S. degree from the University of Minnesota in 1917. He taught vocational agriculture and agricultural chemistry in Minnesota High Schools from 1917 to 1922 and served as an instructor in dairying at the University of Minnesota from 1922 to 1923, where he was awarded his M.S. degree in 1923. He married Rachel Evans in 1923.

Hening came to the New York State Agricultural Experiment Station in 1923 as an Assistant in Research in the Dairy Department, since transferred to the College of Agriculture at Ithaca. He applied basic studies on physico-chemical problems of milk to ice cream making and cream whipping. In 1928 he spent six months in research on the physical properties of milk at the National Institute for Research in Dairying at Shinfield near Reading, England.

He was granted leave of absence from 1943 to 1946 to serve as food technologist of the research and development laboratory of the Quartermaster Corps of the U. S. Army in Chicago where he assisted in researches for the improvement of field rations for the armed services. He gave particular attention to the development of ice cream made from dehydrated ingredients. Returning to the Station he was named Assistant Professor in the Department of Food Science and Technology, and in 1952 was promoted to Associate Professor.

Soon after his return to the Station Professor Hening was assigned the task of developing panel studies in connection with the food processing program. His efficient organization and direction of this project won the full cooperation of his associates throughout the Station. In recent years particularly, his development of the taste panel as a tool for evaluating experimental results touched the activities of practically all Departments and afforded an example of the best kind of “team” work.

In addition to developing taste panel technics, he was also concerned with the utilization of fruit products, particularly as ices, sherbets, and ice creams. Notable among these were his apple-raspberry ice, apple ice cream, and grape sherbet and grape ice cream. He published numerous technical papers on physico-chemical problems, and on the manufacture of dairy products, on the preparation of various ice creams, sherbets, and ices, and on taste panel technics. He was frequently called on to report on his research at scientific and general meetings.

Professor Hening was a member of Alpha Zeta and Sigma Xi. He was long active in the National Dairy Science Association and in recent years in the Institute of Food Technology. At the time of his death he was President-elect of the Western New York Section of the Institute. He was active in community affairs. He was an Elder in the First Presbyterian Church where he had also been quite active in Sunday School work. He was a recent President of the Geneva University Club and a member of the Geneva Country Club and the Torch Club of Geneva. He was interested in athletics, an ardent baseball and football fan, but especially adept in handball and tennis. For sometime he sailed a Star in the races at the Geneva Yacht Club, and in late years had been interested in golf and fishing.

Professor Hening is survived by Mrs. Hening and her mother, Mrs. Jean Evans who makes her home with her daughter and a brother, Dr. Robert Hening. We share with them memories of a fine and genial companion whose unassuming manner, unfailing good humor, and high character made him a person whom we are proud to have had as our friend and colleague.

D. B. Hand, J. D. Lockett, C. S. Pederson

Harry George Henn

October 8, 1919 — October 11, 1994

Harry G. Henn, the Edward Cornell Professor of Law Emeritus, died of a blood disorder in Jacksonville, Florida, at the age of 75. His home since retirement had been in Naples, Florida.

A popular teacher and a productive legal scholar, Harry Henn was a nationally recognized authority in two important fields of law: corporate and copyright law. His books, articles, and teaching materials on corporations, agencies, and partnerships were widely used by law teachers and students as well as by practicing lawyers throughout the country. In 1963, he published his basic text on corporate law, the third and current edition of which was co-authored by John R. Alexander, a former student of Harry's. For many years, Harry contributed commentaries on the New York Business Corporation Law and served as a research and drafting consultant when that legislation was revised in 1963. He was co-author, again with John Alexander, of the Bureau of National Affairs Portfolio on New York corporations and acted as a consultant to the American Law Foundation on issues related to the Model Business Corporation Act.

Harry was also a leading figure in the field of copyright law and was highly respected as an expert in both American and international copyright matters. He was president of the Copyright Society of the U.S.A. and was a member of the Internationale Gesellschaft für Urheberrecht EV, and the Association Littéraire et Artistique Internationale (ALAI). He served as consultant to the Library of Congress in connection with the Universal Copyright Convention and the Copyright Revision Act of 1976 and contributed articles on copyright law to the Encyclopedia Britannica. His *Copyright Law—A Practitioner's Guide*, published by the Practising Law Institute, was widely used and relied on by copyright lawyers through the country. In 1986, he received the annual award of the Copyright Society for his contributions and leadership in the field.

Active in the work of the organized Bar, Harry's professional memberships included the American Bar Association, New York State Bar Association, Association of the Bar of the City of New York, New York County Lawyers Association, Westchester County Bar Association, and Tompkins County Bar Association.

Born in New Rochelle, New York, Harry retained a strong attachment to his hometown. He attended New York University at University Heights, graduating *summa cum laude* in political science in 1941. He was elected to Phi Beta Kappa.

Harry pursued his legal education at Cornell, earning his LL.B. degree in 1943. He served as Editor-in-Chief of the *Cornell Law Quarterly*, was elected to the Order of the Coif, and graduated first in his class, with distinction.

Following law school, Harry became associated with the New York City firm of Whitman, Ransom and Coulson, whose clients included many publishers with copyright, trademark, libel, and corporate law problems. Meanwhile, he pursued graduate study in law at New York University, earning the degree of Doctor of Juridical Science.

Harry returned to Cornell as an Assistant Professor of Law in 1953. At the time of his retirement in 1985, he was the Edward Cornell Professor of Law, the first occupant of that Chair to which he was named in 1970. During his Cornell years, he also taught as a Visiting Professor of Law at Hastings College of Law, the University of California and New York University.

Harry was an individual with a broad range of diverse interests. At Cornell, he participated actively in campus affairs chairing the University Faculty Committee on Music, serving on the Cornell Library Board, and the Board of Directors of the *Cornell Daily Sun*, including a term as president. In the larger Ithaca community, he was president of the Ithaca Opera Association, and for seven years he was Acting Village Justice of Cayuga Heights.

Two of Harry's main outside interests were foreign travel and birding. A prominent feature in Harry's apartment was a wall map of the world whereon the places he visited were marked by pins and the routes taken to get to them lined by red ribbon. It is hard to believe that there were places worth visiting that he had not taken in, or that there was an ocean-going tour or safari across land in search of bird sightings that he had not accompanied. Memorabilia acquired from these expeditions filled his apartment to nearly overflowing, leaving little room for his excellent collection of bird books.

Harry's sense of humor was one of the most memorable personal qualities for which he will long be remembered. He enjoyed people, loved to entertain friends and students in his home, and enriched any conversation whether in a one-on-one or group situation. Harry was a prodigious worker and he held himself to the same high standard of performance he expected of others.

Harry is survived by his brother, Robert A. Henn of New Bern, North Carolina; a nephew; two nieces; and four great-nephews. A service in memory of Harry was held on October 29, 1994 at the Larchmont Avenue Presbyterian Church in Larchmont, New York. On November 4, 1994, a group of Harry's associates and friends drawn from both the Law School and Ithaca communities gathered in the faculty lounge in Myron Taylor Hall to commemorate his life.

W. David Curtiss, Gray Thoron, Russell K. Osgood

Mary Frances Henry

December 1, 1883 — October 2, 1981

With the death of Mary Frances Henry, professor of home economics emerita, on October 2, 1981, at age ninety-seven, the New York State College of Human Ecology (formerly College of Home Economics) lost the last of the women and men who had experienced most of the early history of home economics at Cornell and had made significant contributions to its development. During the first years of its existence (1900-1925) home economics education was an integral part of the College of Agriculture, beginning with a reading course through correspondence, study groups, and winter courses under the direction of Martha Van Rensselaer. In 1907 Flora Rose, with an advanced degree in nutrition from Columbia University, joined the staff, and plans were developed for a four-year curriculum with a major in home economics. Several years elapsed before the program became a reality, but a survey course in foods and nutrition, open to any student in the University, was particularly popular in those early years. The years 1912-13 became a milestone in the history of home economics at Cornell as the department moved into its first building. It was at this time, 1913, that Mary Henry came to Cornell to study nutrition under Miss Rose.

Mary Henry was born in Denver, Colorado, on December 1, 1883. The first two years of her undergraduate study had been at Smith College in Northampton, Massachusetts. Returning home because of family responsibilities, she finished her degree at Colorado College, Colorado Springs. For several years Miss Henry taught English and history in high schools in Wyoming and Colorado. Coming to Cornell as a special student in 1913, she was a student teaching-assistant under Miss Rose. Miss Henry's potential as a faculty member was recognized by Miss Rose, who urged her to pursue advanced study at Columbia University. After graduate study at Cornell and Columbia, Mary Henry accepted appointment as an instructor at Cornell in 1915. She taught for the next seventeen years (1915-32), then relinquished teaching at the time of her appointment as assistant director of the college.

During the years that she taught, Mary Henry developed a five-hour course in nutrition, required of all students in the College of Home Economics. In the twenties the science of nutrition was relatively new and growing. Miss Henry's enthusiasm for the study of nutrition was felt by the students in her classes. Nutrition came alive as each student was required to keep a daily food diary with an evaluation of the known food components. The application of nutrition requirements to one's own daily life was a lesson learned as an undergraduate that has been retained through life by many of Miss Henry's students.

An advanced course for students planning a career in hospital dietetics was Diet and Disease. The principles of diet therapy of that time were taught. In addition, students were introduced to the literature; readings were required in the medical journals and publications as well as nutrition articles. Miss Henry encouraged students to read with an analytical mind, to evaluate the content of the materials being read, and to be thoughtful in the acceptance of information.

The goals Miss Henry set for students were high. She expected students to perform to their full potential. Inspiration to reach the goals was gained from her counsel and guidance. A person with dignity, she was respected by all students. Her relationship with them was reserved, but a quick, wry sense of humor surfaced in conversation and class.

With the appointment in 1932 of Flora Rose as the director of the New York State College of Home Economics, Mary Henry became assistant director (1932-40), then acting director (1940-41) following Miss Rose's retirement. She was named assistant dean with Dean Sarah Blanding in 1942. While having responsibility for various technical aspects of the director's and dean's office, Miss Henry had special responsibility for the administration of the resident instruction area of the program. She served as chairman of the Committee on Resident Educational Policy, of the Committee on Undergraduate Admissions, and of the Counseling Service.

As chairman of the Educational Policy Committee, Mary Henry was a dominant but not domineering leader in the determination of the educational development at Cornell during World War II. This leadership resulted in major changes in the undergraduate program in the late forties. In this development of new educational goals, her vision of the future was always seen against the background of the past, so that progress was evolutionary in character. She did not have a crisis approach to decisions that needed to be made.

One outstanding characteristic of Dean Henry's was recognized by those who worked closely with her and is strongly evident when one reads committee records and college reports written by her or under her direction. Her sensitivity both to people and to words was acute. She was indefatigable in her search for appropriate phrases to convey the flavor of the feelings of the faculty as well as the action being recorded.

Paying tribute to Mary Henry at the time of her retirement, Dean Blanding wrote of her coworker:

Mary Henry has been a distinguished member of this faculty for over thirty years. During all of these years her penetrating mind, her fine educational philosophy, her sound judgment, her sympathetic understanding, and her real devotion to the profession of home economics in its finest and broadest sense have permeated every division of the college's work.

Former students and faculty colleagues treasured Mary Henry's friendship. A person of patience, warmth, and gentle humor, she was a delightful mentor. Generous of her time, sometimes overgenerous of her energy in listening to ideas, complaints, and criticisms of others, she was still implacable in her honesty and in her willingness to sustain a position she believed in.

After her retirement she was able to renew her longtime interests in reading of political affairs, informal essays, and poetry. She could quote extensively from the latter, both serious and whimsical. Taking great pleasure in small things—a bird call, a colored pebble, a line of waving poplars— she would delight her friends by capping such a discovery with appropriate verse.

Mary Henry was predeceased by three sisters and three brothers. She is survived by several nieces, nephews, grandnieces, and grandnephews.

Jean Failing, Bernice Hopkins, Catherine Personius

Francine April Herman

March 1, 1921 — May 18, 2008

Those at Cornell University who knew Francine April Herman remember her passion for teaching and her strong sense of social responsibility. Growing up in New York City during the 1930s, Fran developed a commitment to social and labor causes and was an early advocate for women's rights. A story is told that, while still in high school, Fran was invited to a luncheon at the White House. Walking up to the entrance, she encountered President Franklin Delano Roosevelt who was on his way to a meeting. Anxious to put the young girl at ease, Roosevelt remarked, "Oh, so you're going to have lunch at my house—tell them I said they're to treat you well!" From then on, Francine April Herman was hooked on politics, a topic to which she devoted much of her energy throughout the following years.

Fran attended Hunter College, located in the center of Manhattan and one of the oldest public universities. Its strong public service mission fit well with Fran's evolving interest in the welfare of employees and employee rights. She had also fine-tuned her writing skills, focusing primarily on advertising. This background ultimately led to a contract with Rothschild's Department Store in Ithaca, New York. Fran immediately fell in love with the quirky little town and decided to make it her home. In 1953, she married Louis Herman.

Ithaca provided opportunities for Fran to become heavily involved in communication and the performing arts. She began a program of essays on WHCU, Ithaca's radio station, called "A View from the Kitchen Window." Fran was also instrumental in creating The Green Room Circle, an Ithaca summer theater company. Her love of theater regularly took her to Stratford, Ontario, where she enjoyed the Shakespeare Festival. During this time, she was able to travel, visiting Italy and the Middle East.

Her husband of 11 years, Lou, died in 1964. A few years later, Fran decided to return to school. Because of her life experiences, she was provisionally accepted into the Industrial and Labor Relations School at Cornell University. She quickly embraced academic life, and by 1967, was teaching in the Industrial and Labor Relations Extension Program. Fran received her Master's of Science degree from Cornell in 1973. Her specialty was labor relations with emphasis on communication. In 1973, she joined the faculty in Cornell's School of Hotel Administration where she applied her interdisciplinary background to courses in human resources management, labor relations, and management communication. Fran had a significant impact on the Hotel and the hundreds of students she taught. She quickly realized that it was essential for future hospitality leaders to be able to clearly communicate

complicated analyses and ideas to a variety of constituencies. What evolved from Fran's efforts were a two-course curriculum in management communication and a new disciplinary area in the Hotel School.

Fran loved interacting with her students, especially her teaching assistants whom she mentored enthusiastically. She treated them as budding professionals but also showed concern for their emotional and personal lives so that they would thrive when they stepped out into the world beyond Cornell. Her colleagues at the Hotel School recall the hours she spent with her students discussing controversial issues of the day—particularly those related to labor relations. When it came to her students, Fran had a tireless energy that was often contagious.

Fran orchestrated great parties, always inviting a mix of people drawn from the diverse facets of her own life. She included graduate students as well as faculty. She crossed the borders of many segments of the university and often included members of the local community. Her friendships were wide ranging. The conversations at her parties were rarely superficial: major political and social issues of the day were discussed and debated. One always left her home knowing that Fran had orchestrated more than a simple social gathering.

Fran Herman worked closely with the New York City Hotel and Restaurant Workers' Labor Union. She researched the types of grievances filed and how they were negotiated and settled. Fran provided good insights about the way that people within the hospitality industry—whether they are entry-level housekeepers or top-level executives—can work together to ensure social justice for all. The net result, she believed, would be a humane workplace and a genuinely successful hospitality industry.

Throughout her career, Francine Herman continued to apply her talents to the political arena. During President Jimmy Carter's administration, Fran was appointed a mediator for the U.S. Department of Labor. She was also a mediator and fact-finder for the New York State Public Employment Relations Board from 1973-91. Fran mediated union negotiations in many public school districts, thus contributing to education in yet another important way. She served as a member of Cornell's Advisory Committee on the Status of Women and was Secretary of the University Faculty. Fran strongly supported and worked tirelessly on behalf of the "Cornell 11," a group of women faculty who sued the university for sex discrimination. In 1979, Fran created an endowment, the Mildred April Scholarship Fund of the College of Arts and Sciences at Cornell, in honor of her mother. The endowment supports undergraduate financial needs.

Fran had friends and former students living all over the world. She visited them in Europe and Australia and spent a term teaching in Paris, one of her favorite cities. For many years, Fran's role model and best friend was

Alice Cook, an ILR professor who was the University's Ombudsman and co-founder of the Women's Studies Program. Fran fondly recalled a time in Japan when Alice Cook and she were being honored at a country inn by former students. The meal included the swallowing of live goldfish. " ...The hard part was getting them down without chewing, and having the strangest tickling sensation in your stomach," she said in describing it. Following Alice's death in 1998, Fran was instrumental in establishing a chaired professorship in her honor and was, in turn, honored in 2007 with the Alice Cook Recognition Award. This award is bestowed upon individuals "...who have significantly contributed to women's issues, changing the climate for women at Cornell University."

In 1989, Fran retired from Cornell as Professor Emerita. She died at the age of 87 on May 18 at the Hospicare Residence in Ithaca. Fran Herman appreciated the manifold dimensions of both issues and friendships. Throughout her life, Fran kept her sense of humor and her love of good friends and good scotch. She never stopped fighting for what she knew to be important—a fair shake for all.

Born in New York City on March 1, 1921, Francine Herman was the daughter of Abe and Mildred April. She was predeceased by her father, mother, brother, and husband, Louis Herman, who died in 1964. She is survived by her stepson, Dr. Paul Herman and daughter-in-law, Polly Herman, four grandchildren, Dr. Peter Herman, Anne Herman and Louisa Herman, all of Portland, Oregon, and Dr. Edwin Herman, his wife, Laura Herman-Schultz, and one great-grandchild, Lily Herman, all of Stevens Point, Wisconsin. Many thanks to Dr. Paul Herman for his assistance in creating this memorial statement.

Judith Brownell, Chairperson; Florence Berger, Daphne Jameson

Halldor Hermannsson

January 6, 1878 — August 28, 1958

Halldor Hermannsson was born on January 6, 1878, in Rangarvellin, Iceland. His father was a district judge. He graduated from the Latin school of Reykjavik, then attended the University of Copenhagen. He met Willard Fiske, who was already assembling his Icelandic collection and was seeking aid in cataloging of it. Fiske immediately recognized in Hermannsson a fellow-bibliographer, and bore him off to his Florentine villa in December, 1899. Hermannsson spent more than a year in Florence and heard much talk of Cornell from Fiske and his young librarian, Edwin H. Woodruff (destined to be Dean of the Cornell Law School). His task completed, Hermannsson returned to Copenhagen and to various bookish occupations.

Fiske died in September, 1904, leaving his great library to Cornell, with provision for a curator of the Icelandic collection. Hermannsson was appointed, in 1905, to this post and to an instructorship in Scandinavian languages. He was later lecturer, Assistant Professor, and, in 1924, Professor. He retired from the professorship in 1946 and from the curatorship in 1948.

At Cornell, Hermannsson was known as librarian, bibliographer, and teacher. We were hardly aware of his repute as an authority on Icelandic history and literature. Annually, Cornell publishes a volume termed *Islandica*; thirty-one of these Hermannsson wrote himself, and two others he edited. He also published four catalogs of our unparalleled collections. His many, varied, and authoritative contributions to Icelandic studies made him, in time, the Old Master in his field. Iceland delighted to honor her distinguished son with awards and medals and memberships in knightly orders. (He was Grand-Chevalier of the Order of the Falcon.) In 1930, he received an honorary doctorate from the University of Iceland.

He died in Ithaca on August 28, 1958.

He was a man of books. Enormously erudite, he found the life of books so satisfying that he had no need of another. Learning was his only bride, his business, and his joy. His opinions were strong, his judgments often sharp. Much engaged in controversy, he was always an honorable, though redoubtable, opponent.

He was in many ways a representative of a fading culture—that of nineteenth-century humanistic enlightenment. In his fifty-three years in Ithaca, he never lost his European courtliness and dignity. (He never possessed, doubtless, a sports jacket; he never first-named even his best friends.) He had known well the great men of Cornell's lusty

youth, and he loved to tell piquant anecdotes about them. His keen curiosity continued to the end. Crippled by painful illness in his later days, he never complained, but chose rather to question his visitor on the events and the performers of the active world. His was a fine example of scholarly serenity, of the philosophy, learned from books, which comforts the spirit and defies the augmenting, dissolving, pains of the body.

Morris Bishop, Johann Hannesson, Robert M. Ogden

Glenn Washington Herrick

January 5, 1870 — February 12, 1965

Professor Herrick was born on a farm near Otto, New York, the son of the late Stephen M. and Marion Botsford Herrick. He attended the local schools, and then was a teacher in the public schools from 1888 to 1890. He attended the State Normal School at Fredonia, New York. Later, in 1892, he matriculated at Cornell University, graduating with the B.S.A. degree in 1896. This was followed by a year at Harvard University. From 1897 to 1908, Professor Herrick was Professor of Biology at the State College of Mississippi, Starkville, and then Professor of Entomology for a year at the Agricultural and Mechanical College of Texas, College Station. He returned to Cornell in 1909 to become a member of the staff of the Department of Entomology and Limnology and retired as Professor Emeritus in 1935, so enjoying 30 years of active retirement. He retained his home in Ithaca and was a well-known figure as he took his daily constitutional around the campus and the city.

In 1898 Professor Herrick married the former Nannie Young Burke, Cornell '97, of North Carolina, who died in 1957. They are survived by three children: a daughter, Mrs. Ann Raines of Norman, Oklahoma; and two sons, Professor Marvin T. Herrick of Urbana, Illinois, and Dr. Stephen M. Herrick of Decatur, Georgia.

Professor Herrick taught the beginning courses in entomology, including the course in control of injurious insects. For this work, he wrote several manuals and, with Professor Comstock, was coauthor of the *Manual for the Study of Insects*. Among his other books was *Insects Injurious to the Household and Annoying to Man*, the result of his work in Mississippi. He published many papers and bulletins on insect control, and many more were published by his graduate students. He also contributed to the *Encyclopedia Britannica* as well as to the *Rural New Yorker*. He was a fellow of the Entomological Society of America and of the American Association for the Advancement of Science. He served as president of the American Association of Economic Entomologists in 1915. He was a member of the American Palestine Commission.

Professor Herrick was a fine lecturer, not only clear and instructive but lively and interesting. He was a perfect gentleman of the old school and always showed a kindly interest in people. When he was still active, he and Mrs. Herrick entertained his assistants and the many students every year. Their hospitality was a joy and an encouragement.

Besides his scientific work, Professor Herrick took a great interest in the community and in his church. He had been a member of the Cayuga Heights Village board of trustees and was chairman of the board of trustees of the

first schoolhouse in Cornell Heights. He was clerk of the vestry of St. John's Episcopal Church for sixteen years, later serving as junior warden. He was for several years chairman of Weekday Religious Education sponsored by Ithaca churches. For many years he was insect merit badge counselor for the local Boy Scouts of America.

We remember Professor Herrick as one of the pioneers in economic entomology an inspiring teacher, and a respected and beloved citizen of our community.

W. A. Rawlins, J. G. Franclemont, Henry Dietrich

Barbour Lawson (B.L.) Herrington

June 12, 1904 — February 6, 1998

B.L. Herrington was born in Akron, Ohio and lived there until 1911. After the death of his father, the family moved to a ranch located on a remote bench above the Salmon River, Idaho. The house burned during the winter 1915-16. The family finished the winter in Kendrick, Idaho where B.L. picked coal along the railroad tracks to help out. They moved to St. Mary's, West Virginia. There, B.L. graduated in absentia from high school in 1922, having already entered Montana State College in 1921 as a student of chemical engineering. He earned a B.S. degree in 1925, and worked for three years as an assistant chemist in the Montana State Experiment Station. B.L. entered graduate school at Cornell in 1928 completing his Ph.D. degree in February of 1933, with a major in Dairy Chemistry under Dr. P.F. Sharp, and minors in Physical Chemistry under T.R. Briggs, and in Biochemistry under Dr. James B. Sumner. He had gradually assumed a major teaching load in the Department of Dairy Industry and was offered a permanent position upon graduation. He became Professor of Dairy Chemistry in 1936, and held that post until his retirement.

During the summer of 1935, B.L. developed a commercial method for isolating pure riboflavin from milk. The product was marketed until a method to synthesize the vitamin became more economical. He later (1944) devised a commercial method for the production of lactose.

Professor Herrington was an excellent teacher. Many alumni of CALS remember "Dairy 1," a course he taught for 17 years, often both terms. In 1948, he published a textbook for this course entitled, *Milk and Milk Processing*. This book was also used at several other universities. In his graduate level course in food analysis, he stressed mastery of the basics while introducing the latest in laboratory technology. His office was always open to students, and weekly he would clear a patch on that great long table for a "brown bag" informal seminar open to all. He fostered intellectual curiosity, willingness to try new approaches, and critical judgement or research data. He encouraged –nay– expected students to explore and excel.

In 1945, B.L. developed a teaching program in the field of Food Science. He developed the curriculum, including four new courses (two of which he taught himself), advised all students in the curriculum, and aided the placement of graduates.

In July 1964, B.L. accepted a three-year appointment in the Cornell program at the Philippine College of Agriculture at Los Banos, where he taught chemistry until he retired.

Herrington published on a variety of subjects in dairy science. He wrote a series of papers on lactose and another series on lipase in milk. Both were well regarded. Indirectly he contributed a great deal to research by serving as an unpaid consultant and advisor to faculty members and graduate students in animal and food sciences, microbiology, and nutrition. Much of his research was of an interdisciplinary nature. For example, he built a machine to milk guinea pigs, demonstrated its usefulness and persuaded others that we should know more about the natural food of guinea pigs before using them as test animals in nutrition studies. In 1948, the American Chemical Society presented him with the Borden Award for his contributions to dairy chemistry.

Professor Herrington was active in the development of the College of Agriculture and of Cornell University. Committees on which he served include: University Library Board, Mann Library Committee, Improvement of Instruction in Freshman English, Freshman Mathematics, Admission and Counseling (School of Nutrition), Field Representative (Food Science), and Field Representative (Dairy Science). He participated in the establishment of the Division of Biological Sciences.

Even after his retirement, B.L. continued to contribute to education. For fifteen years, he taught remedial math to fifth grade students in Rio Rancho, New Mexico.

John Sherbon, William Shipe

John Parker Hertel

December 11, 1909 — November 18, 1986

John Hertel, professor emeritus, died at his home, 130 Crest Lane, Ithaca, New York. He was born in 1909 in Trout Run, Pennsylvania, and was reared in the rural community of Ralston, Pennsylvania. He came to Ithaca in 1930 and received his B.S. degree from Cornell in 1934 and his Ph.D. in agricultural economics in 1938.

His professional career centered in the New York State College of Agriculture and Life Sciences at Cornell. He served the college in farm management and personnel administration for three and a half decades. That service included major contributions as secretary of the college with responsibility for the records and registrar areas, as a member of the Admissions Committee, as secretary of the Petitions Committee, and as leader of the advising, scholarship, and foreign student-exchange programs. For many years he offered the introductory orientation course for entering students. He advanced through the academic ranks and was made professor in 1948. In 1967 he was appointed to the post of associate director of resident instruction. In January 1972 he was named professor emeritus by the Cornell University Board of Trustees.

During his tenure in the Office of Resident Instruction John Hertel influenced and, in many cases, shaped the lives of students. College alumni recall with admiration and appreciation interviews with Professor Hertel, who never hesitated to “lay down the law” for the good of both the individual and the institution. Many a life was changed as a result of those inspirational talks for which he was known so well. It can be said that he helped mold the college into the outstanding school it is today.

In another setting John was an alumni member and an active adviser to the Alpha Zeta fraternity. He was a frequent visitor to the AZ house near campus and enjoyed many meals and programs with the brothers. In addition to his work with Alpha Zeta, John was an elected member of Sigma Xi, the scientific research society, and Phi Kappa Phi. He was recognized by the agricultural college honor society, Ho-Nun-De-Kah, for his sustained interest and advice. He was active, too, in community affairs. As a charter member of the Ithaca-Cayuga Rotary Club he contributed to diverse programs supporting community projects and recognizing community leaders in Tompkins County. John was a dedicated member of Forest Home Chapel.

Phrases that his colleagues and friends find most appropriate in describing John Hertel are concerned and compassionate, forthright, fair, astute, analytical, a man of action, and a man of his word.

He is survived by his wife, Martha Warren Hertel; five daughters—Maryjean Yengo of Webster, New York; Peggy Cooney of Laramie, Wyoming; Nancy McCreany of Boston, Massachusetts; Edith Hertel of Waterford, Connecticut; and Lucy Staley of Skaneateles, New York; two sons—Thomas Hertel of Lafayette, Indiana, and Timothy Hertel of Ithaca, New York; and nine grandchildren.

Charles E. Palm, Stanley W. Warren, Herbert L. Everett

George Edward Romaine Hervey

November 18, 1894 — November 23, 1962

George Edward Romaine Hervey died in Geneva, New York, November 23, 1962. He was an entomologist and had been a member of the staff of the New York State Agricultural Experiment Station in Geneva since 1929. He was born at Round Hill, Nova Scotia, November 18, 1894.

George Hervey first became affiliated with Cornell in 1924. He then accepted an extension assistantship in the Departments of Entomology and Plant Pathology in the Spray Information Service—a fruit and vegetable pest control advisory service—and was stationed, initially, in Dutchess County. For the next three years he spent alternating six-month periods in the field (in Wayne and Niagara counties) and at Cornell pursuing graduate work. He was awarded the Ph.D. degree in entomology in 1930.

In 1927 Professor Hervey was employed as a special agent of the New York State Department of Agriculture and Markets to head a research program on the European corn borer, which had assumed new importance at the time. He resigned this post in 1929 to accept a staff appointment in the Department of Entomology of the Experiment Station at Geneva. He remained at this unit of Cornell until his retirement, April 1, 1960, having passed successively through the ranks of Assistant Professor, Associate Professor (1945), and Professor (1949).

Dr. Hervey served with the Canadian Army during World War I. His tour of duty spanned five years, most of which time was spent in the mud and misery of trench warfare in Belgium and France. That he served with distinction is attested by his winning of the coveted Military Medal. He left the service with the rank of lieutenant.

Following the war, Dr. Hervey enrolled at the Nova Scotia Agricultural College, and then after two years entered the Ontario Agricultural College at Guelph, where, in 1923, he received the B.S.A. degree.

Dr. Hervey met his future wife, the former Laura Ray, when the two were employed by the Niagara County Extension Service; she was the home demonstration agent. They were married October 5, 1929. Besides his wife Dr. Hervey is survived by a son Romaine, a daughter Mary (Mrs. Charles Smith), and four grandchildren.

George Hervey's career at Geneva was centered in research work on the insect problems of vegetable crops. His findings provided the basis for many pest-control practices, which ranged from the evaluation of new insecticides to basic biological studies on the insect vectors of bacterial and virus plant diseases of various crops. He made an important contribution to the literature on the response of insects to light, employing the European corn

borer as the test species. Row-crop farmers are in his debt for his development of an inexpensive, low-gallonage, tractor-mounted spraying machine. Dr. Hervey had a questing mind and a dedicated interest in his work that kept him abreast of new developments in his field. Thus in the years of his retirement he was actively pursuing the possibilities of employing virus diseases instead of chemicals for pest control. George Hervey's research efforts were always well planned and executed. He was his own severest critic in regard to his findings, and they never received his endorsement until, in repeated tests, their validity was proved. This standard won for him an enviable reputation for soundness and reliability, not only among his colleagues, but among the growers and agricultural interests he served so well.

Dr. Hervey was a member of the Entomological Society of America and the honorary societies of Gamma Alpha and Sigma Xi.

George Hervey had an unusual capacity for making and keeping friends. He was a kindly, unpretentious person. In later years his interests became largely restricted to his work, to his home and family, and to his many friends. True to his English heritage, he became strongly addicted to the gentle art of gardening. This interest was reflected in the beauty of the flowerbeds under his care and in the productiveness of his kitchen garden. The Hervey home was a friendly place. It attracted a steady flow of visitors. It was, in fact, a veritable mecca for Experiment Station "alumni" who for any reason returned to Geneva for a visit. George Hervey will be missed by many.

Edward H. Glass, Edward H. Smith, Paul J. Chapman

Howard Drysdale Hess

— April 22, 1916

The following Resolutions were adopted by rising vote:

“The Faculty of the University records upon its minutes this memorial of Howard Drysdale Hess, Professor of Machine Design in Sibley College, whose untimely death occurred on April 22.

Professor Hess prepared for college in the schools of Philadelphia and took the M.E. degree from Lehigh University in 1896. His work in practice was in the steel industry and in structural engineering and he became general manager of the Eastern Steel Company before taking up teaching for a life work. In 1902 he became an instructor in Mechanical Engineering in Drexel Institute and two years later he was appointed associate professor in the University of Kansas. He was called to Cornell as assistant professor in the department of Machine Design in 1905 and was promoted to a professorship in 1910.

Four years ago Professor Hess published a text on Machine Design as applied to Hoists and Cranes, and a year later, a text on Graphics of Structural Design. More recent editions of these books have added testimony as to their value in the technical schools.

Professor Hess, during his stay in Ithaca, came in intimate personal contact with over twelve hundred students who have taken the M.E. degree—about a quarter of all Sibley graduates—and he won from them universal respect and affection, and influenced them toward high ideals of engineering work and of life. With his colleagues he established close and enduring friendships and his death has brought to them a deep sense of personal loss. He leaves a memory of high character, genial personality and of work well done.

Signed: Albert W. Smith, W. N. Barnard, W. A. Hammond

E. Elizabeth Hester

December 6, 1918 — July 3, 1979

E. Elizabeth Hester was a professor in the Division of Nutritional Sciences at the time of her death on July 3, 1979, at her home in Ithaca. Professor Hester's affiliation with Cornell had begun some thirty-five years earlier when she arrived to enter the graduate program in food in the Department of Food and Nutrition and continued through her appointment as a full professor and a seven-year term as chairman of that department.

Professor Hester was born in Cookville, Tennessee, on December 6, 1918, and received her undergraduate degree from Memphis State University in Memphis, Tennessee. Arriving at Cornell in 1945, she completed her master's degree two years later and was appointed an instructor and then an assistant professor in the Department of Food and Nutrition. It was highly unusual for an individual to receive a professorial appointment with only a master's degree and that Professor Hester was given this distinction only serves to illustrate the regard with which she was held within the department even as a young faculty member. In 1952 she received her doctoral degree in food science from Cornell and left to accept a research and teaching position at Pennsylvania State University. In 1959 Professor Hester returned to Cornell, the university to which she was deeply devoted, to rejoin the faculty of the Department of Food and Nutrition.

Professor Hester's area of interest was in the physicochemical properties of food, both as a researcher and as a teacher. Her research was centered on cereal grains and her publications appeared primarily in *Cereal Chemistry*. She taught courses on both the undergraduate and graduate level, always establishing high standards for students to attain while at the same time maintaining warmth and rapport. She had a deep personal commitment to teaching and always endeavored to guide her students to an understanding and appreciation of the research base of her field.

In 1964 Miss Hester became a full professor in the Department of Food and Nutrition and in 1966 she was appointed chairman of that department. Under her leadership the department grew, not only in undergraduate and graduate student numbers, but also in program dimensions. Her patience and wisdom were instrumental in redefining the college's mission and in the reorganization of academic departments at the time the college changed from the New York State College of

Home Economics to the New York State College of Human Ecology. The smooth incorporation of the Department of Institutional Management into the Department of Food and Nutrition was due in large measure to the careful

planning of Dr. Hester. During this time the number of students pursuing the requirements for membership in the American Dietetic Association grew rapidly, an emphasis that has continued to the present.

She was also instrumental in the development of an undergraduate honors program in food and nutrition and for several years conducted seminars with students accepted into the honors program. In addition, while she chaired the department, the program responsibilities in the extension area of food and nutrition were also expanded to include involvement in programs such as the federally funded Expanded Food and Nutrition Education Program (EFNEP). This program brought new dimensions to the extension area and included research into food intake, food habits, and nutritional status that have continued and expanded.

In 1973 Dr. Hester stepped down from the chairmanship of the department and took a study leave. During her absence the Department of Human Nutrition and Food and the Graduate School of Nutrition merged to form the Division of Nutritional Sciences. On her return, Dr. Hester continued teaching and became the graduate field representative for the Field of Nutrition. With the merger of the Department of Human Nutrition and the Graduate School of Nutrition, this was now a greatly expanded field encompassing all of the nutrition programs on campus. She was still active in this assignment at the time of her death.

During her years at Cornell, Dr. Hester served on most of the major committees in the college and department, including the Educational Policies Committee, Admission Committee, and petition committees. She also served on the University Budget Committee and the ROTC Committee; her interest in the latter committee emerged from her service as a lieutenant in the United States Navy during World War II.

Professor Hester was a member of the Society of Sigma Xi and president of the local chapter in 1968-69. She was also a member of the American Home Economics Association, the American Association of Cereal Chemists, the Institute of Food Technology, Omicron Nu, Phi Kappa Phi, and the American Association for the Advancement of Science.

Dr. Hester will be remembered for many things. She was totally committed to the Cornell tradition of freedom with responsibility, and her dedication was reflected in the dignity and pride with which she served the University. Her students will remember her as an individual with high standards of performance in the laboratory, in the classroom, and in her writing. As a teacher she always maintained a continuing interest in the progress of her former students as they moved to various positions both in this country and abroad. She continually inspired both current and former students to develop their talents and abilities to the maximum level.

As an administrator, she will be remembered for her leadership during a difficult period of controversy, change, and growth in the department and in the college. Her wisdom, lack of bias, and sense of fair play inspired her colleagues and made the implementation of new ideas and programs far less traumatic for all concerned than they would have been without her counsel and direction.

Her colleagues will remember her kindness and total lack of selfishness to all persons, both within the University and those family members and friends who often called upon her resources when they found themselves in need in places far from Cornell. Her warm counsel was continually available; her energies seemingly endless in providing compassion, solace, and wisdom. They will also remember her total sense of responsibility as a teacher.

All of those who knew her will remember the charming trace of a southern accent still apparent even after thirty-five years in the northeast. Nor can anyone ever forget her unfailing sense of humor, an instant twinkle in the eye when she was amused, and the deep, throaty chuckle when amusement was about to expand into laughter.

E. Elizabeth Hester will be missed by all who knew her. She will be missed for the contributions she made to the university she loved. Most of all, however, she will be missed for herself.

Marjorie M. Devine, Jerry M. Rivers, Mary A. Morrison

George Julius Heuer

February 6, 1882 — December 15, 1950

Dr. George J. Heuer, Lewis Atterbury Stimson Professor of Surgery at Cornell University Medical College from 1932 to 1947, and Surgeon-in-Chief to The New York Hospital, died in Fort Lauderdale, Florida, on December 15, 1950 of coronary thrombosis. Dr. Heuer was born in Madison, Wisconsin, where he received his early education, graduating from the University of Wisconsin with a B. S. degree in 1903. He then entered Johns Hopkins Medical School and received his M.D. degree from there in 1907. Following medical school, he served as intern, assistant resident and resident at the Johns Hopkins Hospital under Dr. W. S. Halsted, then Surgeon-in-Chief and professor of Surgery of the University. He was an outstanding pupil of this surgical master and became a member of his senior staff on completion of his residency.

At the outbreak of World War I, he was in Breslau, Germany, pursuing further study. He joined the American forces in France and served as a major in the Medical Corps and Chief Surgeon of Evacuation Hospital No. 10. At the end of the war he returned to Baltimore. He was an associate professor of surgery at Johns Hopkins when he was called to the University of Cincinnati to be Professor of Surgery and head of the surgical department from 1922 to 1932. He then came to Cornell.

Dr. Heuer was a Fellow of the American College of Surgeons and the American Association for the Advancement of Science, and a member of the American Medical Association, American Surgical Association, Society of Clinical Surgery and an honorary member of the Society of University Surgeons. He also belonged to the Southern Surgical Association, the American Society of Thoracic Surgery, Neurosurgery Society, New York Surgical Society, New York Academy of Medicine, New York State Medical Society, Harvey Society of New York, American Genetic Association, New York Academy of Science, and the Osier Society of New York. He was an honorary member of the Academy of Science of Havana, a member of the Founders Group of the American Board of Surgery, and a member of the advisory board of the Cushing Brain Tumor Registry at Yale Medical School. He belonged to the University Club of New York and the Megantic Fish & Game Corporation of Andover, Massachusetts.

At the time of his death he was Emeritus Professor of Surgery at Cornell and Consultant in Surgery to The New York Hospital. Surviving are his widow, Mrs. Juanita Reid Heuer, two sons, George J. Heuer, Jr. and J. Reid Heuer, and two sisters.

A master of thorough, skillful, and meticulous surgery, Dr. Heuer placed his greatest emphasis on the training of young surgeons through the resident system, which was inaugurated at The New York Hospital—Cornell Medical Center by him. He himself was a product of this system of training, under the late William S. Halsted. As Professor of Surgery first at the University of Cincinnati in 1922 and then at Cornell from 1932, he retired in 1947 after 25 years of full professorship. During that time more than a hundred young surgeons either completed their residencies or obtained the major portion of their training under him. It was to these young men, now located across the country, that he devoted his life as a teacher of surgery. Following his retirement, when his activity became limited because of ill health, it was the admiration, appreciation, and love of these men which gave the greatest satisfaction. His ideals and objectives will live in those who grew to professional maturity under his guidance.

Frank Glenn

Gustave F. Heuser

July 7, 1893 — May 27, 1981

Gustave F. Heuser was one of the first students of Professor James E. Rice, the Father of the Poultry Industry. Heuser, the third person in the world to receive a Doctor of Philosophy degree in poultry science, began research in poultry nutrition at Cornell in 1916. His early work was the start of nutrition research in poultry science at Cornell. This work has continued through the years by Heuser, his colleagues, and his successors, resulting in world-wide recognition of Cornell's contribution to research in this field.

Heuser entered Cornell University in 1911, obtaining the Bachelor of Science degree in agriculture in 1915, the Master of Science degree in 1916, and the Doctor of Philosophy degree in 1918. In 1916 he was appointed instructor of poultry husbandry; he was named an assistant professor of poultry nutrition in 1918 and professor in 1922. Professor Heuser was engaged in teaching, extension, and research in poultry nutrition. For many years he taught a course in poultry nutrition, and he authored the textbook *Poultry Feeding*. Heuser published his first scientific paper in 1920 and proceeded to author or coauthor more than 200 technical and semitechnical articles during his career.

Dr. Heuser was a strong advocate and a moving force in the development of scientific poultry production around the world. He served as secretary-treasurer of the World's Poultry Science Association from 1923 until his retirement in 1957. In addition, he was editor of the *World's Poultry Science Journal* from 1945 to 1957, and of the journal *Poultry Science* from 1936 to 1941. As secretary-treasurer of the World's Poultry Science Association, he attended World's Poultry Congresses in many countries around the world and served on several committees of that organization. During the 1920s he initiated poultry research at Darlington Hall School and Farm in Totnes, England. In 1951 the government of France conferred on him the declaration *Officier du Mérite Agricole* in recognition of his leadership in poultry science.

Dr. Heuser was also a member of the American Poultry Science Association, the American Association for the Advancement of Science, the American Association of University Professors, Sigma Xi, and Acacia. He served on the College Poultry Feed Conference Board from 1924 until his retirement. He was a master in Hobasco Lodge 716 F. & A. M. in 1934, and he served as a representative of the Masonic Temple Corporation, Ithaca, from 1939 until his retirement.

Gustave F. Heuser saw the poultry industry develop from a collection of small barnyard flocks to the large, technically sophisticated industry that exists today. That development came about, in large part, as the result of the efforts of Heuser and his colleagues who pioneered research in poultry nutrition. From his early work with L. C. Norris on rickets in chicks, through the discoveries of the various factors of the vitamin B complex, to the recognition of the importance of proteins and amino acids, Gustave Heuser's efforts and quiet counseling will be remembered by his colleagues and his many undergraduate and graduate students.

Richard E. Austic, Gerald F. Combs, Jr., Milton L. Scott

Waterman Thomas Hewett

Professor of The German Language and Literature

January 10, 1846 — September 13, 1921

On September 13th, 1921, in London, England, a sudden and painless death interrupted Waterman Thomas Hewett in the midst of that persistent search for knowledge, to which as Emeritus Professor in his seventy-sixth year he still devoted the same enthusiasm and energy that had enabled him in younger days to accomplish so much in the field of modern philology and literature. Following closely on personal letters which indicated excellent health, the news of his death came as a shock to his many associates of former years.

A graduate of Amherst College, later a student at Athens, Heidelberg, Leipzig, Berlin and Leiden, the recipient of the degree of Doctor of Philosophy from Cornell University, Professor Hewett was actively associated with our institution during the 40 momentous years from 1870 to 1910, first as Assistant Professor of German, later as Head of the Department of German.

Beginning his university career in the formative period of American Scholarship, he was able as author, editor and prolific contributor to educational periodicals, to aid materially in placing the study of modern languages on a firm scholarly basis. His investigations in Netherlandish, Frisian and German literature carried his name and the prestige of Cornell beyond the confines of our own country and led to his election as member of numerous foreign learned societies. He instituted the Annual Bibliography of Goethe literature in England and America and himself conducted this department of the Goethe Jahrbuch from 1880 to 1885.

Professor Hewett's interests were, however, not confined to foreign letters. His name will ever be associated with our University as that of its faithful chronicler. His first historical work appeared in 1894, to be followed later by the more comprehensive "Cornell University,—A History" published in four volumes in 1905. In 1910 he published a bibliography of the writings of Goldwin Smith. His devotion to scientific ideals, his unconquerable scholarly tenacity were evidenced perhaps even more remarkably after his retirement than during his active teaching career. By sheer power of will he overcame illness which threatened an end of all activity, and for many years, even down to the day of his death, he continued unremittingly and systematically the scholar's quest.

Assistant Professor of North European Languages, 1870—1883

Professor of The German Language and Literature, 1883—1910

Professor Emeritus of The German Language and Literature, 1910—1921

Oliver H. Hewitt

May 21, 1916 — January 27, 1999

To encapsulate the numerous and varied contributions of this enormously popular, energetic and productive Professor of Wildlife Management through his 50 years of exemplary service to Cornell, is challenging. His career developed in two distinct segments: 22 whirlwind years in teaching and research, ending in early retirement in 1971 at age 55; followed by 27 years as Emeritus Professor residing on Florida's southwestern coast, where he taught "Fundamentals of Ornithology," his wildlife specialization, to all interested persons, including alumni through Cornell's Adult University (CAU) programs. Also much involved with others to conserve this area's rich bird life, he sparred often with developers, striving to save fragments of critical habitat.

Oliver H. Hewitt was a native Canadian, born at Blind River, Ontario, later naturalized a U.S. citizen. He received a B.A. degree from McMaster University at Hamilton, Ontario, in 1939, having majored in Zoology and Chemistry. That year he also matriculated in a Master's program in Vertebrate Zoology at Cornell with Arthur A. Allen, "America's First Professor of Ornithology." Following award of the M.S. degree in 1941, Ollie Hewitt continued with Allen for the Ph.D. degree, pursuing interests in waterfowl ecology, and receiving the degree in 1944. Dr. Hewitt then joined Canada's new Dominion Wildlife Service, starting in enforcement as a Migratory Bird Officer.

After World War II, changes at Cornell included formation of a Department of Conservation in 1948. Based in the College of Agriculture, it brought together in Fernow Hall scattered positions including vertebrate specialists from Zoology, a fishery biologist from Entomology, and several foresters from a former Department of Forestry. Arthur Allen's Laboratory of Ornithology was already present in the building. His diverse accomplishments had included working with other national leaders such as Aldo Leopold, to establish the new discipline of Wildlife Management. When Oliver Hewitt started his Master's program, Dr. Allen had just completed a year as second President of the Wildlife Society, which he had helped to form.

When Oliver Hewitt accepted one of the new faculty lines in Conservation in 1948-49, he became Cornell's first Professor of Wildlife Management, joining an academic community notably advanced in the incipient field. Ollie already possessed a thorough familiarity with Allen's wildlife program; he had instructed in the courses, knew field study sites, was acquainted with most of his faculty colleagues, and even knew many of the New York conservation agency staff with whom he would be working. These advantages boosted him into high productivity from the start. His strong personal traits combined admirably to facilitate his immediate and sustained success in teaching and

mentoring roles with both undergraduate and graduate students, and interactions with his professional colleagues. Essentially, he exuded a wonderful good humor, always cheerful, positive, and enthusiastic. As his students still comment, it simply was fun to be with Ollie, and often exciting, too, for he was always exploring new challenges in imaginative ways. These are especially well illustrated by the new research methodologies he developed, including census methods and techniques for animal capture and handling.

Dr. Gustav A. Swanson was the head of Cornell's Conservation Department for 18 years (1948-66). He and Ollie collaborated on a number of projects, including a seven-year stint as lead editors of the *Journal of Wildlife Management*. Gus assumed the editorship in 1949, and proceeded without assistance until 1951, when he persuaded Ollie to become Associate Editor to help with editing and proof reading. The *Journal* grew and prospered under this management. In mid-1953, Ollie took over as Editor at the young age of 37. While he had three associate editors, all at other locations, Ollie continued to introduce valued innovations, and reported enjoying particularly the numerous associations it brought with authors and other members. He retired from the editorship in 1956, but later served The Wildlife Society as Vice President in 1958-59.

From 1961-67, Ollie Hewitt functioned as Assistant Leader in the new federal Cooperative Wildlife Research Unit at Cornell, which directed special assistance to graduate education. In 1965, he and Cornell animal nutritionist, J. Thomas Reid, became co-directors of a two-year study comparing cattle and gazelle as human food sources in Kenya. A sabbatical leave following in 1967-68, allowed Ollie to spend a year in Africa consulting on wildlife problems and teaching a post graduate honors course in wildlife management at the University of Pretoria. Professor Hewitt's first book, *The Wild Turkey and Its Management*, a 589-page tome for which he was sole editor, was published in 1965 by The Wildlife Society and was remarkably successful. Its appearance was coincident with the extensive natural restoration of turkey habitat accompanying regeneration of our Eastern forests on lands released from farming. The ensuing restoration of the wild turkey in America stands as one of the most significant wildlife success stories of our time.

Also in 1965, concerned for the poor opportunities undergraduate students then had for studying marine biology in a field setting, Professor Hewitt joined with five other Cornell professors to plan a summer course at the Isles of Shoals in the Gulf of Maine. Dr. Hewitt's role is now permanently remembered on a bronze plaque in Founders Hall at Cornell's internationally recognized Shoals Marine Laboratory, which grew from these small beginnings. In the early years, evenings on an otherwise uninhabited island ten miles offshore were enlivened by Ollie's stories about his own youthful experiences as a conservation officer, bringing government by small boat to the isolated

coastal villages of the Canadian northeast. The theme of these stories involved how to cope successfully with wildlife problems and difficult political, social, and personal conditions of these tiny, isolated, marine-dependent communities. Ollie's formal lectures and informal stories resonated deeply among 30 students embraced by the rumbling sound of the restless sea.

That first year, anticipating the need for students to observe different species of nesting marine birds on other islands, Ollie Hewitt—fearless by nature and impervious to rigid academic bureaucracy—persuaded his dean to provide a budget of \$200 for that purpose. With it, he obtained a sixteen foot, homemade, wooden boat at Rye, New Hampshire, then ran it solo over ten miles of open ocean to Star Island. These characteristics, and that action, made Ollie Hewitt an instant hero to the students—but also enabled him to demonstrate the nests that established new breeding records in North America for two species of marine birds. With the exception of one absence while in Africa, Ollie Hewitt continued teaching summers at the Shoals until tragic events overtook him.

Early in 1971, Oliver Hewitt's beloved wife, Jean, succumbed to a brain tumor after an extended illness. To the great surprise of many, Ollie retired that August, and soon left Ithaca. The Cornell Board of Trustees named him Professor Emeritus at their October meeting. Abruptly, the significant presence of both Ollie's family and his professional role on campus had ended. For 22 years, the Hewitts—Ollie, Jean, and daughters Eleanor, Nancy, and Virginia—until this tragedy, had maintained a special brand of hospitality for visitors at their home, from entering freshmen to distinguished international scholars.

In his brief academic career of 22 years, Ollie directed 38 advanced degree candidates, wrote more than fifty journal articles, and served annually some 20 to 25 undergraduate advisees, and numerous others who sought his sage counsel.

In 1972, Ollie married a family friend of long standing. He and Martha Hewitt enjoyed a new life together at Port Charlotte, Florida, on the West Coast. The presence there of Professor Perry W. Gilbert, a fellow graduate student of Ollie's and another of the six founders of the Shoals Lab, probably influenced that move.

The following 27 years of Ollie's life constituted a virtual continuation of his academic career, changed only in context from formal classroom to informal adult education. What Ollie undertook primarily as a volunteer for almost three decades, represents a shining example of a regional extension-wildlife specialist's program in ornithology, for it involved a newspaper column and collaboration with professionals in organizations such as local Audubon groups and the Florida Division of Wildlife. Also, he wrote the basic text for this audience, entitled,

Field Book of Birds of the Florida Suncoast, his second book; it appeared in 1976. Professor Perry Gilbert has commented that, despite the geographic restriction in its title, this book serves the entire peninsula well.

In Florida, Dr. Hewitt continued an active correspondence with many of the students he had mentored at Cornell. In addition, he remained directly connected to the university in several other important ways. He was much in demand as speaker at alumni gatherings, and he joined with Professor Emeritus Richard B. Fischer to conduct CAU programs in the Everglades. Ollie's longest and strongest Cornell ties, however, remained with the Library of Natural Sounds at the Laboratory of Ornithology. With constant resolve, Ollie pursued and recorded songs of rare and unusual bird species in the wild, demonstrating special efforts that won him high acclaim. Library Director Greg Budney regarded Ollie's annual trips north to deliver his recordings of inestimable academic and commercial value, as a high point in the Library's year!

Throughout his life, Oliver H. Hewitt's relationships with students and the public embodied the ultimate in personal consideration and helpfulness. In Florida, he was also effective as an activist, employing strategies to confront, contest, and educate developers whose actions threatened special habitats in this region of extremely rapid development. Testimony to these characteristics poured forth from his citizen-clientele at a memorial service following his death in Florida. More quietly, perhaps, Oliver Hewitt's impact on individuals will be genuinely lasting, as his inspiration and knowledge are passed along from one generation to the next, and the many teachers who once listened intently and walked with him in the field, strive to emulate his enthusiastic, caring, helpful, and effective approaches to education and to life.

John M. Kingsbury, Milo E. Richmond, Harlan Brumsted

William Leonard Hewitt

March 9, 1917 — December 13, 1971

Professor Hewitt was born in Elizabeth City, North Carolina, son of Robert Clarence and Alethia Chappell Hewitt. He graduated from high school there in 1935 and received his A.B. degree from the University of North Carolina in 1939.

In 1939-40, Bill Hewitt taught high school mathematics and science at Grimesland, North Carolina. He was commissioned as an ensign in the United States Navy in 1941 and later that same year received a certificate for completion of course work at the Navy Diesel Engineering School in Raleigh, North Carolina. He served in the navy until 1946, attaining the rank of lieutenant commander. He returned to school at Cornell, where he was awarded a Bachelor of Civil Engineering degree in 1948 and a Master of Civil Engineering degree in 1950.

From 1948 to 1950, he was an instructor of engineering drawing at Cornell. He was a distribution engineer with Binghamton Gas Works, Binghamton, New York, in 1950-51, and afterwards, an engineering associate with Hough Soils Engineering Laboratories in Ithaca, New York, for two years.

He returned to Cornell in 1953 to become an assistant professor of civil engineering and a freshman class adviser. He taught courses in transportation engineering and in surveying, conducted research in the areas of pavement design and bituminous materials, directed graduate theses, and organized and participated in many academic and professional seminars and conferences.

He was named associate professor, head of Civil Engineering Graphics, and admissions officer for the School of Civil Engineering in 1957. He was acting director of the School of Civil Engineering during the period 1968-70. At the time of his death, he was the assistant director of the School of Civil and Environmental Engineering, associate professor of environmental engineering in the School, and associate professor of highway engineering in the Department of Agricultural Engineering.

Professor Hewitt was a licensed professional engineer in New York State and had published a number of papers, bulletins, and technical articles. He was a member of Tau Beta Pi, Chi Epsilon, Sigma Xi, Pyramid Fraternity, the Highway Research Board, and the American Society of Civil Engineers. During his long association with Cornell, Bill served on many committees at the University, college and school levels.

Bill Hewitt was recognized by students as one of their most devoted teachers. He would spend his time generously to help them in their academic as well as their personal problems. His meticulous and systematic way of operation was evident not only in his personal conduct but extended to his study and research activities* and the execution of his administrative duties. His thoroughness and hard drive in any task he undertook was difficult to match. Yet with the high standards he set for himself, his modesty, friendliness, and kindness toward others were a hallmark that will long be remembered by his colleagues and others fortunate enough to have come into contact with him.

Bill is survived by his wife, Myrtie Van Etten, and a son, William H. Hewitt, to whom he was selflessly devoted.

With the passing of Bill Hewitt, Cornell lost a faithful member of the faculty, his colleagues and students a trusted friend and valued counselor, and his family a most beloved husband and father.

Arthur J. McNair, James W. Spencer, Ta Liang

George H. Hildebrand

July 7, 1913 — May 18, 2007

George H. Hildebrand, the Maxwell M. Upson Professor of Economics and Industrial and Labor Relations, died in Walnut Creek, California, on May 18, 2007 at the age of 93. He is survived by his second wife, Florabelle Hildebrand, to whom he had been married for 24 years, and his three sons. His first wife, Margaret, died in 1982.

George received his B.A. degree in Economics from UC-Berkley in 1935, his M.A. degree in Economics from Harvard in 1941, and his Ph.D. degree in Economics from Cornell in 1942. After service in the military during World War II, he began his academic career as an Assistant Professor of Economics at UCLA in 1947 and rose through the ranks to full Professor in 1954. In 1960, he returned to Cornell as a Professor of Economics and Industrial Relations and in 1970, he was elected the Maxwell M. Upson Professor of Economics and Industrial and Labor Relations. In 1977, he was elected the founding director of Cornell's Center for the Study of the American Political Economy—a position that he held until his retirement in 1980. His retirement came after the then-mandatory retirement age of 65; his professional stature led the university to voluntarily agree to extend his tenured appointment beyond the mandatory retirement age.

Few scholars can match Hildebrand's academic and professional contributions. His academic writings were numerous and spanned a wide variety of areas in labor economics and collective bargaining, including the effects of tax policies on unemployment and inflation, industrial relations in European nations, bargaining structure and power, impasse resolution, wage differentials, and collective bargaining and antitrust law. Although trained as an institutional labor economist, Hildebrand understood the growing importance of econometrically-based empirical research in economics; in 1965, along with his colleague in the Economics Department, T.C. Liu, he authored an important book, *Manufacturing Production Functions in the United States, 1957: An Interindustry and Interstate Comparison of Productivity*.

George regularly applied his professional expertise to help solve real-world problems in his field. He was a noted arbitrator and mediator in both public and private sector labor relations disputes and had a special interest in labor relations issues in the mining industry throughout his career. He was a member of the prestigious National Academy of Arbitrators and a member of its arbitration panel and the arbitration panels of the Federal Mediation and Conciliation Services and the New York State Public Employee Relations Board. From 1969-71, he served as Deputy Undersecretary of the U.S Department of Labor, and during this period, he was the U.S representative to

the International Labor Organization. Given his academic accomplishments and these professional contributions, it is not surprising that he was elected President of the Industrial Relations Research Association when he returned to Cornell in 1971.

Those of us who were fortunate enough to know George learned many important lessons from him. His effectiveness as a mediator and arbitrator was at least partially due to his extraordinary ability to keep things told to him in complete confidence. The parties to labor disputes that he was helping to resolve knew that nothing that they told him would be divulged to the other party unless he received explicit permission from them to do so. His academic stature at Cornell and the widespread knowledge of his ability to keep confidences undoubtedly were important factors in his selection to be the first faculty member to be a member of a Presidential Search Committee at Cornell; in 1976-77, he served on the committee that recommended the appointment of Frank H.T. Rhodes to be Cornell's 9th President. Those of us on the committee writing this obituary tried to emulate George's discretion while we served as administrators at Cornell.

George also had an uncanny ability to see the positive in difficult situations—another attribute of a skilled mediator (at a more mundane level, he once told one of us that he loved it when it snowed in Ithaca because the snow was such a welcome contrast to Ithaca's predominant gray skies in winter). The importance of trying to make the best out of every circumstance set an important example for his younger colleagues, both as they coped with difficult administrative decisions and as they faced adversity in their personal lives.

Finally, two years before he was planning to retire, George came to one of us (who was then the chair of his department) and said that he no longer was going to vote on new appointment and tenure decisions. He said that this did not mean that he approved of the decisions that his younger colleagues were making; often he did not. But, he went on, we were the ones who would have to live with these decisions for decades, and so we should be the ones making the decisions. As a large number of his former colleagues in economics and industrial and labor relations are now nearing their own retirement ages, and the number of new faculty hiring and tenure decisions their departments must make is increasing, we wonder if those of us now nearing retirement will be able to be as magnanimous in ceding decisions to our younger colleagues as George was.

Ronald G. Ehrenberg, Chairperson; David Lipsky, Robert Stewart Smith

Forrest F. Hill

December 30, 1900 — October 20, 1988

For 25 years, “Frosty” Hill contributed to Cornell as a teacher and administrator. He came to Cornell as a graduate student in 1923 after having completed his bachelor’s degree at the University of Saskatchewan. He was appointed as an assistant professor in 1929, and within a year was promoted to full professor, an indication of his status within the faculty.

Hill’s teaching career at Cornell was interrupted in the 1930s by a succession of appointments to the Farm Credit Administration in Washington. He and W.I. Myers (later to become Dean of the College of Agriculture) were asked by President Roosevelt and Henry Morgenthau to help rescue farmers from the financial crisis then facing agriculture. From 1933 to 1938, Hill served as special assistant and deputy governor of the reorganized farm lending agency. The new organization successfully refinanced millions of farm loans and helped bail out local banks whose assets were tied up in farm mortgages. In 1938, Hill succeeded Myers as Governor of the Farm Credit Administration.

In 1939, Hill returned to Cornell as professor of land economics and devoted his energies to teaching and directing the work of graduate students. He became involved in studies designed to identify areas of New York State where farming was likely to remain unprofitable because of poor soil, unfavorable terrain, and inadequate rural services, including poor roads. Frosty was as much concerned with families displaced from agriculture as with land that had been made obsolete because of technical changes in farming. Successive generations of his graduate students were sent out to find out what was going on in rural areas of the state, and to identify those characteristics of land contributing to success or failure in farming.

Frosty had a colorful way of making points. His lectures were filled with metaphors and witty comments. Students forgot details of land tenure laws and credit arrangements, but they remembered his description of impoverished hill farms producing mainly “poverty grass and goldenrod.” The principal function of poor soil areas he quipped, was to “hold the world together.” Upland farms often commanded an excellent view of the valley below, but students were reminded that “you can’t pay off the mortgage with a view.”

Graduate students looked forward to informal sessions in Frosty’s office during which the breadth of his interest in social as well as economic issues became apparent. He was noted for his quick response to questions, often formulating an answer before the student had quite finished asking the question. Graduate students also

appreciated the invitations to breakfast at the Hills' home where the conversation ranged widely and always with good-humored comments from the professor. Talking with Frosty was as stimulating to colleagues as it was to graduate students because of his quick mind, wide-ranging interests and enthusiasm. He possessed a remarkable capacity to identify what was relevant to a particular problem, and to synthesize ideas.

In 1943, Hill became head of the Department of Agricultural Economics, a position he held for nine years. During this period, he continued to serve on a number of special commissions, including one which recommended a new pricing formula for milk, and another which dealt with the future of Ithaca and the surrounding areas. Frosty also was a member of a distinguished group of agricultural economists who were asked to recommend changes in existing farm policies. In 1949, he was elected President of the Farm Economics Association (later to become the American Agricultural Economics Association), and in 1966 was named as a Fellow of the Association, in recognition of his contributions to the profession.

In 1952, when President Malott asked Hill to become Provost of the University, the only instructions given to him by President Malott were "to work with him while he was on the campus and to act for him while he was away." Frosty carried out these instructions energetically and in a manner that pleased the President, the faculty, and the Board of Trustees.

In 1955, Hill left Ithaca to head the Overseas Development Program of the Ford Foundation. He was recruited for this position by Rowan Gaither, a family friend and colleague dating back to the early days of the Farm Credit Administration in Washington. Gaither was then president of the Ford Foundation. Frosty was persuaded that more ought to be done to improve the technology of food production, especially in Asia. He convinced the Ford Foundation that they ought to join forces with the Rockefeller Foundation in funding an international research program devoted to rice. This took the form of constructing and staffing the International Rice Research Institute (IRRI) in the Philippines. The success of IRRI in developing new high-yielding varieties of rice led Hill to propose establishing additional international research centers, including one in Africa and another in South America. He served for a number of years on the governing boards of two of these centers. Buildings have been named in his honor at both IRRI and the International Institute of Tropical Agriculture in Ibadan, Nigeria.

Hill was an innovator in seeking funds for the international centers as well as in creating them. He recognized at an early stage in their development that funding requirements for the centers would soon outrun the capacity of the Ford and Rockefeller foundations to support them. Hill's leadership was instrumental in bringing together a small group of internationally-minded individuals at the Rockefeller Foundation Conference Center in Bellagio,

Italy, to discuss funding arrangements. This led ultimately to the formation of a consortium of donors that now provide most of the support for the international centers.

Frosty found the challenge of attempting to increase food production stimulating and satisfying. After retiring from his position as vice-president of the Ford Foundation, he remained active for 10 years as a consultant to the Foundation and traveled widely on special assignments, usually accompanied by his wife, Lillian, a trained geneticist, and occasionally by his daughter, Peggy.

After retiring from the Ford Foundation, Frosty returned to Ithaca. Friends continued to enjoy his company at informal dinners in the Rathskeller and delighted in hearing his fund of stories, including many based on his recollections of growing up on a wheat farm in Saskatchewan.

Frosty's influence extended well beyond his tenure as a professor at Cornell. Several of his students have become distinguished members of the profession, including one who is now Director of the International Food Policy Research Institute, and another who is vice-president of the World Bank.

Few individuals have been able to achieve success in so many different areas including teaching, administration, and innovation in international research. He will be remembered as a great conversationalist and a delightful companion.

Frosty is survived by his daughter, Margaret Hill, of Fayetteville, New York.

Randolph Barker, Daniel G. Sisler, Kenneth L. Robinson

A. Miller Hillhouse

December 8, 1902 — December 2, 1986

A. Miller Hillhouse earned an undergraduate degree at Davidson College, a law degree at New York University, and an M. A. in economics from the University of North Carolina at Chapel Hill. He was the director of research for the Municipal Finance Officers' Association in Chicago. There he met municipal bond authority Carl Chatters, the executive director of that organization, and established a friendship with him that was to last a lifetime. Chatters encouraged him to write his first book, *Municipal Bonds: A Century of Experience*. Published in 1938, when many local governments were experiencing financial distress as a result of the depression, the book continues to serve as a resource for practitioners in the field of municipal finance.

During World War II Hillhouse was budget officer of the National Housing Agency in Washington, D.C. Following that he was involved in military government. He served as chairman of a four-power finance committee in Austria under United States general Mark Clark and helped get the Salzburg Festival going again after the war. He also served with the United States military government in Germany under General Lucius Clay and with the United States High Commission under John J. McCloy. His reputation for fairness in those posts was acknowledged by German and American officials. In Germany he became acquainted with Ed Litchfield, who enticed him, in 1952, to join the faculty of what was then the Graduate School of Business and Public Administration (B & PA) at Cornell (now the Samuel Curtis Johnson Graduate School of Management).

At Cornell Hillhouse taught courses in municipal finance, municipal administration, and municipal capital budgeting to students in business and public administration. He also taught municipal finance to city-planning students in the College of Architecture, Art, and Planning.

He was active in several roles among public finance professionals. He served as an adviser to New York State controller Arthur Levitt. As a result of his presence at Cornell, the *Federal Accountant* was edited here for a time. One of his best-known works is *Public Finance: Concepts and Practices*, published in 1968, the year he officially retired.

Jerry Hass recalls that Miller had “a twinkle in his eye and a wry sense of humor.” He wrote humorous verse to mark special occasions as an antidote to frustration and as a means of comment on private or public affairs. Those efforts, he wrote,

Serve for the writer
A psychological escape
Perhaps better than a binge
Or getting into a scrape.

The objects of his humor included a newly revised curriculum for the school (“It’s enough to cause the students, if not the professors, to riot”); Joe McCarthy (Senator Josie Joe / Disguised Don Quixote); and above all, himself (Trousers baggier / Eyebrows shaggier / Shoulders saggier). Miller’s verse was a regular feature of many B&PA ceremonies. One especially notable effort was “The Tribe of B&PA,” a spoof of Longfellow’s “Hiawatha” in which each verse was a portrait of a faculty colleague. Miller assembled his collected verse in a privately printed volume in 1975 entitled *Just for Fun—Nothing More*.

Miller’s retirement from Cornell marked the end of one career and the beginning of another. He moved to Georgia, where he researched, wrote, and published two books, *Gravemarkers in Burke County, Georgia* and *Pierre Gibert, French Huguenot: His Background and Descendants*, an undertaking that he conceived as a tribute to the area in Georgia where he grew up and for which he had great affection.

He is survived by his wife, Elizabeth Cheek Hillhouse, now of Danville, Kentucky; two daughters, Helen and Margaret; and five grandchildren.

Alan McAdams, John McClain, Seymour Smidt

Robert Byron Hinman

September 16, 1888 — July 25, 1943

Robert Byron Hinman was born at Colborne, Ontario, Canada, on September 16, 1888. After he was awarded the Bachelor's degree in Scientific Agriculture at the Ontario Agricultural College in 1915, he was Farm Bureau Agent in the Ontario Department of Agriculture until 1920. During part of this time he served overseas in the Canadian Army in World War I. He received the M.S. degree at Iowa State College in 1920 and in the same year came to Cornell University where he served as Instructor in the Animal Husbandry Department. He was made Assistant Professor in 1921 and Professor of Animal Husbandry in 1937. In 1926 he received the Ph.D. degree at the University of Wisconsin. His thesis work was a study of the effects of chronic alcoholism in relation to the inheritance of acquired characters. He continued this work at Cornell.

Professor Hinman was in charge of the teaching and research work in beef cattle and meats. His sound judgment earned him the respect of animal husbandmen throughout the country and his knowledge in these fields of endeavour caused him to be appointed on many professional committees. He firmly believed that the agriculture of New York State would benefit by a more diversified type of farming and he did much missionary work, with success, on the raising of beef cattle and the home slaughtering of meat. Many of his students are carrying on with this good work throughout New York and neighboring states.

Hinman was also interested in the development of animal breeding work in the College. He was instrumental in bringing the Robert C.M. Auld collection of books and manuscripts on this subject to our Library while his own extensive and valuable collection of books has become the treasured possession of the Animal Husbandry Department. By the desire of his wife and family it forms the R. B. Hinman Memorial Collection. He retired on June 30, 1943, and passed away on July 25, 1943, after a long illness.

These are but the bare facts of his life. Those who knew him well were aware of many years of pain and increasing disability bravely borne. His readiness to help student or colleague with any difficult problem endeared him to all and his enthusiasm was infectious. His fund of anecdotes, seldom repeated, and carrying a wealth of experience and apt interpretation, were part of the educational equipment which he used to such good purpose. But those who knew him best sometimes noted that his expression showed how keenly aware he was of the irony of his wit if it were applied to his own circumstances. We honored him for it and for his constant effort to prevent his troubles from warping his judgment and from impairing his usefulness. We honored him for his fortitude and mourn the loss of a brave colleague.

Harry Alton Hitchcock

— *October 17, 1917*

The following resolutions, presented by Professor Kerr, were adopted by rising vote:

The University Faculty deplores the loss of Harry Alton Hitchcock, Secretary of the University, whose death on October 17, shortly after the opening of the University, followed an illness of several months.

Mr. Hitchcock entered the University in 1896 and promptly won the respect and affection of his college mates; with his teachers he left an abiding memory of a diligent and earnest student, of a sincere and honorable man.

After his graduation with the degree of Bachelor of Science and a subsequent year of graduate study in literature, he was engaged successfully in editorial work and in business management of publications and publishing houses in Boston and New York, work for which he was fitted by inclination and education. During this period he maintained his interest in the University and in the affairs of its alumni.

Called to the office of Secretary of the University, he brought to the service of Cornell a maturity and a training which were of good augury. His quiet humor, scholarly attitude, energy, and dignity gave promise of years of constructive and productive work.

Mr. Hitchcock at once displayed noteworthy capacity for his new duties. His zealous attention to the manifold demands of the office and the unfailing kindness and courtesy of his address elicited warm praise from all with whom he came in contact, officers, alumni, and students alike. His services as keeper of the alumni records, his efforts toward closer relations between the alumni and the University, and his faithful interest in the various alumni organizations in which he became an officer, no less than his energetic direction of the details of routine, are abundant evidence of his activity, ability, and devotion.

It was given him to enjoy but a year of the congenial new life upon which he had entered when the insidious disease which took him away stole on him almost without warning. After a brave struggle for strength, and final recourse to surgery, he faced the inevitable with courage.

His death, in the fullness of his powers, deprives the University of a faithful servant, the Faculty of a trusted counsellor and friend.

Committee: W. Austen, B. S. Monroe, A. T. Kerr, Chairman

James Lynn Hoard

December 28, 1905 — April 10, 1993

James Lynn Hoard, or Lynn as he was known to his many friends and colleagues, was a central figure on the faculty of Cornell's Chemistry Department for 35 years before his formal retirement in 1971. For more than a decade, in the ensuing years, he continued his distinguished career in structural crystallography, appearing daily at his office immersed in the painstaking scholarship that was characteristic of his entire career.

The sixth of seven children, Hoard was born on a family farm in Beckham County in the Oklahoma Territory. He was five when his family moved to Seattle, Washington where he spent his formative years. He studied the piano and for a number of years considered undertaking a career in classical music and interrupted his undergraduate studies for a year of music study. He was blessed with a remarkable memory and a strong sense of enquiry that eventually led to a lifetime of scholarship.

In 1927, Hoard was graduated from the University of Washington *magna cum laude* in chemical engineering. He was also awarded Phi Beta Kappa, the first chemical engineering student at that institution to be so honored. He continued at the University of Washington, earning a Master's degree in chemistry in 1929. He then went on to graduate work at the California Institute of Technology. This institution was rapidly rising as a major world center in science and it was there that he met and worked with Linus Pauling, forming a lifelong friendship. Pauling, reflecting on those early days with Hoard, wrote: "One memory I have of him, from several occasions, is the following. He would have learned about something surprising that had been discovered in the field of science, perhaps just told to him by me. He would stand for some minutes with a look on his face that suggested strongly to me his feeling of surprise and pleasure about the new discovery—his mouth held somewhat open and his eyes seeming to flash with pleasure."

Following Pauling, Lynn Hoard became one of the early pioneers in the application of x-ray diffraction techniques to the determination of crystal and molecular structures. In those days, the challenge of truly arduous calculations required both determination and structural insight of the investigator. In the midst of the Great Depression, Hoard brought his newly acquired skills to Stanford University where he served as an instructor for three years. After a brief term at Ohio State University, he joined Cornell in 1936.

It was characteristic of Hoard's approach to science that he did not—indeed, by nature, could not—turn away from difficult or seemingly intractable problems. His determination and self-confidence led him to pursue them

relentlessly even if it took a decade of effort. Thus, at Cornell, he undertook the study of the element boron and its binary compounds. The structures of these systems are among the most complicated in the Periodic Table. His initial achievement was the landmark structure of boron carbide which established the icosahedron as the basic building block of boron and borides. Later structures of the element itself and related systems led to an authoritative treatise in 1965 that stands today as a primary reference in the field.

In another area, Hoard's work in the structural chemistry of discrete coordination compounds comprises a touchstone for other investigators. His analyses, from the first report of a seven-coordinate complex through pioneering studies of eight-, nine-, and ten-coordinate complexes, have been marked by a singularly comprehensive view of the field.

This is particularly evident in his enunciation of stereochemical principles governing eight-coordination, an invariably cited standard. He also produced an extensive series of papers on coordination compounds of ethylenediaminetetraacetic acid (EDTA) that remain the outstanding source of carefully measured and critically evaluated structural data for these important systems. A dramatic illustration of the value of the insights developed by Hoard was his prediction and subsequent discovery of a seven-coordinate complex of iron (III), a complex that had been thought to be unrealizable.

Hoard's analyses of metalloporphyrin stereochemistry provided analytical underpinnings to a new era in the understanding of hemoproteins and their biological functions. His exacting interpretations of model compound crystal structures led him to set forth quantitative first principles as a basis for understanding such phenomena as cooperativity in the reversible oxygenation of hemoglobin. This approach led others to revise theories of biological processes and to seek and find key results in previously overlooked experimental observations.

Hoard's versatility as a scientist was evident in his work with the Manhattan Project during World War II. In addition to determining the structure of a critical compound of uranium, he conducted a large and successful project on the development of a smokeless propellant for JATO units for the Navy. He also participated in studies of diffusion mechanisms in polymeric materials.

Although he published some 115 papers, Hoard was not a facile writer. He combined faultless syntax with precision and economy of expression. Each paper became a labor of love, written and rewritten, paragraph by paragraph, sentence by sentence, clause by clause. He devoted the same attention to papers from other authors sent to him for review, sometimes spending days reforming ideas, recalculating and giving freely of his own contributions.

Editors, recognizing this, sent him more than his fair share to review. He applied the same stringent criteria to his teaching and would spend hours trying to improve the clarity of a single important concept.

Lynn Hoard loved Cornell and Ithaca and was reluctant to travel, although he frequently did so in later years. He came to Ithaca with his bride, Florence Fahey Hoard of Seattle, and raised a family of three sons, David and the twins Thomas and Laurence. In the early years, although under constant pressure from Lynn's participation in the Manhattan Project and his intense dedication to research, they nevertheless completed a major family project. They helped to design and manage the construction of a unique home which they were to share for forty-five years. Modeled along the lines of a Frank Lloyd Wright design, it has been an Ithaca landmark, graced by carefully planned and beautifully kept gardens.

Hoard's scientific contributions were widely recognized, even at the early stages of his career. In 1946, he was awarded a Guggenheim fellowship which he pursued at the California Institute of Technology. He received a second Guggenheim award in 1960 and then a very rare third fellowship in 1966. It was this third sojourn, spent largely in Cambridge, England that spurred his interest in the relationships between metalloporphyrin structures and biological mechanisms in hemoglobin.

In recognition of his great body of work in three important areas of structural chemistry, Hoard was elected to the National Academy of Sciences in 1972. This was followed in 1977 by the American Chemical Society Award for Distinguished Service in the Advancement of Inorganic Chemistry. Perhaps the most significant recognition he received was the warm esteem in which he was held by his Cornell colleagues, students and friends for more than a half-century.

W.D. Cooke, B. Widom, R.E. Hughes

Elliot Hochstein

November 10, 1908 — May 2, 1971

Elliot was a gentle man, endowed with a brilliant mind, an inner strength, and the capacity to love. His concern was for his fellow man and he directed all of his energies to that end. Tireless in the pursuit of his duty and of what he thought was right, he did not complain even in the torment of his last illness; instead he lamented his inability to complete the many things yet undone.

He used to a full measure his extraordinary intellectual endowment. Born in New York City, he received his early education at Townsend Harris High School, a three-year preparatory school for specially gifted students. He was graduated from Columbia College, third in his class and member of Phi Beta Kappa, he received his Doctor of Medicine degree from New York University-Bellevue Medical College in 1932. Like many others during the dark days of the depression, he began his career in general practice. He served with distinction as a medical officer during World War II. In the years that followed, he became an expert in his craft, a preeminent clinician, whose counsel was sought by his colleagues. He was appointed to the faculty of the Medical College and began his association with The New York Hospital in 1950.

Elliot was always in tune with the most recent advances in medical research because he wisely recognized that the cornerstone of the clinical art was their application to patient care. At the same time, he held the conviction that without the laborious teaching of that art, the great tradition of American medicine would suffer. In the agony of his last illness he talked with me and with others of his concern about this as though he were possessed by it.

Elliot was a great teacher. He had great knowledge and his thirst for more was insatiable. He had unbounded enthusiasm for teaching the young. His ability to communicate was strengthened by that rare ability to transmit his own enthusiasm to his students. When he could not find a suitable textbook for his class, he wrote *Physical Diagnosis* with Cornell's Dr. Albert Rubin. It was derived from his vast experience as a practicing physician and teacher and is clearly destined to be a classic.

In his courses, he introduced the use of new audiovisual aids and created innovative teaching techniques. For the last twenty years, most students of Cornell University Medical College have considered his course in physical diagnosis to be the high point of their medical education.

For a physician who was so actively engaged in teaching and practice, he produced a remarkable number of academic papers on subjects ranging from his major field of heart disease to a study of the rupture of the spleen in malaria and a clinical classification of hypothyroidism.

He was an honorary member of Alpha Omega Alpha, the medical honor society; a diplomate of the American Board of Internal Medicine; a Fellow of the American College of Physicians, the New York Academy of Medicine, and the American Medical Association. He was also a member of the Bethesda Conference of the Committee on Standardized Terminology of the American College of Cardiology and the American Heart Association.

We are grieved at Elliot's untimely passing, yet we must take comfort from what he has meant to each of us. His life was an inspiration, and we have all been enriched in some way by his presence among us.

He is survived by his wife, the former Rose Korchin, and a daughter, Mrs. Amy Friedman of Boston, Massachusetts.

Aaron Feder, M.D.

Alfred Franklin Hocker

April 29, 1902 — February 12, 1948

Alfred Franklin Hocker, M.D., died suddenly of coronary thrombosis, at his home on February 12th. He had served as Instructor and Assistant Professor of Radiology (X-ray Therapy) since 1934, He also had appointments in both the Ear, Nose and Throat and X-ray Departments of New York Hospital. At his death he held the title of Consultant in Radiology. The New York Hospital-Cornell University Medical Center has suffered a very serious loss since Dr. Hocker had become an authority on cancer of the head and neck. His wise counsel in particularly difficult problems was always greatly appreciated.

Dr. Hocker was born in Audubon, Iowa. He attended the University of Oklahoma, and was graduated from the University of Louisville Medical School, Louisville, in 1926. After an internship and practice at the Louisville City Hospital he joined the staff of Memorial Hospital in New York City in 1930 as an Assistant Resident Surgeon. From 1932 to 1935 he was a Research Fellow, studying cancer with particular interest in X-ray Therapy. In 1936 he became Radiologist to the hospital and took charge of Radiation Therapy. In 1942 he joined the staff of the Head and Neck Service at Memorial Hospital, ably performing both the surgery and radiation therapy management of patients under his care.

At the time of his death he was director of the Tumor Clinic at Cornwall, N. Y. He had established this tumor clinic in 1936. The techniques learned at Memorial Hospital were adopted and this clinic was considered as a model for small hospitals. In the year preceding his death he had served as member of a cancer research team in the development of a thyroid cancer treatment, using radioactive iodine. He was a member of the American Medical Association, The American Radium Society and The American College of Radiology. Wherever Dr. Hocker lived and moved the atmosphere of human relations was bound to be more friendly under the force of his warm and generous personality. His kindness and sympathetic understanding inspired an immediate and lasting affection in all those with whom he came in contact. He was generous and tolerant in his judgment of others and modest in his opinion of his own achievements.. He took no part or side in minor disagreements. The universal esteem and affection which he possessed inspired many of his associates to emulate in some degree his unselfish and generous example. His work will be taken up and carried on by others but the death of Alfred Hocker leaves a void in the hearts of his many friends and patients which can never be filled.

H. L. Temple

Charles Francis Hockett

January 17, 1916 — November 3, 2000

Charles (“Chas”) Hockett came to Cornell in the fall of 1946 as a founding member of the Division of Modern Languages, a division of Cornell University which was established for the purpose of teaching the modern languages applying the principles of modern linguistics as understood at the time. Like all the founding members of the Division of Modern Languages, Professor Hockett had charge of a language program—his assignment was Chinese—and for 15 years, Chas ran the Chinese language program in addition to teaching courses in linguistics of all kinds. He was the soul of the linguistics program from his first years until his retirement in 1982, serving on the committee of almost all students enrolled in linguistics during his time, and serving as director of 25 Ph.D. dissertations. His enormous influence was by no means confined to linguistics at Cornell. From his days as a doctoral student to the end of his career, Professor Hockett was at the center of American linguistic thought, the author of seminal books and articles which shaped the American linguistic theory known as “structuralism”. In addition to his shorter articles, many of which were considered seminal to linguistic theory, his book, *Phonology* (1955), shaped phonological theory for a decade and remains important to this day. His introduction to linguistics from 1955, *A Course in Modern Linguistics*, is regarded as a model of clarity. It was a comprehensive introduction to the gamut of linguistic knowledge that had developed by that time and became the standard introductory text for nearly two decades. It continues to be widely studied to this day. In the late 1950s and early 1960s, new theories and approaches developed to rival “structuralism” in American linguistics, most notably those associated with the work of Noam Chomsky. Professor Hockett nonetheless continued to pursue the structuralist program and remained a productive thinker in linguistics to the end of his life.

Chas was born in Columbus, Ohio, where his father, Homer Carey Hockett, taught American history at Ohio State University. Chas entered Ohio State in 1932 at the age of 16, receiving his B.A. and M.A. degrees jointly in 1939. He continued at Yale University, where he studied with the two greatest American linguists of the 1930s, Leonard Bloomfield and Edward Sapir. He finished his Ph.D. degree in a record three years with a dissertation on the then moribund Potawatomi language spoken in Michigan, which became the inspiration for much of the theoretical advances in linguistics that Professor Hockett developed in the subsequent decade. He was widely regarded as Bloomfield’s successor and edited, reworked, and published as dictionaries, grammars, and texts Bloomfield’s voluminous data gathered over a period of more than ten years of work with the now dead Menomini language of Wisconsin. Chas was as much a follower of the anthropological linguist, Sapir, however, and was invited to become

a member of Cornell's Department of Anthropology in 1957. In 1973, he published an introductory anthropology text, *Man's Place in Nature*, which was well received and which he himself regarded as his best work.

As the foremost linguist of his generation and one of the great American linguists of all time, Chas was the recipient of numerous honors. He was named the Goldwin Smith Professor of Linguistics and Anthropology at Cornell, elected to the American Academy of Arts and Sciences and the National Academy of Science, and served as President of the Linguistic Society of America.

Chas had a lively and successful intellectual life in linguistics and anthropology, but he was a man of many parts. He had a deep love for music and a keen ear, and he engaged in a lifelong practice of musical performance and composition. A talented wind instrumentalist, he and his wife, Shirley, were early members of the Ithaca Concert Band, which closed every concert with "Stars and Stripes Forever" featuring Chas on the piccolo. The music he composed ranged from the witty and light to serious and sophisticated, from short pieces written for family and friends and the ICB (some with lyrics he had written as well), to chamber works, to a serious full-length opera, *The Love of Doña Rosita*, based on a play by F. García Lorca, *Los Títeres de Cachiporra*, which received its premier performance by the Ithaca Opera at Ithaca College. Although his professional career was as a linguist, toward the end of his life Chas came to regard his musical compositions as his most lasting legacy.

Chas enjoyed a long and happy marriage to the former Shirley Orlinoff, a mathematician and author of a half-dozen textbooks (which, incidentally, were ALL typed by Chas), with whom he had four girls and one boy. Home life revolved around music. Everyone in the family played an instrument, and family life was enlivened by musical performances together, often of Chas' compositions. Two of his children became professional musicians; one received a Ph.D. degree in Classics and is now a professional writer and instructional designer; one is a book producer; and their son is a systems analyst. Music was Chas' contribution to the Ithaca community. Throughout the last decades of his life, Chas and his wife, Shirley, were unstinting in their financial support and indefatigable in the energy they devoted to bringing music to the Ithaca public. It is largely their leadership and hard work that established the Cayuga Chamber Orchestra, a musical institution which has enriched the musical life of the community far beyond the contributions of Ithaca College and Cornell University, and which after more than a quarter of a century, promises to endure.

James Gair, Sally McConnell-Ginet, John Wolff

Lee F. Hodgden

August 28, 1925 — August 24, 2004

Professor Emeritus Lee F. Hodgden, 78, died in his home on Halcyon Hill in Ithaca on Tuesday, August 24, 2004, after a long, unique, and rich career as an architect and architectural educator.

Born in Kansas in 1925, Lee often reminded friends that he was a descendant of Buffalo Bill, and had himself as an infant been wrapped in buffalo robes. He attended the University of Kansas, graduating in 1946 after two years of military service in WWII, during which time he was one of the first American troops to enter and occupy Japan. In 1949, he received the Master of Architecture degree from the Massachusetts Institute of Technology, where he had the opportunity to study under Alvar Aalto, at that time a visiting professor from Finland.

He began his teaching career at North Carolina State College, where he became associated with Buckminster Fuller, beginning an interest in the complex geometry of architectural structure, which was to become one of his lifelong passions.

After a stay in San Antonio, Texas, where he worked in the office of O'Neil Ford on the design of numerous housing projects, he received a Fulbright grant to study public housing in Finland in 1954. Upon his arrival in Finland, Alvar Aalto, with whom he had studied at M.I.T., hired him as the first American to work in his office. During this time, Lee was a contributor to the design of Aalto's famous *Kulttuuritalo* (House of Culture) in Helsinki (1952-58), among other projects.

When Lee returned to the U.S. to teach at the University of Texas, he became one of a group of pioneering architectural educators known as "The Texas Rangers," working with Bernard Hoesli, Werner Seligmann, John Shaw, and Colin Rowe, all of who eventually became prestigious educators at Cornell. Alexander Caragone publishes a record of this time at Texas in the book, *The Texas Rangers: Notes from an Architectural Underground*. After Texas, he taught at the University of Oregon, where he began a lifelong association and friendship with Alvin Boyarsky, who would become Chairman of the Architectural Association School of Architecture in London from 1971-90, and taught Michael Dennis and Fred Koetter, who later followed him to Cornell.

Lee became a member of the Cornell faculty in 1961. While at Cornell, he taught Architectural Design and Urban Design as well as courses in the Theory of Architecture, where his courses became a mainstay of the curriculum. His design problems were varied, innovative and challenging, ranging from designs of formal gardens to sites in marble quarries in Italy, to houses to be designed in a De Stijl manner. Perhaps one of the most memorable and

challenging of all was the transformation of a cubist painting which was to fold out of the wall to become a chair.

Archie Mackenzie, a former student and colleague, recalls Lee as a teacher:

“In the early 1960s, Lee Hodgden was my teacher—as studio critic, three times, as theory lecturer, twice and, most importantly, as my thesis advisor, for one final semester. As I look back at that time spent with an extraordinary teacher, I realize that he must have chosen me to apprentice with him. For that privilege, I will be forever grateful. Although I never worked for Lee, I have always considered him my mentor, and although I have myself taught architecture for over thirty years, the image of Lee sitting at my table in the studio giving one of his brilliant critiques still fascinates and amazes me. And although I have also now sat with students at their tables, perhaps thousands of times, I want to ask, as if for the first time—to myself or to any who knew him: Can you imagine what it was like to listen to him and to watch him draw, to be so excited by his passion for architecture, to witness such a fertile mind working, a mind so rapt by the possibilities of countless sketches accumulating on the table?”

“I do not know anyone like him nor do I owe anyone more. I am glad for a chance to remember him, to honor him and to tell others that I will never forget him.”

His writings included “Formal Gardens” and “The Interior Façade,” both published in the *Cornell Journal of Architecture*, and several works in progress on the architecture of Alvar Aalto, which were soon to be published.

He was instrumental in the organizing of the Colin Rowe Festschrift, held at Cornell on April 26-28, 1996.

Lee was devoted to the continuing study and teaching of architecture as a way of life. His interests and activities varied widely, ranging from an intense love of the games of “Go” and bocce to the building of a harpsichord for Werner Seligmann’s son, Raphael; from the hand carving of the capitals on the pilasters at the entry of his own house to French and Italian formal gardens; from the development of his “Metron” proportional system to the development of advanced structural systems inspired by Buckminster Fuller that he continued to develop throughout his life.

This love of architecture as life was perhaps best demonstrated by the house on Halcyon Hill that he designed and built for himself and his wife, Laurel. The house was at the same time his work and his place to work, a built theory lecture that was the stage for numerous rubbernecking tours through forced perspective hallways, and a gathering place for faculty and graduate students inevitably centered in his library, who would eventually be force-fed Lee’s ideas on the “teaching of teachers” of architecture. (“That’s not the way an architect thinks” - L.H.)

Lee continued to tirelessly work on his writing, competitions and inventions in his house after his retirement in 1995, enthusiastically embracing new design possibilities made possible by his use of the computer, including the World Trade Center Site Memorial Competition in 2003. In this project, Lee proposed a reconstruction of a three-

story segment of one of the World Trade Center towers, lined in black granite and inscribed with the names of the 9/11 victims. Alvar Aalto's 1959 drawing titled "Once Noble Columns have Fallen" inspired the project.

Archie Mackenzie, Arthur A. Ovaska

Wayne L. Hodges

July 21, 1908 — February 21, 1973

Wayne was born in Spokane, Washington, the son of Elma and Brodie Wilson Hodges. (His father began as a bookkeeper in a small flour mill in Spokane and later became a vice president of General Mills in San Francisco.) Wayne was named after Civil War general “Mad” Anthony Wayne and spent much of his boyhood in public libraries. An interest in literature, history, art, and philosophy grew throughout his life, resulting in his developing an extensive library which was a source of continuing pleasure to him.

After graduating from high school in 1927, Wayne worked for several newspapers, first as a copy boy for the *San Francisco Chronicle*; then as a reporter for the *Vallejo Times-Herald* and the *Santa Rosa Republican*; as a pony editor, rewrite man, and overnight editor for the United Press in San Francisco; and finally, at the age of twenty-one, as the editor of the *Healdsburg Daily Tribune*.

In 1932 he entered the University of California at Berkeley, graduating in 1936 with a B.A. in English and art. Upon joining the staff of Pasadena City College as an instructor, he continued graduate work at the University of Southern California, earning an M.A. in English in 1940.

From 1943 to 1945 Wayne served in the United States Navy, first teaching illiterates and publishing a camp newspaper at Camp Perry, Williamsburg, Virginia, and then working in Harbor Entrance Control at Newport, Rhode Island.

In 1945 he became an English instructor and director of public relations at Cooper Union for the Advancement of Science and Art in New York City. He remained at Cooper Union until joining the faculty of the New York State School of Industrial and Labor Relations in 1951.

The contribution Wayne Hodges made to classroom life at the ILR School was valuable, largely irreplaceable, and quite unexpected. He was engaged initially to advise college administrators about the delicate public relations problems of an educational institution serving “publics” which were mutually hostile and suspicious of persons professing neutrality. Hodges’s responsibility for teaching public relations was thought to be an incidental part of this job! Apparently both his advice and his teaching were so successful that, after his first few years, most of his time was devoted to research and teaching.

Graduate and undergraduate students in ILR formed the first enthusiastic audience for Wayne's blend of practical experience and analytical sharpness. The growing importance to corporations, unions, and government enterprises of managing their relations to one another and to the public as rationally as possible, soon added students from the Graduate School of Business and Public Administration to Professor Hodges's "personal" public. During this period he wrote *Company and Community* (Harper Bros., 1957) and articles in journals and magazines. He was an indefatigable adult educator in the best sense of the word, not only by participating in and directing workshops and seminars for union and company public relations practitioners, but by helping to found a professional association, the Industrial Communication Council.

In 1967 Hodges became director of ILR publications, a post which called on his editorial acumen. Responsible for the School's publishing a number of outstanding volumes and monographs, he remained personally active and productive. His last major production to be completed was the editing of "Technological Change and Human Development," a venture in international scholarly cooperation.

In September 1972, Professor Hodges went into "semiretirement" - completing the manuscript for a new book, "The California Wine Industry," and undertaking a variety of special projects for Cornell. On October 1, 1972, he was named professor emeritus. His official retirement party in December of 1972 was a memorable School occasion, primarily because the guest of honor was a memorable human being, bright, warm, witty, and much loved.

Charlotte Gold, James Huttar, Frank Miller

Joseph Frederick Hodgson

March 7, 1929 — October 5, 1970

Joseph Frederick (Skeef) Hodgson's tragic death at the age of forty-one left his associates and friends in a state of unbelieving shock and bewilderment. He will be sorely missed not only by his friends in the Ithaca area but also by many fellow scientists around the world with whom he maintained professional contacts.

Dr. Hodgson was born in Rochester, New York, and attended the University of Maryland, where he received the B.S. degree in 1951. He received the Ph.D. degree from the University of Wisconsin in 1955. He served with the United States Army at Fort Detrick, Maryland, from 1955 to 1957. In 1957 he joined the U.S. Department of Agriculture, as a research soil scientist at the U.S. Plant, Soil and Nutrition Laboratory on the Cornell University campus. He remained in this position until the time of his death. In December of 1959 he was also given a courtesy appointment as assistant professor of soil science in the Cornell University Department of Agronomy and was promoted to associate professor in July of 1965.

He spent the academic year 1964-65 at Colorado State University in Fort Collins, where he conducted research and gave a series of lectures on the chemistry of trace elements in soils and plants. In 1964 he was invited by North Carolina State University to present a series of lectures on trace elements in soils. In the fall of 1967 he spent one month as a guest lecturer and consultant at the Universidad del Sur, Bahia Blanca, Argentina. This visit was sponsored by the Ford Foundation.

His twenty-four published articles are primarily concerned with the distribution and chemistry of trace elements in soils and their role in plant nutrition. Some of these articles also deal with the requirements of animals for trace elements in the food they eat. His work on the role of complexing of metals by organic ligands has far-reaching implications concerning the regulation of availability to plants of trace elements in soils. In recent years, he was also interested in trace elements in the environment in relation to human health.

His many publications attest to his broad and thorough understanding of the basic chemistry of trace elements in soil and biological systems. In addition, he showed an unusual ability to reduce theoretical chemistry to generally understood terms. His research on trace elements dealt with cobalt, selenium, copper, zinc, iron, phosphorus, cadmium, and chromium. He was also interested in the role of aluminum, arsenic, beryllium, boron, bromine, iodine, fluorine, lead, lithium, manganese, molybdenum, nickel, strontium, tin, tungsten, titanium, and vanadium in biological systems.

Dr. Hodgson was also very deeply concerned with the ability of agriculture to apply the food and fiber needs of the rapidly expanding world population. In this connection, he organized student and faculty seminars to discuss this problem and always emphasized his conviction that population control is essential.

He was active in numerous scientific societies. He was a fellow of the American Association for the Advancement of Science, and a member of the American Society of Agronomy, Soil Science Society of America, International Society of Soil Science, American Chemical Society, Mineralogical Society of America, and the Society of Sigma Xi. He served on committees in these organizations and was a member of the National Research Council Subcommittee on Geochemical Environment in Relation to Health and disease.

He was a past president of the Ellis Hollow Community Association, chairman of the Ellis Hollow long-range planning committee, a past chairman of the Ellis Hollow Fair Committee, a member of the Tompkins County Resource Planning Commission, and a member of the Board of Directors of the Planned Parenthood Association of Tompkins County.

Skeef Hodgson was a very kindly, likable, and jovial person with a good sense of humor. He always stood ready and willing to tackle even the most perplexing problem with objectivity and confidence, while maintaining a completely unruffled composure. The fact that Skeef Hodgson took his own life came as an unbelievable shock to all of us who knew him well. Unfortunately he chose not to disclose even to his most intimate friends his concern for problems which surely must have troubled him more than any of us realized.

He is survived by his wife, Virginia (Jennie) Alexander Hodgson, and two daughters, Lyle Ann and Lori Jean.

Michael Peech, W. H. Allaway, David L. Grunes

Albert Hoefler

March 31, 1891 — February 17, 1977

With the passing of Albert Hoefler, a man of vision, character and dignity, Cornell University and the 4-H Program of New York State Cooperative Extension and the nation lost a leader and friend dedicated to the needs and concerns of youth.

Albert Hoefler was born in Clifton Springs, New York, on March 31, 1891. As a member of the Omega Club in Elmira, his career in youth work started even before the formal establishment of the 4-H program. He graduated from Elmira Free Academy, attended Cornell University, and was graduated in 1916.

Professor Hoefler's entire professional career was devoted to the development of youth through educational programs. His career began in Rensselaer County as director of agriculture for the youth garden program, a World War I school garden program. He was a pioneer in the establishment of county 4-H programs in 1919, setting up and leading a 4-H program in Rensselaer County until his appointment in 1931 as an assistant state 4-H leader at Cornell. In 1943 he was appointed state 4-H leader.

Albert Hoefler was a strong advocate for youth, for youth work as a profession, for the growth and development of volunteer leaders, and for the involvement of local people in program determination. He had an ability to communicate this in essays that have been used nationally to express the ideals and philosophy of 4-H work, as illustrated in the following quotation from 4-Haps, the state newsletter: "We must work with the people whom we would serve, listen and pay heed to what they are saying, share with them the development of ideals and objectives that shall guide us all."

In World War II, Professor Hoefler was appointed executive secretary of the New York State Victory Garden Program. During the same period he provided leadership for New York 4-H'ers who sold bonds that resulted in the commissioning of a liberty ship. In the postwar years, he exerted leadership at the national level by serving as a member of the National Advisory Committee on postwar 4-H programs and assisting in the establishment in Germany of youth organizations similar to 4-H. In this Marshall Plan approach, New York 4-H'ers contributed heavily to the "Hoes for Hoefler" program that he organized to provide basic garden tools to German youth.

Professor Hoefler was instrumental, as chairman of the National 4-H Subcommittee, in the establishment of the National 4-H Foundation and in the development of the International Farm Youth Exchange Program. The

National 4-H Foundation programs, which focus on leadership development for both adults and youth in support of the 4-H program, have had a far-reaching impact on state and county 4-H programs throughout the country. Hoefer, through his involvement with the 4-H Foundation, was instrumental in the establishment of the National 4-H Center in Washington, D.C.

In spite of the demands of his career, Albert Hoefer was an active member of the community. He was the founder and later president of Kiwanis Clubs in Troy and Ithaca. He served as an elected official in the City of Ithaca and was active in bringing about the move of the Tompkins County Hospital to its present location.

Albert Hoefer was recognized by his coworkers at county, state, and national levels for his organizational ability and his strong leadership. He received the Superior Service Award of the United States Department of Agriculture, a special citation by the New York 4-H Agents Association, and the Award of Merit from the Lambda Chapter of Epsilon Sigma Phi, the national extension honorary fraternity. Tangible evidence of the high esteem of his colleagues is the Hoefer Memorial Room at the National 4-H Center and the Hoefer Room, dedicated by the Kiwanis Club of Ithaca, at Tompkins County 4-H Acres. His ideals and philosophies live on in the minds and hearts of men and women who were directly and indirectly exposed to his wisdom.

Albert Hoefer retired as professor emeritus in Extension and State 4-H Leader on December 31, 1955, after a distinguished career of almost forty years. He died on February 17, 1977, and is survived by his wife, Helen, and two sons, Albert, Jr., and David. In his career, Albert Hoefer provided a firm foundation and a sense of direction for youth programs in Cooperative Extension, not only on a state level but on a national level. This foundation has been firm and enduring, the direction dynamic and flexible.

Bernice M. Scott, Phyllis E. Stout, Harold B. Sweet

Helen Paine Hoefler

October 3, 1904 — July 30, 1982

Helen Paine Hoefler will be remembered by her colleagues, students, and friends for her warm personality, skill in teaching, and independence of thought and action. Her strong interest and participation in government, education, and community organizations at all levels throughout her life have left a legacy of unusual achievement.

She was reared on a fruit farm near Medina, New York, and was graduated from the College of Home Economics (now the College of Human Ecology) at Cornell in 1927. College honors included being chosen for a semester to attend the Merrill Palmer School of Child Development in Detroit and membership in Sedowa, Phi Kappa Phi, Omicron Nu, and Pi Lambda Theta. In 1938 she married Albert Hoefler, then assistant state 4-H Club leader.

Mrs. Hoefler began her professional career as a home economist with the Buffalo Niagara and Electric Utilities Company. She then was employed as a cooperative extension home demonstration agent in Wyoming and St. Lawrence Counties. These were the depression years, and extension programs in home economics were concerned with salvaging, repairing, remodeling, and “making do.” It was also the period when extension began the intensive training and use of local volunteer leaders in county Programs—a method of teaching that was to become a key feature of extension work in home economics in the years that followed. Local leaders sharing their knowledge and skills made it possible to reach more homemakers.

Mrs. Hoefler’s rural background, tactful approach, and understanding of the educational process contributed to her success as a home demonstration agent.

In 1935 she was appointed assistant state leader of home demonstration agents, with an office at Cornell and responsibility for personnel, program, and finance in several counties. During the depression and war years cooperative extension was called on to work closely with many state and national organizations established to assist people during those difficult times. Mrs. Hoefler represented extension on several such planning committees, including the Rural Electrification, Rural Fire Prevention, and Nutrition programs.

After receiving her master’s degree in education from Cornell in 1947, she transferred to the Department of Home Economics Education and was appointed an associate professor. She designed a unique curriculum to prepare undergraduates for positions in cooperative extension. This program included a practicum in selected counties under the supervision of faculty and extension agents.

As Lucinda A. Noble, presently director of cooperative extension in New York State and a former student of Mrs. Hoefler, states: "Mrs. Hoefler was highly respected and loved by her associates and students. She was a pioneer in planning and initiating field study experiences in extension education." Another student recalls that she was a memorable and skillful teacher who never forgot an individual. She writes, "Mrs. Hoefler seemed to have a delight in people and encouraged most of us to produce above our usual capabilities."

Because of the success of this new program, a committee of the Association of Land Grant Colleges became interested in developing a similar curriculum in other institutions. As a result, Mrs. Hoefler in 1954 prepared *A Planning Guide for an Undergraduate Program for Extension Workers*.

Mrs. Hoefler also taught courses to acquaint students with community organization and resources, teaching and learning theories, the preparation of educational materials, and informal teaching procedures.

Because of her strong belief in the importance of lay leadership, she worked with a team of faculty members conducting training sessions for leaders in local units of the P.T.A. and other state organizations. She and a colleague wrote the extension bulletin *When You're a Leader*, used widely by educators in lay leadership programs all over the United States. For her contributions to the P.T.A. Mrs. Hoefler was awarded honorary life membership in the New York State Congress of Parents and Teachers.

During the spring of 1949 Mrs. Hoefler went to Germany as a consultant to the Food, Agriculture, and Forestry Branch of the military government of the United States. She worked with the British and Germans to develop a home economics program "which would bring useful and sound information to all families."

In order to spend more time with her husband, she resigned in 1956 from the University. Her retirement made it possible to help plan several of the college institutes and to work on community projects in which she had an abiding interest.

She served as a member of the Board of the State Home Economics Association and was active in the College Alumni Association. Later, as president of the Alumni Association, she helped to get funds for the addition to Martha Van Rensselaer Hall and for various scholarships.

Before her retirement she served as president of the Ithaca and Regional Councils of the Camp Fire Girls and was elected to the National Council, later receiving the Gulick Award for outstanding service. She was a member of the Presbyterian church and the Ithaca Cornell Women's Club and the boards of the City Federation of Women's Organizations and the Women's Republican Club.

As a member of the League of Women Voters she participated in urban renewal studies and in a campaign to revise the Ithaca charter. Because of her interest in government she was asked to run for the County Board of Supervisors and became its first woman member. She served on the legislative, civil service, and salaries committees and was chairwoman of the health and insurance committees.

She was a member of the County Hospital Board of Managers, the Mental Health Board, the Greater Ithaca Planning Board, the Resource Development Committee, and the Human Service Coalition and was chairwoman of the Social Planning Council.

As legislative chairwoman of the American Association of University Women she participated in the struggles to establish the local Board of Cooperative Educational Services and the Tompkins-Cortland Community College. Governor Rockefeller appointed her to an eight-year term as a founding trustee of the college. Her long experience in education and community service contributed greatly to its remarkable success.

She was a charter member of the board of Challenge Industries. Also active on many committees working to enhance the lives of our aging population, she was a member of the board of the Senior Citizens Council and the County Office for the Aging at the time of her death.

Her pioneer efforts encouraged other women to seek and accept service on public boards. Many who were in government sought her help because of her experience, knowledge, and tact.

She will be greatly missed by her family, by the communities in which she worked, and by her Cornell and extension associates. Her competence and cheerful ways enhanced the lives of all who knew her.

Her husband died in 1977. She is survived by two sons, Albert, Jr., of Ithaca and David of Binghamton; her brother, Kenneth Paine of Agawam, Massachusetts; five grandchildren; and two great-grandsons.

H. Irene Patterson, Hazel E. Reed, Helen B. Vandervort

Paul Raymond Hoff

August 29, 1903 — September 4, 1974

Professor Paul Raymond Hoff, born in Dover, Ohio, grew up on a poultry farm and attended elementary and secondary schools in Lisbon, Ohio. He earned the Bachelor of Agriculture degree at Ohio State University in 1928.

During the period 1927-29 he served as extension specialist in agricultural engineering at Ohio State University, and after this experience, he went west to the University of Nebraska, again as extension specialist in agricultural engineering, where he served from May 1929 until February 1934. While at Nebraska, Professor Hoff developed a comprehensive rural sanitation program and obtained cooperation from industry in carrying out the program. He also developed the first intensive 4-H programs at Nebraska in engineering projects on surveying and farm machinery. He joined the USDA Soil Conservation Service in 1934 and carried out field projects in Nebraska and Kansas on soil-saving programs during the “dust bowl” years. In February 1939 he was appointed extension instructor in agricultural engineering at Cornell University and simultaneously enrolled in the Graduate School to pursue a Master of Science in Agriculture, which he earned in 1940. Upon receiving the M.S.A. degree, he was appointed as assistant extension professor in agricultural engineering at Cornell. He was advanced to associate professor in 1945 and to full professor on July 1, 1949.

His programs at Cornell in extension education were quite diverse, encompassing soil conservation, farm drainage, farm machinery, and poultry housing and equipment. During the late war years he devoted much effort to field supervision of fifteen district agricultural engineers who were operating the emergency farm machinery repair program for the New York State War Council. In 1946 an agriculture demonstration train, the “Farm and Home Special,” traveled through New York State on the New York Central system to show farm people what was new in agriculture. Professor Hoff managed the three-week tour for the College of Agriculture; his efficient management won praises from both the college administration and New York Central officials.

From 1945 to 1954 Professor Hoff was project leader of the extension program of Cornell’s Department of Agricultural Engineering. Hoff collaborated actively with the College of Home Economics in the rural housing and community buildings program that was initiated after World War II. His principal efforts were directed to water supply, sewage disposal systems, and heating systems.

Hoff’s interests were in agricultural engineering educational programs, not only in the United States, but also in developing countries. From August 1954 to August 1956 he served as visiting professor with the Cornell-Los

Banos project in the Philippines. In addition to aiding in the rebuilding of the College of Agriculture at Los Banos, he helped establish a drainage system at the college experiment station and conducted research on proper use of irrigation for rice production.

During a sabbatic leave from February 1958 to March 1959, Professor Hoff was engaged by International Cooperative Administration to organize and conduct training programs for instructors of farm machinery operation and service for Mexican extension personnel, agricultural college faculty, employees of agricultural credit banks, and farm machinery distributors.

One of the outstanding accomplishments while he was in Mexico was the establishment, by the Mexican Ministry of Agriculture early in 1959, of a training center to continue, on a permanent basis, the type of machine operation training developed by Professor Hoff.

Because of his interest and concern for technical assistance to developing countries, Hoff retired from Cornell on September 18, 1960, to accept a two-year assignment with the International Cooperation Administration in Brazil. Due to a serious back injury, Professor Hoff chose to accept disability retirement from federal service prior to completion of this assignment in Brazil.

During his twenty-one years at Cornell, Hoff authored or revised over fifty extension publications and prepared many news stories for farmers' benefit. He was a regular contributor to *Extension County News* and wrote frequently for farm magazines. He had great interest in helping people to help themselves. His success in conducting educational programs can be attributed to his ability to instill in people the desire to learn and to encourage them to continue their learning experiences.

Professor Hoff was active in the American Society of Agricultural Engineers, the Cornell Extension Club, Epsilon Sigma Phi, the First Baptist Church of Ithaca, and the Ithaca Rotary Club. In addition to photography, he had a hobby of building radios, stereos, and other electronic equipment.

He was married to Lucy G. Swift in Danville, Kentucky, on March 31, 1929. Their son, Hugh W. Hoff, a graduate of the School of Hotel Administration at Cornell, lives with his wife and four children in Seattle, Washington. For the past several years Professor and Mrs. Hoff have resided at Panoramic City Retirement Community, Lacey, Washington, where Mrs. Hoff will continue to live.

William F. Millier, Orval C. French, Hollis R. Davis

Melvin B. Hoffman

November 19, 1903 — February 21, 1988

Melvin Butler (Pete) Hoffman was born in Blythewood, South Carolina and spent his early boyhood on the family farm. He quickly developed a passion for whatever was at hand, be it work or play, school or the world around him, in a family of two older half-brothers and two younger brothers and two younger sisters.

Pete attended the local school that provided instruction through the 10th grade. At the age of fifteen he sat for the South Carolina College Entrance Examination which he not only passed successfully, but was awarded a scholarship to Clemson College where he enrolled the fall semester 1918. After graduation in 1923 he worked one year for the Federal Horticulture Board in Texas. He then moved to Michigan State where he worked with the noted peach breeder, Dr. Stanley Johnson, and received his M.S. degree in 1926. Following graduation he was appointed to the position of instructor in horticulture at West Virginia University, a post he held until coming to Cornell University as a graduate student in pomology under Dr. A.J. Heinicke in 1931. Early in his graduate career at Cornell he teamed up with other graduate students — L.P. (Jack) Batjer, Frazier Cowart, J. Winston Neely, Charles Palm, Michael Peech and T.J. Peele — to rent an apartment on Stewart Avenue. This was their home during their years of graduate study and preparation for a variety of highly successful professional careers. Friendships and strong ties developed among that group, lasting throughout their lifetimes. The Depression was in full swing, and the frugal management of the apartment often fell to Pete, the senior member of the group. In addition to the serious side of graduate student life in the mid 1930s, there were occasions for relaxation and fun which Pete often recounted. His picturesque southern expressions were entertaining and good for a laugh!

Pete married Helen Kallenberg in 1934. They had two children: a son, Robert, and a daughter, Mary Louise; and, later, two grandchildren.

Pete's background of experience, professional competence, and dedication to fruit growing, led to his appointment as extension instructor in pomology at Cornell prior to receiving his Ph.D. in 1934. He stayed on in the department after receiving his degree and was made assistant professor in 1936. During his early tenure at Cornell he was one of the very few extension workers in the United States who held a doctorate.

Because of the Depression and loss of many trees due to the severe winter of 1933-34, there was a sharp decline in the number of commercial fruit plantings in New York. The decline in tree numbers was more than offset by a marked increase in average yield per acre so that total fruit production was maintained at a high level. The

larger yields were due primarily to improved cultural practices based on research in which Pete was involved and which he advocated as extension fruit specialist. His thesis research on photosynthesis in apple leaves led to the development and use of fungicides that controlled diseases as effectively as lime sulfur resulting in greater efficiency of the foliage on the trees. The pioneering studies on soils suitable for fruit production, with which Pete was closely associated, resulted in the orchard location service as an extension activity that brought about the concentration of new fruit plantings on the better soils and sites. The work on soil management and mineral nutrition of fruit plants paved the way for foliar analysis as a supplement to soil analysis. Leaf and soil analyses as a service to growers was established under Pete's direction. The research on chemical thinning of apples, to which he made major contributions, was widely applied throughout all apple growing regions and has helped to bring about annual production and increased hardiness of the trees. Before the 1960s, apple production fluctuated widely from year to year. Since the advent of very early fruit thinning, production has been relatively stable from year to year. He was also involved in developing sprays that would prevent the preharvest drop of apples. Chemical thinning and preventing preharvest drop of apples doubled the average yields of marketable fruit in New York.

Pete was appointed associate head of the department in 1944 when Dr. Heinicke moved to Geneva as director of the Agricultural Experiment Station. In 1960 Pete was appointed head of the department when Dr. Heinicke retired, and served in that capacity until his retirement in 1970, when he was named professor emeritus.

As department head, Professor Hoffman enthusiastically supported basic research on physiological, anatomical, and biochemical phases of production and storage problems, as well as applied research. He also supported new plantings of apple trees propagated on size controlling rootstocks. Soon after becoming department head, he was asked by the college administration to work with Professor John Einset at Geneva to review the pomology departments at Ithaca and Geneva, to assure that their programs were coordinated to provide the best total program for the fruit industry of the state.

In addition to his extension, research, and administrative positions, he annually taught an upper-division course for undergraduate and graduate students.

As an extension specialist, Pete enjoyed the confidence of all fruit growers. He was respected for his good judgment in suggesting practices that were based on a thorough knowledge of experimental evidence. His method of communication was down to earth, delivered with his southern accent and his famous sense of humor. Growers in all sections of New York felt that they could not conduct their fruit-thinning practices in the spring until they had their briefing sessions at the twilight meetings. Growers from as far away as Missouri would call Pete at

home for specific chemical fruit–thinning recommendations for their individual orchards. He was called upon for consultation and talks in other states. He travelled widely and kept up with the latest developments in other fruit producing regions.

In recognition of his contributions to the fruit industry through research and extension accomplishments, Pete received a special citation from the New York State Horticultural Society in 1969. He authored or co-authored more than forty research and technical papers where he presented his experimental work. In addition, he wrote numerous extension publications and articles for trade journals.

Pete was elected a fellow of the American Society of Horticultural Science in 1968 in recognition of his outstanding professional achievements. He was a member of the American Association for the Advancement of Science, The American Institute of Biological Science, Sigma Xi, Phi Kappa Phi, and is listed in the *American Men of Science*.

Pete Hoffman lived a full life — one that touched many people. He loved his family. Professionally he excelled. Much of New York’s stable and sound fruit industry reflects the research and the guidance he gave to the growers. He provided leadership not only to the fruit industry itself, but to the Department of Pomology as professor and chairman. Pete’s contributions as a professional and humanitarian were substantial. He did much to encourage the work of graduate students and colleagues. Melvin Butler (Pete) Hoffman was respected by all of those who knew him.

G. D. Blanpied, Charles E. Palm, Loyd E. Powell, Louis J. Edgerton

Robert Francis Holland

September 21, 1908 — January 16, 2000

Robert F. Holland was born on a dairy and fruit farm near Holley, New York. He came to Cornell in 1932 and enrolled in the College of Engineering. At that time, he was working for a local retail dairy processor and became interested in Dairy Science. This led him to transfer to the College of Agriculture, where he earned his undergraduate degree. After graduation, he became a candidate for a Doctorate in Dairy Science.

During his time as a graduate student, he was an Instructor in the Basic Dairy Science course, working in association with Professors Paul Sharp and B. L. Herrington. He spent the last year of graduate work at the Geneva Experiment Station under Professor Dahlberg and upon receiving his degree, joined the Cherry Burrell Corporation, a manufacturer of dairy processing equipment. Shortly thereafter, he went to the Grange League Federation (GLF – now Agway) as a Director of Chemical Research to develop a new line of chemical products.

In 1944, Dr. James Sherman, long-time head of Dairy Science, invited Holland to return to Cornell to take over the Extension duties, administrative management of the dairy plant and teach a course in market milk. He succeeded Professor Sherman as head of the department in 1954 and held that position for 18 years until his retirement in 1973. It became his responsibility to shepherd a diverse faculty through changes in name and activities from Dairy Industry to Dairy and Food Science, and finally to Food Science.

His experience in the Engineering College and his expertise in Dairy Science led him into the engineering phase of the dairy industry. He had a strong hand in the development and acceptance of high temperature pasteurization, homogenization and packaging of milk and dairy products. He cooperated in the design of the modern milk plate heat exchangers and deserves much of the credit for developing “clean-in-place” systems for washing and sanitizing dairy equipment – systems which are currently in place in every modern milk and food processing plant.

Dr. Holland’s leadership in extension resulted in fundamental changes in the method of providing farmers, processors and plant operators expert assistance as they consolidated and modernized. He was very instrumental in organizing the milk inspectors, the plant operators and related organizations serving the dairy industry into the New York State Association of Milk and Food Sanitarians (NYSAMFS), a vibrant group of several hundred professionals working in the food industry. He was a past president of that organization and was awarded its highest honor, the Emmet R. Gauhn Memorial Award in 1975. A lasting legacy of his administration was the

merging of the Annual Cornell Dairy Conference with the Annual Convention of the NY State Association of Milk and Food Sanitarians – a strong and lasting force in the dairy and food industry today.

Bob, as he was affectionately known, was a master of morale. His office door was always open and so was his mind. He appreciated initiative, innovation and enthusiasm and always exhibited a ready wit, but “he did not suffer fools gladly.”

He not only aided and abetted the scientific production of his compatriots and staff, but he encouraged (almost insisted) on social and professional contact inside and outside the department. The annual fishing trips to Bob’s Lake (no relation) brought the male faculty and staffs together in a “retreat” like atmosphere. The Dairy wives group, chaired by his wife, Ruth, made our department a harmonious unit. If there were feuds in the department, they were not apparent. He instigated twice weekly lunches with students and staff that did much to bring the department together and focus the many missions.

In 1957, Bob spent a sabbatical year on an International Cooperation Administration appointment in Salonika, Greece. Later, in 1964, he established a dairy department at Edgerton College in Kenya. He spent a final sabbatical in 1972-73 writing and studying.

Bob was married to Ruth McCargo while he was still a graduate student. They raised three boys and one girl. He was active in community affairs; a long time school board member, an active Rotarian, and an enthusiastic member of the City Club of Ithaca, where he presided at the wine table until a week before his death.

He truly loved life. He enjoyed his family, cars, cameras, guns, growing orchids, making wine, fishing and hunting, his Canadian camp, a good laugh and above all, his interaction with people. He made major contributions to Cornell, to his community and to his friends. Characteristically, when he knew that his end was near, he chose to leave us with dignity and on his own terms, refusing any “extraordinary measures.”

Bob leaves a legacy to his many friends. He was, above all, a real human being who enriched the lives of all that knew him.

W. Frank Shipe, James C. White, David K. Bandler

Solomon Cady Hollister

August 4, 1891 — July 6, 1982

Solomon Cady Hollister, retired dean of the College of Engineering and professor emeritus of civil and environmental engineering, made extraordinary contributions in his service to both Cornell University and the engineering profession.

Born in Crystal Falls, Michigan, and raised in the Pacific Northwest, “Holly” (as he was called since his college days) was self-educated to a considerable degree, as many great men have been. He often cited the “pioneer” aspects of his boyhood, when he learned to work with various tools, machines, and materials, as the roots of his aptitude for engineering. He enrolled at Washington State University in 1909 and worked his way through college, taking considerable time off to earn money as a surveyor and engineer. Largely because of his very keen interest in a correspondence course in reinforced concrete that he took from the University of Wisconsin and from his many hours of self-study from books authored by Wisconsin professors, he decided to transfer to Madison, where he completed his final one and a half years and received the Bachelor of Science degree in 1916. He also met his wife-to-be, Ada, at Madison.

He entered engineering practice in 1916 and also taught at the University of Illinois for one year. In 1918, at the age of twenty-six, he was appointed chief designer and head of the Research Branch of the Concrete Ship Section of the U.S. Shipping Board. In this capacity he was responsible for several major innovations in reinforced concrete that led to the construction of the world’s first practical large seagoing concrete vessels. In the 1920s he was a consulting engineer in Philadelphia, designing mainly in reinforced concrete; in 1929 he received the first Wason Research Medal from the American Concrete Institute (ACI) for his innovative design, construction, and testing of a skew-arch bridge built in Chester, Pennsylvania.

Holly also took particular pride in his design of the thirty-foot diameter welded steel penstocks for the Hoover Dam, one of the major projects on which he consulted in the 1930s. His research and consulting activities over seven decades contributed greatly to diverse areas of engineering, including concrete technology, structural welding, and the design of thin-shell structures such as boilers, ships, penstocks, and pressure vessels.

After four years on the faculty at Purdue University, Holly came to Cornell in 1934 as professor and director of the School of Civil Engineering. He was appointed associate dean and then dean of the College of Engineering in 1937, a position he held for twenty-two years until his retirement in 1959. During his tenure as dean, Holly rebuilt

the faculty, curriculum, and physical plant of the College of Engineering and thereby thrust Cornell into the top echelons of engineering education in the United States.

His concerns about the curriculum required intensive faculty participation, of course, and his longer-term plans for the character of engineering education were enlightened and fit well the needs of the time. The major step he initiated was to move the college into a five-year undergraduate curriculum. He also brought the School of Chemical Engineering into the college and instituted a new School of Engineering Physics and the Graduate School of Aeronautical (later Aerospace) Engineering. By wise selection and encouragement of faculty he attempted to accelerate the research program, which he visualized as essential for the vitality of the college. In this same period he established the Engineering College Council to provide advice on college affairs as well as support for the execution of his plans for the college.

But from the very start the major problem faced by Holly was that of facilities. Once he had convinced the central administration not to place the new college facilities in the area on the gorge north of Sibley and had succeeded in placing Olin Hall at the south end of the campus, he was “off to the races.” As a development officer he was an outstanding success—and the Engineering Quadrangle at the south end of the campus gives testimony to this fact. Almost single-handedly he was responsible for raising about \$50 million, primarily from prominent alumni who are now commemorated by the various buildings. Moreover, as a tribute to his intellectual and developmental skills, the Olin family, who provided the funds for the new civil engineering building, asked that it be named Hollister Hall in his honor.

For a period after the war he was vice president of development as well as dean of engineering. After retirement in 1959 he maintained an active role in professional and educational affairs, particularly at Cornell, as a university trustee (1959-64) and as a member of the Engineering College Council until his death.

Holly’s breadth of interests and capabilities was widely recognized by requests for his assistance to help resolve problems of national and international importance. In this regard he served on the second Hoover Commission on the Organization of the Executive Branch of the Government; chaired the Board of Consultants on the Isthmian Canal Study; was a member of a Department of Defense committee of business and scientific leaders to advise the National Security Council on defense systems; and was a member of the steering committee for the study of Africa south of the Sahara undertaken by the National Academy of Sciences. He also served as a member of many other professional and public commissions, including the Manpower Commission of Engineers Joint Council (now the American Association of Engineering Societies); the Committee on Specialized Personnel, Office of

Defense Mobilization; the Advisory Committee on Engineering Sciences for Selective Service; and the Advisory Committee for the National Registry of Engineers and Scientists.

He gave freely of his precious time for these important national activities. From these experiences Holly especially treasured the friendship he developed with Herbert Hoover during and after their work on the second commission. He admired Hoover particularly as an engineer become public servant.

Holly was dedicated to strengthening and improving the quality of engineering education. At the national level he aggressively exploited his leadership positions as chairman of various committees of the Engineers Joint Council for Professional Development to achieve these ends. While president of the American Society for Engineering Education in 1951 he established a committee that in 1955 produced a major study (known as the Grinter Report) that outlined future directions for engineering education. The principles set forth in this report continue to guide engineering education today. He also served as chairman of the Special Committee on Education of the American Institute of Architects, which recommended changes in architectural curricula.

A national figure in the profession as well as in education, Holly was the recipient of numerous awards and honors, including election to the National Academy of Engineering and the Hall of Fame of Engineering Educators of the American Society for Engineering Education (ASEE). He served as president of the American Concrete Institute (ACI) in the early 1930s and was the recipient of the Lamme Award of ASEE in 1952.

Holly was awarded honorary Doctor of Engineering degrees from Stevens Institute of Technology, Purdue University, and Lehigh University and an honorary Doctor of Science degree from the University of Wisconsin. He was elected to honorary membership in no fewer than six national professional societies: American Society of Civil Engineers, American Society for Mechanical Engineers, American Concrete Institute, American Institute of Architects, American Society for Engineering Education, and Chi Epsilon (civil engineering honor society). He was a fellow of the American Association for the Advancement of Science and a life member of both the American Society for Testing and Materials and the Structural Stability Research Council. To be honored by civil engineers, mechanical engineers, and architects reflects the unique breadth of this man. He received the Turner Medal of the ACI in 1979, and Holly's last award came in spring 1982, when he received Washington State University's Alumni Achievement Award for "brilliance and boldness in pioneering the field of reinforced concrete and in bringing prominence to his profession."

Dean Hollister contributed articles to several handbooks and texts and authored many technical papers and articles on structural mechanics, structural engineering, construction materials, and educational matters. He consulted with many companies and was a director of Raymond International, Inc. In one of his many hobbies, paleontology, Holly's scholarship was also recognized. He was a research associate and president of the Paleontological Research Institute in Ithaca and contributed scientific papers and one book to the literature of this field.

Holly always had a strong interest in the history of science and engineering, and two major contributions to Cornell came out of this interest: the Hollister Collection of rare books in engineering and science, which resides in the Department of Rare Books and Special Collections of the Cornell Library, and the history of science program in the College of Arts and Sciences, in which Holly played a key role during its formative stages.

In the 1960s and 1970s he continued to be active in an amazing variety of projects: high-level consulting on many difficult problems, including large power plants; development of improved equipment for football players; research on high-strength concrete; advising faculty and graduate students; participating in civil engineering faculty meetings and curriculum development; and developing materials for his book on marine fossils—to cite but a few of his many interests and activities.

Holly was a famous man, a distinguished man, a good man, a man of great achievements: he was one of the few Renaissance men we have had the privilege of knowing well. He was an artist, a paleontologist, a musician, an analyst, an avid reader, a creative designer, a visionary educator, a most effective promoter, and a great engineer. The Engineering Quadrangle and the revitalized College of Engineering at Cornell are testimony to his dedication to Cornell and to his achievements. We have lost a good friend and a patient adviser.

Dean Hollister is survived by his wife of sixty-three years, Ada, of Ithaca; three children: John G. Hollister of Rockford, Illinois, David G. Hollister of Seattle, Washington, and Elizabeth H. Zimmerman of Madison, Wisconsin; ten grandchildren; and six great-grandchildren.

John F. Abel, Walter R. Lynn, Andrew Schultz, Jr., Richard N. White

Allan Richard Holmberg

October 15, 1909 — October 13, 1966

In the untimely death at fifty-six of Allan Holmberg, Henry Scarborough Professor of Social Sciences, mankind lost a loyal friend; his professional world of anthropology, a leading innovator; and his Cornell colleagues, a distinguished scholar whose contributions to the development of the University extended beyond the wide reaches of his discipline.

A young Quechua Indian attending the new village high school in the Peruvian Andes shyly told our visiting University Provost, “Dr. Holmberg is my good friend.” His fellow anthropologists in 1958 elected Holmberg president of the American Ethnological Society; and an eminent Cornell physicist took courses with him and wrote that Holmberg had been “a very strong influence” on his thought for over a decade.

Professor Holmberg’s cultural roots were deep in a progressive midwestern and liberal Swedish background. He was born in Renville, Minnesota, the second son and sixth of eight children of Axel and Anna Carlson Holmberg. He attended primary school there; graduated from high school in Stillwater, an honor student and president of his class; and in 1935 received his B.A. in anthropology and psychology from the University of Minnesota. He was brought up in a farming-community tradition of hard work, being in part or wholly self-supporting from the age of ten, whether as a grade school boy in charge of the horse and wagon deliveries for a grocer, as a high school member of threshing crews ranging west to North Dakota and Saskatchewan, or in Minneapolis working his interrupted way through the University as a seeds salesman or a night shift hospital orderly (an experience which led him to change his original plan to enter medicine).

Holmberg was first attracted to anthropology through work with the philosopher-anthropologist Wilson Wallis at whose urging he returned to Minnesota for graduate study in anthropology and philosophy. A scholarship in anthropology at Chicago, which had an outstanding department under Fay-Cooper Cole (the father of Cornell’s Professor of Ecology), took him there in 1937 to work with Cole, Robert Redfield, and others. In 1938, he accepted a research position in the Institute of Human Relations at Yale, and it was there that he received his final doctoral training under B. Malinowski, G. P. Murdock, Edward Sapir, and Alfred Metraux, the last being responsible for his interest in Latin America.

In 1940, Holmberg was awarded a Social Science Research Council Fellowship which would support his doctoral dissertation research in Bolivia for two years. But the war extended his stay in Latin America to almost five years:

he briefly served the American Embassy in La Paz and then the Rubber Development Corporation in its collection of wild rubber in the Amazon basin, receiving special commendation for getting out the largest quantity of this commodity obtained in any world-area during the war. In 1945, he returned to the United States to marry Laura Hines, whom he had met in Bolivia, and who survives him with their three children, Anna, David, and Eric. As a Sterling Fellow in Anthropology at Yale he completed his thesis on the Siriono Indians during 1945-46; and he received his Yale doctorate in 1947 while serving in Peru on the staff of the Institute of Social Anthropology of the Smithsonian Institution and as Professor of Anthropology at the National University of San Marcos in Lima.

It was in the following year, 1948, that Allan Holmberg accepted with enthusiasm and faith an invitation to join the Cornell faculty and participate in the novel program in applied anthropology which had recently been established at Cornell with the aid of a grant from the Carnegie Corporation of New York. Thus he began eighteen years of dedicated service to applied anthropology under the aegis of these and other institutions. His consulting relations with officers of the Carnegie Corporation—Charles Dollard, John Gardner, James Perkins— were of mutual value as the foundation developed its special interests in Latin America during the 1950's.

At Cornell, Holmberg's assignment was to aid four colleagues in developing a full teaching program in cultural anthropology on the campus; and to establish somewhere in Latin America a field-research and training project in applied anthropology which could be compared with other Cornell anthropology projects in New Mexico, Nova Scotia, India, and Thailand. After carefully deciding on the basis of surveys against a long-term program in either Mexico or Venezuela and on presenting alternative plans for work in Peru, Holmberg was appointed in 1949 director of the now famous Cornell-Peru Project, given authority and funds to proceed, and in 1951 received faculty tenure as his project became firmly established in Vicos and Lima.

Under Allan Holmberg's able direction the Peru Project led directly or indirectly to other developments at Cornell. By the mid-1950's the number of graduate students and colleagues working on Latin American problems at Cornell was so considerable that in effect an interdisciplinary area program existed, comparable to those in Asian Studies to which Cornell had given priority. Holmberg was the key figure in the developments which led to today's outstanding Cornell-Latin American Program; he attracted students and new faculty, contributed ideas, and judiciously used a Carnegie grant received in 1959 for Andean Research to add strength to Cornell's growing Latin American resources. Another Carnegie grant in 1960 enabled Cornell, Columbia, Harvard, and later Illinois to embark on summer programs of field instruction in anthropology in Latin America for selected undergraduates, with Holmberg in charge of the Cornell programs. He was also responsible somewhat later for bringing to Ithaca

a Peru Peace Corps training program; and in 1962 he began a Cornell study to measure the impact of Peace Corps programs in the Peruvian Andes, reporting in 1966 that these had a definite beneficial effect. From 1963 to 1966, Holmberg was in charge of a series of Cornell special studies of Andean Indian communities for the Agency for International Development.

The wide range of Holmberg's Latin American training and research projects made him a particularly useful member of a number of Cornell committees. These included the executive committee, Social Science Research Center, 1953-56, chairman, 1955-56; advisory board, Cornell Program in Social Psychiatry, 1958-65; President's committee on the evaluation of the College of Agriculture, 1963; Provost's committee on overseas commitments, 1963-66; executive committee and modernization workshop, Center for International Studies, 1964-66; and committee on water resources research, 1964-66. In 1958, he was elected to the Faculty Research Club.

A Cornell task which Holmberg assumed willingly and found most challenging was provided during his tenure on the University library board, 1956-61, a period of much travail when the Olin Research Library was being planned and replanned.

To the development of the field of anthropology at Cornell, Allan Holmberg contributed not only his teaching and research but also his wise counsel. When a separate Department of Anthropology was established in 1962, he was chosen as its chairman, serving until 1966. For the new department he helped obtain a National Institutes of Health Training Grant under which a laboratory in physical anthropology and archaeology was equipped. He also organized under an Agency for International Development contract a series of comparative studies of cultural change based on the work in applied anthropology in Peru, India, and Thailand, developed during his early Cornell years.

By the time Allan Holmberg came to Cornell in 1948, he had already carried on field researches that were to bring him national and international attention. In his doctoral research from 1940 to 1942, he endured incredible hardships to live among and study the Siriono, an isolated hunting and gathering group of the tropical forests of eastern Bolivia. During this expedition he was already beginning to "experiment with culture." The monograph which resulted, *Nomads of the Long Bow*, is recognized as a psychological and philosophical contribution as well as an important contribution to ethnography; and it has been a center of interest and debate since its publication.

From 1946 until 1948, he carried on field work in Peru which further developed his interest in the application of anthropology to practical problems of cultural change. Later, as a Cornell faculty member, he returned to Peru to

expand the research interests he had previously initiated. The result was the Vicos project, which not only became noteworthy as a training ground for social science research but also became famous as an example of the role that applied anthropology can play in the improvement of health, education, economic productivity, self-government, and morale among peasant peoples in a developing area.

As a result of the success of the programs which he guided in Latin America, Holmberg was in constant demand on national advisory bodies, and he gave generously of his time. He served as a member of the Latin American science board and of the committee on overseas studies in the behavioral sciences of the National Academy of Sciences, as a member of the committee on Latin America of the Institute of International Education, as a member of the Latin American committee of the Social Science Research Council and the American Council of Learned Societies, and as a member of both the economic committee and the research advisory committee of the Agency for International Development. In addition, he served on a special panel of the President's scientific advisory committee, acted as consultant to the Ford Foundation in connection with its foreign area training program, and sat on the committee on the social psychology prize of the American Association for the Advancement of Science. In February, 1963, he was a U.S. delegate to the United Nations Conference in Switzerland on the application of science and technology in benefit of the less developed areas; and during the following summer at M.I.T. he met with a national study group on agricultural productivity in underdeveloped countries. He was named a member of the committee on international studies of the New York State Department of Education in 1963.

These memberships and services took Allan Holmberg across disciplinary lines and into fruitful contact with natural scientists, economists, educators, psychologists, and administrators. Yet he received high recognition from his special professional field, anthropology. At Yale he was one of the few anthropologists elected to Sigma Xi. He was one of the first anthropologists to be invited for a fellowship year at the Center for Advanced Studies in the Behavioral Sciences at Palo Alto. He guided a major reorganization of the Society for Applied Anthropology and served as its treasurer and on its editorial board for several years. His many publications in the field of anthropology were well received by his peers and are constantly cited.

One can catalog Allan Holmberg's honors and achievements, but, impressive as they are, the man was something more. His associates will always remember his quiet humor, his modesty, his consideration for colleagues, his concern for students, his belief in the effectiveness of social knowledge, and his respect for human beings everywhere.

Alfred E. Kahn, Morris E. Opler, Lauriston Sharp

Robert St. Clair Holmes

December 7, 1901 — June 5, 1961

Professor Holmes was appointed to the faculty of the Graduate School of Business and Public Administration in 1952. His field was public utilities, business law, and finance. To his work at Cornell he brought not only a thorough academic training but also eighteen years of experience as a government economist and administrator. Two of these years were with the New York State Public Service Commission and the remainder with the Securities and Exchange Commission in Washington, except for a period on loan to the Office of Price Administration. Among his most interesting assignments were the economic analyses preceding the dissolution of the Electric Bond and Share system, and the research for the S.E.C. on the Investment Banking Study of the Temporary National Economic Committee.

Robert S. Holmes was born in Swarthmore, Pennsylvania, where his father was Professor of Philosophy at the college. After obtaining his A.B. there, he studied economics, receiving the M.A. degree from the University of Pennsylvania and his Ph.D. from Princeton. He was a Phi Beta Kappa at Swarthmore, a Harrison Fellow at Pennsylvania, and a pre-doctoral instructor at Princeton. For two years prior to joining the S.E.C. he was an assistant professor at Oberlin, but, like so many other young economists during the New Deal era, he was ultimately drawn into government service. While in Washington he earned an LL.B. at George Washington University and was admitted to the District of Columbia Bar.

At Cornell Professor Holmes established a real place for himself as an effective teacher. His graduate seminars attracted students and challenged them. He liked and made good use of the case approach. For him teaching served as an integrating experience—an opportunity to sift and combine much from what he had learned at the S.E.C., from his long familiarity with the financial problems of public utilities, and from his background in economics and law. Although he undertook some consulting work while at Cornell—for the Florida Power and Light Company, the New York Telephone Company, and four northwestern electric utilities—the classroom was the focus of his major efforts and the source of his greatest satisfaction.

In his personal relationships he was cooperative and considerate of others. He became more deeply concerned in any matter if he sensed any possible unfortunate impact upon an individual. This no doubt sprang partly from his Quaker upbringing and affiliation, Rather than a wide circle of friends, he preferred a few close ones, and, with

them, especially in his own home, he was a delightful companion. He enjoyed good conversation, which he often embellished with a touch of the histrionic.

He leaves a wife, Grace Randall Holmes; two children, Rebecca St. Clair and David Randall; a daughter-in-law; and three grandchildren. His unexpected death was not only a great loss to them but also to his students, his friends, and the faculty of the School.

Arthur E. Nilsson, Melvin G. De Chazeau, Albert M. Hillhouse

Joseph Douglas Hood

November 29, 1889 — October 22, 1966

J. Douglas Hood was born in Laramie, Wyoming, on November 29, 1889, the son of Thomas Henry and Eva Marie Josephine Hood (nee Dickson). He received his Bachelor of Arts degree from the University of Illinois in 1910, his Master of Arts degree from George Washington University in 1913, and his degree of Doctor of Philosophy in 1932 from Cornell University. He was assistant to the state entomologist of Illinois from 1910 to 1912; from 1912 to 1920 he was with the United States biological survey; then followed two years with advertising agencies in Cleveland, Ohio, and Rochester, New York. From 1922 to 1937, he was on the faculty of the University of Rochester, rising from instructor to full Professor. In 1937-38, he was a Resident Doctor at Cornell University, and in 1939, he became a member of the Cornell University faculty, from which he retired to become Professor, Emeritus, in September 1957.

His military career covered the period of World War I; he served as a second lieutenant in the District of Columbia national guard during the Mexican Border Incident in 1916-17, and as a first lieutenant in the Ordnance Department of the United States Army from 1917 to 1918, supervising the procurement of all gun carriages for railway, seacoast, and improvised field artillery.

His accomplishments were many, and in every area of endeavor he was outstanding and a perfectionist. He was an expert pistol and rifle shot and competed in national matches where very few were superior to him. He placed second in the 1914 competition at Sea Girt, New Jersey. He was an excellent huntsman and fly fisherman. In this last area, his ability was recognized by the Armed Forces during the World War II, when he was, for two seasons, an instructor in fly fishing for the military in Labrador. He tied all his own flies; a few may have been his equal in this art, but none excelled him. He was also an excellent bridge player. His other hobbies included the assembling of a remarkable stamp collection and the refinishing of antique furniture.

In his chosen field, entomology, J. Douglas Hood was the outstanding American authority on the Thysanoptera (Thrips), a group of small insects, the study of which he made his life's work. He published 173 papers in scientific journals on the taxonomy of the group. His papers were models of scientific writing in insect taxonomy, and the illustrations he prepared for these papers were exquisite in execution and detail. Occasionally his wit, and sometimes his sarcasm, enlivened the papers; being a perfectionist, he tolerated nothing less in his fellow workers.

He formed an unrivaled collection of the Thysanoptera which, at the time of its acquisition by the United States National Museum, contained over 60,000 slide mounts, representing 2,117 species; of these 1,055 were represented by holotypes of species that Hood described as new to science. The slide mounts represent the best that can be found anywhere. Many hours were spent in preparation of specimens, and the work was often fitted into a busy teaching schedule. Sometimes after a social evening, he would work late into the night counting the tiny insects on slides. The greater part of the specimens that comprised his collection were collected by him in many parts of the world. His last, long, collecting trip outside the United States was to Brazil in 1951.

Although his association with students was that of a teacher in a large introductory course, to the student genuinely interested in entomology he would give freely of his time in instruction and in advice about techniques, places to collect, and workers who might be of assistance. In the field he was a most pleasant, enjoyable, and inspiring associate.

J. Douglas Hood was a member of a number of scientific societies, and at the time of his death he was one of the last living charter members of the Entomological Society of America. The Society was planning to honor him at its annual Meeting in December of 1966.

He is survived by his wife, Helen Hinchler Hood, and a daughter and a son.

William L. Brown, Jr., Roger A. Morse, John G. Franclemont

Warren Howard Hook

May 1, 1886 — September 29, 1948

Warren Howard Hook, Associate Professor of Heat Power Engineering, died September 29, 1948, after 35 years of service in the Sibley School of Mechanical Engineering.

He was born in Ithaca, May 1, 1886, and received his preparatory school training in the Ithaca High School, having graduated from that institution in June 1904. In the fall of that year, he registered in the Sibley School of Mechanical Engineering and in June 1908 received the degree of Mechanical Engineer. After spending two years in commercial work, he returned to Cornell as an instructor in Experimental Engineering. In the fall of 1917, he accepted a position as Assistant Superintendent of maintenance, design, layout and construction of power plants with the Cluett Peabody and Company, Troy, New York. In the fall of 1920 he returned to Cornell as an Assistant Professor of Heat Power Engineering. He was granted a sabbatical leave of absence in 1927-28, and spent the time with the Rochester Gas and Electric Company working on a special problem pertaining to District Steam and Power Plant Design. During a second sabbatical leave in 1937-38, he was associated with the Detroit Edison Company doing research work on steam turbine operating characteristics. In 1941 he was appointed an Associate Professor.

He was a member of the American Society of Mechanical Engineers and held a Professional Engineer's license in New York State.

Prof. Hook was held in high esteem by his students as a counselor, teacher and friend. To those who had the privilege of associating with him, he endeared himself by his kindness and fairmindedness. Despite failing health he continued his teaching almost to the very end. His passing is most keenly felt by his colleagues, fellow associates and all who knew him.

R. E. Clark, Carl Crandall, B. K. Northrop

Grant Sherman Hopkins

September 23, 1865 — December 21, 1952

Dr. Grant Sherman Hopkins, the last member of the original faculty of the New York State Veterinary College, passed away December 21, 1952. He is survived by his wife, Ann Ottaway Hopkins and daughter, Ellen Hopkins Walker of Pittsburgh, Pa. and a sister Katherine Hopkins of Westfield, New York. A number of nieces and nephews survived him. He was the son of Ezra and Catharine Johnson Hopkins and was born in Westfield, New York, September 23, 1865.

Graduating from Westfield High School, he won a Chautauqua Scholarship and entered Cornell University in 1885 and received his B.S. degree in 1889. While an undergraduate, he started his teaching career as student assistant under Dr. Burt G. Wilder in the Department of Zoology and spent a summer at Woods Hole. In 1890, he entered the Graduate School and received the appointment of instructor with Professor Simon Henry Gage, in the Department of Embryology and Histology. He received his D. Sc. degree in 1893.

At the opening of the New York State Veterinary College, he continued with Professor Gage, teaching anatomy and anatomical methods. He matriculated in the Veterinary College and received the D.V.M. degree in 1900. His faculty status in the Veterinary College made him ineligible for the Horace K. White prize, an award given to the one having the highest scholastic standing in his class.

In 1903, he was appointed full professor in veterinary anatomy and became head of the Department of Anatomy on the original veterinary faculty. This appointment he held until his retirement in 1934, thus completing 46 years on the teaching staff of Cornell University.

His sound theory in pedagogy “that the younger student should receive his instruction from the most experienced teacher” resulted in the fact, that he personally taught every freshman class that entered the Veterinary College, until the time of his retirement.

Spare time from his heavy teaching load was taken up by research, and his notable contributions to the field of science is substantiated by the following bibliography:

1. Preparation and Embedding of the Embryo of the Chick.
Hopkins and Gage, Amer. Soc. Microscopy—1890.
2. Structure of the Stomach of the *Amia calva*.
Amer. Soc. Microscopy—1890.

3. The Lymphatics and Enteric Epithelium of *Amia calva*.
Wilder Quarter Century book—1893.
4. Enteron of American Ganoids.
Journal of Morphology—1895. Thesis for D. Sc. degree.
5. Heart of Some Lungless Salamanders.
American Naturalist—1896.
6. Apparatus for Illustrating the Circulation of Lymph.
Amer. Microscopic Soc. Proc.—1896.
7. Relation of the Ligamentum Nuchae to the 1st Cervical Vertebrae—
1899.
8. Notes on the Variation in Origin of the Internal Carotid Artery of the
Horse. Amer. Anat. Soc.—1902.
9. Embryology of the Egg.
Animal Food and Diseases—1905.
10. Requirements for a Veterinary Education Abroad. 1912.
11. Directions for the Dissection and Study of the Cranial Nerves and Blood
Vessels of the Horse. 1913—revised 1922, 1937.
12. A Guide to the Dissection of the Blood Vessels and Nerves of the Pec-
toral and Pelvic Limbs of the Horse. 1914, revised 1925, 1937.
13. Review—Lymphatic Glands in Meat-producing Animals.
Paul Godbille, Vet. Med. Assoc. Jour. 1916.
14. Innervation of the muscle, Retractor Oculi.
Anat. Rec—1916.
15. Paranasal or Facial Sinuses of Sheep.—1918.
16. Atlas of the Viscera in Situ of the Dairy Cow.—1918.
17. Review—The Anatomy of the Domestic Fowl.
B. F. Kaup, Cornell Veterinarian—1919.
18. Establishment and Growth of the New York State Veterinary College—
1919.
19. A Guide to the Dissection of the Thoracic and Abdominal Viscera of
the Horse.—1930. Revised to include the Cow, 1942.
20. Obituary—Dr. P. A. Fish—1931.
21. Obituary—Dr. V. A. Moore—1931.
22. Address—Veterinary Conferences—1932.
23. Response to Retirement—1934.
24. The Correlation of Anatomy and Epidural Anesthesia of Domestic Animals. Vet. College report, 1934-35.

At the time of the retirement of Professor Simon Henry Gage in 1908, a few of his colleagues organized a committee consisting of Drs. V. A. Moore, P. A. Fish, B. F. Kingsbury, A. T. Kerr and G. S. Hopkins to secure a permanent

memorial. This committee in 1916, the 65th birthday of Professor Gage, had made possible the beginning of the Gage Fellowship by presenting the sum of \$2,778.98 to the Treasurer of the University.

In 1940 the committee now consisting of only two of its original members, Drs. Hopkins and Kingsbury, completed its work. On May 20, 1941, the occasion of the 90th birthday of Prof. Gage, the sum of \$10,030.30 was given to the University for the Gage Fellowship Fund.

For several years Dr. Hopkins was Chairman of the Veterinary Flower Library and was largely responsible for the expenditures made for books and periodicals. The growth and usefulness of the library, built upon the policy he established, has resulted in one of the best veterinary libraries in this country.

As a teacher, Dr. Hopkins was most thorough and painstaking. His knowledge of anatomy and its basic needs in the practice of veterinary medicine, his style of presenting the facts and the interest he took in each individual, won for him a lasting impression in both the minds and hearts of all students whose good fortune it was to have been in his classes.

Not only was he interested in the scholastic life of the student, but he had a personal and human interest in all of them. Thus, many came to him for advice and counsel.

In his long period of service to the University, he was a member of the following societies and fraternities: Sigma Xi, Phi Kappa Phi, Sigma Kappa, American Anatomical Society, American Veterinary Medical Association, New York State Veterinary Medical Association and the Statler Club.

He served one term on the Board of the Memorial Hospital. He was also a member of the Presbyterian Church and was for several years chairman of the local district.

As a member of the original faculty of the Veterinary College, he contributed much to the shaping of its policies and the foundation of veterinary medicine in New York State.

His research and texts on veterinary anatomy added much to the standing the College has in the field of veterinary medicine in the United States and justified his selection by Dr. Law to the original faculty of the Veterinary College.

A. G. Danks, M. E. Miller, Earl Sunderville

Herbert Andrew Hopper

Professor of Animal Husbandry

— *November 26, 1937*

In the death of Herbert Andrew Hopper on November 26, 1937, Cornell University lost one of the pioneers in agricultural extension work in New York State and in the nation. Professor Hopper had served the University in his agricultural extension duties for twenty-seven years, having been the first extension specialist in the department of Animal Husbandry. In spite of ill health for the past several years, he had continued in his work with indomitable courage until only a few days before his death.

Professor Hopper was born on a farm in Tompkins County and was graduated from the New York State College of Agriculture in 1903, specializing in dairying and in bacteriology. From 1903 to 1907 he was instructor in dairy husbandry at the University of Illinois, and he received the degree of Master of Science from that institution. While he was in Illinois, Professor Hopper inaugurated a system of testing dairy herds for production which was one of the forerunners of the present-day system of herd testing.

From 1907 to 1908 he was extension dairy husbandman at Purdue University and went from there to the University of California, where he was assistant professor of dairy husbandry until 1911. At the University of California, Professor Hopper started a dairy course for butter and cheese makers and began a series of educational butter-scoring contests for buttermakers, which have been continued since that time.

In 1911 Professor Hopper returned to New York and operated his dairy farm near Ithaca, serving on the extension staff of the College of Agriculture during the winters as extension specialist and assistant professor of animal husbandry. Two years later he took up full-time duties as extension professor of animal husbandry, which position he held at the time of his death. He served as project leader in Animal Husbandry Extension until in 1928 poor health forced a reduction in his duties.

Professor Hopper exerted an exceedingly important influence in the development of the dairy industry of this State. He was one of the pioneers in conducting official production tests of purebred dairy cattle, and in 1915 he made one of the earliest studies on the cost of producing milk in New York. On account of his keen mind and sound judgment, his advice was valued highly by dairymen throughout the State and by his colleagues in this institution.

The Cornell University Faculty desires at this time to express its appreciation of the faithful and courageous service rendered by Professor Hopper.

Herbert I. Horowitz

May 8, 1928 — March 30, 1971

Dr. Herbert I. Horowitz, clinical assistant professor of medicine at Cornell University Medical College and chief of hematology at the Bronx-Lebanon Hospital Center in New York City, died at the age of 42 on March 30, 1971.

Dr. Horowitz was graduated from Yale in 1949 and received his medical degree from the State University of New York Downstate Medical Center in Brooklyn in 1953. He was an intern and resident physician at Montefiore Hospital in New York. After two years of medical service in the United States Navy Medical Corps, he completed his graduate studies at Duke University and in hematology at the Montefiore Hospital. He joined the New York Hospital-Cornell Medical Center in 1960 as the hematologist to the Central Laboratories. He was appointed an assistant professor in the Department of Medicine in 1962. He continued his teaching duties at the Medical College after joining the Bronx-Lebanon Hospital as hematologist-in-chief in 1963.

Dr. Horowitz was a distinguished, nationally respected hematologist who in his brief scientific career contributed over forty articles to scientific publications, chiefly on blood coagulation and the role of the blood platelet in clotting processes. He was an acknowledged expert in the area of immunologic drug purpura and helped devise some of the first clinical tests which demonstrated this phenomenon in man. He was a participant in many major international conferences and in August 1970 presented a summary of his research studies at a meeting of the International Society of Hematology in Munich. In 1970 he and his co-workers were cited by the Journal of the American Medical Association for his outstanding contribution in demonstrating that the bleeding tendency in kidney failure is caused by a metabolic toxin that inhibits blood platelet function.

Dr. Horowitz served on the editorial boards of *Transfusion and Coagulation*, was a Fellow of the American College of Physicians, and a member of the American Physiological Society and the American and International Societies of Hematology. In addition to his major scientific Pursuits, he was an excellent lecturer and teacher and continued to play an important role in the teaching program of the second-year medical students at Cornell. He was respected and admired by his friends and scientific colleagues for his gentle humor and quiet courage.

Dr. Horowitz resided in Mount Vernon, New York, with his wife, the former Ellen Gossert, and three children, Lisa, David, and Gregory.

Ralph Nochman, M.D.

Frank L. Horsfall, Jr.

December 14, 1906 — February 19, 1971

Frank L. Horsfall, Jr., received his medical degree from McGill University in 1932. While in medical school, he became interested in the bacteriological studies conducted by Hans Zinsser in Boston. As a house officer in Pathology, in Peter Bent Brigham Hospital in Boston, Horsfall began studies of immunological reactions. This presaged a lifelong interest which proved important in many subsequent investigations. Horsfall documented the manifestations of formaldehyde hypersensitivity in man and demonstrated that the skin is also hypersensitive to small amounts of injected formolized proteins. He then studied in detail the antigenic properties of formolized proteins in rabbits and guinea pigs. After finishing his work in Boston, Horsfall returned for one year to Montreal to serve as a resident physician in the Royal Victoria Hospital.

In 1934 Horsfall was appointed assistant in The Rockefeller Institute and assistant resident physician in the hospital of the Institute. He joined the laboratory of Oswald Avery. With Kenneth Goodner, Horsfall worked intensively on the role of lipids in immune reactions. The study of lobar pneumonia at the Rockefeller Hospital, initiated and led by Rufus Cole, the first director of the hospital, provided a matrix within which many theoretical and practical advances were made. These not only set new trends in research and clinical practice but helped to lay the foundation for new scientific disciplines such as immunochemistry and biochemical genetics. Following the demonstration that the capsular polysaccharide is the carrier of the immunological specificity of pneumococcus, Horsfall became keenly interested in the antibodies directed against pneumococci. Already by 1912, Cole and Alphonse R. Dochez had developed an immune serum against pneumococcus type 1 that was effective in the treatment of pneumococcal pneumonia in man. This serum was prepared in horses. Horsfall was the central figure in investigations which led to the development of antipneumococcal rabbit sera against several highly pathogenic types. The rabbit serum proved superior to horse serum in that it caused much less severe allergic reactions. Soon after this discovery, however, the wide use of the type-specific immune sera was rendered unnecessary by the arrival of antibacterial chemotherapeutic agents.

It is important to note, as Horsfall did on December 30, 1937, in his Eli Lilly and Co. Research Award Lecture before the Society of American Bacteriologists, that the development of the rabbit antiserum as a therapeutic agent in the treatment of pneumococcal pneumonia grew out of extensive studies of largely theoretical problems concerned with the characterization of antibodies in different animal species. Horsfall became highly regarded for

his quantitative, critical, and comprehensive approach to biological problems underlying the needs for improved diagnosis and therapy in the clinic.

In 1937 Horsfall joined the International Health Division of The Rockefeller Foundation and proceeded to Uppsala, Sweden, where he worked with Arne Tiselius on the electrophoretic technique for study of proteins using hemocyanins as test substances. Several important aspects bearing on the precision and reproducibility of measurements were explored. Evidence was also obtained that hemocyanins exist in a number of forms, all of which have the same molecular weight but differ slightly from one another electrochemically.

Horsfall's interest in physical approaches to biological questions is further documented by the fact that his first paper from The Rockefeller Foundation laboratories concerned a method for determining the differential sedimentation of proteins in the high-speed centrifuge.

While with The Rockefeller Foundation, Horsfall entered the field of virology. In collaboration with Richard G. Hahn, Horsfall discovered a new virus capable of causing fatal pneumonia in mice. The pneumonia virus of mice proved an important tool for studies of latent and complex infections, which Horsfall undertook some years later. At The Rockefeller Foundation, Horsfall concentrated his efforts on influenza and became a leading authority in this field. His studies ranged from detailed investigations of the immunological properties of influenza virus strains to epidemiology of influenza, and culminated in the development of a vaccine against influenza A, which was proven to be effective in reducing the incidence of influenza by one half in large-scale field studies. Unlike the earlier vaccines against smallpox and yellow fever, influenza vaccine was the first inactivated viral vaccine which was shown to be useful in the immunization of man. The effectiveness of influenza vaccine demonstrated that viral infection was not necessary for the development of specific antiviral immunity. The development of the inactivated influenza virus vaccine paved the way for the subsequent development of vaccines against poliomyelitis and adenovirus infections.

In 1941, Horsfall returned to The Rockefeller Institute as member and physician to The Rockefeller Institute Hospital. He established a program of study of primary typical pneumonia, and returned to the study of the pneumonia virus of mice. He also continued his investigations on influenza. Associated with Horsfall was a remarkable group of investigators, including Edward C. Curnen, George S. Mirick, Lewis Thomas, and James E. Ziegler, Jr. Intensive search for a viral causative agent of primary typical pneumonia produced a number of findings indicative of a transmissible infectious agent responsible for the pneumonia. Although no definite identification of the causative agent could be made at that time, Horsfall's studies greatly enhanced knowledge of the disease.

The pneumonia virus of mice was characterized by many techniques. The remarkable discovery was made that this virus associates with a tissue component of the mouse lung to form a particle 2-3 times its own size. Horsfall and co-workers demonstrated that it is possible to separate the virus from the host protein without destroying its activity. Evidence was then obtained that the susceptibility of mammalian species to infection with pneumonia virus of mice is related to the presence of the component which combines with the virus.

During World War II, The Rockefeller Institute was under contract with the U.S. Naval Hospital in Brooklyn to receive Navy patients at the Institute's Hospital. Thomas M. Rivers, who had succeeded Rufus Cole as director of The Rockefeller Institute Hospital, organized a group of physicians who were inducted into the Navy and constituted the Naval Research Unit at the Hospital of The Rockefeller Institute. Rivers headed the unit until November 1943, when he left on Navy duty for the South Pacific. He was succeeded by Lieutenant Commander Horsfall, who remained in charge of the Naval Research Unit until the end of the war.

Important new directions in Horsfall's research originated from his decision to investigate infections caused by more than one agent. Reciprocal interference was established among influenza viruses. The remarkable discovery was made that virus particles inactivated by ultraviolet radiation could still inhibit reproduction of challenge viruses even though they themselves could no longer multiply. With Maclyn McCarty, Horsfall made an unexpected finding concerning the effect of injecting mice with pneumonia virus of mice together with *Streptococcus MG*, isolated from patients with primary atypical pneumonia; the streptococcus lessened the severity of the virus infection by inhibiting the reproduction of the pneumonia virus of mice. The inhibitory substance was identified as a polysaccharide. Subsequently polysaccharides from different bacteria were shown to be able to cure virus pneumonia caused by pneumonia virus of mice. This was the first demonstration of successful chemotherapy of an experimental viral disease in a natural host. These studies with Harold S. Ginsberg are classic in that quantitative techniques were used to measure multiplication of virus and virus-induced tissue damage. The principle was established that a virus-induced disease process can be curtailed by chemically inhibiting the intracellular multiplication of the causative agent.

Igor Tamm and Horsfall isolated the first pure macromolecular receptor substance for influenza virus. This mucoprotein from human urine was characterized as to physical, chemical, and biological properties. The substance, seven million molecular weight units in size, is a substrate for the viral neuraminidase, and proved a highly useful reagent in studies on viral neuraminidase action and affinity for receptor substances. Moreover, in

urological investigations done in several laboratories this mucoprotein has been identified as the matrix substance in granular casts and as the substance responsible for postoperative urinary block.

In the fifties, work on influenza viruses gradually shifted from the study of antigenic variation and interaction with receptor substances to the study of the intracellular replication process. Horsfall undertook an extensive quantitative study of the autointerference phenomenon, and showed that with both influenza A and B viruses, there is a critical particle-cell ratio above which alterations appear in the dynamics of reproduction and yield of virus particles. The rate of viral reproduction diminishes when more than three virus particles are inoculated per cell. This is accomplished by decrease in the total yield of virus particles, and a decrease in the proportion of infective particles in the yield. Horsfall demonstrated that infective particles and particles rendered noninfective at 35 or 22°C cause similar alterations in the reproductive process. Tamm and Horsfall initiated comprehensive studies on the inhibition of influenza virus multiplication by benzimidazole derivatives. These studies established that the virus-inhibiting activity and toxicity of derivatives vary in parallel in many modifications of compounds, but independently in others. Thus, evidence was obtained in support of the concept that highly selective inhibitors of virus multiplication may be obtained among benzimidazole derivatives, as was proven in later studies.

In all of Horsfall's research there is discernible a personal approach characterized by emphasis on fundamental biological reactions and processes, and on quantitation. He was equally at home in immunology, bacteriology, and virology. Whenever a problem called for new or improved methods, instruments, or research facilities, Horsfall was ready to design and renovate. While committed to the advancement of knowledge, Horsfall was well aware of needs for better methods of treatment and prophylaxis of diseases caused by bacteria and viruses. He responded forcefully to these needs in his work without impairing his effectiveness as a scientist concerned with the biology of infectious processes. In his many associates he instilled the quantitative scientific approach. Horsfall typified by personal example the value of in-depth study, which knows no disciplinary boundaries, and which is as much a challenge in learning as it is a challenge in obtaining new findings. It is thus that Horsfall made a lasting contribution to our understanding of the biology of bacteria and viruses, and also to serotherapy, vaccination, and chemotherapy.

Horsfall's superb judgment, broad interests, and administrative ability were widely recognized. In 1955 he was appointed vice president for clinical studies in The Rockefeller Institute, and in 1960 he became president and director of the Sloan-Kettering Institute for Cancer Research, a post he held until his death in 1971.

While at The Rockefeller University, Dr. Horsfall developed informal ties with many members of the Cornell University Medical College and The New York Hospital. When he assumed the position as president and director of the Sloan-Kettering Institute for Cancer Research in 1960, he was appointed Professor of medicine at Cornell University Medical College. He maintained an active interest in the Department of Medicine and was a strong supporter of the Department. Despite a very busy schedule, he was always willing to participate in the activities of the Department. His death represents a significant loss to medical science. Sloan-Kettering Institute has been deprived of a beloved leader and the Department of Medicine of a loyal friend.

Igor Tamm, M.D., Alexander G. Bearn, M.D.

Edwin Ray Hoskins

May 20, 1891 — November 8, 1982

Edwin Ray Hoskins, professor emeritus of education, died November 8, 1982, at the age of ninety-one. Born on a farm near Auburn, of New York farmer parentage, he was the fifth generation to own or supervise the ancestral farms, Hoskins Homesteads, of Scipio Center. He was a graduate of the Moravia Training Class, and after having four years of teaching experience in rural schools of Cayuga County, New York, graduated from Moravia High School, class of 1914. He served in the 78th Army Division during World War I, returning to study at Cornell University, where he earned his B.S. degree in 1919, his M.S. in 1924, and his Ph.D. in 1933.

During the 1920s he was a teacher of vocational agriculture, a high school principal, a critic teacher in the Trumansburg Central School (then a Cornell practice center affiliated with the Department of Rural Education), and an itinerant teacher trainer in agricultural education. In 1931 Mr. Hoskins was appointed by the Department of Rural Education in the College of Agriculture at Cornell University as teacher trainer in agricultural education. He was promoted to assistant professor of rural education in 1933 and subsequently to associate professor and professor. On retirement from state service on January 31, 1955, he was appointed professor of rural education emeritus.

Professor Hoskins was a thirty-year member and past president of the Association of Teachers of Agriculture of New York, past member of the Advisory Council of the New York Association of Future Farmers of America (FFA), and a member of long standing in many professional, fraternal, and farm organizations. He was also active in department, college, and University committee work and activities. Professor Hoskins was engaged in preparation of graduate and undergraduate teachers of vocational agriculture at Cornell for over thirty years. During that time he was particularly concerned with youth in rural areas. His understanding of, and appreciation for, the American farmer and his problems earned for him the well-deserved respect of his professional colleagues.

His experience in management of farms and teaching in rural schools before entering college led to his desire to aid rural youth in discovering, analyzing, and solving certain basic problems. He set and maintained high standards of service to all rural youth, especially to out-of-school groups. His writings and publications related to rural youth and leaders of rural youth, dealing with specific problems of vocational education in agriculture.

During the decade of the 1940s his activities and responsibilities varied as related to the war and postwar periods. He was a member of the editorial managing board of the *Agricultural Education Magazine* and served as the North

Atlantic regional representative to study the effectiveness of the Institution-on-Farm Training Program (IOF) for veterans. He was later appointed national chairman for the completion of this study and in 1951 launched the national study to determine the effectiveness of the program. He gave considerable time and attention to supplying emergency teachers during the war period and to the retraining of veterans during the postwar period in an effort to supply more qualified teachers of vocational agriculture and leaders for the IOF program.

He conducted a study of rural military veterans in 1944 to determine their educational and economic needs for readjustment to civilian life; he was responsible for the adult education section of the Intermediate District study in ten Upstate areas in 1945. Much time and effort was also given to development of cooperative relationships with some sixty secondary schools in establishing the apprentice teaching programs.

Following his retirement Professor Hoskins was free to travel and served abroad, first in India and later in the Philippines. His work in India at the Agricultural College in Poona with the Kansas State College project in reference to developing a program for extension education at the college combined his interests and expertise in vocational education with farm management. This Ford Foundation-funded program involved development of supporting facilities and an associated training program at Cornell University for professors affiliated with the Agricultural College.

During his career at Cornell Professor Hoskins influenced the lives and careers of many. In 1978 many of them contributed to the establishment of an Ag Quad tree in his honor. The sugar maple stands today outside Stone Hall as a living memorial to his dedicated life of service to education of rural youth.

Professor Hoskins was the widower of Ethel Williams Hoskins, who died in 1952. He is survived by two sons, Earl W. Hoskins of Wolcott and Edwin Paul Hoskins of Sidney; a daughter, Angie Gilchrist of Manasquan, New Jersey; eight grandchildren; and four great-grandchildren.

Marvin D. Clock, Helen L. Wardeberg, William E. Drake

Ralph Sheldon Hosmer

March 4, 1874 — July 19, 1963

Ralph Sheldon Hosmer was born March 4, 1874, at Deerfield, Massachusetts, the son of the Reverend George Herbert and Julia West (Sheldon) Hosmer. His death occurred July 19, 1963.

After completing his preparatory education, two years of which were at the Boston Latin School, he entered Harvard University from which he was graduated in 1894 with the B.A.S. degree. He spent an additional year at Harvard and then started in 1896 a career in government service that lasted until 1914.

His first government position was with the Division of Soils during the period May 1896, to November 1898. In the latter year, he became interested in Forestry through the influence of Gifford Pinchot, and, as a result, transferred his activities to the Division of Forestry, then just reorganized under Mr. Pinchot. Forestry was new and strange to the United States.

His early work in the field was spent principally in the Adirondacks and the White Mountains. After several years with Pinchot, Hosmer took a leave of absence to attend the newly established Yale School of Forestry, obtaining his Master of Forestry Degree in 1902. He was a member of the first class to be graduated from this School. He returned to his position with the government but stayed only until 1904, when he left for Hawaii to become the first Superintendent of Forestry of the Division established there in 1903. This position was held until he returned in 1914 to become Professor of Forestry and head of the Department of Forestry established in 1910 at New York State College of Agriculture at Cornell University. This position Professor Hosmer held until July 1942, when he retired from active service and was made Professor Emeritus of Forestry.

It was on December 30, 1913 that Ralph Hosmer was married to Jessie Nash Irwin; three children were born, David Irwin, Jane Sheldon (Mrs. Robert Hall Llewellyn), and Emily Francis (Mrs. Marc Daniels).

Only those who were associated intimately with Professor Hosmer know of his loyalty and devotion to forestry, his warm personality, extraordinarily generous nature, and his fair dealings with everyone.

He was one of the seven charter members of the Society of American Foresters and was the last living member of this group. He served as the president of the Society in 1923, was made a fellow soon after the grade was established, has been active on innumerable committees, and has prepared historical summaries of great and lasting value to

the Society. Especially noteworthy in Society affairs was the award to him in 1950 of the Sir William Schlich Memorial Forestry Medal. This award gave Professor Hosmer great pleasure.

A history of additional honors, positions, and memberships will give some idea of the extraordinary range of Professor Hosmer's activities. He was a delegate to the White House Conference of Governors in 1908, and, upon his return to Honolulu, was made Chairman of the Territorial Conservation Commission of Hawaii, 1908-1914; a member of the Research Council of the Northeastern Forest Experiment Station, 1926-1942; secretary of the Forestry Section, International Congress of Plant Sciences, 1926; a member of the City Planning Commission of the City of Ithaca, New York, 1928-1938; a member of the New York State Conservation Advisory Council, 1932-1941; and an honorary life member of the Empire State Forest Products Association from 1942 till his death. He was an active member of the American Forestry Association.

Professor Hosmer was a fellow of the American Association for the Advancement of Science, also a fellow of the Forest History Foundation, an organization in which he was much interested and to which he had given much of his time since retirement. He was a member of two fraternities, Alpha Zeta and Phi Kappa Phi. One of his many interests during his latter years on the Cornell Faculty and after retirement was the Cornell University Arboretum, later developed into the Cornell Plantations.

Professor Hosmer was over the years a writer of many articles, bulletins, and books. To be mentioned in particular are *Impressions of European Forestry*, written during a six-month trip in 1921 in various European countries; *A Forty Years' History of the Society of American Foresters* (1940); *The Cornell Plantations—A History* (1947); *The Society of American Foresters—An Historical Summary* (1950); and *Forestry at Cornell* (1950). His writings have always been characterized by an easy style and meticulous accuracy. It may be added here that, after his retirement at Cornell, Professor Hosmer spent a great deal of time in genealogical research and writing. The volume, *The Genealogy of the Irwin Family* (1938) is one of his noteworthy productions.

Probably the two periods in Professor Hosmer's professional life that are of greatest interest would be his careers in Hawaii and at Cornell.

As noted previously, Ralph Hosmer served as territorial forester in Hawaii from 1904 to 1914. His activities there resulted in the establishment of a system of forest reserves that by 1914 had reached an area of some 800,000 acres. The momentum of this project was such that at present more than 1,200,000 acres, one quarter of the land area of Hawaii, are now reserved. Following the establishment of the reserves, administrative measures were inaugurated

primarily those of protection from grazing, fire, and trespass. Professor Hosmer's foresight and energy were responsible for the start of forestry in Hawaii. His contributions were recognized and memorialized in the Ralph S. Hosmer grove of timber on the slopes of Mt. Haleakala in the Hawaiian National Park.

Professor Hosmer took an active part in civic affairs. He was a prominent member of the Unitarian Church and gave much of his time and effort to its administration.

He lived and participated in forestry during its entire span of years in the United States. During his active years on the Cornell Faculty, Professor Hosmer was especially interested in forest protection, policy, and history. As the years passed, his attention dealt more and more with matters of history. His contributions in this field have served forestry well, and, as time goes on, will be increasingly valuable.

C. H. Guise, E. L. Palmer, D. S. Welch

T. Richard Houpt

October 9, 1925 — October 7, 2003

On the morning of October 6, 2003 Professor Emeritus T. Richard Houpt delivered a 90-minute lecture to first-year students of Veterinary Medicine. The following morning, he said a sad “goodbye” to the last of his experimental animals and closed his laboratory. In the afternoon, together with his beloved wife and constant co-investigator and companion, Dr. Katherine Albro Houpt, he attended a departmental seminar following which he engaged the speaker in animated discussion. Very shortly thereafter he returned home and, within the hour kept an unexpected appointment with a much higher authority. The orderly series of events closing out his earthly life encapsulates the things that he valued most dearly: his loving relationships with his family, students, and experimental animals (particularly his pigs) as well as with his engagement in expanding the knowledge and understanding of veterinary physiology. When Dr. R.O. Davies, a close friend and colleague, was asked to concisely summarize Dick’s career, he said that the attribute that best defined Dick as a scholar was that he wanted to help everyone “know how animals work.”

After accomplishing the goal of instructing veterinary students for fifty years, Dick “cut back a bit” by discontinuing his practice of baking cinnamon buns for tutorial groups on Friday mornings. Fortunately, he continued to present lectures and to publish in his areas of expertise including Acid-Base balance, and Water and Electrolyte balance and the Regulation of Food Intake and Satiety. His unpretentious and lucid style was much appreciated by students as were colorful slides drawn from his research adventures in comparative aspects of salt and water balance and temperature regulation—the laughing (panting) reindeer, the imperious camel (which doesn’t store water in its humps), and himself astride a tiny burro in the deserts of North Africa.

Born in Roslyn, Pennsylvania, Dick received his undergraduate and Veterinary Medical education at the University of Pennsylvania, completing the V.M.D. degree in 1950. In 1953, he completed the M.S. degree in Veterinary Pathology at the University of Illinois, Urbana. Subsequently, he returned to the University of Pennsylvania Graduate School of Arts and Sciences and received the Ph.D. degree in Medical Physiology in 1958. During his graduate studies at Illinois and Penn, he was employed as Instructor in Veterinary Physiology and Pharmacology except for one year spent as a Research Associate in the Duke University Desert Expedition headed by Professors Bodil and Knut Schmidt-Nielsen in Beni Abbes, Algeria. They studied water and nitrogen conservation in camels. This served as the entrée to Dick’s dissertation on urea recycling in herbivorous animals including ruminants and horses.

Following the completion of the Ph.D. degree, he remained at the University of Pennsylvania as a member of the faculties of the School of Veterinary Medicine and of the Graduate School of Arts and Sciences. He stayed there as a valued teacher and researcher until his recruitment in 1971 as Professor of Veterinary Physiology at the New York State College of Veterinary Medicine, Cornell University.

The arrival of Dick and Kathe Houpt at Cornell provided additional strength and breadth to an already preeminent center of research and teaching of comparative gastrointestinal physiology. Over the years, Dick's research turned toward behavioral physiology and, particularly, ingestive behavior—neural and hormonal factors regulating hunger, thirst and satiety using pigs as his experimental model. Often in collaboration with Kathe, he has published extensively concerning the use of pigs as experimental subjects.

His wife; his two sons, Thomas and Charles; and his brother, David, survive Dick. He was a central figure in the teaching of Veterinary Physiology to professional, graduate and undergraduate students at Cornell from his arrival in 1971 until the penultimate day of his life. His notable career achievements were recognized in 2000 with the Alumni Award of Merit for Teaching and Research from the University of Pennsylvania School of Veterinary Medicine. He was an outstanding mentor, much loved and admired by his students and colleagues as an example of the best attributes of a scholar and a human being. We miss him.

Ronald R. Minor, Richard E. Rawson, John F. Wootton

Frank Bonar Howe

June 4, 1887 — July 21, 1976

Frank Bonar Howe, professor of soil technology emeritus, is remembered both for his service to Cornell and the people of New York and for his business and community activities in the Ithaca area. From 1920 until his retirement from Cornell in 1950, Professor Howe devoted his energies to the inventory of soil resources of New York State and to problems of soil use and conservation. His expertise in land use and value developed during this period and was the foundation for a second career in a real estate and insurance business in Ithaca after his retirement from Cornell. During his residence in the Ithaca area, he was active in community affairs.

Professor Howe was born in Nashua, Iowa, the son of John W. and Josephine Bonar Howe. He graduated from the University of Colorado in 1911 with the A.B. degree. In 1912 he married Blendena Fox of Boulder, Colorado. He was awarded the M.S. degree at Iowa State College in 1915.

Professor Howe began his professional career with the United States Geological Survey in land classification and appraisal in western United States. In 1920, Professor T. L. Lyon, head of Cornell's Department of Soil Technology, brought Mr. Howe to Cornell for work on the inventory of soils of New York with the title soil surveyor. He continued in this capacity when the crop production function of the Department of Farm Crops was combined with Department of Soil Technology to form the Department of Agronomy in 1921.

During the 1920s farm abandonment became a serious problem in New York and resources for soil surveys were increased, with Mr. Howe in a leadership role. In 1934 he was promoted to assistant professor of soil technology and soil surveyor in the experiment station, adding teaching to his responsibilities.

Professor Howe had been active as a member of the Water Resources Advisory Committee of the New York State Planning Commission since 1931. He had also established the first soil erosion control project in New York in 1932. By 1934, he was recognized as one of the leading authorities on soil and water problems in the state at a time when the soil and water conservation movement was receiving national attention. Professor Howe was granted leave from the University to serve as regional director for the newly formed Soil Erosion Service of the United States Department of Interior on July 1, 1934. When the Soil Erosion Service became the Soil Conservation Service of the United States Department of Agriculture in 1935, Professor Howe was its first coordinator for the State of New York. His leave from the University was extended to September 27, 1935, when he resigned to fulfill obligations to the federal service.

Professor Howe returned to Cornell in his former capacity on January 1, 1936. On July 1, 1937 he was promoted to professor of soil technology, serving in that capacity until his retirement on June 30, 1950, and his appointment as professor emeritus on July 1 of the same year.

On retirement, Professor Howe embarked immediately on a second career in the real estate and insurance business in Ithaca. He was a member of the Ithaca Board of Realtors for twenty-two years, including a term as president of that body.

During Professor Howe's tenure at Cornell, soil surveys of twenty-nine counties were completed and published. At his retirement, the field work had been completed for six additional counties, and the reports were ready for publication. He was author or coauthor of a number of other publications dealing with soil resources of New York and their use and management. His most significant publication was *The Classification and Agricultural Value of New York Soils*, published as Cornell University Agricultural Experiment Station Bulletin 619 in 1935. This remained the standard reference on soil resources of New York for twenty years.

Professor Howe was a member of Sigma Nu and Alpha Chi Sigma fraternities. He was a member of the American Soil Survey Association, the Soil Science Society of America, and the American Society of Agronomy. He served as Ithaca commander of Sons of Union Veterans and was a thirtysecond degree Mason. He served as a member of Kalirah Temple Shrine of Binghamton and of the First Church of Christ Scientist of Ithaca.

Professor Howe is survived by a son, Frank B. Howe, Jr.; two daughters, Virginia Howe Fernald and Josephine Howe; six grandchildren; and three great-grandchildren.

Robert D. Miller, Robert B. Musgrave, Marlin G. Cline

George Henry Howe

February 9, 1888 — April 13, 1955

George Henry Howe, Associate Professor of Pomology of the New York State Agricultural Experiment Station at Geneva, died in the Geneva General Hospital on April 13, 1955. He was born February 9, 1888, at Jericho, Vermont. When four years of age, upon the death of his father, he went to Pittsford, VT, to reside on the farm of an uncle where he spent his boyhood. He attended high school in Pittsford and received the B.S. degree from the University of Vermont in 1910.

From July to November, 1910, he was employed jointly by the Vermont Agricultural Experiment Station and the United States Department of Agriculture on potato investigations. William Stuart, who became world famous for his work on potatoes, was the leader in these investigations; and he rated Howe highly for his work and loyalty. On November 11, 1910, he was appointed Assistant Horticulturist at the Experiment Station at Geneva where he served faithfully, with the exception of a leave of absence during World War I, until his death. He enlisted in the Army as a private in March 1918 and was honorably discharged in May 1919. At that time he was in charge of an agricultural reconstruction program of occupational therapy for disabled soldiers at the Walter Reed General Army Hospital. Although he was in the service for a brief period he made several deep friendships that continued during his life. In 1919 he was made Associate in Research and in 1946 Assistant Professor of Pomology.

Howe was a valuable man for the Experiment Station, for he carried out every assignment to the last letter. No one was ever more meticulous, painstaking, faithful, and helpful. He arrived at the Station at the time the fruit monographs were being prepared and published. Their preparation entailed a vast amount of work, for the horticultural literature had to be searched for the history of the various varieties and detailed descriptions made of the plant and its fruit. These studies aided Howe in becoming a well-known authority on tree fruits, especially the cherry, pear, and apple. He was unexcelled as a field man as he kept accurate records on the blooming and ripening dates of the various fruits, and described and evaluated many thousands of varieties and seedlings. This experience gave him excellent judgment in selecting fruits that offered possibilities for commercial and amateur growers.

In addition to these main tasks, Howe worked and assisted on many other problems, such as the ringing of fruit trees to induce earlier bearing, breeding roses, testing the behavior of tree fruits on different rootstocks, and

exhibiting fruits at various horticultural meetings and the State Fair. One of his roses, which unfortunately has been lost, was named in honor of the wife of Director Whitman H. Jordan.

He was a Fellow in the American Association for the Advancement of Science and a member of the American Society for Horticultural Science and of Alpha Zeta. In addition to aiding in the preparation of the monographs on cherries, peaches, pears, and small fruits, he was the author of numerous bulletins, circulars, and articles for the press.

He was married on September 3, 1927, to Lenore L. Treat of Spring Valley, New York. He is survived by his wife, a daughter, Mrs. John H. Horan of Honeoye Falls, and two grandchildren, Patricia Mary and David John.

Professor Howe had a retiring personality and liked to remain in the background. He was always faithful and nothing pleased him more than to be of service to others. Unfortunately, his health failed him during the last few years of his life and he was much disturbed that he had to restrict his activities. His knowledge of fruits was vast and he helped to identify many fruits for growers and the county agents. He will be missed by friends and many growers who were benefitted by his information and council.

F. L. Gambrell, J. D. Luckett, Richard Wellington

Harley Earl Howe

August 26, 1882 — August 18, 1965

Harley Earl Howe, born in Linneus, Missouri, began his career as a teacher in a small elementary country school in his native state. It was thus that he entered nearly half a century of active teaching, most of it at Cornell University.

To continue his own formal education he returned in 1904 to the University of Missouri from which he received the Bachelor of Science degree in Education in 1906. Then, after two years as a graduate student and teaching assistant at the University of Missouri and a summer term at the University of Chicago, he was granted a scholarship in the fall of 1908 to attend Cornell. He completed the requirements for the M.A. degree in 1909 and for the Ph.D. degree in 1916. His unusual pedagogical perceptions were clearly evident by 1909, and he was then appointed an instructor in physics in the College of Arts and Sciences. He continued teaching in this capacity until 1912 when he accepted an appointment as Professor of Physics at Randolph Macon College, Ashland, Virginia.

In 1918 Dr. Howe returned to Cornell as an Assistant Professor in Physics. For the next 32 years he taught and developed introductory physics courses for students in the Colleges of Arts and Sciences, Agriculture, and Home Economics, and in other Cornell divisions. Advanced to full professorship in 1937, he taught continuously until his formal retirement in 1950.

Many of his colleagues and former teaching assistants will recall with nostalgic pleasure those free-for-all discussions in the Monday staff meetings of his courses, when with painstaking care, the week's pedagogical problems were bared with new insights into the art and practice of teaching. Luster was continually added to his reputation. All with whom he associated were constantly stimulated by his warm cheerful humor, by his broad human outlook, and by his contagious example of the dignity of the teacher. After 1950, as Emeritus Professor for fifteen years, he continued in his inimitable, spry, and alert fashion to gently prod his colleagues and former students to see and to uphold the unquestionable verities.

Professor Howe successfully put down in writing his characteristic and well-tested pedagogical style. He published in 1942 a textbook, *Introduction to Physics*. Immediately popular among teachers everywhere, this text went through two editions and was studied by tens of thousands of students throughout the United States and Canada.

During the 1930's Professor Howe very appropriately became a member of the Executive Board of the American Association of Physics Teachers, no doubt his favorite professional organization. During practically all of his active

life he was also a member of the American Physical Society, Optical Society of America, American Association for the Advancement of Science, Sigma Xi, and Gamma Alpha.

His research interests were mainly in the areas of optics, colorimetry, and absorption by organic salts; but he was always primarily a teacher, and it may be fairly said that his real research was in pedagogy.

On August 21, 1913, Professor Howe married Eva Belle Rich of Hobart, New York. A daughter, Marion, was born in 1918 during their last year at Randolph Macon College. Always a devoted husband and father, he especially enjoyed his years in retirement when he had the cherished time to spend with his family, and with them to enjoy the companionship of his many friends and the delights of his University, of his town, and of his country.

Leroy L. Barnes, Carlton C. Murdock, Lyman G. Parratt

Eric Vail Howell

August 29, 1891 — August 5, 1978

Eric Vail Howell, professor of engineering mechanics and materials emeritus, was born in Riverhead, New York, in 1891. His father was an attorney in nearby Southampton where Eric attended public schools before entering Cornell to study civil engineering. In 1914 he received the degree of Civil Engineer, which at that time was the official first (bachelor's) degree in the field. He went to Pennsylvania State College as an instructor in 1916-17 and then returned to Cornell to take his Master of Civil Engineering degree in 1918. He was appointed an instructor in the same year and began a professional affiliation with the College of Engineering that continued until his retirement in 1956.

Until 1948 mechanics and materials were taught separately in civil engineering and mechanical engineering, with separate orientations. In civil engineering the emphasis was on the teaching of mechanics as a base for structural and hydraulic design, and Professor Howell taught in this mode for many years. In style and manner he was formal and dignified, though not without a dry sense of humor. Along the way, he collaborated with faculty colleagues George and Rettger in writing several editions of the textbook *Mechanics of Materials*.

In 1948 the two departments of mechanics and materials from civil engineering and mechanical engineering were consolidated into a separate autonomous department, and Professor Howell became a member of that faculty.

During his years at Cornell, he also performed engineering services for the Land and Highway Division of the State of New York, the Finger Lakes State Parks Commission, and the City of Ithaca Engineer's Office.

He married the former Jessie M. Adkinson in 1915, with whom he shared a strong interest in contract bridge. Professor and Mrs. Howell were active in bridge circles in both the Cornell and Ithaca communities for many years.

Professor Howell was an avid golfer and a long-time member of the Ithaca Country Club; he was also a member of the Ithaca Power Squadron and the Ithaca Hobasco Lodge, Free and Accepted Masons. His professional affiliations included the American Society for Engineering Education and the Cornell Society of Engineers.

When Professor Howell retired in 1956, he was among the last of the civil engineering faculty who had served Cornell during the difficult years of the 1920s and 1930s, and on into the changing era following World War II.

Richard H. Lance, John F. McManus

David Fletcher Hoy
Registrar and Member of the Faculty

— *December 6, 1930*

A truly vital character passed into Cornell history when David Fletcher Hoy suddenly ceased his labors for the institution that he loved so well.

To some, even while still in his active, duty-crowded career, he had become a tradition of Cornell going back to distant days.

He had merited the respect and confidence of those whose contacts were with him as an administrative officer.

But his death has brought deepest sorrow and a sense of personal loss to all that group that loved him for those friendly graces which were experienced in such full measure by all who were so fortunate as to come into intimate association with him.

The University Faculty, of which he was an honored member, would record their admiration for a colleague whose devotion to the University at no time knew a limit; helpful, wise, efficient, he was available at every season with generous cooperation.

Linking us with the University's early days, he was an active factor in the expansion of the institution. To his steady hand and high ideals cherished with unswerving devotion. Cornell owes a debt of deepest gratitude.

George James Hucker

August 19, 1893 — May 18, 1988

George Hucker was raised on a farm near Cascade, Iowa. He obtained his A.B. degree from Lenox College in 1915, his A.M. degree from Columbia University in 1916, his Ph.D. degree from Yale in 1924, and an honorary degree from Hobart and William Smith Colleges in 1964. Following overseas service during World War I as a lieutenant in the Sanitary Corps, he joined the staff of the New York State Agricultural Experiment Station in 1919 as an assistant in research. He retired from Cornell in 1963 as professor of bacteriology.

Dr. Hucker was a very productive researcher. His early studies dealt with the microbiology of cheese manufacture and sanitation in dairy plants. Later, his interests were extended to the microbiology of frozen vegetables and to the sanitation problems associated with these foods. His more basic research was concerned with the taxonomy of the different genera of *cocci* that are important in foods. He contributed to a number of editions of Bergey's *Manual of Determinative Bacteriology* and his publication with Carl Pederson on the genus *Leuconostoc* served as the definitive taxonomic reference for many years. His name remains well known to most bacteriologists due to his improvement, the Hucker modification, of the Gram stain. He authored over 200 papers during his 44 years at Cornell.

George Hucker was characterized by his colleagues as a mover and a shaker. In his profession, his unusual organizational and promotional talents were applied on local, national and international levels in the fields of bacteriology, dairy science and public health. Perhaps his greatest contribution was being one of a small group of scientists who founded the Institute of Food Technologists (IFT). Hucker served as the first secretary-treasurer of IFT and was elected its president in 1947. IFT is now the principal professional society for food scientists, with a membership exceeding 24,000.

Dr. Hucker was equally active in community affairs. He served on Geneva General Hospital's board of trustees for 15 years and on the board of directors of the Rochester Regional Council of Hospitals. He was president of the Geneva Historical Society for ten years and was largely responsible for the addition of a \$100,000 wing to the Society's museum. His many contributions were recognized by the naming of an exhibition room in his honor.

He also is a former president of the Geneva Community Chest, the Geneva Country Club, the Finger Lakes Torch Club, the Geneva University Club, and the Geneva Rotary Club. He served as district governor of Rotary International, and was honored by being appointed a Paul Harris Fellow.

Dr. Hucker's hobbies were photography and the collecting of early American and English silver. As a talented photographer, he made documentaries for the Ontario Day Care Center, the YMCA, the historical society, and Rotary's camp for crippled children.

Dr. Hucker is survived by his wife, Marjorie.

Paul J. Chapman, Willard B. Robinson, Don F. Splittstoesser

Hugh Cecil Hockett

July 13, 1890 — March 22, 1989

Hugh Hockett was born in Madagascar, the eldest of three sons of missionary parents. At the age of six, he and his brother Arnold were sent to England for their schooling. When he left school he had no specific plans for the future and drifted from farm labor to horticulture. His father then arranged for him to go to Canada to learn scientific agriculture at the Ontario Agricultural College (now University of Guelph). He arrived in Canada in 1912 and the staff at Guelph recommended research in entomology, for which he was forever grateful.

When WWI broke out, Hockett joined the Canadian Expeditionary Force and was posted to the Princess Patricia Canadian Light Infantry. With practically no training, his unit tried to defend the Salient at Ypres. The unit was overrun and Hockett's right hand was smashed by a shell fragment. The hand healed to the point where he had some muscular control. Hockett rarely spoke of his injury and most people thought it was caused by some malignant form of arthritis. Both of his brothers, Arnold and Oliver, were killed in WWI.

He returned to Guelph for a B.S.A. degree in 1919 and M.A. degree in 1921 and then went to Cornell where he received a Ph.D. degree in 1923. He was appointed assistant professor at the New York Agricultural Experiment Station, Geneva, and after the end of WW II, he went to work at the Long Island Vegetable Research Farm at Riverhead.

His work was largely in economic entomology and related mostly to insects attacking vegetables. He published many well received papers. However, his fame, which extends well beyond Cornell, is based on his taxonomic studies of the family Anthomyiidae and related groups in the Diptera. These flies are of considerable economic importance. His systematic studies began in 1924 and resulted in many long papers culminating in 1965 with his monograph on the "Muscidae of Northern Canada, Alaska and Greenland". Several years later another two papers covered the California genera. His contribution in 1987 to the *Manual of Nearctic Diptera* is outstanding although most of the work was done prior to 1987.

Most of Hockett's work was done at his home, which was located directly across the highway from the Vegetable Research Farm. He visited European museums to study type specimens and usually managed to collect specimens on these trips. He loved field work and collected specimens in various localities, but mostly in New Hampshire and Maine.

Hugh Hockett was married for many years to Grace Watkins who died in 1964. There were no children. Since 1983 he lived with a niece, Mrs. Meg McCrystal of Henrietta, New York.

J.G. Franclemont, L.L. Pechuman

Note: Much of the information ON the part played by Hockett in WWI is from Dr. G.E. Shewell, Ottawa, Canada.

Ernest Wilson Huffcut

— *May 4, 1907*

The Faculty of the University records upon its minutes this memorial of Ernest Wilson Huffcut whose beneficent influence upon the life and work of the University extended far beyond his daily service to the College of Law of which he was the distinguished Director.

He was closely identified with the University as student or teacher for more than twenty years and always a potent factor in its varied activities. Entering Cornell in 1880 he received the degree of Bachelor of Laws in 1888. Here he was instructor in English from 1885 to 1888; professor of Law from 1893 to 1903 and Dean of the Law Faculty and Director of the College of Law from 1903 until his untimely death in the present year.

Possessed of logical understanding of his theme, rare eloquence and perfect clarity of expression, a large intellectual and social sympathy and a dominant instinct for progressive action, he was accorded a foremost place by his fellow workers in the field of legal education in this country. These same attributes won for him a like regard in the deliberations of this Faculty and its committees, and in his relations with alumni and student organizations. His spirit of devoted service to his University in all its concerns—those of lesser importance as well as those more vital to its welfare—was ever voiced with persuasive grace and practical wisdom. In the death of Dean Huffcut the State has been deprived of an exemplar of civic duty and Cornell University has lost a most gifted and loyal son.

F. Irvine, E. H. Woodruff, G. L. Burr, C. H. Hull

Charles Henry Hull

Goldwin Smith Professor of American History

September 29, 1864 — July 15, 1936

Charles Henry Hull was born in Ithaca, September 29, 1864. He graduated from Cornell University in 1886, was appointed Assistant Librarian in 1889, and the year following went to Germany, where he studied economics and history for two years, receiving the degree of Doctor of Philosophy from the University of Halle in 1892. Returning to Cornell as Instructor in Political and Social Institutions, he was appointed Assistant Professor of Political Economy in 1893, Professor of American History in 1901, and Goldwin Smith Professor of American History in 1912. He retired from active service in 1931, in excellent health and in the prime of his intellectual powers, only to be prostrated by an obscure and painful disease which he endured with great fortitude until his death, July 15, 1936.

Residing virtually all his life in the place of his birth, Professor Hull's activities were identified, in a singularly happy and useful way, with the City of Ithaca and Cornell University, both of which he served untiringly and to their great advantage. His knowledge of men and things, his sound judgment, and his integrity in thought and conduct made it inevitable that honors and responsibilities should be incessantly thrust upon him. He served as Secretary of the University Faculty, as Dean of the College of Arts and Sciences, and as Faculty representative on the Board of Trustees. His knowledge and love of books, and his competence in the purchase and care of them, was of incalculable assistance to those in charge of the library. He was one of the founders and the first president of the Co-operative Society. He served as president of the Town and Gown Club, and was one of those who did most to make it an agreeable and a useful meeting place for faculty members and townsmen. He served as Vice President of the Ithaca Community Chest, as President of the Hospital Association, as a member of the Ithaca Board of Education, as a Director of the Chamber of Commerce and of the Cornell Library Association. It would be difficult to name a man who, so unobtrusively and with so little self-seeking, was so incessantly and so competently occupied with the practical affairs of the community and the university which he loved.

Although immersed in practical affairs, Professor Hull always regarded teaching as the first of his obligations. Countless men and women throughout the country will remember him as a teacher and a friend. They will remember that he was exacting in his requirements, unerring in detecting and caustic in exposing slipshod or dishonest effort. They will remember still better the acute intelligence, the vivid personality of the man, the genuine interest he took in their work, the time he freely gave in helping them to do it well. Best of all, they will remember

that he was their friend as well as their teacher, that he always met them as individuals, without aloofness or condescension, and that no one was ever more warmly sympathetic, or more ready with substantial aid, when they came to him for advice in any personal trouble.

As a scholar, Professor Hull achieved high distinction. He was one of those who can acquire wide and exact knowledge, and who possess as a native endowment that critical insight, that constructive imagination, and that sympathetic understanding which, applied to knowledge, lead to wisdom. His edition of *The Economic Writings of Sir William Petty*, published when he was thirty-four years of age, was at once pronounced by competent critics, in Europe and America, to be in its kind a masterpiece without blemish. The dominant characteristic of his mind was an insatiable intellectual curiosity—the desire to know what is true in order to understand what is possible and desirable to be done. “I am inclined to think,” he once said, “that there are no uninteresting subjects, there are only uninterested people.” By virtue of a happy union of erudite learning and an analytical intelligence of the first order, he could find any subject interesting by disclosing its essential nature and its significant relations. Whether in the study occupied with books, or among men occupied with affairs, he was ever engaged in research in the original and best sense of that term— engaged in searching more profoundly into the truth of alleged facts, into the validity of accepted conclusions.

We admired Professor Hull for his competence, we honored him for what he did; but we loved and revered him for what he was. We loved him for his sincerity, for his unfailing courtesy and kindness, for his indefeasible integrity. We loved him for the serenity with which he met good and evil fortune, for the subtle humor that disarmed contentiousness, for the ironic understatement that deflated high claims, for the instinctive generosity that promoted good will. We shall remember him as he went about among us, never idle, yet never hurried, and ever ready to lend himself to our necessities. Those of us whose work brought us into close association with him can never forget how free we always were to consult him on any subject, simple or recondite, that might concern us. We shall not forget the genuine modesty with which he would first of all assure us that he knew very little about the matter; nor forget that he would then, in his calm and leisurely manner, in sentences elaborate and unconfined, sinuously intricate and infinitely qualified, set before us a reticulated pattern of relevant facts and of the circumstances that occasioned them, from which there would emerge the conclusions that seemed to him tentatively tenable. Nor shall we forget that he would then sincerely apologize for not being able to be of any real assistance to us. Least of all shall we forget how all but impossible it was to come away from such conferences without having our knowledge increased from his store, our insight quickened by his criticism, our judgment fortified and our wisdom deepened by the easy play of his profound and flexible intelligence.

Those who speak of Charles Henry Hull have no need to recall the precaution *de mortuis nil nisi bonum*. In his life as in his death, as a scholar and as a colleague, as a man and as a citizen, above all as a friend, there is nothing but good that can be said or will be remembered of him. He was a man whose character and conduct challenged pessimism and engendered courage by exhibiting, consistently and in rare perfection, those qualities of intelligence and good will that are essential to a life that is at once wisely ordered and memorable.

Retired: June 1931 Fac. Rec. p. 1726

M. Lovell Hulse

October 21, 1895 — November 13, 1968

Emeritus Professor Melvin Lovell Hulse was born at Naples, New York, on October 21, 1895, the son of Arville and Harriet C. Hulse. He received his elementary education in Canandaigua and was graduated from the Victor, New York, high school in 1912. Colgate University awarded him the A.B. degree in 1917 with a major in mathematics. He enlisted in the United States Army in September 1917, became a second lieutenant in the Quartermaster's Corps, and participated in the St. Mihiel and Meuse Argonne offensives. He served in the American Expeditionary Force abroad until August 1919.

After returning to the United States, he engaged in business and farming for some years before beginning his career in education. From 1925 to 1928 he taught mathematics at the Centenary Collegiate Institute in New Jersey. As a teacher there he began his graduate study in education at the Cornell University Summer Session in 1926, and he was awarded the M.A. degree in February 1929. Appointed an instructor in Education at Cornell that year, he continued to work on his doctorate which was awarded in 1934. He was then appointed assistant professor of Education. He was promoted to an associate professorship in 1941 and to a professorship in 1949.

Professor Hulse's great administrative and executive abilities were demonstrated and recognized early in his career at Cornell. From 1932 to 1946 he was chairman of the committee on teacher training in the College of Arts and Sciences, and chairman of the Bureau of Educational Service (teacher placement). From 1930 to 1945 he was secretary of the School of Education. In 1944-45 he was assistant director of the Summer Session, and in 1946, acting director. He was appointed assistant dean and secretary of the College in 1946, and in 1948 he was appointed associate dean, a position he held until his retirement in 1963. From July 1, 1951, to February 1, 1952, he served as acting dean of the College. As emeritus professor he was appointed a part-time consultant to the College for 1963-64. He was a member of Phi Kappa Phi and of Kappa Phi Kappa. As a scholar he contributed over the years various articles to professional journals.

Professor Hulse married Miss Marian Patterson of Hamilton, New York, in 1918. Following her death in 1953, he married Miss Kathryn Ranck of Ithaca in 1954, who survives him.

In the early years of his career at Cornell, Professor Hulse made his greatest contribution to the College of Arts and Sciences in its teacher training program, which, under his guidance and influence, developed for perhaps the only period in the history of the College into a sound and effective instrument for the preparation of secondary school

teachers. He taught successful courses in methods of teaching, but perhaps more important was his supervision of practice teaching where his wisdom, experience, and insight into character and personality were best brought to bear upon the problems of the apprentice teacher. To this day many a teacher recalls gratefully the kindly, helpful criticism and advice he received from Lovell Hulse.

When, at the close of World War II, University policies with regard to teacher training changed, and the program was transferred from the Arts College; Professor Hulse's talents were henceforth concentrated upon the many problems of the postwar college.

In a time of both expansion and change in the College, Lovell Hulse was a strong force for continuity, consistency, and integrity. It was his role as secretary of the College and secretary of the faculty not just to record the decisions of the faculty (and its standing Committees on Educational Policy and Academic Records), but to serve as its active institutional memory. It was not enough simply to know the exact phrasing of a piece of faculty legislation; he maintained a thoughtful concern for the aims which had originally prompted it and for the interlocking considerations which had usually given it final shape in faculty discussion. This role as the memory of the faculty naturally merged with a conscientious effort to see that the expressed intentions of the faculty were carried out and that its earlier decisions were not forgotten or overlooked as new concerns arose. In this role he had sometimes to remind the faculty of the implications of past decisions and to propose that earlier and later decisions be reconciled in a consistent policy.

From his scrutiny of student records and student performance, and from his overall view of course offerings and course enrollments, he was usually the first to see what effect any newly instituted plan, program, or regulation was having. From his long experience with these matters, and from his alert sense of human beings, he developed an intuition of the probable reaction of both faculty and students to any new proposal. To the succession of five deans of the College during his term of office, he was a generous friend and wise counselor who often bore significant responsibility for whatever successes they achieved. The College of Arts and Sciences, for its great postwar improvement in quality and standing, will long be indebted to Lovell Hulse. His many friends among the faculty and the alumni will not soon forget him.

G. Ferris Cronkhite, Paul M. O'Leary, Francis E. Mineka

Margaret Louise Humphrey

June 22, 1905 — December 20, 1983

Margaret Louise Humphrey, professor emerita, died on December 20, 1983, after a long illness, in Charlotte, North Carolina, where she had lived since 1975. She was a member of the faculty of the College of Home Economics (now the College of Human Ecology) from 1933 to 1967. After retirement she taught in the State University College at Buffalo from 1968 to 1971.

Miss Humphrey joined the faculty of the Department of Textiles and Clothing in the fall of 1933, when the college was just settling into Martha Van Rensselaer Hall, the new building. For faculty and students who came to Cornell in the postwar years Margaret provided a link with the past as an excellent chronicler of events, frustrations, and achievements during the administrations of director Flora Rose, assistant director Mary Henry, and later, the college's first dean, Sarah Blanding. Margaret helped us to appreciate the work of the early builders of the college and to gain insight for future directions.

Miss Humphrey had other qualities. She had talent as an apparel designer that was widely recognized. Her keen insight was sought in the development of the professional program, and several advanced courses that she developed contributed immeasurably to the students' professional placement. She inspired students to develop their abilities to the fullest potential and as an able teacher helped them acquire the technical skills essential to careers in designing, retailing, or teaching. Views of her students' stunning apparel designs delighted many audiences, including our New York State citizens who came to Farm and Home Week.

She participated over the years in building the Cornell Costume Collection. From her private collection she donated valuable examples of Czechoslovakian national costume and costumes designed by Hollywood designers for well-known films. The Hollywood designs were collected during her sabbatic leave, when she worked as a practicing designer with Don Loper and other Hollywood designers.

Miss Humphrey received her preparatory education at the Ward-Belmont School, in Nashville, Tennessee. Her baccalaureate degree was from the University of Wisconsin in 1929, and her M.A. degree was from Teachers College, Columbia University, in 1933.

Margaret, daughter of Charles and Eva Humphrey, was born and reared in Ironwood, Michigan, where her remains are interred. She is survived by her brother, Charles, of Ironwood.

Lucinda Noble, Frances Spratt, Elsie McMurry

Chester Jermain Hunn

March 14, 1884 — June 30, 1941

Chester Jermain Hunn, Assistant Professor in the Department of Floriculture and Ornamental Horticulture, died June 30, 1941, at the Memorial Hospital, Ithaca, New York, in his fifty-seventh year. He had been in ill health for some time.

The name Hunn has long been associated with Cornell horticulture, since Charles E. Hunn, the father of Professor Hunn, was gardener in charge of the greenhouses when Liberty Hyde Bailey began horticultural instruction at Cornell. Later Chester J. Hunn was largely responsible for establishing the courses of instruction in nursery management, and for research in plant propagation. These activities have received the cordial support of the nurserymen of New York State. Recently he had had an active part in assembling and propagating plant materials for the Cornell Arboretum. For this he possessed a special gift and enthusiasm and these brought him into wide contact with nurserymen and their organizations all over the country.

Professor Hunn was graduated from Cornell in 1908, after which he went to the Experiment Station in Honolulu. In 1910 he married Jessie McCormick of California, who was then teaching in Hawaii. He transferred to the University of Puerto Rico in 1914, and returned to Cornell for graduate study in 1916. During the first world war he served as Registrar of the Cornell Aviation School and in 1920 he joined the staff of the Bureau of Plant Industry of the Department of Agriculture at Washington, D. C. Professor Hunn was called to Cornell in 1926 as Assistant Professor of Ornamental Horticulture.

Professor Hunn was a member of Lambda Chi Alpha and Pi Alpha Xi; was faculty adviser for the honorary fraternity, Scarab; and was co-founder, with Professor Hosmer, of the Hawaiian Club of Cornell University, in which he had a continuing and active interest. In these societies and in many other student, alumni, and horticultural activities Professor Hunn's helpful participation will be greatly missed. Especially will he be missed by students of the University, because he always maintained an alert, understanding, and sympathetic interest in their athletic, social, and educational enterprises, and endeared himself to all of those with whom he came in contact.

Robert Walter Hunt

July 12, 1904 — March 31, 1951

Dr. Robert Walter Hunt, Associate Attending Surgeon (Urology) and Assistant Professor of Clinical Surgery (Urology) at the New York Hospital-Cornell Medical Center, died suddenly on March 31, 1951.

Dr. Hunt was born in Santa Barbara, California, where he received his elementary and high school education. He received his B. A. degree from the Leland Stanford University in 1926. While at Stanford he was a member of that institution's outstanding football team. After graduation he spent two years in business and then re-entered Stanford University, matriculating in the Medical School, from which he graduated with the degree of Doctor of Medicine in 1933.

He was interne and then house officer in surgery at the San Francisco City and County Hospital from 1932 to 1934. He then practiced general surgery in Santa Barbara, California for one year, at which time he was appointed externe in the Department of Urology, James Buchanan Brady Foundation of the New York Hospital, on October 1, 1935. He continued in a steady progression on the Brady Service as interne, senior interne and assistant resident surgeon and finally resident surgeon (Urology), the latter from January 1, 1938 to September 1, 1938. On completion of the residency he was appointed assistant surgeon to out-patients in the Department of Urology, James Buchanan Brady Foundation, being promoted to surgeon to outpatients on April 1, 1940. On July 1, 1941 he was appointed assistant attending surgeon; in September, 1942 he entered the U. S. Army Air Force Medical Corps, from which he was honorably discharged as Major in the spring of 1945. He was reappointed assistant attending surgeon (Urology) on July 1, 1945.

Shortly after the consolidation of the two urological services at the New York Hospital-Cornell Medical Center in September, 1949 Dr. Hunt was appointed assistant professor of clinical surgery (Urology) and associate attending surgeon (Urology), in which capacities he served faithfully and well until the time of his death.

Dr. Hunt was engaged in the private practice of urology and was also Director of Urology at St. Clare's Hospital in New York City. He was a member of the American Urological Association, a fellow of the American College of Surgeons, a fellow of the American Medical Association and a diplomate of the American Board of Urology.

Besides a host of friends and respectful colleagues, Dr. Hunt is survived by his wife and two sons.

Victor F. Marshall

Louis Merwin Hurd

April 5, 1885 — January 23, 1961

Louis Merwin Hurd, Professor Emeritus of Poultry Husbandry, and for forty-three years a member of the staff of that department, died on January 23, 1961, in Orlando, Florida.

Professor Hurd was born in West Morris, Connecticut, in 1885. He graduated from the Buchanan, New York, high school in 1904 and followed this with a year of postgraduate work at the Skaneateles High School. After attending Syracuse University for one year, he completed short courses in dairying and poultry farming at Cornell in 1909. He joined the Poultry Department staff in 1910 and served in the capacity of extension poultryman until his retirement on March 31, 1953. Soon afterward Professor and Mrs. Hurd moved to Orlando, Florida, where they lived until his death.

Professor Hurd's judgment in his chosen field was respected highly by poultrymen of New York State. In addition, the influence of his ideas and sound judgment extended not only to other states but to many foreign countries as well. He was the author of two books: *Practical Poultry Farming*, published in 1928, and *Modern Poultry Farming*, published in 1944. These books, because of their practical application as well as technical accuracy, were widely read by poultrymen and were translated into many languages for the use of poultry keepers in other parts of the world. During his long career as extension poultryman he wrote many bulletins and journal articles.

He was instrumental in initiating a statewide fowl pox control program in the late 1920s and a pullorum control program in 1935. In 1944, he instituted time and distance studies of poultry chores. During the later years of extension service he devoted considerable study to the problems of duck growers on Long Island and goose raisers throughout the United States. His bulletins in these two fields are still sought by poultrymen.

Professor Hurd was a member and past president of the Cornell chapter of Epsilon Sigma Phi, national honorary extension fraternity. After initiating the awards of merit for members in the local chapter in 1947, he served as chairman of the awards committee from 1947 to 1950. He was also a member and past president of the Cornell Extension Club, which he helped to organize. He was a member of the Poultry Science Association and served that organization as a director from 1940 to 1944.

The New York State Fair and many county fair groups relied heavily upon Professor Hurd's knowledge of production judging. He was in charge of the production poultry and egg shows at the New York State Fair in Syracuse for

several years. From 1918 to 1937 Cornell held a one-week Poultry Judging School, which attracted students from throughout the United States as well as some foreign countries. Professor Hurd contributed much to the success of those schools and to a statewide culling program carried out by the county agricultural agents for a number of years.

One of Professor Hurd's greatest contributions to the industry of New York State was his ability to give sound management assistance through farm visits in company with the county agricultural agents. His background of practical farm experience, coupled with a sincere desire to be of assistance to poultrymen, helped him to gain the trust and friendship of those with whom he came in contact.

Professor Hurd was a devoted son, husband, and father. His first wife, Ella Hurd, died in 1940. For a number of years his mother helped to carry on the home responsibilities. He was married in 1948 to Margaret Severin Derry, and they purchased a home in Orlando, Florida, soon after his retirement in 1953.

One daughter, Caroline Hurd Wallenbach, died of polio suddenly in 1953, leaving a family of three children. A son, David Hurd, lives in Ithaca.

J. H. Bruckner, W. G. Earle, D. R. Marble

Wallie Abraham Hurwitz

February 18, 1886 — January 6, 1958

Wallie Abraham Hurwitz, Emeritus Professor of Mathematics, died January 6, 1958, in Raleigh, N. C. after suffering a heart attack while enroute to Florida. Professor Hurwitz was born February 18, 1886, in Fulton, Mo. He received A.B., B.S., and A.M. degrees from the University of Missouri in 1906, the A.M. from Harvard in 1907 and the Ph.D. from Göttingen in 1910. From 1910 to 1958, he devoted his keen mathematical and other talents to Cornell.

He became Instructor in 1910, Assistant Professor in 1914, Professor in 1924, and Professor Emeritus in 1954.

Few men have the broad knowledge and appreciation of the whole field of mathematics that Professor Hurwitz had. He made substantial contributions to mathematical research in several subjects, and is best known for his pioneering work in the theory of divergent series. He was a member of many American and foreign scientific societies. He served for many years in various editorial capacities, and habitually gave valuable ideas and advice to students and scientific investigators at Cornell and elsewhere. He was a superb teacher who believed that everything should be rigorously proved and thoroughly understood. His lectures, which were always meticulously prepared and vigorously delivered, exemplified careful planning and clear thought in developments of theories and attacks upon problems.

Apart from mathematics, his principal intellectual interests were music, drama, and literature. He was an enthusiastic violist. He attended almost every concert and play on the campus and frequently went to New York City to attend a dozen or more in a few days. His library included remarkable collections of Gilbert and Sullivan scores and memorabilia, and of cryptography and cryptanalysis, which he bequeathed to Cornell. He was a public-spirited man, and generously gave his time and money to worthy organizations. These organizations, including Cornell, profited by the fact that Professor Hurwitz was a sagacious man. In the summer of 1929 he thought the stock market had gone so high that he should sell every share of stock that he owned, and he did it.

His personal qualities included an uncompromising integrity which was always recognized and admired. His opinions, which were sometimes expressed in stirring speeches, very often influenced the decisions of his department and of the committees and faculties of his College and the University.

In his social relationships, he was a friendly bachelor. Many a young man, new to the University, found that Professor Hurwitz took a kindly interest in him, talked about University affairs, invited him to concerts and plays, and made him feel welcome. As the years passed, Professor Hurwitz maintained these friendships and the families of his friends became his friends. He took special delight in assembling friends, old and young, to read passages from humorous literature. All through his long career his social, as well as intellectual, value to the University was tremendous.

R. P. Agnew, Harry Caplan, W. H. French

John Hutchins

October 15, 1909 — October 28, 1996

John Hutchins was one of the pioneer faculty members of Cornell's Samuel Curtis Johnson Graduate School of Management. Over the years, he devoted his talent and energies to the school initially called the Graduate School of Business and Public Administration ("B&PA") and to the Department of Economics. Throughout his long career at Cornell, he retained a joint appointment in the Department of Economics and was deeply involved in the affairs of that department.

John received his undergraduate degree from MIT, where he was honored with membership in Tau Beta Pi. He did his graduate work at Harvard, where he became an expert on Business History and Transportation (the latter, the fore-runner of what has evolved into the field of Business Logistics.) At Harvard, he was the recipient of the David Ames Wells Prize, the most coveted and prestigious accolade in economics graduate (Ph.D.) study, awarded annually by Harvard's Economics Department. John's dissertation was published in the "Harvard Economic Studies" series.

From 1942-45, John served as director of the Russian and East European Shipping Area of the War Shipping Administration in Washington. He was also a member of the President's Soviet Protocol Committee, of which Harry Hopkins was chairman, working to resolve a number of disputes with the Soviets. In 1945, John handled transportation for the United Nations relief for Poland and Czechoslovakia.

His book, *The American Maritime Industry and Public Policy, 1789-1914*, published by the Harvard University Press in 1941 and reprinted in 1969, is one of the outstanding works in the field of transportation economics and business history. For many years, John served as a Trustee of the Business History Foundation and as a Trustee of the Committee on Research in Economic History, Inc.

John Hutchins was a member of that group of unusual scholars that first created and then provided the backbone for Cornell's Management School over which they presided with intellectual honesty, openness, and magnanimity. Their personal and professional loyalty to the institution was legendary. Their breadth, commitment, and insight made possible the creation of the new school and its culture of civility, a culture that has survived and flourished with its tradition of the faculty "open door." Generations of students benefited from their inspiration and instruction.

John was an active participant in the fundamental decisions that created B&PA. For example, John originated and taught the required course, Business and Government, to the full second year class. The architecture of the first

two floors of Malott Hall was determined by John's judgment that it was important that the school have a large lecture hall. The result was Bache amphitheater — a teaching and lecture space that has served the school and the university well since its construction more than thirty years ago.

In 1960, John published a review article in the *Administrative Science Quarterly* dealing with two studies of American business education (one by the Ford Foundation and the other by the Carnegie Foundation) that together had a huge impact on the development of modern M.B.A programs. John had little quarrel with the contents or recommendations of these reports; rather, he used his article to discuss further, broad issues including the relationship between administration and entrepreneurship, and between business education and the quality of business leadership. These issues are on the agendas of leading business schools today; John's article is worthy of a careful re-reading today.

At faculty meetings of the school, John assumed his seat at the right hand of the dean. He contributed his observations and insights to discussions on every topic in his quiet and dignified way. His colleagues will never forget his comments on an applicant for a faculty position with the school's economics group. While attesting to the candidate's intellect and excellent record, John described the candidate as, "Not being cooked yet!" That phrase captured an intellectual immaturity and naiveté of the candidate — matters that would not have stood him in good stead with M.B.A. and M.P.A. graduate students.

At another level, John would take the extra steps to support the intellectual freedom of his junior colleagues. He volunteered assistance whenever it was needed.

Back in the days when the University Faculty met as a Faculty, John was a welcome and active commentator on the vital policy issues of the day. It was rare that John missed a session. His comments enriched and influenced the understanding and perceptions of this group, thus influencing the policies and direction of Cornell for over thirty years.

John Hutchins was a "Boston Brahmin" in the best sense of those words. He was consistently pleasant, optimistic, courtly, and gracious. He and his wife Leila were active creators of community and comity for the school and its faculty. All faculty newcomers to the school, were "called-on" by Leila and John. This welcome to Ithaca was unique. No matter what the circumstance—even with the Hutchins arriving to welcome a young faculty couple busily painting their living room or changing diapers—each occasion is remembered to this day with warmth and affection.

The Hutchins' lovely, livable home was frequently a site for gracious and tasteful entertainment to welcome the new arrivals to the school, to celebrate the holiday season, to signal the coming of Spring. Leila was a wonderful, friendly hostess who put everyone at ease. John's stentorian laughter (and unique bridge-play) kept guests at ease.

John's commitment to maritime matters took many forms. He was a scholar but also an avid and expert recreational sailor, an activity he shared with a multitude of guests each summer. They would put to sea from the Hutchins' summer home in York, Maine in "Blue Squawl," a yawl of some forty feet.

John Hutchins is survived by Leila, his wife; daughters, Leila Phipps and Mary Adelman; and sons, Morton, B&PA '67, and John; as well as by a dozen grandchildren: six granddaughters and six grandsons; and two great grandchildren. We all miss him.

Harold Bierman, Jr., Alan K. McAdams, Seymour Smidt

Margaret Hutchins

October 24, 1893 — February 24, 1992

Born in Palmyra, New York, Margaret Hutchins died, after a short illness, in Rochester, New York at the age of ninety-eight. She had been a member of the Cornell faculty for twenty-two years prior to her retirement. Professor Hutchins received her undergraduate education at the Rochester Mechanics Institute (now Rochester Institute of Technology). Before going to Columbia University to study for a Master's degree, she ran a dressmaking business where she could indulge her love of beautiful fabrics and her skill in clothing design. This gift never left her and to the end of her life she enjoyed beautiful colors and designs.

Professor Hutchins started her academic career as a faculty member in the Department of Home Economics at Russell Sage College in Troy, New York. Subsequently, she supervised the Home Economics program in the secondary schools of Syracuse, New York. Later she joined the New York State Department of Education as a supervisor in the statewide program of Home Economics in elementary and secondary schools.

She came to Cornell in 1935 as an Instructor of Home Economics Education in the Rural Education Department of the College of Agriculture; she also assumed responsibility for supervising the Home Economics program in the Ithaca city school system. In 1943 she was granted a Cornell Ph.D. in the field of Education with minors in Psychology and Economics of the Household. She was a member of the honorary societies of Pi Lambda Theta and Phi Kappa Phi.

In 1946 a Department of Home Economics Education was established in the College of Home Economics (now the College of Human Ecology) and Dr. Hutchins was appointed Professor and Chairman. She held this position until her retirement in 1957.

The years between 1946-57 were a time of rapid development. In addition to the programs for undergraduate preparation of teachers and extension agents, the graduate program increased considerably. Women were returning from service in World War II ready to study for an advanced degree. Foreign students were once more able to travel freely from their own countries and U.S. nationals came from many states including Hawaii.

Professor Hutchins was well inbred in the Cornell tradition and worked hard to insure that students should understand the freedom and responsibility provided at graduate level for individual program and thesis development. She was patient with those students who either were at a loss for a thesis topic or who underestimated

the magnitude of what they hoped to develop. Rarely imposing her own preference she was able to guide them to a suitable choice through friendly discussion and a realistic approach to the problem.

Students remember Margaret's interest and concern for their welfare. One student remembers her entrance interview and feeling apprehensive about her financial status. She was not only assured of an assistantship but arrangements were made for her to interview for a dormitory counsellor's job. Others remember the enjoyable gathering in Miss Hutchins' apartment where tea, sherry and cheese straws were invariably the refreshments offered! For many years she maintained contact with past students and was able to visit several in the U.S.A. and Europe during her frequent travels after her retirement.

Professor Hutchins was appreciated by faculty in her department and elsewhere on campus for her skills as a mediator and in achieving consensus in group discussions. She rarely took an adversarial position supporting others when she could, yet knowing when to accept a situation which appeared inevitable. One of her most endearing gifts was her zest for life and her active sense of humor. She could be relied upon to lighten an occasion even when circumstances were difficult. Her jokes were always to the point particularly when told against herself.

During her working years she maintained a close relationship with the Bureau of Home Economics of the New York State Education Department. She was a valued adviser and consultant on program development particularly in the area of in-service education. Many group conferences and short courses throughout the state were developed at her instigation. She was also a leader in the North East Interstate Conferences organized by the U.S. Office of Education. In addition, besides a substantial summer session program, she would frequently organize short courses for supervisors and administrators throughout the country.

After her retirement in 1957, Margaret remained in Ithaca accompanied first by her cousin Margaret Stevens and then by her sister, Ruth. During this period she had time to devote to her love for travel and for reading, an important part of her life. She was also an active participant in the programs of her church.

In 1975, Margaret moved to Rochester to be nearer to her brother, Irving, and his family. She kept close contact with her friends in Ithaca as well as becoming involved in many activities in Rochester. In 1985, she received the Distinguished Alumni Award from the College of Applied Science and Technology,

Margaret Hutchins will be remembered as a loving and compassionate human being with a warm sense of humor; she was a true professional in her work and a wise administrator.

Irene Patterson, Kathryn Walker, Kathleen Rhodes

John Irwin Hutchinson

Professor of Mathematics

— *December 1, 1935*

Cornell University and the City of Ithaca were shocked by the sudden death, on December 1, 1935, of John Irwin Hutchinson.

He had given more than forty-one years of service to Cornell, as instructor (1894), assistant professor (1903), and professor (1910) of mathematics. He came to Cornell University as Instructor in Mathematics in 1894, at the time when it had been decided to choose as instructors mature men who should participate both in giving advanced instruction and in directing the investigations of mature students. He had recently received his doctorate at the new University of Chicago, and was indeed its first recipient of that degree in mathematics. He began actively to discharge the duties and responsibilities of his position here. He was one of the founders and most active members of the Oliver Mathematical Club, organized for the purpose of hearing and subjecting to searching criticism addresses on the reading and research of its members. He took part in all grades of instruction. Several elementary textbooks, written in conjunction with colleagues, had long popularity, not only in the University, but throughout the United States. His advanced courses and his research were chiefly in analysis, but usually in fields closely allied to topics in geometry, the theory of groups, and the theory of numbers. Among his original productions, two achievements deserve particular mention for their permanent value and the attention they attracted here and abroad: the introduction of the isometric circle in connection with automorphic functions, and the discovery of the infinite group of birational transformations of the general Kummer surface.

Hutchinson played an active role almost from the start in the new American Mathematical Society. He was a frequent contributor to its Bulletin and was one of the first assistant editors of its Transactions, launched in 1900,—an office which he held until failing health led him to relinquish it fifteen years later. In 1904 he was one of the major speakers at the international meeting of mathematicians held in connection with the World's Fair at St. Louis.

A nervous breakdown in 1911 interrupted his work for some time. On his recovery he devoted his energies, with his former skill and penetration, to the generalized zeta-function in the analytic theory of numbers. These contributions also received recognition and praise from other specialists.

In addition to the logical intellect of the mathematician, Hutchinson had a great love of all beauty whether in nature or in art. His knowledge of astronomy gave him keen interest in the starry heavens, and his love of nature was evinced in his appreciation of, and delight in the cultivation of flowers; in the songs of birds, and in the play of light and shade on the distant hillside. Early training as a pianist and lifelong cultivation of a discriminating taste for fine music, were sources of deep satisfaction to him. In literature his mind was stored with a knowledge of both ancient and modern classics from which he derived much of his intellectual recreation. To those few of his colleagues and friends who knew him intimately, was revealed something of the rare strength and beauty of his gifted personality.

His life was gentle; and the elements
So mixed in him that Nature might stand up
And say to all the world, *This was a man!*

To Mrs. Hutchinson we extend our heartfelt condolences; we rejoice that we could share with her in the beneficent influence of a sincere, rich, and useful life.

Frederick Bruce Hutt

August 20, 1897 — September 6, 1991

Because of his outstanding background, training, and experience, Frederick Bruce Hutt was invited to Cornell in 1934 to become the second Chairman of the Department of Poultry Husbandry, replacing the popular “Jimmy” Rice who had retired after serving approximately 35 years as the Chairman of the Department which he originated at the turn of the century.

Hutt’s academic career began with a B.S.A. degree in Poultry Husbandry in 1923 from the Ontario Agricultural College in Guelph, Ontario, Canada. This was a follow-up of his interest and experience with chickens that began in 1909 and included raising chickens as a source of income to pay his way through college. He earned the M.S. degree in Genetics in 1925 from the University of Wisconsin. A position as Lecturer in Poultry Husbandry at the University of Manitoba, that permitted time for continued graduate work, led to a M.A. degree in Zoology in 1927. To advance his knowledge of animal genetics, he took a leave and went to the University of Edinburgh in Scotland for a Ph.D. in 1929. Based on the extent and quality of his research over the next 10 years, he earned a D.Sc. degree in Genetics from the University of Edinburgh in 1939.

In 1931, Dr. Hutt went to the University of Minnesota as Professor of Poultry Husbandry and Animal Genetics. Members of the Poultry Science Association, which included many that had been or were at Cornell, recognized his many abilities and elected him President of the Association in 1932. He was the youngest person ever to hold that position.

At Cornell, President Edmund Day soon recognized Hutt’s capabilities and moved him from the College of Agriculture to the College of Arts and Sciences as Chairman of the Department of Zoology, a position he held from 1939-1944. During this period, he continued his research at the Poultry Department and taught a course in Human Genetics.

Professor Hutt’s teaching at Cornell began with a course in Poultry Genetics that continued for about 30 years. In 1949, after gathering research information over the years for his lectures from his own research and that from all over the world, he wrote the classic work, *Genetics of the Fowl*, which soon became the “bible” for all those interested in poultry genetics and poultry breeding. Its importance and need all over the world led to its translation into Spanish and Polish.

Soon after his return to full time at the Poultry Department, without any administrative responsibilities, his long-term interests in genetics of domestic animals and resistance to disease led, with the approval of Dean Hagan of the College of Veterinary Medicine, to a course in genetics designed especially for veterinary students. The purpose was to teach them the role of heredity as it applied to their profession. He taught this basic course for 20 years and used only material dealing with animal traits of interest to the veterinary student rather than those involving the fruit fly or plants when such was needed to explain the basic principles of Mendelian genetics. This was the first time such a course was taught at any veterinary college. This activity led in 1964 to another excellent text book, *Animal Genetics*. A little earlier (1958), he had written another book – *Genetic Resistance to Disease in Domestic Animals*. After retiring in 1965, as then required, a continuing request from many people for information on genetic traits of importance to dogs led to his *Genetics for Dog Breeders* in 1979. Then, in 1982 with the help of a former graduate student as junior author, he prepared the 2nd edition of *Animal Genetics*. All of his books, like his scientific publications, were extremely well written in a form easily understood by laymen and scientists alike. He would cite the facts from the literature, rather than opinions or beliefs, and then state his interpretations of the information provided.

His extensive research in genetics, especially of the fowl, involved many traits and thus added much to the existing knowledge of heredity in poultry. He constructed the first chromosome map for the chicken. Among the 250± scientific publications was one concerning his discovery of the sex-linked gene that causes dwarfism. This gene is now used around the world to produce economically efficient mothers of broiler chicks.

Throughout his long professional career, Dr. Hutt emphasized the role of heredity in resistance to disease of all types. He demonstrated how to use proper procedures for the selection of breeders that could lead to better viability, in spite of the presence of disease producing agents or conditions such as poor nutrition. He set an excellent example of neatness and orderliness in all his research records and other material, including that used in classes, and encouraged his graduate students to do likewise. His critiques of seminars and of papers being written by students bore forewarnings that these be not only factual but also correct in diction, spelling, and grammar.

At seminars and scientific presentations by others, he would often ask very specific and incisive questions. They would often force the speaker to come to some conclusion or to recognize that other information had not been considered. A common question involved the extent to which heredity might have played a part in the findings when the subject being discussed was not one of genetics.

Professor Hutt enjoyed using examples to illustrate the strong influence of genetics on resistance to diseases. On one occasion, he lectured to animal scientists on the potential value of selecting for resistance to mastitis in cattle. He suggested that if oysters could develop resistance to a specific disease, as they had done at Malpeque Bay in Canada, so might cows. He was also very responsive in a similar manner to some questions. At an evening banquet in England, Dr. Hutt was introduced to a famous Englishman, Dr. J.B.S. Haldane, who responded – “you must be the chicken geneticist.” The answer was –“no, I am the fowl geneticist – but please make sure you spell that word correctly.”

His office door was always open to anyone who wanted help, advice, or information. Many times it did not involve genetics, but, if in the field of biology, he often could provide an answer. His memory of what had been done and by whom many years ago provided answers to many questions.

Fred Hutt had many interests in the early years following his birth in Guelph that continued throughout life. At the early age of 8, he sent a letter to the local newspaper in Guelph pointing out that their report of the date of return of a specific butterfly was incorrect. He had seen that butterfly at two different locations which he then specified. As a teenager, his collection of insects became a source of specimens needed by some of the college students to meet their quotas for Entomology courses. Other interests involved wild birds, upon which he published several articles, and stamp collection where he concentrated on those of Britain and the Commonwealth.

Dr. Hutt served on the Editorial Board of the *Journal of Heredity* for 25 years. He was a visiting lecturer at many universities in the United States and elsewhere. He also served as a consultant to commercial poultry breeders in England and the United States. He was a member of 10 or more scientific societies or associations.

He received many awards for his outstanding accomplishments that started with the Poultry Science Association Research Award in 1929 and later their Borden Award for Research in 1946. He received the Tom Newman International Award for Poultry Husbandry Research in 1960 for his discovery and detailed study of the sex-linked gene for dwarfism in chickens. The ones he appreciated most were being made an Honorary Fellow in the Royal Society of Edinburgh in 1975 and elections to the American Poultry Hall of Fame in 1980 and to the International Poultry Hall of Fame in 1988. He also received an Honorary Doctor of Science degree from the University of Brno, Czechoslovakia in 1965. This was especially significant since it was at this institution, then listed as in Brüun, Austria, that the science of genetics had its origin under Mendel. His alma mater, the University of Guelph, bestowed the Honorary Doctor of Science degree on Dr. Hutt in 1974.

Professor Hutt is survived by two sons, Bruce and Robert; a daughter, Margaret; thirteen grandchildren; and twelve great grandchildren. There are many others, not genetically related to him, who will continue to remember Professor Hutt for his wit and for his contributions to their erudition, education, training, knowledge, and careers related to poultry science and the poultry industry.

Stephen E. Bloom, Milton L. Scott, Randall K. Cole

James Hutton

November 30, 1902 — October 29, 1980

Born in Airth, Stirlingshire, Scotland, son of a sea captain, James Hutton came to the United States as a young boy. He graduated from the Walton, New York, High School in 1920 and received his Bachelor of Arts degree at Cornell in 1924, having been elected to Phi Beta Kappa in his junior year. His Master of Arts, in 1925, and his Doctor of Philosophy, in 1927, were also Cornell degrees. Except for a year as instructor in Greek and Latin at Columbia University (1926-27), he was a member of the Cornell faculty for the rest of his life: instructor 1927-29, assistant professor 1929-38, professor from 1938 on. In 1961 he was appointed Kappa Alpha Professor of Classics, and on his retirement in 1973 was named Kappa Alpha Professor emeritus. He served as chairman of the Department of Classics from 1946 to 1952. From 1927 to 1943 he was also a member of the Department for the Comparative Study of Literature, in association with Professor Lane Cooper.

As a student and in the early years of his teaching career, Hutton was much influenced by Lane Cooper, who was at the time a dominant Cornell figure in the study of literature. Cooper was the director of his doctoral dissertation, "The Influence of the Greek Anthology," and to Cooper he no doubt owed in some measure the great breadth of his scholarly training and his concern for both classical and post-classical literature, with an emphasis on the links between them. But his style as a teacher stood in marked contrast to the authoritarianism of Lane Cooper. Hutton's way of teaching was to encourage students to produce their own views and then to help them on their way by means of deft criticism and correction, offered gently but firmly, and by suggesting further territory for exploration.

James Hutton combined extraordinary erudition with discriminating literary judgment. The erudition was never on conspicuous display, but no one could know him or his work for long without coming to realize the astonishing range and precision of his knowledge. At the center of his scholarly interests was the influence of the classics on later European literature, and this interest is reflected in much of his published work as well as in the distinguished course, Humanism in the Renaissance, that he gave for many years. Many of his students would give foremost place to his skill as a critic and interpreter of such ancient authors as Homer, Pindar, Aeschylus, Virgil, and, very conspicuously, the poets of the Greek Anthology. Still other students have particularly vivid memories of his course entitled Modern Writers on Art, and others again would give first mention to the course that he gave—an

inheritance from Lane Cooper on Cooper's retirement—on Greek and Latin literature in translation, a seminar-style course for undergraduates that for many years attracted some of the most gifted Cornell students.

In the scholarly world he is known first and foremost for his two great studies of the influence of the Greek Anthology: *The Greek Anthology in Italy* (Cornell University Press, 1935) and *The Greek Anthology in France and in the Latin Writers of the Netherlands to the Year 1800* (Cornell University Press, 1946). These two volumes alone are sufficient to ensure James Hutton lasting renown as an authority on the European tradition of classical literature, but they give no adequate impression of the diversity and comprehensiveness of his literary studies. His numerous articles and reviews deal with literary subjects ranging from classical antiquity to the twentieth century. Some of these articles are minor classics, such as the essay entitled "Spenser's 'Adamantine Chains': A Cosmological Metaphor," which was his contribution to *The Classical Tradition* (1967), a festschrift for his friend and colleague of many years, Harry Caplan. Another conspicuous example is "Some English Poems in Praise of Music," in *English Miscellany 2* (1951), a 63-page study of sixteenth and seventeenth-century English poems on music, tracing the history of the tradition of the harmony of the spheres that lies behind this poetry. Even some of Hutton's reviews deserve notice as significant essays on their topics, such as his searching review of Gilbert Highet's *The Classical Tradition* (*American Journal of Philology*, 1952). It should be added, moreover, that in everything that he wrote Hutton was a stylist of elegance and lucidity.

A selection of his essays, including three previously unpublished, appeared shortly after his death, in a volume entitled *Essays on Renaissance Poetry*, edited by Rita Guerlac (Cornell University Press, 1980). Left finished except for minor revisions, and to be published in 1981 by W. W. Norton & Co., is a translation, with extensive introduction and notes, of Aristotle's *Poetics*. He left also a large and very valuable unpublished study of peace poetry in the Renaissance.

A scholar and critic of international reputation, Hutton was in steady demand as a reader and adviser to literary projects of university presses. He served as an editor of *Cornell Studies in Classical Philology*; contributed to the *Catalogus Translationum et Commentariorum*, edited by P. O. Kristeller; was involved in numerous other scholarly enterprises; and served many times as a critic and reviser of the work of his friends and colleagues at Cornell and elsewhere, a service performed as an act of friendship and concern for the advancement of scholarship. This service was really an extension of his role as teacher, and the same careful and erudite criticism was enjoyed by a large number of graduate students in the preparation of their essays and dissertations in many fields besides Classics—Comparative Literature, Medieval Studies, English, and Romance.

Apart from a sabbatic year spent in Europe in the thirties and one or two trips to Scotland, Hutton seldom departed far or for long from Ithaca, and then usually to attend a meeting of a learned society. He was a member of the American Philological Association, serving on its board of directors from 1959 to 1963, of the Modern Language Association, and of the Renaissance Society of America. From 1944 to 1950 he was a member of the Committee on Renaissance Studies of the American Council of Learned Societies.

His other chief destination on leaving Ithaca was his beloved farm in North Lansing, with its spacious and handsome early-nineteenth-century house, where for many years he spent summer vacations, adding a measure of leisurely gardening to his customary literary pursuits.

Though quiet and unassuming in his way of life as in his personal manner, he was accorded many honors, including a Guggenheim Fellowship in 1958-59. On his retirement he was presented, by a group of old friends and colleagues, with a volume of studies entitled *Poetry and Poetics from Ancient Greece to the Renaissance* (Cornell University Press, 1975). He kept up an active correspondence with scholars in various fields, in this country and abroad, and retained a strong interest in Scotland, the country of his birth.

A life-long bachelor, he lived with his mother, Mrs. Elizabeth Hutton, and they shared a house for many years with Lane Cooper. After the death of his mother and of Lane Cooper, he continued to live at 123 Roberts Place, with his cousin, Mrs. Margaret Green. Frail health as well as his natural inclination for a quiet life led him to stay mostly at home during the last years of his life, but to his visitors as to his correspondents he continued to be a lively and companionable friend, with the same enthusiasm for literature and scholarship, and the same delightful combination of grace, wit, and learning that commanded the admiration and the affection of his colleagues and his students over the years.

Robert E. Kaske, Edward P. Morris, Gordon M. Kirkwood

Elias Huzar

February 14, 1915 — December 28, 1950

Elias Huzar, Associate Professor of Government, died unexpectedly in Washington, D. C, December 28, 1950. A young man of great promise, he had just been recommended at the age of 35 for a Professorship in the Department of Government.

Born February 14, 1915, in New York City, Mr. Huzar received the degrees of Bachelor of Arts at William Jewell College in 1935, of Master of Arts at Princeton University in 1937 and of Doctor of Philosophy at Princeton in 1938. At Princeton Mr. Huzar received the outstanding award of the Graduate School—the Procter Fellowship.

Coming to Cornell in 1938 as Instructor in Government, Mr. Huzar was advanced to Assistant Professor in 1943 and to Associate Professor in 1946.

During the Second World War, Mr. Huzar made determined efforts to enter the Army or the Navy but was rejected by both services because of defective eyesight. In May 1943 he embraced the opportunity to serve in Washington as Administrative Analyst, Bureau of the Budget, Executive Office of the President, in which position he was able to contribute his specialized skills to the furtherance of the war effort until October 1945. It is indicative of the quality of his services that he was given temporary appointments with the Bureau of the Budget again in 1946, 1948 and 1950, and was urged to accept full time appointment with that agency. From June to September, 1948, Mr. Huzar served as consultant to the Hoover Commission on Organization of the Executive Branch of the Government, making an administrative survey in Alaska and in Washington of the Alaska Indian Service.

Despite his teaching duties and his professional administrative activities, Mr. Huzar found time to publish a dozen articles and an outstanding volume entitled *The Purse and the Sword: Control of the Army by Congress through Military Appropriations, 1933-1950*—a work which has won the commendation of military, political and academic authorities.

In June 1950, Elias Huzar married Eleanor Goltz, who survives him.

Elias Huzar was a retiring person; yet a deep-seated kindness and thoughtfulness about others illumined his personal relations. With the tragic loss of so promising a teacher and scholar has come to those who knew him a realization of the value of his life and a deep feeling of personal sorrow.

Clyde Edwin Ingalls

October 11, 1904 — December 6, 1992

Clyde Edwin Ingalls was born in Canisteo, New York on October 11, 1904. As boys, Clyde and his brother, Arthur, worked in their father's hardware store in Canisteo and became known locally as a pair of inventive youngsters. His interest in engineering and technology followed naturally from these activities and led him to enter Rensselaer Polytechnic Institute (RPI) in Rochester, New York. He received the degree of electrical engineer in June 1927 and remained at RPI until 1929 as a graduate student, instructor in electrical engineering and communications, and as assistant operator of broadcast, experimental, and amateur radio stations. During this period Clyde developed his deep interest in radio engineering, the field that was to become a major component of his life's work.

Clyde had a distinguished career in non-academic circles before coming to Cornell. From 1929 to 1941 he was with the Stromberg-Carlson Telephone Manufacturing Company in Rochester, New York as radio engineer, head of the Research Laboratory, and head of the Instrument Development Laboratory. In those capacities Clyde made many innovative contributions to high-frequency electronic engineering, particularly in radio broadcasting and reception and in early television. During the war years, from 1941 to 1945, Clyde was with the eminent Massachusetts Institute of Technology Radiation Laboratory where he was in charge of all work on fire-control radar receivers. One of his most significant developments in that period was a fast automatic-gain-control technique that reduced feedback instabilities and minimized most forms of radar jamming. He was also the author of several articles in the Radiation Laboratory Series of books on radar. In 1946 he formed a private consulting firm, Canisteo Electronic Instrument Laboratories, with which he was affiliated for many years afterward.

In 1947, Clyde was recruited by Charles R. Burrows, director of the School of Electrical Engineering. He joined the EE Faculty as an associate professor in September of that year, and was associated with the School for 24 years until his retirement in 1971. Throughout his career as a member of the EE Faculty, Professor Ingalls taught both elementary and advanced courses, but principally theory and laboratory courses to upper-class and graduate students. He taught the first course in television at Cornell, which developed into two courses, one in transient operation of networks, and the other in network analysis and synthesis based on the use of the Laplace transform and convolution methods. He taught the first course in transistors in the School and developed several courses in acoustics. He built the first computer at Cornell and was chairman of a committee that established computing facilities on campus that eventually developed into the Cornell Computing Center.

Clyde was active on many committees in the School and in the College, with particular emphasis on those involved with graduate study. For three years he was chairman of the Graduate Committee of the Engineering Division of the Graduate School, and in that period served as the first adviser in the School to all graduate students in the M. Eng. (Electrical) Program. He also served as special committee chairman and minor committee member for many doctoral and masters graduate students. He was a member of a committee in the School that revised the entire laboratory program beyond the second year to conform with a new Engineering College program that placed all engineering students in a common curriculum in their first two years.

The EE School building, Phillips Hall, has a tower without windows that was originally designed to house an acoustics laboratory. It is likely that Director Burrows had that project in mind when he convinced Clyde to come to Cornell. Since the funding for an elaborate anechoic chamber for the tower never materialized, Clyde had to conduct his acoustic research with electric organs and various loudspeaker configurations in an inexpensive chamber that he designed, built, and installed in the tower.

In 1961, Clyde and a colleague from the General Electric Laboratory conducted some acoustic research of an unusual nature. He presented the results of that study at a meeting of the Acoustical Society of America at the University of Texas in Austin in October 1964. The newspaper, *The Austin Statesman*, reported (erroneously) that Clyde had said humans could hear electromagnetic waves, specifically radar waves. The resulting flurry of reports by other newspapers created a minor sensation that did not subside until Walter Sullivan reported the correct version of the phenomenon in the *New York Times* of December 6, 1964. It seems Clyde and his colleague had found that certain individuals with good hearing at high frequencies could indeed detect pulsed radar waves that impinged directly on the cranium, and that the pulse-repetition rate of the radar signal could be “heard” without benefit of the ear. Clyde reported he had experienced the phenomenon himself, although he advised others not to try the experiment. He also said that a somewhat parallel phenomenon had been reported on several occasions by people who had heard a hissing sound when they observed a falling meteorite, even though the object was travelling at a speed far exceeding that of sound. Clyde received many letters and inquiries as a result of all this publicity and was particularly amused by a book about UFOs that justified their existence on the basis of his work. His paper, “The Sensation of Hearing in Electromagnetic Fields,” was published in the *New York State Journal of Medicine*, Vol. 67, No. 22, November 15, 1967.

Clyde was a senior member of the Institute of Electrical and Electronic Engineers (IEEE) and of the Institute of Radio Engineers (IRE), and a member of the Acoustical Society of America. He held all of the offices in the Ithaca

Section of IRE and served as program chairman of the Cornell Chapter of the Society of Sigma Xi. He was a licensed Professional Engineer in New York State.

Although Clyde maintained he was not a musician, he enjoyed playing the piano as a hobby and always tuned the instrument himself. In the latter stages of his illness, when he could no longer speak coherently, he still retained his ability to sing and harmonize. Some members of St. Paul's United Methodist Church in Ithaca may recall that Clyde used his acoustical expertise to design and install the church sound system.

When Clyde retired from Cornell he moved to Potsdam, New York and taught in the Electrical Engineering Department at Clarkson University for one semester until an accident and subsequent ill health caused him to end his academic activities. He was able to continue as an amateur radio operator and to enjoy music for some time until increasing medical difficulties necessitated admission to a nursing home.

Well before his retirement Professor Ingalls had the satisfaction of knowing that many of the innovative ideas and techniques he introduced into the EE curriculum and in the laboratories of the School for the first time had become standard material in many courses. He came to the School at a time when electrical engineering education was undergoing major changes. In his quiet and modest way he preferred to work behind the scenes, but his extensive theoretical background, clear understanding of engineering principles, and broad industrial experience allowed him to make key contributions to the evolving new standards in the EE School.

On June 29, 1929, Clyde married Mary Ann Ross in Canisteo, New York. He is survived by his wife who lives in Potsdam, New York; a daughter, Barbara Trerise of Potsdam, New York; a son, Norman R. of Parish, New York; a daughter, Janet Cameron of Washington, Pennsylvania; a brother, Arthur of Huntington, West Virginia; twin sisters, Rachel Titus of Bloomfield, Connecticut and Ruth Morrison of Lakeland, Florida; and nine grandchildren.

Professor Ingalls will be long remembered as a dedicated teacher and adviser, and a respected colleague and friend.

Nelson H. Bryant, William H. Erickson, Simpson Linke

Francis Marion R. Isenberg

May 13, 1910 — March 18, 1997

Francis Marion R. Isenberg, better known as “Ike”, died at age 86 after several years of poor health in Pennsylvania at the Masonic Home in Elizabethtown, where he and his family had moved seven years before. He was born in Pennsylvania when Halley’s Comet was observed in 1910, and always felt that he came in with the comet and might go out with it like Mark Twain, and was therefore very worried about its reappearance during May 1986.

Dr. Isenberg was Professor of Vegetable Crops at Cornell for 23 years specializing in postharvest physiology, and was involved in extension, research, and teaching in the area of handling and storage of vegetables. He will always be remembered for his innovative part, in cooperation with other Cornell workers, in extending the process of Controlled Atmosphere Storage (CA), which had already been successful in prolonging the storage period with apples, to the cabbage industry in New York State. The nation’s first cabbage CA storage was built on a commercial farm in New York State and has been very successful. He was also instrumental in developing the commercial use of maleic hydrazide (MH), a chemical sprout inhibitor, to extend the storage life of onions. When applied in the field just before maturity, MH prevents sprouting and increases the storage longevity of onions placed in storage. He introduced the paper carton packing box for lettuce and the method of vacuum cooling harvested lettuce. As well as such practical research, he was well known for his basic research particularly in early plant hormone research, and was one of the first to try an early version of the now sophisticated high performance liquid chromatography (HPLC). As an active member of the international postharvest community of the International Society for Horticultural Science, he organized the Third International Symposium on Vegetable Storage that was held at Cornell, and was well known and respected by the International Postharvest Working Group.

Ike had a very active and fertile mind, and after retirement in 1975 he continued to work with growers as a consultant on problems of cabbage storage. The New York State Vegetable Growers Association honored him in recognition of his outstanding service to the vegetable industry, and the Oswego Vegetable Association also cited him for his many contributions. He later carved out a special niche for himself as a special consultant in legal disputes, planning experiments to solve problems between growers and shippers when produce arrived in an unacceptable condition.

Ike grew up in Altoona, Pennsylvania, and was full of stories of that town when he was a boy. He attended Penn State Nautical School and served as the Junior Captain for one year, graduating in the class of 1932. He was in the

Merchant Marine from 1932-34. During the Depression, only three of thirty ships “fitted out,” so he therefore went into business selling office equipment. Because of his nautical training and experience, in World War II, he served the United States as a Navy Reserve Officer, volunteering for active duty in 1941. He served four and a half years in the navy, mainly as captain of a minesweeper in the Pacific, around Australia, and in the Indian Ocean, and as commanding officer of a small fleet of mine sweepers in the South West Pacific and Indian Oceans. He served the United States Navy, the British Navy, and the Australian Navy. At the end of the war he returned to school on the GI Bill, going back to Penn State University for Graduate School. Originally intending to become a diesel engineer, he was sidetracked by a charming Professor of Horticulture (his words), and obtained a Master’s degree in Soil Chemistry followed by a Ph.D. degree in Horticulture with Biochemistry and Physiology as minors in 1953. He was an active member of the Ithaca Rotary Club and also served terms as president and treasurer, and he attended Rotary meetings in Stratford, England, when he was on sabbatical at the Vegetable Research Station at Wellesbourne. He was also a Mason, and a long time member and officer of the First Presbyterian Church of Ithaca.

He is survived by his wife of nearly 58 years, Arlee; and by his daughter, Nancy.

James R. Hicks, William C. Kelly, Henry M. Munger, Pamela M. Ludford

Stephen W. Jacobs

May 12, 1919 — August 8, 1978

Stephen W. Jacobs came to Cornell in 1960 from previous teaching positions as an architectural historian at the University of California at Berkeley, Middlebury College, and Miami University of Ohio. Holding degrees from Harvard College, the Harvard Graduate School of Design, and Princeton University, he taught his subject with the authority and confidence of one trained both as a professional architect and as an art historian. Further mastery of his field came through first-hand study of buildings and spaces in America and abroad that were the goals of his extensive travels from his youth until his death.

Early in his career Jacobs developed a passionate concern for historic area preservation. He regarded this as a vital application of his academic studies that complemented and broadened the underlying scholarly discipline of architectural history. Recognizing the potential danger to the architectural heritage of the country posed by federal renewal programs, he used his influence to have preservation included as an important objective of national urban policy.

While at Berkeley he helped to develop a system of surveying and recording historic sites and structures that is still regarded as a model in the field. Later, at Cornell, he devised a method of surveying rural areas that was even more innovative and reflects better than any other work his whole approach to physical artifacts. If he did not create the ideal of professional training for historic preservation, he arrived on the scene very early on the morning of the eighth day and soon became a nationally recognized leader in the preservation movement.

At Cornell he reorganized and expanded the undergraduate curriculum in architectural history and instituted three graduate degree programs that are respected throughout the country. For citizen leaders and professionals in allied fields seeking additional training, he established the Cornell Summer Institute in Preservation Planning as an intensive short course in the subject. In a different version he also presented this material as one of the popular Alumni University courses.

He helped to found many organizations important to the preservation effort, including the California Heritage Society, Historic Ithaca, and the Preservation League of New York State. Elected the first president of Historic Ithaca, he shaped the organization into an effective protector of the local urban environment. A former president of the central New York chapter of the Society of Architectural Historians, he also served on the board of directors of the national body and as chairman of its committee on architectural preservation. Many other organizations

profited from his participation. Among them were the American Institute of Architects, the Association for Preservation Technology, and the National Trust for Historic Preservation.

For seventeen years Jacobs was deeply involved in the archaeological exploration of Sardis, capital of the ancient kingdom of Lydia in Western Turkey, first as senior architect and then as associate director of this joint Harvard-Cornell venture. It was under his supervision that the Roman Gymnasium and the Imperial Hall of Honor were excavated and restored, the latter being the most important single achievement of the project. Many students from the college and other institutions received their initial training in field archaeology under his direction and continued to work in Ithaca or elsewhere on drawings and interpretative studies when the summer excavations were finished.

He invested enormous amounts of time in his teaching, research, and administrative responsibilities. He never expected less than excellence from his students and was disappointed, though understanding, if one fell short of his expectations. Often students found him too demanding of time and thought, but few graduates early in their careers did not look back with new appreciation on the manner in which they had been trained and to the man who had been responsible.

Steve Jacobs possessed a remarkable mind. A question concerning some obscure or elusive fact or calling for an opinion, critical judgment, or analysis always produced a reply that was informed, relevant, and cogent. He seemed to have forgotten nothing, and he shared his knowledge and perceptions gladly and generously.

Asking him for something seen on his desk a week earlier was quite a different matter. His office was the despair of a succession of able secretaries—a great haystack of paper occupied all available surfaces. Everyone sent him everything on the myriad subjects that interested him, and he found it difficult to part with the letters, pamphlets, guides, leaflets, maps, and other printed material that threatened at times to make his office uninhabitable.

While the history of architecture and preservation planning were his fields of scholarship, he refused to allow his mind to be contained by even the spacious boundaries of those disciplines. He knew more than most practicing landscape architects about the history and applications of their profession. Although he never served as a city planner, his knowledge of that field was extensive as well.

He was a true connoisseur: learned, respectful of the artifact with which he was concerned, and amazingly well informed on subjects as diverse as maps and prints, tools and implements, furniture, folk art, painting, and

sculpture. He cherished them all, the eccentric and bizarre as well as the noblest of human creations, and he could explain with persuasive words why each was important as a symbol of some element of taste, period, or area.

He was a man of intellectual courage and steadfast moral convictions. During that stormy period of the University a decade ago, he provided an anchor for many of us. Pointing out that both academic and personal standards of conduct must be maintained in the face of mindless attacks and irresponsible demands, he helped restore our sense of confidence that solutions could be found and order restored.

The public Jacobs was always dignified, often serious, and occasionally reserved. This masked an impish sense of humor that bubbled out at unexpected and welcome times to delight and entertain. To be a friend of Steve Jacobs was a rare privilege, and those of us who were so honored will not let his memory fade.

Barclay G. Jones, Christian F. Otto, John W. Reps

Henry Sylvester Jacoby

April 8, 1857 — August 1, 1955

As an immigrant from the Palatinate, Germany, in September 1741, Peter Jacoby, the Pioneer, landed in Philadelphia and settled in nearby Bucks Co., Pa. Between the landing of the pioneer and the birth of his great, great, great grandson Henry Sylvester Jacoby four generations of farmers intervened, two skilled as blacksmiths, one as a mason, and all of them residing in Bucks Co., Pa. or nearby. This background of farming and trades in the lives of his paternal ancestors led Professor Jacoby, in the preface of the Jacoby Family Genealogy published in 1930, to say, “The author will never cease to be grateful to God that he was born in the open country and spent his childhood and early youth on a farm with all its opportunities for unhurried observation of plants (including weeds), flowers, and fruit; of insects and birds; of domestic animals as well as a few wild ones; and which instilled a love of nature which has been a constant joy in life.” “If the advantages of present day Agricultural education” (1930), “had then been available the author’s life work might have been quite different.”

The life activities of Henry Sylvester Jacoby centered around his family, his chosen vocation of technical education, and his avocations of genealogy, and church service.

His formal education began in 1861 when he entered public school, and he continued in the public school until 1870. During the summers of 1864-1868 he attended a private summer school under David W. Hess. From 1870-1872 he attended the Excelsior Normal Institute (an Academy) ; for the school year 1872-73 he was enrolled in the preparatory department of Lehigh University; and from 1873-77 he attended Lehigh University. He pursued a course in civil engineering and upon graduation received the degree of civil engineer, C. E. Throughout his life, while health permitted, he was an enthusiastic supporter of the educational work carried on at Lake Chautauqua, N. Y. Beginning in 1878 he completed the four-year course of study of the pioneer class of the Chautauqua Literary and Scientific Circle. During the next four years he completed a number of supplementary reading courses, and the Chautauqua Normal Course as an aid in conducting Teacher Training Classes.

His technical engagements, beginning at the age of 16, included a summer in an architect’s office in Allentown, Pa.; another summer on surveys for the location of the Allentown and Coopersburg turnpike; research in the Recorder’s office of Bucks Co. and the necessary drawing to trace the history of certain lands in Durham and Springfield Townships. He worked seven months as a stadia rodman on the Lehigh Topographical Corps, Second Geological Survey of Pa.; a year as transitman on gauging the Red River in Louisiana; six years as chief draughtsman

in the U. S. Engineer office in Memphis, Tenn.; and four years as an Instructor in Civil Engineering at Lehigh University. From 1890 to 1922 he served successively as Assistant Professor, Associate Professor, and Professor of Bridge Engineering and Graphics in the College (later School) of Civil Engineering at Cornell University. He was Professor in charge of the Department from 1890 until his retirement in 1922.

While teaching he was also busily engaged in writing textbooks to be used in the courses he was teaching. He was the joint author with Mansfield Merriman of "Roofs and Bridges, Parts I, II, III, and IV," a college text widely used and frequently revised; and a joint author with Roland P. Davis of "Foundations of Bridges and Buildings". He also was the author of "Plain Lettering", and of "Structural Details", as well as smaller texts in pamphlet form, and articles on technical subjects which from time to time appeared in engineering periodicals.

Professor Jacoby was a member of many professional and educational societies, and served actively in the work of some of those organizations. As a long-time member of the American Society of Civil Engineers, he was elected in 1939 to Honorary membership in that Society. He entered into the activities of the Society for the Promotion of Engineering Education (now known as the American Society for Engineering Education), serving as Secretary from 1900-1902, and as President for the year 1915-1916. From 1906 to 1911 he served as Chairman of the Committee on Wooden Bridges and Trestles of the American Railway Engineering Association. For a year, 1894-1895, he served as Secretary, and during the year 1900-1901, as Chairman of the Section on Mechanical Science and Engineering of the American Association for the Advancement of Science. Other Society affiliations included the American Society of Testing Materials, Washington Academy of Sciences, American Association of University Professors, Pennsylvania-German Society, Historical Society of Pennsylvania, Lehigh Co. (Pa.) Historical Society, National Genealogical Society, Genealogical Society of Pennsylvania, Cosmos Club of Washington, D. C, the Cornell Society of Engineers, and the Cornell University Club. In recognition of his technical and research abilities he was elected to the honorary societies of Sigma Xi, and Tau Beta Pi. In 1931 he was elected to Honorary membership in the Washington Society of Engineers. During the celebration of the seventy-fifth anniversary of the founding of Lehigh University, he was awarded the Honorary degree of Doctor of Engineering by that University.

Most of his paternal ancestors were members of the Reformed Church or of the Mennonite Church, and a family background of church loyalty and support characterized Professor Jacoby throughout life. From early years he was active in the work of the local Methodist Church to which he belonged. He gave much time and energy to the field of religious education in the leadership of Bible classes, both in his church and at Cornell University. He also

served as a Director on the Board of Directors of the Cornell University Christian Association, and of the Ithaca Young Men's Christian Association.

His efforts in the interest of interdenominational Sunday School work included service as Secretary of the Northampton County (Pa.) Sunday School Association for the year 1899-1900; President of the Tompkins County (N.Y.) Sunday School Association from 1899 to 1915; and as a member of the Executive Committee of the New York State Sunday School Association from 1900 to 1921, the last four years of which he was chairman of this committee. He was a member of the Executive Committee of the International Sunday School Association from 1914 to 1925, and Chairman of its Committee on Field Work for four years. Other service included the position of Director of the Community Training School of Religious Education, Ithaca, 1915-1917.

As an avocation, Professor Jacoby began the collection of genealogical data concerning his near relatives during the summers of 1875 and 1876. The death of his father in July of the latter year increased his desire to collect more data of this nature. From 1875 to 1914 his work in the field of genealogy was more or less regular but in the latter year he began to devote much more time to correspondence with members of the family. In a few years he came to the conviction that it might be possible to trace practically every descendant of the pioneer, Peter Jacoby. After his retirement from active service at Cornell University, Professor Jacoby devoted most of his time to continuing the correspondence, visiting members of the family, especially the older members. He carried on research in the Library of Congress; in the records of the Geographic Division of the U. S. Census Bureau; and in the U. S. Pension Bureau. To enable him to devote more time to the work, he took up residence in Washington, D. C. In 1930, at the age of 73, he submitted for publication the wealth of information contained in the "Jacoby Family Genealogy, Henry S. Jacoby", a volume of nearly 700 pages. Eleven years later he published the "Supplement to the Jacoby Family Genealogy". This latter volume contained additional family history that he had accumulated. The Council of the Institute of American Genealogy, in recognition of his work in this field, awarded him a "Certificate of Merit in Genealogy".

On May 18, 1880, he married Laura Louise Saylor of Bethlehem, Pa. Their three sons were graduated from Cornell University; John Vincent in 1908 with the degree of B.S. in Agriculture; Hurlbut Smith in 1908 with the degree of A.B., and C. E. in 1910; and Freeman Steel in 1910 with the degree of B.S. in Agriculture.

Professor Jacoby was a student and a scholar throughout life. As a teacher he had a keen and analytical mind, high educational standards, and a vast accumulated storehouse of pertinent matter as an aid in his teaching. His was a master-mind in collecting, codifying and correlating information in various fields. He was an outstanding

example of patience and perseverance; a man of deep religious convictions and loyalty to his church affiliations; and an educator who became nationally and professionally known and respected in his fields of endeavor. Professor Jacoby was a man who brought fame and recognition to Cornell University as well as to himself.

Carl Crandall, John E. Perry, Charles L. Walker

Howard S. Jeck

December 24, 1883 — December 29, 1949

Howard S. Jeck died at the New York Hospital on December 29, 1949, following a cerebral hemorrhage.

Dr. Jeck was sixty-six years old at his death. He was born in Nashville, Tennessee, on December 24, 1883, the youngest of eight children of Peter and Anna Barth Jeck. He attended public school and the Bowen Academy in Nashville, and later graduated from the Sheffield Scientific School of Yale University in 1904 with the degree of Bachelor of Philosophy.

He returned to Nashville and attended the Vanderbilt University Medical School and received his M. D. from that University in 1909. Following this, he studied in Vienna and then returned to Nashville to practice medicine for a short time. Feeling that his training was incomplete, he came to New York and interned at Bellevue Hospital in the Department of Surgery from 1913 to 1915.

On completing his service at Bellevue Hospital in 1915, he became associated in the practice of urology with Dr. Edward L. Keyes, Jr., and this association continued until 1933, when he established an independent office at 745 Fifth Avenue, New York City, and continued the practice of urology until the time of his death.

He was actively associated with Bellevue Hospital for thirty-three years and was Director of the Department of Urology there from 1938 to 1946, when he retired with the honorary rank of Consultant in Urology. He served as President of the Bellevue Alumni Association for the year 1946. He was Associate Professor of Clinical Surgery (Urology) Cornell University Medical College, Associate Attending Surgeon, The New York Hospital, and Professor of Urology at the New York Polyclinic Medical School.

Dr. Jeck was a member of the American Medical Association, the New York Society of the American Urological Association, and of the American Association of Genito-Urinary Surgeons. He was Consulting Urologist at the Nyack, White Plains, Good Samaritan, Rockland State Hospitals in New York State, and the St. John's Hospital in Brooklyn and the Norwalk Hospital in Connecticut.

Dr. Jeck wrote numerous articles of interest to the urological fraternity and throughout his distinguished career did much to further the science of medicine. To those of us who knew him as a teacher and associate and friend, he was more than a doctor—he was a gentleman of the old school and, we who were fortunate enough to have the opportunity of knowing him, loved him and are sad at his passing.

Dr. Jeck is survived by his beloved wife, Norine Lever Jeck and two sons, Henry Keyes Jeck and Dr. Howard S. Jeck, Jr., as well as a sister, Mrs. James B. McKee.

J. W. Draper

Joseph Olmstead Jeffrey

November 6, 1902 — February 12, 1982

After forty-four years of devoted service to Cornell engineering students, Professor Jeffrey retired in 1969 to the status of professor of materials science and engineering emeritus. This is one of the longest periods of teaching in the college. Upon retiring from Cornell he began a second career as an active and dynamic consultant at Morse Chain. He was fortunate to remain healthy and vigorous during this period except for a few illnesses in the past two years. His many friends and former students mourn his passing.

He was born in Auburn, New York, and studied at the Trinity Boys School in New York City. Subsequently he attended Cornell University and received the Bachelor of Science degree in mechanical engineering in 1925. In the same year, he was appointed instructor in experimental engineering, where he specialized in the mechanical testing of materials. He received his Master of Mechanical Engineering degree in 1935, and in 1937 was made an assistant professor and then in 1941 associate professor of experimental engineering. Because of a reorganization in the College of Engineering, in 1942 he became an associate professor in the Department of Engineering Materials and in 1944 professor of engineering materials. Following World War II, another reorganization in the College of Engineering led to the formation of a new Department of Engineering Mechanics and Materials, located in Thurston Hall, and Joe became a professor in this department. In 1963 yet another reorganization created the Engineering Physics and Materials Science Department, in which he was also a professor. This was a period of dynamic growth in the materials area that led in 1965 to the formation of the present Department of Materials Science and Engineering, where he continued his service to the University.

For many years Joe was the leading teacher of the properties of materials and of the testing of materials at Cornell and influenced the careers of thousands of engineering students. He was an active practicing engineer as well and held industrial positions at International Motors, Curtis Airplane Corporation, General Electric Research Laboratories, and the Morse Chain Company. His activities as consultant for several companies resulted in a constant flow of interesting materials problems into the classroom.

Joe had many outside interests. He was an active bowler and member of the Ithaca Yacht Club. He was a member of the Ithaca Garden Club and its civic development committee, the City Club of Ithaca, and the hospital landscape project. Joe and his wife, Dottie, were childless, which made them all the more devoted to the well-being of the Cornell student body. Dorothy died only a few days after Joe.

Professor Jeffrey was a meticulous and dedicated teacher. In the lengthy laboratory classes that were common in his day, he knew the details and idiosyncrasies of every machine. He was kind to students and genuinely interested in their welfare. However, he had high standards. In his dealing with other faculty members he was always diplomatic and calm. He was a member of the American Association of University Professors, the American Society of Engineering Education, the American Society for Metals, Sigma Xi, Tau Beta Pi, Phi Kappa Phi, Pi Tau Sigma, and Atmos.

Following his successful career at Cornell, Professor Jeffrey served with the International Executive Service Corps at Arya Mehr University in Teheran, Iran, where he helped develop a materials curriculum and laboratory and helped devise ways in which the university could carry out applied research programs with Iranian industries. He also became the first executive secretary of the Cornell Society of Engineers and served in this position from 1969 until his death.

John Kern, of Morse Chain, says that Joe's fearlessness during tension tests on chains was greatly admired. When the other people involved were hiding behind screens or elsewhere, in readiness for the break, Joe was right up there with pieces of chain flying all around him.

Joe Jeffrey was an effective teacher, an excellent practicing engineer, a good neighbor, and a loving husband. He will be remembered with deep affection.

Harry D. Conway, Richard M. Phelan, Arthur L. Ruoff

Burton Aaron Jennings

March 12, 1895 — March 18, 1964

Burton Aaron Jennings, Professor Emeritus of Agricultural Engineering, died suddenly of a heart attack on March 18, 1964, at his home near Ithaca. He was sixty-nine years old.

Professor Jennings, a native of New York State, was born in Killawog on March 12, 1895. His early years were spent on Long Island and in near-by Cortland County. After graduating from Cincinnatus High School and before enrolling in the New York State College of Agriculture, he came to Cornell as an employee of the Department of Farm Practice. During World War I, while still an undergraduate at Cornell, he was an instructor for the New York State Food Commission. In that capacity he conducted special tractor repair schools and operated a power-ditching machine for tile drainage systems on many New York farms. He served also as an assistant instructor in the Department of Agricultural Engineering before receiving his Bachelor of Science degree in February, 1921.

Immediately following graduation from Cornell, Professor Jennings was employed as farm manager at the George Junior Republic, Freeville. He returned to Cornell, April 1, 1922, as an instructor in Agricultural Engineering Courses 2, 3, and 10. On July 1, 1924, he became an extension specialist with primary interests in drainage and farm machinery. He was made an Assistant Professor July 1, 1926. He continued work in the field of extension until July 1, 1939. Professor Jennings became well known and highly respected by New York State farmers for his thorough understanding of the operation and adjustment of a multitude of farm machines. He pioneered in teaching farmers how to properly adjust, repair, and operate farm machines and also conducted many tractor repair schools throughout the state. He has surveyed and planned hundreds of drainage systems, both tile and open ditch, for farms throughout the state.

On July 1, 1939, Burton A. Jennings was made a full Professor and in the fall of that year started his career on the teaching staff. From 1939 to 1951 he was responsible for the courses in farm power, Agricultural Engineering 102, and farm machinery, Agricultural Engineering 103, and from 1946 to 1958 the farm mechanics course, Agricultural Engineering 1. In the many years of teaching, Professor Jennings continued to seek better ways to illustrate the many new concepts that he introduced to his students. He wrote and made available to his students at cost an offset printed textbook for his farm mechanics course. He is remembered by his colleagues and students as an outstanding teacher.

His publications include numerous extension bulletins, departmental mimeographed bulletins, and *Farm Research* and *Agricultural Engineering Journal* articles. In 1945 he received an award from the American Society of Agricultural Engineers, of which he was a member, for a paper, "Mow Curing of Hay."

His research activities were in milk house design and construction, air blast sprayer development, both field and mow curing of hay, and corrosion tests of farm fencing and metal roofing materials. The work with fencing and roofing materials was conducted under the auspices of the American Society for Testing Materials. Professor Jennings was an energetic and stimulating cooperater in interdepartmental research. His approach to problems was basic and original. In addition to contributing a practical viewpoint, he always asked himself and his co-workers: "Why?" During hay-curing studies he invented an ingenious method of labeling plants in the swath so that it was possible to learn just what the side-delivery rake did in windrow "positioning" of hay. Those of us who shared research projects with him could not avoid some feeling of professional improvement.

One of his rare gifts was the ability to explain even the most complicated subject in crisp, concise English, which made it both attractive and simple to every listener. This helped to establish Professor Jennings as one of Cornell's outstanding teachers, both among farmers and resident students.

When the United States entered World War II, Professor Jennings trained the fifteen agricultural engineers who were sent throughout the state on the War Emergency Farm Machinery Repair Program to keep farm tractors and machinery going. This special training in the fundamentals of tractor and machinery operation proved to be a most important factor in the success of this program.

Professor Jennings saw the Department of Agricultural Engineering grow from cramped quarters in the basement of Stone Hall to the modern, well-equipped Riley-Robb Hall it now occupies. He took the lead in the planning of this building, working persistently for many years preparing plans and incorporating many of the best features of other buildings until the existing building evolved.

His activities were never limited to those in connection with Cornell University. He was an outdoorsman, and his hunting and fishing expeditions took him into the hinterlands of the United States and Canada. Other sports and hobbies included photography, fly tying, bowling, golfing, and the building of bamboo fly-rods. In these, as in all others of his activities, Professor Jennings persistently aimed for perfection.

Professor Jennings retired from the faculty of Cornell University on June 30, 1958. He had served Cornell for thirty-six years. After retirement he added to his many hobbies the task of remodeling and modernizing an old farmhouse on Applegate Corners Road. This, as was true with all his endeavors, was done with perfection.

His many friends, colleagues, and former students have recognized his contribution to agriculture by establishing a scholarship fund called the Burton A. Jennings Scholarship for Agricultural Engineering students.

Professor Jennings is survived by his wife, Clara Jennings; a son; two daughters; nine grandchildren; and two brothers.

H. B. Hartwig, E. D. Markwardt, W. F. Millier

Neal Frederick Jensen

October 4, 1915 — November 24, 2003

Neal Frederick Jensen, Professor of Plant Breeding, Emeritus, died on November 24, 2003 in Albuquerque, New Mexico. Neal obtained his Ph.D. degree at Cornell in Plant Breeding in 1943. He returned to the department as a faculty member in 1946 and until his retirement in 1978, he was responsible for the breeding of small grain varieties, primarily wheat and oats. The products of his research were significant to northeast farmers and his ideas and skills in breeding small grains were recognized by his peers nationally and internationally and were evident in the graduate students who obtained their degrees under his guidance.

Neal was born in Hazen, North Dakota on October 4, 1915, one of eight children. His family lived on a ranch in the Red Butte area where he attended grade school. He went to high school in Hazen. Following his graduation from North Dakota Agricultural College in 1939 with a B.S. degree in Agronomy, he came to Cornell for his graduate studies with Dr. H.H. Love. He was awarded his Ph.D. degree in 1943, after he had entered the U.S. Navy as an Ensign in October 1942. After serving three and one half years on active duty, mostly in the Pacific, he continued in the Reserves and retired in 1963 with the rank of Lieutenant Commander. Neal rejoined the Department of Plant Breeding in 1946 as an Assistant Professor. He was promoted to Associate Professor in 1948 and to Professor in 1951. He retired and was granted Emeritus status in 1978.

In his 33 years of tenure on the faculty, Neal distinguished himself by the 22 varieties of wheat, oats, and barley he developed, the 20 graduate students who obtained their degrees with him, and the extensive writing he did on specifics of cereal breeding and the broad areas of plant breeding methodology. For his contributions, in 1978 he was selected for one of the first Liberty Hyde Bailey professorships in the college. In addition, he was the first recipient of the DeKalb Crop Science Distinguished Career Awards awarded by the Crop Science Society of America.

Neal Jensen was an original thinker who was widely known among scientists for his innovative breeding methods. Probably his best-known contribution was the concept of intravarietal diversification, which led to multiline varieties. Multiline varieties were found to be effective in reducing losses due to foliar pathogens, buffering against environmental extremes and increasing grain yield. Other significant contributions include various breeding methods and techniques, extension education, and graduate teaching.

New York farmers and consumers also benefited from Neal's research. His breeding programs produced a steady flow of superior cereal grain varieties for farmers in New York and surrounding regions. New York farmers liked Neal's varieties. For nearly two decades, they planted them on over 95% of their wheat and barley acreage and 70% of their oat acreage. Such wide acceptance of a breeders' developments is rare. His wheat variety, Yorkstar, was the leading variety in New York, Michigan and Eastern Canada for nearly a decade. Neal's varieties were noted for high yields and strong disease resistance. They returned millions of dollars to New York farmers and to the state's agricultural economy.

In addition to his dedication to small grains breeding, Neal had a lifelong interest in baseball, which was common with several other members of the department at that time. He also applied his plant breeding skills to the creation of new peony varieties. He developed a strong interest in Civil War history, spending much time searching for artifacts in farm fields adjacent to important Civil War battlefields. After his retirement, Neal and his wife, Mary, moved to Arizona where he took on many new interests including painting and searching for gold. His penchant for writing led him to write a textbook of plant breeding methods and a memoir of his experiences during World War II. In 1984, the Jensens moved to Albuquerque, New Mexico.

At the close of the war in 1946, Neal married Mary Willard Webb of Nashville, Tennessee. They had four children: Barbara, Lawrence, Margaret, and Thomas. Mary taught fourth grade at Belle Sherman School for many years. She died just five months before Neal.

Ronnie Coffman, Mark Sorrells, Robert Plaisted

Vernon Jensen

July 10, 1907 — September 27, 1998

His students knew Vernon (“Pete”) Jensen as a teacher-writer, but there was much more. He was also a staunch family man, father of four (Vernon Jr., Karen, Linda and Margo), active in his church, a dedicated floriculturalist and an active athlete well into his sixties. The Fall Creek Drive residence which he and his wife, Esther, called “home” was a welcoming location for many students, especially when Linda and Margo, the Jensen’s ice-skating twins, were at Ithaca High School and, later, at Cornell. Whether it was black-eyed susans, fritillarium imperialis, meadow rue or wood hyacinth, floriculture was a consuming hobby. The child of Danish immigrants who came to the Great Salt Lake Basin as Mormon converts, Pete was active in the Ithaca Church of Jesus Christ of Latter Day Saints and a long-time teacher in its Adult Gospel Doctrine class. A varsity baseball player as an undergraduate at Brigham Young University, he starred in faculty-student softball games.

Pete received his Bachelor’s degree in American History in 1932. He learned through personal experience about unemployment during the Great Depression when the only paid work available was as a substitute teacher in his hometown Salt Lake City public schools. Pete and Esther, who had married when he was still in college, decided that he would enter the Master’s degree program at the University of California at Berkeley; that seemed to be all they could manage. Pete excelled there with the assistance of Professor Charles Gulick whom Pete fondly remembered as a “wonderful mentor.” When Pete told Gulick he could not continue his studies because he had a wife and child to support, Gulick arranged to have the university provide the financial support Pete needed. Pete often recalled: “that’s when I was launched in pursuit of a Ph.D.” Pete also remembered his fellow graduate students as an exceptionally “illustrious crowd” that included Clark Kerr, John Dunlop, Lloyd Fisher, Sam Kagel, George Hildebrand, and Arthur Ross.

While working on his dissertation, Pete accepted a one-year appointment to teach economic history and labor problems at the University of Colorado. The one-year assignment lasted nine years from 1937-46. During these years, Pete received his Ph.D. degree in 1939, and became a consultant to the National Defense Mediation Board in 1941. During the war, he served as a public panel member, mediator and arbitrator for the National War Labor Board (NWLB) and Wage Stabilization Director of the NWLB’s Ninth Region.

While working for the NWLB, Pete learned about a newly established School of Industrial and Labor Relations from Phillips Bradley, a touring member of New York State’s Joint Legislative Committee on Industrial and Labor

Conditions (the “Ives Committee”). This committee, chaired by the Leader of the New York State Assembly, Irving M. Ives— who became the School’s first Dean in 1945—played a key role in the creation of a state-supported School of Industrial and Labor Relations at Cornell University. At Bradley’s urging, Pete applied for a professorship and joined the School’s faculty in 1946. As Pete was fond of saying, “The future of the School was subjected to five days of discussion.”

Pete’s first book, *Lumber and Labor*, was published in 1945 and was reprinted in 1971 by Arno Press and the *New York Times* in their series “Classics in American Labor.” In 1950, Cornell University Press published *Heritage of Conflict-Labor Relations in the Nonferrous Metals Industry Up to 1930*. Greenwood Press reissued *Heritage of Conflict* in 1968 in its important series “The Making of Industrial America.” In 1954, the ILR Press published the second volume, *Nonferrous Metals Unionism, 1932-1952*—a masterful description and analysis of Communist infiltration and capture of the International Union of Mine, Mill and Smelter Workers (formerly the Western Federation of Miners) and the subsequent expulsion of the union from the CIO. Other important books include, *Hiring of Dock Workers and Employment Practices in the Ports of New York, Liverpool, London, Rotterdam, and Marseilles*, published by Harvard University Press in 1964, and *Decasualization and Modernization of Dock Work* in London, published by the ILR Press in 1971.

In 1973, the same year that the Cornell University Trustees elected Pete, Professor Emeritus, Cornell University Press published his *Strife on the Waterfront: The Port of New York Since 1945*. One reviewer’s comments provide insight into not only the importance of that book but also into Pete’s approach to scholarship:

“Strife on the Waterfront is a first-rate account of labor-management-government relations; it is not a narrow study in labor economics...The author is concerned with humanistic and institutional as well as economic and political facets of the industry.”

Pete became Associate Dean in July 1965 at a time when the faculty again was seriously disputing the ILR School’s future direction. He maintained steadfastly that neither unionism nor collective bargaining should be written off because collective bargaining is a basic democratic institution based on the rights of individual workers in a democratic society. He wrote:

“It was my belief from the beginning that it was intended by the framers of the School, and as it was embodied in the legislation creating the School, that collective bargaining was to be the heart and soul of the School.”

We who were colleagues are honored to prepare these all too brief comments about one of the ILR School’s most distinguished professors. We remember him as a towering volleyball player who loved to needle the graduate

students on the other side of the net when he would spike the ball. We also remember him as the Dean who told one of us that the faculty had recommended tenure (and with that wry grin on his face, added that the faculty was not infallible) and another of us when newly arrived and frustrated and disillusioned about the inability to find suitable housing, “to keep in mind that sooner or later everyone who moved to Ithaca finds a place to live. We haven’t lost a faculty member yet because he couldn’t find a place to live.” He was the Dean who raised hell with a colleague who had the audacity to paint his own office something other than institutional green (one of the very best confrontations in ILR School history) followed, wonderfully, some months later by a wastepaper basket fire in that same office (replete with trucks and sirens) caused by cigar ashes flicked by that same colleague who had to suffer the wrath of Pete once again.

In an era of too many entrepreneur-academics, Pete’s selfless dedication to the School, his love of teaching and scholarship, and his genuine concern for his colleagues’ welfare stand out as the standard of what a distinguished professor and administrator should be.

David B. Lipsky, Duncan MacIntyre, James A. Gross

Oskar Augustus Johannsen

May 14, 1870 — November 7, 1961

The passing of Professor Oskar A. Johannsen causes us to pause and to reflect on the contributions of this lovable pioneer to the field of entomology and to mankind. During his academic career he served Cornell as a teacher for nearly forty years and continued to inspire young people in the Department of Entomology for another twenty years. His service actually extended beyond Cornell, as with his command of several languages he added greatly to the prestige of American scientists in foreign countries.

Born in Davenport, Iowa, of parents who had emigrated to the United States from Denmark, Professor Johannsen attended high school in State Center, Iowa. After graduation in 1890, he entered the Agricultural Engineering Department of the University of Illinois. There he was a member of the Adelphi Society and the editor of *Technograph*. After receiving an engineering degree in 1894, he was a draftsman and designer of structural steel (1894-1899). He next joined the Department of Civil Engineering at Cornell University, where he served as instructor, 1899-1904.

Professor Johannsen developed such an interest in biological subjects that while an instructor in engineering he completed the requirement and was awarded two Cornell degrees in entomology, A.M. in 1902, and Ph.D. in 1904. He then continued his teaching in civil engineering as an Assistant Professor, 1904-1909.

The field of biology, in which he was to spend the rest of his life, beckoned. He went to the University of Maine, where he filled the position of Professor of Entomology from 1909 to 1912. Then he returned to Cornell, where he served as an Assistant Professor of Entomology, 1912-1914, and as Professor of General Biology, 1914-1920. During the fruitful years 1920-1938, he was Professor of Entomology at Cornell where he taught courses in insect morphology, anatomy, and embryology. After guiding entomologists during the years 1936-1938 as department head, he retired on June 30, 1938. Retirement to him meant freedom from administrative obligation to continue his excellent works on aquatic Diptera.

Professor Johannsen was not only active in teaching, but his contributions in the research field were numerous. Beginning in 1903 and extending to 1950 he published over one hundred articles in scientific journals and several monographic works in which he described many insects new to science. He was a co-author of three books: *Medical Entomology*, *Histological Technique*, and *Embryology of Insects and Myriapods*. He gave his extensive scientific library and his large insect collection, which contained several hundred type specimens, to the Cornell

Department of Entomology and Limnology. Membership in the honorary societies of Sigma Xi, Phi Kappa Phi, and Tau Beta Pi documented his research ability and scholarship.

In 1896 Professor Johannsen married Harriette Alice Fuller. He is survived by his wife and their children, Dorothea Elizabeth (Dr. Dorothea J. Crook), Laurence, and Albert.

Professor Johannsen helped develop entomology, an infant field when he started his life's work. Throughout his career he was sympathetic towards the broader aspects of natural history. He was always kindly and helpful; the twinkle in his eye and the contagious smile won him many friends. His very gracious manner endeared him to both his students and his colleagues. We will always remember him as a friend and as a scientist. It is also a pleasure to acknowledge his excellent scientific contributions that have added so greatly to the stature of the Cornell Entomology Department.

C. O. Berg, Henry Dietrich, B. V. Travis

Orvis F. Johndrew, Jr.

December 11, 1909 — September 19, 1981

Orvis F. “Scotty” Johndrew was a caring, sharing, gentle man, devoted to his family, to Cornell University, and to student athletes.

Scotty was born in Rochester, New York, on December 11, 1909, and received his primary and secondary education there. He received his Bachelor of Science degree from Cornell in 1935 and a Master of Science degree in 1950. Shortly after graduation in 1935 he married his college sweetheart, Janice Berryman. They have two daughters: Mrs. Jack (Pat) Gaskin, of Gainesville, Florida, and Mrs. Gary (Judy) Fenstermacher, of Blacksburg, Virginia, and five grandchildren.

Scotty’s interest in sports permeated all his academic and professional career. Following graduation from Cornell he taught vocational agriculture and coached track and basketball at high schools in Breesport and Hammondsport, New York. Later he became head of the Poultry Department and director of athletics at the New York State Institute of Agriculture and Home Economics at Cobleskill. As director of athletics he was also coach of the basketball team. Some of his fondest memories were of the six years at Cobleskill, during which time his teams defeated Niagara University and Long Island University, teams that were the powerhouses of the East.

Scotty next was called to the Marketing Practices Section of the Poultry Branch, United States Department of Agriculture. While in Washington and later at Cornell, he was responsible for initiating and developing productive studies of poultry and egg marketing methods and facilities. As a leading contributor to the Northeast Regional Extension Egg Marketing Research Group, he was author and coauthor of a variety of publications. These interpreted market research and were very valuable as extension publications relating to egg and poultry marketing.

While in Washington, Scotty’s interest in things athletic continued. As an outlet for his energy, he became a tennis enthusiast. With his long arms and legs, his competitive spirit, and his athletic ability, he soon excelled in this sport. His interest in tennis continued into his Cornell years, and numerous Cornell Poultry Science Department round robin matches were the result of his efforts.

Scotty was knowledgeable, innovative, and enthusiastic regarding the poultry industry and sports. His coming to Cornell was “hand in glove” in many ways. Professionally his poultry experience and his tact kept him in constant

demand by producers and commercial marketing firms. It was at his instigation that the New York State poultry industry trade organization.

SPICE, was formed. SPICE is visible and viable evidence of Scotty's unique ability to bring people together to do things.

In sports Scotty soon became a confidant of Ned Harkness and a parent to Cornell hockey players. It is not by accident that some of Cornell's best hockey teams were developed when Scotty was working with Ned. Later, when Ned left Cornell, Scotty focused on lacrosse, assisting Richie Moran in his efforts, and proudly wore the watch presented to him by the Cornell national championship team of 1971.

Scotty was a competitor. And, even though occasionally incapacitated to the point where he needed a cane in order to get around, he still attended the practice sessions, thereby setting an example of fortitude for the national championship teams of 1976 and 1977.

Scotty enjoyed being with people and was sincerely interested in their welfare. Consequently he was very much involved in community affairs. He was an especially dedicated Rotarian, faithful in attendance and in his hearty support and enthusiastic involvement in Rotary activities.

Scotty was a charter member of the Sunday Morning Coffee Club. For eighteen years he and Joe Zeilic, Pete Maxson, and Art Muka would meet to review the week in sports. The group originally met at Bill Krantz's Community Corners restaurant. When Bill closed his Corners restaurant, the group moved its summer sessions to the Moakley House and winter meetings to the Sheraton. The group has grown and now includes longtime friend and colleague Line Fields, large-animal veterinarian at Cobleskill and at Cornell during Scotty's sojourn there; George Pfann, football all-American; Hollis Davis, agricultural engineer; Charlie Foote; Howard Sinsabaugh; Ben Mintz; Guy Torbert; and Marty Stiles—all well-known Cornell sports enthusiasts.

Scotty was a modest and unassuming man who had great love for Cornell. This love and respect, and his genuine humility, made his appointment as professor of poultry science emeritus in his words, "one of the proudest moments of my life, and I will cherish this appointment as long as I live."

Now it is we, Scotty's family, his colleagues, his student athletes, his friends, who will cherish his gentle manner, his heartfelt concern, and his kindly counsel as long as we live.

Charles E. Ostrander, Milton L. Scott, Edward A. Schano

Herbert H. Johnson

July 16, 1931 — October 1, 1989

Herbert H. Johnson came to Cornell in 1960 after earning B.S., M.S., and Ph.D. degrees from Case Institute of Technology, and teaching for three years at Lehigh University. He joined the then Department of Mechanics and Materials as an assistant professor of materials. The “Materials” portion of this department was combined with the Department of Engineering Physics in 1962, and finally the Department of Materials Science and Engineering was formed in 1965. He was a member of this department until his death. Materials science was born and flourished during the Herb Johnson period, and he played a major part in its development.

During his career at Cornell, he served as department head from 1970 to 1974, and then as director of the Materials Science Center until 1984. His honors included membership in the National Academy of Engineering. He was also a fellow of the American Society for Metals (ASM), a Case Scholar, a Campbell Lecturer for the ASM, and a councillor of the Materials Research Society.

Johnson maintained an active research program in the mechanical behavior of solids; in recent years he was concerned mainly with hydrogen embrittlement of steel and the influence of hydrogen on metal fatigue. The symposium volume, “Fourth International Conference on the Effects of Hydrogen on Material Behavior,” held in Jackson Lake Lodge, Moran, Wyoming, September 12-16, 1989, has been dedicated to him. He was a consultant to a number of industrial, government and academic organizations.

He was active on national committees related to materials science. He served on the Council of Materials Science of the Department of Energy. As chairman of the Solid State Sciences Committee of the National Research Council he guided the recently completed study “Mankind’s Science and Engineering for the 1990s”.

Herb enjoyed teaching and working with young people. His carefully prepared lectures contained many anecdotes of applications of materials in industry. He cared deeply for the students. When one of his students suffered a broken leg in athletics and was on crutches, Herb drove to his house every morning and brought him to school. Again, when one of his students had to take Herb’s class and another class was scheduled at the same time, and passing both classes was required for graduation, he arranged two special tutorial sessions for her weekly so she could make it through on schedule. Even when his illness was severe, he still met regularly with his students until hospitalization made that impossible.

William B. Streett, Dean of the College of Engineering, had remarked that “Herb was one of those special people who excelled in everything he did. He was often called upon to conduct special studies, to serve on committees, and to apply his talents to the solution of problems in the college and the university, and he always said yes. His death is a severe loss for Cornell.”

As faculty members we found Herb always ready for scientific discussion and always helpful with any kind of problem we had.

Herb had an enjoyable family life with his wife, Marguerite, and his five children (two sons and three daughters). He is survived by them, his mother and brother, and a granddaughter.

After his family and materials science, Herb loved football. He was a dedicated fan of the Cleveland Browns.

Herbert Johnson made profound contributions to the study of hydrogen embrittlement of steel, to the field of materials science in general, and to the people around him. He was a true friend and colleague, and is greatly missed.

Harry D. Conway, Che-Yu Li, Arthur L. Ruoff

John Raven Johnson

August 9, 1900 — May 25, 1983

John Raven Johnson came to Cornell's chemistry department as an assistant professor in 1927. Although only twenty-seven years old, he had already developed a deserved reputation as one of the nation's brilliant young chemists. He had taken his Ph.D. degree at the University of Illinois in 1922, spent two years abroad doing research at the Collège de France under a prestigious American Field Service fellowship, and spent three further years at Illinois as an instructor, where, among other things, he coauthored with his teacher and friend, Roger Adams, a widely used laboratory textbook on organic chemistry.

Jack Johnson (as he was known to all his friends) brought to Cornell the new organic chemistry that Illinois had become famous for. He quickly put into place a lively program of research and attracted large numbers of graduate students. He also restructured Cornell's courses in organic chemistry and taught them superbly. Since, in addition, Johnson was a lively-minded and personable man with many friends, it is not surprising that in 1930, when he was barely thirty years old, he became a full professor at Cornell.

During the decade of the 1930s Cornell brought from the outside another half-dozen young chemists, most of whom, like Johnson, stayed at Cornell. In combination, and with the addition in 1940 of the great Peter Debye, they helped change the face of Cornell's chemistry department. Johnson was a central figure in this new generation of Cornell chemists. He became the implicit leader of the organic chemistry group and greatly influenced subsequent hirings in the field. He quickly received outside recognition, becoming a member of the National Academy of Sciences in 1948. In 1952 he became the Todd Professor of Chemistry at Cornell, thus occupying the only chair available to chemistry at the time.

Johnson's research bridged the old and the new in organic chemistry. He and his students gave much effort to devising syntheses and determining structures of important molecules in the best tradition of organic chemistry. His work on the synthesis of gliotoxin is especially well known. However, Johnson was also interested in new and unusual types of organic molecules and did pioneering work on organo-boron compounds and on the chemistry of furan derivatives. Finally, he was an early student of the mechanisms by which complex organic molecules undergo change from one form to others.

Jack Johnson was an early and valued senior consultant to the research groups of the Du Pont de Nemours Company, which was the major chemical concern of the United States. This close association continued even after his retirement from Cornell.

In the period 1941-45 Johnson became deeply involved with the scientific aspects of the United States wartime development efforts. He was an early participant in studies on the synthesis of new chemical explosives and also contributed to the vigorous United States search for new antimalarial agents. From 1942 to 1945 he served in London, England, as the scientific liaison officer for chemistry of the U.S. Office of Scientific Research and Development. For his wartime services he received the U.S. Medal of Merit.

Jack Johnson returned to Cornell when the war ended and resumed his career of supervising the research of graduate students, teaching large classes of students of organic chemistry, and consulting with the Du Pont company. In 1951 he served for a year in West Germany as special consultant on scientific matters for the U.S. Department of State. In 1965 Johnson retired from Cornell and he and Hope, his wife of thirty-six years, moved to their beloved home in Vermont. His life became increasingly restricted, but he remained engaging and intellectually lively up to his death in May 1983. He is survived by his wife and two sons, Keith and Leonard.

Jack Johnson's Cornell colleagues and his many students and other friends will remember him with admiration and affection as one of the important figures in the development of Cornell into the great research university that it now is.

Albert W. Laubengayer, William T. Miller, Richard F. Porter, Frank A. Long

Philip Gustaf Johnson

September 21, 1900 — October 3, 1994

Philip Gustaf Johnson, Professor Emeritus of Science Education, died in Chapel Hill, North Carolina, on October 3, 1994. Born September 21, 1900, on a farm in Loomis, Nebraska, the fifth of six children of Swedish immigrants, he began his education in a one-room school, speaking only Swedish. From the village public school he entered the county high school from which he graduated. He entered the University of Nebraska engineering program and dropped out after one year, but he returned to the Teachers College and, with careful planning, graduated in 1923 with his entering class and with a Certificate to teach Science and Mathematics. For two years he was a high school teacher of science, mathematics, and Spanish in Havelock, Nebraska.

From 1925-26, he was a graduate student at the University of Minnesota, but the following year was invited to the University of Nebraska as a graduate student and staff member. He earned his M.S. degree from the University of Nebraska in 1931, with a major in chemistry and minors in biological science and chemistry. From Nebraska, he came to Cornell on a scholarship in pursuit of a more advanced degree, initially as a Fellow in Nature Study and Forestry. He completed his Ph.D. degree in 1933, with a major in science education and minors in biological science and chemistry.

After a brief sojourn in Nebraska, and armed with his degree, he returned to Cornell in 1935 as an Assistant Professor of Science Education. In this position, he assumed the dual responsibility of preparing certified teachers for secondary school science and teaching classes at Ithaca High School. He rose quickly to the rank of Professor of Science Education, and in his early professorship saw the need for a formal, national organization of science teachers. Encouraged by his work with the NEA's Department of Science Instruction, and supported by affiliation with the AAAS, he was largely responsible for the founding, in 1944, of the National Science Teachers Association, which today boasts 50,000 members. He was the first president of NSTA. An energetic visionary, he was called to Washington in 1946, where for seven years he was Specialist in Science Education in the U.S. Office of Education.

In 1953, Dr. Johnson returned to Cornell as Professor and Head of Science Education, which included what was then called "Nature Study," but today is more widely accepted as environmental education. It was after his return that he, together with Professor Paul deH. Hurd of Stanford University, entered an agreement with the Shell Oil Company to support the influential Shell Merit Fellowship Program, a program of graduate study whereby highly selected high school science and math teachers were brought together for special training to become

leaders in their fields. Many of today's outstanding program leaders, department chairs, authors, and educational administrators are products of that far-sighted program that spanned the years 1953-68 and was one of the first industry-supported university programs in science education.

During his tenure at Cornell, Professor Johnson was exceedingly active as lecturer, consultant, and author. He was Director of the NSF Program for Science Teachers at Cornell from 1959-63; Fulbright Lecturer at the University of Chile in Valparaiso; and Lecturer in Residence or Visiting Professor at the University of Costa Rica, Emory University, the University of California at Berkeley, the University of South Dakota, and Oregon State University. There was almost no science education program of size or substance in which Professor Johnson did not have a role or considerable influence.

A serious heart attack in the late 1950s slowed him only momentarily, and he returned to full-time duties at a self-regulated pace that would have worn out most people. He was instrumental in basing at Cornell the AAAS Feasibility Study that led to NSF's development of the largest and one of the most innovative elementary school science programs to that time—*Science, A Process Approach*. Few people are aware that it was Professor Philip Johnson's foresight that gave birth to that program.

When he retired from his Cornell professorship in 1967, Professor Johnson did not retire from professional education. He continued to serve as a Visiting Professor and Science Education Consultant to Puerto Rico and Canada and his active involvement in NSTA. Numerous recognitions and awards from that body attest to his creative and devoted support to science education. He received the Recognition Award of the Science Teachers Association of New York State (1947 and 1987); the Canadian Science Teachers awarded him their Centennial Award in Science Education (1967); and the National Science Teachers Association awarded him their Distinguished Service Citation (1970).

Professor Johnson authored many journal articles and was a co-author of the widely-used, pre-War science textbook series, *Modern Science*, by Dull, Mann, and Johnson. He was the senior author of NSTA's *School Facilities for Science Instruction* and author of numerous articles in various journals and bulletins from NSTA and the U.S. Office of Education. In all his writing, he remained modestly in the background, preferring to create and administer than to accept credit and public acclaim.

A life member of NSTA, NEA, and STANYS, his interests broadened in his final years. He was a consultant on human rights for North Carolina Memorial Hospital; had a lively interest in human rights in educational and medical research; and remained very active in church work.

Philip Johnson married Elsie Thiel in 1929. They had two children: Tom, born in 1935, now an architect in California; and Pat (Evans), born in 1937, now residing in Chapel Hill, North Carolina. His first wife, Elsie, died in 1979 after fifty years of marriage. In 1981, he remarried. Olive, who gave unstinting support to Professor Johnson in his professional as well as social and family life, continues to live in their Chapel Hill home. Into his nineties, Professor Johnson was a regular participant in annual conventions of NSTA, where he continued to host the Shell Merit Fellows. Productive into his last decade, he still produced articles for journals such as *The Science Teacher*.

Always a gentleman of impeccable taste and sense of propriety, he had an infectious sense of humor as well as a rare insight into the problems and programs of public education, especially science education. He was truly a giant of the old school. One of his grandchildren expressed a fitting family tribute to Professor Johnson when he said, "Grandfathers are for loving and fixing things." Phil was that kind of man.

Joe Bail, Helen Wardeberg, Verne Rockcastle

Thomas Homer Johnson

February 18, 1940 — October 6, 1994

Professor Thomas Johnson was born in Geneva, Illinois. He recalled, in a recent career statement, the foundations of his future in landscape architecture. He remembered fondly childhood experiences learning tree identification at the Morton Arboretum, “keeping bird migration records, being fascinated by films like *The Vanishing Prairie*, and identifying with the buildings of Frank Lloyd Wright” that he discovered in his native state of Illinois and nearby Wisconsin. From these beginnings grew a heartfelt desire to integrate people, art, design and the natural world. Embarking on a path to become a landscape architect led him first to the University of Illinois. There he studied under his mentor, Stanley White, graduating first in his class with a Bachelor in Landscape Architecture degree. The recipient of the Edward L. Ryerson Travelling Fellowship, he then travelled to Europe to explore the Italian villa gardens and European cities and towns.

Returning to the United States, Professor Johnson entered Harvard University’s Graduate School of Design where he studied under Hideo Sasaki, graduating with a Master of Landscape Architecture degree in 1966. He spent until 1974 actively engaged in professional practice, from which he developed a firm grounding in design as an applied art.

It was practicing as a design associate in the office of his Harvard teacher, Hideo Sasaki, which Professor Johnson often recalled as a significant influence on his emergence as a designer. While at the firm of Sasaki, Dawson, De May Associates from 1966-70, he was a team member on many projects including the first place award-winning St. Louis Missouri Mall Competition. His design for the State University of New York at Buffalo is featured in Geoffrey and Susan Jellicoe’s *The Landscapes of Man* (1975), and is recognized as a significant modern landscape work.

From 1970-74, Professor Johnson was co-principal of his own firm, Lawrence & Johnson Associates of Barnstable, Massachusetts. The firm’s projects included large-scale housing developments, residences, and communities. Often cited among his accomplishments was the establishment of The Old Kings Highway Regional Historic District Commission, an agency which preserved traditional visual patterns in the public landscape of Cape Cod.

Professor Johnson joined the Cornell Landscape Architecture Program faculty in 1974 where he was a devoted teacher to both graduate and undergraduate students. His twenty years of instruction helped to train students who

went on to become Rome Prize winners, Presidential scholars, university professors, and design practitioners in internationally known landscape architecture firms.

Notable among his numerous extension and community service activities were his design seminars, workshop series, and accompanying publications that he developed to address local applications of the New York State Environmental Quality Review Act (SEQR), a project funded by a Cornell University Rockefeller Foundation Grant (1977).

Professor Johnson was active in campus committees: chair of the Landscape Architecture Program Internship Committee and member of both the Campus Planning and the Agriculture College Land Use Committees. In addition to his teaching, research, and extension work, he also maintained a consulting practice, engaging in projects on the Cornell University campus and in the Ithaca area (Cornell Business and Technology Park, 1988).

Design Theory and Education were the focus of Professor Johnson's teaching and research during his years at Cornell. Motivated by the belief that the landscape architectural profession lacked an educational text on design theory, he endeavored to develop basic two- and three-dimensional design teaching techniques. Using the classroom as his research lab, Professor Johnson originated a landscape architectural design language theory accompanied by a "building blocks" design learning sequence in which elements, syntax, references, and procedures for classical, naturalistic, modern, and post-modern design approaches were articulated. His design languages theory became the principal subject of papers given at professional conferences and a manuscript he was preparing at the time of his death entitled: *From Basic Design to Design Languages, Design Theory in Landscape Architecture*. "Classicism, naturalism, the fried egg, the inverted sweatshirt, the nine-square," were the words and concepts he championed and which continue to resonate in the minds and memories of students who benefited from his inspired teaching.

Professor Johnson was the leader of several award-winning Cornell student design studio teams. With his students, he was awarded first prize in the Genesee River Design Competition (Rochester, New York, 1978), a Merit Award in the Jacobs Pillow National Design Competition (National Endowment for the Arts, 1984), and exhibition selection in both the Sesquicentennial Park National Design Competition (Houston, Texas, 1986) and the Minnesota State Capital National Design Competition (St. Paul, Minnesota, 1987).

Professor Johnson is remembered for his open-mindedness, his imagination, his compassionate heart and his generosity. Those qualities made him both a devoted teacher and a guiding spirit in Cornell's landscape architecture program. Because he appreciated and cultivated individuality, he was able to guide and motivate students, drawing

forth while instilling a passion for the creative effort. Those very qualities led to Professor Johnson's selection as an outstanding teacher by Cornell's Merrill Presidential Scholar Program in 1986.

Many will, for years to come, recall Professor Johnson's animated and inspirational "criticisms" delivered during the final design critiques (held at semester end when students typically present their work to a faculty jury). Professor Johnson would rise out of his chair and as though he were cutting right through the layers of ideas imbedded on the student's drawings, he could "see" with laser precision, so clearly what a design was trying to do and where it could take the next step. He always stood, faced the students and faculty and, with a knowing grin, gesturing hands and flowing thoughts, would have us all (students and faculty alike) under his spell for a moment. Usually he would finish with encouraging words saying "and if you just do this, and this, and then this, ah-ha, you'll have it!" All of us gained and learned from Professor Johnson's critiques, lucid remarks, and lively demonstrations. Design was truly part of his being and nature, and the legacy of his teaching will continue to endure in the eyes and hands of the hundreds of students and colleagues to whom he made a real difference.

Professor Johnson is survived by his wife, Helen Elizabeth Hunsberger Johnson; his two sons, Travis Muirhead Johnson and Jay Benjamin Johnson; his sister, Jane Johnson Sims of Wayne, Michigan; as well as five sisters and brothers-in-law and their families.

Marvin Adleman, Peter Trowbridge, Paula Horrigan

Warren T. Johnson

April 22, 1925 — November 9, 1994

Warren T. Johnson, Professor of Entomology Emeritus, died after an extended illness. Born in Charleston, West Virginia, he received his B.S. degree from Morris Harvey College in Charleston. Following service in the Army, he received his Master's degree from Ohio State University and his Ph.D. degree in entomology from the University of Maryland where he remained a member of the faculty for ten years. He joined the Cornell faculty in 1962 with a joint appointment in the Departments of Entomology and Plant Pathology, was appointed Professor in the Department of Entomology in 1972, and Professor Emeritus in 1991.

Dr. Johnson was the author or co-author of more than 75 publications on arthropods affecting woody ornamental plants and their control. His early interests were with insects affecting nut trees; later he worked on strategies for controlling the forest tent caterpillar, scale insects, and many others; and he ended his career with much work on the use of horticultural oils and growing degree days for pest management. He co-authored and revised yearly the Cornell Recommendations for Maintenance of Trees and Shrubs.

Professor Johnson was a member of several professional societies including the Entomological Society of America, Entomological Society of Canada, the International Society of Arboriculture, American Phytopathological Society and the honorary scientific fraternity, Sigma Xi.

One of his greatest rewards came from his association with students and young professionals. In 1965, he established TIEG (Teen International Entomology Group) to introduce youth worldwide to the science of entomology. TIEG encouraged the study of entomology and the exchange of ideas and material related to the science. A newsletter was published which included comprehensive life history studies, scientific notes, do-it-yourself techniques, and a list of materials for exchange and sale. At one time, the organization boasted over 2,000 members. The project was deemed worthy of support by the Entomological Society of America and the Entomological Society of Canada.

Dr. Johnson served as Chairman of the Youth Program for the International Congress of Entomology held in Washington, D.C. (1976); and as advisor to numerous graduate and undergraduate students—many of whom sought his friendship and counsel until his death.

Dr. Johnson's distinguished career in extension won him numerous awards and reflected his thorough grounding in insect pest management, his concern for the problems of the people, and his skill as a teacher. His widely

acclaimed reference book, *Insects That Feed on Trees and Shrubs: An Illustrated Practical Guide* (first published in 1976), is a classic in its field and is used by plant care professionals throughout the world. He was also a co-author, with Dr. Wayne Sinclair, of the book *Diseases of Trees and Shrubs*, which was published in 1987.

His career in extension kept him busy with lectures and demonstrations at county, regional, and statewide meetings of cooperative extension staff and leaders in the horticultural field.

Warren was a stimulating mentor for young people with an interest in entomology and plant pathology, always keenly aware of public and industry concerns and of conceptions and misconceptions in his field. He truly believed in using a problem-solving approach to teaching and in learning by doing. He was a caring, concerned mentor.

Warren's work brought him some travels. From a National Science Foundation grant in 1964, Johnson went to London for the International Congress of Entomology. He participated in the same congress in Moscow, in the former Soviet Union, in 1968. Four years later, he went to the congressional meeting in Canberra, Australia. He also performed entomological research at the Archbold Research Station in Florida and at the Gulf Coast Research Laboratory in Mississippi in the early 1970s. On one of his sabbatical leaves, Johnson was a Visiting Scientist at the Canada Department of Forestry where he studied microbial pesticides. On another at U.C. Berkeley, he began laying the groundwork for his book *Insects that Feed on Trees and Shrubs*. Most recently he visited China for the International Conference of Entomology and for some sightseeing afterward. The community benefited from his active involvement and leadership with the Ithaca Rotary Club, 4-H, and the Boy Scouts of America. In addition he attended St. Paul's United Methodist Church, where he was a choir member for 32 years. He served on many committees of the church and as president and longtime board member of the Wesley Foundation of Cornell United Religious Work. He will best be remembered for his cheerfulness and caring for others.

He is survived by his wife of 45 years, the former Alice Rose Bent; two children, daughter Marilyn Barnard and son Warren Edward Johnson; and four -grandsons, Nicholas Johnson and Benjamin, Taylor, and Jay Barnard; and a sister, Jean Biernat.

George Hudler, Carolyn Klass, Richard Hoebeke, Roger Morse

Frances A. Johnston

June 22, 1901 — May 27, 1984

Frances Johnston's association with Cornell began in 1946, when, as an assistant professor, she joined the Department of Food and Nutrition in the New York State College of Home Economics. At that time her responsibilities were primarily with research and the graduate nutrition program. Her active professional career with the college continued for the next nineteen years. During that period, and afterwards as a professor emerita, she exerted a profound and lasting influence on the caliber and scope of nutrition programs at Cornell.

Professor Johnston was born in Troy, Ohio, where she received her high school education. After a year at Mt. Holyoke College, in Massachusetts, she completed her Bachelor of Science degree in chemistry in 1923 at Western College, in Ohio. In 1926 she received the master's degree in home economics-nutrition from the University of Chicago, where her primary interest was in the factors affecting appetite in preschool children. Following graduation she accepted a position for one year with a biochemist in the Northwestern Yeast Company, in Chicago. During the summer of 1928 she taught at Wittenberg College of Wittenberg University, and from 1928 until 1936 she held the position of assistant professor at Wesleyan College, in Delaware, Ohio.

Returning to Chicago to study for her Ph.D., she worked with Dr. Lydia J. Roberts on the iron requirements of children. She received her doctoral degree in 1941 and remained in Chicago as a research associate until 1946, when she joined the faculty of the Department of Food and Nutrition at Cornell. She was promoted to associate professor in 1949 and to professor in 1955, holding simultaneously a membership on the faculty of the School of Nutrition. At the time of her retirement, in 1965, she was made a professor emerita.

Professor Johnston remained in Ithaca after her retirement until 1979, when she moved to Scottsdale, Arizona, where she died on May 27, 1984, at the age of eighty-two.

Continuing her research on iron requirements after coming to Cornell, she focused primarily on young children, adolescents, and young adults. Extending her research to include the availability of iron from selected foods, her studies were among those used in the evaluation and establishment of the recommended dietary allowances for iron by the Food and Nutrition Board of the National Research Council. Her research also included studies on the effect of adaptation to long-term low-calcium intakes on human calcium requirements. She continued her research on human requirements to include the requirement for Vitamin B₆, an area in which very little research had been done previously.

Professor Johnston's work was conducted primarily with human subjects, although in her later research she also used experimental animals, particularly for pilot work needed to establish methods and to select metabolic products for analysis. Research using human subjects presented particular problems in that she had to develop methodology for both the conduct of the study and analytical procedures. Her work led to improvements in the methods and procedures needed for work with human subjects. In 1977 the Division of Nutritional Sciences remodeled the laboratory area in which she had pursued her research and dedicated it as the Frances A. Johnston-Charlotte A. Young Human Metabolic Research Unit in honor of two of the faculty members who had advanced human metabolic studies at Cornell.

Professor Johnston's original career choice had been chemistry, but she found that there were more opportunities for women in nutrition. In her research she was able to combine both interests. Her high laboratory standards and attention to detail provided excellent training for her students. She participated actively in her laboratory work, instructing the students and technicians personally in the various methods used. Although her studies were so well planned they almost seemed to run by themselves, nevertheless she made it a point to be present at every meal to determine the progress of the study and to encourage the subjects on the strict dietary regimens. During one summer, when she conducted studies with adolescent girls, she obtained the cooperation of colleagues in providing the girls with diverse activities, thus helping to assure the success of the study. Because of her concern for others both academically and personally, she received excellent cooperation from her students and from her human subjects alike.

During her active career at Cornell Professor Johnston was adviser to some thirty graduate students at both the M.S. and Ph.D. levels. Most of her teaching and research responsibilities were with the graduate program. In addition to the students in her laboratory, she worked with all nutrition students in the various seminars offered. Although reserved, she came to know her students well, and many remember the short afternoon break for tea that she routinely prepared. She was often affectionately referred to by her students as Miss J. Because of Dr. Johnston's dedication and teaching abilities, her students received excellent training professionally and in interpersonal relationships. Many have assumed leadership positions in academia in the United States, Canada, and elsewhere.

Professor Johnston was also quick to offer support to new faculty members when they joined the department and was open to the pursuit of new ideas and programs. She was also ready to help to assure the success of a new venture. She did not hesitate to establish her own ideas in a quiet and gracious way, but she was also able and anxious to encourage the development of others.

During the period of her distinguished tenure at Cornell, she published some fifty scientific papers, most of which were co-authored with her students. In 1951 she received the Borden Award from the American Home Economics Association for her outstanding research in nutrition. She was a member of several professional societies: the American Institute of Nutrition, the American Home Economics Association, the American Dietetics Association, and the American Association for the Advancement of Science, as well as honorary societies including Sigma Xi, Phi Kappa Phi, Omicron Nu, and Sigma Delta Epsilon.

Each year, with other colleagues in the department, she prepared Thanksgiving dinner for those faculty and graduate students who were too far from home to share the holiday with their families. This hospitality might include as many as twenty-five or thirty sitting down together on the festive occasion. Professor Johnston was also generous with her lake cottage, and visits there provided a welcome relief from the hot summer days for many faculty members.

Because she was a person who was deeply interested in the community in which she lived, upon retirement Dr. Johnston became very active in many community projects, contributing both financially and with personal involvement. She worked quietly but effectively, and her example influenced the community. She was forward-looking, quickly recognizing community needs and encouraging and supporting the activities of others while taking little credit for herself. Shortly after retirement, as a member of a committee of the Presbyterian Church, she became one of the principal organizers of the Meals on Wheels program in Ithaca, a joint project involving the Tompkins County Health Department, the hospital dietary department, and local churches who supplied the volunteers. She approached the project as she would a research project and evaluated similar programs in other areas in the state and nationwide. The organization and structure of the program was uncomplicated but provided for emergencies. The program was effectively instituted in 1967 and is still in operation in much the same way today. Those who were associated with her in her community endeavors speak of her as a friendly, warm, outgoing but quiet person who had a profound impact on the organizations to which she contributed.

Both during her active professional life at Cornell and as a professor emerita, Frances was a good friend and benefactor of Cornell. She established a Nutrition Research Grant in 1950 and made gifts to support research in both the Department of Food and Nutrition and later in the Division of Nutritional Sciences. Some of this support is still available. Many graduate students can be grateful for her generosity in supporting graduate fellowships: the Katharine Wyckoff Harris Fellowship for students in human nutrition, food, and food-service programs and the Grace Steininger Fellowship. She made a generous commitment that will help the building expansion in the

Division of Nutritional Sciences and has established a major trust for the benefit of the University, for which she was honored in 1982. The American Association of University Women named a scholarship in her honor in 1980.

Professor Johnston was predeceased by a brother, Edward, and is survived by her sister-in-law, a niece and nephew in Arizona, as well as six great-nephews, two great-great-nephews, and one great-great-niece.

She will be remembered by her friends and colleagues as a gracious, thoughtful, considerate, and unassuming person with a pleasant sense of humor; by the community for her encouragement, recognition, and support of community endeavors; and at Cornell for her research contributions and her continued interest and support in the development of an outstanding nutrition program.

Catherine J. Personius, Malden C. Nesheim, Mary A. Morrison

Otto Matthijs Jolles

March 14, 1911 — July 16, 1968

With the passing of Matthijs Jolles, Cornell lost one of its outstanding humanists who had become one of the leading figures in the councils of the College of Arts and Sciences.

He was born in Berlin, Germany, and studied literature, history and philosophy at the Universities of Hamburg, Leipzig and Heidelberg. He took his Ph.D. at Heidelberg in 1933 and then left Germany because of the disastrous political events of that year. He continued his studies at the Sorbonne for one further year. He then went to the University College of Wales in 1935 where he was instructor in German until 1938, and at the same time took an M.A. in international relations.

He came to this country in 1938 to be instructor in German at the University of Chicago, rising to the rank of professor there in 1955, and acting as visiting professor at the University of Frankfurt am Main in 1960. While at Chicago he was instructor in the Military Institute from 1942 to 1945, a member of the important Committee on the History of Culture from 1947 to 1951 and Chairman of that same Committee from 1955 until he came to Cornell in 1962 as Professor of German literature. He was also one of the editors of the important periodical *Deutsche Beiträge zur geistigen Ueberlieferung*. He played a large part in the expansion of the Cornell Department of German Literature and its curriculum, taught a wide variety of courses, and assumed the chairmanship of the Department in 1965. He was about to relinquish these arduous duties, which he had fulfilled so well, and to go on sabbatical leave at the time of his sudden death.

He was a brilliant teacher and a scholar of international reputation. His special field of interest was the age of Goethe, and he published many articles on Lessing, Goethe and Schiller. He published a full-scale study of Goethe's aesthetics in 1957 (*Goethes Kunstanschauung*, Francke, Berne), and at the time of his death he had almost completed a book on Schiller with the working title *Dichtkunst und Lebenskunst: Studien zum Problem der Sprache bei Friedrich Schiller*. From what Matthijs Jolles had already published on Schiller and from his passionate talking about this subject, it is to be expected that this book will be an important extension of our understanding of this difficult, complex, but great author. And the very title of this work shows that its author "did not," to quote one of his closest Chicago colleagues, "separate the world of letters from the world of life."

His Chicago colleagues characterize the three outstanding features of his work there as "his skill as a teacher, a personal concern for his students, and the breadth of his scholarly interests." His friend and colleague there

Professor Hanns Stefan Schultz has testified that “students came from his classes, whether he talked about Schiller or about Lowes Dickinson, with the feeling that what they had heard or discussed was not some parcel of past history, but something that concerned them and their own world.” This statement was true of his work at Cornell as well, whether inside the German Department or in the Six-Year Ph.D. Program of which he was an early and enthusiastic supporter. His interest in the Program centered, not on the idea of acceleration, but on the idea of interdisciplinary study and of freedom for exceptional students; and he offered one of the first four seminars of the Program on the topic of history and literature, a combination which he had developed in Chicago. He won the warm friendship of the students by his unfailing concern for them and by his whole-hearted dedication to the subject of his interest. He was an adviser and counselor *par excellence*, unfailingly sympathetic, yet he never let his own high standards of performance drop and he demanded the best from his students.

For him, education involved the maximum amount of individual choice. He found a sufficient measure of this at Cornell, though he would have liked more. He was a strong supporter of all interdisciplinary programs, disapproved of departments whose rigid insistence on major requirements discouraged the adventurous student who had thought out his own meaningful combination of interests, and he wholeheartedly espoused the new freshman humanities seminars. His belief in the educative value of the humanities was his outstanding characteristic, and it was apparent in all that he did here. Perhaps his most lasting contribution to Cornell was to encourage us to think not in narrow departmental terms, but to think across the boundaries of individual disciplines. Such thinking was not new at Cornell, nor at the University of Chicago where Matthijs Jolles had enthusiastically participated in a bold experimental educational program. And it was something which he himself had experienced in his student years in Germany, for he had benefited greatly from that freedom to listen to great teachers without being held to examinations, the freedom to be exposed to many different disciplines before committing oneself to a specialization. This was his conception of education.

Herbert Deinert, Stephen M. Parrish, Eric A. Blackall

Barclay Gibbs Jones

June 3, 1925 — May 26, 1997

Barclay Jones, Professor of City and Regional Planning at Cornell University since 1961, played a key international role in the intellectual development of urban economics, city planning, regional science, and historic preservation. He trained scores of young people who have gone on to become academics, professionals, and heads of academic departments and research organizations throughout the world

After he served in the U.S. Army in World War II, where he received the Purple Heart, he earned Bachelor's degrees in both Art and Architecture from the University of Pennsylvania; a Master's degree in Regional Planning in 1955; and a Ph.D. degree in Economics from the University of North Carolina in 1961. He married Ann Tompkins in 1957. They had two children, Barclay Gibbs Jones, 3rd, and Louise Jones. Barclay first joined the planning faculty at the University of California at Berkeley and in 1961 moved to the Department of City and Regional Planning at Cornell. Ann died in 1994.

Barclay contributed immeasurably to the growth of the graduate programs in City and Regional Planning, Regional Science, and Historic Preservation Planning at Cornell. When he arrived at Cornell, the department was very small with only two full time and two part time faculty members. He played a major role in the subsequent development of the department and its expansion from primarily a professional planning program to one with parallel emphases on research and scholarship. He placed great importance on synergy among professional education, research, and academic scholarship, the three components of the department's programs.

Barclay supported the building of many scholarly and academic institutions. He was a major force not only in the building of the graduate program in planning at Cornell but also at the University of Puerto Rico. With Professor Stephen Jacobs he built and maintained the historic preservation program and established connections with Chinese, Russian, and East European researchers. He actively lobbied for scholarly research in architecture, and he served as the lone social scientist in an earthquake research group, dominated by engineers and geologists. Throughout his career for over 30 years, he generated the bulk of graduate planning research fellowships at Cornell. An endowment in the City and Regional Planning programs at Cornell University was established to support teaching and quantitative research methods in Professor Jones' name by former student, Thomas W. Jones, former President and Chief Operating Officer to TIAA-CREF.

Barclay was a member of the American Institute of Architects, the American Institute of Certified Planners, Phi Kappa Phi, the American Economic Association, the American Association for the Advancement of Science, and the Society of Architectural Historians. He served as president of the Urban and Regional Information Systems Association from 1966-69, president of the North East Regional Science Association in both 1975-76 and 1987-88, and president of the Regional Science Association in 1983. He was the chairman of the City of Ithaca Landmarks Preservation Commission from 1984-91 and was president of Historic Ithaca and the Tompkins County Landmarks Commission, a local nonprofit organization concerned with historic preservation. He was named a Fellow of the U.S. International Council on Monuments and Sites in 1986 and received the National Parks Service's 1988 Public Service Award from the U.S. Department of the Interior.

Barclay was an active researcher, scholar, teacher, and consultant, in addition to his many achievements in teaching, program building and development, and community service. His research encompassed important issues in regional science, city and regional planning, and historic preservation planning, and he published over 50 papers in these fields, many of them co-authored with his students. In 1990, he was named Distinguished Planning Educator by the American Collegiate Schools of Planning. His consulting activities, which extend back more than 30 years, ranged from small towns in upstate New York to national governments around the world. His most recent assignments were with the United Nations and the World Bank. He was also an active member of the executive and research committees of the National Center for Earthquake Engineering Research at the State University of New York in Buffalo.

Barclay Jones will be remembered not only for his scholarly and professional accomplishments, but also, perhaps particularly for the great emphasis he placed on his relationships with his students. He dedicated his career to supervising and guiding his graduate students in planning at Cornell University. He gave special attention to Ph.D. candidates in planning and was responsible for supervising more doctoral candidates in the department than any other single faculty member. Nearly twenty department chairpersons in planning at universities throughout the United States were products of the Cornell program, and Barclay served on the committees of most of them. It has been estimated that he served as a chairperson for more than one-third of all the students who received doctoral degrees in planning and regional science from Cornell in addition to his work with professional planning students and undergraduates.

Barclay's enthusiasm for planning, its history and its constant evolution were infectious. Among Cornell students his sessions with his doctoral candidates and his advisees were legendary: 10 p.m. for the early appointment

and 1:00 a.m. for the late appointment. It was in these leisurely but intellectually challenging sessions that the mentor-student relationship was most obvious and students were encouraged to develop their own philosophies of planning. One of his former doctoral students has been quoted as saying, "All of his students felt like me, that they were getting 90 percent of Barclay's attention." His philosophy of education is perhaps best summed-up in his own words:

"If you do it right, your students will go on to do things you could never do, write things you could never write, conduct research you could never carry out, solve problems beyond your capacity, and surpass you in numerous ways. What you must do as an educator is create a learning opportunity for younger people that will make you obsolete."

Pierre Clavel, John Forester, Sidney Saltzman, K.C. Parsons

George William Jones

— *October 29, 1911*

We, the members of the University Faculty, desire to place on record a tribute of respect to the memory of an honored colleague, Professor George William Jones, a detailed appreciation of whose life and work was placed in our minutes on the occasion of his retirement from active service in 1907.

As a teacher he labored with unwearied patience and undivided loyalty to inculcate the best intellectual attainments of clear thinking, sound reasoning, and accurate exposition. His ideals were of the highest, and towards their realization he exacted of himself and of his students a whole-hearted devotion.

As a citizen he conceived nobly and enforced faithfully his obligations, in promoting charitable and philanthropic work, in efforts to improve the moral environment of the student, and in extending a helping hand to those in need of aid or encouragement.

To the bereaved family of our late associate and friend we express our warmest sympathy and regard.

Source: Records, p. 533, November 10, 1911

RETIREMENT STATEMENT

“On the retirement of Professor George William Jones from active participation in the work of the Cornell University Faculty after a distinguished service of thirty years, we the members of that faculty desire to place on record our high estimate of his worth as a teacher, a colleague and a man.

Joining the Department of Mathematics before the end of the first decade of its history, already a teacher of ripe experience, he bore an honorable part in the formative years, and during the still more critical period of rapid expansion which followed, in helping to shape those sound educational ideals which have prevailed in that department.

The influence of Professor Jones has been carried far beyond the bounds of the University both by his text-books and by the large number of successful teachers who have received at least part of their training in his class-room. Like many other sound mathematicians he has given much attention to the philosophy of the fundamental concepts, and to the pedagogical value of mathematical studies in a scheme of liberal education. Being a born teacher he

has always adapted himself easily to the capacity of his pupils. A master of the Socratic method, he would probe to the bottom of the student's knowledge by judicious questions, and then build on solid foundations. He has been wont to say that the mathematical class-room should be not merely a lecture room, but also a laboratory, a place for drill in applied logic. Many of his students have said that they received their first notion of what sound reasoning means from the searching and kindly criticism of Professor Jones.

The logical bent of his mind is well exemplified in his text-books of algebra and trigonometry, in which those subjects are each beaten out into a chain of carefully stated theorems and problems after the manner of Euclid's Geometry, there being never a word wasted and no long word used where a short one would do as well.

In matters of discipline Professor Jones has always shown a fine blending of firmness and kindness; and he has been helpful and friendly to all, both inside and outside the class-room. It will never be known how many scores of persons have gone to him each year for advice and guidance, and have been helped by him, pecuniarily and otherwise, his ready aid to the needy extending even beyond his means. His helpfulness is of a tonic quality, and he has no countenance for the shirk or the law-breaker until they show fruits of repentance. He is regarded by a long line of Cornell men and women as an embodiment of the manly Christian virtues, and by the people of Ithaca as a useful and public-spirited citizen.

Professor Jones has also been conscientious in attention to the business of the faculty, and he takes a deep interest in questions of educational policy. A man of well-poised judgment, he does his own thinking, and is not easily misled by high-sounding phrases that may make the worse appear the better reason. We shall long remember how he has been wont, in few but pregnant words, with old-fashioned courtesy, to express his earnest advocacy of whatever promotes good order and sound scholarship.

At all times and places he is an example of soldierly devotion to duty; a champion of good causes, however unpopular; a friend of the weak and friendless; an enemy of none but evil doers; and a wise helper of all who wish to live nobly. His work is not done, even at three score years and ten. May he stay with us long!

Horace Leonard Jones

March 15, 1879 — October 31, 1954

Horace Leonard Jones, native of Tennessee, came to Cornell University in 1907 as a Graduate Scholar in Archaeology and Comparative Philology, after receiving the A.B. degree at Carson-Newman College, and the A.M. degree at George Washington University. His association with Cornell University continued until his retirement in 1947, except for one year of service (1909-10) as Acting President of Virginia Intermont College for Women. He received the doctoral degree here in 1909, was appointed Assistant Professor of Greek in 1910, and Professor in 1920.

Professor Jones had a rare mastery of the Greek language. His first book, the *Poetic Plural of Greek Tragedy in the Light of Homeric Usage*, won high praise from students of Greek literature, but his scholarly monument is his eight-volume edition and translation, in the Loeb Classical Library, of the *Geography* of Strabo. He was honored by Carson-Newman College with its first award of the LL.D. degree (in 1917), and by American Hellenists with an appointment (in 1929-30) as Annual Professor in the American School of Classical Studies at Athens, Greece. He was a devoted scholar and well-liked teacher, kind, helpful, and loyal to his students, of whom he trained a goodly number for productive scholarship. And he participated actively in the life of the University. He was President of the local Chapter of Phi Beta Kappa in 1928-29. A member of Phi Kappa Sigma, he served his fraternity for years as a guide of its destinies, giving freely of his time and counsel; he was for long President of the fraternity's Corporation.

Professor Jones had a strong sense of civic responsibility. During the First World War he was Director of the War Camp Community Service for the camps in the Virginia Peninsula, and spoke often on behalf of the War Chest and the Liberty Loan Campaigns. With the same ideal of public service he held office for six years (1936-42) as Mayor of Interlaken, N. Y., carrying out his duties with distinction, as was publicly recognized by his fellow townsmen when he resigned because of ill health.

He married Edna Earle Lyle in 1909, and after her death (in 1920), Frieda Louise Sullivan, in 1922. His home, enlivened by seven children, was a pleasant centre of social life for his students and friends, who will remember him with gratitude and great affection.

M. G. Bishop, Harry Caplan, James Hutton

Robert B. Jones

January 31, 1920 — November 23, 2007

Robert B. Jones, Professor Emeritus of Linguistics and Asian Studies, passed away November 23, 2007 in the Lakeside Nursing home, Ithaca. RB, as he was known to all, was born January 31, 1920, in Dallas, Texas. He began undergraduate study in music, studying organ under Dora Poteet Barclay at Southern Methodist University. RB became an accomplished organist, and played organ regularly until shortly before his death. His studies were interrupted in 1941, when war broke out. RB joined the U.S. Army, where he was chosen for language training in Japanese. It was this training that stimulated his interest in linguistics. Following Army service, RB resumed his studies at the University of California, Berkeley, where he graduated in 1947. He continued on for post-graduate studies at Berkeley and completed his Ph.D. degree in Linguistics in 1958 under the renowned specialist in Thai and Amerindian linguistics, Mary Haas. His Ph.D. dissertation was a descriptive and historical study of the major languages in the Karen language family (Sgaw, Pho, and Pa'o), spoken in Burma and Thailand. RB revised and expanded the dissertation after a year of fieldwork in Burma funded by the Ford Foundation in 1957-58. The resulting study was published in the University of California linguistic series as *Karen Linguistic Studies*. This monograph is among the most thoroughgoing studies of any Tibeto-Burman language and is still the most authoritative single-volume study of the Karen family. In addition to extensive texts, and an in-depth analysis of the phonology, morphology, and syntax of Sgaw, it contains phonological sketches of Pho, Pa'o, and Palaychi and a reconstruction and glossary of Proto-Karen based on a comparison of the phonology of those four dialects.

After leaving Berkeley, RB taught briefly at Georgetown University and in the Foreign Service Institute of the State Department. In 1955, he joined the faculty of the then Division of Modern Languages of Cornell University and was given charge of all the language programs dealing with mainland Southeast Asia as well as Japanese. At the same time, he took part in the development of the Field of Linguistics and in the Southeast Asian Studies program. He taught courses and mentored students in both of these areas. RB taught Vietnamese, Thai, Burmese, as well as Japanese and linguistics courses. This unusually heavy teaching load was reduced somewhat after the first couple of years, when a Japanese teacher was hired, and then again in 1970, when the Department of Modern Languages and Linguistics was authorized to hire a professor of Vietnamese studies. RB remained in charge of Burmese and Thai and continued teaching linguistics and area studies courses until his retirement in 1986. He served as Graduate Field Representative in Linguistics for several years prior to his retirement.

Developing Asian language programs during RB's early days at Cornell meant creating pedagogical materials, for

little was available for use in the classroom for Asian languages. RB created and published materials for learning beginning Vietnamese and advanced Thai and for the Burmese and Japanese writing systems. His primary academic interest was historical linguistics, and his teaching covered all of the major language groups in mainland Southeast Asia. He published a seminal article on the historical phonology of the Tai languages, and as noted above, *Karen Linguistic Studies*, the published version of his Ph.D. dissertation, is a keystone of modern Tibeto-Burman historical linguistics. RB was highly respected by colleagues in his areas of expertise, and he was invited to serve as a consultant to the National Science Foundation, the Defense Language Institute, the Ford Foundation, the Library of Congress, the *Encyclopedia Britannica*, the Department of Health Education and Welfare, and the Center for Applied Linguistics. An extensive collection of RB's unpublished papers on Southeast Asian linguistics and other topics are catalogued in the Cornell University Library Rare Manuscript Collection. A partial bibliography of RB's writings on Tibeto-Burman follows at the end of this memorial. An important manuscript on Old Burmese was incomplete at the time of RB's death.

RB's social life revolved around music and the church. Upon arriving in Ithaca in 1955, RB joined the choir of St John's Episcopal Church, where he met the choir director and organist, A. Richard Strauss, who became his life-long companion. Several years thereafter, RB and Richard bought a house together on Glenside Road, where Richard established an organ-building business and built a succession of organs for RB, as well as a harpsichord. RB played both instruments regularly. There they entertained their wide circle of friends with music and RB's gourmet cooking. RB was also an avid gardener and established an exquisite garden, ringed with rhododendrons, in the woodsy setting of Glenside. Inside the house, RB had established a solarium filled with orchids and other gorgeous blooming plants, where his several cats (he once had as many as five) loved to nap.

RB's faithful companion, A. Richard Strauss, cared for him in the last months of his life.

John U. Wolff, Chairperson; Richard L. Leed, John B. Whitman

Walter Roy Jones

August 9, 1902 — March 8, 1954

Walter Roy Jones, Professor of Electrical Engineering, was born in Ossining, New York. His early schooling was in Poughkeepsie and led directly to Cornell where he entered in 1921. The characteristics of the man which were to profoundly influence his later life were apparent in his undergraduate activities. Small of physical stature, he was coxswain of Cornell crews for two years. Completely self supporting as an undergraduate, his tremendous vitality and driving energy were noted by the faculty long before graduation. He received the E. E. degree in 1925.

First activity after graduation was a short stay with Western Union Telegraph Company, in Buffalo, New York. Always interested in radio engineering he found the Federal Radio Corporation of Buffalo more to his liking, and by 1929 he had become engineer in charge of development and research. When it became apparent that the company would not survive he left, taking with him two of his best men to positions in Sylvania Electric Products Inc. where he spent several years traveling extensively as commercial engineer. In the course of these travels he built a large circle of friends including engineering executives of most of the radio equipment manufacturers of the nation. These contacts were to serve him well later at Cornell. He also developed a unique style of addressing technical meetings, which placed him in great demand as a speaker, particularly at radio technician's gatherings. While at Sylvania he kept up his interest and contacts as a Cornell alumnus. He was at his best entertaining a class of Cornell engineers visiting the Sylvania tube factory in Emporium, Pennsylvania. Starting in the early 1930's such trips became annual affairs for students majoring in communications and electronics. In his 19-year stay with Sylvania, Walter Jones rose to the position of chief engineer of the radio tube division.

Professor Jones received his first appointment to the Cornell Faculty as Associate Professor of Electrical Engineering in 1948, and in 1951 he was made Professor of Electrical Engineering.

Professor Jones' activities while on the Cornell faculty went far beyond routine teaching. Shortly after his appointment he was made coordinator of research for the School of Electrical Engineering. His very considerable managerial talents and nationwide contacts led to rapid expansions of his two favorite projects, the vacuum tube laboratory and sponsored research in vacuum tubes. His friends in industry donated substantial quantities of equipment helping him to bring the vacuum tube laboratory from a small corner in a basement room to one of the best of college laboratories in the country. In the field of sponsored research Professor Jones brought to Cornell several contracts. One in particular is concerned with evaluation of vacuum tubes in government and industrial

service and involves the testing and analysis of thousands of tubes which have failed in service. This project is large enough to require the services of a full time staff, and offers valuable and instructive employment to a number of engineering students, both graduate and undergraduate.

Outside of the University, Professor Jones gave prodigally of his time and ability to his church, fraternity, and community. Always interested in young people, he was superintendent of youth activities for the Methodist Church of Ithaca. Before coming to Ithaca he was president of the Elk Lick Council, Boy Scouts of America, and received the Silver Beaver Award for distinguished service from this organization. Long a member of the Masonic order, he attained the 32nd degree in the Scottish Rite, and was at the time of his death adviser to the Order of the Rainbow. His membership in honorary and technical societies included Eta Kappa Nu, Sigma Xi, Institute of Radio Engineers, American Institute of Electrical Engineers in which he was chairman of the Ithaca Section, Radio Club of America of which he was a Fellow, and the Society of Motion Picture and Television Engineers.

His untimely death at the age of 51 years terminated a rich and colorful career just approaching a climax of achievement and value to the University community. The personal loss felt by his colleagues and the many students who sought his help and advice is profound.

C. W. Gartlein, True McLean, B. K. Northrop

Riverda Harding Jordan

April 12, 1873 — September 11, 1950

Riverda Harding Jordan, professor emeritus of education, suffered a fatal heart attack September 11, 1950 in Atlantic City while attending a national meeting of the Phi Gamma Delta fraternity. Devoted to his family throughout his lifetime, his death was deeply mourned by the surviving members— his mother, Clara Harding Jordan; his wife, Mary Vinette Hoover Jordan; and two sons, Richard Hollister Jordan and Hoover Harding Jordan. He had in fact broken his annual trip to visit his mother in order to attend the fraternal convention.

Professor Jordan received his A. B. degree at Yale in 1893, and his M. A. from the same institution in 1913. In the years between, he engaged in business and teaching, having been successively, after 1897, teacher, director of athletics, principal of the Central High School, and director of the Normal Training School in St. Joseph, Missouri. In 1911 he was appointed principal of West High School in Minneapolis and in 1917 he entered the University of Minnesota as a graduate student and instructor in rhetoric and education. He received the Ph. D. at Minnesota in 1919 and was immediately appointed professor of education and chairman of the department at Dartmouth College. In 1921 Professor Jordan accepted a call to the Department of Education in the College of Arts and Sciences at Cornell.

The years following were busy years, indeed, for he gave full measure of his strength and energy to teaching, writing, administrative duties, committee work, and to student advisory responsibilities. He always taught a full program of courses both undergraduate and graduate. He attracted many students to education and over the years saw them placed in responsible positions. His Summer Session course in school administration was considered a sine qua non by generations of graduate students of education. In fact, membership in this course had prestige and a status value over and above ordinary academic considerations. His general methods course for seniors, the primary source of teacher training in his time, remained a cherished memory in the minds of many who entered teaching after graduation.

During the ten-year period, 1924-1934, Professor Jordan was director of the Cornell University Summer Session and a member of the National Association of Summer Session Directors, of which he became the secretary in 1927 and president in 1931. He was active in the Society of College Teachers of Education and was a member of its executive committee for three years. He was vice-president of the National Association of Colleges and Departments of Education in 1929, and chairman of its executive committee in 1937-38. Professor Jordan was a

member of the New York City School Commission, in 1924-25, and the Youngstown, Ohio, Survey in 1932. He was a member of the New York State Examination Board from 1926 to 1941.

Professor Jordan contributed to numerous professional periodicals and was a member of the Board of Editors of *Social Science*. He was the author of the following volumes: *Nationality and School Progress*, 1921; *Educational Measurement and the Classroom Teacher* (with A. R. Gilliland), 1924; *Extra-classroom Activities*, 1928; *Manual on how to study*, 1929; *Junior High School Course of Study*, 1930; and *Education as a Life Work*, 1930. The last title summarizes well Professor Jordan's career, and his sympathetic treatment of the subject reflects very exactly his own attitude toward education.

Professor Jordan was a friendly person and sought the association of other people. He belonged to many societies and fraternities, among them the following: Phi Kappa Phi, Phi Gamma Delta, Phi Delta Kappa, Kappa Phi Kappa, Pi Gamma Mu, Alpha Kappa Delta. Of these he was most active in Phi Delta Kappa which recognized his contribution by the award of an honor key; in Kappa Phi Kappa, of which he was a founder, national president, 1922-1927, and councilor, 1928-1939; and in Phi Gamma Delta. Doubtless the latter captured his interest to the greatest extent. He served the Phi Gamma Delta fraternity loyally during his lifetime, encouraging the local chapters and the national society to place greater emphasis on scholarship. He was chairman of the national scholarship committee of the fraternity from 1926 until his death. At its meeting in Atlantic City the fraternity paid their respects to Professor Jordan by endowing a scholarship in his name. He knew of this action prior to his death and greatly appreciated the recognition of his efforts to promote scholarship in his fraternity.

Professor Jordan retired from Cornell in 1941 and he and Mrs. Jordan established a new residence at Avon Park, Florida; but he did not retire from active participation in human affairs. He held for two years a visiting professorship at the University of Tampa and was chairman of a committee on cultural relations sponsored by the Florida Inter-American Center. Long a member of Rotary International, he was elected president of the Avon Club in 1944-45. He was a member of the Board of Directors of the Avon Chamber of Commerce and became a national councilor of the United States Chamber of Commerce. So until the close of his life, he continued, characteristically, to add new activities and new laurels to the old and familiar tasks which he never quite relinquished.

Seldom does the academic man establish himself so firmly in the ranks of his profession and range so widely in associated activities and community affairs as did Professor Jordan. His loss will be deeply felt in many quarters.

M. L. Hulse, C. B. Moore, R. M. Ogden

William Kirby Jordan

May 24, 1923 — October 11, 1988

Bill Jordan was an outstanding teacher, colleague, and friend. A complete Cornellian, he earned all three degrees here before being appointed to the faculty in the Department of Dairy Science in 1950. He was a patient and understanding advisor to many students, both undergraduate and graduate. His teaching was done with precision and effectiveness during his 37 years on the faculty. In all that he did, Bill set a standard of excellence for the department.

Professor Jordan had a long-term interest in the engineering aspects of food-processing. He and his students worked on detecting and describing the fleeting events occurring during operations such as homogenization and direct steam injection heating. His interest in safe processing led to work on the interaction between metal surfaces, food soils, and hydrodynamics of the cleaning solution. Bill enjoyed teaching and research in the area of ice cream manufacture. He was a key element in the expansion of his department from dairy science to the more general food science.

Bill had sabbatical leaves in Sweden, Ireland, England, and the Dominican Republic. He was a member of Alpha Zeta, Sigma Xi, and Phi Kappa Phi. He also served on numerous campus committees and was Field Representative for Dairy Science, 1966-69, and for Food Science, 1984-1987.

Bill's devotion to his profession extended beyond the classroom and the laboratory. Throughout his academic life, he participated in professional societies and associations. A major national commitment was his service on the 3-A Sanitary Standards Committee from 1959. He was chairman of the Central New York Institute of Food Technologists, and president of the New York State Association of Milk and Food Sanitarians. He was recognized for his service to the dairy industry by the latter association by being given the Emmet R. Gauhn Award in 1982.

Bill's first love was his family. He and Esther met as students at Cornell and had an unusually close and loving relationship for over four decades. Their four children reflect the love, humor, and concern for the natural order of things that characterized the Jordan home. His devoted companionship and care throughout Esther's long illness was a beautiful tribute to their love for each other.

Nothing pleased Bill more than the opportunity to relax by spending a few days caring for the land and trees around him. The physical labor of felling a tree or establishing a pond was a welcome counterpoint to the intellectual

demands of the professorial workday. When not working on his land, he could be found tinkering with a piece of machinery. His ancient Volkswagen buses were legendary.

Bill was, above all, a gentleman. He was never heard to say anything disparaging about another person. He saw good in everyone. This trait made him a pleasure to know and a success in his work with others. It also led to a concern for the welfare and progress of others far beyond that for himself.

These were his values. We were fortunate to have shared them.

David K. Bandler, John W. Sherbon

Eleanor Jordan

December 28, 1920 — February 18, 2009

Eleanor Jordan passed away peacefully in her sleep on February 18, 2009. She was living in the home of her daughter, Telly, and her son-in-law. Her son, Temple, lived in the vicinity and had been able to see her often.

We will always remember her as a great colleague, as a brilliant, charismatic, inspiring teacher and, above all, as a warm, witty and caring human being and friend. She first came to Cornell in 1969 as a Visiting Scholar after retiring from the Foreign Service Institute Language School, where she had held the position of Dean of the School of Asian Languages. In 1971, she was granted tenure at Cornell and the following year founded the FALCON Program. She had already become the primary force in the teaching of Japanese, having published the two-volume text, *Beginning Japanese*. For many, many decades, year after year, *Beginning Japanese* topped the best-seller list of Yale University Press and it remains in print today. During her time at Cornell, she published *Reading Japanese*, a revolutionary and highly acclaimed textbook, still in print. Toward the end of her 18 years at Cornell, she began her mammoth work, *Japanese: the Spoken Language*, which came out in three volumes. After leaving Cornell in 1988, she assumed a position with the National Foreign Language Center in Washington, DC, where she published, with Richard Lambert, the comprehensive and important study, *Japanese Language Instruction in the United States: Resources, Practice, and Investment Strategy*.

Only a small sampling of the awards she has received in her lengthy and productive career include: The Order of the Precious Crown, granted by His Majesty, the Emperor of Japan in 1985; The Japan Foundation Award in 1985; The Papalia Award for Excellence in Teacher Education, from the American Council on the Teaching of Foreign Languages in 1993. She also received four honorary doctorates and served as President of the Association for Asian Studies once and President of the Association of Teachers of Japanese twice.

Robert Joseph Suple, Chairperson

Andre Laurent Jorissen

January 17, 1913 — February 27, 1958

Andre L. Jorissen, Professor of Civil Engineering, died in Ithaca on February 27, 1958, after a short illness. His untimely death deprived the College of Engineering of the services of one of its most capable teachers and prominent engineers.

Professor Jorissen was born on January 17, 1913, in Liege, Belgium. He studied at the University of Liege and was awarded a civil engineering degree in 1935. Subsequently, he was elected a Fellow of the Belgian-American Educational Foundation and studied at the Massachusetts Institute of Technology where he earned a master of science degree in 1936. He returned to his Alma Mater as an assistant to conduct research and continue graduate studies in fluid mechanics, water power, naval construction and sanitary engineering until 1943, with time out for military service. In World War II, he served in his country's army as a Lieutenant with distinction. He was captured and held prisoner by the Germans for one year.

He was an Associate of the Belgian National Fund for Scientific Research from 1943-1949. He also was an Advanced Fellow of the Belgian-American Educational Foundation during 1946, charged with a study of American fluid mechanics laboratories and the design of a new hydraulic laboratory at the University of Liege. In 1947, the Laboratoire central d'Hydraulique of Paris, France, retained him as a scientific advisor on model studies of river and harbor installations. The Doctor of Science degree was awarded to him by the University of Liege in 1949.

The Pennsylvania State University invited Professor Jorissen to join its teaching and research staff in the same year. As Professor of Civil Engineering he was in charge of the hydraulic laboratory and taught undergraduate and graduate courses. In 1951, he was awarded a Hooker Fellowship by Cornell University in order to visit European laboratories and subsequently became Head of the Department of Hydraulics and Hydraulic Engineering in its School of Civil Engineering. At Cornell, Professor Jorissen devoted time and energy to the welfare of the school and its students. He worked and planned diligently to further and improve the aims and objectives of the institution through his active membership on many committees and by exhibiting quiet and genuine concern in student-faculty relationships. His temperament and wide experiences made him a particularly effective teacher and his advice was sought by many in planning their careers.

Because of his professional eminence and his engaging personality, Professor Jorissen was widely known and respected. His major research interests were in the field of fluid metering devices, which was reflected by the many

papers contributed to scientific journals. He was an active member of the American Society of Civil Engineers and the American Society of Mechanical Engineers, participating prominently in research and standardization of fluid meters. In the American Society for Engineering Education he served as secretary of its graduate division. As a member of the International Standards Organization he served on numerous technical committees where his linguistic skills were an additional asset. He was also affiliated with the International Association for Hydraulic Research, the Association des Ingenieurs sortis de l'Ecole de Liege, and the Society Royal Beige des Ingenieurs et des Industrials. Professor Jorissen was a member of Sigma Xi, Tau Beta Pi, Chi Epsilon, and Pyramid. As a licensed Professional Engineer of the State of New York, he was called upon frequently for consultation and services. He became a United States citizen in 1954.

He had long harbored the hope to write a treatise on fluid measurements. The opportunity seemed at hand when he was awarded a Guggenheim Grant for his approaching Sabbatical leave. He and his family had planned to travel to Europe, where he was to lecture, study and write. Unfortunately, illness and death interfered.

His immediate associates will remember him mostly as one who sought and enjoyed the friendship of his colleagues and neighbors. He was a scholarly person interested in Napoleonic history and the history of the United States. He was an ardent stamp collector and very fond of travel. His home was open to his graduate students who valued his never failing ability to encourage the weary and to enthuse the capable. The scientific community will miss Professor Jorissen as one of its prominent members and more will share the sorrow of his wife, Lucy, and daughter, Anne.

P. G. Mayer, Carl Crandall, W. O. Lynch

George McT. Kahin

January 25, 1918 — January 29, 2000

George McTurnan Kahin, Aaron L. Binenkorb Professor of International Studies, Emeritus, died at Strong Memorial Hospital in Rochester on January 29, 2000, a few days after his 82nd birthday. More than any single other scholar, he helped create the new “field” of Southeast Asian Studies, and built Cornell University’s Southeast Asia Program into the preeminent institution of its kind, not merely in the United States, but in the international arena. He was also the most consistent, outspoken, and scholarly critic of American policy in Asia over the whole period of the Cold War.

George was born in Baltimore on January 25, 1918, but grew up in Seattle. He graduated from Harvard University in 1940 with a major in history. When, in the wake of Pearl Harbor, Japanese-Americans on the West Coast were interned in an atmosphere of racist hysteria, many unscrupulous “Caucasian” Americans took the opportunity to refuse to repay their debts to these innocent fellow-citizens. Characteristically, George joined the American Friends in the thankless task of collecting these debts for the internees. Then, and later, he did not want to be ashamed of his country, which he hoped would live up to its highest ideals. From 1942-45, he served with the U.S. Army, and was trained to be parachuted behind enemy lines in the Japanese-occupied Netherlands Indies. He was sent to Europe instead, but his engagement with Asia had begun.

After obtaining an M.A. degree at Stanford University in 1946, he moved to The Johns Hopkins University to prepare himself for Doctoral fieldwork on the nationalist revolution in Indonesia against returning Dutch colonial rule. He arrived in mid-1948, and quickly aroused the hostility of the Dutch by his candid sympathy for the independence movement, and his warm relations with the movement’s leaders. On his return to America, he worked hard with important members of the Congress to shift Washington’s support from its NATO ally, The Netherlands, to anti-colonial Indonesia. In 1951, he completed his dissertation, which was immediately published as *Nationalism and Revolution*, and remains a classic half a century later. In 1951, he joined Cornell’s Department of Government where he taught for 37 years until his retirement in 1988.

George’s strong advocacy of Indonesia, and of a general change in American Asian policy in a more progressive direction won him powerful enemies in McCarthy’s Washington, and for some years he was deprived of his passport. But he found a principled supporter in Cornell President Deane Malott, and enlightened backers at the

Ford and Rockefeller Foundations, for building, together with the late Professor Lauriston Sharp, an historically new Southeast Asia Program. Their success was such that students came from all over the world to study in the Program, and many of these went back home eventually to play important roles as scholars, civil servants, administrators, and public intellectuals. The “Cornell model” was soon widely imitated at other universities in the United States and overseas. In 1954, George also founded the Cornell Modern Indonesia Project which he directed for thirty-four years, and which published foundational work on contemporary Indonesia by both Indonesian and non-Indonesian scholars.

George’s abiding concern was to make Americans more aware of and more sympathetic to the newly independent peoples of Asia. Accordingly, working with colleagues and his own advanced students, he produced sophisticated textbooks on the governments and politics of the region, which became the standard works for undergraduate and graduate students all over the country.

Long a critic of Cold War policies backing, openly and clandestinely, rightwing military dictatorships in Asia, he was among the first leading American scholars to oppose the Vietnam War. At the famous national teach-in of May 1965, he, along with Professor Mary Wright of Yale University, and Professor Hans Morgenthau of the University of Chicago, represented the opposition to the war with great effectiveness. In 1967, he published, in collaboration with John W. Lewis, *The United States in Vietnam*, the first scholarly critique of American policy. Almost twenty years later, he published the magisterial, *Intervention: How America Became Involved in Vietnam*, which was based on thousands of declassified documents as well as countless interviews with participants in the War from every political group. His teaching paralleled his scholarship. Generations of Cornellians remember fondly his great course on America in Asia. Among them must be Richard Rusk, son of Lyndon Johnson’s Secretary of State, Dean Rusk, whom George treated with the greatest courtesy even as he criticized the father’s policies. For this course above all, George was eventually honored with a coveted Clark Teaching Award. Yet, unlike many scholars with strong political convictions, George never imposed his views on his graduate students, who included 1960s radicals, as well as junior government officials from the State Department and the Department of Defense. Provided they worked hard, and maintained strict scholarly standards of research, they were encouraged to write as they wished. During the Cornell crisis of 1969, he spoke out strongly for academic freedom, especially for those whose pro-war views he detested. He was endlessly supportive of his students, especially of their initiatives. The internationally respected journal, *Indonesia*, now in its 34th year of publication, though initiated by graduate students, would never have gotten off the ground without George’s disinterested support.

Eventually, many honors came George's way. He was elected president of the Association of Asian Studies (1973-74), was made an Honorary Fellow of London's School of Oriental and African Studies, and became a member of the American Academy of Arts and Sciences. But he wore these honors with characteristic modesty. There was nothing he disliked more than arrogance, and it was natural that one of his heroes was Senator William Fulbright, author of the compelling book, *The Arrogance of Power*.

It was a matter of abiding sadness to him that after 1965 the Indonesia he loved fell into the hands of a brutal military dictatorship, which lasted until 1998. For some years, he was blacklisted by this regime and barred from entry to the country. Yet the abiding affection Indonesians felt for him as their champion during the struggle for independence forced even this regime to award him a medal for his historic role in building ties between Americans and Indonesians. George was initially reluctant to accept the medal, but in the interests of his students from both countries, and with hopes for the longer term, he eventually changed his mind. George's countless admirers and friends are all happy that he lived long enough to see the dictator fall, and democracy returned to the country where his concern with Asia had begun.

In 1992, four years after his retirement, Cornell University inaugurated the George McT. Kahin Center for Advanced Research on Southeast Asia, situated at 640 Stewart Avenue, in what was once the mansion of Ithaca's prominent Treman family. George's wry words on the occasion will be fondly remembered by all that attended the event. He noted that according to Parkinson's Law, the grander the building, the less serious the work done inside it. He urged all the students to make sure that in this instance at least Parkinson be proven wrong. Retirement did not slow George down too much. At the age of 77, in collaboration with Audrey Kahin, his wife of (then) 28 years, he published *Subversion as Foreign Policy*, a trenchant analysis of the CIA's clandestine role in the 1958-61 rebellion against the central government in Indonesia.

That George lived so long and so productively, in spite of illnesses that would have crippled most of us, must be attributed not only to his own spiritual vigor, but to the devoted care and intellectual companionship of Audrey, a leading historian of Indonesia in her own right. To her above all, as well as to Brian and Sharon, his children from his first marriage, all of us here at Cornell who were among George's countless friends and students, express our deepest sympathy. They have lost a husband and a father who was a gentleman in the true sense, but who was also in the wider world a great man. We shall not see his like again.

Benedict Anderson, Walter LaFeber, Peter Katzenstein

Peter Kahn

July 5, 1921 — February 16, 1997

Peter Kahn was an accomplished artist and a deeply learned man. His vivifying and exemplary presence had such an impact on students, colleagues, and friends, and was expressed in such a dazzling variety of activities, that his life is not readily captured by focusing simply on his academic career or his artistic production. What gets lost is his warmth, his contagious enthusiasm, his generosity, and his almost infinite capacity for friendship. During almost forty years of association with Cornell, he combined with light but disciplined skill, such elaborate forms of cultural creation as painting, graphic production, typography, and theatre design, with the arts of daily life: conversation, gardening, cooking and mushroom collecting. He altered the visual landscape around him through his abundant and freely-given posters, so effectively announcing forthcoming cultural events that they were often collected as soon as they were put up, and very few of his contemporaries will be able to imagine the Finger Lakes region without seeing it through Peter's paintings, woodcuts and drawings.

Peter was born in Leipzig, Germany in 1921. He immigrated to New York in 1937 where he rejoined his father, Emil Kahn, the former conductor of the Stuttgart Philharmonic Orchestra. During World War II, Peter served in the U.S. Army as a tank mechanic and also as a court interpreter at the Nuremberg pre-trials. After the war, in 1945, Peter returned to New York where he participated in the emergence of Abstract Expressionist painting, a movement that made New York the creative center of the international art world at that time. He was a student of the master teacher and artist, Hans Hoffman, whose impact and influence were enormous on what came to be called "action" painting. At the same time, Peter completed a Master's degree in Philosophy at New York University in 1951.

After two years of teaching art at Louisiana State University, Peter was appointed in 1954 to the chairmanship of the Art Department at what is now Hampton University. He was an active participant in the nascent civil rights movement during this period before accepting a position at Cornell in the Fine Arts Department of the College of Architecture in 1957.

Peter remained at Cornell until his death, except for a brief stint at the University of Victoria in Canada from 1968-69, a move undertaken in part as a protest against the Vietnam War. On his return, Peter was offered a position in the Art History Department of the College of Arts and Sciences. The appointment was both unusual and imaginative. Although not strictly an art historian either by training or inclination, he was encouraged to give

students direct, experiential acquaintance with the traditional materials and methods of the artists, and to offer courses on the development of letter forms and the history of the book. At the same time, and in recognition of his wide learning, Peter was given free rein to form alliances across academic disciplines. The result was a series of interdisciplinary courses in music, mathematics, the theatre, sociology, European history and French and German literature, and in the Rare Books Department of the University Libraries.

Peter's commitment to teaching was simply an overflow of his ebullient and generous nature. It didn't matter if the setting was a university classroom, a group of aspiring local artists meeting in his barn after work, or a study tour abroad offered under the auspices of the Cornell Alumni University (CAU). From 1978 until his death (with no break following his "retirement" in 1984), he offered thirteen CAU courses. These covered, in addition to study tours in Europe, such varied subjects as drawing, rare books, the "Art of Seeing" and "Learning from the Modern Masters". It is no exaggeration to say that Peter played an indispensable role in making CAU a major part of the Cornell experience for many alumni.

Peter chaired the Advanced Placement in Art Program of the Educational Testing Service in Princeton from 1970-74. He was a visiting artist and teacher at the University of Virginia, London Royal College of Art, Cal Tech, Purdue, New York University, and Hobart. He also directed the Cornell Program in Hamburg during 1985-86.

His activities were not limited to academic projects, however far-flung. From involvement in Amnesty International, whose logo is a variant on Peter's original design and of which he was a founding member and generous supporter of the Ithaca chapter, to such civic activities as the Trumansburg Fire Department, Library Board and Board of Zoning Appeals. As one of his co-workers says, "he was everywhere." He inspired the poster for an exhibition of "Edible Art" that raised funds for the Tompkins County Arts Council. He was a supporter of the Upstate Crafts Fair, active in the local movement for Historic Preservation, and in the creation of the "Summer Ithaca" guide to promote Ithaca's rich resources of crafts and cultural events. The Ithaca Festival which grew out of the latter initiative honored him in 1997 by adopting a Peter Kahn watercolor of the local landscape as their emblem and disseminating it in thousands of reproductions on T-shirts, badges, and mugs.

Peter's energy and inventiveness seemed to spill over into every domain, but he was especially devoted to the theater. He was interested in every aspect of staging and performance (including musical performance) and was often the first person who came to mind when a group contemplated "putting on a show."

Peter was not an actor or a director but he was an ideal collaborator who contributed to every facet of the undertaking from program design to costumes, stage setting and all forms of interpretation. Here, his many talents fully came

into play. Thanks to his education and general culture, he understood different styles and traditions and could unerringly find the right note. He was also a good reader of texts and could link what he saw on the page to what would eventually be seen on a stage. His practical sense blended well with his painterly eye so that his sets not only worked technically (Peter was a real craftsman) but were wonderfully evocative and handsome, as were his costumes. Yet, Peter was frugal and disciplined. He shunned the ornate and the bombastic. Thus his esthetic sense worked hand in hand with an ethical sensitivity that required honest labor and simplicity.

To all this, Peter added enthusiasm and inventiveness so that his very presence during rehearsals and, later, performances was a joy for actors and directors alike. All of these activities brought out the very best in him and blended the depth of the serious artist with the playfulness of the Renaissance man.

Peter and his wife of fifty years, Ruth Stiles Gannett Kahn, author of the Children's classic, *My Father's Dragon*, were noted for the warmth of their hospitality. Friends, students and visitors found welcome and sparkling conversation in the large yellow Victorian farm-house on the edge of Trumansburg, with its print-shop, studio-barn, orchard and carefully tended flower gardens.

It was in Trumansburg in 1977, when Peter was 55 years old, that he became a volunteer firefighter. For twenty years, he responded to fires, directed traffic at emergencies, cooked omelets and pancakes at fund raisers. He was on duty at the scene of an accident on a cold February night when he had a fatal heart attack. He died as he lived, always at the center of things and giving generously of his energy and his gifts.

Peter's work has been shown widely in this country, most recently in 1997 at the Museum of American Art in New Britain, Connecticut in an exhibition, "All in the Family". This title follows from the fact that the exhibition includes work by Peter; his brother, Wolf; his sister-in-law, Emily Mason; her mother, Alice Trumbull Mason; their daughter, Cecily Kahn and her husband, David Kapp.

Peter is survived by his wife, Ruth; their seven daughters: Charlotte Kahn, Margaret Kahn Crone, Sarah Manfredi, Hannah Kahn, Louise Kahn, Catherine Kahn, and Elizabeth Ratzlaff; and also by his brothers, Wolf and Hans Alfred; his sister, Eva Ekvall; and eight grandchildren.

Alain Seznec, Esther Dotson, Stanley O'Connor

Louis William Kaiser

May 12, 1906 — December 18, 1981

Louis William Kaiser was called to Cornell at a time when radio was becoming an increasingly important tool in adult education. Pioneering work of some twenty years in the use of radio in agriculture and home economics had preceded him here, but he was not a stranger in these areas. Because of the growing sophistication of radio, the need was felt for someone with broad experience and knowledge to direct and develop the educational programs.

Kaiser came out of the world of commercial radio in 1945 to become assistant professor and head of radio services in the newly created Department of Extension Teaching and Information (now the Department of Communication Arts). This was a joint department of the Colleges of Agriculture and Home Economics. Behind him were sixteen years of broad experience in radio broadcasting and administration.

He served Cornell and the people of New York State for twenty-five years through his courses in radio and television and his extension radio services, helping students prepare for and develop their careers in broadcasting, and as faculty adviser for Cornell's student-owned and operated radio stations, WVBR-AM and WVBR-FM.

His interest in radio developed early. He recalled staying up late many nights as a boy, listening clandestinely to broadcasts. It was a thrill in those days to hear from such far-off places as Pittsburgh, Chicago, and Charlotte, North Carolina.

Though born in Cortland, New York, Kaiser's formative years were spent in Syracuse, where the family had moved and where he attended the New York State College of Forestry for two years. He was later to complete his education through night courses and on weekends at Ithaca College, where he received the degree of Bachelor of Fine Arts in Television and Radio in January 1949.

His professional career began in 1927 as an announcer at WSYR, Syracuse, and he was soon advanced to chief announcer and studio director. An early achievement was the development of an agricultural radio program featuring the county 4-H clubs. In 1930 he moved to Buffalo as chief announcer and program director of WBEN, where he originated, produced, and announced a daily farm program over a period of six years. Local farm leaders and extension staff participated, providing a steady, reliable voice for agriculture in western New York. This was an innovation for radio in those days because most farm programs were devoted solely to weather, crops, and market reports.

When the *Buffalo Evening News* became affiliated with WEBR in 1936, he was named station manager to reorganize and train the newly acquired staff. On completion of this assignment he was made director of the combined WBEN-WEBR radio news service.

The challenge of putting a brand-new station on the air brought him back to Syracuse in 1940 as manager and program director of WOLF, where he employed and trained a complete radio staff. He left the station in 1942 to enlist in the United States Army Air Corps as a 2nd lieutenant, serving as special service officer at Muroc, California. Honorably discharged in 1944 with the rank of captain, he reentered the broadcasting field as a supervisor at WFBL in Syracuse.

From this post he joined the college faculty to become, in addition, extension radio specialist and radio farm director of the Cornell-owned stations, WHCU-AM and WHCU-FM. In his various capacities Kaiser was responsible for the production of radio programs for farmers and homemakers of the state and for special manuscript services to extension agents.

Effectiveness of this work is indicated, for example, in a 1948 report showing radio briefs sent twice weekly to forty stations and sixty-eight thousand letters received in one year from listeners requesting one hundred twenty-seven thousand Cornell bulletins. Operational advice during the crop season and tips for stations giving daily weather forecasts were typical features. Over seventy stations cooperated at various times.

A survey conducted several years later among farm broadcasters and county agricultural agents indicated that stations across the state annually gave more than three thousand hours of radio time to agriculture. The operation headed by Kaiser involved tape-recorded programs to some one hundred stations and agents; a weekly syndicated manuscript service to the stations; an exclusive weekly script on commercial farm-subjects to agricultural agents; and a comprehensive monthly script featuring Cornell research to all the state's broadcasters.

During his career he arranged for several nationwide broadcasts from Cornell by the three major networks—CBS, NBC, and ABC—and participated in each. In the late 1940s, when television was relatively new, he helped to plan programs over WRCB-TV Schenectady—one of the first stations in the state to televise regular farm and home programs. As other television outlets developed, he enlisted cooperation.

Lou was concerned with keeping up in the technology of the communications industry and advanced the transcription service by more personalized attention to the individual stations. He also made early use of one-camera closed-circuit television, tape recorders, and videotape.

Kaiser had a good relationship with students, supportive of the view that personality is part of the magic of teaching. He guided students on field trips to stations where they could observe inner workings and behind-the-scenes operations by the professionals. As faculty adviser to WVBR, he provided advice and counsel to students for almost two decades. In appreciation the Cornell Radio Guild presented to him a plaque, the first citation of its kind in the Guild's thirty-year history. Some of his advisees and students in the radio writing and broadcasting courses became farm program directors and managers of stations in New York and elsewhere.

Among other awards, one of special meaning came in 1962 from the National Association of TV and Radio Farm Directors for "thirty-five years of service to agriculture through farm broadcasting." He was a charter member. Kaiser also held memberships in two radio-affiliated national fraternities—the Collegiate Iota Beta Sigma (a life member) and the honorary Alpha Epsilon Rho.

A kind, warm, and friendly person, he had a broad range of interests and hobbies. He enjoyed sports as both a participant and a spectator and was a competent bowler in the University league. He liked to fish. He collected stamps and coins. Over a span of twenty years he compiled a list of post offices and postmasters of New York State in the period from 1789 to 1850. Some of this research was done in the National Archives in Washington, D.C.

But by far his most compelling hobby was as a bibliophile. He became a specialist in local and regional history and western Americana. His three-thousand-volume collection contained numerous rare first editions, including the original orderly book of General Marinus Willett, who defended the Mohawk Valley against British troops in the Revolutionary War. He also owned letters written by George Washington and Thomas Jefferson and other documents.

Kaiser retired in 1970. He and his wife spent their last years together in a Cortland nursing home. His wife predeceased him by about two years.

C. H. Freeman, E. S. Phillips, W. B. Ward, J. S. Knapp

Robert J. Kane

April 24, 1911 — May 31, 1992

Robert J. Kane, 81, Dean Emeritus of Health and Physical Education at Cornell University and the President of the United States Olympic Committee from 1977 to 1981, died Sunday, May 31, 1992, in Ithaca, New York of heart and respiratory failure.

Kane, a 1934 graduate of Cornell, had been an athletic administrator with the University for 36 years until his retirement in June 1976. He served as Assistant Director under James Lynah for three years (1939-41) and as Acting Director from 1941 through 1944 when he was named Director. Through his last five years, he was promoted to Dean of the Department of Physical Education and Athletics and served as Assistant to the President of the University.

During his tenure at Cornell, the Big Red won national championships in hockey, lacrosse, rowing and polo, and Ivy League championships in football, basketball, hockey, lacrosse, gymnastics, soccer, fencing, track, tennis, rifle and wrestling.

While he was Director, new athletic facilities costing \$9 million were built: Teagle gymnasium for men; Helen Newman gymnasium for women; Lynah ice rink; Collyer boathouse; Grumman squash courts; the University's 18-hole golf course and Moakley clubhouse; Paul Schoellkopf House for visiting teams; a Poly-Turf football field and a Poly-Surf track. He also started an endowment fund for men's and women's athletics.

"Bob Kane was one of the all-time great Cornell athletes," Frank H. T. Rhodes, president of Cornell, has said. "He was an outstanding athletic director and in fact he has been the dean of Cornell athletic directors. He went from his position at Cornell to national and international prominence. He was a great sportsman, a great Cornellian and a good friend. I salute his accomplishments. He did an excellent job in bringing strength across the board to Cornell athletics, and served as a mentor and friend to generations of Cornellians."

An outstanding track athlete, Kane held the Cornell record for the 200-meter dash until 1977. In 1933 and 1934, he was runner-up in that event at the IC4A championships and in his senior year he ran on winning 440- and 880-yard relay teams at the Penn Relays. As a representative of the New York Athletic Club, he was a member of the National AAU relay champions on 440, 880 and mile relay teams in 1933, 1934 and 1935. While touring Europe with a select group of American stars in 1934, he set the European record for the 300-meter dash.

A native Ithacan, he earned letters at Ithaca High School in track, football and basketball. He was the New York State high school champion in the 100- and 200-yard dashes.

Robert Kane was closely associated with the U.S. Olympic Committee, beginning in 1951 when he was elected to its Board of Directors. He was manager of the 1952 men's track and field team for the Games at Helsinki. In 1960, he became Assistant Administrative Chairman for all U.S. teams in Rome. In 1964, he served as Chief Administrative official of the U.S. delegation in Tokyo and was elected Secretary of the Olympic Committee, a position he also held in 1968 at the Games in Mexico City. Kane served as Second Vice President for the 1972 Munich Games and was Executive Vice President for the 1976 Games in Montreal. He was elected President of the USOC for a four-year term in April 1977 and led the USOC through a period of great growth, only to be bitterly disappointed by the boycott of the Moscow Games in 1980 by the United States at the request of President Jimmy Carter.

He created the idea of the U.S. Olympic Festival (originally called the National Sports Festival) and put it into motion in 1978 at Colorado Springs, Colorado. He was inducted into the U.S. Olympic Hall of Fame in 1986.

Kane, who served on a State Department panel that offered advice on ways of furthering international understanding through sports, held numerous high positions in intercollegiate athletics. He was Vice President of the National Collegiate Athletic Association in 1948 and was a two-time President of the Eastern College Athletic Conference.

Kane had been a member of the Cornell University Board of Trustees and the Cornell University Council, a group of alumni and friends who help the University in its immediate and long-range development, since it was established in 1951.

He is the author of a book about the history of Cornell Athletics, titled *Good Sports*, published by the University in July 1992.

He is survived by his wife, Ruth Brosmer Kane; one daughter, Karen K. Nichol of Freeville, New York; one son, Christopher R. (Kip) Kane of Phoenix, Arizona; seven grandchildren; one brother, Thomas J. Kane of New York City; three sisters, Claudine Malone of Oneida, New York; Kathleen Reynolds of Palos Verdes Estates, California; and Eileen McNamara of Ridgewood, New Jersey; and several nieces and nephews.

Memorial donations may be made to the Cornell University Moakley Fund for the support of track and field athletics, c/o Cornell University, P. O. Box 729, Ithaca, New York 14851.

Louis Albright, Dave Wohlhueter, Laing Kennedy

Vladimir Karapetoff

January 8, 1876 — January 11, 1948

Dr. Vladimir Karapetoff, professor emeritus of electrical engineering at Cornell University, passed away of a coronary occlusion Sunday, January 11, 1948, at the Park West Hospital in New York City. In March 1947, he had suffered a heart attack from which he recovered sufficiently to continue his work as consulting engineer, author, and other activities.

Dr. Karapetoff was born in St. Petersburg, Russia, January 8, 1876. He was the son of an engineer, Nikita Ivanovitch Karapetoff, and of Anna Joakimovna Ivanova, one of the few Russian women to attend military medical school. His childhood was spent in Tiflis. He was graduated from the Imperial Institute of Ways of Communication, St. Petersburg, Russia, in 1897 with a degree of Civil Engineer and received his Master of Mechanical Engineering in 1902. From 1899-1900 he studied electrical engineering at the Polytechnic Institute, Darmstadt, Germany.

Before coming to the United States of America in 1902, Professor Karapetoff worked as a junior engineer in the department of interior waterways with headquarters in St. Petersburg. He also was an instructor of electrical engineering, hydraulics, mechanics and physics in three technical schools and a night school. The Czarist Government then sent him to this country as an engineering apprentice with the Westinghouse Electric Corporation, East Pittsburgh, Pa., where he worked during 1902-04. He was naturalized March 22, 1909.

Dr. Karapetoff's professional attainments are numerous. Early in his career he served in the engineering department of Allis-Chalmers Company; Niagara, Lockport, and Ontario Power Company; General Electric Company; Commonwealth Edison Company; Gibbs and Hill; J. G. White and Company. He also assisted the U. S. Government in the solution of engineering problems during World War I and later was consulting engineer for Roebing Sons Company, Klaxon Company, General Electric Company and the Detroit Edison Company.

Professor Karapetoff was a licensed professional engineer in New York State and served as chairman and member of general and technical committees of the American Institute of Electrical Engineers, National Electric Light Association and American Association of University Professors. He was chairman of the sub-committee on Physics of the Electrical Insulation Conference of the National Research Council from 1928 to 1935 and chairman of the sub-committee on Monographs from 1935 to 1938.

In research Dr. Karapetoff was interested especially in applications of mathematics, mechanics, and physics

to electrical engineering. Specific contributions which he made include improvements in the theory of and computations pertaining to electric and magnetic circuits, high-voltage insulation, transmission lines, and electrical machinery as well as studies in the structure of matter applied to gaseous conduction of electricity and dielectric behavior. The results of these theoretical investigations took the form of kinematic computing devices, scales and mechanical models, illustrating the derived principles for practical applications. Experimental researches on machinery, measuring instruments, and properties of electrical materials were carried out for clients.

Many of us also knew Professor Karapetoff as a fine musician. He was an accomplished performer on the piano, violoncello and double bass, and toured the country giving recitals and lectures on Wagner, Liszt, Chopin, MacDowell, Schumann, Brahms, Debussy and Russian composers. Until nearly the end of his teaching career he played in the Cornell University Orchestra and various chamber music groups. In 1922, after some years of study, Dr. Karapetoff combined his scientific skill and musical knowledge in developing a cello with five strings on which violin music could be played. This is the only such five-stringed cello in existence and has been willed to the Franklin Institute.

Professor Karapetoff was probably best known for his long teaching career. His experience in this country began in 1904 as assistant professor of electrical engineering at Cornell University. He was appointed full professor in 1908 and continued as such until 1939 when he became Professor Emeritus. Thus he devoted thirty-five years in active teaching at Cornell. Professor Karapetoff, on all but the most formal occasions, preferred to be known as "Kary" and was so addressed by all his friends and co-workers.

He served as non-resident lecturer on electrical machinery at the U. S. Army Post-Graduate school for engineer officers, Washington Barracks D. C, was visiting professor in the Graduate School of Brooklyn Polytechnic Institute from 1930 to 1932 and also in Stevens Institute of Technology from 1940 to 1941.

Dr. Karapetoff wrote profusely. His two volumes on Experimental Electrical Engineering, now in the fourth edition, are accepted widely as standard texts and have also been translated into Spanish. The texts: Electrical Circuit, Magnetic Circuit and Elementary Electrical Testing are also well known. He wrote five volumes on Engineering Applications of High Mathematics, and translated Gevant's "Liquid Dielectrics" from the German. His book entitled "Resistance to Propulsion of Ships" was written in Russian, and "Polyphase Electric System with Unbalanced Load" was written in German and Russian.

In 1937 he published a book entitled "Rythmical Tales of Stormy Years," comprising a collection of his poems which attracted considerable interest. Besides his books, he published over two hundred papers and articles on scientific, engineering, ethical and educational topics. He was research editor of Electrical World from 1917-1927.

Dr. Karapetoff was a life member of the American Institute of Electrical Engineers, The Franklin Institute, American Association for the Advancement of Science, American Mathematical Society, Mathematical Association of America, American Physical Society, the U. S. Naval Institute and the U. S. Naval Reserve Officers' Association. For several years he was a member of the Board of Trustees of Ithaca College. Dr. Karapetoff received honorary membership in Tau Beta Pi, Eta Kappa Nu, Sigma Nu and Phi Mu Alpha. He was awarded the coveted International Montefiore Prize in 1922 and the Elliot Cresson Gold Medal of the Franklin Institute in 1927. In 1934 from New York College of Music he received an honorary Doctor of Music and in 1937 from the Polytechnic Institute of Brooklyn he received the honorary degree of Doctor of Science.

In 1942 and 1943 Professor Karapetoff successively lost the sight of both eyes. Although operations temporarily restored the detached retina he enjoyed little sight thereafter. To the end his characteristic cheerfulness, determination and ingenuity prevailed over aging physique; he was always the explorer and met his loss of sight with new learning in the techniques of Braille, the Talking Book Machine, etc. He was particularly devoted to Eta Kappa Nu and seldom missed the annual Eta Kappa Nu Award dinner in New York City. These occasions grew to mark a national "Kary" reunion almost as much as a recognition of outstanding young engineers. Even after blindness he continued to attend and address these meetings in his always refreshingly original and lucid exposition of technical interests.

Through these later years much of his happiness came through the devotion of his wife, R. M. Karapetoff Cobb, who survives him. He lived a rich, full life and contributed more than most to the University, especially to the teaching and engineering professions, and notable to the many other fields which seriously or as hobbies attracted his active interest.

R. F. Chamberlain, W. A. Hurwitz, B. M. Strong

David A. Karnofsky

March 28, 1914 — August 31, 1969

The Cornell University Medical College has lost one of its most illustrious members in the death of Dr. David A. Karnofsky on August 31, 1969. At the time of his death Dr. Karnofsky was chief of the Medical Oncology Service, Department of Medicine; head of the Division of Chemotherapy Research of Sloan-Kettering Institute; professor of medicine at Cornell University Medical Center; and physician to out-patients at The New York Hospital.

During a period of twenty-three years at Memorial Hospital, Dr. Karnofsky became a legend. His knowledge of cancer was encyclopedic. No one could present a clinical problem to him without coming away with some suggestion for the patient's benefit. He was legendary to the many men who trained under him for his uncanny ability to size up a patient's problem as well as to bring to light what might be done for the patient.

What motivated him were pure elements of human character: devotion to principle, self-denial, compassion for the sick, an unfailing sense of duty, and a love for the work he devoted his life to and for the place in which he worked. Nothing he ever did even faintly suggested self-promotion; all that he did was for others. These qualities, plus a high degree of intelligence, a wonderful sense of humor, and enormous perception and sensitivity to all things about him made him truly one of the greatest of all physicians that Memorial Hospital has been privileged to have carry forward its noble undertaking.

Many men inspire by their example of character but count for little in the way of other accomplishments in life. Not so for Dr. Karnofsky. He not only inspired others by his character but his accomplishments had vast substance and impact on American medicine. He, more than any one individual, was responsible for having established the clinical discipline known as medical oncology. By establishing this discipline upon sound principles and objective observations, he made it respected by the medical community and was responsible for attracting many men to the field. In addition, his many original observations in the field of cancer chemotherapy helped form the basis on which a wide variety of chemical agents are used clinically today.

For this unique man we will always have love and affection. The world was enriched by his life as were all of us who were privileged to be his colleagues.

Dr. Karnofsky is survived by his wife and four children.

W. P. Laird Myers, M.D.

Robert Earl Kaske

June 1, 1921 — August 8, 1989

Robert Earl Kaske, an eminence among the medievalists of his generation and a teacher of extraordinary skill and dedication, died at his home on North Quarry Street on 8 August 1989, having served for twenty-five years as professor of English at Cornell and, since 1975, as Avalon Foundation Professor in the Humanities.

Bob grew up in Cincinnati, where he was born on June 1, 1921. He graduated *magna cum laude* from Xavier University in 1942, immediately entered the field artillery, and served with distinction as a platoon leader and company commander in the Pacific. Upon leaving the army he began graduate study at Chapel Hill, receiving his doctorate in 1950. He taught at Washington University, Penn State, Chapel Hill and Illinois before coming to Cornell in 1964.

Once installed at Cornell, Bob founded a graduate program in Medieval Studies which soon came to be recognized as the foremost program of its kind in North America. Sustained by Bob's own rigorous standards and boundless enthusiasm, and by his unique ability to instill these qualities in others, the program produced a group of scholars who have become the backbone of the next generation in medieval studies, and who, in their collective achievement and their dedication to the pedagogical and scholarly ideals of their mentor, constitute Bob's true monument.

If Bob was the heart and soul of the Medieval Studies Program, the heart of his teaching was a bibliographical seminar which not only opened up the possibilities of medievalist scholarship to Bob's own students, but was presented in various forms at virtually every major center of medieval studies in the country, and has become one of the scholarly legends of our time. A burning issue among students of medieval poetry in the '50s and '60s was the question of whether our mystery could be practiced, as it were, *in vacuo*, on the model of that "New Criticism" which, in other areas of literary study, was rejecting traditional historicist scholarship in favor of a minute attention to the internal workings of the text. Those opposed to this tendency argued that, because of the historical remoteness of the medieval world, the poetry of that world must be read as nearly as possible through medieval eyes, in the light of a careful reconstruction of medieval intellectual and religious culture. Bob Kaske, though his writings abound in "close readings" as deft and probing as those of any new critic, was strongly committed to this latter position, and did perhaps more than any medievalist of his time to give practical expression to the historicist ideal. His bibliographical seminar was both a dazzlingly comprehensive repertory of the literary and religious texts medieval scholars read and wrote, and an introduction to the ways in which these texts can be employed in

the study of medieval literary culture. Conceived with an astute eye to the needs of beginning graduate students, it made the tools of serious medievalist scholarship available to them and communicated Bob's own zeal for such scholarship in a highly effective way. The material substance of the seminar was eventually reproduced in book form (*Medieval Christian Literary Imagery: A Guide to Interpretation*. Toronto, 1987), but while this has achieved its due acknowledgment as an indispensable tool for medievalists, no mere book can recreate the rich life its contents enjoyed in the animated version purveyed by Bob himself over three decades.

In the classroom Bob was a showman in the best sense of that term. His lectures were entertaining (often very funny), well organized and informative. Perhaps the most striking feature of his teaching, however, was his scrupulous care in responding to students' written work. Submitting a paper to Bob Kaske was a great educational experience: his students learned how to write English, and how to develop an argument, and when they made mistakes Bob would not only show them what was wrong, but would characteristically show them how to correct it. In this aspect of the process of teaching, Bob simply had no peer.

Bob also had a wonderful capacity for maintaining warm scholarly friendships, and will be sorely missed by his colleagues in the profession. In addition to working tirelessly with his own students, he frequently served as a much-admired mentor for medievalists who had not been in his courses, a generosity which extended to his work as a member of the editorial boards of *The Chaucer Review*, *A Manual of the Writings in Middle English*, *Speculum*, and *Traditio*. From 1975 until his death he was chief editor of *Traditio*, and one of the great scholarly editors of his generation: a colleague has observed that his extensive bibliography would be far longer if it could be made to include the many contributions to that journal that Bob has in effect co-authored.

Among many honors and awards, Bob received fellowships from the American Council of Learned Societies, the Guggenheim Foundation (twice), Cornell's Society for the Humanities, the Southeastern Institute of Medieval and Renaissance Studies, and the National Endowment for the Humanities. In 1975 he was elected Councillor of the Medieval Academy of America, and in 1982 he was named as a Fellow of the Academy.

Bob Kaske is survived by his wife, Carol, professor of English at Cornell; a son, Richard, of Ithaca; a son, David, of Cincinnati; and three grandchildren.

Alice M. Colby-Hall, Thomas D. Hill, Winthrop Wetherbee

Jacob (Jack) Kaufman

December 13, 1914 — March 9, 2005

Jacob (Jack) Kaufman passed away on March 9, 2005 at the age of 90.

Professor Kaufman had a long association with Cornell's ILR School, starting in 1950 when he was a member of the University of Buffalo faculty and taught part-time as an Adjunct faculty member for the ILR Extension program in Western New York, specializing in Railroad Labor Relations. In 1955, he served as a full-time Visiting Lecturer on and off campus. After joining the faculty of Penn State University as Professor and Director of the Institute for Research on Human Resources, he was appointed Professor and Director of Cornell ILR's Metropolitan Extension office in 1977. His research, teaching and publications dealt with issues in labor economics, labor relations in the railroad industry, and manpower training. From 1981 until his retirement, Professor Kaufman was the Associate Director of the Division of Extension. Upon his retirement in January 1985, he was named Professor Emeritus.

His son, Richard Kaufman of New Paltz, New York, survives him.

Lois Gray

William H. Kaven

September 25, 1922 – December 27, 2008

William H. Kaven, Professor Emeritus of Economics and Marketing in the School of Hotel Administration, died on December 27, 2008, at Cayuga Medical Center in Ithaca. Bill was born in Canton, Ohio, where his father ran a successful wholesale distributing business supplying hotels, restaurants, industrial caterers, and food and drug stores. The years in which he observed the family business, then managed and owned it, colored Bill's entire career teaching management.

He attended the local Canton public schools, earned his Bachelor's degree from Ohio State University in 1946, his Master's in Business Administration from Kent State University in 1962, and a doctorate from Cornell in business and public administration in 1965. While a graduate student at Cornell, Bill lectured part-time at Ithaca College (1963-65) before taking faculty positions at the University of Virginia (1965-68) and Sir George Williams University (now Concordia University) in Montreal (1968-70). He returned to Cornell in 1970 as an Associate Professor and was promoted to professor with tenure in 1980. Initially, Bill taught undergraduate economics courses but he quickly grew into the head of the School's marketing department. One former student, who later was involved in the School's alliances in the Caribbean, remembers Bill "as a tall, distinguished gentleman, smoking cigars in his office" conversing in an intense, but fatherly, manner.

In 1944, Bill married Frederica Kraft and they briefly lived in Monroe, Louisiana, while Bill underwent military training in the Army Air Corps. He served as an aerial navigator in the Second World War flying support missions behind enemy lines, dropping supplies and personnel and evacuating the wounded (particularly in Yugoslavia); another duty was to fly such generals as Dwight Eisenhower to their official meetings. After peace was declared in Europe, Bill was stationed in Belem, at the mouth of the Amazon River, and flew relay legs transporting troops and officers to Asia, where the war continued. Frederica and other wives joined their husbands for several months in Belem.

After the war, Bill completed his Bachelor's degree at Ohio State. The Kavens then moved to Canton where he worked again for the family distributing business, buying it in 1952 and greatly expanding it. He was active in Canton business and community organizations, serving on many boards, charity and civic, including six years on the Canton City Planning Commission. Their three children—Robert, Mary, and Luke—were born in Canton. The very evening after attending a presentation by an Ohio State professor, Bill announced to Frederica that he

wanted to take up an academic career. Acting on that decision immediately, he commuted an hour each way to his master's classes at Kent State University while continuing to work full-time to manage his business. M.B.A. degree in hand, the family moved to Ithaca where Bill undertook his doctoral studies in Business and Public Administration at the Johnson Graduate School of Management.

After earning his doctorate, Bill first taught organizational theory and behavior, marketing, and economics at the McIntire School at the University of Virginia, then moved to Sir George Williams University in Montreal for two years. In Canada, both Kavens were sympathetic to the anti-war movement and provided substantial assistance to conscientious objectors. Still, they felt too removed from American culture and sought a position back in the States. Thus Bill joined the Hotel School faculty in 1970 and the couple moved into a lovely historic home on Wyckoff Road, which they furnished with the antiques for which they shared a passion. Throughout many decades of attending auctions and house sales, they amassed an exceptional collection of distinctive Americana. At their Wyckoff home and the house overlooking Cayuga Lake to which they subsequently moved, they entertained colleagues and friends from Ithaca and around the world with wonderful food, warm humor, and lively dinner conversation ranging over every conceivable topic.

Bill introduced the first required marketing course for hotel undergraduates and established among students a strong specialty interest in international marketing. During his first sabbatical, in 1977, he and Frederica traveled throughout Europe and South America during which Bill taught and conducted research at schools in The Hague, Helsinki, and Rio de Janeiro. In fact, his career at the Hotel School was marked by a number of international responsibilities and initiatives. After former dean Robert Beck appointed him Director of International Programs at the School, Bill established and helped oversee hospitality curricula in Aruba, Brazil, the Dominican Republic, Mexico, Puerto Rico, and Venezuela. Some of these programs that Bill helped seed are still flourishing today.

Students whose lives he enriched recall Bill as an arresting figure. Dr. Bonnie Farber Canziani, Director of the Hospitality Program at UNC, Greensboro describes Bill as the single most influential person in her career. While an undergraduate Spanish major, Bonnie took several business elective courses in the Hotel School and remembers that while she was reading hallway flyers about teaching in Mexico and Brazil, a tall man came by and asked if she was interested. After she admitted that she was not a hotelier, Bill "hurrumphed" and invited her downstairs for coffee. Next thing Bonnie realized, she was taking three masters courses her senior year and applying for the M.P.S. program. She then taught in Venezuela and Puerto Rico on behalf of the international alliances. Bonnie says,

“Without that chance meeting, I would probably never have had the opportunities I have had, including coming back to Cornell for the doctorate. All thanks to Bill Kaven.”

Daniel Sternfels, whom Bill recruited to be the first director of the program in the Dominican Republic, also remembers Bill fondly. He reports that when fluctuations in the exchange rate seriously affected the D. R. Hotel School’s operating budget, Bill first backed the young Cornell team’s compensation 100%, then negotiated a reduction in Cornell’s fees. Dan recalls Bill, as do so many other students, as “a true friend and gentleman.” Another student, Italian Roberto Wirth, who has a serious hearing impairment, remembers how Bill went out of his way to provide individual tutoring which helped stimulate his understanding of marketing. Later Bill developed a case study around the Hassler Hotel in Rome, which Roberto manages, and twice invited Roberto to guest lecture in his courses. Roberto, who for thirty years maintained a strong personal relationship with his mentor, says,

“I owe him a lot because his patience in sharing his knowledge allowed me to base my business on his principles and his overall generosity contributed to make me what I am today.”

Bill was heavily engaged in executive education programs around the world, especially in Japan and India, many for the Hotel Sales Management Association (HSMA) but others for national hotel associations, government tourism agencies, and international hotel or restaurant companies. Similarly, his consulting was largely in international marketing involving trade associations but dealing more broadly with tourism development for such clients as the Puerto Rico Tourism Development Corporation and the Indian Institute for Tourism and Development. In the 1970s, he was appointed to the advisory board of the Brazilian Cultural Foundation in New York.

His professional interests were reflected in his scholarship as well. Bill authored one book, *Managing the Major Sale*, published by the American Management Association, and numerous case studies, book chapters, and articles about international hospitality marketing and the management of distribution channels, many for the *Cornell Hotel & Restaurant Administration Quarterly*.

Bill served the University in a number of assignments, as a member of the University Senate and the Faculty Council of Representatives, the University Unions Board of Governors, and as chair of the Campus Store Advisory Board for eight years. At the Hotel School, in addition to so ably leading the international initiatives for many years, Bill served on the Scholarship Committee, Graduate Admissions Committee, and countless search and tenure committees. When Bill retired in June 1993, he was appointed Professor Emeritus.

Bill Kaven is survived by his wife, Frederica; three children—Rob, Mary, and Luke; grandsons Daniel and Trevor; two great-grandchildren; and numerous nieces and nephews. He touched the lives of countless students at Cornell and elsewhere including participants in professional seminars in all corners of the world. His colleagues and friends miss him greatly.

Richard H. Penner, Chairperson; A. Neal Geller, Leo Renaghan

Chase Delmar Kearl

July 26, 1917 — June 27, 1973

The life of Chase Delmar Kearl was dedicated to family, work, and service, and to living each day fully. After a day at the office and an evening of work in the garden, he was found dead in the pasture of their farm home on the night of June 27. A medical examination identified a massive coronary as the cause of death. His attachment to family, his commitment to work, and his interest in agriculture was pursued to his life's end.

Delmar Kearl grew up in an agricultural environment, his father having been an agricultural extension agent. He did his undergraduate work at the University of Idaho and at Utah State University, where he received the Bachelor of Science degree in 1941. He was active in student affairs and on the yearbook staff. During World War II, Kearl served as an officer in the anti-aircraft artillery. He participated in the invasion of Normandy and was wounded during the recapture of France and Belgium. While in military service, he met and married Marjorie Lail of North Carolina.

In 1946 Delmar Kearl came to Cornell University to do graduate work in agricultural economics. He received a master's degree in 1947 and a Doctor of Philosophy degree in 1949, and upon completion he joined the staff of the agricultural economics department as an assistant professor of farm management. He became an associate professor in 1952 and a full professor in 1961.

Professor Kearl taught a course on farm cost accounting, but he spent most of his time doing research on farm enterprise costs and returns, and on the evaluation of new technology. His research was carried out with farmers of the state, who on a voluntary basis agreed to keep detailed physical and financial records for each productive enterprise on their farms. A special commitment and persistence is required on the part of a researcher to gain this kind of cooperative effort and to insist that it be done well. Analysis can be tedious and pedestrian, but Del never let detailed work interfere with the larger purpose, recognizing the value that such research can have in the development and maintenance of a viable agriculture. In recent years, he restructured and computerized the Cornell farm cost accounting system, the oldest and most respected in the United States. Among its many uses, the basic input-output data from this project is used throughout the nation in the linear programming and budgeting of farm enterprises. He was a strong advocate of the principle of making research results available promptly to all who could use them, so he was a frequent contributor to the *Extension News* and other farm magazines, and the author of many college publications.

Del Kearn had a unique faculty for sensing critical areas related to changes in farming. He researched these areas in order to arrive at conclusions which he was willing and able to defend. This he did with such areas as specialized poultry operations, free-stall housing for dairy cattle, sugar beet production in New York, the places of soybeans and of corn for grain in this region, and recently, changes in systems for growing fruit. In approaching these situations, he faced facts squarely and encouraged others to do the same. He spoke clearly on the basis of his analysis even though it differed from views held by others. He was respected for his fearless desire to present facts as he saw them, and for his belief that such commitment was essential in applied research.

Del Kearn served as secretary-treasurer of the American Agricultural Economics Association from 1958 to 1969 and assumed primary responsibility for preparing and publishing the first two directories of the membership of the Association. At the termination of his office, a special citation in recognition of his service was presented to him at the annual meeting of the Association.

From 1954 to 1956, Professor Kearn was a member of the Cornell-Los Banos team to the University of the Philippines, College of Agriculture. He assisted in developing their department of agricultural economics and at the same time interested a number of young Filipinos in the study of agricultural economics — some of whom now hold key positions in the Philippines. He also provided leadership in organizing the Philippine Agricultural Economics Association. In 1960 he went to Uganda as an adviser to the Department of Agriculture. There he collaborated with Ugandans in writing a text on farm management which included illustrations from East African experiences. He also served as a consultant in Jamaica, to the University of Venezuela, and to the Puerto Rican Agricultural Experiment Station.

In addition to his professional duties, Professor Kearn participated in many activities of the Greater Cornell community. He was a member of the Board of Directors of Cornell United Religious Work, and served several years as a director of Cayuga Lodge, a cooperative housing unit on campus. He and his wife were former cochairmen of both the Belle Sherman and the Lansing Parent-Teacher Associations, and board members of the Grad Fax Club. He had been president of the Bryant Civic Association and was a member of the Lansing Lions Club. He served as a scoutmaster, on local and regional scout boards, and at the time of his death was chairman of the sustaining membership committee of the Louis Agassiz Fuertes Boy Scout Council. He was a Kiwanis Little League baseball coach and a Pee-Wee hockey coach, having had a winning team that played throughout the Northeast and Eastern Canada.

Delmar Kearn was active in the Church of Jesus Christ of Latter-Day Saints. He served as a missionary in England from 1937 to 1939 and, while living in the Ithaca area, held numerous administrative positions in the local, regional, and state branches of the church. He served as chairman of the building committees for both the Mitchell Street Chapel built in 1952 and the Burleigh Drive Chapel built in 1970.

Home and family ranked high among Del Kearn's values. Even with a heavy professional schedule, he found time to coach his boys' teams and to teach them how to work and assume responsibilities. He purchased a farm home in order to enhance the environment for rearing his children. Gardening was one of Del's hobbies. He planted more than enough for the family needs and enjoyed sharing vegetables and flowers with neighbors, friends, and colleagues. His home and garden were always well cared for and a source of much satisfaction to him and his family.

He is survived by his wife, Marjorie Lail Kearn; three daughters, Mrs. Sandra Kearn Stone, Debbie Ann, and Shari Lyn; three sons, Steven, Kenneth, and Rodney; a sister and four brothers.

The life of Del Kearn was a full and busy one. He organized and managed well, was meticulous in attending to details, and was devoted to the improvement of agriculture and the well being of mankind. He was strong in his convictions, believed in the right to think otherwise, respected the rights of others, and fostered the Cornell tradition of freedom with responsibility. His contributions to the University, state, nation, and the world will continue as farmers, students, and professional colleagues benefit from the work he did and the ideas he developed during the more than twenty-five years of association with Cornell University.

Eddy L. LaDue, William W. Reeder, C. Arthur Bratton

William T. Keeton

February 3, 1933 — August 17, 1980

William T. Keeton, Liberty Hyde Bailey Professor of Biology in the Section of Neurobiology and Behavior, and member of Cornell's Board of Trustees, died at his home on August 17th. He was forty-seven.

Keeton was born and raised in Virginia. He attended the College of the University of Chicago, receiving a Bachelor of Arts degree with distinction in 1953, and subsequently a Bachelor of Science degree in zoology in 1954 in the Division of Biological Sciences at the same institution. He began his graduate work at the Virginia Polytechnic Institute, where he received a Master of Arts degree in 1965, and completed it at Cornell, where he was awarded the Doctor of Philosophy degree in 1958.

After occupying brief positions at Radford College and Virginia Polytechnic Institute, Keeton joined the Cornell faculty of entomology in 1958. One year later he began teaching the introductory biology course, soon known on campus as "Keeton's course" because of his spellbinding lectures. Often there was standing room only at his presentations, with students overflowing into the hall to hear him speak. He sought to integrate botany and zoology in his teaching and saw evolutionary theory and adaptation as the unifying concepts. His creative approach won him critical acclaim, and the graduating seniors of 1966 bestowed upon him the Professor of Merit Award for excellence in teaching.

Driven by his own enthusiasm for the course, and encouraged by the students' responses, he wrote his textbook, *Biological Science*, which was first published by Norton in 1967. Now in its third edition, the book has introduced thousands of students to biology and stimulated untold numbers to take up biology as a profession.

In his early years at Cornell, Keeton established himself as a leading scholar in the study of the systematics and phylogeny of millipedes, but in 1965-66 he made a major shift in research priorities and took up the study of orientation mechanisms of animals.

As a boy in Virginia, Keeton had raced homing pigeons, and their navigational feats stimulated his curiosity. When the Division of Biological Sciences was created, he joined the Section of Neurobiology and Behavior and established a large research project devoted to discovering the secrets of pigeon homing.

He was the first to report that pigeons can orient under total overcast, without the sun as a dominant cue. He was also one of the first to document the use of magnetic cues in homing orientation. Such findings led to a totally

new philosophy for conducting orientation research. Prior to Keeton's discoveries, researchers had been seeking a unified, single-cue theory to explain homing behavior. But Keeton was able to demonstrate that animals can use multiple sources of directional information. Recent work by Keeton and his associates led to the discovery of other cue systems (involving polarized light, infrasound, and sensitivities to barometric pressure). It also focused on questions of the hierarchy of importance of the various cueing systems, and on how the merits of alternative cues are evaluated by an organism. Keeton became an international leader in orientation work, and the Cornell lofts served as a center for visiting students and scientists from around the world.

Keeton was a most active member of the Cornell community. He served on innumerable committees, was the secretary of the University Faculty (1969-71), a member of the Faculty Council (1969-71), chairman of the Section of Neurobiology and Behavior (1970-76), and had been recently elected to a five-year term on the Board of Trustees. His loss will be deeply felt by his students and colleagues at Cornell and throughout the academic world.

He is survived by his wife, the former Barbara Orcutt; two daughters, Lynn and Nancy; a son, William Scott Keeton; and his parents, the William Ivy Keetons of Richmond.

Thomas Eisner, Howard C. Howland, Melvin L. Kreithen, Stephen T. Emlen

Elizabeth B. Keller

December 28, 1917 — December 20, 1997

Dr. Elizabeth B. Keller, a member of the Cornell University faculty for 23 years, died of leukemia on December 20, 1997 at the age of 79. She was a valued friend and colleague to many of us in the Section of Biochemistry, Molecular, and Cell Biology and to others on this campus. Like some other biochemists of her generation, she had an unending love of her discipline that led her to continue her research and teaching up until a week of her death.

Dr. Keller (born Elizabeth Waterbury Beach) was the youngest of three daughters of Frederick P. Beach and Ruth W. Beach, Congregational missionaries in China. Her childhood in Fujian Province, China, had a major impact upon her character and outlook on life. She attended Oberlin College for two years and received a B.A. degree from the University of Chicago in 1940. Her Ph.D. work, carried out under the direction of Dr. Vincent duVigneaud at the Cornell Medical College in New York City, was on the formation and transfer of methyl groups in metabolism and involved some of the early uses of radioisotopes to trace metabolic pathways. From 1949-60 at Harvard University and the Massachusetts Institute of Technology, she studied the process by which cells make proteins, a subject that was central to biochemistry and the newly emerging field of molecular biology at that time. Among her major accomplishments of that period were working out methods for concentrating all of the protein factors necessary for performing protein synthesis in a test tube, showing that GTP was required for protein synthesis in addition to ATP, and finding that large particles (now called ribosomes) are necessary for protein synthesis.

Recruited to Cornell by Dr. Robert Holley, Dr. Keller became a member of the faculty in 1965. She contributed to the work that culminated in the determination of the nucleotide sequence of a transfer RNA from yeast, work for which Holley received the Nobel Prize. Dr. Holley shared the prize money with his close colleagues, including Dr. Keller. A feature of transfer RNAs that is mentioned in every biochemistry textbook, its ability to fold into a cloverleaf structure, was the brainchild of Dr. Keller. The focus of some of her later work centered on signals required for initiation of transcription of genes in multicellular organisms, using as an example a muscle-specific gene from the fruit fly. In addition, she chose to study a family of genes and their protein gene products, the Ras family, that are known to be altered in a large percentage of some cancers. She worked on where these proteins are localized within cells, and investigated changes in the properties of cells caused by different members of the Ras family.

In reviewing Dr. Keller's scientific work, one can find a continuous thread that runs through it, all related to the expression of genes. She was a major participant in three landmark areas of biochemistry, starting with her work reporting the chemical synthesis of methionine labeled with carbon 14 that was the starting point for tracing the flow of methyl groups in metabolism. The Nobel prize awarded to Vincent duVigneaud was based in part upon this work. Having a labeled amino acid in hand, it was natural to extend her studies to how amino acids made their way into proteins, a problem that she tackled in collaboration with Dr. Paul C. Zamecnik at the Huntington Laboratories at Harvard and the Massachusetts General Hospital in Boston. Her papers during that period of the 1950s are classics, essentially laying out the major outlines of protein synthesis. The protein synthesis trail led inevitably to RNA, and her admiration for Robert Holley's work led her to Cornell in Ithaca and her important contribution to the structure of tRNA. The last-mentioned contribution stemmed in part from her love of and need to visualize molecules with models, usually simple models that she constructed from paper and paper clips, or pieces of wire. Some of her models were used by colleagues for decades in teaching undergraduate students.

Dr. Keller's work was funded continuously by the National Institutes of Health from the time of her appointment at Cornell University until her retirement. She trained nine Ph.D. students, two of whom work in industry and the others having faculty positions in various parts of the world. In addition, her laboratory provided training to nine postdoctoral students. Dr. Keller was a mentor to many undergraduate students. At the time of her death, four undergraduate students were working on independent research projects with her, and three of them continued their projects and wrote honors theses. Dr. Keller maintained an active correspondence with many of her students, including undergraduate students who worked with her.

Dr. Keller was instrumental in designing and teaching laboratory exercises that served well a generation of undergraduate and graduate students. She was not comfortable in front of large audiences, but overcame that shyness when asked to present lectures in cell biology, something she did for the last 10 years. Her lectures were characterized by meticulous preparation.

Dr. Keller's style was to work behind the scenes to insure an environment where all could work effectively. She was the person who made sure that common equipment worked, that the distilled water was of high purity, and that the library had the best collection of books. Inspection of the library in the Biotechnology Building, now the Elizabeth B. Keller Reading Room, offers a glimpse of her personality. The choice of books and journals reflects Dr. Keller's tendency to focus on the essentials, and the orderly atmosphere mirrors her uncluttered mind.

Bik Tye, David B. Wilson, Joseph M. Calvo

Gerald B. Kelley

June 24, 1928 — December 7, 1987

Gerald B. Kelley came to Cornell in 1963 from the University of Wisconsin, where he had received a Ph.D. and had become chair of the Departments of Linguistics and Indian Studies. His previous educational experience was in and about Boston, and he was particularly fond of recollecting his days at Boston Latin School, from which he graduated in 1945. Throughout his career he remembered his Latin School lessons well, frequently citing passages from Greek, Latin, and English literature and, in rare lapses of memory, reminding his interlocutors that a true gentleman should have at least forgotten his Greek.

Gerry spent several years in India, where he loved to be, and of which he had a deep and broad knowledge. He played an important role in training scholars and in helping to establish centers of linguistics. He was a Rockefeller Fellow in India from 1957 to 1959 and while there taught in the summer schools of linguistics that were so significant in training the leading and now senior linguists of India, as well as a large number of their American counterparts in Indian linguistics. With the late Gordon H. Fairbanks, also of Cornell, he helped to establish, under the auspices of the Ford Foundation, the Linguistics Department of the University of Delhi, which remains one of the most active centers of linguistics in India. He was most closely associated with Hyderabad, however, where he was instrumental in establishing the distinguished department at Osmania University.

As Telegu was the primary area of his own research, he visited there on many occasions for short or long periods. A large proportion of the linguists there were his students or his close colleagues. His services at Osmania have now been recognized by a series of endowed annual lectures on linguistics in his name, testifying to the high regard and affection in which he was held.

In addition to his professional linguistic interests, Gerry was especially engaged by anachronistic remnants of the Raj, as he was by anachronism in general, not without a characteristic mixture of affection and detachment. He had a keen observer's eye for imperial remnants and their extensions and transformations in independent India, of which he provided vivid and lively characterizations to many an engaged audience. He particularly treasured his membership in the Secunderabad Club, where the regimental insignia and portraits of the military commanders are displayed in a series unbroken from the nineteenth century to the present; the only detectable difference since independence was that those regiments, and the commanders, are now Indian. He, with his wife Helen, was working on a book on decorative motifs displayed on antique cannon found in India. A drawing by Peter Kahn of

one of these designs appears on the bookplate which will be appended to the books acquired through the Gerald B. Kelley Memorial Book Fund of the Cornell University Library.

At Cornell, Gerry taught courses in general linguistics and sociolinguistics as well as south Asian linguistics, and in recent years also taught a course on the history of English. He also was in charge of instruction in Hindi and Telegu, and conducted Hindi examinations under the National Association of Self-Instructional Language Programs.

His earlier articles are on Telegu, and especially phonology, but the work for which he is most often cited is his paper on "The Status of Hindi as a Lingua Franca", which was a pioneering contribution to Indian sociolinguistics utilizing census data in a careful but imaginative way. Much of his subsequent work had to do with sociolinguistic problems with special reference to India, and at the time of his death he was working on a general book on sociolinguistics. He was also engaged in research, in tune with his other interests, on the language of the log of an East Indiaman in the first half of the last century.

Gerry Kelley served on several occasions as director of the South Asia Program and the South Asian Center at Cornell. He was also present at the founding of the American Institute of Indian Studies, of which Cornell is a charter Class A member, and served several terms as a trustee of that consortium, which is the major funding source and conduit of funding for American scholars in Indian studies, facilitating research and conducting language programs. He also served on its language committee and at the time of his death was an elected member of the Executive Committee.

From 1971 to 1975 Gerry served as chairman of the Department of Modern Languages and Linguistics, an organization founded in 1946 as the Division of Modern Languages and headed at that time by J Milton Cowan. Gerry was thus responsible for the success of that transition from a division to a department, as well as being in charge of the complete renovation of the building that housed it, Morrill Hall. It was under Gerry Kelley's chairmanship that Morrill Hall came to be devoted in its entirety to Modern Languages and Linguistics.

Gerry was a person singularly lacking in malice, but with a capacity for outrage, which was triggered by perceived injustice and particularly by what he perceived as exploitation or victimization of the less powerful. He possessed a lively and penetrating sense of humor, often at his own expense and never mean, which found an outlet in his capacity for animated and colorful expression and the precise turn of phrase. These characteristics along with his mastery of the anecdote as an art form, made him a delightful companion as well as a supportive colleague.

He was immensely gregarious and his pleasure in friends was mixed with his delight in language. His sport and his pastime was free-wheeling conversation, and any flash of wit, or unexpected figure of speech, his own or another's, brought an almost physical joy. He was a great raconteur, and this gift was fed by an almost photographic memory. His gently skeptical view of life was at the heart of his humor, keeping him alive to the possibilities for absurdity lurking in the most conventional of situations. Something of this quality caused him to treasure a poem of Archilochus which he kept in the Greek original on his office wall. In it a warrior laments the loss of his shield to a barbarian, but brightens immediately at the thought that, after all, he survived the battle and can always buy another one just as good.

James W. Gair, Stanley J. O'Connor, Richard L. Leed

Peter Paul Kellogg

December 13, 1899 — January 31, 1975

Peter Paul Kellogg, professor emeritus of ornithology and bioacoustics, died of cancer in Houston, Texas, on January 31, 1975. Born in Wilkes Barre, Pennsylvania, he moved to Rochester, New York, at the age of four. When he was fourteen, he left school and worked, successively, in a shoe factory, as a Western Union messenger, and as a meat-market clerk. At the age of twenty-two he returned to high school to prepare for college, supporting himself during this period with a full-time job in a coal-gas plant at night. He entered Cornell in 1925 and received his B.S. degree in 1929, at the age of thirty. He promptly enrolled as a graduate student in ornithology under Arthur A. Allen, and received his Ph.D. degree in 1938. Having held the position of instructor in ornithology during his graduate years, he was appointed an assistant professor as soon as he completed his doctorate in 1938. He was promoted to the rank of associate professor in 1946, and was named a full professor in 1953. He officially retired from Cornell with emeritus status in 1966, though in recent years he taught ornithology courses in Cornell's summer Alumni University.

Professor Kellogg was best known for his work in recording and analyzing bird songs and other natural sounds. Not content merely to use established techniques in his work, he devoted much of his effort to developing better equipment for field work in bioacoustics. For example, he and a student, Peter Keane, developed in 1932 in the basement of McGraw Hall the first parabolic reflector for use in the field recording of natural sounds, after having seen a photograph of a reflector being used in a theater to catch the voices of the actors on stage. Later he worked with N. M. Haynes of the Amplifier Corporation of America in the development of the first commercially produced field tape recorder, which was marketed in 1951. This tape recorder was promptly adopted by most investigators in natural history recording and thus greatly expanded the possibilities for work in this area of biology.

Dr. Kellogg participated in several important expeditions for the purpose of recording bird songs. To mention only a few of these, he and Dr. Allen visited many parts of the United States in 1935 to record the voices of species of birds that were threatened with extinction. In 1939 he and Allen made a trip to the Pacific Coast and to Arizona to record birds. In 1961 he participated in an expedition to the Orinoco Basin in eastern Venezuela. At various other times he made field trips to East Africa, Mexico, and the Caribbean.

During World War II Dr. Kellogg temporarily left Cornell, first to organize and direct a radar school for the Western Electric Company and later to investigate acoustical problems of jungles for the U.S. Army. The latter work was carried out in Panama in 1944-45.

Through the joint efforts of Professors Allen and Kellogg, Cornell became known as one of the principal centers for ornithological education and research in the United States. These two men were especially concerned with the importance of disseminating ornithological knowledge to the interested public at a time when the great stress on conservation education that we know today did not yet exist. This interest of theirs led in 1955 to the establishment of the Cornell Laboratory of Ornithology, with Professors Allen and Kellogg officially recognized as cofounders. A new building for the laboratory was erected and a sanctuary established in the Sapsucker Woods area, a few miles northeast of the main campus. The facility was dedicated in 1957. Dr. Kellogg became a life member of the Administrative Board of the Laboratory of Ornithology, and he also served until his retirement as assistant director of the laboratory.

One of Dr. Kellogg's principal activities in the laboratory was the establishment of the Library of Natural Sounds, which today includes recordings of songs or calls of about one-quarter of the world's species of birds, as well as recordings of amphibians and other animals. This facility is used not only by Cornell students and faculty but also by investigators at many other institutions.

The first published phonograph record of wild bird songs was produced at Cornell by Albert R. Brand in 1932, while Kellogg was a graduate student. Dr. Kellogg became very much interested in the production of such records, and over the years he produced a succession of recordings including "American Bird Songs," "Voices of the Night," "Bird Songs in Your Garden," "Dawn in a Duck Blind," and "Field Guide to Bird Songs," which accompanied Peterson's well-known *Field Guide to Birds*. These recordings became very widely known and contributed substantially to Cornell's reputation in ornithology. Proceeds from their sale became a major source of financial support to the Laboratory of Ornithology. There is every indication that their popularity with the public and their importance to the laboratory will continue for many years to come.

For nearly thirty years Dr. Kellogg's voice was familiar to radio listeners throughout the Finger Lakes Region through his production of the weekly program "Know Your Birds" on WHCU. This program will celebrate its fortieth anniversary in the fall of 1975. It is the longest continuously running radio program in the United States. The interest in ornithology and in conservation that it will surely continue to generate will serve as a memorial to Dr. Kellogg's many contributions to the study of birds.

Douglas Lancaster, W. T. Keeton

Burnham Kelly

January 23, 1912 — February 3, 1999

On February 3, 1999, the AAP College lost one of its most important members, Burnham Kelly, who gave the college its current shape and form. As Dean from 1960-71, Kelly guided the college into a new era of growth and change. He caused it to have greater recognition and prestige among the recognized leading schools teaching architecture, art and city and regional planning. His impact was felt across the college in the undergraduate and graduate teaching areas where he expanded the college's professional offerings to embrace urban design, historic preservation, and regional science. He re-established the dormant Landscape Architecture Program, and initiated a Masters and Doctoral program in Architectural and Urban History. He also helped build the excellent Ph.D. degree program in Regional Planning. During his term as Dean, the college gave the signal to the world about its new approach by restructuring itself into three departments and several new graduate fields. This was reflected in a change of name from the College of Architecture to the College of Architecture, Art and Planning.

The scope of change did not stop there. Kelly was a visionary builder in other areas as well. He started a New York City program for architects and planners, which gave AAP students an opportunity to study in an environment much different from Ithaca. In New York, they could experience the urban environment first-hand, and see the work of top architects, planners and artists. While there, students could meet with many of the leaders in their fields, an opportunity not readily available in Ithaca. In addition, Burnham embraced community service as an important responsibility of the college, and an integral part of the education of design and planning professionals. Indeed, with his urging and support, the college became the leader in service among the endowed schools at Cornell. The breadth and depth of these changes, in retrospect, is remarkable. The deans who followed him from the 1970s on built on the foundation he established.

Burnham Kelly was born in 1912 in Evanston, Illinois. He attended Williams College, graduating in 1933. He went on to study law at Harvard, graduating in 1936, and practiced law briefly in Rhode Island before returning to study city planning at MIT. He received the Master of City Planning degree from MIT in 1941, and eventually returned there to join the faculty of its Planning Department after a stint in the service during World War II. During the war years, 1941-45, Kelly worked with the National Defense Research Council and the Office of Scientific Research and Development in Washington, D.C. He also served overseas during this period, primarily in France, on war-related research. In 1946, he was awarded the Army-Navy Certificate of Appreciation for his work for the government.

Kelly taught and did research at MIT from 1945-60. His teaching dealt primarily with land use law and housing. In those years, Burnham's strong interests were focussed on research on industrialized housing. While there, he served as the head of MIT's Bemis Foundation that was concerned with the U.S. housing industry. His record of accomplishments at MIT brought him to the attention of the Cornell faculty and administrators as they searched for a new dean for what was then called the Architecture College. He was selected for the deanship in 1960. At Cornell, Kelly pursued his interests in land use law and housing. After leaving the deanship in 1971, he returned to the classroom to offer those subjects in the Department of City and Regional Planning. He continued to teach well after he retired from the faculty, until 1987. CRP students considered Burnham an excellent teacher who taught a rigorous course that was critically important to their preparation as planning professionals.

In his long career, Burnham was widely recognized for his abilities and accomplishments; for these, he garnered many awards. Among the most important to him was the recognition by his alma mater, Williams College, which awarded him the honorary degree of Doctor of Humane Letters in 1963. In addition, Kelly was appointed by President Kennedy to the National Fine Arts Commission, serving from 1963-67. This committee influenced all federal architecture and art in the nation's capital. Following this, New York's Governor Rockefeller appointed him to the New York State Council on Architecture where he served with distinction from 1968-72. He also served as a trustee for the institute for Architecture and Urban Studies in New York City from 1968-1974, and was a director of the Housing Association of Metropolitan Boston during his MIT days. Dean Kelly also published many articles and authored or edited two books emanating from his housing research with the Bemis Foundation: *Prefabrication of Houses and Design* in 1951, and *Production of Houses* in 1959.

Those who knew Burnham and who served with him at the AAP College when he was Dean remember him as always willing to listen and entertain new ideas. In a sense, he was a futurist, although he would be too modest to allow that term to be applied to him. He was easy to approach, thoughtful and supportive of the faculty's initiatives, but always looking to further ideas brought to him that would put the college at the cutting edge of the professions. His colleagues then and now think of him as a builder of programs at the college, especially those in the City and Regional Planning Department. He gave CRP the guidance, backing and encouragement it needed, at a critical time in its development, to make it the world-class department it is today.

His closest colleagues and friends knew him to be a warm and devoted father. He adored his wife, Jean, who shared many years of life with him until her death a few years previously. Burnham was a man who fully enjoyed life, especially being outdoors in nature. He loved skiing, both downhill and cross-country, enjoyed camping and

canoeing, and most other outdoor sports. In his retirement years, he continued to be physically active, expanding his interests to include square dancing, worldwide travel and the study of art. In retrospect, those who knew him well remember a man who led a full and productive life, leaving behind important contributions to his family, his university and to the community.

In later years, when he shared his life experiences, he seemed somewhat surprised that people thought he had done so much in his lifetime. He was truly modest, believing that he was not really deserving of any credit; he claimed that he was just doing his job. He believed that he was exceptionally lucky throughout his life, lucky with his wife and family, with the people who worked with him, and with the places he worked. His colleagues and friends felt fortunate, also, that he lived and worked with them in Ithaca at Cornell.

Pierre Clavel, John W. Reps, Stuart W. Stein

Matthew A. Kelly

June 17, 1913 — January 18, 1993

Matt Kelly grew up in the Bronx, the son of a textile salesman who died when Matt was very young. He was raised by his mother along with a younger sister and together they faced the depression. In addition to his considerable intellect and academic ability, Matt was a world class swimmer. He soon learned that he could use his swimming ability to further his academic ability. For example, he was recruited by Evander Childs High School in the Bronx to be a member of its swimming team. He won a scholarship to Mercersburg Academy where his swim team set a world record. He turned down an offer to be on the U.S. Olympic swim team to continue his education at Amherst College which he attended on scholarship and graduated *cum laude*, Phi Beta Kappa and with high honors in economics. He married Perce, who helped him work his way through Princeton University graduate school as coach of the Westchester Country Club swim team. After receiving his Ph.D. degree in economics from Princeton, Matt joined the Department of Economics as a faculty member from 1940 to 1950.

During World War II he took a leave of absence from academia to serve the United States government as chief economist for the Office of Price Administration and labor relations specialist officer in the U.S.N.R. Following the war he was enlisted by the Office of Military Government to represent the United States in negotiations and developing labor relations policies with U.S. allies, Great Britain, France and the Soviet Union for occupied Germany. After returning to the classroom at Princeton, he was again enlisted as a negotiator by the Printing Industry in Washington, D.C. and later in New York City where he represented unionized printers at the bargaining table for sixteen years, acquiring a reputation for labor relations expertise which was widely respected by both employers and Unions.

With his combination of academic and professional accomplishments, Matt was an ideal candidate for appointment to the ILR faculty as a member of the Collective Bargaining and Extension Departments, a position created in 1966, which involved him in resident teaching on campus and in designing and teaching courses for ILR practitioners in New York City. He also conducted a seminar for ILR resident students who spent a semester in New York City.

In the 1970s he directed a national conference and a series of seminars on “Automation and Employment” and an international conference held in Jerusalem on “Technological Changes and Human Development.” Conference proceedings which he edited were published as monographs. His research interests ranged from public sector bargaining to railroad labor relations and publications included a book on *Labor and Industrial Relations: Terms,*

Laws, Court Decisions and Arbitration Standards which is widely used as a text and reference work along with numerous articles on collective bargaining and arbitration.

Matt was a moving force in faculty discussions which led to the establishment of the New York MSILR Program with Baruch College. This was an unusual venture, never undertaken before or since, of a joint degree program involving the collaboration of two independent tax supported institutions aimed at providing graduate instruction in the evening for individuals who for the most part were actively employed in the field of industrial relations and human resource management. Unique to the program was that the faculty was full time while the students were part-time. The degree itself bore the name of both institutions and some students attended graduation ceremonies at both campuses.

Matt Kelly was the academic director representing Cornell when the first classes met in 1977 and, in addition to his administrative responsibilities, taught each term a variety of courses, most notably collective bargaining and arbitration. The MSILR Program in New York would not have survived without his patient shepherding and it remains a monument to his abilities.

His retirement in 1982 was only nominal although he yielded his administrative duties. Without a pause in the pace of his life, he continued to teach in the MSILR Program for eleven years until the last month of his life. Within weeks of his death, he wrote a letter to his successor acknowledging his inability to teach in the spring term although he promised that he would be available in the fall. It must be observed that his pay for teaching was minimal. Indeed, as his health weakened in the last years, the cost of door to door transportation to meet his classes exceeded his remuneration.

Matt Kelly was a master teacher who incorporated the best in Cornell's traditional concern with students. His course outlines were long and elaborate with each week's assignment set forth in great detail. His lectures were carefully crafted and structured on the essential points of his subject. He was a demanding teacher, insisting on high quality student performance, and somehow the students met his demands. He challenged them and they responded by rising beyond themselves. Homework assignments, exams and term papers were riddled with Matt Kelly's red pencilled comments which were an extension of his lectures.

Matt's service to the wider community of industrial relations was to be found in his work as an arbitrator, fact finder and mediator in many labor-management disputes.

As early as 1941, the Governor of New Jersey appointed him to a labor panel of arbitrators. Since then, he arbitrated in an enormous number of cases in both the private and public sectors. In 1971, during a period of wage and salary controls, he was a consultant with the Cost of Living Council, an alternate member of the Pay Board, a member of the Pay Panel and a Special Hearing Officer for Cases and Appeals. He was a mediator in disputes involving the City of New York and police officers and other uniform services, chairman of the President's Emergency Board for the Long Island Railroad and its non-operating unions, member of a Board of Inquiry in a contract dispute between cemetery workers and cemeteries in the metropolitan area of New York, and was arbitrator for the North American Soccer League and Players Association, New York City Transit Authority and Transit Supervisors Organization, District 1199, National Union of Hospital and Health Care Employees, and League of Voluntary Hospitals, and the International Association of Machinists and Aerospace Workers and the Trans World Airlines System Board of Adjustment. For over 20 years, he was the arbitrator of the Consolidated Edison Company of New York and the Utility Workers Union of America, Local 1-2.

To his colleagues, Matt was an endearing, outgoing and enthusiastic partner and friend in the complicated, ambiguous and wonderful world of academe. A wise and kind man, he remains in memory as he was in life a lodestar for personal decency and professional responsibility.

He is survived by his lifelong companion—his wife Perce—and two children. His son, Randy, has followed in his footsteps as an arbitrator and teacher in the labor relations field and his daughter, Debbie, is a practicing attorney.

Esta Bigler, Phil Ross, Lois S. Gray

William C. Kelly

June 14, 1919 — March 20, 1999

William Cary (Bill) Kelly, Professor Emeritus in the Department of Fruit and Vegetable Science at Cornell University, died at his daughter's home in California after a brief struggle with lung cancer. Bill Kelly was born in Memphis, Tennessee. He received his B.S. degree in 1940 from the University of Tennessee, his M.S. degree in 1941 from Ohio State University, and his Ph.D. degree in Vegetable Crops at Cornell University in 1945.

Bill married Judith Neil, December 27, 1942. They had four children—David, Karen, Steven, and Nancy—and seven grandchildren. Judy Kelly died in 1990 after a very protracted illness.

Bill's first position after the Ph.D. degree was as Horticulturist at the U.S. Plant Soil and Nutrition Laboratory in Ithaca. In 1948, he was appointed Assistant Professor in the Department of Vegetable Crops, where he conducted research and extension work in mineral nutrition and vegetable crop physiology. Although gifted in both research and extension, it was teaching and advising students that became Professor Kelly's real passion. He taught "Vegetable Crop Physiology" and "Research Methods in Vegetable Crops" for 30 years, and "Organic Gardening" for 11 years. In all of these courses, Bill took a personal approach to his students. For example, he typically knew the name, major subject, and interests of each of the 80 or so students enrolled in his two-hour course in organic gardening.

Bill Kelly pioneered new teaching methods. In his class in organic gardening, he did not lecture; students who previously had participated in the course made short presentations, followed by lively class discussions under Bill's supervision. In teaching vegetable physiology, he relied heavily upon classic research papers to make his points, and in so doing helped his students learn how to interpret and appreciate research. Students were organized into teams, and the members of each team worked cooperatively to "dig into" the research literature and develop answers to assigned problems. The product of these exercises provided the focus for a discussion period that Bill held weekly with each team. Students were expected to defend their conclusions based upon experimental data from the research articles. "Look at the data, not the abstract," was the constant reminder. Examinations were not written, but were given orally to the teams as an extension of the weekly discussion periods. In this way, Professor Kelly gave students experience in critical thinking, assimilation of information, and oral defense of one's position.

Bill Kelly's teaching assistants were encouraged to experiment, and he often adapted their ideas into the framework of his courses. Because of their association with Bill, graduate students wanted to teach and wanted to learn

to be better teachers. In recognition of his innovative teaching, Dr. Kelly received the Distinguished Graduate Teaching M.A. Blake Award from the American Society of Horticultural Science, the College of Agriculture and Life Sciences Edgerton Teaching Career Award, and the College of Agriculture and Life Sciences Professor of Merit Award.

Because of the personable traits evident in Bill's teaching style, he was much sought after as an advisor. Professor Kelly advised both graduate and undergraduate students, and over the years became a leading mentor for the department. He was known and loved for his warmth, independent thought, keen insight, honest criticism, and straightforward suggestions. He had a way of being supportive yet making people think for themselves. During the turbulent Vietnam era, when many professors were viewed with suspicion, Bill found ways to break through the barriers. His friendly counsel and non-judgmental attitude helped scores of undergraduate and graduate students survive those years. No count is available of the total number of undergraduate students for whom Bill served as advisor; but by the time of his retirement, he was advising 25-30 undergraduates per year, most from outside his department. Dr. Kelly's graduate advising was equally remarkable. He directed studies for 32 M.S. and 25 Ph.D. candidates and served on approximately 120 graduate student committees in the fields of International Agriculture and Vegetable Crops.

Bill Kelly was also appreciated for his technical abilities and common sense insights. He was a master of experimental design and analysis, and his ability with statistics served not only his own graduate students, but also many other graduate students inside and outside of the department. Faculty members frequently consulted with Bill, too. His memory for detail was remarkable; he never ceased to surprise with his ability to recall names of former students, authors of relevant papers, or obscure published material that might be helpful to the person who was asking him for advice.

Dr. Kelly's sabbatical leaves took him to the Philippines, Iran, and the United Arab Emirates. With H.C. Thompson, he co-authored the fifth edition of *Vegetable Crops*, the most influential college text on commercial vegetables. For more than 20 years, this classic publication was by far the leading college text on the subject.

Dr. Kelly was a member of the American Society of Horticultural Science, American Society of Plant Physiologists, American Association for Advancement of Science, Empire State Soil Fertility Association, International Society for Horticultural Science, Sigma Xi, Phi Kappa Phi, Gamma Sigma Delta, and Alpha Zeta. In addition to his teaching awards, he was a Fellow of the American Association for Advancement of Science.

Bill Kelly became Professor Emeritus in 1983 but continued his contributions to the department. In his retirement years, he found many ways to keep his mind sharp. He took courses in crafts, especially at the Farmers' Museum in Cooperstown, and collected antique tools. He enjoyed educational travel experiences, which he often combined with visits to his family. He continued to attend scientific meetings, where he was always a center of attention from former students; and when at home he hardly ever missed a departmental seminar. On Monday nights, Bill carried on his life-long love of bowling with other members of his department in the Ag Bowling League. Bill Kelly was one who helped shape the former Department of Vegetable Crops, and he will be remembered with affection by his former students and colleagues from around the world.

Robert D. Sweet, Leonard D. Topoleski, Elmer E. Ewing

Lincoln D. Kelsey

May 22, 1894 — September 6, 1966

Lincoln D. Kelsey was a missionary at heart who found an outlet for his interests through commitment to his community and to agricultural people at home and overseas. He trained students from all parts of the world in the art of extension teaching. Out of his sincere interest in other people, he assumed a number of varied assignments and carried them through with eminent success. His friendliness and keen sense of humor endeared “Abe” Kelsey to all who knew him.

Lincoln Kelsey was born in Saratoga Springs, New York, and spent much of his boyhood on a farm near West Hartford, Connecticut. His career of service began when he became a county agricultural agent in Massachusetts following his graduation from Massachusetts Agricultural College (now Massachusetts State University) in 1917. That career was interrupted for a period of military service during World War I but was renewed when he volunteered for Turkish agricultural relief work under the Near East Relief Program.

On returning from Turkey in 1920, Kelsey became an agricultural agent in Franklin County, where he also organized extension work in home economics. His work continued from 1923 to 1928 as an agricultural agent in Albany County. He organized 4-H work in that county.

His successful performance in the field led to his appointment on the Cornell staff as an assistant state leader of county agricultural agents. He remained on the extension administration staff until his retirement in 1955, but in the intervening years he participated as an organizer and a leader in numerous responsible positions, some of them as part of his official duties and some while on leave from his post.

In 1935, he took leave to serve as rural rehabilitation adviser with the Federal Emergency Relief Administration for the northeastern states. Upon his return to the University, he assisted the director of extension in relations with the Farm Security Administration, the Soil Conservation Service, the National Youth Administration, and the Rural Electrification Administration. He was the first secretary of the State Soil Conservation Committee.

In 1944, the missionary spirit again took Professor Kelsey overseas for two years as an agricultural specialist with the United Nations Relief and Rehabilitation Administration and then as director of agriculture and fisheries in the Balkan and Greek missions of UNRRA. In 1953, he returned to that part of the world under the United

States Department of Agriculture to assist in training 250 extension workers and to help establish a new extension service in Iran.

Following his retirement from Cornell, Professor Kelsey traveled to the Philippines on a joint assignment with the Council on Economic and Cultural Affairs (now the Agricultural Development Council) and the Cornell-Los Banos Project. While in Los Banos from 1956 to 1958, he greatly strengthened the pre-service training program at the Community Development Center. Throughout all his work abroad he took a personal interest in many individuals, their problems, and their way of life.

As a scholar and as a student of cooperative extension work, he was coauthor of a book with C. C. Hearne of the United States Department of Agriculture entitled *Cooperative Extension Work*. This text has been translated into six other languages. Through the book, through his other writings, and through an undergraduate class in extension which he taught for many years, Professor Kelsey helped shape the careers of many young men and women from this country and other parts of the world.

For fourteen years he directed the annual Farm and Home Week at Cornell. At the same time he served as contact officer for all foreign visitors coming to the College of Agriculture. His knowledge of other countries, his keen interest in agricultural problems, and his remarkable facility for relating himself to people with differing backgrounds and interests helped him meet the needs of approximately 200 visitors a year from forty or more different countries.

In his community, Professor Kelsey's interest in others found expression through leadership in the First Congregational Church of Ithaca and other community organizations. He served on the board of directors of the Congregational-Christian Conference of New York State. For fifteen years he served on the board of control of Cornell United Religious Work, twice as its chairman.

Professor Kelsey's interest in people was shared by his wife, Alice Geer Kelsey, who accompanied him on travels abroad. In addition to his wife, he is survived by four children and eighteen grandchildren. He enjoyed the out-of-doors, and, when stricken, he was camping in the Adirondacks, next to nature which he dearly loved.

Whatever he did, Lincoln D. Kelsey's friendliness and enjoyable sense of humor left an impression long to be remembered. His sincere interest in the welfare of other people was affirmed by his full and rewarding life as a good teacher, expert administrator, able volunteer in community work, and admirable family man.

Fred B. Morris, L. R. Simons, Arthur E. Durfee

M. Slade Kendrick

August 24, 1894 — June 17, 1980

Few persons more closely exemplified the scholarly gentleman of principle than did M. Slade Kendrick during his long career at Cornell. Toward students he was warm, friendly, and helpful, almost always optimistic and happy, but also gently insistent upon good work. He was a contemplative, introspective intellectual, calm of spirit, who read and wrote widely, enjoyed poetry, and appreciated philosophy. He was keenly interested in public affairs but avoided, apparently deliberately, intensive participation in political and community issues and problems. In his professional writings in economics and public finance, and in other writing as well as speech, he adhered to high standards of English expression. He was the soul of courtesy to friends and others.

His correctness of manner may have been misinterpreted as aloofness; yet he wrote in 1969 some years after retiring: “For some reason which I have never understood, people will sometimes tell me their problems, particularly their troubles. Thus I have come to know the feelings, attitudes and reactions of a number of other persons.” He accorded great respect and warm friendship through his lifetime to those who had influenced him most strongly: former teachers, classmates, students, and faculty associates. He was deeply devoted to his family.

At retirement in 1962, Slade was professor of public finance in the Department of Agricultural Economics, College of Agriculture, and professor of economics in the Department of Economics, College of Arts and Sciences. He had served over forty years on the staff and faculty of Cornell except for temporary leaves, beginning as an instructor in the Department of Economics upon entering graduate school in the fall of 1921. He held dual appointments in the two departments as assistant professor, associate professor, and full professor for thirty-eight years.

Slade was born and grew up in Mendon, Missouri. He was graduated from high school there, where he had ridden a horse five miles daily to and from school. He taught in a country school for what must have been an “academic year” before going on to the University of Missouri where he received his Bachelor of Arts degree in 1918. Before graduation he entered military service, was in France in the infantry with the Eighty-ninth Division of the American Expeditionary Forces, and was discharged in 1919. He returned to the University of Missouri and was awarded the Master of Arts degree in 1921. In 1922 he was married to Nita Collier, a fellow student at Missouri, who became his lifelong mate and who served for many years as a lecturer in the School of Hotel Administration. At Missouri he also came under the influence of a teacher, Dr. John Neihardt, poet and philosopher, whose lifetime friendship he cherished, and whom he often spoke of to friends at Cornell.

Slade received his doctorate in February 1924. His major subject for his doctoral program was agricultural economics, and his minors were economic theory and political science. H. J. Davenport was his committee representative in economic theory. He was another teacher who influenced and inspired Slade, and after Davenport's death he offered a course for a number of years in the economic theories of his mentor.

Two other Cornell figures strongly influenced his career. One was George F. Warren, head of the Department of Agricultural Economics until his death in the late 1930s. The other was Liberty Hyde Bailey, a former dean of the College of Agriculture, who lived and worked in Ithaca and was a person of prodigious accomplishment.

At Cornell Professor Kendrick taught for many years a large class in taxation, an advanced course in federal public finance, and a graduate seminar in public finance. He was recognized as a capable teacher who mastered his subject thoroughly and who developed it logically and lucidly. He guided the work of graduate students, preferring thorough training of a few to general supervision of many. He maintained an intense and friendly interest in their graduate and subsequent careers.

He wrote a number of research papers, scholarly journal articles, extension bulletins, and books. He earned a national reputation as one of the leading experts in public finance. Between 1941 and 1952 he spent most of his summers doing research at the National Bureau of Economic Research in New York; an outgrowth of this work was an occasional paper of the Bureau in 1955, "A Century and Half of Federal Expenditures." His textbook *Public Finance: Principles and Problems* (Houghton Mifflin, 1951) was one of few in the field at the time, and widely cited.

In 1930 the Connecticut State College of Agriculture invited him to do an investigation of the Connecticut tax system. Shortly thereafter he prepared a Cornell extension bulletin entitled "The New York System of Taxation," which was later updated. In later years the state Tax Commission assumed responsibility for its periodic revision. For a year and a half after April 1934, during the heady days of President Roosevelt's New Deal, he was in Washington, D.C., working in the Agricultural Adjustment Administration in various capacities related to his taxation expertise. In 1937 he spent a summer in Washington, D.C., on a study of the controversial undistributed profits tax for the Brookings Institution, and later did other work for Brookings. In the late 1930s, he was a member of the Committee on Federal Taxation of the National Tax Association. At this time he was editor for the Tax Research Foundation of a division of the ambitious publication *Tax Systems of the World*.

In 1959 he gave important testimony on the corporate tax structure before the Ways and Means Committee of the House of Representatives. After his retirement the Organization of American States asked him to conduct a tax

study for the Republic of Panama. In this period he also served for several years as a consultant to the New York State Tax Commission.

He was a visiting professor at various times at various universities: Duke University, Michigan State University, University of Washington (Seattle), and the University of Hawaii. Among the Cornell campus committees on which he served was the University lecture committee, of which he was chairman for six years.

Slade was a member of the Phi Beta Kappa and Phi Kappa Phi honor societies. His memberships in professional organizations included the American Economic Association, the National Tax Association, and the Tax Institute.

Slade leaves, in addition to his wife Nita, two daughters, Mrs. Kenneth (Alice) Lansing of Urbana, Illinois, and Mrs. Hollis (Kathleen) Hatfield of Wheaton, Illinois. There are also four grandchildren.

Paul M. O'Leary, Bernard F. Stanton, Robert P. Story, Edward A. Lutz

Foster Kennedy

February 7, 1884 — January 7, 1952

To Foster Kennedy life was so attractive and to life he brought such a rich, warm personality, that it is not easy to write of him as one who has parted company with us.

His friends will always remember his sparkling conversation, his flashing humor, and his intellectual activities which were far beyond the conventional pattern. His mind was keen and flexible. The vast range of his curiosity is reflected in the diversity of his writings which were enriched by a unique gift for dramatic expression as well as distinction of style. Kennedy was a comprehensive observer. Experience wrote his ideas. For him, science was not mere observation, nor the docile following of authority. In his Presidential Address “Science, Civilization and Faith”, before the American Neurological Association, he wrote: “So in science, we risk degenerating into a medley of hypothesis if we join not science to philosophy, which the Greeks used to integrate all knowledge. And philosophy lacks meaning if there be little feeling for beauty and the arts that make a pattern for us out of the unknowable; for life, ‘like a dome of many colored glass, stains the white radiance of eternity.’ Science can be no cloistered or fugitive thing. It cannot sit cowering in its laboratory, while freedom dies.”

Kennedy worshipped freedom of the spirit and fought for it. During World War I he was granted leave of absence to go to France with the Harvard Unit, February 26, 1917. He served as Medicin-Chef, Hospital Militaire V. H. No. 76, France; he was commissioned Lieutenant, Royal British Army Medical Corps, France, and soon promoted to Captain and Major. His name appeared in dispatches of that period.

As Director of the Neurological Service, Second (Cornell) Medical Division, Bellevue Hospital, to which he took office December 7, 1915, he became a recognized leader in medicine throughout the world and brought distinction both to the Neurological Service and to Bellevue Hospital. His merit was acknowledged by the neurological societies of London, Paris, Mexico, Cuba, Sweden and Budapest. He was made President of the American Neurological Association. He received from Cuba the decoration, Orden Nacional de Merito, Carlos F. Finley en el brado de Official; from France, Chevalier of the Legion of Honor.

Kennedy was a great doctor, a great scholar, a great friend, a great public figure—a great man. We feel deeply the true measure of his personality and friendship in his passing. Fortunately, his dynamic spirit, his inspiration, and the memory of his iridescent wit will keep his greatness before us for our contemplation.

Louis Hausman

May Kennedy

March 13, 1880 — April 12, 1965

May Kennedy, former Associate Director of the Cornell University-New York Hospital School of Nursing and a pioneer in psychiatric nursing, died April 12, 1965, in the hospital. She was 84 years old and had lived at 200 East 66th Street.

Miss Kennedy, who retired in 1947, was a former president of the State Board of Nurse Examiners, and a former treasurer of the American Nurses Association and chairman of its mental hygiene section for four years.

She had lectured widely and conducted many institutes on psychiatric nursing; she was the author of many papers on that subject.

In World War I she served with the American Expeditionary Force as head nurse at LaFauche and chief nurse of Neurological Hospital 2 and Base Hospital 87 at Toul, France.

She was born in New Holland, Ohio. She graduated from St. Joseph's Hospital School of Nursing in Chicago. She received her Bachelor's degree from Teachers College, Columbia University, and her Master's degree from the University of Chicago.

Miss Kennedy began her career as a psychiatric nurse. She was chief nurse at Anna and Kankakee State Hospital in Illinois.

In 1919 she was superintendent of nurses at Indianapolis City Hospital. The next year she was named director of the Illinois State School of Psychiatric Nursing. From 1928 to 1931 she lectured at the University of Chicago and at schools of nursing in the area.

Miss Kennedy was appointed director of the division of nursing of the Illinois Department of Public Welfare in 1929. She was a member of the nurse examiners board of the Illinois Civil Service Commission and a former president of the Illinois State Nurses Association.

She joined the New York Hospital School of Nursing as Associate Director in 1932.

Muriel R. Carbery

George Clarence Kent

July 28, 1910 — September 19, 2008

George Kent joined Cornell's Department of Plant Pathology in 1945 as a full Professor. At that time, he was already known as a leading teacher in his field, and was co-author with I.E. Melhus of *Elements of Plant Pathology*, which was arguably the major American textbook then available for that subject. He was specifically recruited to teach the basic courses in plant pathology, because the department intended to maintain the instructional excellence for which it was widely known. Five years later, George became Head of the department, and he served in that role until 1970. For three years in the early 1960s, he served concurrently as Head of Cornell's Department of Botany. He was also the first Coordinator of Planning and Development in the College of Agriculture and Life Sciences from 1970 until his retirement in 1975 as Professor Emeritus. After retirement, he served the College's dean by working on special projects.

George undertook a number of outside assignments. From late 1952 to early 1954, he was Visiting Professor of Plant Pathology at the University of the Philippines College of Agriculture in Los Baños. He returned to Los Baños several times for short periods of work at the International Rice Research Institute. He also served as a consultant to the U.S. Department of Agriculture at Beltsville, Maryland, as well as the Department of the Army at Fort Detrick, Maryland.

Although born in New Hampshire, George grew up in college communities in Kansas and New Mexico. Academic orientation came early to him because of his father's career in academia and presidency of New Mexico A&M (now New Mexico State University). George studied there for three years, then earned his B.A. degree at Oxford University in England as a Rhodes Scholar in 1933. He obtained his Ph.D. degree at Iowa State College in Ames, Iowa in 1936 and joined the faculty there in 1937, teaching plant pathology and conducting research on diseases of corn and of orchard, nursery, and forage crops until he was called to Cornell.

George was an independent thinker with a strong work ethic and an unwavering sense of fairness. He strongly encouraged faculty interaction, turning bi-weekly faculty meetings into discussions of departmental programs and policies based on shared decision-making. At those meetings, he required a verbal report from each faculty member usually once a year on teaching, extension and research successes and failures, followed by a question and answer session with those in the audience. Graduate students were invited to listen to those parts of the faculty meetings. He wore the leadership mantle comfortably, remaining always in charge but never overbearing. Under

his guidance, research emphasis in the department changed from the treatment of plant diseases to the search for causes and prevention, while teaching and extension activities were highly respected and supported fully. Graduate and undergraduate instruction and training in international agriculture were added to the departmental program under Kent, providing new opportunities for both domestic and international students.

Kent's teaching was memorable for his framework of concepts and linkage of concepts to facts and for his ability to reveal the pedagogy underlying his classroom work. Excellent as the instructor of a class, he also delighted in informal interactions with students, during which his displays of logic and insistence on critical questions created models that students later tried to emulate. Those who knew of his 1939 textbook were surprised that, during his Cornell years, Kent eschewed teaching "by the book." He and his faculty did, however, produce and duplicate a series of reviews of important plant diseases, which served as instructional references. Many who were taught by George Kent went on to significant teaching careers of their own.

George was a Fellow of the American Phytopathological Society and a member of the Botanical Society of America, the American Association of Rhodes Scholars, Phi Kappa Phi, Sigma Xi, and the Society for Advancement of Science (Philippines). He also served on the Board of Directors of the Alumni Association of New Mexico State University.

George "Shorty" Kent was a devoted family man. In 1938, he married Ruth Olson. They began married life in Ames, Iowa, where their three children were born. When Ruth, the love and joy of his life, became ill in later life, he took care of her. During her residence in nursing facilities, he visited her daily until her death in 1997. George is survived by a daughter, Ann (Allan) Witztum of Beer Sheva, Israel; two sons, Captain George A. (Mary Louise Hoffman) Kent, U.S.N. (Retired) of Cambridge, Massachusetts; and Captain Thomas R. (Carol Anne Ford) Kent, U.S.N. (Retired) of Norfolk, Virginia; one granddaughter, six grandsons, eleven great-grandchildren, and his sister.

We, colleagues who have known him and been influenced by him, treasure our memories of this kind, thoughtful, ever-encouraging leader, a philosopher and a realist who faced the world with wonder and humor, and whose work and personnel choices enhanced the position of Cornell's Department of Plant Pathology as one of the most respected in the nation.

Richard P. Korf, Chairperson; James W. Lorbeer, Wayne A. Sinclair

Eldon Kenworthy

May 27, 1935 — March 14, 1998

Eldon “Bud” Kenworthy, formerly of Ithaca, New York, died on March 14, 1998 at Saint Mary Medical Center in Walla Walla, Washington of injuries sustained after he was accidentally struck by an automobile. Bud had resided in Walla Walla with his wife, Cynthia Witman, since 1992. An internationally recognized expert in Latin American politics, Professor Kenworthy went to Whitman College as the Arnold Distinguished Visiting Professor in 1991, and joined the faculty of the politics department the following year.

From 1996-92, Bud was a member of the faculty of Cornell University, where he taught Latin American politics and served as director of undergraduate studies in the Government Department. In 1970, he received Cornell’s Clark Award for Excellence in Teaching. An inspiring and devoted teacher, he is remembered by his colleagues for his insistence that teaching and advising undergraduates be a priority even at a university known for its research and graduate programs.

Bud Kenworthy was born in Pasadena, California. He received his Bachelor’s degree from Oberlin College in 1956 and his Doctorate in Political Science in 1970 from Yale University. Author of six books, including *America Americas: Myth in the Making of U.S. Policy toward Latin America*, he both studied and deeply loved the area and its people. He and Cynthia were involved with a number of Ithacans in reforestation and other environmental projects in Costa Rica.

Bud Kenworthy’s close relationship with students became critically important during the period of unrest that troubled many universities in the late 1960s. In 1969, at Cornell University, he addressed a gathering of 4,000 students whose leaders were urging violent tactics. Known to students as a young and sympathetic professor, Kenworthy cautioned them to be “rational radicals.” His influence prevailed.

Bud will be remembered for many reasons. Those who knew him well might still hear his warm rich voice and recall his enthusiasm for the good life of gardens and homesteading and community. Bud was also a lover of wild places, and frequently backpacked in the high country. He died surrounded by friends.

He is survived by his wife, Cynthia Witman; his brother and sister, Dudley Kenworthy and Janet Walls; his daughter, Lauren Kenworthy; and his grandsons Byron Kenworthy Schaeffer and Jesse Schaeffer Kenworthy. His younger daughter, Shannon, died in 1973.

Peter Katzenstein, Isaac Kramnick

Abram Tucker Kerr

January 7, 1873 — August 15, 1938

After years of faithful service to Cornell University, Abram Tucker Kerr died on August 15, 1938. He was born in Buffalo, New York, on January 7, 1873. There he attended the public schools. After obtaining his B.S. at Cornell in 1895 he returned to Buffalo as a medical student and received the M.D. degree from the University of Buffalo in 1897. While studying medicine he was student assistant in histology and pathology and in 1898-1900 was acting and adjunct professor of Anatomy in the University of Buffalo. He studied at Göttingen in 1899 and at Johns Hopkins in 1899-1900. He was called to Cornell in 1900 as assistant professor of Anatomy and became professor of that subject in 1904. He became the administrative head of the Ithaca division of the Medical College in 1902 and held that office for thirty-six years.

In addition to his heavy load of teaching and administrative duties he found time to serve the University whenever the need arose. No sacrifice of time or effort was too great when the interests of Cornell were involved. Older members of the faculty will recall with feeling his unselfish services in one of the greatest emergencies this University has ever been called upon to face—the tragic typhoid epidemic in 1903. They will recall, too, his calm, efficient handling of the crisis that came with the influenza epidemic in 1918. Dr. Kerr played a leading part in the reorganization of the Cornell Infirmary; to him its staff turned constantly for advice. He acted as chairman of the Trustees' Committee on Hygiene and Sanitation from its formation in 1909 to his death. He organized the health services of Cornell and served as acting professor of Hygiene in 1920-21 and again in 1935-36. His organizing capacities were called upon to help solve the traffic problem on the campus, which had become acute with the rapid increase in the use of the automobile.

He was deeply interested in the health problems of the City of Ithaca and served from 1911 to 1912 as president and subsequently for several terms as vice-president of the board of trustees of the Ithaca Memorial Hospital. By his colleagues in the medical profession he was made president of the Tompkins County Medical Society in 1910. As a member of the executive committee of the American Association of Anatomists from 1910-1914, and as a contributor to standard textbooks on Anatomy, he played his part in the development of his chosen field.

But in spite of his wide interests and varied activities the Ithaca Division of the Medical College, which he served devotedly for thirty-eight years, remained closest to his heart and to it he devoted his best efforts. He survived its dissolution a little more than two months.

Harry A. Kerr

September 4, 1914 — January 11, 1989

Harry A. Kerr was a member of the College of Agriculture faculty from 1946 to his retirement as professor of soil conservation emeritus, November 12, 1972. He occupied a unique position in his early years as extension conservationist in Extension Administration, 1946 to 1954, with joint financial support from the U.S. Department of Agriculture and the College. Thereafter, he became a member of the Department of Agronomy until his retirement.

Born in 1914 on a dairy farm near Franklinville, Cattaraugus County, New York, Harry entered Cornell as a freshman in agricultural economics in 1938. He received his B.S. degree in 1942 and M.S. degree in 1953. After high school graduation he was first employed with the Civilian Conservation Corps and then with the Soil Conservation Service in New York State, New Hampshire, and Vermont. As a faculty member in the Department of Agronomy, Professor Kerr served as executive secretary of the New York State Soil and Water Conservation Committee, and as extension soil conservationist. After 26 years with Cornell University, he retired with the well deserved title of professor emeritus.

According to former department chairman, Nyle C. Brady, “Professor Kerr was better informed on water conservation, utilization and management than any man on the Cornell staff. He used his knowledge and experience in water conservation to help not only the farmers of New York State, but other groups such as industries, municipalities, and those concerned with recreation. In his work in extension, he demonstrated remarkable ability in dealing with adult as well as younger groups.”

Professor Kerr brought a wealth of practical “hands-on” experience in conservation farm planning and actual conservation construction. For this work he was recognized as “man-of-the-year” in 1970 by the New York Soil and Water Districts Association, Inc. At that time Kerr was honored for “... his contributions to the development of conservation districts within the state.”

Harry’s life-long concern for others led to his being elected to the Tompkins County Board of Legislators, later to become its chairman. In this capacity he was instrumental in establishing a new Tompkins County Hospital on West Hill.

Harry Kerr was instrumental in establishing most of the county conservation districts in New York. He wrote the original legislation which provided matching state funds for hiring conservation field managers and technicians. In 1989, fifty-seven New York counties employed 250 people who contributed to conservation/agriculture, planting hundreds of thousands of trees and shrubs; constructing thousands of farm ponds and marshes; improving hundreds of thousands of acres of agricultural land by installation of underground tiles and ditches for drainage of excess water; irrigation of farm lands; the protection of soil from erosion by engineering and vegetative means, and mapping the soils of many counties. Those activities are testimony to Harry's efforts.

Professor Kerr drafted the legislation that authorized state financial aid for the soil survey, the use of county and state highway equipment to do conservation work on private property, and the preservation of the State Barge Canal for flood control purposes. He also wrote extension bulletins and popular articles on soil and water conservation.

Harry was active in national conservation: a charter member, vice president and secretary/treasurer of the National Association of Executive Directors for State Conservation Committees; vice president of the Soil Conservation Society of America; and member of the Agronomy Society of America. Professor Kerr received numerous awards from these and other organizations including the New York Soil and Water Conservation Districts' Association, the National Association of Conservation Districts, and the State Forest Practice Board.

For many years, he was editor of a monthly conservation publication titled "Down to Earth", the oldest conservation magazine in the nation, published continuously since 1941. He also authored a Conservation Handbook for county legislators which was used for many years as a management tool.

Harry organized a state consortium of conservation agencies and boards that met annually to provide leadership to the governor on conservation matters.

Working with the State Fish and Wildlife Management Board and Federation of Sportsmen's Clubs, he was instrumental in building Cornell's Arnot Forest Educational Center for training of youth-4H and teachers in the skills of conservation.

Professor Kerr played the violin—as a young man he specialized in western and bluegrass music. He was a pilot and an early member and officer of the East Hill Flying Club. He was a wine-maker of consequence, an ardent walleye fisherman, and enjoyed "woods work" in his forestry holding on Bull Hill Road, Newfield. With his sons, Mike and Neal, he built his retirement home in these woods.

Harry was most sensitive to others. His unmistakable opinions were always presented in a gentle manner. Harry loved children, and he also devoted time to visiting and caring for many elderly friends. But for the people of New York, his legacy is one of clean water, green fields, and forests.

Harry is survived by his wife, Marguerite Hunt; two sons, Neal and Mike Kerr, and four grandchildren.

Willard Crony, Reeshon Feuer, Thomas W. Scott

Zoltan Irme Kertesz

September 2, 1903 — August 23, 1968

Professor Kertesz died unexpectedly at his home in Geneva, New York, on August 23, 1968. His passing deprived the University, the state, the country, and the world of a valuable source of counsel in food science and technology.

Professor Kertesz was educated in his native Hungary, receiving his doctorate in 1927 from the Royal Hungarian University at Debreczen. Following post-doctorate training at the Biochemical Institute in Stockholm, Sweden, in 1928, he accepted an appointment as assistant in research at the New York State Agricultural Experiment Station at Geneva, New York. He advanced to associate in 1930 and to professor of chemistry in 1940. Professor Kertesz took an early retirement from the University in 1962 in order to become chief of the Food Science and Technology Branch, Nutrition Division, Food and Agriculture Organization, a branch of the United Nations. He maintained his office in Rome, Italy, until the fall of 1966 at which time he returned to the United States to serve as secretary of the Protein Advisory Group of the same organization until earlier this year.

As reflected by his professional itinerary, Professor Kertesz was best characterized as having a vigorous enthusiasm for his work and a drive to contribute to his chosen field in the largest way possible. At the Experiment Station, his research as a plant biochemist yielded 160 publications, of which about half were concerned with his special field of pectin chemistry. Unwilling to restrict his activities to the research laboratory, he became interested in the practical application of pectin chemistry to problems of fruit and vegetable processing. He was successful in developing the industrial use of clarifying enzymes for the production of fruit and vegetable juices, and the use of calcium salts to firm canned vegetables, for which he received an award from the National Cannery Association. He was in almost constant touch with the processing industry and its problems of vegetable texture. In his last few years at the Experiment Station, Professor Kertesz applied his knowledge and energies to investigating the use of high energy radiation as a means of food preservation, a process which he ardently believed could be a significant factor in enhancing the world food supply.

Professor Kertesz became intimately involved in problems of world health and nutrition which culminated in his association with the United Nations organization. His success in these activities led to his being awarded the Institute of Food Technologists' coveted International Award in 1967.

Professor Kertesz was an active member of many professional organizations, including the American Chemical Society, American Society of Plant Physiologists, American Association for the Advancement of Science,

Institute of Food Technologists (charter member), Sigma Xi, and Phi Tau Sigma. He served as editor of both *Food Technology* and *Food Research* for the years 1950-52, and subsequently served as consulting editor. He edited a series of monographs entitled *Economic Crops*, published by Interscience Publishers. His monograph *The Pectin Substances*, which was published in 1951 by Interscience Publishers, is a classic, widely cited by pectin chemists. At the time of his death he was in the process of compiling and editing an *Encyclopedia of Food* to be published by John Wiley and Sons.

Professor Kertesz also served on numerous national and international committees including the United States Technical Industrial Intelligence Committee (England, Germany, Austria, France), 1945; scientific consultant, Office of Technical Services, United States Department of Commerce, 1946-47; nutrition officer with Food and Agriculture Organization in Ceylon, 1952-53; acting resident representative, United Nations Technical Advisory Board, 1953; consultant, Interdepartmental Committee on Nutrition for National Defense, participating in surveys in Korea (1956), Turkey (1957-58), Libya (1957), and Ethiopia (1958).

In addition to his dynamic professional interests, Professor Kertesz was also an ardent athlete, particularly adept in tennis and skiing. Those who participated with him in these activities knew well his competitive spirit.

Professor Kertesz is survived by his wife, Anna Frommer; a son, Christopher; a daughter, Vera Cobb; two grandchildren; and several brothers and sisters living in his native Hungary.

R. S. Shallenberger, J. P. Van Buren, L. M. Massey, Jr.

Edward Loughbough Keyes

May 15, 1873 — March 16, 1949

Edward Loughbough Keyes, retired Professor of Urology, Cornell University Medical College, died March 16, 1949 in New York.

Dr. Keyes was born May 15, 1873, in Elizabeth, New Jersey, the son of Dr. Edward Lawrence and Sarah Loughbough Keyes. His father was a distinguished physician and author, and his grandfather was General Erasmus Darwin Keyes. Dr. Keyes graduated from Georgetown University in 1892 and received a Ph.D. in 1901 and M.D. from the College of Physicians and Surgeons of Columbia in 1905. He married Emma Willard Scudder of New York on November 7, 1898, and was the father of five children, Edward Lawrence, Emma Willard, Elizabeth Hewlett, Alexander Loughbough and John Hewlett Keyes who died at twelve years of age.

His first wife died February 27, 1943, and he married Bessie Potter Vonnoh (sculptor), widow of Robert Vonnoh, portrait artist, in June, 1948. He is survived by his second wife and his four remaining children.

Dr. Keyes had a brilliant career in Medicine, starting as a lecturer in Urology at the Georgetown Medical School from 1902-1906. He was appointed Adjunct Professor of Urology at the Georgetown Medical School from 1903-1908. From 1904-1910 he was lecturer on Surgery at Cornell University Medical School and was surgeon to St. Vincent's Hospital from 1920-1932. He was appointed Professor of Urology at Bellevue Medical School from 1910-1911 and at Cornell University Medical School from 1911-1937. He was in charge of the Department of Urology, New York Hospital from the opening of the hospital until 1937. He was Urologist at Bellevue Hospital from 1910-1924 and Surgeon to General Memorial Hospital from 1914-1917, Consulting Urologist at Memorial Hospital, Bellevue Hospital, New York Hospital and St. Vincent's Hospital.

Dr. Keyes served during the First World War as a major in the Medical Corps and was promoted to Lt. Colonel and then to Colonel. (He was the Director of Base Hospital #1, Bellevue General Hospital.) He was also Consultant in Urology for the A. E. F. and was decorated as an Officer of the Legion of Honor (France) in 1935.

He was honored by membership in many scientific societies. In 1903 he had the honor of being the youngest member elected to the Medical and Surgical Society since 1867. He was also a member of the Practitioners Society. He was a Fellow of the American College of Surgeons, Fellow of the Royal College of Surgeons, London, a member of the American Association of Genito-Urinary Surgeons, and was the President of that Society in 1912. He was

President of the Social Hygiene Association, the International Urological Society and was elected President of the American Urological Association in 1916. He belonged to the Clinical Urological Association. He was Vice President of the New York Academy of Medicine from 1921-1923. Dr. Keyes was the author of Keyes Text Book of Urology, which was his revision of the original text book by his father. This book has been used in many of our medical schools as a standard text book of Urology for years. He contributed numerous scientific articles to the medical literature and the above mentioned honors were showered upon him here and abroad.

He was a member of the Century Club. As a member of the Charaka Club he contributed many brilliant articles which were published in their books. He also had a small book of his poems, speeches and articles published.

He was a man of great character, vision and determination. As an example of Dr. Keyes' dexterity with languages and his graciousness, we know that he learned sufficient Spanish to address the urologists at Madrid on the occasion of the meeting of the International Association of Urologists in Spanish. He also spoke French fluently and enjoyed entertaining continental urologists.

The outstanding scientific achievements of Dr. Keyes will remain as a lasting memorial to his intellectual genius. His depth of emotion, the sparkle of his personality and quick wit will be remembered by all of us who had the good fortune to know the charm of this great man.

R. S. Hotchkiss

Anwar A. Khan

October 16, 1934 — June 28, 1997

Dr. Anwar A. Khan, a world-renowned scientist in the fields of Seed Physiology, Biochemistry, and Molecular Biology, died suddenly on Saturday, June 28, 1997 at Geneva General Hospital. He suffered a heart attack at his home on White Springs Road in Geneva. Funeral services were held on June 30, 1997 at the Islamic Center in Rochester, New York. A Memorial Recognition attended by many of his colleagues, friends and family was held on July 8, 1997 in Jordan Hall at the New York State Agricultural Experiment Station in Geneva, New York. His wife, Tamken, and two children, Karim and Zeba, survive Dr. Khan.

Professor Khan was borne in Monghyr, Pakistan. He received his B.S. and M.S. degrees from the University of Karachi, Pakistan, in Chemistry, Biology, and Physiology in 1956 and 1957, respectively. He was awarded his Doctorate degree from the Department of Biology at the University of Chicago in 1963. He was a postdoctoral fellow in the Department of Biochemistry at Michigan State University from 1963-65. Dr. Khan was appointed Assistant Professor at Cornell University on the Geneva Campus in 1965. He was promoted to Associate Professor in 1971 and to Professor in 1980.

Dr. Khan was one of the most highly respected scientists in his field. His work on dormancy and germination of seeds, on hormone physiology, on stress physiology, and physiological and chemical seed treatments was known throughout the world. He was looked to by his peers for advice from throughout the world. He spent his life learning everything he could about the dormancy period of seeds and also how they germinated. He was concerned about seed quality and being sure that when seeds germinated they would establish themselves as well as possible under varying soil and climatic conditions. Professor Khan collaborated on various aspects of seed physiology and seed treatments with many colleagues at Cornell and elsewhere. He was a great collaborator to all, always a delight to work with, always pleasant and very generous with his time and efforts. He will be sorely missed by many of his colleagues in the scientific community as well as by his wonderful family and numerous friends.

A prolific writer, Professor Khan had more than 170 refereed scientific journal articles to his credit. He also was editor of three books in the areas of seed physiology and biology that were published in 1977, 1982, and 1992. Additionally, he was awarded a U.S. Patent in 1994 that covered some of his more critical work on inducing dormancy in non-dormant seeds.

Besides his work at the Geneva Station, Khan spent sabbatical leaves at the International Rice Research Institute, Los Banos, Philippines (1985-86); the Agricultural University, Wageningen, Holland (1978); the University of Liege, Belgium (1971); the University of Ghent, Belgium (1971-72); and the University of Clermont-Ferrand, France (1972).

Because his research had application on a worldwide basis, Dr. Khan was a frequent invited speaker to international symposia, special workshops, research projects reviews, and other involvements and consultancies. Most recently he was an invited speaker at the 1995 Annual Meeting of the Korean Society of Horticultural Science. He presented results of his research at symposia in such countries as Brazil, Honduras, Denmark, Saudi Arabia, China, India, Karachi, Pakistan, Turkey, Poland, Russia, Japan, New Zealand, Australia, Canada, as well as at many different meetings in the United States.

Khan received many research grants from throughout the world to help support his research. Major grants included those from the United States Agency for International Development, the American Seed Research Foundation, the Herman Frasch Foundation, the New York Seed Association, the National Science Foundation, the New York Beet Research Association, the New York Snap Bean Research Association, the New York Sweet Corn Research Association, and many others.

Khan was a member of the American Society of Plant Physiologists, American Society of Horticultural Sciences, American Society of Crop Science, American Society of Agronomy, Weed Science Society of America, International Plant Growth Substance Association, and Sigma Xi.

George Abawi, Gary Harman, Hugh Price

Huynh Kim Khanh

April 20, 1936 — March 27, 1990

Professor Huynh Kim Khanh of Cornell's Department of Government and Southeast Asia Program died in Ithaca on March 27, 1990 of heart failure at the age of 53. One of the foremost scholars of modern Vietnam, he is best known for his classic *Vietnamese Communism, 1925-45*, published by Cornell University Press in 1982. Appointed associate professor in Cornell's Department of Government in July 1989, he taught courses on the Governments and Politics of Southeast Asia and on the Vietnam War, as well as a seminar on Issues in Contemporary Vietnamese Politics.

Huynh Kim Khanh was born April 20, 1936, in Quang Nam, Vietnam, where his father was a Presbyterian minister. Following the conclusion of the French-Vietnamese war in 1954, Khanh worked for nearly two years as interpreter and assistant to the director of the Mennonite's Church World Service in the settlement of refugees. For this work he was rewarded with a year's scholarship in the United States which was followed by a two-year U.S. government A.I.D. scholarship that saw him through a B.A. degree at Johns Hopkins and the beginning of graduate study at Lehigh University, where he received his M.A. degree. Then followed modest scholarships at the University of California at Berkeley, which together with earnings from various jobs enabled him to commence his study towards a Ph.D. degree in political science. But then in 1965 came the United States' deepening involvement in the Vietnam War. Khanh, who viewed this American involvement as morally abhorrent and politically wrong, went to the more congenial political climate of Canada, where he became a Canadian citizen and taught at the Universities of Dalhousie and Western Ontario. Two years after completing his doctorate at Berkeley in 1972, he spent eight years as senior research fellow at the Institute of Southeast Asian Studies in Singapore, for two of these years editing its journal, *Southeast Asian Affairs*. Then, following a year as visiting professor at the Institute National des Langues et Civilisations Orientales at the Université de Paris III (Sorbonne Nouvelle), in 1986 he accepted a position as research fellow and director of the Indochina Project in the Toronto-York Universities' Joint Center for Asia-Pacific Studies. A year after being appointed associate professor at York University's French-speaking Glendon College in 1988 he was invited to come to Cornell.

During the past two years Professor Khanh made two substantial visits to Vietnam in connection with his own research. He was also active in consulting on Indochina with the Canadian Ministry of External Affairs and in working towards normalization of relations between the United States and Vietnam. When he died he was well

advanced in work on what would have been three important books: *Communism in Vietnam, 1945-54*; *Contemporary Vietnamese Foreign Relations*; and *The Vietnamese Revolutionary Experience*.

Huynh Kim Khanh is survived by his 90 year-old father, Luyen Kim Huynh; and two brothers, Binh Thai Huynh and Tinh Trang Huynh, all of Washington, D.C.; two sisters resident in Toronto, Mrs. Xuan My Nguyen and Mrs. Ngoc Dung Hoang, and another sister, Miss Ngoc Tran Huynh of Paris.

Khanh was here with us in Ithaca only very briefly, less than eight months. He was happy at Cornell as was indicated by his having bought a house just before he died. Members of the Department of Government and the Southeast Asia Program and our students will miss him not only for his teaching and scholarship, but also for his personal warmth and his ebullient and infectious enthusiasm that tended to give a lift to all who interacted with him.

John H. Badgley, Keith W. Taylor, George McT. Kahin

Jack Carl Kiefer

January 25, 1924 — August 10, 1981

Jack Carl Kiefer was born in Cincinnati, Ohio, on January 25, 1924. He died of a heart attack in Berkeley, California, on August 10, 1981.

Jack Kiefer graduated from the Massachusetts Institute of Technology with a degree in electrical engineering (class of '43) and served in the air force during World War II. He earned a master's degree in economics from MIT in 1948. He studied under Jack Wolfowitz at Columbia University and received his Doctor of Philosophy degree in 1952. He became an instructor at Cornell in 1951 and continued to be a valuable and illustrious member of the faculty for twenty-eight years, from 1973 on as Horace White Professor of Mathematics. In 1957 he married Dooley Sciple, and Jack and Dooley soon became a very important couple in the department. In 1979 he took early retirement and became professor of statistics at the University of California at Berkeley.

Jack was internationally recognized as a leader in mathematical statistics. His papers—he wrote over one hundred—range over most parts of statistics, including among others coding theory, minimax procedures, tests of fit, and the study of sample distribution functions. The topic in which his contribution was most basic and most important is the design of experiments; he has been referred to as “father of experimental design.” He worked in this field throughout his life and brought many different mathematical tools to bear on it. His results have found a large variety of applications in scientific research and in industry.

His distinguished work was recognized by many honors. Kiefer was elected to the National Academy of Sciences in 1975, he was a fellow of the American Academy of Arts and Sciences and a former president of the Institute of Mathematical Statistics, and he served on many committees of national and international societies during his tenure at Cornell and Berkeley. He was a visiting professor at Oxford University (1957-58), at Stanford University (1962-63), and at Berkeley (1975), held Guggenheim fellowships, and was a Wald lecturer. Most recently, Kiefer was one of two professors to initiate the Berkeley-Beijing exchange program in 1980.

In addition to his eminence as a scholar, Jack was a fine lecturer and a superb teacher. He was a successful and popular lecturer at both the undergraduate and the advanced level. He was also an excellent guide to his graduate students; some are now among the most distinguished mathematical statisticians of their generation.

Jack was a very special person—intelligent, sensitive, giving, and just. His sympathies and interests ranged wide, from political causes to stamp collecting, from a deep love of music to mushrooms. And everything that he did, he did remarkably well.

Not long after his interest in mushrooms was awakened by the visiting French mathematician Jacques Deny, he acquired an extensive knowledge of the places and the times at which one could find mushrooms in and around Ithaca. The collecting trips with his family and his friends were a great source of pleasure for him and them. He thought of himself as an amateur mycologist, but there was nothing amateurish about the scientific articles that he wrote on mushrooms. The mycologists at Cornell recognized him as an expert. Occasionally they would refer collectors to him for advice on classification.

Everyone who came in contact with Jack sensed his human warmth and sincerity. He was a very good, sympathetic listener, and he was always willing to give help where it was needed. The depth of his human commitment was shown by his devoted work for the causes he believed in: human rights, civil liberties, the Liberal party of New York State, the protest against the war in Vietnam, and environmental issues.

Another facet of his character was a fine sense of humor, which found delightful expression through his poems, produced for innumerable occasions. When he was president of the mathematical colloquium, every visiting speaker was welcomed with a graceful verse. While at MIT he wrote and directed some of the “Tech shows,” the annual musical comedies.

But there was a quality deeper than charm or friendliness that distinguished Jack. As his former colleague Paul Olum puts it: “There were many things that made Jack a special person: his intelligence, his exceptional ability in mathematics, his warmth and generosity of spirit, his commitment to human causes, his willingness to take a stand on issues, his sense of excitement about everything—books, music, mushrooms, stamps—at one time even politics and sailboats. But I think that the quality in Jack that meant most to me, that I admired and respected the most, was his complete honesty. It was a straightforward kind of honesty—not deliberate or self-conscious, as with some people—rather a natural, spontaneous integrity. It was that, together with his warmth and supportiveness, that made it so good to talk with him, that made him such a wonderful friend.”

Jack is survived by his wife, Dooley Sciple Kiefer; his daughter, Sarah, and his son, Daniel—both Cornell students; and his mother, Marguerite R. Kiefer, of Cincinnati.

Roger H. Farrell, Alex Rosenberg, Wolfgang H. Fuchs

George A. Kiersch

April 15, 1918 — October 19, 2001

On October 19, 2001, George A. Kiersch, Professor Emeritus in Geological Sciences, died at his home in Tucson, Arizona, after a prolonged illness. He was a member of the Cornell faculty from 1960 until his retirement in 1978; and he served as Chairman of the Department from 1965-71.

Dr. Kiersch was a native of Lodi, California, and attended Modesto High School. He graduated from the Colorado School of Mines in 1942 and started graduate school, but World War II intervened. He served as an officer in the U.S. Army Corps of Engineers in the U.S.A. and in New Guinea. On the north coast of New Guinea he learned the vital military engineering technique of dredging modern coral rubble from reefs to build roads and runways. When crushed and sprayed with water, the coral self-cemented to durable pavements, which on many Pacific islands are still in use today. After the war, he continued his association with the Corps as a project geologist, involved with many projects of which two stand out: the Folsom Dam in California and the underground explosives tests in Utah. During this period, Dr. Kiersch re-entered graduate school at the University of Arizona where from September 1945 to June 1947 he served as a Teaching Assistant under Edwin D. McKee (Cornell, A.B. 1928). George remembered McKee's courses in Sedimentation as "exceptional." One of his classmates was Donald F. Campbell (Cornell, M.S., 1938), who had been an assistant to Cornell Professor Heinrich Ries in 1937.

After completing his Ph.D. degree in 1947 under the watchful eye of his major professor, Burt S. Butler (Cornell, A.B., 1905; A.M., 1907), from 1950-51 he was chief geologist with the United States and Mexico International Boundary and Water Commission, but soon Kiersch was able to continue his association with McKee and the University of Arizona. During the 1951-52 academic year, McKee was awarded a contract by the U.S. Indian Service to do a geological survey and study of all mineral resources in the Indian Lands in Arizona and Utah, an area of over 22,000 square miles. Kiersch was hired as the supervisor of field activities, which caused him to travel throughout the reservation, and most of the time, he would end up sleeping on a cot next to the truck. After the 1952-53 field season, McKee resigned from the university to take a position with the United States Geological Survey, and Kiersch took over the "Contract for Navajo-Hopi Indian Reservation Survey, Arizona-Utah" in September 1953. He continued in this capacity, completing the survey by the end of the summer, 1955. The University of Arizona Press published three volumes of survey results in 1955-56.

In November 1955, he returned to San Francisco to become Exploration Chief for the Southern Pacific Corporation, where his first task was to survey all their landholdings in the western U.S., using many of the techniques and approaches he had utilized in the Indian Reservation Survey. But the academic world still had a strong hold on him, so after getting the Southern Pacific Corporation survey well on the road to completion, Dr. Kiersch resigned to become a tenured professor at Cornell in 1960. Many of the SoPacCor personnel wondered why he would leave what Kiersch himself described as, "...perhaps the best and most exciting job of my career." Someone said to him, "George, nobody leaves San Francisco and your position to move to Ithaca, New York!" But he did. "Admittedly, it was a gamble," he said, "but people like E.D. [McKee] and B.S. Butler were partly responsible for my willingness... [to come to Ithaca and Cornell]."¹

While at Cornell, Kirsch wore two hats, first as a university professor teaching such courses as Structural Geology, Sedimentation, Engineering Geology and Groundwater. In class, he had a quiet presence and presented well-documented material, much of it taken from his own work. Certainly his students could not complain that they did not receive any training on "real-world" examples. Kiersch was Departmental Chair during some difficult years at Cornell, plagued by antiquated facilities in McGraw Hall. A low point must have been when he opened his office door one winter day to find that a steam pipe above his office had frozen, broken, and flooded the horsehair plaster of the ancient ceiling, which had crashed across his desk. Valiant efforts by Kiersch, his secretary Genevieve Siany, and other members of the department could only partly salvage his soggy books and papers. Fortunately, before he became Professor Emeritus in 1978, he witnessed the renaissance of the Department of Geological Sciences.

Under his other hat, he was a professional geological consultant in engineering geology, and he worked on projects that took him to practically every country on the globe. He consulted with more than 100 private companies, as well as with governmental agencies in Washington, D.C., California, Puerto Rico, Taiwan, Thailand, Italy, Brazil, Qatar, and many others. From 1963-64, while on leave from Cornell, Kiersch was a Visiting Senior Fellow at Technical University of Vienna. This association led to his involvement in several major engineering projects in Europe. Kiersch was one of the experts asked to investigate the tragic Vaiont Dam disaster in Italy, unfortunately too late to help the thousands of people who were killed there. His analysis of what happened and why, published in 1964 (*Civil Engineer*, v. 34, pp. 32-39), was given two prestigious awards: First Place Award for the best article in a professional magazine, given by *Industrial Marketing Magazine*, and the first Clair P. Holdredge Award from the Association of Engineering Geologists.

¹ Personal quotations by Dr. Kiersch are taken from a letter he wrote to William R. Brice on June 23, 1999.

He served as editor for the Geological Society of America's *Engineering Geology Case Studies*, from 1962-73. Kiersch was also, from 1962-65, the director of a worldwide research project on geothermal steam, supported by the Air Force Cambridge Research Laboratories. Given the fact that the Cornell Geology Department was one of the pioneers in the field of engineering geology, it is not surprising that Kiersch became interested in the history of his subject, on which he published several articles.

His publications include more than five book-size volumes, close to 60 technical papers, and well over 750 technical reports. He was the editor or co-editor of six volumes of case studies. In addition to receiving the Holdredge Award from the Association of Engineering Geologists, he was elected an honorary member of that organization in 1985. In 1986, he was awarded the Distinguished Practice Award of the Engineering Geology Division of the Geological Society of America. One of his last awards came in 2001, not too long before his death, when he received the Palmes Academiques from the French minister of culture in recognition of his many contributions in the application of geology and the other geosciences to major projects in civil, military, mining, and environmental engineering. Kiersch was a Fellow in the Geological Society of America and the American Society of Civil Engineers, and for ten years he was a member of the trustee advisory council at the Colorado School of Mines.

His four children, Dana Haycock, Mary Kiersch, George Kiersch, and Nancy Bohner, and ten grandchildren survive him. He was pre-deceased by his wife, Jane.

William R. Brice, Arthur L. Bloom

N.B: Most of this statement was prepared by William R. Brice, based on his research for "Cornell Geology through the Years" (College of Engineering, Cornell University, 1989).

Myunghwan Kim

February 8, 1932 — December 23, 1991

Myunghwan Kim was born in Seoul, Korea on February 8, 1932. After completing his secondary education in Seoul, he served in the Republic of Korea Army from 1950 to 1954, and was honorably discharged with the rank of Lieutenant. Because of his excellent command of English, Kim (as he preferred to be called by his colleagues) had been assigned to the U.S. Army as an interpreter. During this tour of duty he became acquainted with an officer on leave from the faculty of the University of Alabama, who persuaded him to come to the United States as an exchange student after he was done with his army service. Kim received a B.S. degree in Electrical Engineering, with distinction, from the University of Alabama in 1958, and entered graduate study at Yale University, where he was a Danforth Fellow. He received the M.Eng. degree in Electrical Engineering in 1959, worked as an electrical engineer for the Tennessee Valley Authority (TVA) in Chattanooga, Tennessee for a year, and returned to Yale where he obtained the Ph.D. in 1962. In the same year Kim joined the faculty of the School of Electrical Engineering and was associated with Cornell for the remainder of his career.

Professor Kim began his career in the Electrical Engineering School in the field of control theory with concentration on applications to electromechanical systems. During his early years his teaching activities were confined to this area with principal attention given to the courses in Feedback Control Systems and in Random Processes in Control Systems. Soon after joining the Electrical Engineering Faculty he developed an interest in the electrical aspects of biological processes, the field that eventually became the basis for his major contributions to the School. Following a sabbatical leave at the California Institute of Technology where he was a Visiting Associate in biology and a Senior Postdoctoral Associate at the Jet Propulsion Laboratory in Pasadena, California, he began research on the application of control theory to biological systems. In 1970 he established a Bioelectric Systems Laboratory in the Electrical Engineering School that attracted several young faculty members and a number of graduate students. The research of that group concerned the application of instrumentation, control theory, computer engineering, and integrated circuit technology to biomedical problems, particularly in learning how information is coded and processed in the nervous system. Special instrumentation was developed to help decipher the behavior of complex interconnections of neurons, both in the peripheral and central nervous systems. Kim and his group also studied the feasibility of employing optimal control techniques in the problem of administering chemotherapy to treat cancer. Activity in this area centered on the development of a very large-scale integrated (VLSI) circuit chip that would be able to track the growth of many individual cells and to monitor the concentration of a particular drug

in their vicinity. During this period Kim taught undergraduate courses in Digital Systems and Theory of Linear Systems, and graduate-level courses in Bioelectric Systems and Bioinstrumentation. He also conducted frequent graduate seminars in Bioelectric Systems.

The presence of a bioelectronic laboratory in Phillips Hall created some unusual occurrences in the normal course of events in an electrical-engineering building. One day, for example, a large wooden crate marked FRAGILE-SEA WATER-HANDLE WITH CARE appeared on the loading dock. Eventually the crate was unpacked in Kim's lab. It contained a glass aquarium, indeed filled with sea water, that was to be the home of *Aplysia*, a sea snail popular with neurophysiologists because of the simple organization of its nervous system and the large size of many of its neurons. Kim delighted in showing his "pet" to visitors, and with characteristic enthusiasm would describe the bioelectric studies that his group could perform with the aid of the creature. In later years, when interest in biological studies declined in the School, Kim returned to control-system theory, but his research on the application of VLSI techniques to biological systems stimulated a strong interest in computer technology. In this period he taught course EE 230, Introduction to Digital Systems, served as a class advisor, and was a member of the EE Faculty Committee. During a leave of absence in 1984, he began an association with the Korean Advanced Institute of Science and Technology (KAIST) in Seoul as an Adjunct Professor of Electrical Engineering. He taught courses there in computer engineering and control theory and worked on VLSI system designs applied to advanced computers. On his return to Cornell, he taught again in the areas of control theory and in the electrical machine laboratory. Following his retirement he returned to KAIST and directed development of a Korean version of a supercomputer until his death in 1991.

At Cornell Professor Kim was also a member of the National Nanofabrication Facility (NNF), the Engineering and Theory Center, and the Applied Mathematics Center. He held a National Institute of Health Special Research Fellowship in 1970-71. He was a Senior Member of the Institute of Electrical and Electronic Engineers, a member of the New York Academy of Sciences, and a member of the Cell Kinetic Society. Kim had 52 formal publications and 33 conference papers, with the majority being in the bioelectronics and bioscience fields. His friends and colleagues at KAIST held a special memorial service in Seoul, and arranged to collect and publish his papers in a memorial volume.

While Kim was a student at the University of Alabama he attended an ecumenical conference at Ohio State University in Columbus, Ohio and met Young Sook Susan Hyun. They were married on Tennessee when he was with the TVA. He is survived by his wife who resides in Ithaca, New York; a son, Eugene of Ithaca, New York; a son

and daughter-in-law, Erwin and Tina of Rutherford, New Jersey; a son, Edward of Cortland, New York; a daughter, Julie of Ithaca, New York; a brother, Dr. Gene H. Kim of Searingtown, New York; and two sisters, Mrs. Pauline Kim of Riverside, California, and Mrs. June Kim Yeum of Landsdale, Pennsylvania.

Professor Kim will be long remembered as a caring teacher and adviser, a dedicated researcher, and a respected colleague and friend.

James S. Thorp, H.C. Torng, Simpson Linke

Dexter Simpson Kimball

October 21, 1865 — November 1, 1952

Dexter S. Kimball was born in New River, New Brunswick, several months after the Civil War ended. A full account of his life would read like a typical American success story of a career during the post-war years of rapid industrialization and mechanization. He grew up in the lumbering districts of New Brunswick and western Washington, became a journeyman machinist, a designer of heavy machinery, a works manager, and finally a national reformer in the field of engineering education.

His family, part English, part Scottish, part Irish, swung between Maine where his grandparents lived and New Brunswick where he was born, as the occupations of millwright and ship carpenter beckoned them. When Dexter, the eldest of the four children, reached five the family moved to Marysville, a small mill town in the outskirts of Fredericton, capital of New Brunswick. There he spent ten happy years, and profited greatly from a grade school of exceptional quality and an excellent school library. When Dexter reached fifteen, family connections lured the Kimballs to an even richer lumbering district around Puget Sound. The family of eight spent a week on the railroad from Boston to the Pacific Coast and another in San Francisco waiting for the steamer from which they disembarked at Port Gamble on the Sound, where they were welcomed by residents most of whom had themselves come earlier from Maine.

Shortly after Dexter's arrival he secured employment as an apprentice in the machine shop of the Puget Mill Company. The resident engineers, machinists, millwrights, and blacksmiths at and around Port Gamble had to keep the machinery of the sawmills running. Dexter as the only apprentice was called upon to work at various kinds of jobs, some new, others emergency repairs. At nineteen he was substituting for engineers in the Port Gamble mills and made a number of trips as assistant engineer on the company's towboats. A year later he substituted for a short time as engineer and machinist in charge of the Port Ludlow mill, one of the largest and newest on Puget Sound. At twenty-two he left Port Gamble for San Francisco looking for work with a brighter future and found it with the Union Iron Works, then the most important engineering company on the Pacific Coast. It employed thousands in building ships, mining machinery, land and marine boilers and stationary and marine engines. For six years Kimball worked there as journeyman machinist gaining practical engineering experience of a varied kind. Then he resigned in order to get an engineering education. Stanford University had just opened only a few miles away. At the age of twenty-eight Dexter registered there, first as a special and later as a regular student. Three

years later he received the degree of A.B. in engineering. He was greatly helped and inspired at Stanford by the professor of mechanical engineering, A. W. Smith, who did much to shape Dexter's future career.

After graduating he returned to the Union Iron Works where the theoretical training he had acquired at the university gave him an advantage and brought rapid advancement. The 500 ton hydraulic press which he designed for shaping cold steel plates is still in use. When the two sets of hoisting engines he had designed were finished he moved with them to Butte, Montana, first to supervise their installation and then to run them. After a brief stay there he went to Cornell University to organize and offer a pioneer course in designing heavy machinery under Professor Barr and Director Thurston who had been for thirteen years at the head of Cornell's Sibley College of Mechanical Engineering and the Mechanic Arts, and as Kimball later declared had "raised the standard of entrance requirements and undergraduate instruction to the highest level ever attained in American engineering schools." After three years of teaching, however, Kimball's slow academic advancement combined with an alluring invitation from one of his former Stanford teachers, Dr. F. A. C. Perrine, who had gone into business as president of the Stanley Electric and Manufacturing Company, took him to Pittsfield, Massachusetts, to build and equip a new factory.

While he was there, Thurston died, Kimball's Stanford friend A. W. Smith succeeded him, and persuaded Kimball to return to Cornell as Professor of Mechanic Arts charged with modernizing the shops and shop courses. He introduced a course then unknown to the engineering world which dealt really with the economics of production, but which, in order to win the acceptance of a conservative faculty, had to be disguised under the less revealing title of Works Administration.

While Kimball was developing his courses in engineering at Cornell, Stanford University planned to offer a professional degree to graduates who had later achieved distinction and who submitted a thesis as evidence of what they had done. Stanford made Kimball and his career an exhibit on which to rest its case for creating the new degree, that of Mechanical Engineer, and it was conferred on him in 1913.

For thirty-two years Kimball was a member of the Cornell faculty and for a longer time a lecturer popular in many places. He was active also in many educational and professional societies and served twice as temporary president of the University. The honorary degree of Doctor of Laws was conferred on him by the University of Rochester, Doctor of Science by the Case School of Applied Science, and Doctor of Engineering by Kansas State College, by Northeastern University, and by Lehigh University. He was awarded four gold medals, one by an educational and

three by engineering societies. For two years during the Second World War he was Chief of the Priorities Section in the Machine Tool Division of the War Production Board.

Perhaps no other member of the faculty in recent years has had as much rich association as Kimball with alumni and undergraduates. When Willard Straight Hall, the student union, opened, he became one of the members of its first Board of Governors and was reappointed until his retirement eleven years later after a longer term of service than any other member, a service recognized by the student Board of Managers when it dedicated to him one of the special dining rooms and adorned its walls with photographs which he selected to illustrate the university's early years.

The most recent engineering building on the campus likewise has been named jointly for him and Thurston, Cornell's other great pioneer in engineering education.

The reputation of an administrator or teacher is ephemeral: what one writes in a scientific field lasts a little longer either in the writer's own words or as built into thinking of later scholars. Probably the most definable and durable part of Kimball's work is to be found in his books; of them the most important was *The Principles of Industrial Organization*, which appeared forty years ago, has run through six editions and is still standard. An authoritative review said of it:

"From the first page to the last, the reader is aware that he is being given the fruits of a wise and mature scholarship and the benefits of a broad experience. The book portrays and illuminates the influence of our developing mechanical arts upon our economic problems more adequately than any that has previously appeared."

In 1919 the Cornell Schools of Civil, Mechanical and Electrical Engineering were combined and Kimball became dean of the consolidated college, a position he retained for seventeen years. When he reached the retiring age, the Cornell Society of Engineers paid tribute to him in these words:

"We are proud of Dean Kimball's national fame as an engineer and leader in engineering education: we are mindful of his outstanding professional achievements which have contributed to the prestige of our College. Yet, in the intimacy of this Cornell group, our main desire is to record our respect and affection for one who in the discharge of his duties has evinced qualities of gentle humanity and gracious friendship adorning his technical skill and attainments.

"He has done perhaps his most important work for education in two fields, as Dean of the College of Engineering and as writer of successful books in a newly opened and most important field.

“By the breadth of his intellectual interests and by his literary and artistic knowledge and sympathies, he has set a lofty standard for his fellow engineers who wish to add to their scientific accomplishments something of his maturity and richness of understanding of the finer things of life.”

For seventeen years after he nominally retired and received this tribute, Kimball continued to render invaluable services to his university, his town, his country and mankind.

Asa Carlton King

June 24, 1877 — January 17, 1967

Asa Carlton King, Professor Emeritus, served as Professor of Farm Practice and Farm Superintendence in the New York State College of Agriculture for thirty years. He had resided at 117 McIntyre Place, Forest Home, since 1915.

Professor King was reared on a farm near Trumansburg, New York. He graduated from the Trumansburg Academy, matriculated at the College of Agriculture at Cornell University in September, 1895, and received his B.S. degree in agriculture in June, 1899. As an undergraduate he was a prominent member of the Cornell crew under the famed Coach Courtney and was navy director for one year. He was a member of the Sphinx Head and Alpha Gamma Rho fraternity.

For ten years following his graduation from the College of Agriculture, he operated a fruit farm at Trumansburg. His success as a farmer resulted in his being called in 1909 by the New York State Department of Agriculture to lecture at farmers' institutes. At that time it was the policy of the Department of Agriculture to rely almost exclusively on men who were actively engaged in farming to relate their experiences in following recommendations of the College and Experiment Stations. Many farmers were not yet ready to listen respectfully to college professors and government research workers, but college-trained men who were making an outstanding success of a practical farm enterprise had great influence in stimulating farmers to adopt improved methods and to strive for a better understanding of the scientific principles underlying farm operations. Professor King was unusually successful in winning the confidence of farmers and helped to lay the foundations for an enlarged extension service that was soon to follow.

During the winter of 1911-12, Professor King was employed by the College of Agriculture to give instruction at Extension Schools. These schools, organized throughout the State, were set up usually as a five-day course with a staff of three or more instructors, most of them college professors. "Carl" King soon became one of the most popular conductors of Extension Schools although he was still primarily a farmer.

On April 1, 1915, A. C. King accepted a full-time position at the College of Agriculture as Professor of Farm Practice; and during the thirty years in which he had charge of the faculty requirement in farm practice, almost 10,000 men students were enrolled in the College. Professor King evaluated the farm experience of these students and placed many of the inexperienced men on farms where they could gain additional experience to complete

the practice requirement. He brought to this work a sympathetic understanding of the problems arising when an inexperienced city boy worked for a practical farmer. Under his supervision both the students and the farmers profited.

On the retirement of Professor J. L. Stone in 1920, Professor King assumed responsibility for supervision of the College farmlands not under jurisdiction of the various departments, and at that time his title was changed to Professor of Farm Practice and Farm Superintendence. Under his direction the lands were well-managed for the purposes of research, instruction, and production of crops for livestock. The services expected of Farm Practice by the departments were maintained on an efficient and cooperative basis.

During the twenties and thirties Professor King promoted the change from horse-farming to power-farming. At one time there were sixteen teams of horses used on the University farm for farm work and to haul ice for the dairy plant and coal for the University heating plant. Professor King also helped to promote tile drainage not only on the College farmlands but on farms in the state. He was instrumental in establishing the boarding house in Forest Home for single employees.

In addition to his regular work he found time to serve his community by taking an active interest in the Forest Home school and Forest Home Improvement Association. Professor King was a friendly man who worked well with other people. He was a great lover of nature and, after retirement, pursued his hobbies of fishing and hunting, and hiking through the fields to observe wild flowers. He loved to pick wild strawberries.

In 1905 he married Viola Doyle, who passed away in 1947. In 1960, he married Helen Covell. He is survived by Mrs. Helen Covell King and two daughters, Mrs. Dorothy Hoyt Dillingham of Ithaca and Mrs. Edith King Fulton of Houston, Texas, and four grandchildren.

A. E. Durfee, A. W. Gibson, S. R. Shapley

Benjamin Freeman Kingsbury

November 18, 1872 — July 8, 1946

Benjamin Freeman Kingsbury was born at St. Charles, Missouri on November 18, 1872, the son of Benjamin Barnes and Sarah Nichols Freeman Kingsbury. A few years thereafter his parents moved to Defiance, Ohio, where he prepared for college.

He received the degree of Bachelor of Arts from Buchtel College, now the Municipal University of Akron, in 1893. In the fall of the same year he came to Cornell for graduate work under the direction of Professors Burt Green Wilder and Simon Henry Gage

He received the degree of Master of Science in 1894. His thesis for the Master's degree, "The Histological Structure of the Enteron of *Necturus maculatus*," was awarded first prize in animal histology by the American Microscopical Society and was published in the proceedings of the Society for 1894. He was appointed University Graduate Scholar in Physiology and Vertebrate Zoology in 1894 and in June, 1895, received the degree of Doctor of Philosophy. His doctoral dissertation, "The Brain of *Necturus maculatus*," has become one of the minor classics of neurology. In 1895-96 he held the Goldwin Smith Fellowship in Physiology and Vertebrae Zoology.

When in 1896 the Department of Histology was organized by the late Professor Gage in the newly established College of Veterinary Medicine, Dr. Kingsbury was appointed Instructor in Microscopical Methods, Histology and Embryology and three years later was promoted to an assistant professorship. In 1902 he was made Assistant Professor of Physiology in the Ithaca division of the Medical College. From 1902 to 1904 he studied at the University of Freiburg, i. B., where he received the degree of Doctor of Medicine in 1904.

On the retirement of the late Professor Gage in 1908, Dr. Kingsbury was chosen to succeed him as Professor and Head of the Department of Histology and Embryology.

After his retirement in 1941 Professor Kingsbury was elected Guest Professor of Anatomy in the Medical School of the University of North Carolina. He died in Chapel Hill on July 8, 1946. He is survived by his wife, Janet Williamson Kingsbury, and four children by a former marriage.

Professor Kingsbury served as vice-president of the American Association of Anatomists in 1932-33 and was a member of a number of other scientific and honorary societies. He enjoyed international distinction for his researches in neurology, histology and embryology. He was the author of numerous contributions to scientific

journals, and the following books: *Vertebrate Histology* (with Professor S. H. Gage), 1900; *Laboratory Directions in Pharmacology*, 1905; *Laboratory Directions in Physiology*, 1906; *Laboratory Directions in Histology and Histological technique* 1910, (numerous editions); and *Histological Technique* (with Professor O. A. Johannsen), 1927. He was elected a member of the Institute Internationale d'Embryologie and in 1934 was awarded the degree of Doctor of Science *honoris causa* by Bowdoin College.

Professor Kingsbury was retiring, even shy; only those closest to him could appreciate the real qualities of the man, but even those not so privileged could not fail to see that his was a nature rare in any walk of life.

His achievements as an investigator were outstanding, but it is as a teacher of superlative qualities that he will be remembered by his students, to whose interests he was ever unselfishly devoted. He taught naturally, simply, and lucidly, the effortlessness of his performance concealing the thoughtful preparation for it. Nor was his teaching confined to the classroom and laboratory; the whole conduct of his life was an inspiring example. His students revere his memory, and in them his profound and wholesome influence will live on.

H. B. Adelman, W. N. Barnard, B. P. Young

Otto Kinkeldey

November 27, 1878 — September 19, 1966

Otto Kinkeldey was born in New York City. After attending public schools there, he received the A.B. degree from the College of the City of New York in 1898 and the M.A. in English literature and philosophy from New York University in 1900. For the next two years he did graduate work in music at Columbia University under Edward MacDowell. From 1898 to 1902, he was organist and choirmaster of the Episcopal Chapel of the Incarnation in New York City. In 1902, he went abroad to continue his musical, literary, and historical studies at the University of Berlin under Hermann Kretzschmar and at the Royal Academic Institute for Church Music in Berlin under Robert Radecke, serving at the same time as organist and musical director of the American Church in Berlin.

In 1906-07, he was sent by the Prussian government on a research trip through the ducal, church, and town libraries of the central German states for the purpose of cataloging and describing the musical scores and books on music in those libraries. Returning to the University of Berlin, he continued his studies and received the Ph.D. degree *summa cum laude* in 1909 for a thesis on “Orgel und Klavier in der Musik des 16. Jahrhunderts”—a path-breaking achievement at the time and a classic work in its field.

In 1909, Dr. Kinkeldey became instructor in organ and music theory at the University of Breslau and librarian of the Royal Academic Institute for Church Music connected with that university; a year later he was enrolled as Lecturer in Music History in the Faculty of Philosophy and received the honorary title of Professor. When war broke out in 1914, he returned to the United States to head the division of music in the New York Public Library, continuing there until 1923 except for two years of service (1917-19) in the army.

From 1923 to 1927, Dr. Kinkeldey was chairman of the Department of Music at Cornell; he also served as University Organist in his first year and directed the Sage Chapel Choir in the vesper services all four years. It was under his chairmanship that musicology became, for the first time at Cornell, a subject for graduate study; probably the first seminar in musicology in this country was given here by Dr. Kinkeldey in 1924-25.

After three more years at the New York Public Library, Dr. Kinkeldey returned to Cornell in 1930 as University Librarian and holder of the first professorship of musicology to be established in the United States, a double office which he filled with distinction until his retirement in 1946. His term as librarian coincided with difficult times: beset by lack of space, lack of properly trained staff, and inadequate budgets, he labored through the years of depression and war, constantly urging in his annual reports the needed expansions. “We are demonstrating,”

he declared in one report, "the theorem that two bodies, when they take the form of books or library workers, can occupy the same space." An honored guest at the formal dedication of Uris and Olin Libraries in October 1962, Dr. Kinkeldey was able to see accomplished what he had so long worked for. Meanwhile, he had performed many services to the academic community outside the round of his official duties, including the giving of informal seminars in bibliography for the benefit of graduate students. And despite the shortage of funds he had managed through his connections in Germany to acquire some of the basic sets which are the foundation of the present superb collection of the music library.

During all these years Dr. Kinkeldey was also active in library and musicological affairs on a national scale. He was one of the founders of both the Music Library Association and the American Musicological Society, serving as president of the former from 1931 to 1935 and of the latter from 1934 to 1936, and again in 1941-42. He took an active interest in both organizations up to the last year of his life. The American Musicological Society made him honorary president and devoted to him a special volume of its journal (1960) as a *Festschrift*. He was awarded the honorary degree of Doctor of Letters by Princeton University in 1947. After his official retirement from Cornell, he served as visiting professor at Harvard, Texas, Washington, Princeton, and other universities until 1958. In 1948, he gave a series of Messenger Lectures at Cornell on the subject, "Music and the Universe."

Dr. Kinkeldey's published musicological works were not extremely numerous, but every one bore the mark of authority and careful scholarship. He was himself an accomplished musician as well as a scholar. His influence on the development of musicology in the United States was fundamental and far-reaching. It was an influence exercised through his teaching and, of even greater consequence, through his example. One of his colleagues remarked in 1958, "I venture to say that there is no serious American musical scholar of this generation who does not consciously reflect some sort of contact with the ideal of scholarship which Dr. Kinkeldey embodies." He belonged to the last generation of musicologists in which it was still possible for one man to be at home in every area of the discipline; he was perhaps the last great "generalist" in that field. His grasp of the essentials of any problem was always sound and always expressed with clarity, force, and humor. For many years he ably defended the cause of musicological studies against the sneers of so-called "practical" musicians, thereby eventually making way for the introduction of musicology as an academic discipline in virtually every graduate school in this country. His eminent position as a living link between European and American musicology was dramatized in his address to the International Musicological Society on the occasion of its congress at New York in 1961, the first such congress to be held outside Europe.

Those of his friends who were also his professional colleagues will always recall with gratitude Dr. Kinkeldey's readiness to place at their disposal his immense knowledge and sound judgment in musicological matters. More than one of us never submitted a manuscript until after it had passed the scrutiny of that keen intelligence. In personal relationships Dr. Kinkeldey was a man of few words, externally not demonstrative but a friend on whose understanding and affection one could always rely. And his home will be remembered as a delightful center of social life in the Cornell community.

Harry Caplan, G. F. Shepherd, Jr., Donald J. Grout

John Edward Kinsella

February 22, 1938 — May 2, 1993

John Kinsella was born in Ireland and received his Bachelor's degree in Dublin. He received his Master's and Doctorate degrees at Penn State in biology and food chemistry in 1965 and 1967 respectively. Cornell's Dairy Science Department hired John in 1967 to replace Professor Krukovsky to teach lipid chemistry as one of his responsibilities.

Within a very short time, John established himself as a leading researcher in the physical chemistry of food proteins, as well as in lipid biochemistry. Space in Stocking Hall was soon stretched to accommodate researchers that came from far and wide to study and work with Professor Kinsella. He and his associates applied the results of their research to improve food, and formulated new uses for lipid and protein fractions. These efforts were extended into a myriad of related programs that were health related. He worked on the mechanism of lipid oxidation, the effects of natural antioxidants, and the nutritional value of polyunsaturated fatty acids. Through John's vision, as well as his leadership, important changes in departmental programs were made.

To his credit, it seems as if almost heaven and earth were moved to secure support and funds to build the new Food Processing and Development Laboratory. What would not be so visible to outsiders would be the subtleness of change he made in focus that attracted new faculty with expertise in biotechnology, chemical engineering, and theoretical biophysics. The Department of Food Science that evolved from dairy science was enriched with an emphasis placed in packaging, toxicology and other areas. The merging of the past with the present with a cadre of young people to challenge the future was set in place to serve the future.

John served as departmental chair (1977-85), associate director of the Institute of Food Science (1977-80), and then director (1987). In 1976, he was the recipient of the Borden Award for his early research accomplishments in the biochemistry of milk lipid biosynthesis. In 1981, he was named the Liberty Hyde Bailey Professor of Food Biochemistry. In 1984, he was honored by being awarded the first General Foods Distinguished Professor Chair of Food Science. He held several patents, published more than 500 papers, numerous book chapters and reviews, and was the author of one book and the editor of two others. John received many honors and awards. He was named a Fulbright Fellow in 1983, was the recipient of the prestigious Babcock-Hart Award in 1987, the Atwater International Award from the USDA in 1988 and two awards from the American Chemical Society—the Advancement of Food Chemistry Award for Outstanding Research in Chemistry in 1990 and the Spencer Award in 1991. In 1991, John

was also presented with the Stephen S. Chang Award for distinguished research in lipid biochemistry at the 82nd AOCS Annual Meeting in Chicago, Illinois.

In 1990, John Kinsella, the distinguished scientist, academic leader and dedicated educator accepted still another challenge, deanship of the College of Agriculture and Environmental Sciences at the University of California. Here, too, he was recognized for vision and strength in leading the college through some of its most challenging periods. His dedication to science, scholarship, and service to society was well recognized.

John had so much more to contribute to science with his special gift of vision and leadership which has been lost with his sudden and untimely death. Those of us lucky enough to have known and worked with him realized he was endowed with special gifts that brought great credit to his students, his department, his college, the university, and himself. The twinkling eyes, the short lab coat, and the cup of tea were familiar characteristics of both the young and then later the more mature professor. Regardless of the many national and international accolades and honors that were bestowed on him, he seemed unchanged to those of us with whom he worked. John was modest to a fault and quick to praise others for achievements made in their professional careers. Food science is a better field because of him. We are sure to continue to harvest benefits from his work in the years ahead and these will attest to his distinguished scholarly achievements. A bright star has been extinguished.

Carl Bait, Syed Rizvi, Robert R. Zall

Alexander Kira

May 31, 1928 — October 4, 2005

Alexander Kira, Professor Emeritus of Architecture, died from cancer, on October 4, 2005, at a nursing facility in Ithaca, New York. Born in Estonia, his parents immigrated to the United States when Alexander was two years old. He was raised in New York City and began a long association with the College of Architecture, Art and Planning, beginning as a student in the Department of Architecture. He graduated with a Bachelor's degree in Architecture in 1953 and a Master's degree in City and Regional Planning in 1957.

He was appointed Assistant Professor in the Department of Architecture in 1957, promoted to Associate Professor in 1962, and promoted to full Professor in 1968. He was Secretary of the Faculty for Architecture in 1975; Associate Dean of the College of Architecture, Art and Planning from 1976-78; Associate Dean for Administration and Student Records from 1978-80, and served the Department as Chair's Associate for many years in charge of undergraduate admissions, student awards, enrollment, and thesis. He was named Professor Emeritus in July 1996.

As a design critic for almost forty years, Professor Kira taught various levels of design. To freshman students, Alex Kira was an intimidating persona. In the upper year studio, he was one of the first faculty members in the Department of Architecture to focus on interior architecture in his design studios. In a period prior to the utilization of computer-generated images, his students were required to develop large mechanically constructed color interior perspectives identifying all the materials proposed in their designs. At the time, presentations of this type were unique in the department. His juries were conducted to simulate professional presentations and students were required to be appropriately dressed for these reviews.

Professor Kira was attracted to the Miesian discipline of design (Architect Ludwig Mies Van Der Rohe). This influence was evident in his teaching and in the two houses he designed for himself in Cayuga Heights. Those of us who had occasion to visit his homes recall that he and his wife, Marian, were always extremely gracious hosts and proud to show off the many special features of these houses. Storage compartments, in every area of the houses, were designed to accommodate specific items such as wine glasses, placemats, or socks. The interiors were always comfortable, clean, properly arranged and camera ready. One could also easily recognize Alex Kira's car in the Sibley parking lot. Porsche, Thunderbird or Mercedes, his car was always washed and polished.

Professor Kira was best known for his book, *The Bathroom*, first published in 1966. The book, a graphic study of the ergonomics of bathroom fixtures and how they should be redesigned, appeared in an expanded second edition in 1976. The book, translated into numerous foreign languages, was considered quite groundbreaking and controversial when first published. It stimulated an article about Professor Kira in *Time Magazine*. He was often invited to lecture abroad on the topic of his book, especially in Japan. Professor Richard Penner, School of Hotel Administration, a former student of Alex Kira, prepared some of the illustrations of the second edition. He recalls how his drawings were scrutinized, with a “reducing glass”—the opposite of a magnifying glass—to make sure the lines would read when the illustrations were reduced in the printed version. Penner considers this experience with Kira as the most formative part of his education at Cornell.

Years later, Professor Penner invited Alex Kira to give a guest lecture on “Luxury.” Kira, always well tailored and imposing, would be able to define this term to his hotel management undergraduates. Essentially, Kira’s definition was that luxury equaled choice. Luxury meant a choice of finishes, a choice of room locations, and a choice of dining options. Penner invited Professor Kira to lunch in the old Statler Main Dining Room. The waitress offered a soup and sandwich special. What is it? Tuna salad on rye or something like that. Kira requested tuna on whole wheat, but she replied that it didn’t come that way. Alex Kira, raised his eyebrows in the way all remembered, lowered his chin, and gave his typical “humph,”—Luxury!

Professor Kira is survived by his wife, Marian M. Kira, Cornell B.S. degree Human Ecology ‘38, M.S degree Human Ecology ‘60. He will long be remembered by his colleagues in the Department of Architecture and his many friends at Cornell. He will be missed by generations of students, many of who only gained an appreciation of his teaching philosophy later in their careers as architects.

Mario L. Schack

Gordon M. Kirkwood

May 7, 1916 — January 16, 2007

Gordon M. Kirkwood was a Professor of Classics at Cornell for nearly 40 years and a renowned scholar of Greek literature. Born May 7, 1916, in Toronto, he was the son of George L.M. and Gertrude Marlatt Kirkwood. After growing up in Peterborough, Ontario, he entered Trinity College, University of Toronto, where he earned his B.A. degree in Classics in 1938. That fall, he enrolled at Cornell for graduate study, where he met Patricia Frueh, also a graduate student in Classics, who was to become his wife of 66 years. After receiving their M.A. degrees from Cornell in 1939, both went to Johns Hopkins University to complete their education. They were married in 1940 and in 1942 were awarded their Ph.D. degrees in Classics.

Mr. Kirkwood enlisted in the Canadian Navy in 1942, and was posted in Ottawa where he served as an intelligence officer during World War II. In 1945, he moved to Washington, DC, where he worked in intelligence for the British Foreign Office until the end of the war.

He returned to academia in 1945, taking a position as a Latin master at Lower Canada College in Montreal. The next year, he joined the Classics Department at Cornell as an Instructor and remained there for the next 38 years. He became a full Professor in 1959 and in 1973 was named the Frederic J. Whiton Professor of Classics.

Among his scholarly publications was *A Study of Sophoclean Drama*, which was selected for the 1959 Goodwin Award of Merit given by the American Philological Association to the year's outstanding contribution to classical scholarship. He was also author of *Early Greek Monody* (1974) and editor of *Poetry and Poetics, Studies in Honor of James Hutton* (1975) and *Selections from Pindar* (1981). On a lighter note, he wrote a popular *Short Guide to Classical Mythology* (1960), which remains in print to this day. He also wrote numerous articles and reviews and was co-editor of *Cornell Studies in Classical Philology*.

Although he was well known for his scholarship, Mr. Kirkwood believed strongly that educating students was a professor's most important job. Not surprisingly, then, he was a dedicated and popular teacher of Greek and Latin language and literature. In 1978, he won Cornell's Clark Award for Distinguished Teaching.

From 1963-72, he was Chairman of the Classics Department. During his tenure, he substantially expanded and strengthened the department. He also helped establish the Prescott W. Townsend Fund, which brings scholars to campus to lecture and supports pre-doctoral fellowships and travel grants for classics graduate students.

Among the awards he received were fellowships from the Ford Foundation, the Guggenheim Foundation, the American Council of Learned Societies, and the National Endowment for the Humanities. He was elected President of the American Philological Association for 1981.

After he retired in 1984 as Professor Emeritus, friends and colleagues compiled a volume of essays in his honor entitled "Language and the Tragic Hero." During his retirement, he remained involved in his field and wrote *The Classics at Cornell*, a history of the department, published in 1999.

At a memorial gathering on April 14, 2007, many friends and colleagues testified to the importance of Gordon's influence at key times in their lives and others wrote of his outstanding teaching and scholarship and of the famous hospitality of the Kirkwood family. Jeffrey Rusten, Acting Chair of Classics, said:

"In addition to being a world-renowned scholar of Greek literature and an influential teacher, as department chair Gordon was the first to conceive of classics as embracing archeology, historical linguistics, and contemporary approaches to literature. Our department today is unthinkable without his vision."

Cornell alumna Isabel McGinty, now a lawyer, wrote that the elementary Greek class he taught was

"a course that changed the course of my life. I loved the material. It captivated me and sparked my interest in taking more and more Classics courses. But it was Professor Kirkwood himself who made the class such a pleasure to attend, and made the study of the Greek language so exquisite an experience."

Former colleague Ralph Johnson, now Professor Emeritus in the Department of Classics at the University of Chicago, wrote:

"of my many warm memories of Ithaca and Cornell among the brightest are those of Gordon and Patricia. Their welcoming of newcomers was overwhelming in its kindness and generosity, and throughout the years their company was delightful and unfailingly affectionate. I've known many chairmen in my day, some of them good, some a bit less so, but none in my mind matches Gordon for what seems now a unique clustering of chairmanly virtues: fair-minded, firm, compassionate, witty, a paragon of unostentatious civility and a perfect master when it came to fashioning equitable compromises. Rarest of rare birds."

Andrew Ford, a Cornell undergraduate and now Professor of Classics at Princeton, wrote that

"I vividly see him with the sunlight glinting off his glasses and with that big smile, but I recall few specific dicta. I think this is because so much of what he said became part of my mental furniture; a lot of what I know and respond to in Greek poetry came to light while Gordon was teaching."

It would not be an exaggeration to say that many who knew Gordon Kirkwood regarded him with a warm affection akin to love.

Mr. Kirkwood was active as a volunteer in the area of mental health. He was a member of the Tompkins County Mental Health Services Board and was on the original board of directors of HOMES, Inc. He also served on the board of Challenge Industries.

He is survived by his wife, Patricia; his sons, Michael, of Ithaca, and David and his wife, Annie, of New York; his sister-in-law, Margaret Frueh Rogers, of Fairfax, Virginia; and several nieces and nephews.

Pietro Pucci, Chair; Kevin Clinton, John Coleman

Thomas Kirsch

May 29, 1930 — May 17, 1999

When A. Thomas Kirsch died, we all lost a valued scholar, colleague, and friend. An anthropologist, a Southeast Asia specialist, a student of religion, and an experienced academic administrator, he was an ideal colleague and is sorely missed. Born in Syracuse, he was educated at the Christian Brothers Academy, Syracuse, and Syracuse University. After serving in the U.S. Army during the Korean War, he entered Harvard University and obtained his Doctorate in Anthropology, studying Phu Thai religious syncretism in Northeastern Thailand. He remained at Harvard as an Instructor until 1966 when he moved to Princeton University. In 1970, he joined Cornell's Department of Anthropology and Southeast Asia Program. In 1984, he married Yohko Tsuji, a fellow anthropologist. They were a happy couple. Yohko won the admiration and gratitude of all for the encouragement she gave Tom in continuing to lead a full life after his surgery in 1992. During his Cornell career, Tom served as the Department of Anthropology's Chair for nine-and-a-half years and was Acting Chair of the Department of Asian Studies.

Tom Kirsch's graduate training in the 1960s coincided with a very special period in the history of social anthropology in the United States. He studied in the Social Relations Department at Harvard, the forerunner of all interdisciplinary programs that sought to integrate anthropology, social and clinical psychology, and sociology. All of his subsequent teaching and writing bears the strong stamp of Talcott Parsons and the particular understanding of the concept of evolution that Parsonian theory entailed. One of the enduring criticisms of Parsons's work has been that it remained unattached to empirical data, and it was one of Tom's most enduring achievements that he linked the two in such profitable ways. His research focused primarily on religious syncretism and changes in religion and society in Northeast Thailand. He returned to Harvard to write his dissertation. In the roughly 25 years between the time he took his Ph.D. degree in 1967 and was stricken by cancer, he was able to return to Thailand for four more periods of research.

With James L. Peacock, he co-authored, *The Human Direction: An Evolutionary Introduction to Social and Cultural Anthropology*, published in 1970. His subsequent publications deal almost exclusively with religion and their style of argument is both clear and remarkably trenchant. Tom's steady stream of reviews are models of what an academic book reviewer ought to aim to do, but perhaps his most impressive contributions to scholarship on Theravada Buddhism and syncretism were delivered in the form of (uncollected) lectures, panel papers, workshop contributions, and seminar presentations. At the time of his death, when many anthropologists were engaged in

renouncing empirical research in favor of disembodied theory, Tom never wavered from his commitment to the project of fostering their interaction.

Kirsch's influence as a Southeast Asian specialist was the result of the disciplinary approach he brought to his studies of mainland Southeast Asia and especially of Thailand. Trained as a cultural anthropologist, he was always concerned with the dynamic relation of culture and society, maintained a special focus on religion and worldview, and possessed a keen sense of the influence of history. An awareness of the role of human agency and motivation informed his work.

Early in his career, he came to see culture as a system of values, concepts, and ideas that shaped and controlled individual action and the structure of society. When, in 1962, he began fieldwork in northeastern Thailand, he discovered a Buddhist country with ample cultural resources to engage his particular interests. Continually exploring the ramifications of the Buddhist concept of merit, over the years Kirsch undertook important studies of, for example, Thai gender roles, Thai economic activities, Buddhist monastic reform, and the persisting relationship of animism and brahmanism with Theravada Buddhism. However, he was more than a fieldworker. He also wrote on early Thai and Khmer history and mobilized his anthropological expertise to challenge conventional historical wisdom on such topics as the significance of kinship systems or the rise and fall of political systems. In the context of Khmer history, he argued that more attention should be paid to the achievement of social integration through, among other things, polygamy or the varying relationship between the cosmological claims of divine kingship and of the Buddhist monkhood. His Southeast Asian interests were even more extensive, and by many he is best known for his classic study in 1973 of religion and society in upland Southeast Asia, where his focus was on religion and world view rather than on the political explanations preferred by others. In this study, Kirsch avoided seeing rituals and feasting simply as part of the traditional cultures of "tribal" groups and, instead, saw them as being dynamically connected with the negotiation and contestation of social arrangements and rank. In the field of Thai studies, his influence was considerable. Some might say that it was profound. His judgment was invariably sought.

Kirsch's work in the anthropology of Thai village life also situated his work within the field of Religious Studies. Because of his extensive fieldwork in rural Thailand, he became a leading ethnographer of Thai Buddhist village life. During the years he worked and conducted research in Thailand, the central structures of Thai village life shifted dramatically. His ethnographies, therefore, made not only important theoretical contributions, but also became some of the last anthropological descriptions of Thai village religious life when the forest monk tradition was a

vibrant modality of religious expression. The attention to religious institutions and structures in his scholarship was also passed on to his many doctoral students.

At Cornell, he played a central role in the establishment of the academic study of religion as a field of study in the College of Arts and Sciences. In 1989, he was one of several scholars in the college asked to serve on a Religious Studies steering committee charged with creating an academic program for the study of religion at Cornell. With his active participation and often-direct intellectual leadership, Religious Studies was approved as a major in 1991, and the Religious Studies Program adopted a curriculum with core offerings the same year. He served on the steering committee for the program until his death. During that time, he chaired the curriculum committee, advised many Religious Studies majors, and served on numerous Honors committees.

No memory of Tom would be complete that failed to emphasize his delight in teaching and his success as a teacher. He was one of the most deceptively memorable teachers we have known. No orator, Tom quietly and patiently went through materials, questions, and issues with no attempt to enthrall the listener with high-sounding terminology or performative aplomb. Yet, as the students engaged him in discussion, they inevitably found a stronger “push back” than they expected, a mind that insisted on clarity and logic and rejected puffery. Perhaps the detail that most captures this sheer intellectual intensity is what happened to his classes after his throat operation in 1992 left him with an electric monotone voice. For most academics, this would have signaled the end of lecturing and seminar leading. For Tom, it seemed to clear away the remaining underbrush, leaving the pure ideas only.

After his surgery, if anything, his classes were more intensely exciting to students. We all remember walking by his office during this period, hearing the monotone and seeing the students on the edge of their chairs, in the kind of rapt attention we always seek but rarely attain. Those of us who supervised students with him most remember his delight in them. What struck us most was Tom’s pure pleasure in students’ creativity, accomplishments, and intelligence. No professorial jealousies there, no need to hold the ground as their intellectual superior, just sheer joy. His students responded by outdoing themselves and by struggling to meet a standard that they alone set, thinking somehow they were trying to meet his expectations when he was simply enjoying the process of watching them grow as young colleagues. The symposium in his honor, organized by the Anthropology Department in February 1999, enabled them to express their gratitude clearly.

As a colleague, Tom embodied the virtues of judiciousness and patience; he was always ready to discuss issues with students and colleagues alike and enjoyed nothing more than trading critiques of newly published work and

reviewing yet again for the uninformed an anthropological classic that, more often than not, he had just re-read or found a reference to.

There was little he had not read, and he was the most generous of colleagues in his willingness to share his opinions and debate them with anyone who valued academic exchange. He will also be remembered by his colleagues as always being ready to take on responsibilities even when he was already shouldering more than enough. He set a tone for the rest of us that we will have to struggle to maintain.

Jane Marie Law, Robert J. Smith, Oliver W. Wolters, Davydd J. Greenwood

Ruth N. Klippstein

January 4, 1923 — May 14, 1993

A member of the Cornell University Faculty since 1961, Ruth Klippstein was a leader in nutrition education for the public. Through her work in Cooperative Extension she trained county-based professionals and developed printed and audio-visual educational materials on many topics including dietary guidance, food fads, organic and health foods, the nutritional value of foods, and food safety. Ruth was nationally recognized for her expertise related to home food preservation and for many years worked to advocate research and outreach to provide consumers with recommendations for safe methods of preserving foods at home. She developed the Food Value Wheel, a schematic for dietary guidance that was widely adapted by other nutrition educators. She was also one of the first nutrition education specialists to address vegetarianism and the nutrition education needs of the elderly. Her bulletin, *The Sodium Content of Your Food* (1981), was the basis for consumer education programming by the Food and Drug Administration and the U.S. Department of Agriculture.

Born in Ohio, Ruth received her Bachelor's degree in nutrition from the University of Cincinnati in 1944 and her Master's degree in nutrition and physiology from Michigan State University in 1946. She moved to Oregon in 1946 where she worked as a research assistant in nutrition prior to becoming an extension agent in Lane County. She became an assistant professor and nutrition extension specialist at Oregon State University in 1957 and held that position until moving to Cornell in 1961.

At Cornell, Ruth held the positions of assistant professor (1961-64), associate professor (1964-76), and professor (1976-85). For several years, she was the department extension leader and she taught an undergraduate course in Extension nutrition education methods. She was appointed professor emeritus in the Division of Nutritional Sciences in 1985. Soon after she retired, she received an award from the Extension honorary, Epsilon Sigma Phi, and was recognized by the New York State Extension Home Economics Association for her accomplishments. She left Ithaca to fulfil her long-time dream of returning to Oregon and living on the banks of the McKenzie River.

Ruth was involved in many professional activities. She was an active member of the New York State Nutrition Council for many years and chaired the Council from 1971-73. She served on the New York State Heart Affiliate Hypertension Committee and chaired the State Heart Affiliate Nutrition Committee from 1983-85. She was often called on by the media and policy-makers for advice in the areas of her expertise.

Throughout her career Ruth was a proponent of informal teaching methods and the leadership roles women needed to take in nutrition, health, and agriculture. She believed strongly that Cooperative Extension programs should take a proactive role in addressing issues and using innovative and appropriate teaching methods. She worked within the Cooperative Extension system as an advocate for change. In her own programs she tried to anticipate upcoming issues of importance to the public such as food fads, inflation, and energy usage, in order to have educational programs ready to address consumers' needs.

Ruth was active in the Presbyterian Church. With support from the National Council of Churches, she spent a 1967 sabbatical leave in Thailand as a consultant to nutrition education programs. She was a member of the Agricultural Missions Executive Board from 1970-72.

Ruth was respected and will be fondly remembered by her colleagues for her sense of humor, the support she provided for young faculty members and extension agents, her commitment to Cornell University and Cooperative Extension, and the role model she provided for working mothers. She is survived by her sister, Dr. Jeanne Nitchals of Cincinnati, Ohio; her daughter, Marjory Crouse of Atlanta, Georgia; her son, Rick Klippstein of Clinton, New Jersey; and three grandchildren.

Ardyth Gillespie, Martha Mopes, Carole Bisogni

Walter Carl Klotz

July 27, 1875 — June 29, 1941

The sudden and unexpected death of Walter C. Klotz came as a shock to his professional colleagues and his many other friends. He passed away on June 29, 1941, at his home in New York at the age of sixty-five. His association with Cornell University Medical College began in 1926 as Director of the Clinic and Assistant Professor of Public Health and Preventive Medicine. With the amalgamation of the Medical College and the New York Hospital in 1932 he was appointed Director of the Out-Patient Service of the latter institution and continued in that position as well as in his professorship until his demise.

Dr. Klotz received his early education in the Friends Seminary in New York City. After attendance at Colgate University he studied medicine at the College of Physicians and Surgeons, New York, receiving his medical degree in 1898. There followed post-graduate study abroad and seven years of private practice in New York during which period he also served as assistant surgeon in the Roosevelt Hospital. From 1909 to 1926 his work was almost entirely in the field of tuberculosis and was largely of an administrative character. After three years as medical director and superintendent of the Vermont Sanitarium at Pittsford he served, during 1912, as industrial surgeon for the Phelps-Dodge Company at Douglas, Arizona. The years 1913 to 1918 were spent as resident surgeon-in-charge at the Barlow Sanitarium, Los Angeles, California. During this period he also held an instructorship in medicine in the Los Angeles Division of the University of California School of Medicine. In recognition of his extensive experience in the management of tuberculosis he received the appointment of Associate Medical Director of the Committee for Prevention of Tuberculosis in France (Rockefeller Foundation) and served in that country from June 1918 to October 1919. On his return he became Medical Director of the Blue Ridge Sanitarium, Charlottesville, Virginia, (1919-21) and also Associate Professor of Medicine at the University of Virginia. There then followed five years (1921-26) as Medical Officer-in-Charge, Veterans Hospital at Johnson City, Tennessee. On the basis of his now widely recognized ability in hospital management he was appointed in 1926 to the directorship of the Cornell Clinic and also to the staff of the Department of Public Health and Preventive Medicine as Assistant Professor with the purpose of promoting instruction in the preventive opportunities in clinical medicine.

He had a gift for friendship; always a delightful companion, genial, interesting, and well informed. His attitude toward his associates of whatever status was kindly and considerate. He exhibited a strong sense of duty and responsibility in his activities as administrator. Soon after assuming direction of the old Cornell pay clinic, he

organized the work on a more practical basis than had been the case theretofore. He gave constant thought to the clinic problems and discussed them daily with the doctors, social workers, and department heads. None felt any hesitancy in making suggestions and criticisms as these were received with cordiality and often led to thoughtful discussions. On occupancy of the new buildings in 1932, Dr. Klotz was confronted with a difficult problem in reorganizing the out-patient department of the New York Hospital, which was now an amalgamation of the old free clinic of the hospital and the Cornell pay clinic. He worked incessantly to perfect the executive machinery necessary to bring the greatly expanded space and facilities with its associated professional staff of several hundred physicians and nurses, many of whom did not know each other or what was expected of them, into a smoothly running organization. The occasional development of conflicting interests and demands on the part of the several clinical services was inevitable but he always tried to deal with these problems in a fair way and above all to act for the best interests of the whole organization both from the economic and efficiency standpoints. It may be truly said that under his direction the high standards of clinical care which have long characterized this out-patient service of the New York Hospital to the public, and which are widely recognized, have not only been maintained but have been greatly expanded in scope and usefulness: a notable achievement and a lasting memorial.

Dr. Klotz during the course of his career made a number of contributions to medical literature. Some of these articles were concerned with the diagnosis and management of tuberculosis cases; others with clinic organization. He was a member of the New York County and State Medical Societies and a fellow of the American Medical Association. He was also a fellow of the New York Academy of Medicine and of the American Public Health Association. Other memberships were in the American Clinical and Climatological Society, the National Tuberculosis Association, the Harvey Society, the American Association for the Advancement of Science, and the New York Tuberculosis and Health Association.

He is survived by his wife, the former Gertrude O. Whitehouse, by a brother and a sister, and by two sons and a daughter.

James Stephen Knapp

October 15, 1908 — January 12, 1998

Professor Emeritus James S. Knapp died at his home in Ithaca at age 89. He was a retired faculty member of the Department of Communication in the New York State College of Agriculture and Life Sciences.

A native Ithacan and the son of the late Mr. and Mrs. John P. Knapp, he attended Immaculate Conception School, Ithaca High School, and Cornell University. After graduating from Cornell in 1931, he worked as a reporter and news editor of the *Adirondack Daily Enterprise* in Saranac Lake, New York. He returned to Cornell in 1934 as Assistant Editor in the College of Agriculture's Office of Publication. A short time later, he was appointed an Instructor in the Extension Service, and later became a full Professor in the Department of Extension Teaching and Information.

His accomplishments included 29 years as head of the Press Division in the college. During World War II (1942-44), he was Assistant and then Acting Director of Public Information for Cornell University.

He was an excellent writer, editor, and teacher. He taught news writing at the undergraduate level for 17 years, and contributed articles to many daily and weekly newspapers and farm publications. For several years, he maintained a close association with the New York Press Association, which, in 1960, presented him with their Community Service Award. He served the National Editorial Association as a judge of both weekly and daily newspapers and presented awards to those he rated as excellent in presentation and interpretation of agricultural and community information.

For 30 years, he issued a "Service Sheet" with items of journalistic interest gleaned from 125 New York State newspapers provided by publishers, and for many years prepared a publication, *Extension Echoes*, circulated weekly to the extension staff in the College of Agriculture. He and his small staff prepared news and feature articles for 85 daily and 350 weekly newspapers in the State, and for a selected list of national and regional publications. All of this was accomplished with the underlying principle that the basic information was centered in the results of research and academic work by the college with only a small fraction allocated to publicity or promotion. Evidence of the soundness of this approach was that the "products" produced by the press service under Professor Knapp's leadership won a majority of the awards of excellence in national competition with other land-grant universities.

At a special affair commemorating 25 years of service, his colleagues presented him with a citation that read in part:

“Your knowledge of the newspaper and magazine fields in New York State, your excellent working relationships with editors, your willingness to try out new ideas and make them work, and your reputation as a newsman and not a publicity man are the major reasons why we have a press service second to none.”

Professor Knapp was a Life Member and Director of the American Agricultural College Editors Association, the New York Society of Newspaper Editors, and the Public Relations Council of the State University of New York. He also was Honorary President of the Tompkins County Horticultural Society. He was a member of the Cornell Club of Ithaca, the Kiwanis, and Elks Clubs.

During his membership in Sigma Delta Chi, a national professional journalism fraternity, Jim helped stage the famous “Delicate Brown” dinner that attracted hundreds of leading citizens. In his youth he was a golfer and horseshoe pitcher, and during most of his lifetime maintained an active interest in Cornell athletics.

He is survived by two nephews, John P. Knapp III, of Fair Haven, New Jersey and Alan Bubier, of Annapolis, Maryland; and a niece, Mrs. George P. Wood, of Mountain Lakes, New Jersey.

Robert J. Ames, William B. Ward, Elmer S. Phillips

Wayne Robert Knapp

May 13, 1947 — August 5, 1982

Wayne Robert Knapp, Department of Agronomy at Cornell University, died August 5, 1982, as a result of injuries sustained in an automobile accident that day. He was thirty-five years old.

A native of Alamosa, Colorado, Wayne received his B.S. degree from Colorado State University in 1969 with a major in crop science. He was honored as the outstanding senior in agronomy and was the recipient of the Rocky Mountain Plant Food Award and the Alpha Zeta Honor Senior Award. He served as vice president of the Agronomy Club and president of Farmhouse Fraternity and was active in several other campus organizations. Following graduation he spent several months in Greece as a participant in the International Farm Youth Exchange Program. Knapp received his M.S. and Ph.D. degrees from Purdue University in 1972 and 1974, respectively. Thesis research involved dry matter and metabolic losses associated with harvest procedures for alfalfa hay and the use of propionic acid and anhydrous ammonia as hay preservatives.

Entering his position (70 percent extension and 30 percent research) at Cornell directly from graduate school in 1974, he discovered a pressing need for research and extension programs on production practices for several of the principle grain crops of the state, including corn, oats, and wheat, and on minor crops such as barley, buckwheat, sorghum, and sunflowers. Within a very short time the statements in *Cornell Recommends for Field Crops* were derived to a large extent from his own research efforts and his cooperative work with other staff members. His familiarity with the scientific literature, his acquaintance with research and recommendations elsewhere in the region, and his ability to sense what topics would become important combined to strengthen his position as a primary source of information for extension workers across the state, graduate students, and colleagues. As part of his extension program he authored a series of *Field Crops Factsheets* concerning grain crop production practices, and a bulletin on *Growing Buckwheat in the Northeast* and was a major author and editor for the *Cornell Field Crops Handbook*.

In recent years he was involved in a joint research effort with Professor Thomas W. Scott on conventional and no-tillage corn production systems utilizing cover crops to decrease soil erosion and dependence on fertilizer nitrogen while maintaining high corn yields. Most recently he had assumed the leadership role in feasibility studies on the production of hard red spring wheat in the Northeast and authored a publication on *Spring Wheat Production*.

In addition to his extension and research responsibilities, Dr. Knapp served as major professor for five M.S. degree students.

During his career as an agronomist Wayne had been elected to membership in Alpha Zeta, Beta Beta Beta, Phi Kappa Phi, and Sigma Xi. At the time of his death he was an active member of the American Society of Agronomy and the Crop Science Society of America. He had been promoted to associate professor with tenure in 1980.

Although Wayne had readily accepted the challenges of a new life and career in New York State, his appreciation of Colorado and the West was not diminished. Growing up in the San Luis Valley in the Rocky Mountains helped form the unassuming, easy-going personality that we knew and that gave Wayne a unique appreciation for the out-of-doors. A favorite activity while growing up and on periodic visits to his home state was horseback camping in the mountains. He also had a keen interest in trapping, hunting, and fishing the mountain streams. As a country-western music fan of long standing with considerable knowledge about the artists and history of the country music industry, Wayne served as a resource person for many who only recently gained an appreciation for this art form.

While maintaining close ties with his family and friends in Colorado, he had redirected his energies into a new life with his wife, Jill, and son, Daniel Nathan. Much leisure time was spent remodeling and furnishing a Greek revival house built in the 1820s and gardening on their minifarm in the town of Dryden. Their gardens produced the usual array of vegetables and fruit along with an interesting assortment of chili peppers and edible beans, which Wayne incorporated into some of the Mexican dishes he enjoyed preparing.

Wayne R. Knapp will, of course, be remembered for the contributions he made to New York agriculture during his brief career as an extension agronomist. He will also be remembered fondly as a devoted husband, father, and friend.

Russell R. Hahn, Robert F. Lucey, Madison J. Wright

Georges Abdallah Knaysi

June 21, 1898 — October 3, 1978

Georges Abdallah Knaysi, professor of microbiology emeritus, died on October 3, 1978, after a long illness. Following his retirement in 1966, which terminated a forty-two-year career at Cornell University, he left Ithaca for Petersburg and later Richmond, Virginia, where he made his home until his death.

Professor Knaysi was born in Hasbaya, Lebanon, on June 21, 1898. He attended St. Joseph's University in Beirut and L'Ecole Duvigneau de L'anneau in Paris. A naturalized United States citizen, he received three degrees from Cornell: the Bachelor of Science in 1924, Master of Science in 1925, and Doctor of Philosophy in 1929. The honorary degree of Doctor of Science was awarded to him by St. Bonaventure University in 1952.

Although his scientific accomplishments led to his eventual world-wide recognition, his entire professional life, except for short periods, was spent at Cornell. He held the positions of instructor of bacteriology from 1926 to 1931, assistant professor of bacteriology from 1931 to 1942, associate professor of bacteriology from 1942 to 1944, and professor of bacteriology from 1944 to 1966.

Professor Knaysi successfully combined the roles of teacher and research worker. He developed and taught two courses that, at the time they were initiated, were unique. One course was on the cytology of bacteria and the other on yeasts and molds.

The cytology course was a scholarly effort that brought together a scattered and varied literature. Bacterial structure can be studied both as an end in itself, and as a means for relating structure to function. To understand biological phenomena there must be a synthesis of physiological and cytological knowledge. Professor Knaysi was a proponent of this meaningful synthesis. This is illustrated by the chapters on growth, motility, and sporulation in the two editions of his book *Elements of Bacterial Cytology*. The book was an authoritative statement and critique of the existing scientific literature and his own research contributions. It also reflected Knaysi's long-term interest in the biology of bacterial endospores. He recognized the value of nutritional manipulation of cultures to make structural features of bacteria visible. Notable was his successful demonstration of the bacterial nucleus by reduction of the ribonucleic acid basophilia of cytoplasm, achieved by forcing the growth of bacteria under conditions of nitrogen and phosphorus starvation. His further research interests lay in physiology, particularly the relations of oxygen and oxidation-reduction potentials to the life of bacteria. When his failing health brought his efforts to a halt, he had almost reached a final goal, namely, the completion of a third edition of his book.

Prof. Knaysi's place as a pioneer in bacterial cytology was recognized when the Radio Corporation of America called upon him as a consultant in development and first use of the electron microscope as a tool for study of the structure of microorganisms.

The course Professor Knaysi taught on yeasts and molds gave instruction on the biology and means for identifying these sometimes useful, sometimes harmful microorganisms. It prepared the novice microbiologist for work in the fermentation industry where these organisms can be benefactors or nuisances. Both courses demonstrated that it is possible at the same time to pursue basic research and to be favorably disposed toward showing how basic knowledge can have practical significance.

Professor Knaysi held a Fulbright lectureship at the University of Paris faculty of medicine in 1953. He served as adviser to the United States Army at Camp Detrick, Maryland, from 1946 to 1949 and as a consultant to the United States Department of Agriculture in 1960. He was an associate editor of the *Journal of Bacteriology*. Among the professional societies that he was affiliated with were the American Society for Microbiology, American Association for the Advancement of Science, American Dairy Science Association, New York Academy of Sciences, American Academy of Microbiology, Société Française de Microbiologie, Société de Pathologie Comparée, Phi Kappa Phi, and Sigma Xi.

Professor Knaysi's professional development was strongly supported by Professor James M. Sherman, department head during many of Knaysi's years at Cornell. Sherman recognized Knaysi's superb craftsmanship in the laboratory and the importance of his meticulous attention to experimental detail. Knaysi's knowledge of mathematics and physics was exceptional, as was his ability to apply them in biology in an era when the boundaries between these disciplines of science were still sharp and had hardly begun to dissolve.

In 1967, one year following Prof. Knaysi's retirement, a symposium on the subject of microbial organization was held in Ithaca in his honor. The event, featuring international contributors, was a source of deep satisfaction to him.

In Stocking Hall where he conducted his research and taught his classes "Doc George," always a quiet, independent worker, increasingly in his later years enjoyed the privacy of the laboratory. He was devoted to his family and took pride and pleasure in the accomplishments of his three sons, Dr. Georges A. Knaysi, Jr., of Richmond, Edmund J. Knaysi of Miami, and Dr. Fred A. Knaysi of Norfolk. Also among his survivors are his wife, Adele Maosha Knaysi, whom he married in 1939, and four grandchildren.

Barbour L. Herrington, Carl Lamanna, Harry W. Seeley, Jr.

Lewis Knudson

October 15, 1884 — August 31, 1958

In his fifty-first year of scientific achievement following his initial appointment to the staff of the New York State College of Agriculture and Cornell University, Lewis Knudson, Professor Emeritus of Botany, died at his home in Ithaca on August 31, 1958. He is survived by his widow, two sons and several grandchildren.

Lewis Knudson was born in Milwaukee, Wisconsin, on October 15, 1884. Upon graduation from the University of Missouri in February, 1908, with the degree of B.S.A., he came to Cornell as assistant in plant physiology and began his teaching under Professor B. M. Duggar. He advanced to the rank of instructor at the end of the term, received the Doctor's degree, and was appointed Assistant Professor of Plant Physiology in 1911. Upon the resignation of Professor Duggar in 1912, he was made acting head of that department.

In 1916, three years after, the Department of Plant Physiology was incorporated into the newly created Department of Botany and Dr. Knudson became Professor of Botany.

During 1919-1921 he spent a year in France and six months in Spain, lecturing in Madrid and Barcelona, carrying out research at the Sorbonne, and attending lectures in the Pasteur Institute. In 1941, on the retirement of Professor Karl M. Wiegand, he became head of the Department of Botany. He retired, after 45 years with the College, on June 30, 1952.

Professor Knudson was an exceptionally effective teacher of both elementary and advanced courses in plant physiology and, during the absence of a colleague, also lectured with marked success in the general botany course. His sympathetic and stimulating direction of graduate work led 25 students to complete the work for the Doctor's degree under his direction. Among these are some of the most widely known names in plant physiology, horticulture, and related sciences.

In research, Dr. Knudson's work dealt with a variety of problems of fundamental importance to the field of plant physiology. His first major research was on tannic acid fermentation. Turning his interest then to a consideration of the physiology of the bacteria, he and his students developed a widely used method of culturing the nitrogen-fixing bacteria associated with legumes. His pioneering work on the organic nutrition of green plants produced highly useful methods of growing these plants in pure culture. This same work, applied to the nonsymbiotic germination of orchid seeds, was to revolutionize the commercial growing of orchids. Professor Knudson also applied these pure

culture techniques to the study of induced mutations in the haploid phase of ferns and demonstrated permanent changes in the chloroplasts by treating the fern spores with X-rays.

Professor Knudson's investigations of the physiology of the ripening of bananas, and of banana diseases, made major contributions to the economy of the Central American countries which raise this fruit. He also worked on rubber-producing plants in collaboration with several of his colleagues during and after the Second World War. Dr. Knudson's activities in consulting service and research continued after his retirement, and he had practically completed a monograph on the banana at the time of his death.

During his period of active service Dr. Knudson, in recognition of his clear judgment, was named to many of the most important committees of the Cornell faculty. Following retirement, he received the Gold Medal award of the Federated Garden Clubs of New York State in 1956 for "distinguished service in scientific research on the physiology and nutrition of plants," an honor accorded only one other scientist, the late Liberty Hyde Bailey. In 1957, Dr. Knudson was the recipient of an honorary Doctor of Science degree from his alma mater, the University of Missouri.

Dr. Knudson was a Fellow of the American Association for the Advancement of Science. His professional, scientific, and honorary society affiliations included the Botanical Society of America, American Society of Naturalists, Real Sociedad Espanola de Historia Natural, American Society of Plant Physiologists, Sigma Xi, Phi Kappa Phi, Alpha Zeta, and Gamma Alpha.

Dr. Knudson's distinguished contributions to science are in the record, and his inspiring lectures will live long in the memory of his students.

While he was famous as a research investigator and teacher, his innate human friendliness is also a memorial in the minds of many. However occupied he might have been with his own affairs, he was never too busy to listen sympathetically to the problems of others, and to offer kindly advice. He knew and loved many men of low and high degree, and they in turn loved him. He enjoyed life to the full.

D. G. Clark, L. C. Petry, A. W. Gibson

Milton R. Konvitz

March 12, 1908 — September 5, 2003

Milton R. Konvitz was born in 1908 in Safed, Palestine, then under Ottoman administration. He died at the age of 95 in September 2003, in Oakhurst, New Jersey, after a brief illness. Mary, his wife, and his son Josef, and two grandsons survive him.

During the years of his active tenure at Cornell from 1946 until 1973, Professor Konvitz was one of the true giants of the university community in general and the ILR and Law Schools in particular. He was also instrumental in the establishment and building of the Department of Near Eastern Studies and the Program of Jewish Studies in the College of Arts and Sciences.

Milton Konvitz epitomized an era in which a liberal education stood at the heart of a great university and was central to the life of the mind. No single individual, save Konvitz himself, could possibly capture in words the extraordinary breadth of his learning, wide-ranging commitments, and accomplishments. He was deeply schooled in philosophy, literature, and in the broad field of classical and modern Judaica. In particular, Professor Konvitz held the Hebrew Bible in high esteem as the foundational text of Jewish civilization. He was also drawn to reflect on the ways in which the Hebrew Bible seemed to speak, in his view, to the urgent legal and moral questions of the day. Professor Konvitz was thus a classical 20th century liberal thinker: he was and remained an optimist's optimist even though his life very nearly overlapped with a century awash in crimes against humanity.

Professor Konvitz joined the ILR Faculty as one of its earliest members in 1945 and began teaching the following year. He offered a course on Labor Law and also proposed a course on Civil Rights, then a subject of rising concern in America and accordingly, a new subject in American universities. At the time of his appointment to ILR, Konvitz was Assistant General Counsel of the NAACP Legal Defense Fund and had taught courses on Civil Rights both at the NYU Law School and at the New School for Social Research.

Industrial Relations was in its infancy as an academic field when the ILR School was founded. Most labor-related courses typically were consigned to Economics departments in research universities. As such, the design of a curriculum for a four-year program in the field was necessarily innovative. Among the early and less successful curricular experiments was an ethics class taught in the Philosophy Department with the support of ILR. Konvitz, who had earned his Ph.D. degree at Cornell from that very department and a lifelong student of philosophy, was subsequently called upon to consider designing a course more attuned to the needs of ILR undergraduates.

His solution, which, as he described it, neatly avoided trespassing on any other department's turf, was a two-semester sequence, "The Development of American Ideals." In the first semester, Professor Konvitz led students through the intellectual and philosophical foundations of American ideals and institutions through studying pertinent Greek, Roman and European intellectual antecedents, selected essays of Emerson and significant passages from the Hebrew Bible. The focus of his second semester was a study of American legal history relating to the Bill of Rights and the Civil War Amendments with particular focus on Supreme Court opinions and decisions that affected how these documents were applied in contemporary American society.

Milton Konvitz applied all of the breadth of his immense classical, Judaic, and legal learning and his singularly philosophical sensibility to this celebrated course. American Ideals became one of the most popular courses at Cornell during the years it was taught by Professor Konvitz. Through it, Dr. Konvitz was able to touch 8,000 undergraduates from colleges throughout the campus among whose ranks numbered a future Supreme Court Justice, Ruth Bader Ginsburg and future chairs of the Cornell Board of Trustees. Many of these students remember the two semesters they spent with Dr. Konvitz as the crowning intellectual experience of their Cornell education. At virtually every Cornell Reunion, a generation of students can be heard discussing their experiences in this course and their enduring respect for a beloved, inspiring, and masterful professor.

Preparing for and teaching American Ideals was also to have a profound effect on Professor Konvitz himself.

"Former students," he wrote, "have been kind enough to give me credit for the American Ideals course, but I give them and the course credit for the books that flowed out of it: Civil Rights in Immigration (1953), Fundamental Liberties of a Free People (1957, with a second edition with a newly written introduction published the year of his death, 2003), A Century of Civil Rights (1961), First Amendment Freedoms (1963) Expanding Liberties (1966), Religious Liberty and Conscience (1968) and The Bill of Rights Reader (1960, in its 5th Ed.). In 1973, also two books on Emerson and a book on American pragmatists."

Beyond his writings on the Bill of Rights, which have been cited in Supreme Court decisions and which have distinguished him as among the most significant scholars on the subject, Professor Konvitz was a prodigious writer of wide-ranging interests. In all he published nine books, edited eleven, contributed chapters to seventy volumes and wrote well over two hundred articles for or letters to publications as diverse as the *New York Times* and *Commentary*. Serving on the editorial board of 15 scholarly journals, Dr. Konvitz was particularly proud of his work as the Founding Editor of the *Industrial and Labor Relations Review* and as the Co-Founder of *Judaism*, *Midstream*, and the *Journal of Law and Religion*. He was awarded seven honorary degrees from various universities and was the recipient of many distinguished fellowships and awards.

Perhaps Dr. Konvitz's most substantive, pragmatic contribution as a legal scholar was his efforts of nearly three decades as the Director of Cornell's Liberian Codification Project. On behalf of the Republic of Liberia, Konvitz and his research staff compiled that nation's legal code. The laws documented and codified in the project are still in force in that Republic today, despite its periodic political upheavals. Konvitz also edited the opinions of Liberia's Supreme Court. For these efforts, he received the Grand Band of the Order of the Star of Africa, Liberia's highest civil award as well as an honorary degree from the University of Liberia.

Professor Konvitz's lifelong commitment to study the intellectual history of the ideal of individual rights and the notion of human dignity bespoke of his engagement with the universally human and the particularly Jewish. He thus ranks alongside American Jewish thinkers such as Mordecai Kaplan and Abraham Joshua Heschel. Like them, the progressive outlook informing Konvitz's thought derives from a vision of social justice articulated by the classical prophets of ancient Israel. Konvitz's intellectual and personal commitment is exemplified in *Judaism and Human Rights* (1972), *Judaism and the American Idea* (1978), and *Torah and Constitution: Essays in American Jewish Thought* (1998).

Professor Konvitz was a masterful teacher and model educator. For Professor Konvitz, living the life of the mind at Cornell was a special privilege, even a sacred calling that represented a unique opportunity to be seized and relished as much as learning itself. So he endeavored to inspire his students and challenge them regarding the significance of ideas and ideals in life before sending them on quests of their own. That is why Professor Konvitz, twinkle in his eye, savored every letter, phone call, clipping, article or book he received from a former student.

In recent years, to visit Milton and Mary at their home was to witness firsthand a rare and affectionate partnership between two uncommonly fine people who shared so very many years together. Milton would be comfortably ensconced in the inner sanctum of his *steibel*, as Mary would call his library, reading or typing on what was surely the last, barely functioning electric typewriter in the western hemisphere, till a visitor would appear. Mary would summon Milton and the two of them, together as always, were the most eager and gracious hosts.

Former President Hunter Rawlings called Dr. Konvitz "the quintessential scholar-teacher," when he announced the establishment of The Milton R. Konvitz Professorship in Near Eastern and Jewish Studies in 1998.

The Cornell and Ithaca community along with members of the Konvitz family came together to pay tribute to Milton R. Konvitz's life and work in a memorial service held on October 23, 2003.

Richard Strassberg, Ross Brann

Frank V. Kosikowski

January 10, 1916 — April 6, 1995

Frank Kosikowski was a major force in the field of Dairy/ Food Science for over a half-century. During this time, he contributed abundantly to the scientific literature and touched many, many lives with elegance and grace. He instilled a new meaning to life-long learning and provided a standard of excellence and integrity for us all.

Born in Torrington, Connecticut, Frank Kosikowski received his B.S. degree (1939) from the University of Connecticut and his M.S. (1941) and Ph.D. (1944) degrees from Cornell University. In 1945, he was appointed to the Cornell faculty as Assistant Professor and rose through the ranks to become full Professor in 1952. He was Professor Emeritus since his June 30, 1986 retirement.

Frank Kosikowski came naturally into the academic profession. During his legendary career, he steadfastly nurtured in himself and in his sixty graduate students and thirty postdoctorates the ability to think critically and creatively. Many of his former students and postdoctorates occupy commanding positions in research, education and international food development. Just as his teaching was characterized by an interest in good education, his research was directed toward new concepts, products, and processes that brought him national and international prominence. Under his authorship or co-authorship, approximately 450 scientific papers, three books, and technical articles and reviews were published—including 12 patents. One of his books, *Cheese and Fermented Milk Foods*, has become a classic in its field for educators, processors, and regulatory agencies around the globe and has been translated into a number of languages. Working diligently with one of his former students during the last days of his life, he kept himself busy revising and updating this masterpiece of the cheese world.

Frank Kosikowski was regarded as a scientist whose influential work in the areas of chemistry of cheese flavors, development of foods from microorganisms and microbial enzymes, whey utilization, low-lactose milk, pasteurization and antibiotic tests for milk, and molecular membrane separations such as ultrafiltration led to the development of many novel products and new processes. The impact of his work was recognized and honored in the form of many awards bestowed upon him, such as the Dairy Industry Fellowship for Advanced Study, Fulbright Research Scholar Award, Borden Award and Gold Medal for Research, ACDPI-Nordica International Award, Pfizer Award, Albert Pollio Memorial Award, Marschall Award, and the National Cheese Institute Award. He was also elected a Fellow of the AAAS and was a member of the Scientific Advisory Council for The Refrigeration

Research Foundation. A co-founder of the American Cultured Dairy Products Institute and the founder of the American Cheese Society, he set high standards in professional dedication and leadership.

Frank Kosikowski's interest in the international arena came from a personal crusade aimed at stressing the profound importance of food and agriculture in international affairs generally and in developing countries particularly. Delivering an invitational address at a UN Conference in France; advising the government of Puerto Rico and the Food Industry of Ireland; providing technical assistance at the FAO Headquarters in Italy; participating in extended visits to Iran, Afghanistan, India, Australia, New Zealand, Thailand, and Japan; serving on the faculties of Monterrey Institute of Technology, Mexico, and Simon Bolivar University, Venezuela; participating in technical meetings and lecturing in Finland, Russia, Argentina, and Chile; serving on the Expert Advisory Committee on Food Hygiene of WHO for 16 years; cooperating with scientists in Yugoslavia, France, England, and Germany; holding repeated editorial board appointments on national and international scientific journals; establishing and teaching a course on International Food Development for 20 years and initiating a graduate major in International Food Science at Cornell—all of these actions contributed in part toward a life-long service to the international community. To honor his efforts, he was decorated with the Officer Merite d'Agricole Award by the government of France, selected as the First Fellow in the Irish-USA Exchange Research Program, elected an honorary member of the Italian Veterinary Society, and named the recipient of the Institute of Food Technologists' International Award.

The Department of Food Science organized a symposium on Cheese Biotechnology and International Food Development on October 18-20, 1987, to honor Frank Kosikowski and to pay tribute to his distinguished service to Cornell University and the profession at large. His students, colleagues and friends came from around the world to express their gratitude and affection for The Professor. In December 1990, Captain Leo Berger of New York City, a former student of Frank Kosikowski, pledged a major monetary gift to the Department of Food Science at Cornell to support the international food development program to honor him as a teacher and scientist.

Frank V. Kosikowski died Thursday, April 6, 1995, at the Tompkins Community Hospital. Besides his wife, Anne Hudak Kosikowski, he is survived by his daughter and son-in-law Frances and Mario Vecchi of Denver, Colorado; and three grandchildren, Gabriel, Daniel and Eva Vecchi. To those of us who knew him well, the memory of his intellect, spirit and avid affection for humanity will live on, across international boundaries.

D.K. Bandler, R.A. Ledford, S.J. Mulvaney, S.S.H. Rizvi

Milton Lurie Kramer

November 23, 1906 — March 8, 1965

Dr. Milton Lurie Kramer, Attending Physician of The New York Hospital and Clinical Professor of Medicine in the Cornell Medical College, died March 8, 1965, at the age of 58.

He served on the staff of the hospital from 1933 to the time of his death. He was one of that small group of physicians on whom patients, colleagues, students, and the community depend to an inordinate extent. Widely respected as a scientific and scholarly physician, a literate, articulate, broadly educated man, and a cultured human being, few people have had as great an influence on standards of excellence in patient care or education at all levels within our institution as he did during his thirty years of dedicated service. He was known as a physician to physicians, but his interest and devoted service to his patients extended equally to those in all life's various stations.

Dr. Kramer was born in Hoboken, New Jersey, November 23, 1906. He attended Columbia, receiving his A.B. degree before graduating from the Columbia College of Physicians and Surgeons in 1929. His scholarship as a student was recognized by election to Alpha Omega Alpha. He served two years on the House Staff of Beth Israel Hospital in New York, following which he served as a Fellow in the Pathologisches Institut of the University of Berlin from 1931 to 1933. Following his return to this country he maintained associations with both the New York Hospital-Cornell Medical Center and Beth Israel Hospital, receiving recognition in both for his unusual skills and contributions. He served as Director of Medicine at the Hospital for Joint Diseases from 1957. He was widely recognized within the profession and was a member of the American College of Physicians, The New York Academy of Medicine, and other national and local societies.

Dr. Kramer is survived by his wife, Helen, and a son, Robert.

E. Hugh Luckey

Ralph E. Krenzin

September 26, 1916 — November 7, 1984

Ralph E. Krenzin came to Cornell in 1959 as an associate professor of agronomy and extension agronomist. After thirteen years of distinguished work in 4-H agronomy and field-crop management extension with emphasis on New York State's corn crop, he retired in 1972.

Ralph was born in Kingsley, Kansas, on a wheat farm. As a farm youth he became active in the 4-H beef cattle program, exhibiting a steer that received first-place prizes in both the Kansas City Royal Show and the Chicago International Livestock Exhibition. In 1939 Ralph received his Bachelor of Science degree from Kansas State University. He met and married Esther P. Glanzer in 1941, while serving as a county agricultural agent of Sumner and Ellis counties, Kansas. He was a crop specialist and 4-H agent there from 1939 to 1944, organizing 4-H youth programs and, with the assistance of Mrs. Krenzin, women's home demonstration programs. In addition, Ralph established farmer field trials of corn and small grains, especially wheat. In a one-year period he organized sixteen new 4-H clubs and attended eight hundred agricultural meetings. Ralph also initiated the corn and small-grain field days at the Fort Hays, Kansas, experimental station.

In 1944 Ralph undertook graduate study. After serving as a sergeant major in the chemical warfare corps in World War II, he received his master's degree from Kansas State in 1947. In that year he became an extension specialist in forage crops and youth programs at Iowa State University, and he continued to study part-time for his Ph.D. degree, which he received in 1958.

At Cornell Ralph directed extension education activities in field-crop management and was team leader of the agronomy 4-H program. Ralph worked diligently in his friendly and genial manner to instruct, to guide, and to assist young people in their efforts to explore and understand the world and themselves. He spent many happy days as a judge for the 4-H program at county fairs.

In the early sixties Ralph took the leadership in revitalizing the forage-crop exhibit at the New York State Fair in Syracuse, serving as division superintendent for many years. He initiated the annual Corn Congress farmer and industry educational meetings, which continue as a feature extension activity each winter. From 1963 to 1965 Ralph was extension project leader for the Department of Agronomy. In the late sixties, on a sabbatical leave for the United States Department of Agriculture as an extension and crop specialist in Brazil, he developed forage test field trials and crop experiments emphasizing new technologies. Upon his return he served as faculty liaison

officer for the Cornell Peace Corps Training Program in Agriculture and Human Ecology, in which capacity he helped many students through the transition from college to Third World missions.

Ralph Krenzin was a contributor to the interdepartmental publication *Cornell Recommends for Field Crops*, which is released each year at a series of regional educational field-crop dealer meetings throughout New York State. Ralph developed publications on forage crops and was a regular contributor to many agricultural newspapers. His service as extension specialist and leader was recognized by membership in many agricultural and honorary societies. He was an active and much-sought-after community and church leader.

Ralph was a dedicated and loving family man. Surviving family members are his wife, Esther Glanzer Krenzin, of Ithaca, and his daughter, Kathryn E. Moore, of St. Louis, Missouri.

Madison Wright, Willard Cronney, Reeshon Feuer

Norman Kretzmann

November 4, 1928 — August 1, 1998

Norman Kretzmann, Susan Linn Sage Professor of Philosophy, Emeritus at Cornell University, died on August 1, 1998, in Ithaca, New York. Although he had been under treatment since August 1991 for an incurable cancer, he remained philosophically active until a few weeks before his death.

Norman was born in Chicago on November 4, 1928, the son of Adalbert Raphael Kretzmann, a Lutheran pastor, and Josephine Heidelberg Kretzmann. He received his secondary education at Concordia in Bronxville, New York, his B.A. degree from Valparaiso University in 1949, and his Ph.D. degree from Johns Hopkins University in 1953. Before joining the Cornell faculty as an Associate Professor in 1966, he taught at Bryn Mawr College (1953-54), Ohio State University (1954-61), and the University of Illinois at Champaign-Urbana (1961-66). He was promoted to Professor at Cornell in 1968, and was appointed Susan Linn Sage Professor of Philosophy in 1977. He retired from Cornell in 1995.

Norman's years at Cornell were full of service to the university, and to his college and department. He was Chair of the Sage School of Philosophy from 1970-75, Director of the Religious Studies Program from 1981-90, Acting Director of the Society for the Humanities in 1982, and Acting Director of the Field of Medieval Studies in 1987.

His record of exemplary service to Cornell was matched by a record of exemplary service to the philosophical profession. The two were combined in his service to *The Philosophical Review*, of which he was Co-editor (1967-68), Managing Editor (1968-69, 1970-75), and Editor-in-chief (1985-87). He was Editor of the New Synthese Historical Library (1989-92).

He served the American Philosophical Association as a member of its Eastern Division Executive Committee (1981-84), as a member of the Committee on Lectures, Publications and Research (1986-89), and as an advisor to the Eastern Division Program Committee (1985-88). In addition, he served on the Executive Committees of the Society for Medieval and Renaissance Philosophy and the Society for Christian Philosophers.

Norman's curriculum vita lists fourteen books, a pamphlet, sixty-nine articles, and twenty-one reviews. He wrote on a variety of topics. Several of his early papers were on ethics, including a provocative defense of Mill in "Desire as Proof of Desirability." His early articles include a long and influential "History of Semantics" for the Edwards (ed.) *Encyclopedia of Philosophy*, and influential papers on Locke's semantic theory and Plato on the correctness of names.

However, increasingly the focus of his work was on Medieval Philosophy and the Philosophy of Religion. Norman's work on Medieval Philosophy falls into two phases. The outlook of his first phase, up to the early 1980s, informs his editing of the landmark, *Cambridge History of Later Medieval Philosophy*. Norman wanted to show that Medieval philosophers were engaged in such central philosophical pursuits as logic, philosophy of language, and philosophy of science.

In emphasizing these features of Medieval Philosophy, Norman was trying to introduce the richness and variety of Medieval Philosophy into the mainstream of twentieth-century philosophical discussion. He thought it important to show that Medieval Philosophy was not confined to major figures like Aquinas, and that it was not confined to rational theology, metaphysics, and ethics. Thus, the Cambridge History deliberately emphasizes the philosophical significance of philosophers previously ignored, and gives special weight to the Medieval contribution to logic, philosophy of language, and the foundations of natural philosophy. This approach to Medieval Philosophy also resulted in a series of papers on semantics and natural philosophy, on the "Oxford Calculators", and in an edition and translation, published by Norman and Barbara Ensign Kretzmann, of the *Sophismata of Richard Kilvington*.

In the early 1980s, the focus of Norman's work in Medieval Philosophy began to shift. He began to concentrate on Aquinas, especially his philosophical theology, metaphysics and ethics. Having done what he could to show that Medieval philosophers were genuine philosophers who ought to interest their twentieth-century successors, he approached a central figure and his central concerns as one would approach a philosopher whose views deserve to be taken seriously and evaluated both critically and sympathetically. Norman's work displays a striking growth of sympathy with Aquinas and with his philosophical aspirations, but no diminution of the critical and argumentative spirit of all Norman's engagement with Medieval Philosophy. Aquinas' natural theology was the subject of his Wilde Lectures at Oxford University in 1994, which started him on a series of three books, each dealing with one of the three volumes of Aquinas' *Contra Gentiles*. The first of these, *The Metaphysics of Theism*, was published in 1997, and the second, *The Metaphysics of Creation*, is forthcoming. He was in the middle of writing the third, *Metaphysics of Providence*, at the time of his death.

One way in which Norman sought to overcome the neglect of Medieval Philosophy was through his own teaching. He was an enormously dedicated and effective teacher, and the leading scholars in Medieval Philosophy include several of his students. The excellence of his teaching was recognized in 1992 when he was the first recipient of the Northeast Association of Graduate Schools Award for Outstanding Graduate Teaching.

Norman's concern to disseminate knowledge and appreciation of Medieval Philosophy manifested itself in other ways. He was translator or joint translator of four volumes, and Principal Editor of the Yale Library of Medieval Philosophy. He was a founder and Chair of the Editorial Board of the journal, *Medieval Philosophy and Theology*. He was Advisor Editor of *Faith and Philosophy* 9 (1992) No. 4: Medieval Philosophical Theology and its Contemporary Extensions; and Advisor Editor of *Revue Internationale de Philosophie* 52 (1998) No. 2: Saint Thomas Aquinas. Most recently, he was Subject Editor for Medieval and Patristic Philosophy for the *Routledge Encyclopaedia of Philosophy*.

Norman also made important contributions to the philosophy of religion. In an early article, "Omniscience and Immutability" (1966), he questioned the coherence of perfect-being theism. However, in later articles, most notably "Eternity" (1981) and "Absolute Simplicity" (1985) (both co-authored with Eleanore Stump), he developed and defended it.

Norman's excellence as a teacher and scholar was recognized in many ways. He was awarded a Guggenheim Fellowship in 1969, which he declined in order to take an NEH fellowship and a visiting Fellowship at Balliol College, Oxford. He was twice awarded NEH Research Fellowships (1969-70, and 1977-78). He held a faculty fellowship at the Cornell Society for the Humanities (1974). In addition, he held a Senior Fellowship at the National Humanities Center (1992-93).

Norman's intellect and learning, and his extraordinary wit and personal warmth, won him the respect and deep affection of colleagues and students alike. He counted himself, even after he knew he had a fatal illness, as a very lucky man. This was partly because he was able to make his living doing what he loved — for he did love the teaching and philosophical scholarship into which he poured his energy. He enjoyed playing and listening to music, reading novels and history, canoeing, and many other activities. In addition, he derived enormous pleasure and comfort from his family. He is survived by his wife of forty-one years, Barbara Ensign Kretzmann; his daughters, Anita Kretzmann, Maria Sañudo, and Julia Kretzmann; and his two grandchildren.

Carl Ginet, Scott MacDonald, Sydney Shoemaker

John W. Kronik

May 18, 1931 — January 22, 2006

Professor John W. Kronik died on January 22, 2006, in Los Angeles, California. He was a Professor Emeritus of Spanish Literature in the Department of Romance Studies at Cornell and an internationally renowned Hispanist scholar and teacher.

John Kronik was born in Vienna, Austria, on May 18, 1931; his family emigrated to the U.S. in 1939. He completed his undergraduate studies at Queens College, New York, where he was elected to Phi Beta Kappa and received the B.A. degree in Spanish *summa cum laude* in 1952. He received both his M.A. (1953) and his Ph.D. (1960) degrees in Spanish from the University of Wisconsin, Madison, specializing in 19th and 20th century Spanish Literature. He was the author of a book on Spanish theater, *La Farsa (1927-1936) y el teatro español de preguerra* (1971) and co-author of *Creación de una realidad ficticia: las novelas de Torquemada* (1997). He was also co-editor of *Intertextual Pursuits: literary mediations in modern Spanish narrative* (1998) and co-editor of *Textos y contextos de Galdos: actas del simposio centenario de Fortunata y Jacinta* (1994). In his more than 70 articles and book chapters and more than 40 reviews, Kronik ranged across nineteenth and twentieth century Spanish literature and, in recent years, wrote on Latin-American narrative and theater as well. He presented invited lectures in more than 60 colleges and universities, as well as papers at countless conferences and professional meetings.

Kronik received numerous academic honors and awards, including two Fulbright Fellowships (1960-61 and 1987-88), a Rockefeller Research Residency (1975), and an ACLS grant in 1983, and a Guggenheim Fellowship in 1983-84. He was president of the International Association of Galdosistas from 1981-85, and was the editor of *Anales Galdosianos* from 1985-90. John was a prolific and meticulous editor and served on the editorial boards of 31 distinguished journals. Perhaps his most notable service as an editor of the journal began in 1986 when he was appointed by the board of the Modern Language Association to be the first editor of its principal journal, PMLA, after the position was separated from that of Executive Director; he was also the first Hispanist to hold that editorship and the first to exercise the editor's duties from his home institution, editing PMLA at Cornell from 1986 through 1992. His efforts to transform PMLA led to a massive increase in submissions and turned the journal into an important forum for the discussion of current issues in field. He was honored with a Distinguished Retiring Editor Award from the Council of Editors of Learned Journals in 1992.

Kronik joined the faculty at Cornell in 1966. Prior to coming to Cornell, he was an Assistant Professor of Romance Languages at Hamilton College (1958-63), and an Assistant Professor of Spanish at the University of Illinois (1963-66). During his career, he was also a visiting professor at Colby College; Columbia University; Syracuse University; Bryn Mawr College Centro de Estudios Hispánicos (Madrid); Purdue University, Middlebury College, Brigham Young University, University of Colorado, University of California, Berkeley; University of California, Irvine; the University of California, Los Angeles; and the University of California, Riverside. At Cornell, where the posts he held included Director of Undergraduate Studies in Spanish and Director of Graduate Studies in Romance Studies, Kronik was a fabled teacher whom his students repeatedly identified as the most accomplished pedagogue they had ever encountered. During his career, he directed some 30 Ph.D. dissertations and on three occasions was appointed to teach Summer Seminars for College Teachers sponsored by the National Endowment for the Humanities.

After his retirement from the editorship of PMLA, John Kronik became the pre-eminent elder statesman in two distinct, yet interlocking spheres, Hispanism in the United States and the affairs of the Modern Language Association. In each of these arenas, he was a quiet, yet profoundly influential presence, recognized by all as the consummate professional. His colleagues and students appreciated not only his wisdom and learning, but also his remarkable discretion and personal generosity. In 1995, his scholarly career was celebrated in a *festschrift* published by the *Bucknell Review: Self-Conscious Art: A Tribute to John W. Kronik*. Cornell students and faculty will continue to honor his memory, thanks to the annual John W. Kronik Lecture, endowed by Robin Koenig, one of his former undergraduate students, and her husband Scott Koenig.

Debra Castillo, Philip Lewis

Vladimir Nicitich Krukovsky

October 8, 1901 — January 16, 1969

Professor Krukovsky was born in Odessa, Imperial Russia, on October 8, 1901. He was graduated from V. A. Zhukovsky's Real School of Odessa in 1918 and attended the Polytechnic Institute of that city in 1918-19.

In 1919 he joined the Volunteer Anti-Communist Army and attended Sergievskoe Officers' Artillery School. Following military service in the Crimea, he resided in Turkey and subsequently moved to Czechoslovakia. Here he attended the Polytechnic Institute of Prague from which he was graduated in 1926 receiving the engineering degree.

From 1926-29 he served as assistant manager and then manager of Agricultural Industries in Czechoslovakia. In 1930 he and his wife, Josefa, emigrated to the United States. He became a citizen in 1936.

Dr. Krukovsky entered the graduate school of Cornell University in 1933 receiving the M.S. degree in 1934 and the Ph.D. in 1935. He was instructor in dairy chemistry from 1935-39. In 1939 he was promoted to assistant professor; in 1946 to associate professor and in 1954 to professor. He became professor emeritus upon his retirement.

Although his research in the field of lipids was of great interest to him, he nevertheless found time to teach two courses in dairy chemistry—one on analytical methods and one on fats and fat-like substances. His personal concern for each student was a large factor in the popularity of his courses.

Much of Dr. Krukovsky's research was concerned with various aspects of lipolysis and oxidation of milk fat and their effect on the flavor and keeping Quality of milk and milk products. He was much interested in vitamins A, D, E and K and other materials associated with milk fat. He first demonstrated the influence of vitamin E in the prevention of oxidized flavor development in milk.

In recognition of his research accomplishments, the American Chemical Society conferred upon him its 1961 Borden Award for outstanding research in dairy chemistry. This consisted of \$1,000 and a gold medal. In December 1966 he was elected a Fellow of the American Association for the Advancement of Science. He was also a member of the New York Academy of Sciences, Phi Kappa Phi, Sigma Xi, and the American Dairy Science Association.

From 1948 to 1967 he served on the Scientific, Liaison and Advisory Board of the Quartermaster Food and Container Institute of the Armed Forces. In 1955 he took part in the preparation of tables on "Detoxication

Mechanisms of Animals” for the *Handbook of Biological Data*, published by the National Academy of Sciences and National Research Council.

He was author and coauthor of more than 100 scientific research papers dealing with the biochemical properties of milk and milk products that affect their palatability and nutritive value. He also translated and abstracted more than 1,000 Russian scientific papers for Chemical Abstracts Service. He was proficient in the Czech, German, and French languages as well.

On June 30, 1967, Dr. Krukovsky retired from active duty as professor of dairy chemistry in the Department of Food Science at Cornell University, ending a thirty-three year period of service.

He is survived by his son, Nicholas, also a Cornell graduate.

J. K. Loosli, W. K. Jordan, R. F. Holland

James A. Krumhansl

August 2, 1919 — May 6, 2004

James A. Krumhansl, associated with the Department of Physics at Cornell for fifty years (graduate studies in 1940 to retirement in 1990), was a peripatetic theoretical physicist whose efforts benefited science, Cornell, and the physics community at large.

Krumhansl's scientific research focused on theoretical condensed matter physics and materials science, but his research interests also spanned communication and information systems, applied mathematics, nonlinear science and molecular biological physics. During World War II, he worked on pulse communication systems and secrecy systems for the U.S. Navy, and at the Stromberg-Carlson Corporation on microwave systems. He received U.S. patents on pulse coding communications circuits.

He was particularly known for his Cornell work on phonons (quantized sound waves), solitons (particle-like wave excitations) and defects in materials. He was a Guggenheim fellow, a National Science Foundation senior postdoctoral fellow at the University of Oxford, a Fulbright fellow to Yugoslavia, a Royal Society visiting fellow at the University of Cambridge and a visiting fellow at Oxford University. His scientific influence went beyond the direct contributions of his papers and those of his students: he traveled extensively and proselytized on behalf of ideas and methods he identified as of central importance. Much of the excitement about solitons and martensitic transformations in the physics community grew out of his enthusiastic talks around the country.

Along with Robert L. Sproull, Krumhansl played a major role in launching the Laboratory of Atomic and Solid State Physics at Cornell in 1959. During his tenure as the Director of that Laboratory from 1960-64, he was instrumental in bringing to Cornell many of the young theorists and experimentalists who led the department to a central national role in the physics of condensed matter. Cornell Ph.D. students now populate many of the key laboratories and departments around the country, in no small part because of Krumhansl's vision.

Krumhansl played significant roles in various national enterprises. He co-founded the Materials Research Council at the Defense Advanced Research Projects Agency at the U.S. Department of Defense. From 1977-79, he was Assistant Director for Mathematics, Physical Sciences and Engineering at the National Science Foundation, where he led program development in microscience and computer systems. He was a consultant to the director of the Los Alamos National Laboratory. He served on the board of the American Institute of Physics and served terms

as Editor-in-Chief of *Physical Review Letters* and the *Journal of Applied Physics*. He served as President of the American Physical Society in 1989.

Through all of these activities, Krumhansl's congenital optimism, enthusiasm and joie de vivre energized his students, research collaborators, colleagues and friends.

Jim's life was characterized by diversity of interest, exploration, and enthusiasm (some might say impulsive recklessness). We have heard tales of Jim riding down the Beebe Lake toboggan run on ice skates and down Buffalo Street Hill without brakes, playing the violin in string quartets, choosing the steepest ski slope to accelerate his learning curve (at the expense of a ripped Achilles tendon), aspiring (early on) to play professional baseball, practicing for six hours on the recorder in the back seat of a car on the drive from Ithaca to Ontario, and sailing the shores of Maine with little attention to the danger markings on the charts. For Jim, life was an adventure game, which needed to be played to the full.

Following his retirement from Cornell in 1990, Krumhansl moved to Amherst, Massachusetts and, ultimately, to a Kendal community in Hanover, New Hampshire. His daughter, Carol Krumhansl, is a Professor of Psychology at Cornell, specializing in cognitive psychology. Two sons, James and Peter, a grandson, Robert, and a granddaughter, Kira, also survive him.

Doug Fitchen, Don Holcomb, Bob Silsbee, Jim Sethna

Paul J. Kruse

September 7, 1883 — February 17, 1974

In thirty-two years of professional service to Cornell University Paul Kruse was, in the view of students and colleagues, a colorful teacher, staunch advocate of the views he professed, and good friend. Spanning the long period since his retirement in 1949, the picture emerges of a man with a keen relish for life; Professor Kruse loved to teach, to persuade, to befriend, to be with people.

Born in Boone, Iowa, Paul Kruse grew up on a farm and attended the public schools of his region. He earned the B.A. degree from the University of Iowa in 1906 and the M.A. from the University of Washington (1913) and completed requirements for the Ph.D. at Columbia in 1918, working under the direction of E. L. Thorndike, who was then a major figure in the fields of psychology and measurement. During this period he also served as a superintendent of schools and as an instructor at the University of Washington.

In 1917 Professor Kruse came to Cornell to join George Works and others in developing the newly formed Department of Rural Education in the College of Agriculture. Serving one year as assistant professor, he was then promoted to a professorship, a position he held until retirement in 1949. While at Cornell he served as a member of the Committee of 21, established in 1922 to survey New York's rural schools, and of a number of other state, local, and University committees dealing with teaching and learning. He was a member of the American Association for the Advancement of Science, the American Psychological Association, Phi Kappa Phi, and Phi Delta Kappa. Especially interested in the Ithaca community, Paul Kruse served as a trustee of the George Junior Republic and on the boards of a number of organizations dealing with children's welfare. He was an active member of the Rotary Club.

During his latter years at Cornell, Professor Kruse became interested in applying his expertise as an educational psychologist to the problems of teaching confronted by cooperative extension workers. Simultaneously, in the mid-1940s interest began to grow among cooperative extension personnel in learning more about the psychological dimension of their instructional tasks. These emerging interests led to requests from outside New York State for Professor Kruse to take part in workshops, annual conferences, and special summer schools for extension workers.

In 1947 the faculty of the College of Agriculture, on recommendation of a committee, approved the establishment of a professorship in extension education. Professor Kruse served for two years in this role until his retirement in 1949 as professor emeritus of education. After retirement, Dr. Kruse continued periodically to teach educational

psychology especially adapted to extension workers attending regional summer schools. His retirement residence was in San Diego, California.

Marvin D. Glock, J. Paul Leagans, Frederick H. Stutz

Johann Peter Krusius

February 4, 1944 — January 30, 2003

Professor Johann Peter Krusius died of cancer at age 58 on January 30, 2003 in Ithaca, New York. Peter graduated with honors in 1964 from the School of Reserve Officers, Finnish Defense Forces and entered the Helsinki University of Technology in Finland. He received the Diploma Engineer degree in Electrical Engineering in 1969 with distinction, the Licentiate of Technology degree in 1972, and the Ph.D. degree in 1975 (both in Electron Physics). Following receipt of his doctorate, he did research on semiconductor physics for two years at the University of Dortmund (West Germany) Institute of Physics, and from 1977-79 as a Docent of Technology at the Helsinki University of Technology Electron Physics Laboratory. Peter came to Cornell as a Fulbright Fellow in the School of Electrical Engineering and the National Submicron Facility in 1979, remained as a Research Associate, was appointed an Associate Professor in 1981, and was promoted to full Professor in 1987.

Upon his appointment to professorial rank, Peter began a remarkable career of productive research and publication, excellent instruction, and outstanding technical leadership in his fields of semiconductor electronics and microelectronics. In 1986, he was appointed Associate Director of the Joint Services Electronics Program (JSEP) at Cornell, a multi-university basic-research program supported by the U.S. Army, Navy, and Air Force. Also in that year, Peter served as Associate Director of a related activity, the Industrial Affiliates Program of the National Submicron Facility. During the early years of JSEP, principal attention had been given to high-speed microwave devices, but recent emphasis had shifted to optoelectronics. Following a sabbatical year at the IBM T.J. Watson Research Center in 1988-89, Peter became Director of JSEP and together with three EE faculty members started a new three-year research program on the fundamentals of speed limits of optoelectronic devices. By that time, his research interests had begun to focus on ultra-high-density nanoelectronics, femtosecond carrier processes in semiconductor heterostructures, and integration and packaging of high-speed computers from individual circuits on a chip to full systems. In September 1990, Peter cooperated with Professor Che-Yu Li, of the Department of Materials Science and Engineering, to establish the Industry-Cornell University Alliance for Electronic Packaging. On a sabbatical leave during the spring 1995 term, Peter was a Visiting Professor at the Royal Institute of Technology (KTH) in Stockholm, Sweden, where he offered a special course and conducted collaborative research at KTH with circuit and system designers on system integration and system packaging for digital computing and telecommunication applications. In 1997, he became Director of the Cornell University

Electronic Packaging Program, following Professor Li's tenure in that office, and established the Cornell Advanced Facility for Electronic Packaging.

Peter described electronic packaging research as being concerned with attempts to bridge the gap between the largest component and the smallest component in an electronic system. Since a typical circuit with an electronic chip is a highly complex array with hundreds, perhaps thousands, of interconnections from the outside world to the tiny elements within the chip, an effective electronic package requires design of novel connection procedures, development of new materials, and avoidance of electrical interactions between closely positioned elements. Peter predicted that future conduct of electron packaging research in the new state-of-the-art clean-room facilities planned for Duffield Hall would allow his research group to reach system-level device counts comparable to the number of neurons in the human brain.

From 1998–99, Peter served as Director of the Semiconductor Research Corporation (SRC) Interdisciplinary Program on Microscience and Technology at Cornell, and continued as Director of the Electronic Packaging Facility in a three-year program to construct a unique tool that could fabricate over 5000 connections to integrated circuit chips. In this period, Peter joined with Professor Joseph M. Ballantyne in an effort to establish, as part of a consortium of seven universities, an ambitious national semiconductor research effort known as the Focus Center Research Program, with an ultimate goal to develop a new generation of more powerful computer chips by devising new methods to interconnect microchip components. While this program was won by another consortium, it forged useful interactions with other universities in future joint efforts.

Attention to electronic packaging concepts over the years led Peter and his colleagues to invent an important new flat-screen television and video technology. He established a research group that designed and developed techniques for joining color flat-panel television and video screens to make large active matrix liquid crystal displays made up of three panels tiled together into a single, seamless piece of glass. In 1996, he helped found Rainbow Display Inc. (RDI), a Cornell startup company created to build the displays. In 1999, RDI signed a joint development agreement with Philips Flat Display Systems, a unit of Royal Philips Electronics of the Netherlands, one of the world's largest consumer electronics companies. Last year, the display technology won the Society for Information Display magazine's Display of the Year Gold Award, their highest honor.

The major portion of Peter's 23-year academic career at Cornell was devoted to teaching juniors, seniors, and graduate students in semiconductor electronics, microfabrication, and physical design of computer packaging. He supervised the thesis research of over 30 Ph.D. students in these areas and guided more than 100 Master of

Engineering students through design projects related to his active research program. Initially, he taught courses EE 435-36, Semiconductor Electronics I and II, and later developed a new version of the junior-level course, EE 315, Electronic Circuit Design, that was offered for the first time in the 1995 Fall term. That course was notable for its imaginative projects that required the students to design, build, and test control circuitry in a three-week period. Peter made major contributions to the curriculum with the popular course EE/ECE 536, Microfabrication, taken by hundreds of students through the years, and EE/ECE 537, Physical Design of High-Speed Computers. Recently he developed a 300-level version of the latter course (ECE 336) that is being offered for the first time this year, but was disappointed that his health prevented him from participating in the new course.

Peter brought to the classroom the same dedication, attention to detail, and thorough preparation that he applied to his research activities. He was greatly admired by his students who appreciated his highly organized course web page, clearly delivered lectures, and sometimes-unique approach to examinations. He was generous with his office hours and his consultation time with students and always made certain that all questions were answered, even if he remained overtime. He was a particularly conscientious class advisor, and always attended meetings of the ECE Faculty Committee to ensure his proper attention to academic actions that might relate to his advisees. Peter served on the ECE Curriculum and Standards Committee, and was a member of a committee to study the Master of Engineering Program in the College.

Peter was a prolific contributor to the literature in his field. He authored or coauthored over 250 publications in technical journals and over 150 conference presentations, wrote over 25 invention disclosures or patent applications, won a number of outstanding paper awards, and served as editor-in-chief of the *IEEE Transactions on Components, Packaging, and Manufacturing Technology--Advanced Packaging*. He was the author of a chapter entitled, "Fundamental Limits for Electronic Packaging," in the textbook, *Fundamentals of Electronic Packaging*, by Donald P. Seraphin, Ronald Laskey, and Che-Yu Li, published by McGraw-Hill in 1987. Peter was a senior member of the IEEE and a member of the American Physical Society, the Materials Research Society, the Electrochemical Society, and the American Association of Science. Despite his busy schedule of teaching, research and business affairs, Peter was an avid skier and windsurfer and enjoyed Bach and other classical music, science fiction, gadgets, home repairs, and automobile maintenance.

Peter Krusius's cheerful presence, keen research initiative, and technical expertise will be greatly missed. He will be long remembered as a devoted teacher and advisor, a dedicated scholar, a respected colleague, and a good friend.

Peter and Eeva Kuokkanen were married in 1969 in Helsinki, Finland. Following ten years in Helsinki, which

included two years in Dortmund, Germany, they moved to Ithaca, New York where they spent the last 23 years of their 33 years of life together. Peter is survived by his wife, Eeva, of Ithaca, New York; his sons, Paul, of Boston, Massachusetts; Otto, of Boston, Massachusetts (both Cornell graduates); and Leo, a Cornell undergraduate student, of Ithaca, New York; and his extended family in Finland and Germany.

Joseph M. Ballantyne, Dieter Ast, Clifford R. Pollock

Claude L. Kulp

April 28, 1894 — July 25, 1969

Few men have contributed so much, so well, to so many, in the promotion of education in the Empire State as has Claude L. Kulp. A native son, formally educated in the public schools of Rochester and at Rochester Mechanics Institute, the University of Rochester, Columbia and Cornell Universities, he, throughout his lifetime, steadily sought further educational perfection through his own studious efforts.

Since his early years he had dedicated his talents to the general welfare of children and youth, ever sensitive to the fullest development of their potentialities through education at its best in a viable democracy. Rare is the educator who has successfully taken the progressive and comprehensive steps in educational services that can be credited to Claude L. Kulp. Among his varied positions may be mentioned teacher of industrial arts, football coach, director of vocational education, director of elementary education, assistant superintendent, and superintendent of schools. Further, he served as associate state commissioner for elementary, secondary and adult education; professor of education; supervisor of experimental programs in elementary teacher education; and coordinator of the office of field services at Cornell University. Each advance came without solicitation, with notable modesty; each position was held with distinction; all were marked by a high degree of success.

Other services included the direction and coordination of school surveys; consultant services in many school systems; director, division of civic education for Out-of-School Youth (New York), 1941; and instructor, coast artillery school, World War I.

His colleagues in education honored him by election to several presidencies, first as president of the Southern Zone, New York State Teachers Association, and later to president of the New York State Teachers Association. For many years after his tenure as president he served the New York State Teachers Association as treasurer. In 1938 he was elected president of the New York State Council of City and Village Superintendents. He was chairman of the executive committee of the New York Council on Rural Education for twenty years.

He served with distinction as a member of a number of state and national education committees, including the Advisory Council and Planning Committee of the American Association of School Administrators; the Professional Advisory Committee on Readjustment of High School Education; the Regents Examination Board; and the Legislation Committee of the National Education Association. He was also a consultant to the Temporary Commission on Educational Finance, New York State.

Colleges, universities and other institutions also benefited from his wisdom and broad experience. He was a member of numerous boards of trustees, including those of George Junior Republic, Ithaca College and Syracuse University.

He was well known throughout the state of New York. In every district, large and small, he was marked as a man of distinction not only for his leadership in education but for his high character and human touch. Effective, eloquent and pleasing in platform address, he consistently sustained the cause of better educational opportunities for all children. He vigorously supported education at all times, particularly against vicious attack. He never failed to exalt the work of the teacher and professor as fundamental to our democratic society.

Numerous professional journals sought the sagacious and poignant articles from his pen. The results of experimental programs under his direction have been widely circulated and the significant results of numerous survey reports have been given the immortal baptism of printer's ink.

In addition to the realm of professional education Claude L. Kulp was a distinguished citizen of the Ithaca community. His many activities included chairman of a church board of trustees, president of the Y.M.C.A. board of directors, president of the Boy Scouts of America Council, and American Legionnaire. He served in the presidencies (Ithaca) of the Rotary Club, Chamber of Commerce, and Community Chest, and in the chairmanships of the Greater Cornell Fund and the Tompkins County War and Community Fund. He was on the board of trustees of the Ithaca Savings Bank.

His friends and associates remember him for yet other things: for his warm and very human personality; for his humility, which was at odds with his magnificent abilities and experience; for his executive proficiencies as coupled with extraordinary friendliness and ease of approach; for his consummate devotion to his work; for the high-principled convictions exemplified by his everyday life; for his love of family and community; and for the multitude of friends whom he served but of whom he asked little.

He is survived by his wife, Mabel Ross Kulp; two sons, Arthur Claude Kulp and Robert Ross Kulp; and five grandchildren.

Elise Strang L'Esperance

— *January 21, 1959*

The illustrious career of one of America's outstanding women of medicine came to an end when Dr. Elise Strang L'Esperance died on January 21, 1959. For a large part of her professional career, Dr. L'Esperance was a member of the faculty of Cornell University Medical College, first in the Department of Pathology and later in the Department of Public Health and Preventive Medicine. Dr. L'Esperance was born in Yorktown, New York, the daughter of Dr. Albert Strang, physician, and Kate DePew Strang. She received her medical degree from the Women's Medical College of the New York Infirmity for Women and Children and then served an internship at the Babies Hospital in New York City. After several years in practice, Dr. L'Esperance returned to laboratory and research work on the staff of Dr. William H. Park of the Tuberculosis Research Commission of the New York City Board of Health. In 1910 she joined the staff of Dr. James Ewing in the Department of Pathology, Cornell University Medical College, first as assistant, then as instructor, and finally as Assistant Professor, which post she held from 1920 to 1932. This appointment marked the first time that a woman had attained professorial rank at Cornell University Medical College. In addition to her work with Dr. Ewing, Dr. L'Esperance served as pathologist on the staff of a number of hospitals in New York City. During this period, she published reports of work in tuberculosis immunology and then a series of studies on cancer problems, including primary hepatoma, gynecological tumors, and Hodgkin's disease.

In 1932, Dr. L'Esperance together with her sister Miss May Strang founded the Strang Tumor Clinic at the New York Infirmity in memory of their mother, Kate DePew Strang. It was during her directorship of this clinic that she came to realize the need for a clinic, in addition to the tumor and diagnostic clinic, which could provide periodic examinations for asymptomatic patients as a preventive measure against the development of cancer. As a consequence, in 1937, Dr. L'Esperance and her sister founded the Kate DePew Strang Cancer Prevention Clinic at the New York Infirmity. This was followed in 1940 by a similar clinic of the same name at Memorial Hospital. These clinics, in continuous operation since their founding, have demonstrated the feasibility of periodic examination as a tool in preventive medicine and have served as forerunners of a large cancer detection center program throughout this country and abroad. In addition to the public service rendered in this important area, Dr. L'Esperance devoted much of her attention to professional education in the field of cancer preventive examinations and cancer control. This included an encouraging welcome to doctors who wished to observe or participate in the clinic and the support of physicians and surgeons in training, particularly women. Dr. L'Esperance always

maintained a vigorous devotion to the importance of women in medicine, and was helpful to many during their period of undergraduate and postgraduate training.

For her outstanding achievements in cancer education, Dr. L'Esperance received in 1942 the Clement Cleveland medal of the New York City Cancer Committee, a division of the American Cancer Society. In 1946 she received the Friendship Award for eminent achievement from the American Women's Association, and, in 1947, the Medallion of Honor of the Women's International Exposition for outstanding achievements in the field of cancer. In 1951, Dr. L'Esperance received the Albert Lasker Award of the American Public Health Association in recognition of the "eternal inscription written by her inspired application of preventive medicine to cancer control."

In 1946, Dr. L'Esperance was drafted by the American Medical Women's Association to establish and act as editor of its official publication, the *Journal of the American Medical Women's Association*. In 1948, she left the editorship of the *Journal* to become president of the Association. She served on the board of this organization for many years as well as on the executive committee of the board of trustees of the New York Infirmary, and on the board of managers of Memorial Hospital and Memorial Center for Cancer and Allied Diseases—appointments to which she loyally devoted her attention until a very short time before her death. For many years, Dr. L'Esperance was a member of the board of directors and of the executive committee of the New York City Cancer Committee.

Outside her profession, Dr. L'Esperance attained a national reputation for horse breeding and horse showing. She owned and developed the Red Blind Stable in Pelham Manor and exhibited ponies in single and double, tandem, amateur, ladies, open, and state competitions throughout the eastern United States, including the National Horse Show at Madison Square Garden where she was a prominent exhibitor and the winner of blue ribbons and trophies on numerous occasions.

In the words of one of her close administrative associates, Dr. L'Esperance was unforgettable for "her energy, her vigorous intellectual approach to any problem, her humor and her generosity. She was a natural leader who could draw loyalty and hard work from all around her. Like all effective executives she had a good hard quality so that she could make decisions and stick to them even when decisions were painful. But back of this healthy hardness there was a big warm heart. No one knows how much she has done for others all through her life. She has always been a giver in the broadest meaning of the word."

In the words of a fellow physician and associate in cancer research, "It is impossible to estimate how many human lives the Strang Clinics which Dr. L'Esperance created have saved. . . . They are the first, largest, and most exemplary

of their kind, and have done much to stem the earlier public fear of cancer. . . . The public owes Dr. L'Esperance a great debt of gratitude because she has pointed out a new path for fighting cancer.”

Emerson Day

Myron D. Lacy

August 1, 1908 — January 26, 1982

Myron D. Lacy, professor emeritus of animal science, died January 26, 1982, at his winter home in Lake Park, Florida. A native of Marble, Texas, he graduated from Texas A & M University with a Bachelor of Science degree in 1930 and from Iowa State University with a Master of Science degree in 1931. He had a highly successful career as director of Cooperative Extension in Clinton County, Iowa, before joining the Cornell faculty in 1946 as professor of animal husbandry in charge of the Livestock and Meats Extension program. He retired from Cornell in 1971.

During his twenty-five years of service at Cornell, Professor Lacy developed one of the most outstanding programs in beef cattle extension in the country. He possessed unusual abilities as a teacher of youth and adults and as an organizer of educational programs to benefit New York's agriculture and consumers. Through his work he gained the respect and support of livestock producers, agricultural leaders, and extension workers throughout the state. Professor Lacy initiated the bull-testing program, the 500 Beef Club, and worked effectively with the New York Beef Cattleman's Association. He developed many improvements in the highly successful Beef Cattleman's Short Course, which provided high-quality instruction and practical experience in all phases of beef cattle production and management. Professor Lacy's annual short course attracted beef cattlemen from throughout the northeastern states. The short-course students so respected his leadership that they often returned to attend successive courses.

Professor Lacy was recognized by the American Society of Animal Science (ASAS) in 1966, when he was awarded the National Animal Science Extension Award. In 1955 he received the Swift and Company Founder Centennial Award of the ASAS, and he was honored by the New York Beef Cattleman's Association in 1967.

In 1974 friends and associates of Professor Lacy and his coworker, John I. Miller, established the Lacy-Miller Scholarship Fund in the College of Agriculture and Life Sciences to provide scholarships to outstanding students in the Department of Animal Science at Cornell.

Myron Lacy was a man of outstanding personal characteristics, admired by his colleagues and coworkers and especially by agricultural producers throughout the state. He was a man of integrity, dignity, and warmth, whose enthusiasm and ability to get along well with people of all ages greatly enhanced his leadership role in agricultural extension at Cornell University. His smile and genuine interest in people and their activities were a regular part of his work.

Professor Lacy is survived by his wife, Ivyl Lacy, of Lake Park, Florida; a daughter, Myrna Rooney, of Houston, Texas; a son, Richard Lacy, of Minneapolis, Minnesota; and seven grandchildren.

Kenneth L. Turk, George H. Wellington, Douglas E. Hogue

Carl Edwin Ladd

February 25, 1888 — July 23, 1943

Carl Edwin Ladd was born on the family farm at McLean, New York, February 25, 1888. He was a student at the Cortland Normal School from 1903 to his graduation in 1907 and distinguished himself there as a speaker and as a student. After teaching at South Otselic, he came to Cornell in 1909 and in 1912 was graduated from the college of which he eventually became the Dean. His professional record speaks for itself: Director of the Agricultural Schools at Delhi and Alfred, specialist in Agricultural Education in the New York State Education Department, instructor and extension professor in Agricultural Economics at Cornell, Director of Extension, Director of Experiment Stations, and Dean of the Colleges of Agriculture and Home Economics at Cornell, Deputy Commissioner of Conservation for the State of New York, member of the State War Council, member of the State Emergency Food Commission, Director of the Farm Credit Administration, Springfield, Massachusetts.

Few persons have so genuinely and so creditably represented the wholesome rural life as did he. In spite of exceptional opportunities to serve agriculture nationally and internationally he preferred to keep himself identified with the soil and with the New York countryside, where he learned as a boy the rewards and the hardships of life on a farm. In the height of his professional career, his conversation again and again turned wistfully to planning what he would do when he retired to his farm at McLean, New York. His interest in the history of agriculture in New York might then have been developed to the full.

Dean Ladd gave himself so unselfishly to the work for which he was called that his plans to devote himself to his farm never materialized, though he did live on it at the time of his death. His professional contacts reached an ever-widening circle and the successful development of activities with which he identified himself from his youth to his death continually brought new and more difficult responsibilities. With the stress of a world at war, there was an ever-increasing demand on him for counsel which taxed his strength, and yet his only apparent criterion for accepting or rejecting new responsibilities was, "If this project will bring our boys safely home one day sooner, I must give it my support." Although Dean Ladd believed that many of the problems of the day would solve themselves anyway, if given a chance, he worked fearlessly and indefatigably when he recognized that a real need for administrative decision existed.

Because of mature judgment, unusual personality, and ability to work well with others, administrative responsibilities came to him in increasing measure with the years. As a result, although he was trained as an agricultural economist,

he spent most of his life in administrative work. He had a broad and keen interest in the teaching, extension, and research fields of agriculture. He made notable contributions in stimulating the preparation and publication of textbooks in agriculture and home economics. He had a profound conviction that through the activities of the Land-Grant Colleges many of our more trying civil problems might be solved, and he gave unstintingly of his time and ability to the advancement of that group. He was regarded as a leader in agriculture not only in the State of New York but in the entire nation as well.

Despite the many professional honors that came to him, he was still Carl to his hosts of friends. He took pride in the fact that janitor, farmer, student, or professor need feel no hesitation in sharing his troubles with the Dean. One of the oldest members of the staff remarked the day after the Dean's death that Carl Ladd was the first person on the campus to call him by his given name. To talk with Dr. Ladd was always a pleasure and a privilege, regardless of whether the conversation touched national or international problems, the little acts of daily life, or the joys of friendship. Each conversation was one to be remembered.

Dean Ladd's interests were perennially youthful. He maintained a constant interest in the students of the College, frequently inviting groups of them to his office or his home to get their point of view; and he took time from his heavy administrative duties to teach a course in Current Problems of Agriculture.

While his colleagues will always remember his quick wit in conversation, his poise and his warm friendliness at all times, the loss of his influence will reach many who never knew him personally.

Nothing can adequately voice the personal and professional loss caused by his death, July 23, 1943.

William Sargent Ladd

August 16, 1887 — September 17, 1949

William Sargent Ladd, former Dean of Cornell University Medical College, died on September 17th, 1949. In the field of medicine his activities extended from the detailed care of private patients to the administration of a Medical School. However, he was also notable as a man whose interests ranged from the mountains of Alaska to the American University of Beirut, Syria.

Born in Portland, Oregon, on August 16, 1887, he spent most of his life in the East. In 1910 he graduated from Amherst College and in 1915 received the degree of M.D. from the Columbia College of Physicians and Surgeons. After an internship in the Peter Bent Brigham Hospital in Boston, Ladd returned to the Department of Medicine at Columbia and the Presbyterian Hospital but left in 1917-18 to serve in the Medical Corps of the Army in World War I. Returning to civilian life, he engaged in research and teaching at Johns Hopkins Hospital for two years and then once more returned to Columbia in New York. While still at Columbia he came to Cornell as a volunteer to work with the Sage Calorimeter in Bellevue Hospital. It was not until 1931 that he became a member of the Department of Medicine of Cornell and Assistant Attending Physician on the staffs of Bellevue and New York Hospital. In 1931 when the Cornell Medical College was about to move into its new buildings on 68th Street, the Dean, Dr. Walter L. Niles, asked Dr. Ladd to become Associate Dean. It was a wise selection because Ladd took great interest in medical students and their problems and combined a straightforward sympathetic approach with real executive ability. His background of association with four leading medical schools and five large hospitals had given him a wide experience in medical education. In 1935, Dr. Ladd was asked to serve as Dean and as Professor of Medicine and Attending Physician at The New York Hospital. As Dean he helped to clarify the relationship of the Medical School and its closely affiliated institution, The New York Hospital, and there was a steady advance in both administration and education. As a member of the Board of Managers of Memorial Hospital he exerted much influence in the establishment of this hospital in its new location. Unfortunately, a heart attack in 1942 brought on a period of invalidism and made it necessary for him to retire from the Deanship. After a few months, he returned to the practice of medicine and, though not able to attempt heavy administrative duties, continued his active interest in Cornell.

As an investigator, Dr. Ladd concentrated in the field of metabolism. His studies on diabetic acidosis published with W. W. Palmer 1920-21 and with H. B. Richardson in 1924 are still of great importance. He was also active in the study of pernicious anemia and of the food in hospitals.

A well known explorer and the first to climb several peaks in the Canadian Rockies, Dr. Ladd in 1931 led the expedition that made the first ascent of Mount Fairweather. He himself did not quite reach the summit as with characteristic generosity he turned back so that two others of the party using his food could reach the top.

In 1915 Dr. Ladd married Mary Richardson Babbott who survives him. With her he shared all his interests and activities. There are four children, Frances Wood, William Sargent, Anthony Thorton and John.

Those who knew Ladd well, remember best his militant honesty, generosity and warm heart. His spirit was the spirit of the mountain tops.

D. J. Edwards

Max Ludwig Laistner

1890 — December 10, 1959

Max Ludwig Wolfram Laistner, John Stambaugh Professor of History, Emeritus, died in Ithaca, December 10, 1959. He had retired from his active professorship on June 30, 1958. One of the eminent men who made their academic home in Boardman Hall—professors of law, of government, and of history—he had few equals among the scholars who have served Cornell University.

Born in 1890, the son of Max and Lisette Laistner, he had his education at the Merchant Taylor's school in London and at Cambridge University. At Cambridge he gained distinction, winning first class honors in classics and the Craven scholarship for archeological studies. His studies took him to Greece and widened his knowledge of the European scene and of European languages. German he knew as familiarly as he knew English; he spoke and read French and Italian. He now gained a working knowledge of modern Greek. The Greek and Latin of the ancients he had mastered so well during his formal education that on returning to England he won appointment as assistant lecturer in classics at Birmingham University. Following a brief period of service in the British Army, where he held the rank of sergeant, he took up academic life again and lectured on ancient history at Manchester University and at the University of London.

He came to Cornell University as Professor of Ancient History in 1925 and soon made his mark among the historians and classical scholars of this country. Cornell bestowed upon him the title of John Stambaugh Professor of History in 1940. As such he was successor to the late Professor Carl Becker. In later years he served for brief periods as special lecturer at the University of California and the University of Virginia.

Professor Laistner's fame rests upon his achievement as a scholar and as a teacher of graduate students. The most widely known of his books is *Thought and Letters in Western Europe, A.D. 300-900*, but his scholarship ranged over many topics in the ancient and medieval history of the West and included work of great importance regarding the writings of the Venerable Bede. The high standard and considerable volume of his scholarship gained for him the degree of Doctor of Letters, which Cambridge awarded him in 1944. His old college, Jesus College, Cambridge, elected him an honorary fellow, a mark of distinction he treasured with special pride. Scholarly societies in the United States and in Europe accorded him membership and used his services in positions of authority. Among students of the humanities he was known throughout the world.

Professor Laistner had a mind of unusual power. Exactness of knowledge was its first quality, capaciousness the second. What he knew he knew precisely. He knew much. The literature and thought of early Western civilization were open to him, and in these wide, rich fields he journeyed throughout his life. He read constantly in modern European history and had a knowledge of certain aspects of British history in the nineteenth and twentieth centuries surpassed by few in this country. During the second World War he joined the motley crew of professors who taught American history to the Army and Navy students who came to Cornell.

The sciences were outside the range of his knowledge. Music he knew well and enjoyed deeply, as became a member of a distinguished musical family. He served for many years on the University's Music Committee.

Professor Laistner's taste in music and other arts was conservative. He was conservative too in his attitude toward the social and political life of our times. He had too large a mind to be a die-hard Tory. Perhaps, as one who remained a British subject throughout his life, he would have claimed Victorian liberalism as his creed, the liberalism and urbanity of a Morley shading into the liberal conservatism of a Macmillan, with a touch of Churchill too. But while he adjusted his political views to the twentieth century he rejected many creations of our times. Not for him the automobile, the gramophone, or the radio. Even the telephone stirred him to loud abuse unless it served his purpose and then was hung up. Taxi and bus he took in time of necessity. More commonly he walked, and with a firm step as though to demonstrate his self-reliance.

Self-reliant he was on one side. On the other he depended much upon the few people who made up his intimate circle. Of these by far the most important while she lived was his mother. She had joined him in Ithaca the year after he came here, and she, strong as of the earth, wise, witty, warm-hearted, remained the center of his household for thirty years. No mother had a more devoted son.

He was constant as a friend to the dozen or so men and women who were members of his circle. To them, as to his graduate students, he was a sound, steady, frank adviser, a man to turn to in time of need, for there was within him a rock-like integrity. The quality of mind that made his scholarship purposeful and exact shone out in his judgments on matters of principle, however slight or personal the topic. He made clear choices and did not waver. Nor did he hesitate to avow his prejudices. But though the quality of his mind was rock-like, he was a man of warm heart and deep emotion. These also he did not hide. He was quick to assuage the grief of others, to concern himself over their health, to rejoice in their happiness.

Ill health had gained upon him in the last few years. Death took away a great scholar, a humanist of many gifts, whose mind had been trained in a discipline rare in the world of today. As members of the Cornell community we mourn the passing of one who shared his learning with us and enlarged the reputation of this University. Those who were in the fellowship of his acquaintance know that they have lost a loyal friend, a man upright, spirited, wise, and generous.

F. G. Marcham, Knight Biggerstaff, Harry Caplan

Robert C. Lamb

May 11, 1919 — March 31, 1997

Dr. Robert C. Lamb, Emeritus Professor in Cornell University's Department of Horticultural Sciences at the New York State Agricultural Experiment Station in Geneva, New York, died at his home following a serious illness due to a breathing disorder.

Dr. Lamb was born in Saskatoon, Saskatchewan. He was awarded a B.S. degree from the University of Saskatchewan in 1941. After serving in Europe as a Captain in the Royal Canadian Army Service Corps from 1941-45, he received his M.S. and Ph.D. degrees from the University of Minnesota in 1947 and 1954, respectively. He became a naturalized citizen of the U.S.A. in June 1952.

Bob joined the New York State Agricultural Experiment Station in 1948. A description of his duties at the onset of his career reads: "Leader of projects to produce improved varieties of peaches, nectarines, apricots, cherries, and pears for New York State conditions. He also directs the work of breeding new varieties of apples and pears resistant to fire blight, scab, and other destructive diseases. He will be expected to continue and expand this work in the future"— which he did with international award winning success.

In 1988, Bob received the Wilder Medal from the American Pomological Society for his fruit breeding research and in recognition of his two-term presidency of this professional society (1981 and 1982). The award recognized his work in variety development and highlighted the development of the scab resistant apple cultivars 'Liberty' and 'Freedom'; his introduction of two hardy peaches, 'Brighton' and 'Eden'; the nectarine varieties 'New Yorker' and 'Morton'; the high quality pears 'Aurora' and 'Highland'; and the apricot varieties 'Farmingdale' and 'Alfred'.

Bob joined plant collection expeditions to Nepal and Romania seeking peach, apricot, and plum cultivars for use in breeding. He lectured at international fruit breeding conferences in Eastern Europe and was principal advisor to fruit breeding graduate students who are now leading their country's apple breeding. The 'Liberty' apple that Dr. Lamb collaboratively developed with his Station pathologist colleagues has steadily progressed to a place of commercial merit, especially for orchardists seeking new options for reduced pesticide production.

Bob retired from Cornell University in 1988 but continued to devote considerable time to the Geneva Experiment Station activities. He kept office hours where he assisted with fruit breeding research such as fresh and processed fruit quality evaluations. He was a member of the Board of Directors of the New York State Fruit Testing Cooperative

Association, a Geneva Experiment Station based fruit nursery for variety testing of new and noteworthy fruit introductions from the Geneva programs. He assisted in creating trials throughout New York orchards to evaluate the potential of advanced selections and new varieties to meet the commercial needs of New York growers.

Bob was a member of the Sigma Xi Scientific Society, the American Society for Horticultural Science, the Canadian Horticultural Society, and the American Pomological Society. In addition to his work at the Geneva Station, Dr. Lamb was active in community affairs. He was a member of the Seneca Lake Yacht Club, the Geneva Historical Society, and diligently served on the Troop Committee of Boy Scout Troop #4, sponsored by the Presbyterian Church in Geneva, where he was a Ruling Elder and headed many church committees.

Bob is survived by his wife, Barbara; three children: David S. Lamb, of Spokane, Washington, Elizabeth M. Lamb, of Fayetteville, Arkansas, and William A. Lamb, of Newark, New York; two grandsons, Christopher Robert, of Spokane, and Robert John, of Newark; and his brother, Thomas W. Lamb, of Saskatoon, Saskatchewan.

Dr. Lamb's legacy of breeding disease resistant varieties of apples, cold hardy apricots and peaches, and delicious pears has benefited the New York fruit industry and consumers. This year a national review of Cornell's plant breeding program acknowledged Dr. Lamb's research and the contributions he has made to breeding pears that are resistant to the pear psylla, a pest of pear orchards in New York and world-wide. He left a wealth of germplasm in his breeding collections, many of which have the potential to be released as improved cultivars. He pursued challenging long term research such as examining resistance in apple to powdery mildew and fire blight. This work required close cooperation with plant pathologists and the patience and persistence to use wild species in strategies that required several generations of breeding and rigorous selection for multigenic traits.

Bob Lamb's legacy extends far beyond his professional career. He was dedicated to his research, and had an enthusiasm that was contagious to students, visiting scientists and to his colleagues. His kindness was one attribute that benefited all that interacted with him. Students and faculty were made to feel like family within a short time of visiting the Lamb household, and Bob and Barbara were considered "local" grandparents by several children of the Geneva Experiment Station faculty. His positive attitude and good humor never wavered, even in illness. Bob's hearty laugh, warm smile, and the twinkle in his eye will long be remembered by all who were fortunate enough to know him.

Robert Andersen, Michael Dickson, Susan Brown

William W. Lambert

May 10, 1919 — February 26, 2005

Professor Emeritus William Wilson Lambert was born in Amherst, Nova Scotia on May 10, 1919. He grew up in Taunton, Massachusetts, earned a Bachelor's degree from Brown University, an M.S. degree from the University of Nebraska in 1943, and, in 1950, his Ph.D. degree from Harvard University. Between the M.S. and the Ph.D. degrees, he pursued human engineering problems as a civilian research specialist of the United States Navy. His doctoral studies "hom" at Harvard was the Department of Social Relations, which surely contributed to his extraordinary breadth of interests and accomplishments.

In 1951, Dr. William W. Lambert accepted a professorial appointment in the College of Arts and Sciences at Cornell University, and remained there, albeit with many leaves, for the next 54 years. He simultaneously held appointments in the departments of Anthropology, Psychology, and Sociology and was often involved in both interdepartmental activities and cross-cultural studies. One interdepartmental outcome was an undergraduate major in Social Relations, which for about 20 years allowed students to combine input from the three departments, and to produce a unified undergraduate thesis. He also found time for administrative activities, serving at different times as Acting Chair of Sociology and Anthropology, and of Psychology, and, for almost six years as the Dean of the Graduate School.

Professor Lambert's teaching spanned many of the major areas of his three departments. There were seminars in anthropology, aggression, cross-cultural topics, and stress. Other courses included biological bases of social behavior, culture and personality, both developmental and educational psychology, individual differences, learning, perception, personality, social psychology, and statistics.

Graduate student mentoring was important to Professor Lambert. He served as the Special Committee chair for sixteen graduate students who earned the Ph.D., and as a minor committee member for another seventeen. His doctoral students went on to distinguished careers, generally at academic institutions. In order to provide support for graduate students during their training, and to help fund research facilities, Professor Lambert actively sought and participated in training grants from both NIH and NSF. The William W. Lambert Laboratory of Social Psychology, located in Uris Hall that houses two of his departments, Psychology and Sociology, was named in his honor.

His publications began in the early 1950s as the outcomes of laboratory experiments (e.g., “Reinforcement and extinction as factors in size estimation” in the *Journal of Experimental Psychology*), but by the late 1950s and thereafter, had acquired cross-cultural and social foci, with an interest in emotional aspects of human behavior frequently evident. As an example, in 1958, “A restatement and test of Schlosberg’s theory of emotion with two kinds of subjects from Greece” appeared in the *Journal of Abnormal and Social Psychology*. Many textbooks, book chapters, journal articles, and edited volumes followed over the next 35 years. Especially well known are the 1973 textbook, *Social Psychology*, jointly authored with his brother, Wallace E. Lambert; guides to the Human Relations Area Files that appeared in 1978; the 1979 *Handbook of Cross-Cultural Psychology*, co-edited with former student Harry Triandis; a series of cross-cultural chapters with former student Allen L. Tan, beginning in 1979, on aggression in children; the six-cultures-project derived 1964 *Mothers of Six Cultures*, authored jointly with Leigh Minturn; and the 1968 *Handbook of Personality Theory and Research*, co-edited with Edgar F. Borgatta. There was an ongoing series of stress-related studies on children, based in Sweden, for which a multiple-authored one, appearing in *Child Development* in 1994, may have been Professor Lambert’s last publication.

During leaves from Cornell, Professor Lambert had appointments at many institutions, including that of a Fellow at the Center for Advanced Study in the Behavioral Sciences in Palo Alto, California; a Fulbright Lecturer at the University of Oslo, Norway; a NIMH Fellow at the University of Stockholm, Sweden; a Rockefeller Professor at the University of the Philippines; and a Guggenheim Fellow and a Fulbright Lecturer at the London School of Economics and the University of Padua, Italy.

He served the international scientific community as President of the Society for Cross-Cultural Research, and as an editorial board member or editor of the journals *Behavioral Medicine*, *Sociological Forum*, *Sociometry*, *The Journal of Human Stress*, and the *International Journal of Intercultural Relations*. At a national level, he served on NSF and NIGMS review panels.

Beyond all these formal activities and appointments, William W. Lambert had many close friendships at Cornell and elsewhere, a warm family life, and an enjoyment of the arts, and of tennis. Professor Emeritus William W. Lambert died on February 26, 2005 in Arlington, Virginia.

Donald P. Hayes, Robin M. Williams, Jr., Bruce P. Halpern

Ernest William Lampe

December 27, 1896 — October 19, 1966

Dr. Lampe, distinguished surgeon and teacher, died of a heart attack at the age of sixty-nine. At the time of his death he was on the courtesy-attending staff of The New York Hospital, Clinical Professor of Anatomy, Emeritus, at Cornell, and Visiting Surgeon at Bellevue Hospital.

With the opening of The New York Hospital-Cornell Medical Center in 1932, Dr. Lampe joined the medical faculty as an instructor in surgery, to begin an illustrious career in teaching. Although well known as a surgeon, he was famous for his classical monographs on surgical anatomy, and his popular course in this subject was attended by surgeons from all parts of the world. It was, however, in his weekly evening seminars for attending and resident staffs of The New York Hospital that his method of teaching became a truly memorable experience; then, his complete absorption and contagious enthusiasm and his vivid descriptions of anatomical details were enhanced by free-hand blackboard sketches which revealed still another authentic talent. His clear and concise instruction was always given sympathetically, not as a superior but as a peer. In all sincerity he would listen with interest to the opinion of a student and react with pleasure if he thought it contributed to the discussion.

Dr. Lampe was born in one of the last frontiers of this country, a small mining town, Virginia, Minnesota. He graduated from the University of Minnesota in 1920, and received his medical degree in 1923 at Rush Medical School.

Dr. Lampe was a diplomate of and examiner for the American Board of Surgery, a Fellow of the American College of Surgeons and of the New York Academy of Medicine, a member of the New York Surgical Society, the Harvey Society, the New York Society for Thoracic Surgery and the New York State Society for Medical Research.

For his many years of exemplary service to the Finnish community along the eastern seaboard, he was decorated in 1954 by the Government of Finland with the title of Knight, First Class, Order of the Lion of Finland.

Surviving are his widow, Mrs. Yvonne Lampe; three brothers, Arthur, of Minneapolis, Minnesota, Elmer, of Hanover, New Hampshire, and Jacob, of New York City; and three sisters, Mrs. Ernest Knuti of Evanston, Illinois, Mrs. Lewis Woodruff of Joliet, Illinois, and Mrs. Paul Peterson of Nyack, New York.

Cranston W. Holman, M.D.

Douglas J. Lathwell

March 28, 1922 — April 6, 2003

As a soil scientist, Douglas J. Lathwell served his university, citizens of New York State, and the world at large. He taught and advised Cornell undergraduates from many countries and served on committees that guided the research and instruction of graduate students here and abroad. He developed educational materials for farmers and other agricultural professionals to help them manage soil fertility and to understand better the role of laboratory- and field-based analytical tests of their soils in making scientifically sound land use judgments that were economically feasible and environmentally compatible. His entire career was marked by a consistent sensitivity to the balance between economic well being of farmers and consumers while minimizing the environmental impact of farming on environmental quality.

A product of a small rural school in Benzie County, Michigan, he was a rural schoolteacher for one year before enrolling in the Michigan State College of Agriculture in the fall of 1942. In preparation for anticipated training as a meteorologist with the U.S. Army Air Force, he was sent to Brown University for a year (1943-44), but when the Army discontinued the program, he was sent to join the garrison of the Panama Canal Zone. Honorably discharged with the rank of Sergeant in 1946, he resumed his studies at Michigan State College, graduating with honors and a Bachelor's degree in Soil Science in 1947. In 1950, he received a Ph.D. degree from Ohio State University and immediately began his professional career as Assistant Professor in the Department of Agronomy at Cornell.

Beginning in 1950, Professor Lathwell managed all aspects of soil testing at Cornell and after ten years of his leadership, utilization of the laboratory increased from 10,000 to 50,000 samples per year. During his tenure, the laboratory was upgraded routinely to take advantage of developing analytical technology. He and Professor Peech published a research and extension bulletin describing interpretation of soil tests that at the time was "cutting edge" and has become a classic reference in soil fertility and nutrient management programs.

Professor Lathwell began to devote a substantial part of his time to agricultural production systems in developing countries in 1956 with a sabbatical leave in Honduras advising universities and government agencies on their development of a soil-testing program. In the period 1970-72, Cornell University, North Carolina State University, the University of Hawaii and other academic institutions conducted a collaborative program for managing soils in the tropics. Doug participated in the early stages of this program and spent a sabbatical leave in Puerto Rico in 1970 developing prototype field experiments that became the template for similar field-based soil fertility research in

Brazil, Colombia, Peru, and Ghana. Between 1976 and 1989, he assumed the leadership in coordinating the Cornell portion of this program. He developed and maintained this interdisciplinary, multi-institutional international research program at Cornell for several years and in the process, the group trained over 20 Ph.D. students. Publications he authored and edited during this time summarized the work on lime, phosphorus fertilizers, soil compaction, and beneficial uses of green manures, most notably in Puerto Rico, Ghana and Brazil.

Professor Lathwell was elected as Fellow of the American Society of Agronomy, Soil Science Society of America, and the American Association for the Advancement of Science. In 1964, he was a Fulbright Scholar to the Netherlands. He served as a member or chair of the Fellowship Committee of the Graduate School and also served as Director of Graduate Studies in the Graduate Field of Agronomy, CALS Education Policy Committee, and CALS Admissions Policy Committee.

Beginning in 1952 and continuing until his retirement in 1989, he taught introductory courses in soil science at least one semester per year. He was advisor to over 200 undergraduate students and served as major and minor adviser on over 100 M.S. and Ph.D. graduate student committees.

Professor Lathwell was an active participant in discussions, both speaking and listening, covering all manner of topics. He was a gentle man at all times. But he did not always agree. His most caustic expletive was “horse feathers.” When he used that term you knew that the discussion had gone off track and that it was time to re-evaluate what had just been said. Colleagues, students, and friends often sought his wise counsel.

He always cared deeply for the affairs of the department, his professional home for over 40 years, and was pointed with his sage advice when asked to comment on the thornier issues facing departmental administrators. Though seldom did he feel it was his place to volunteer his views on such issues, he commanded such great respect by department leaders that his advice was sought and gladly accepted whenever it was offered. Most enjoyable were the times he would recount to us during morning coffee breaks those stories of his latest retirement adventures with his family.

Doug was a valued colleague, a close friend to many over the years, and a dedicated environmental professional. He contributed significantly to advancing our profession of soil science, promoting environmentally sound agronomic practices, and sustaining food production systems in many regions of the world. He touched deeply many lives in such positive ways that he will forever have our respect and admiration and will never be forgotten.

Stephen D. DeGloria, Robert D. Miller David R. Bouldin

Herbert David Laube

October 15, 1880 — September 12, 1960

Herbert Laube came to the Cornell Law School in 1925 and retired in 1948, coming back one term in 1955 to teach the course in wills. The *Quarterly* dedicated its spring issue of 1949 to him and published one of his notable articles “The Jurisprudence of Interests.”

Born in Brodhead, Wisconsin, in 1880, he received his undergraduate degree from the University of Wisconsin in 1903 and a Master of Arts degree from the University of Michigan in 1911. He did other graduate work in the University of Chicago. He taught in various high schools in Wisconsin and Illinois and at the Normal School in Green County, Wisconsin. At the age of thirty-one he came east to teach at the William L. Dickinson High School in Jersey City, New Jersey, and he soon began the study of law at Columbia Law School, from which he graduated in 1916 at the age of thirty-six. He remained in New Jersey during World War I as a lecturer for the War Department in Bayonne and Jersey City, and after the war he returned to Milwaukee to practice law and to become journal clerk and parliamentarian to the Wisconsin Senate. He then enrolled as a graduate student at the Harvard Law School and received his S.J.D. in 1924. He indicated his affection and respect for several of his teachers, notably Professors Charles E. Merriam, Charles R. Henderson, and Albion Small of the University of Chicago, Charles Beard of Columbia, and particularly Roscoe Pound of Harvard, who directed his graduate work and who influenced his thinking and his life. He taught two years at St. Louis University and one summer at Drake University before he came to Cornell at the age of forty-five, where he was to spend the rest of his active life.

He is survived by his wife, Vivian F. Laube, and a brother, Frank Laube, of Seattle, Washington.

Laube was a good teacher, well-trained, well prepared, gentle, and precise. He was a prodigious worker and published three casebooks and many articles and reviews. In the controversies of the late twenties and early thirties with respect to curriculum and the aims and methods of legal education, he was a partisan, a traditionalist, and proud to be a pupil and disciple of Roscoe Pound, to whom he felt he owed so much. His students remember well his methods and techniques in his teaching of courses in wills, mortgages, and, particularly, quasi-contracts and jurisprudence.

His early studies of sociology were ripened by his contact with Pound and the school of sociological jurisprudence.

In his tribute to him at the memorial service in the chapel, Anabel Taylor, Rev. Edward L. Christie of Ithaca said he found in him dignity, serenity, humor, and kindness. Describing the reaction of Professor Laube's students to him, he said "As they looked at that calm face and listened to that quiet voice, I am certain the dignity, serenity, the almost shy laughter, the friendly warmth also became a part of them." So they did: he had great dignity, he was serene, he had found an inner peace.

Gentle as he was, however, he had an intense, even a fierce, hatred of injustice. He wanted his jurisprudence translated into action, judicial or legislative. Yet he was himself a man of books. When he retired in 1948, he kept his law school office. Daily he came and worked, read, and wrote. He did not stop until he was well into his last illness.

He had a long life in preparation for law teaching. Excellent undergraduate and graduate training were of course part of it. Secondary school teaching, over a period so long that it might have seemed to be his chosen vocation, contributed. Then came the Columbia and Harvard Law Schools with a brief span in practical politics as a legislative aide between these two periods of study. Finally he came to Cornell where he made his life in the law. Here at forty-five he began a teaching and writing career which ultimately brought him to the front ranks of those of his generation. One half of the faculty with whom he spent most of his active life are now gone with him: Charles Burdick, Lyman Wilson, George Thompson, and Horace Whiteside. It was a strong faculty on which he sat. Twenty-four classes will remember him respectfully and affectionately as a fine teacher, a great scholar, and a worthy member of the group, which brought them into the profession of the lawyer.

John W. MacDonald, William H. Farnham, Robert S. Stevens

Albert Washington Laubengayer

February 22, 1899 — June 15, 1988

Albert W. Laubengayer, known to his colleagues as “Lauby”, was associated with the chemistry department for over seventy years. He was a kind and gracious man, warm hearted, friendly and concerned for the welfare of others. He contributed immensely to the development and the character of the present day department.

Born on a Kansas wheat farm, Lauby entered Cornell as a freshman chemistry student in 1917, just in time to be inducted into the Student Army Training Corps. After graduation in 1921 with a B. Chem. degree, he went to Oregon State College as an instructor in chemistry. He returned to Cornell for graduate study in 1923 as a member of the first group of graduate students to occupy the new Baker Laboratory. He received a Ph.D. in 1926 under Professor Louis M. Dennis and began his postdoctoral career at Cornell with a Heckscher Fellowship (1926) and as lecturer in inorganic chemistry (1927-28). He retired from the department in 1966 with the well deserved title of professor emeritus.

Professor Laubengayer was an outstanding research chemist who was voted one of the Ten Most Outstanding Inorganic Chemists in the U.S.A. by the Chicago Section of the American Chemical society in 1947. Lauby’s research at Cornell was mainly in the area of synthetic inorganic chemistry and he was a pioneer in the development of boron chemistry. He prepared and studied novel boron hydrides, organo-boron and heterocyclic boron-nitrogen compounds. His work provided an important basis for further developments by later generations of chemists. One of his major achievements was the preparation of crystals of pure elemental boron. This result made possible the determination of an accurate x-ray structure of the material and thus contributed to the important discovery of a unique form of bonding between boron atoms in polyhedral structures. In later years before his retirement, his research turned to the synthesis of inorganic polymers containing boron-nitrogen and aluminum-nitrogen frameworks. In addition to his research activities Lauby always emphasized the importance of teaching. In hiring and promoting faculty, he could be counted upon to raise the right questions about the quality of a candidate’s teaching. This emphasis grew out of his genuine concern for students. To Lauby, Cornell existed primarily for the students.

Lauby himself was a dedicated and effective teacher. He would rise at 5 a.m. to prepare for his 8 a.m. general chemistry lectures. Clear exposition, lively demonstrations, and great enthusiasm for chemistry were the hallmarks of the lectures in which he shared his impressive knowledge of the chemistry of the elements. Lauby

was also devoted to graduate education. He enjoyed working with his graduate students and over fifty students received their degrees under his direction. Lauby had a quick and active mind, boundless energy, and notably good judgment. In motivating and evaluating students, he managed to find the proper balance between high standards and realistic expectations.

Professor Laubengayer had a great loyalty to the department and worked hard at instilling a similar loyalty in other members of the faculty. He was a strong proponent of recruiting the best young chemists and of promotion from within, because he felt that this was the best way to build a distinguished faculty with a deep loyalty to the department, and the university. He was an excellent mentor for young faculty, providing a strong link to the history and traditions of chemistry at Cornell. He and his lovely wife, Grace, offered welcoming hospitality to newcomers, whether in their home or at departmental receptions. They knew how to make young faculty feel at home and they treated them as valued members of the Cornell community.

Lauby had many interests beyond teaching and research and such interests were often associated with departmental affairs. He and Grace played a leading role in the old Grad-Fax dancing group. He played the guitar and enjoyed leading the singing at Chemistry Department picnics when that was the fashion. He organized chemistry square dances and chose to have such an event as the climax to his retirement party.

He enjoyed sailing on Cayuga Lake and was co-founder and first president of the American Wine Society, now grown to thousands of members. For many years he was an active member of the Ithaca Oenological Union of Home Wine Makers and even managed, with the help of his home health-care aide, to bottle his 1987 vintage. He loved figure skating and was a member of the American Figure Skating Association.

Over the years, generations of Cornell students have returned to campus to visit with Lauby and express their thanks for his influence on their lives. They will miss him and so will the Department of Chemistry.

Robert C. Fay, William T. Miller, Robert A. Plane, Richard F. Porter, W. D. Cooke

George Nieman Lauman

February 15, 1874 — November 1, 1944

George Nieman Lauman, Professor of Rural Economy, Emeritus, departed this life November 1, 1944, from his home in Ithaca, New York, at the age of seventy years. He had retired from active duties in 1942, after having served on the faculty of the College of Arts and Sciences for thirty years and on the faculties of the College of Agriculture and of Cornell University for forty-three years. While memory of him is still green, it is only fitting that his colleagues should pause to consider him and his work.

G. N. Lauman was born in Pittsburgh (Allegheny), Pennsylvania, on February 15, 1874. Following graduation from high school, he worked for two years in an architect's office and then came to Ithaca where he prepared at the Cascadilla School for entrance to Cornell. In the University he elected to take an agricultural course because of the opportunity that it offered for obtaining an education in the sciences; he was graduated in 1897 with the degree of B.S.A.

Having shown a predilection for horticulture, he became an assistant in that work, and in 1899 an instructor. In 1902, his duties were broadened to include agriculture as well as horticulture. These interests bore literary fruit in the form of collaborations with and other assistance given to Dean Liberty Hyde Bailey in the preparation of the *Cyclopedia of American Agriculture*, and the *Cyclopedia of American Horticulture*.

The young teacher, however, became increasingly interested in the economic and social problems of agriculture then only beginning to be studied. In the school year 1899-1900, he gave the first course in the history of agriculture offered in this country. Two years later, he taught the economics of agriculture. In 1903 came official recognition of the new field and this pioneer worker was made an instructor in rural economy. That year farm accounting was added to his offering of courses. In 1904-1905, he broke new ground again by teaching one of the early courses in rural sociology.

Promotion to Assistant Professor of Rural Economy came in 1905, and to Professor in 1909. He served as head of the Department of Rural Economy from its inception until that unit was combined with the Department of Farm Management. He became a Fellow of the American Association for the Advancement of Science. In 1913, he was an official delegate from New York on The American Commission on Agricultural Cooperation and Rural Credit in Europe. Service on this commission required travel abroad, and visits to many institutions, duties that doubtless appealed to Professor Lauman, for he had already been in Europe, and was to go again after the conclusion of

the work. From 1903 to 1910, while advancing in the field of his permanent interest, Professor Lauman served as Secretary to the Faculty of the College of Agriculture.

Although Professor Lauman gave attention to the subdivisions of Rural Economy in which he taught classes, his chief interest was the history of agriculture. On that subject he gathered extensive materials for study, from European as well as from American sources, and became a recognized authority.

In Professor Lauman's thinking, a catholicity of outlook was deepened by the long perspective of the past. Accuracy was ever his watchword as he worked out the intricate patterns of rural economic problems past and present. And to be accurate, in his opinion, meant not only that the surrounding circumstances of an event or issue must be studied, but also their past must be known and evaluated. This is not the easy pathway to scholarship, but Professor Lauman travelled it with singular steadiness of purpose. He read extensively from a wide range of sources. He attended many university lectures including the lectures in a considerable number of courses. His emphasis was always on what he regarded as matters of importance to the scholar. Things that he regarded as of temporary significance attracted him not at all, whatever reward in popular or even professional recognition might attach to their pursuit, and interested him only as material for observation, recent additions to the great store of history, to be classified and ticketed for comparison with others from years long past. He was not to be turned from the course that he had laid out.

We cannot take leave of this sturdy individualist, who lived his own life and no other, without recalling him as he walked among us. In Professor Lauman, gentleness and humor were blended with understanding. He was in personal relations the soul of courtesy, consideration, and honor. Regret that he has gone is sweetened by the memory of him.

Doctor James Law

Professor of Veterinary Medicine and Surgery

February 13, 1838 — May 10, 1921

The career of James Law embraced the first fifty years of the history of Cornell University. He was a member of the first Faculty which began its work in October, 1868, and until his death, May 10, 1921, either as active or emeritus professor his services to the University and his adopted country were continuous and invaluable.

It was significant that in the young University almost the first professorship created was of a subject that had at that time no academic standing in America, and the value of which to purely scientific studies and to the welfare of the State was scarcely dreamed of. To Ezra Cornell was due the recognition of that subject; and to Andrew White was due the recognition of the equal value of all subjects of academic study.

No choice could have been happier from these two points of view. The new professor had been trained in the best schools of Europe under the most famous teachers of their day, and was himself of such personal dignity of character as to impress all who met him with the conviction that he was of the highest type of scholar and man.

Although his chair was but one of many in the new university, Dr. Law by his own broad knowledge practically founded a course in Veterinary Medicine, and furnished the country with graduates who later organized the National Control of Animal Diseases.

It was the broad knowledge of every branch of his subject and his practical application of it to the problems of animal industry in the United States that won for him and the University, which he served so faithfully, the recognition by the State of New York and the Federal Government of his accomplishments; and which led to the creation, in 1894, of the New York State Veterinary College, the first state veterinary college in America.

During the interval between 1868 and 1894, Dr. Law had, almost single-handed, accomplished a revolution in the conception of the knowledge and practice of Veterinary Medicine in the United States, and had raised it to a rank coordinate with human medicine. His persistent effort in raising the standard of veterinary education has found expression not only in the institution of which he was head, but also in the veterinary colleges of America.

He was a great teacher because he was a great scholar, and he pursued his unremitting labors almost to the last hour of his long and honored life. He won the affection and respect of all who knew him, and the University owes him for his splendid example of unselfish devotion, gratitude which cannot be expressed in words.

Chronology

Professor of Veterinary Medicine and Surgery, 1868 – 1896

Professor of the Principles and Practice of Veterinary Medicine, Veterinary Science, and Veterinary Therapeutics, 1896 – 1908

Director of The New York State Veterinary College and Dean of Faculty of Veterinary Medicine, 1896 – 1908

Emeritus Professor of The Principles and Practice of Veterinary Medicine, 1908 – 1921

Peggy Lawler

June 24, 1929 — November 21, 1996

Peggy Lawler was born and raised in New Orleans, the daughter of Mark R. and Katharine Lawler. She studied dance as a girl while attending the Country Day School. After receiving a B.A. degree in English in 1950 from Texas Women's University, she went on to a career in dance, teaching at the Putney School in Vermont for the next two years. From 1947-54, she spent her summers studying and teaching dance at the Perry-Mansfield School of the Theater in Steamboat Springs, Colorado. There she met Harriette Ann Gray, with whose dance company she toured the United States from 1951-55. After teaching in her own studio in Redondo Beach, California for two years, she taught dance at San José State University from 1958-64, where she became an Assistant Professor after earning her M.A. degree in Dance in 1961.

Peggy Lawler was the head of the Dance Program at Cornell University from 1965 to her retirement in 1988 as Professor Emeritus. During that time, she succeeded in turning dance from an extracurricular activity into a recognized field of study, moving dance into the Department of Theatre Arts, and creating the dance major. Her vision inspired many students to pursue a life of dance, and to live all aspects of their life with commitment and spirit. She was a founding member, choreographer, dancer, and teacher with the Ithaca Dancemakers from 1972-82. After her retirement, she taught dance at Deep Springs College for two semesters.

In 1981, she made a barnstorming tour of the United States with her "Solo Cycle" of dances, often performing in small towns for people who would otherwise not have seen dance. Her choreography was characterized by musicality, elegant craftsmanship, subtlety, and humor. Some of her larger works include two productions of Stravinsky's, *Renard*, performed with live orchestra and vocalists and choreography of Karel Husa's, *Trojan Women*, for a cast of eighteen women and children with the composer conducting.

A lover of music, for many years she hosted weekly gatherings of friends for singing. Most recently she sang with the Ithaca Community Chorus and Chamber Singers. She shared many wonderful evenings of recorder playing with a small group and took pleasure in playing piano. In recent years, she dedicated herself to writing, producing short autobiographical pieces, and a journal of her 1981 dance tour.

She was an avid traveler, frequently taking off on cross country trips to the Western mountain ranges, where she renewed her spirit with wilderness hikes. She also liked to spend time at the cabin she and a few friends hand-built in the coastal Maine town of her father's origin. She traveled in Europe, South Asia, Mexico, Canada, and Great

Britain, always with great curiosity and an extraordinary talent for engaging with the people and life of any place she visited. Her generosity, love of nature, and artistry were gifts to the entire Ithaca community.

She is survived by her mother, Katharine Lawler; her brother, Robert Lawler and wife Penny, of Port Angeles, Washington, and their children, Betsy, Jenny, and Kenneth; as well as many devoted friends.

Don Fredericksen, Lamar Herrin, Joyce Morgenroth

James E. Lawrence

June 6, 1926 — February 5, 2002

Over his lifetime, James E. Lawrence had these significant professional interests: teaching and advising Cornell University students; improving the environment of his beloved Catskills; and writing, publishing, and producing educational radio and television programs.

Jim was born in Kingston, New York on the Hudson River, started high school there but left to join the U.S. Navy in 1943 to be trained as a torpedo specialist. He received a medical discharge in 1945, returned to Kingston High School, and was graduated in 1946. His Cornell education began that year as a special two-year student in Wildlife Management. Based on this experience, he decided to complete a four-year program with a major in the same subject and graduated with a Bachelor of Science degree in 1950. That same year, on July 15, he married Joan E. Deegan.

The New York State Conservation Department hired him as Assistant Game Manager for the Lower Hudson District which ran on both sides of the Hudson from Ulster and Dutchess Counties down the river and out to the end of Long Island. Jim was assigned to census the deer herd on Long island, which was raising havoc with farmers' crops. They were also jumping the 12-foot fence at Brookhaven Laboratory to eat the radioactive plants.

He returned to the Poughkeepsie office of the Conservation Department to educate sportsmen about the need for managing the deer herd, building wildlife marshes, and protecting the environment. Part of this effort involved a weekly series of articles for the Woodstock, New York newspaper that brought the changing outdoor scene to the attention of local people with emphasis on protecting the environment.

In June 1953, Jim was appointed Executive Director of the Stony Brook-Millstone Watershed Association in Pennington, New Jersey. Again, environmental education was his principal emphasis with the goal of raising public awareness of the need for land and water management.

In late 1954, Jim became the first Community Resource Development Extension Agent in New York State serving a rural non-farm audience with headquarters in Binghamton (Broome County). At that time, many hill farms in the Southern Tier were being abandoned by farmers and purchased by people who didn't need or necessarily want to farm for a living. He held workshops using his knowledge and that of Extension Specialists at Cornell to inform these new residents about farm ponds, Christmas trees, wildlife marshes, and land and water conservation. Recognizing the need for educational material on these and other subjects, he produced several publications

and radio and television programs. He wrote and published a book, *Growing and Selling Christmas Trees*, and submitted articles to national magazines, local newspapers, and *The New York Times*. He was selected to become a member of the New York State Joint Legislative Committee on Natural Resources and wrote several reports for the committee.

With a strong background in communication and extension work, Jim came to Cornell on October 1, 1958 as an Assistant Professor in the Department of Extension Teaching and Information (now divided into the Office of Media and Technology Services and the Department of Communication). Innovations in the department's radio and television operations and its academic courses in those media became evident a short time after his arrival. Also, he gave television-programming assistance to 125 agricultural, home economics, and 4-H Extension Agents who participated in live programs throughout New York State with an estimated weekly audience of more than one million persons. Evidence of his ability and leadership in the development of successful TV "short courses" was reported by many Cornell Extension specialists, including this letter from Dr. L.C. Cunningham, Agricultural Economist:

"I welcome an opportunity to describe the work of James Lawrence in connection with our 'short course' programs telecast over WNBF-TV Binghamton, WBEN-TV Buffalo, and WTEN-TV Troy. These programs, with an enrollment of approximately 2,500 farmers, were based on information obtained from the series of regional farm management studies of dairy farms in New York State. I had no experience in the use of this medium, and to have the guidance of a person trained in this area and with TV experience was most helpful. Admittedly, I am very much in the amateur class, so Lawrence not only helped to avoid a beginner's errors but also made many constructive suggestions in the preparation and presentation of the subject matter. Also, one of his major contributions was to make the telecasts a matter of teamwork between the specialist and agricultural agents from 10 counties."

To complement the actual production of radio and TV programs, Jim prepared a quarterly training newsletter "Video Views" for Cooperative Extension staff members and a publication titled, "Television and the Communication Process as Related to the Extension Program." Both received wide recognition in New York and other states and earned awards of excellence from the American Association of Agricultural College Editors.

During the 1964-65 academic year, Lawrence attended Syracuse University and received a Master's degree in Communications. The following year, he was promoted to Associate Professor at Cornell. In addition to teaching several courses, he became faculty advisor to several student organizations, including *Cornell Countryman* magazine, Agriculture Positive Action Council (AgPAC), and the Cornell Radio Guild where he soon became involved in programming for the students' independent radio station WVBR-FM (Voice of the Big Red).

While at Cornell, he founded his own business, "Outdoor Publications". He wrote and published books and maps of the Catskills and Adirondack regions. These maps show fishing areas, state lands, and other information useful to hunters, fishermen, hikers, and visitors to these areas.

When he retired from the university on May 31, 1983, he did not slow down but expanded his business and continued his lifelong commitment to environmental education. He worked behind the scenes with local groups, legislators, and others to see that the local and global environment was protected. He continued his writing on these subjects and often contributed articles and letters to local Catskill newspapers. Many people in the region have said he is sorely missed because his writing gave clarity to local controversies and made them think about and do the right thing for the area.

In retirement, Jim and Joan spent "summers" (April to November) at their summer home in Mt. Tremper. He considered the Catskills "The Center of the Earth" and was never happier than when he was there.

He was a member of several organizations, including Cayuga Lake Watershed Network, Nature Conservancy, Audubon Society, Sierra Club, and American Legion Post #150 of Phoenicia, New York. He also was a communicant at Immaculate Conception Church in Ithaca, New York.

James E. Lawrence died suddenly on February 5, 2002, at his home in Ithaca. Besides his wife of 51 years, Joan Deegan Lawrence, survivors include five daughters and two sons: Joyce Lawrence, Ithaca; Jill Lawrence, Oakland, California; Janet Hawkes, Ithaca; Jean Rightmire, Dryden; Jane Cullings, Newfield; James Lawrence, Newfield; and John Lawrence, Seattle, Washington; and five grandchildren.

Royal D. Colle, Donald Schwartz, William B. Ward

Leonard Alexander Lawrence

November 4, 1881 — August 10, 1947

The death of Leonard Alexander Lawrence on August 10, 1947 brought to a close a career of forty years of successful teaching at Cornell. Born at Calais, Maine, on November 4, 1881, he was for the first twenty-three years of his life a resident of that state. He was graduated from the University of Maine in 1904 with the degree of Bachelor of Science obtained in the course in Civil Engineering. During his college career he engaged in long distance running and established an intercollegiate record in the two-mile race which stood unbeaten for seven years. His participation in collegiate athletics while a student led to a life time interest in college sports.

After spending three years practicing his profession by doing mine surveying in western Pennsylvania, he came to Cornell in the Fall of 1907 as an instructor in the College of Civil Engineering. In 1916 he was promoted to assistant professor and in 1944 to the grade of associate professor.

His main interest was in surveying and his teaching was largely devoted to that branch of civil engineering. Outdoor life always appealed to him. Teaching at the Cornell Summer Survey Camp, as he did for many years, was a source of great pleasure to him.

During the First World War, he taught for a time in the Aviation School at Cornell. In 1941 he spent the summer vacation months at Huntsville, Alabama, where he had charge of field surveying parties for the engineering firm of Whitman, Requardt and Smith, who were the engineers for a large chemical warfare plant. He was also for a time a field engineer for the Cornell Athletic Association during the construction of Schoellkopf Field.

In spite of the fact that his health had not been the best for a year or two, he was anxious to teach at the summer survey in 1947. He had completed his work at the first session of the Survey with his usual efficiency, and returned to his home for the two day recess between sessions. During the night before the opening of the second session he suffered a fatal heart attack and died in his sleep.

He was a member of the Phi Kappa Sigma and Acacia fraternities and of the Masonic Lodge. He was also a member of a number of honorary societies, among which were the Spiked Shoe, Quill and Dagger, and Pyramid.

As a teacher Professor Lawrence will long be remembered for his kindly interest in students and their personal problems. His colleagues will long remember him as one who was never too busy to help anyone in need. Both students and faculty have lost a kindly, unselfish and self-effacing friend.

Harry Britton, J. E. Perry, P. H. Underwood

John William Layer

August 18, 1927 — March 13, 1975

Agriculture lost a dedicated servant with the untimely death of John W. Layer on March 13, 1975, at the age of forty-seven, as the result of a long illness with the rare disease amyotrophic lateral sclerosis. He is survived by his wife, Marie, and their two children, Kathy and Chris.

A native of Buffalo, New York, John served in the United States Army Corps of Engineers during 1945-47. Thereafter he entered Cornell University and received the Bachelor of Science degree in 1951. Upon graduation he was appointed district extension agricultural engineer for the southeastern counties of New York State. In 1956 John returned to Ithaca as an instructor in the Department of Agricultural Engineering. The following year he completed his Master of Science degree and was appointed assistant professor of agricultural engineering. Promotion to associate professor came in 1963. Upon retirement on August 21, 1972, after twenty-one years of service at Cornell University, he was named professor of agricultural engineering, emeritus, by Cornell's Board of Trustees.

John's primary extension responsibility was to develop and carry out an educational program in the design and construction of structures for storing farm produce. He also cooperated in research on ventilation and designs for such facilities. John became one of the leading authorities on storage of fruit, potatoes, onions, and flowers, as well as silage, hay, and grains. His advice and counsel were sought by growers, building consultants, contractors, and manufacturers from all parts of the nation. As an expert in construction of controlled-atmosphere storages for apples, he was called upon to advise farmers in New York and nearby states wherever specialists were not available. His counsel was sought for almost every refrigerated-storage facility built on a farm in the state in the last fifteen years of his career. His extension bulletin *Farm Refrigerated Storages* is considered a model and is consulted throughout the country.

As an active member of the College Floriculture Industry Program Committee, he provided effective leadership in approaching greenhouse environmental control problems. He was one of the key authors of the Cornell extension publication *Fertilizer Proportioners for Floriculture and Nursery Crop Production Management*. This manual and the extension program for which it was developed were highly successful in motivating commercial flower producers to mechanize and improve crop nutrition practices. The manual continues to be unique and to be used nationally, not only by extension and industry personnel but also by college teachers, as a floriculture text. John

also coauthored numerous other publications in the area of greenhouse environmental control. He was appointed leader of the College Floriculture Industry Program in 1970 and served in this role until his illness forced his retirement.

In 1970 the New York State Flower Industries, Inc., recognized him for his industrywide contributions and service and conferred honorary membership on him. They further recognized his contributions in 1971 with a special citation on behalf of the state's floriculture industry.

Nationally, he was a leader in the American Society of Agricultural Engineers, served as chairman of the committee to plan and conduct the North Atlantic Section Meeting of the ASAE in 1965, and was on the planning committee of the national meeting held at Cornell in 1959. He was a member of the Executive Committee of the North Atlantic Region of ASAE and in 1971, chairman of their Farm Structures Division. He was active on several technical committees at the national level of ASAE and contributed to the preparation of some of the standards incorporated into the Agricultural Engineers Yearbook. The society conferred honorary life membership on him in 1972 in recognition of his work and devotion to the society and the profession.

To fulfill John's wishes, the John W. Layer Memorial Scholarship Award in Agricultural Engineering has been established. Its purpose is to encourage professionalism and participation in activities of the American Society of Agricultural Engineers by undergraduate student majors in agricultural engineering.

John was project superintendent of the Farm Buildings Project at the New York State Fair for several years and was responsible for planning and supervising the construction of the major facilities.

He was author of eleven bulletins and dozens of articles for industry and for country extension publications. In national competition he received the ASAE Blue Ribbon Award in the category of extension publications.

Active in community service, John served as a member of the board of trustees of the Presbyterian Church in Trumansburg, chairman of the board of trustees of Cayuga Lodge, chairman of the Brooktondale Community Center, and a member of the Brooktondale Volunteer Fire Department.

John Layer loved life, people, and a good story. He engaged in conversation as both friend and teacher with enthusiasm, knowledge, and a sly, beguiling wit. He often took a positive position on unpopular issues and said what others feared to mention, but he was never pedantic or overbearing. He respected other points of view. These characteristics served him well in his occupation as an extension agricultural engineer. He worked hard and enthusiastically at helping people solve problems related to engineering and made it a point to know his clients

and audiences. As a result, he became an extremely effective teacher with an admirable sense of what to emphasize and when to lighten a lecture with humor. He presented well-organized and aptly illustrated material with clearly articulated delivery—always managing to say just what he intended to say. Most importantly, he could interpret technical subject matter for his audiences so they could appreciate the salient points.

John loved life, and his enthusiasm for it and determination to get back to living it fully carried him through the years of fighting his little-known disease. It deprived him of one of his most prized possessions—communication with the people he loved. His mind remained alert and active, even as his body withered and finally could no longer support his effort to live. Yet he was convinced he would win. His devoted nurse expresses it best: “John was not only a professor at Cornell, but also a teacher to many of us in the medical profession—a teacher of patience and understanding. It was he who taught many of us the real meaning of these words. John was physically vegetated; however, his mental faculties were completely intact to his day of passing. His smile, his blink, and his sparkling eyes will always be a remembrance of this man to whom so many are thankful.” John did win.

Carl F. Gortzig, Everett D. Markwardt, Ronald B. Furry

J. Paul Leagans

September 11, 1910 — February 5, 2001

J. Paul Leagans, Professor Emeritus in Cornell's College of Agriculture and Life Sciences, died February 5, 2001, at the age of 90. He was internationally recognized for his pioneering work in the third and fourth dimensions of the evolving Land Grant educational philosophy, namely extension and international work. He is said to have coined the term "Extension Education" and is considered by many as the father of this field of specialization.

Born in Cana, North Carolina, on September 11, 1910, Paul was the son of Granville and Camilla Collette Leagans. He received a B.S. degree in Agricultural Education from North Carolina State University in 1934. In his early career, he held positions as high school teacher of agriculture, county cooperative extension agent and, on the State Extension Staff in Raleigh, North Carolina, as a program leader and training specialist.

Paul pursued graduate work at North Carolina State University in Economics and Farm Management while serving as a Senior Agriculturalist in the Division of Research and Training with the USDA Federal Extension Service. As a Rockefeller Foundation Fellow, he studied at the University of Chicago, with his dissertation research being done in Raleigh, North Carolina. He received his Ph.D. degree in Adult Education in 1949 from the University of Chicago.

At Cornell University, Dr. Leagans was appointed Professor and Coordinator of Graduate Programs in Education and Continuing Education in the Department of Rural Education, New York State College of Agriculture and was a faculty member in the Cornell Graduate School. He initiated a graduate level program in extension and adult education that became a model for universities across the United States and throughout the world. Aided by a \$500,000 grant from the Ford Foundation in 1955, graduate degree programs were developed in this area of specialization. The establishment of graduate study in extension education not only enhanced domestic cooperative extension programs but also attracted foreign students and donor agencies that supported his work in the international arena.

Professor Leagans was a respected teacher and advisor. His reputation drew numbers of American and foreign students to Cornell to study under his tutelage. Many returned to positions of prestige and responsibility in their home countries and institutions. Paul and his wife often opened their home to these students, providing not only education but also heart-warming American-style hospitality.

Professor Leagans also served as consultant and lecturer at institutions that were developing similar graduate programs in this area of specialization. On special leave from Cornell in 1958-60, Paul served as a Ford Foundation Consultant to the Government of India on Extension Education systems. He returned often to India and consulted in several South American and African countries as well. He also provided leadership in the establishment of graduate programs in extension and international education at U.S.A. Land Grant Universities. Research contracts with agencies such as the Office of Naval Research, U.S. Agency for International Development, and the Ford and Rockefeller Foundations provided valuable stimuli and resources to consolidate further graduate study in this emerging field.

In collaboration with colleagues and graduate students, a number of research papers and Ph.D, Ed.D. and M.S. theses were published. He authored several books and many articles. Notably, he was senior author of *Behavioral Change in Agriculture*, published by Cornell University Press. Throughout his career, Professor Leagans was active in community work, including Rotary, Boy Scouts of America, and YMCA.

In May 1977, the Cornell Board of Trustees awarded Paul the title of Professor of Extension Education Emeritus. After his retirement, the family relocated to Mocksville, North Carolina. Paul continued teaching and consulting at North Carolina State University, where he served as a Visiting Professor (1977-87) in the Department of Adult and Community College Education. To encourage continuing graduate study and research in this field of study, Paul and his wife endowed the Agricultural and Extension Education Fellowship at North Carolina State University.

J. Paul Leagans died at his home in Mocksville, North Carolina. He is survived by his wife of 67 years, Mary Louise Lakey Leagans; and by two sons, John and William. His daughter, Linda, predeceased him.

Harold Cushman, Edwin Oyer, Helen Wardeberg

Fred G. Lechner

September 23, 1915 — November 1, 1983

The retirement of Fred G. Lechner as professor emeritus, on September 1, 1982, concluded twenty-five years of teaching at Cornell and a total teaching career of forty-two years. Prior to his Cornell appointment Fred taught high school vocational agriculture at Holyoke and Brighton, Colorado. During the time he taught vocational agriculture he also served as a supervising teacher-trainer in agricultural education for the State of Colorado and was a member of the Future Farmers of America Advisers Committee.

Fred came to Cornell in September 1957, appointed as a staff member in charge of developing the new agricultural engineering mechanization teaching facilities. These facilities included hands-on laboratories for carpentry, plumbing, electricity, welding, and lathe work. The astute organization of each of these facilities attests to Fred's pedagogical expertise.

Fred was born in Hudson, Colorado. His college education included a B.S. degree in agriculture (1938) and an M.E. in agricultural education (1952) from Colorado A & M (now Colorado State University). His Ph.D. was attained in 1958 from Michigan State University, where he specialized in vocational agriculture. He met and married Frankie D. Hill while teaching vocational agriculture at Holyoke, Colorado.

Fred's educational background together with his teaching experience in vocational agriculture and agricultural engineering mechanization inspired him to develop a close working relationship with New York State vocational agriculture teachers. He provided special summer classes at Cornell so that they could work toward advanced degrees. He also developed pamphlets, study outlines, and visual aids that were used as resource material for high school vocational agriculture teachers.

Cornell students desiring hands-on experience in carpentry and metal work found that opportunity in Professor Lechner's classes. Basic instructions in woodworking, welding, sheet metal, and lathe were available. After becoming proficient in several of the crafts, a student was encouraged to combine them in a project. Many students designed and built various items such as picnic tables, feed carts, and sewing cabinets for their personal use.

Professor Lechner reached an audience much larger than those in the classroom. Active in cooperative extension, he co-authored bulletins and gave radio talks that made his expertise available to many. Examples of the subjects

covered included planning farm shops, tuning gasoline engines, and techniques of welding. Commercial welders and welding sales representatives stayed in touch with Fred to learn of new methods and techniques.

Fred was professionally active in promoting the teaching of high school vocational agriculture and was a member of the American Vocational Agricultural Teachers Association. He was a member of the American Society of Agricultural Engineers (ASAE) for twenty-five years. He used his influence to maintain agricultural engineering mechanization as a credible activity of the ASAE. As an ASAE member he was secretary of the Agricultural Teacher Education Committee for five years and held membership on the ASAE Instruction in Agricultural Mechanization Committee.

If any of Fred's activities could be called a hobby, it would be the development of mechanical devices. An ongoing project was his version of a lawn mower. Each summer, when his lawn was growing profusely, he would still be working on the latest modification of his mower. This tinkering would go on past the middle of July, which did not matter, as the mower could cut grass even though it was knee high. To save face in the neighborhood Frankie acquired her own mower and used it to keep a presentable front lawn. Fred also built his own orchard spray rig.

As part of his activities in the Department of Agricultural Engineering, Fred developed a cart to be used to distribute feed for livestock. Working together with other Cornell staff, he contributed his mechanical know-how toward the development of an automated plant grower. This device rotated shelves containing potted plants through a lighting and watering cycle. The schedule of the shelf movement could be adjusted to the day-length regimen of the plants. An internal watering mechanism provided water for the plants. Fred was awarded two blue ribbons by the American Society of Agricultural Engineers for these developments.

A large part of Fred's life was devoted to altruistic civic activities. One of these activities was the Lion's Club, which he initially joined during his first teaching assignment at Holyoke, Colorado. He continued his Lion's Club membership during his whole life, serving in various capacities as a local or district official. As a member of the Lansing Lion's Club he received a tribute from the Town of Lansing for his efforts in the renovation of the former Grange Hall into the Lansing Community Center. Fred also was secretary of the New York State Eye Bank, an activity supported by the Lion's Club. Other civic activities included being a Boy Scout leader, a member of the Lansing Central School's PTA, and a member of the Lansing Board of Education for one term.

Fred was an ardent supporter of the credit union movement. His credit union experience began in Adams County, Colorado, where he was a member of the board of directors. He served in various official positions of the Cornell Federal Credit Union from 1957 through 1967.

Professor Lechner received a number of awards. His most cherished recognition was the Distinguished Service Award for Civic Activities by the United States Chamber of Commerce. College scholastic honor societies included Alpha Zeta, Alpha Tau Alpha, and Phi Delta Kappa. As a high school teacher he was proud that the Brighton, Colorado, 1954 high school annual was dedicated to him. The Future Farmers of America awarded him the Honorary Colorado State Farmer Degree and the Honorary American Farmer Degree. He won four ASAE blue ribbon awards for excellence in developing plans and publications. The Agricultural Teachers Association of New York gave him a journalism award in 1972 and an honorary life membership in 1974. In addition to being Lansing Lion of the Year for 1969-70, Fred was awarded so many other Lion statuettes that there was no more room for them on the mantle.

Professor Lechner is survived by his wife, Frankie, of Ithaca; four sons and a daughter (all graduates of Cornell); and three grandchildren. John and Robert are involved as Ph.D.'s in cancer research and are located in Washington, D.C. Larry is a construction contractor, and Leland a professional surveyor (both located at Vail, Colorado). Linda is employed in food technology research at Hamlin, New York.

Wesley W. Gunkel, Norman R. Scott, Robert T. Lorenzen

Charles Alexander Lee

August 28, 1922 — June 11, 2001

Charles Alexander Lee was born in Brooklyn, New York, on August 28, 1922. After graduating with the B.E.E. degree in Communications from Rensselaer Polytechnic Institute in June 1943 and spending three years in military service, Charles entered graduate study at Columbia University and obtained his Ph.D. degree in Physics under Nobel Laureate I.I. Rabi in 1953. He remained at Columbia for a year of postdoctoral work on molecular-beam analysis of the rotational and hyperfine structures of potassium chloride, and then joined the technical staff of Bell Laboratories where he collaborated and obtained patents with another Nobel Laureate, William Shockley, the inventor of the transistor. Charles came to Cornell as an Associate Professor of Electrical Engineering in 1967, attained full professorial rank in 1972, and retired as Emeritus Professor in July 1991.

During his 13 years with Bell Labs, Professor Lee made two extraordinary contributions that have shaped the technology we use and study today. At the time of this groundbreaking work, the fields of integrated circuits and optoelectronics were non-existent. His pioneering work helped to initiate both fields and continues to guide developments in these important areas 40 years later.

Specifically, Charles developed and demonstrated the first diffused-based transistor in 1955 by introducing the concept of planar semiconductor processing which was a critical step for the invention of the integrated circuit by Jack Kilby a few years later, for which Kilby was awarded the Nobel Prize in Physics in 2000. In his 1956 paper, "A High Frequency Diffused Base Germanium Transistor," *Bell System Technical Journal*, pp. 23-34, Charles emphasized that the diffusion process gave precise control over the transistor feature size in the vertical direction, and opened the way to development of transistors of unprecedented speed. The 500 MHz cut-off frequency of his germanium device would still be state-of-the-art for a transistor with the 1.5-micron minimum feature size used in his experiments. A particular feature of this diffused-base design was the graded doping of the base. Such a gradient produces an internal electric field in the base that accelerates carriers, thereby enhancing the speed. This design is used today by IBM in its fastest silicon-germanium bipolar transistors.

Charles and his collaborators also carried out pioneering work on avalanche breakdown in semiconductors. Avalanche breakdown is used to make microwave oscillators and photodiodes with built-in amplification via avalanche gain. The silicon avalanche diode remains the detector of choice for photon counting today where low-noise avalanche gain is critical. The results of their 1964 keystone publication, "Ionization Rates for Holes and

Electrons in Silicon,” *Physical Review*, Vol. 134, A761, remain the gold standard against which almost all newer results have been evaluated for 30 years.

The major portion of Charles’ 24-year academic career at Cornell was given principally to teaching junior, senior, and graduate courses in solid-state electronics and semiconductor devices and physics, and to directing the thesis research of his graduate students. His participation in the founding of the National Research and Resource Facility for Submicron Structures (now the Cornell Nanofabrication Facility), in particular in establishing the ion-implantation capability in the early facility, represents one of his prime contributions to the EE School.

In addition to teaching in his areas of specialty, Charles also taught broader undergraduate laboratory courses, served as a class advisor, and was a member of the EE Graduate Committee, the EE Policy Committee, the Engineering College Admissions Advisory Committee, and the Program Committee of the Submicron Facility. From 1976-79, he was a participant in a program to enhance graduate studies at Howard University in Washington, D.C. and at North Carolina A. & T. State University. His research at Cornell was supported extensively by federal and corporate agencies, and he was a frequent consultant to industrial laboratories. He was a Life Senior Member of the Institute of Electrical and Electronic Engineers (IEEE) and a member of the American Physical Society. Charles was elected to the engineering honorary societies Tau Beta Pi, and Eta Kappa Nu, and the scientific research society Sigma Xi, and was a member of the American Association for the Advancement of Science. Following his retirement, he continued to do research and contribute to the literature in his fields of interest.

Charles is remembered for his infinite patience, calm demeanor, and good humor. He was always willing and able to share his knowledge of the latest theories and techniques (as well as the latest chess moves) with his colleagues, both within the school and from other departments, and, of course, with his many graduate and undergraduate students. He mentored younger faculty and prodded graduate students gently. He encouraged his students to question authority, and showed them that scientific research is a game to be enjoyed rather than a life and death struggle to the top. His teaching has helped them to wind up on the right side of most questions, if not always the winning one. Many could say they truly loved him for his friendly presence, wise counsel, technical expertise, and especially for the twinkle in his eye.

Charles and Lillian Rezek were married on May 31, 1953, in New York City, New York. Following 14 years in New Providence, New Jersey, while Charles was with Bell Laboratories, the last 34 years of their 48 years of life together were spent in Ithaca, New York. Charles is survived by his wife, Lillian, of Ithaca, New York; his son,

Kevin, of Gaithersburg, Maryland; and his daughter, Susanne, of Albany, New York. He was predeceased by his elder brother, John Alfred Lee.

Charles will be long remembered as a dedicated and creative scholar, a devoted teacher and advisor, a highly respected colleague, an intellectual companion, and a good friend.

Simpson Linke, Chung L. Tang, G. Conrad Dalman

Frank Andrew Lee

August 14, 1901 — September 25, 1999

Professor Emeritus Frank Lee was born in Seattle, Washington, on August 14, 1901, the only child of Frank and Amelia Staengel Lee. He died on September 25, 1999, at the age of 98, in Waterloo, New York.

He received his B.S. degree in 1923, and M.S. degree in 1926 from the University of Washington, where he also received the Ph.D. degree. For a brief time, he worked as a chemist for the State of Washington, and then he joined Duquesne University as an Assistant Professor of Pharmacology, attaining the rank of Associate Professor. An increasing interest in food chemistry led him to Leland Stanford University as a Research Associate in the Food Research Institute. Prior to his joining Cornell University, he was a chemist at Hunt Brothers Packing Company in San Francisco. In 1936, he was appointed Assistant Professor of Chemistry in the Division of Chemistry at the New York State Agricultural Experiment Station. This division merged with Bacteriology to become the Department of Food Science and Technology, and it was from this department that Frank retired in 1967.

He was a member of the American Chemical Society, and was very active in the Institute of Food Technologists, especially the Western New York Section where he was a founding member, and served as Secretary, Treasurer, Chairman, and Councilor over a period of years. Lee was on the editorial boards of the Institute's two major publications, *Food Technology* and the *Journal of Food Research*. Additionally, he was a member of Phi Lambda Upsilon and Sigma Xi. Professor Lee traveled extensively in Europe, presenting lectures at international symposia on food and biological chemistry.

As Professor of Chemistry, Lee conducted research on the blanching and freezing of fruits and vegetables when that industry was in its infancy. In addition to his work on vitamin retention and changes, he was best known for his studies on the oxidation of lipids in vegetables and in explaining the role of oxidation and changes in the deterioration of frozen fruits and vegetables, particularly peas, snap beans, soybeans and carrots. His work on lipids extended to studies on red meats and poultry. Professor Lee had more than 65 peer-reviewed scientific articles published during his career plus numerous review articles and bulletins. He wrote the textbook, *Basic Food Chemistry*. A second edition was published in 1983.

Throughout his career, he carried out a good deal of laboratory work himself. He had little regard for time of day. New night watchmen were always alerted about the food chemistry professor who would often work in his laboratory at all hours of the night.

He was a hunter and a fisherman. The Adirondacks was his favorite area for hunting, since during his hunting years, there were relatively few deer in the Finger Lakes region. He often got small hunting parties together to try their luck in the mountains. A passion for fishing was satisfied by taking advantage of Geneva's location on Seneca Lake. His hunting was complemented by an interest in conservation, shown by his long-term support of the Sierra Club.

Another of Frank's interests was in cooking, specializing in pastries. He claimed it was the artistic side of food chemistry. One particular pastry that he liked to make was Kaiser Zahne Torte, a very nice Viennese type cake with lots of whipped cream and fruit. He had a good sweet tooth.

A long interest in antiques resulted in a fine collection that eventually made up about half the furnishings of his apartment. He was particularly proud of a Chippendale sofa he had acquired in Pennsylvania. A love of books led to the creation of a private library containing many items relating to ancient Egypt.

Frank made a lot of trips after he retired. The most extensive of those were to Egypt, Iran, China, Russia and Germany. Many people at the Experiment Station were treated to a gourmet dinner made by Frank, followed by slides of his travels.

He was a real bookworm. If he was not in his office or laboratory, the place to look for him was a back table in the library surrounded by books and journals. Aiding him in his insistence on keeping current with the literature was his fluency in reading French and German. Later in his career, he taught himself Russian. Frank would become quite upset when journals were canceled, as during periods of budget cuts, particularly since the first to go were often German or French chemical journals of special interest to workers in food science.

After he retired, he spent a good part of his time in the Experiment Station Library. It became his main contact with his colleagues and friends. It was a place where he felt comfortable, where he could see people without having to make prior arrangements. His regard for the library was reflected in his generous bequest to the Experiment Station Library for the express purpose of bolstering the journal collection. The library has since been named the Frank A. Lee Library.

While Frank Lee was a very private person, he was a familiar, friendly, and well-regarded fixture at the Experiment Station and in Geneva. He has left a legacy of classic good manners and generosity that will keep him in our minds for many years to come.

Don Splittstoesser, Keith Steinkraus, Jerome Van Buren

Lee Charlotte Lee

July 19, 1935 — April 30, 2006

Lee C. Lee, Professor Emerita of Human Development in the College of Human Ecology at Cornell University, died unexpectedly on Sunday, April 30, 2006. She retired in 2004 after a 35-year career at Cornell. Following a two-year stay in San Francisco, Lee had returned to Ithaca and had been putting the finishing touches on her retirement home on the shores of Cayuga Lake at the time of her death.

Lee was born in Suzhou, China and received her early education in Hong Kong. In 1954, then a teacher at the American School in Taipei, Taiwan, Lee came to the United States as a self-supporting undergraduate student at Mount Union College in Ohio. She had few financial resources other than the promise of a four-year scholarship but excelled in her academic work and received a B.A. degree in Psychology and Mathematics in 1957, followed by a Master's degree in Clinical Psychology at Ohio University in 1959. Lee worked as a research psychologist at the Fels Research Institute in Yellow Springs, Ohio prior to completing a Ph.D. degree in Developmental Psychology at Ohio State University in 1968.

That same year, Lee joined the Cornell faculty as an Assistant Professor. It is believed that she was the first woman professor of Asian ancestry appointed at Cornell. Her teaching areas included experimental child psychology, research methods, personality and social development, Asian-American identity, and cross-cultural issues in development. She was a strong proponent of the importance of cultural and ethnic factors shaping the development of young children. Professor Lee was known as a demanding teacher who set high standards of scholarship for her students, while always being available to them as supportive mentor and guide. One of her greatest satisfactions in retirement was to hear from former students expressing their appreciation for what they had learned under her rigorous guidance.

Professor Lee was a pioneer in the development of Asian American studies as a field of inquiry. She had become increasingly concerned about Asian American students' lack of knowledge about their history in the United States, as well as Americans' unfamiliarity with Asian Americans and their culture. This led to her developing such courses as the Psychosocial History of the Chinese in America, History of Asians in America, and Asian American Identity and Personality. In addition, with characteristic initiative, Lee became actively involved as a key leader in the development of the Asian American Studies Program at Cornell, and served as its founding Director from 1987-92. This was recognized as the first such program among East Coast universities, and it served as a model for

similar programs launched by other universities. From 1986-90, Lee organized a series of Cornell Symposia dealing with issues of Asian American higher education, films, and identity formation, bringing together colleagues from various universities having common interests in this area of scholarship. Another of Lee's contributions to this field of inquiry was her editing the first *Handbook of Asian American Psychology* (with Nolan Zane, 1997), which has been described as a landmark publication in its field. She was a frequently invited university and conference speaker on issues of multicultural education and aspects of Asian American scholarship.

Lee had broad academic interests and maintained collegial associations with faculty from a variety of units across the University, including the East Asia Program, Asian Studies, Psychology, and the Johnson Museum of Art. She served on many college and university boards and committees during her long tenure at Cornell.

In the early 1980s, when the doors re-opened allowing behavioral scholarship in the People's Republic of China following the Cultural Revolution, Professor Lee obtained a research fellowship from the National Academy of Sciences to study the development of prosocial behavior in children in Beijing and Shanghai. Lee was one of the first American psychologists to do research in China in this new era, also collaborating with Chinese colleagues from Tongji Medical University in Wuhan, in a seven-site study of the socialization of Chinese children. Several significant publications emerged from this research, including *Political Socialization and Parental Values in the People's Republic of China* (1991, with G.Q. Zhan), and *Day Care in the People's Republic of China* (1992).

From 1992-94, Lee returned to Hong Kong as a Fulbright scholar and became the founding director of the Hong Kong-American Center, based at the Chinese University of Hong Kong. The Center's goal was promoting the understanding of American society and culture in the Hong Kong community, as well as the understanding of Hong Kong in the United States. This university still benefits today from the fruits of the Center, as do the many scholars who have served on its faculty.

Among Lee's many honors was an appointment as a Fellow at the Center for Advanced Study in the Behavioral Sciences at Stanford University (1982-83), and election as president of the Society for the Study of Ethnic Minorities, in the American Psychology Association (1991). Since 2004, Lee served as a Board Member of the Asian Pacific American Legal Center in southern California, providing legal services, education and civil rights support for the Asian Pacific American community. She was an active member of both the American Psychological Association and the Society for Research in Child Development. In the latter group, as a member of the Committee on Racial and Ethnic Issues, Lee played a key role in guiding the work of this committee in its formative years, so that its recommendations led to significant changes enacted by the Society's Governing Council. She was a pioneer

in bringing together in constructive ways priorities regarding issues of ethnic diversity and child development scholarship.

Lee was also an accomplished photographer, with particular interests in candid and informal portraits of children and adults in a variety of settings. She documented the lives of ordinary people in China during a 7000-mile trip in 1982, and she portrayed similar scenes in New York City as well. Exhibitions of her work have been held at the Everson Museum in Syracuse, the Hartell Gallery at Cornell, as well as Stanford, Elmira, and the Asian Arts Institute in New York City.

Professor Lee served in a faculty-in-residence role at Cornell's International Living Center, and for a good many years she was a faculty fellow affiliated with student residential units at Cornell. Beyond purely academic matters, Lee took a strong personal interest in the well being of students, and she was known for her empathy in recognizing and helping those in need of particular assistance and support.

Lee often expressed her gratitude for the kindness of the many people who helped her throughout her years as a student, and during her academic career. She used her personal and financial resources to support many causes dear to her heart, e.g., donations of Asian art to the Herbert F. Johnson Museum of Art, support of the Museum's educational programming for school children, and an endowment for Gannett Health Services intended to help students meet emergency health care costs. Having served on the Board of University Health Services, Lee had become acutely aware of the need for safety nets to help students meet unexpected medical expenses. To help meet this need, in 2004 she created *Professor Lee Lee's Fund in Gratitude for the Joy of Students*. In setting up this fund, Lee indicated that she wanted to "roll back" to students some of the comfort and happiness teaching brought to her over the years. Regarding her commitment to helping those in need, Lee was quoted as saying, "All my life, a lot of strangers have been good to me. This is like payback."

Lee will be remembered for her energy and enthusiasm, which inspired successions of Cornell students to excel beyond their self-expectations. Her colleagues and friends will also remember her as a forceful and caring advocate for causes of fairness and equity, student well being, and children's welfare.

Professor Lee is survived by her brother, Harry King, who came from Taiwan to attend her memorial service at Cornell, and by several half-sisters, including Susie Chow of Foster City, California, and Carmen Chang of Palo Alto, California.

Steven J. Ceci, John Doris, Henry N. Ricciuti

Myron A. Lee

March 21, 1887 — May 8, 1938

Professor Myron A. Lee died on May 8, 1938, after a brief illness. His untimely death removes one of the pioneer minds that have led the progress of the College of Engineering in recent years.

He was born in Auburn, New York, on March 21, 1887, and attended the public schools in that city. He graduated from Cornell University in 1909 with the degree of mechanical engineer. After employment by the Western Electric Company at Hawthorne, Illinois, he returned to Cornell in 1910 as an instructor in Machine Design. He received the degree of master of mechanical engineering in 1913. In 1916 he was promoted to an assistant professorship in Machine Design. The new course in Industrial Engineering was then being developed and Professor Lee was transferred to that work in 1921. In 1924 he was advanced to a professorship in Industrial Engineering and was soon made head of the department, and he held that position until his death.

During the summer vacations and sabbatic leaves of absence Professor Lee spent much time in practical work with the McIntosh Seymour Company of Auburn, the General Electric Company, the Thomas-Morse Aircraft Corporation of Ithaca, and the Gleason Works at Rochester. For some time he was in charge of standardization work at the International Business Machine Corporation in Endicott. He was therefore well informed as to both the theory and the practice of his profession and because of this wide knowledge he was an unusually excellent teacher.

He was a man of kindly and helpful disposition and his ready smile will be greatly missed. Always willing to give unsparingly of his time and effort, he combined sound technical instruction with a common-sense practical philosophy which gave the student that extra incentive which only a real teacher can impart. He will be remembered with affection by a large number of alumni. He will be missed equally by his colleagues, who always held him in high regard.

His publications include three books published by the International Correspondence Schools and used widely as textbooks, namely, *Motion and Time Study*, *Motion Economy*, and *Wage Payments*, and many articles contributed to the technical and business magazines. He was a member of the Society for the Promotion of Engineering Education and of the honorary societies of Sigma Xi, Tau Beta Pi, and Atmos. He was also a past master of Hobasco Lodge, Free and Accepted Masons, a director of the Young Men's Christian Association, and a member of St. John's Episcopal Church.

Louis Leibovitz

May 29, 1921 — August 22, 1998

Professor Louis Leibovitz, 77, died Saturday, August 22, 1998, in Falmouth, Massachusetts.

He was born on May 29, 1921, in Philadelphia, Pennsylvania, where he lived until he finished high school. He attended Pennsylvania State University from 1939-42 and then spent the next four years in the U.S. Army. From 1946-50, he was a student in the Veterinary College at the University of Pennsylvania and received his V.M.D. degree in 1950. He was a Doctoral candidate at Rutgers University but withdrew prior to receiving the Ph.D. degree due to the death of his major professor, Frederick Beaudette.

In 1963, after several years in private practice, and ten years as a Professor of Poultry Pathology and Director of the Poultry Diagnostic Laboratory at the Delaware Valley College in Doylestown, Pennsylvania, Lou began an association with Cornell University that placed him in three different locations. The first years were spent in Eastport, L.I., where he was a Field Veterinarian at the Cornell University Duck Research Laboratory. During his stay in that laboratory, Dr. Leibovitz made many contributions to avian parasitology and various diseases of ducks. His foremost contribution in this area was the first diagnosis of duck plague (duck virus enteritis) in North America coupled with extensive studies on the biology of this disease in domestic and wild waterfowl. He also described a new coccidial species in ducks.

In 1973, he was appointed Associate Professor in the College of Veterinary Medicine and moved his family to Ithaca. He was promoted to Professor in 1982. His major activity during his stay in Ithaca was the development and implementation of a comprehensive program of teaching, research and service in the area of aquatic animal medicine. Lou established a fish diagnostic laboratory and quietly carved a niche for his work and a clientele for his services, which were supported by the New York State Sea Grant Institute. The multimillion-dollar shellfish industry was having serious problems with disease and welcomed his help with clam and oyster propagation. He guided the graduate studies of several students who went on to serve the fish and shellfish industries. The tropical fish industry also used his services.

In 1981, after eight years in Ithaca, he undertook a “temporary” assignment in Woods Hole, Massachusetts. It came about as a result of a cooperative program between Cornell University and the University of Pennsylvania with support from the National Institutes of Health and the agreement of Professor Calnek who “loaned” Dr. Leibovitz to the program for one year to get it started. The intent was to establish an aquatic animal diagnostic

laboratory that could monitor the health of marine animals used by scientists conducting research at the Marine Biology Laboratory. Another goal was to develop disease-free and genetically defined stocks of marine animals for research purposes. This entirely new initiative was so successful that it was considered important for him to remain there and he thus continued his career as Director of the Marine Animal Health Laboratory until his retirement in 1989. During this period, he remained a member of the Cornell faculty.

Dr. Leibovitz took a sabbatic leave in France during the 1980-81 academic year, while serving as a Research Consultant to the French Government Shellfishing Agency. During the same year, he served as a Consultant to the U.S. Fish and Wildlife Service. In 1985, he was honored by receiving the 1985 Centennial Award of the School of Veterinary Medicine at the University of Pennsylvania, and the 1985 Special Achievement Award from the Alumni Association of the same institution. He was an editorial board member for three scientific journals and belonged to seven professional associations. Over his career, he published nearly fifty scientific papers.

Lou was a scientist with insatiable curiosity and contagious enthusiasm for whatever he undertook. As problems presented themselves, he often opened totally new areas of research. He even became interested in starfish diseases, much to the dismay of the scallop and clam hatcheries that saw little need for studying the diseases of a major predator. In a community as diverse and knowledgeable as Woods Hole, many national and international disease problems were presented for solution. Some of these were: shell deformity in hard clams; a new disease of captive squid; a new disease of Pacific oysters; diseases of the horseshoe crab; and diseases of elasmobranchs. The best tribute to the success of his program is the fact that upon his retirement, it was deemed essential by both the Marine Biology Laboratory and the National Institutes of Health, who funded his work, that the project be continued.

Each year in May, when veterinary students arrived for the summer Aquavet Program, Lou would beam with excitement anticipating his interaction with them in the laboratory and classroom. His classes were infused with puzzling real problems requiring real solutions. Lou gave freely of his time while managing an increasing diagnostic load in a busy laboratory. His greeting of visitors was genuine and his enthusiasm for the work at the lab continued until the day he retired.

Work was all consuming for him, but he still found time for some woodcarving. He had considerable artistic talent and he used it effectively in preparing his own drawings of parasites and other objects for his publications.

When he retired on December 31, 1988, he was promoted to Professor Emeritus of Aquatic Animal Medicine in recognition of his many and varied accomplishments and contributions to the mission of Cornell University.

Lou was married to his loving wife, Anne, for 46 years. She predeceased him by less than three weeks. They are survived by two sons: Daniel Leibovitz, of Hilliard, Ohio, and Henry Leibovitz, of North Kingston, Rhode Island. Both Lou and Anne always became part of the community in which they lived and Woods Hole was no exception. Visitors to their home were always welcome and they enjoyed hearing about the success of others.

Howard E. Evans, Julius Fabricant, Bruce W. Calnek

Rowland Willis Leiby

September 29, 1892 — July 12, 1977

Rowland Leiby was born in Allentown, Pennsylvania. He attended Muhlenberg College in the same state and received his Bachelor of Science degree in 1912. Between 1912 and 1921 he worked as an assistant entomologist for the North Carolina Department of Agriculture and as a graduate assistant at Cornell. He received his Doctor of Philosophy degree from Cornell in 1921.

Rowland Leiby's interest was in the control of insect pests and he published two substantial papers on insect biology and control in 1919 and 1920. However, his doctoral thesis was a basic study of polyembryony in insects, a little-understood entomological phenomenon. His thesis, still considered a classic in its field, was published in the *Journal of Morphology* in 1922. In 1924 he produced another extensive paper on the subject and in 1928 he reported to the International Congress of Entomology at Ithaca on polyembryony.

In the meantime he returned to North Carolina to work in the field of applied entomology and in 1925 was appointed state entomologist of North Carolina. In 1937 Leiby came to Cornell as an assistant professor in the Department of Entomology, with extension responsibility in the field of insect control on vegetables. He was made an associate professor in 1944 and professor in 1949. He retired in September 1954 to his native state of Pennsylvania.

Rowland Leiby had a lively sense of humor and a friendly personality. He was well liked by his coworkers and appreciated by the vegetable growers of New York to whose interests he was devoted for many years.

LaVerne L. Pechuman

Edgar R. Lemon

August 22, 1921 – March 30, 2009

Dr. Edgar R. Lemon, 87, passed away on March 30, 2009. Born in Buffalo, New York, he was the son of Dr. A. Bert and Greta Lemon, and had one brother, Jim. Voted “Most Likely to Succeed” by his high school, he brightened many a life with the eternal twinkle in his eye. He earned his Bachelor’s and Master’s degrees at Cornell University, and his Ph.D. degree at Michigan State University.

Dr. Lemon became a world-renowned scientist in the field of Agronomy. His profession was as a Cornell research professor, and he liked to introduce himself as an Environmental Physicist. In retirement, he created a Constructed Wetlands experiment in Niagara-on-the-Lake that expanded into raising the environmental consciousness of the community.

He married Donna Deline, of Port Colborne, Ontario, in 1944. They had three sons, Wilfred, Bruce, and Bob; and three grandchildren, Strawberry, Aubrie, and Loris. Edgar and Donna had celebrated their 64th anniversary in July 2008.

“Dad/Grandpa taught us all the Lemon values of integrity, love of the earth and sailing.”

Office of the Dean of Faculty

Eric H. Lenneberg

September 19, 1921 — May 31, 1975

Eric Lenneberg was born in Düsseldorf, Germany, where he attended school until he moved with his parents to Brazil in 1933. In 1945 he came to the United States. He graduated with a B.A. degree from the University of Chicago in 1949 and remained there to study linguistics. He received his Ph.D. from Harvard in psychology and linguistics in 1956, going on to study neuroscience at the Harvard Medical School as a Russell Sage Fellow. For a number of years he taught at Harvard and did research at the Children's Hospital Medical Center in Boston. During much of this time he held a USPHS Career Development Award in Mental Health. He was visiting professor of psychology at the University of Zurich in 1964-65. In 1967 he moved to the University of Michigan as professor of psychology and fellow in the Center for Human Growth and Development. In 1968 he was called to Cornell as professor of psychology, with an appointment in neurobiology and behavior as well. His two undergraduate courses were extremely popular and well rated. His rigorously high standards combined with his enthusiasm for his subject and his regard for his students created a special kind of loyalty in them. In recent years Lenneberg divided his time between Ithaca and White Plains, where he worked with several of his graduate students on clinical research in neuropsychology at the Westchester Division of The New York Hospital-Cornell Medical Center.

During his time at the Children's Hospital in Boston, Lenneberg became known for locating children with extraordinary language disabilities or living in unusual circumstances so as to provide strategic points of inquiry for theoretical questions of language development. These cases led to important papers on the developmental course of babbling in a deaf child born to deaf parents and a paper on an older child who (for anatomical reasons) could not speak at all but who could manifest understanding of complex instructions. Lenneberg was the first to propose that the human capacity for language can only be explained on the basis of biological properties of the human brain and vocal tract. His interest and expertise in both language and psychobiology were combined in his book, *Biological Foundations of Language*, published in 1967 and now a classic. He went on to explore the evidence that language capacity is a specialized form of a more general cognitive capacity rather than a development of either animal vocalization or nonvocal communication.

Eric Lenneberg was well known in many countries for his work on the biological aspects of language. He was a visiting professor at the Universidade Federal de Pernambuco, Recife, Brazil; an invited lecturer at the Academia Nacional de Neurologia do Brasil (of which he was an honorary member); organizer and chairman of a symposium

on “Language as Behavior” at the Max Planck Institute, Tübingen, Germany; participant and voted a permanent member of the International Symposium on Neuro-psychology; participant in a conference on mental retardation held by the Medical Research Council, London; and a consultant to UNESCO. With his wife, Elizabeth, he edited a book for UNESCO, *Foundations of Language Development: A Multidisciplinary Approach*.

Lenneberg was a member of Phi Beta Kappa, Sigma Xi, the Linguistic Society of America, the American Psychological Association, the Society for Research in Child Development, and the American Association for the Advancement of Science. He had held fellowships from the American Council of Learned Societies, the Social Research Council, the Russell Sage Foundation, the Guggenheim Foundation, and Wenner Gren. He lectured and presented colloquia at all the major universities in this country, as well as many European ones, and served on the editorial boards of several journals. His research was published in numerous journals, ranging from psychological journals, *Daedalus*, and *Science to Language*, the *American Annals of the Deaf*, and neurological journals.

Eric Lenneberg’s work established new directions for the study of language and provided an inspiration for his devoted students. His death is a severe loss to the broad community of scholars seeking to unravel the neural and developmental basis of language, as well as to his colleagues and students in the University. He is survived by his wife, Elizabeth; two children, Miriam and Roger; and a brother, Helmut.

Ulric Neisser, Daniel Tapper, Eleanor J. Gibson

Ellis Pierson Leonard

April 6, 1904 — February 7, 1991

Dr. Ellis Pierson Leonard's long distinguished career will forever leave deep impressions in the Veterinary College and throughout the veterinary profession. His early years began in Pleasant Plains, New Jersey. After obtaining a Bachelor of Science degree from Rutgers University in 1924, he entered Cornell University and completed a Doctor of Veterinary Medicine degree in 1934. Following graduation, he joined the Small Animal Clinic staff at Kansas State University for two years. He then entered private practice in Summit, New Jersey, with Dr. Joseph B. Engle and served until 1948 when Dean William A. Hagan of Cornell University recruited him as department chairman and director of the Veterinary Medical Teaching Hospital's Small Animal Clinic. He held this position until his retirement on July 1, 1969 when he was elected Professor Emeritus of Small Animal Surgery.

As director of the Small Animal Clinic, Dr. Leonard made extensive recommendations for the new construction of college facilities, including countless innovations in design which were later adopted by veterinary hospitals throughout the world. These included glass cages, heated outdoor runs, special drains, sterile surgical suites, as well as one of the first intensive care units for the critical care of animals. Visitors entering the small animal hospital were always impressed with the scrupulous cleanliness of the clinic and the meticulous care of patients his high standards required.

Dr. Leonard is credited with introducing and promoting aseptic surgical techniques to veterinary medicine. He was a pioneer in the surgical treatment of intervertebral disc diseases as well as a designer of orthopedic carts for patient rehabilitation. He developed innovative techniques for the internal fixation of fractures, especially repairs of the elbow, knee, and jaw. He pioneered the development of canine hip prostheses. He was also a superb soft tissue surgeon noted for his cardiac and intestinal surgery. Dr. Leonard was among the first to use oxygen for the management of animal patients under anesthesia. In 1955, he arranged for the first color television demonstration of surgical techniques at a veterinary college conference.

As author of two surgical textbooks, *Fundamentals of Small Animal Surgery* which was translated into five languages, and *Orthopedic Surgery of the Dog and Cat*, he influenced his whole profession. He was also a contributor to the first edition of *Canine Medicine and Artificial Insemination of Farm Animals*. Canine obstetrics was also a special interest, and in cooperation with A.E. Harrop of London, England, he conducted the first successful transatlantic artificial insemination in a dog.

Dr. Leonard remained professionally active in his retirement. He authored two historical books on the College of Veterinary Medicine at Cornell University, *A Cornell Heritage 1868-1908*, published in 1979, and *In the James Law Tradition 1908-1948*, published in 1982. In more recent years, he completed a history of the New York State Veterinary Medical Society entitled, *A Veterinary Centennial in New York State*.

Dr. Leonard received many professional honors. During his student days, he was awarded the Jane Miller Prize in Physiology in 1932, and the Ann Besse Prize in Medicine in 1934. He was cited in *Who's Who in America*. He received the American Animal Hospital Association Mark Morris Award in 1953. In 1986, he was given the prestigious Daniel E. Salmon Award by the Alumni Association of the College of Veterinary Medicine at Cornell University. He was a member of the American Veterinary Medical Association with Gold Star Status, American Animal Hospital Association, and a New York State Veterinary Medical Society Distinguished member. He served as secretary/treasurer and president of the Southern Tier Veterinary Medical Association, and as secretary/treasurer of the Alumni Association of the New York State College of Veterinary Medicine.

Professionally, he took great pride in being a founding Diplomate of the American College of Veterinary Surgeons. He loved life, family, veterinary medicine, and Cornell.

In leisure time at home, he made use of his fine motor skills, and his artistic talents allowed him to make elegant miniature furniture for a special doll house prepared for his granddaughter. Months before the holiday season, he began work on wooden children's puzzles which he designed, made, and carefully painted with nontoxic paint.

During his twenty-one years as a professor emeritus, Dr. Leonard appeared weekly at the college in the morning, always dressed in a three-piece suit. He enjoyed sharing memories of past events as he made his rounds. In his suit coat pocket was a seemingly endless supply of hard candy known as "silver mints" which he presented to all he met. His devotion and commitment to Mrs. Leonard was particularly special.

During his life, "E.P." enjoyed other vastly different experiences from moving houses with a team of horses to working in a bank. Listening to Dr. Leonard's experiences was always intriguing and made one wonder how any one person could have such a diversity of talents. He gave a great deal during his life during which he had a positive influence on the lives of hundreds of young men and women. His legacy of honesty, fairness, and the work ethic is treasured by many. Indeed, he was a Cornellian of outstanding professional and personal attributes who will long be remembered fondly by his colleagues and by the students who benefitted wonderfully from his guidance and skills.

Dr. Leonard is survived by his wife, Alice Adele; and son, Jay Leeson.

Robert W. Kirk, George C. Poppensiek, Ronald C. Riis

Samuel Leeson Leonard

November 26, 1905 — November 11, 2007

Samuel Leeson Leonard, zoologist, passed away on November 11, 2007 at the age of 101. His research had a major impact on our understanding of reproductive endocrinology and contributed to the development of in vitro fertilization and hormonally based contraception. Dr. Leonard was born in Elizabeth, New Jersey and graduated from Rutgers University. He earned his doctorate in Zoology from the University of Wisconsin in 1931. He joined the Cornell Faculty in 1941 as an Associate Professor after teaching at Union College and Rutgers. In 1949, he was promoted to full Professor and retired in the 1970s. After his retirement, he was a regular visitor to campus as an Emeritus faculty member.

As a doctoral student at the University of Wisconsin, Dr. Leonard made the pioneering discovery that the pituitary gland produces two distinct hormones rather than a single hormone as had been previously thought. The new hormones were named follicle stimulating hormone (FSH), and luteinizing hormone (LH). These hormones function to stimulate ovaries and testes to produce sex hormones such as estrogen, progesterone, and testosterone, and thus are important for fertility. Dr. Leonard's discovery ultimately led to the use of FSH and/or LH to increase egg production in cattle, and later as an important element of infertility treatments in people.

In the 1930s, Dr. Leonard carried out a series of experiments to investigate the function of estrogen in rats and rabbits, discovering that applications of estrogen could prevent ovulation. This early finding laid the groundwork for use of hormone treatments as effective contraceptives.

Dr. Leonard's work also provided important insight into the role of hormones in behavior. In 1939, he showed that although female canaries normally do not sing, they could be induced to sing if treated with the male sex hormone, testosterone, while they matured. This discovery highlighted the direct role that hormones could have in promoting secondary sexual characteristics.

Dr. Leonard took to heart the teaching and mentoring of graduate students and of the ~9000 undergraduates to whom he lectured in zoology. Throughout his long life, he remained in contact with his former mentees, staying current with their work and taking great pride in their accomplishments.

Dr. Leonard was predeceased by his wife, Olive, and by their son David Leonard. He is survived by his daughter, Patricia Hoard, by four grandchildren, and by one great-grandchild.

Kenneth Kempfues, Chairperson; Ross MacIntyre, Mariana Wolfner

Harry Levin

March 3, 1925 — May 30, 1993

After taking only two and one-half years to earn a Ph.D. degree in psychology at the University of Michigan, Harry Levin became immediately involved in a landmark research project. In collaboration with Robert Sears and Eleanor Maccoby, he co-authored what is perhaps the best known single book in developmental psychology: *Patterns of Child Rearing*, a book that debunked both popular and scientific myths about the effects of different patterns of child rearing. This book is also remarkable for its graceful and thoughtful treatment of the relations between Freudian theory and classical learning theory.

Harry moved to Cornell in 1955. He became quickly involved in activities across several departments, eventually settling into the Department of Psychology, where he was the first William R. Kenan Jr. Professor of Psychology. He developed and directed Project Literacy, a large scale project that led to a revolution of psychological and educational views of the nature of reading. One of the outcomes of this work was a marvelous collaboration with Eleanor Gibson that led to their highly influential book, *The Psychology of Reading*. This book had a major impact not only on academic researchers but also on parents and elementary school teachers and it still stands as the single most influential work on the subject. A related line of work culminated in Harry's book on the eye-voice span, that seemingly innocuous difference between what you are currently reading out loud and what you have visually encoded. Harry demonstrated that this span was deeply involved in understanding both the nature of all reading and in understanding many of the difficulties confronting slow readers.

Harry's later work focused on the social psychology of language. A highly creative and fascinating series of studies ensued showing how individuals adjust their style of speech in different social contexts, whether they be those of the lecture hall, the doctor's office, or the day care center. He uncovered an extraordinary range of ways in which these differences are manifested in speech, ranging from changes in syntactic structure to shifts towards an increased use of the latinate lexicon in more formal settings. He helped all of us see for the first time the dynamic and complex systems of subtle codes that are used in language in real social situations, codes that can have profound impacts on how we understand what others really mean.

Harry's research achievements only touch upon his extraordinary contributions to Cornell. As chair of the Department of Psychology he attracted and retained some of the most eminent faculty in that department's history, including several members of the National Academy of Sciences and one of the very few psychologists

to ever receive the National Science Medal. He successfully challenged the university's nepotism rule when he saw it working against the career developments of women doing research at Cornell. He instilled a new vigor and enthusiasm in the department that continues to grow and expand almost twenty years after his chairmanship.

As dean of the college, Harry drew heavily on his ability to embrace and take a genuine interest in all forms of understanding and scholarly achievement. He advocated unfailingly the centrality of the liberal arts and sciences to intellectual and creative life and to the university itself. He helped departments develop extraordinary faculties and worked hard to obtain resources to support an outstanding faculty and outstanding curricula. He also cared deeply about undergraduate education. While he knew that strong teaching and advising were products of inquisitive, intelligent, caring minds rather than clever schemes, he also knew that undergraduate education needs direct attention. He appointed a series of faculty committees to study and recommend to the faculty ways to improve general education, advising, and the quality of instruction. The Undergraduate Research Program, the College Scholar Program as it is now, and a firm commitment to T.A. training are all legacies of Harry's deanship.

Harry took great pride in his students. Indeed his students glowed with pleasure when they were around him as they gained enormous passion from his pride and nurturance. Harry was the sort of teacher who wanted to give his students a lifelong gift of learning and how to think, and he did so on countless occasions. They would respond with a passion and enthusiasm that we all dream of kindling in our own students. He was always trying to find ways to support students and help them succeed and they clearly understood and appreciated such an interest.

Harry's life was characterized by a deep joy of discovery, a great pleasure and enthusiasm in sharing his work with others, and profound integrity. For those reasons he was the ideal colleague. Dropping by Harry's office was invariably an opportunity to learn something new. He would almost always have a new book or article that he wanted to share and would have a special perspective he wanted to explore with any visitor. Harry was also always good in a crisis, when a tough decision needed to be made, or when action needed to be taken quickly. Whether that crisis was at a personal or college level, it was immensely reassuring to know that Harry was there to make sure it was resolved.

One cannot write or remember Harry without remembering his full enjoyment of the good things of life: music, science, language and languages, literature, art, food, and conversation. But most all, one remembers his interest in people—in their backgrounds, their perceptions and orderings of the world, and in their personal lives.

Much of Harry's own great dignity rose from his clear conviction that everyone else had great dignity as well and deserved to be treated as such.

Together with his wife of 47 years, Debby, Harry has made an enormous difference to all members of his department, the university as a whole and the broader community. Their three children, David, Lynn, and Rebecca, are glowing examples of their ability to create passion and values in others; and the process continues in their wonderful grandchildren.

Lynne Abel, Bruce Halpern, Frank Keil

Leon I. Levine

July 5, 1897 — April 18, 1961

Dr. Leon I. Levine, long associated with The New York Hospital and Cornell University Medical College, died on April 18, 1961. His death was sudden, but for many years he had been disabled by symptoms of coronary insufficiency, which prevented full participation in the teaching, and clinical activities he loved and did so well.

Dr. Levine was born on July 5, 1897, near Kiev, Russia, and emigrated with his family to the United States in 1902. He attended Townsend Harris High School and the College of the City of New York, from which he graduated in 1918. He attended Cornell University Medical College, graduating in 1922 with special distinction as winner of the Polk Prize for special research during his senior year. He served a two-year rotating internship on the Second Cornell Division of Bellevue Hospital from 1922 to 1924. Following this he served a residency in pediatrics at St. Mary's Hospital for children and undertook active practice of medicine in New York City in 1925.

During his thirty-six years of active private practice in New York City, Dr. Levine maintained a loyal and effective contact with his alma mater, Cornell, and the New York Hospital. Most of his teaching centered in the instruction of undergraduate medical students and house staff on the wards of the Cornell Medical Division at Bellevue Hospital, which he knew so well. For five years, from 1925 to 1930, he was actively involved in the clinical and student teaching activities in the Cornell Pay Clinic. He was attending physician on the Second Cornell Medical Division and assistant attending physician at the New York Hospital until his semiretirement. As Assistant Professor of Clinical Medicine at Cornell University Medical College, he was responsible for instruction of many groups of second-year medical students in physical diagnosis, both at the New York Hospital and Bellevue Hospital. Perhaps his most influential teaching was accomplished as tutor for third-year students in the Department of Medicine at Cornell. Here he was able to inculcate into large numbers of students a most detailed approach to accurate history taking and complete examination of the patient. His requirements were always strict and exhaustive. Nevertheless, his students many years later expressed their appreciation for his disciplined approach. At the time of initiation of formal postgraduate instruction on the Cornell Medical Division of Bellevue Hospital in 1946, Dr. Levine was one of the important participants and continued in this program for nearly five years.

Dr. Levine was a member of the New York County Medical Society, the American Medical Association, the New York Heart Association, the New York Academy of Medicine, and the New York Academy of Sciences.

In 1941 Dr. Levine married Dr. Anna Kaslow, a graduate of the New York University College of Medicine, class of 1925, and was in practice with her until the time of his death. They had no children. Dr. Levine's life centered in medicine, his home, and his former students. He maintained an intimate knowledge of all of his former students and took great pride in their accomplishments. His major medical hobby was the collection of a personal reference library, containing approximately 80,000 individual articles filed in such a way that they were readily available for his immediate reference.

Dr. Levine was a devoted clinician and teacher and a personable colleague. His death is recorded with deep regret.

E. Hugh Luckey, M.D.

P. Philip Levine

August 25, 1907 — September 27, 1979

After a prolonged illness, Dr. P. Philip Levine died on September 27, 1979, at the age of seventy-two.

Dr. Levine was born on August 25, 1907, in New York City. He received the Bachelor of Science degree from the City College of New York in 1927 and then entered the New York State Veterinary College. His education was interrupted while he taught school in New York City (1930-31). He received both a Master of Science and a Doctor of Veterinary Medicine in 1932. After spending two years with the New York State Conservation Department, he returned to Cornell as an instructor in avian diseases. His Doctor of Philosophy degree was obtained under the direction of William A. Hagan in 1937. He rose through the ranks from instructor in 1934 to professor in 1944. In 1961 he was named head of the newly created Department of Avian Diseases, a post he held for five years. He was appointed professor emeritus upon retirement in 1973.

Dr. Levine's research in the field of avian diseases resulted in vastly improved methods of poultry production. His investigations were responsible for the control of coccidiosis, chronic respiratory disease, and duck virus hepatitis. His work on mycoplasmal and viral diseases is well known to poultry pathologists throughout the world.

Dr. Levine's talents were not limited to research. He was also an outstanding teacher, administrator, editor, and public servant. As a teacher he had few peers either in the classroom or as a supervisor of graduate students. As an administrator his efforts led to the formation of the Department of Avian Diseases, with highly successful programs in teaching, diagnosis, extension, and research. Through his leadership, a duck research laboratory on Long Island and a series of regional poultry diagnostic laboratories were developed.

In addition to these services to Cornell University, another important part of his scientific contributions was made as an editor. He served a long period as editor of the *Cornell Veterinarian* and on the editorial board of the other journals. This preparation stood him in good stead for one of the major contributions, his founding of the journal *Avian Diseases* in 1957. Not only was he editor, but he also arranged for the financing, printing, and organizing of all of the managerial tasks associated with starting a new journal.

During his later years, Dr. Levine's career assumed an international flavor. He took on projects for the Rockefeller Foundation in Mexico, for the United States Agency for International Development program in Israel and for

the United Nations Food and Agriculture Organization in Peru, Israel, and Mexico. In all of these areas he made significant contributions and many friends.

Dr. Levine's sphere of influence was broad. He was a member and active participant in numerous professional organizations. These services were recognized by his election as president of the American Association of Avian Pathologists, as president of the World Veterinary Poultry Association, and by the Special Service Award of the American Association of Avian Pathologists. He was also the recipient of many other awards and prizes, among them the honorary degree of Doctor of Veterinary Medicine from the Ludwig Maximilian University of Munich.

Dr. Levine was truly a gentleman and a scholar. His high standards and performance in his profession made him universally respected among his colleagues. His warm personality, his ever-present good humor, and his sincere interest and devotion to other people made him a warmly loved person with a multitude of friends all over the world.

Julius Fabricant, Ellis P. Leonard, Bruce W. Calnek

Charles S. Levy

August 15, 1931 — November 5, 1998

Charles S. Levy died unexpectedly at the Cayuga Medical Center in Ithaca on November 5, 1998, following heart surgery. He was born on August 15, 1931, in New York City.

Charles was Valedictorian of his class at Hamilton College, from which he received the A.B. degree with high honors in English and Classics in 1953. As an undergraduate, he excelled in mathematics as well as the humanities, and following scientific study at M.I.T., served as meteorologist in the U.S. Air Force. He studied at Oxford University as a Fulbright Fellow from 1957-59 and then at Cornell, where he earned the Ph.D. degree in English in 1962. He was Assistant Professor of English at the University of Minnesota from 1962-67, when he returned to Cornell as Associate Professor. He became Professor of English in 1975. Having been inducted into Phi Beta Kappa in 1952, he later served as member and chair of that organization's selection committee. He also held a fellowship from the American Council of Learned Societies. He was a member of the Modern Language Association, the American Philological Association, and the Renaissance Society of America. An active member of the American Association of University Professors throughout his career, he served a term as chairman of its Cornell chapter.

Professor Levy was recognized as a leading authority on the life and times of Sir Philip Sidney, Elizabethan England's premier courtier and man of letters, whose correspondence he was editing for the Oxford University Press at the time of his death. The project involved the transcription, translation, and annotation of hundreds of printed and manuscript letters, both from and to Sidney, scattered in dozens of repositories in Europe and North America. Few scholars of our time possessed the prodigious philological learning required for such a vast and complex undertaking. The Oxford University Press has agreed to sustain the project under the direction of Professor Victor Skretkowicz, former Fellow of Cornell's Society for the Humanities, who has been granted custody of Professor Levy's papers by his widow.

Professor Levy was among the most dedicated members of Cornell's College of Arts and Sciences and Department of English, serving on numerous committees over the years, where his sure command of parliamentary procedure was frequently put to good use, and as Director of Graduate Studies in English from 1968-71. From 1968-70, he participated in the Hampton-Cornell Cooperative teaching program.

At Cornell, he taught Shakespeare and other major literary figures of the English Renaissance to students at all levels, from freshmen to Ph.D. candidates, as well as advanced courses in the English sonnet tradition and in expository

writing. He was known as a demanding but highly organized, scrupulously fair, and utterly conscientious teacher. While he never courted popularity, he inspired strong loyalty from more discerning students. As Brandon Bigelow ('94) put it in his letter to the editor of *The Cornell Daily Sun*, both as classroom teacher and academic advisor, Professor Levy was

“a mentor and a friend. Beneath the formal demeanor lay the heart of a man deeply committed to his students. His advice was always thoughtful and well received, and extended far beyond my undergraduate years at Cornell...I was not the only one; he maintained contact with many of his advisees, and all of us benefited from his continued interest and help.”

As a scholar, Professor Levy was not only demanding but exacting. For him, “close enough” was never good enough: his motto was “let’s get it right.” A tireless advocate for academic causes in which he believed, he was also, when necessary, a tenacious as well as an eloquent disputant, especially in defense of traditional humanistic values.

Charles is survived by his wife of 42 years, Andrée Grandjean Levy, who was instrumental in developing his deep and abiding love of France, the French people, and French culture. Other survivors include his two daughters, Marian Wilson and Claudia Manganello; his sister, Ann Lathrop; his stepmother, Dr. Ernestine Friedl Harmel; and his four grandchildren, Blake and Sean Wilson, Isabella and Cecilia Manganello.

Donald D. Eddy, Carol V. Kaske, Barry B. Adams

Bertha (Betty) Ann Lewis

October 21, 1927 — April 17, 2008

Bertha (Betty) Ann Lewis, M.S., Ph.D., died at the Truman Senior Living Center in Truman, Minnesota on Thursday, April 17, 2008 at the age of 80.

Betty was a native of Minnesota; born in Watonwan County and raised in rural Lewisville. Following graduation from Truman High School, she matriculated at the University of Minnesota where she earned a Bachelor's degree in Chemistry in 1949, a Master's of Science degree in Chemistry in 1954 and a Doctorate of Philosophy degree in Chemistry in 1957. Following the conferral of her Ph.D. degree, she continued to develop her academic career at the University of Minnesota as a teacher and research scientist, and developed what became a life-long interest in food carbohydrates. During this time, she also instructed a course in mortuary science at the College of St. Catherine's.

Betty was recruited to Cornell University, Ithaca, New York in 1967 as an Associate Professor in the Department of Textiles and Clothing/Design & Environmental Analysis. On February 01, 1970, she was jointly appointed as Associate Professor of Human Nutrition and Food. She was granted tenure in 1973 and the following year appointed Associate Dean for Research and Graduate Education in the College of Human Ecology and as Assistant Director of the Cornell University Agriculture Experiment Station. Her official appointment was transferred to the Division of Nutritional Sciences on July 11, 1980 until her retirement on July 16, 2006.

Betty was a highly active faculty member and distinguished scholar who contributed to the teaching, research and extension missions of the University. The undergraduate students best knew Betty for her instruction of NS345, Nutritional and Physiochemical Aspects of Food, which is a required course for all nutritional sciences majors. She also co-instructed FS/NS 620, Food Carbohydrates, a graduate level course with Professor John Brady in the Food Science Department. Among her contributions to Cornell Cooperative Extension, she authored a chapter on complex carbohydrates and fiber to the Cornell Extension Handbook, *Take Charge of Your Health*, in 1989. Betty enthusiastically served the graduate field of nutrition as Director of Graduate Studies for the Graduate Field of Nutrition and was awarded a National Needs Graduate Fellowship Program from the United States Department of Agriculture.

Betty's research and teaching activities focused on food biochemistry and the chemistry of food components, with applications to health, nutrition and food preparation and processing. In 2002, she was named to ISI's list of

Highly Cited scientists in the Agricultural Sciences, an honor accorded to less than 0.5% of publishing researchers. She was among the first scientists to do research on dietary fiber and one of the few women scientists nationally working in the field of polymer chemistry. Betty was an inventive and innovative scientist with interests in both original research and advancing the development of new methodologies. Her research program generated over 50 peer-reviewed publications. Her 1991 publication entitled "Methods for dietary fiber, neutral fiber and nonstarch polysaccharides in relation to animal nutrition" has received over 3,300 citations since its publication, with 483 citations in 2008. Her research findings led to a better understanding of the role of complex carbohydrates to the quality of food as well as their physiological roles in health and disease. Later in her career, she developed an interest in food photochemicals including antioxidants and the relationship between their biological and health-promoting function and their chemical structure. Throughout her career, she served on several committees of the American Chemical Society, was national president of Sigma Delta Epsilon-graduate Women in Science and was an active member of the Institute of Food Science and Technology.

Betty loved the outdoors and traveled to national parks, was an avid bird watcher, and established and hiked the trails of the Finger Lakes region.

She moved back to Minnesota in 2006 following her retirement from Cornell University to be with her extended family. Her modest manner, well-developed sense of humor, and wise counsel are missed by her many friends in Ithaca.

Patrick Stover, Chairperson; Patsy Brannon, Thomas Brenna

George Morris Lewis

June 11, 1899 — February 27, 1966

Dr. George Lewis died in The New York Hospital, February 27, 1966, at the age of sixty-seven.

He was born in Elkhorn, Manitoba, Canada, on June 11, 1899. His father John Lewis who was a Baptist minister and his mother Ada Elizabeth (Yarwood) Lewis were born in Wales and migrated to rural Western Canada just before the turn of the twentieth century.

George attended the local country schools. At the age of 15 he contracted poliomyelitis. When the acute symptoms subsided he continued his education and received an M.D. degree from the University of Alberta in 1925. In 1965 the Medical Alumni Association of the University of Alberta conferred upon George Lewis the outstanding Achievement Award for 1965 in recognition of distinguished service to medicine.

Dr. Lewis became a naturalized United States citizen in 1931.

After graduation from medical school, George Lewis came to New York City and served his internship at the Skin and Cancer Hospital from 1925 to 1926. He then joined the dermatology staff at the New York Post Graduate Medical School and Hospital to continue his dermatological studies. At the same time he was associated in office practice with Dr. George Miller MacKee. Dr. Lewis remained with the Skin and Cancer Unit until 1940. It was at this institution that he carried on extensive clinical and laboratory research in dermatological mycology.

In 1932 he joined the Cornell Clinic Medical Staff. However his major teaching, research, and clinical activities were at the Skin and Cancer Unit until 1940 when he was offered and accepted the Directorship of the Department of Dermatology at The New York Hospital and Cornell University Medical College. By successive promotions he became Clinical Professor of Medicine (Dermatology) at Cornell University Medical College and Attending Physician (Dermatology) at the New York Hospital. He retired in 1962, and he was appointed Emeritus Clinical Professor of Medicine and Consultant Physician at the Hospital.

Dr. Lewis completely reorganized the department of Dermatology at The New York Hospital. With the help of Miss Mary Hopper, a mycological laboratory and clinic second to none were established as well as a dermatopathology department and a clinical photographic unit. A dermatological library was put together, and the physical therapy and surgical units were modernized. A dermatology residency program was instituted, and the teaching of dermatology updated.

Dr. Lewis was Consultant Dermatologist to the Memorial and Polyclinic Hospitals in New York City and to Vassar Brothers Hospital in Poughkeepsie. Considering his busy schedule and his many activities and interests, one could say that Dr. Lewis was a prolific writer. He wrote and published over one hundred articles which appeared in various medical journals, and two books, each of which went into several editions. In addition, he was a member of the editorial board of the *Archives of Dermatology and Syphilology* for about 10 years, *The Journal for Investigative Dermatology* and the *New York State Journal of Medicine*.

Early in his dermatological career Dr. Lewis saw the need to develop and expand the field of mycology amongst dermatologists. With the collaboration of Miss Mary Hopper, Dr. Lewis developed an excellent mycology laboratory where extensive clinical research was carried out and where fungous diseases were diagnosed and treated more successfully than ever before. They were the first to recognize the characteristic clinical lesions caused by *T. rubrum* infection. The accumulation of clinical and laboratory material pertaining to fungous infections was published in their first practical monograph for dermatologists on fungous diseases. *Introduction to Medical Mycology* was first published in 1939. There were four editions altogether published in 1939, 1943, 1948, and 1958 with various collaborators.

During many years of teaching elementary dermatology to third and fourth year medical students at Cornell Medical College, Dr. Lewis became aware of the fact that a special type of textbook was required to augment the lectures, the clinical discussions, and the bedside teaching. He wrote a simple practical textbook on dermatology especially useful to medical students and general practitioners. *Practical Dermatology* was first published in 1952 and a second edition in 1959. The third edition will soon be published with Dr. Clayton E. Wheeler as co-author.

Dr. Lewis was extremely active in local, regional, national, and international dermatological societies. He was a member of both the New York and the Manhattan Dermatological Societies and served both of these as Secretary and President. Later he was elected to honorary membership to both societies. He was a fellow of the New York Academy of Medicine and became chairman of the Membership Committee. He was also Secretary and Chairman of its section on Dermatology. He was a member of the New York State Medical Society, the Mycological Society of America, the Society for Investigative Dermatology, and the American Medical Association. He was elected to the American Dermatological Association in 1937 and was elected President in 1962. He was a member, secretary-treasurer, and president of the American Board of Dermatology. He served as secretary-treasurer for eight years during which time the Board had the responsibility of examining more candidates and setting up more training centers than in any other eight year period. It was a colossal task, and Dr. Lewis handled all of the assignments

with great efficiency and tact. He became a Fellow of the American Academy of Dermatology in 1938 when it first started. Each year he served as a teacher, lecturer, panelist, exhibitor, group leader, and in 1956 he was elected President. He was a member of the Atlantic Dermatological Conference and attended the International Dermatological Society meeting in Washington in 1963. He was an honorary member of the British, Canadian, and Venezuelan Dermatological Societies and a corresponding member of the Swedish Dermatological Society.

George Lewis had other interests besides dermatology. He read the Bible extensively and was an expert on Abraham Lincoln, who was his great hero. He never missed an opportunity to visit and contemplate at the great Lincoln Memorial in Washington. He loved birds and took pains to provide housing and food for them throughout the year. He followed the stock market and devised elaborate charts of his own. He had a modest collection of jade, and he always carried a piece of jade in his pocket. He knew a good deal of the history of American dermatology.

When George died, there passed from our midst a fine Christian gentleman who was all man and who displayed great courage in overcoming physical and environmental handicaps to become one of the truly great American Dermatologists of our era. He was a good doctor with great patience and compassion and Possessed superior intellectual curiosity and attainments. He was a seeker of the truth who unselfishly shared his knowledge with his students and colleagues. He was an inspiring teacher and a forthright thinker with very definite ideas of his own. He took nothing for granted and walked a straight line all his life. His unremitting candor and his firm stand for ethical principles and for what he believed to be the truth, gained for him the respect and admiration of his contemporaries. George was a simple, reasonable, humble, and charitable man who loved his work. He gave unstintingly of his time and energy to improve the status of dermatology and to guide young men who chose medicine as a profession.

Dermatology has lost a fine and devoted physician, and his family lost a fine and, a good husband and father. Those of us who knew George feel a great personal loss. He leaves behind a great heritage and monument in the body of his great scientific and spiritual contributions.

Anthony C. Cipollaro

Taylor Downer Lewis

April 24, 1911 — March 1, 1969

Taylor D. Lewis, professor of civil engineering, died unexpectedly at the age of fifty-seven. A cardiac condition had necessitated a rest from University responsibilities during the fall semester, but he was actively teaching again at the time of his brief, final illness.

Professor Lewis was born in Detroit, Michigan. He received the B.S. degree in civil engineering from the University of Michigan in 1934 and, in 1937, a certificate from the Bureau for Street Traffic Research at Harvard University. He was awarded the degree of civil engineer by the University of Michigan in 1950.

Taylor Lewis began his professional career in 1934 with the Connecticut State Highway Department. In 1937 he became highway safety engineer with the Globe Indemnity Company in New York City. From 1938-40, he served as traffic engineer for the cities of Wichita, Kansas, and Gary, Indiana.

Called to active duty in the army in 1940, Professor Lewis was released in 1946, after service in North Africa, Italy, France, and Germany, as a lieutenant colonel in the Field Artillery. He was subsequently promoted to colonel in the Army Reserve.

After World War II, Professor Lewis resumed his career in engineering as a research assistant at the Bureau of Highway Traffic at Yale University. He came to Cornell as an assistant professor of civil engineering in 1946, and was promoted to associate professor in 1949 and professor in 1955. He was head of the Department of Transportation Engineering from 1954 until 1966.

During the summers of 1949 and 1950, Professor Lewis coordinated field work in Alaska and Greenland for the University's arctic research program. Other short term professional assignments included civil engineer for the Panama Canal Company (1951), operations analyst with the Operations Research Office of the Johns Hopkins University (1952-53), and senior visiting fellow, British Road Research Laboratory (1960-61). During the 1967-68 academic year, he was engaged in transportation systems planning with Freeman, Fox, Wilbur Smith, and Associates in London, England. Professor Lewis served as a consultant, beginning in 1953, to the Operations Research Office of the Department of the Army. He served as a traffic consultant to several municipalities, including Ithaca, and often was called upon to advise the Board on Traffic Control at Cornell. He was frequently called to serve as an expert witness in court cases.

Professor Lewis was registered as a professional engineer in Connecticut, Indiana, and New York. He was a member of the honorary societies Sigma Xi and Chi Epsilon. A fellow in the American Society of Civil Engineers, he served as chairman of the Highway Division's Committee on Significance of Tests for Highway Materials; locally, he served as president of the Ithaca Section of ASCE in 1959-60. He also held membership in the Institute of Traffic Engineers, Highway Research Board, Operations Research Society of America, American Road Builders Association, and American Society of Testing Materials. In ASTM, he was a member of committees on road and paving materials, and the effect of water on bituminous mixtures. He was the author of many papers and articles in the areas of traffic engineering and highway materials.

Something of the extent to which Taylor Lewis was respected as a traffic engineer in the Ithaca community is evident from these words of Charles Chatfield, news editor for WHCU:

Taylor Lewis, from the public works department point of view, was not a professor. He was one of their boys. He was a man who had highly specialized engineering knowledge of traffic and parking problems. His recommendations, even the ones considered too unpolitic to adopt, were considered sound. Taylor Lewis, in the capacity of traffic constant, was trusted for his good sense, and therefore he was respected. ... In essence, the service that Professor Taylor Lewis gave Ithaca was a high standard for those who attempt to bridge the distance between a campus and a city hall.

Taylor Lewis served the community in many ways other than as a traffic constant. He served as a member of the village board in Cayuga Heights and as captain of the fire company. Interested in sailing, he had been commodore of the Ithaca Yacht Club. He was also an ardent skier and tended to chafe under the enforced slowdown in physical activities this past winter.

To his students and colleagues, Taylor was a good teacher, sympathetic adviser, and warm friend. If students ever thought early in a course that his teaching was underorganized, they came to learn later that it was by intent. His laboratory courses in highway materials were open-ended experiences that brought benefits far beyond mere proficiency in performing standard tests. Students benefited also from his patience in letting them approach a task their own way before quietly offering a then-obviously-better alternative.

Professor Lewis is survived by his wife, Clara Bartholow Lewis, his daughter, Clare, and his sons, Forbes and Samuel.

Donald J. Belcher, Ta Liang, James W. Spencer

W. Jack Lewis

December 16, 1915 — June 15, 2002

W. Jack Lewis served Cornell as Director of Cornell United Religious Work from 1963-81. An ordained minister, Lewis was educated at the University of Texas at Austin and the Austin Presbyterian Theological Seminary. Prior to coming to Cornell, he served as a chaplain with the U.S. Navy in the Pacific theater in World War II, where he ministered to one of the first African-American Marine Corp units. After the war, he worked with university students as a Presbyterian minister in Austin, Texas. In the early 1950s, he founded the Christian Faith and Life Community, a residential, coeducational, and racially integrated lay center for University of Texas students. The Community was a model that greatly influenced strategies for ministry in higher education as well as future lay communities.

As Director of CURW, he served Cornell during a tumultuous time of student unrest and academic reform. With the campus sharply divided over issues of race and war and generational lifestyles, the lanky and genial Texan was a mediating presence, wise counselor, and advocate for social justice. Under his leadership and with his support for student activists, CURW became a center for dialogue on the sociopolitical issues facing the campus and nation. Lewis' commitment to religious and cultural inclusiveness fostered ties to all segments of the Ithaca and Cornell community.

During his tenure at CURW, Lewis helped establish a host of enduring community services. Among them were the Festival of Black Gospel, the Center for Religion, Ethics and Social Policy (CRESP), Suicide Prevention and Crisis Service, Pastoral Counseling Service, the Commons Coffee House at Anabel Taylor Hall, and Hospicare. In his retirement years, he helped set up the hospital chaplaincy at Cayuga Medical Center and he organized the Hospital Visitation Program supported by Cornell's Human Resources office.

He was an active member of the general faculty and the emeritus faculty. With the help of President Frank H.T. Rhodes, Lewis administered a revival of the University Baccalaureate Service at Commencement after a hiatus of eight years.

Lewis was a vital member of the Kendal community, where his wife, Mary, still resides. He continued his ministry at Kendal by organizing monthly interfaith worship services, an annual fund through which Kendal residents collectively support community organizations, and by conducting memorial services. He was frequently called upon to conduct weddings and funerals for Cornell faculty, staff, alumni and other members of the Ithaca

community. Despite a crippling accident that left both of his legs broken, Lewis found his way back to mobility and resumed his round of hospital visits.

He left us all in his debt and he will be remembered as a faithful, caring friend. His life is captured in his daily prayer:

Today with God's help,
I'll do the best I can
with what I have,
where I am,
and I'll care about others.

Timothy C. Marchell, Carolyn Taber, Robert L. Johnson

Allyn Bryson Ley

December 5, 1918 — September 29, 2006

Allyn Bryson Ley, MD, Director of the Cornell University Health Services and Cornell University Professor, 1971-87, died in Ithaca on September 29, 2006, after suffering complications following a fall.

In the words of the present Director, Janet Corson-Rikert, MD.

“our university health services has been built on the shoulders of visionaries and heroes. Dr. Ley has been one of the most important of those heroes.”

He was recruited from his distinguished tenure at Cornell Medical College in New York City to restructure and modernize the health services on the Ithaca campus. The list of his noteworthy achievements includes the innovative introduction of nurse practitioners as clinicians; the provision, despite significant controversy, of reproductive and other sexual health care services for students; the institution of a broad volunteer program creating opportunities for students and the broader Cornell community; the transition from the large Sage Infirmary complex to a small overnight unit at Gannett; the development, in cooperation with a local pharmacist, of the first college health service drug formulary; expansion of services in counseling and psychotherapy, radiology, occupational medicine, sports medicine, physical therapy and travel medicine; and the expansion of the medical laboratory at Gannett, which, on his retirement was named in his honor.

Dr. Ley used his research talents here in Ithaca, cooperating, for example, with Sloan Kettering, in studying the insidious spread of the scourge that became known as AIDS.

These many accomplishments reflect the fact that he was a national leader in expanding college health services to meet the increasingly complex medical and mental health care needs of students. He was able to do so much because of his extraordinary imagination both about the goals for his institution and the people who could work toward those goals. He was a beloved mentor and example to his staff who continue to honor his commitment to the provision of high quality and relevant health services in the Cornell community. And he did all these things while continuing to offer his particular expertise in caring for individual patients with extraordinary attention to the complex details of their lives.

Part of Allyn Ley's vision was the conviction that Cornell could significantly cooperate with the Ithaca community in the delivery of effective health care not only to students but also to the local population. Those ideas evolved in a unique town-gown collaboration enabling the growth and increasing the vitality of Planned Parenthood of

Tompkins County. When Dr. Ley arrived in Ithaca in 1971, student agitation had led the university to ask Ithaca's fledgling Planned Parenthood to operate a contraceptive clinic for students and townspeople in Sage House on East State Street. At Dr. Ley's invitation, the clinic and the agency's offices were moved to the third floor of the underused Sage Infirmary and, strengthened by considerable in-kind support from Cornell, Planned Parenthood was able to expand its services. For ten years, until Dr. Ley was able to consolidate the University Health Services in an enlarged Gannett Health Center on the main campus, this unique partnership provided high quality reproductive health care to large numbers of women and men from Cornell and the larger Ithaca community.

Allyn Ley was born on December 5, 1918 in Springfield, Massachusetts, the fourth son of Leo L. Ley and Lovira Tait. He graduated from Dartmouth College in 1939 and received his medical degree from Columbia Physicians & Surgeons in 1942. He served as a lieutenant in the U.S. Navy from 1943-46. For 17 months during World War II, he was the sole medical officer on the USS Haynesworth, a destroyer stationed in the South Pacific. During his service, his ship was nearly capsized by Typhoon Cobra and also attacked by a kamikaze fighter.

After the war, Allyn did his residency at New York Hospital/Cornell Medical College and went on to Harvard Medical School where he did a two-year research fellowship in hematology at the Thorndike Institute. He returned to Cornell Medical College as a faculty member and researcher at Memorial Hospital/Sloan Kettering Institute and served as Director of Hematology and the Blood Bank. His most significant accomplishment as a hematologist was the discovery of an immunologic reaction to penicillin. This was widely recognized as a seminal discovery that led to better understanding of many drug reactions. Allyn refocused his later career at the Medical College on developing new methods of health care delivery, and in 1963, he was appointed Director of Ambulatory Services at New York Hospital and continued to teach as a Professor of Medicine until he came to Ithaca.

In retirement, Allyn stayed active in the community, overseeing the Allyn B. Ley Clinical Laboratory, driving for Gadabout and serving on local boards such as Challenge Industries and Kendal at Ithaca. He was also an active member of the City Club, Ithaca Yacht Club, Ithaca Bridge Club, First Congregational Church and Forest Home Chapel.

Allyn loved to travel, frequently traveling around the country and abroad. In 1969, he, accompanied by his wife, Barbara, spent a year in Tunisia as the Chief of Staff of the SS Hope, a floating hospital that provided medical education and care in developing countries. He also spent six weeks in 1985 providing medical care in a remote refugee camp on the Thai-Cambodian border, a dangerous but deeply rewarding endeavor.

Throughout his long life, Allyn was guided by a strong sense of fairness, generosity, kindness and the importance of family and community. He was an extremely devoted husband, father, mentor and friend who offered unwavering love and support to untold numbers of students, staff and colleagues, to his large circle of friends and adoring family. A jovial and charismatic person, he often said he was born with “happy genes” and was grateful for what a lucky and rewarding life he had lived. He is survived by his brother, Gordon; his second wife, Barbara Goble Ley; his six children, Bryson, David, Christopher, Douglas, Bradford and Marcie; and his six grandchildren, Colin, Duncan, Casey, Jenny, Max and Desmond. His first wife, Sidney Barr Ley, and his two brothers, Robert and Douglas, predeceased him.

Rosalind Kenworthy, Chair; Kate Potteiger, Nianne VanFleet

Ta Liang

June 11, 1916 — November 1, 1987

We had the distinct privilege of knowing Ta Liang, a pioneer in the use of aerial photographs for landform analysis, a skilled civil engineer, a superb teacher, the “mayor” of Ithaca’s Chinese community, and one of the world’s finest human beings.

Born in Teitsin, in northern China, Ta was a celebrity at birth — the first male of the 26th generation of the Liang family from the Dragon Lake Village. His diplomatic approach to all situations was inherited from his father who had been China’s ambassador to Australia. Ta’s early education was by tutors, laying the foundation for his broad interest in classical Chinese.

He received a Bachelor of Engineering degree from Tsing Hua University in 1937, worked briefly as an engineer for a railroad, then went to Burma, where he established a successful engineering company while only in his mid-twenties. In Burma, he also met and married Daisy, his beloved wife for forty-two years, and Cornell’s greatest sports fan. Daisy had participated in the Far Eastern Olympics and was in Burma teaching. Although they met in Burma, their native villages in China were only a few miles apart. After Japan invaded Burma, Ta became a senior engineer with the U.S. Armed Forces, working in the China-Burma-India Theater, supervising the design and construction of roads, airports and housing facilities. He was awarded the U.S. War Department’s Meritorious Civilian Service Emblem in 1945.

After World War II, Ta passed a national examination in China and was one of the few selected to be sent to the U.S. for graduate study. He was accepted at Cornell and went on to earn a M.C.E. and Ph.D. in 1948 and 1952, respectively. His Ph.D. dissertation was based on the detection of landslides using aerial photographs. From 1950 to 1954, he was a research associate in civil engineering, working with Donald Belcher to make major advances in interpreting soil and rock conditions from aerial photographs. During this period, he was co-director of an extensive air photo training program in Burma. After spending 1955 to 1957 with the engineering firm of TAMS, he returned to Cornell to join the civil engineering faculty. He remained at Cornell until retiring as professor emeritus in 1984.

At Cornell, Ta developed and taught courses in physical environment evaluation and aerial photographic studies, served as advisor to hundreds of students from a variety of disciplines, and was responsible for many remote sensing research projects. From 1961 to 1965, he directed a tropical soils air photo project, sponsored by the Air

Force Cambridge Research Laboratories; from 1970 to 1972, he co-directed the Land Use and Resource Inventory of Puerto Rico; and from 1972 to 1982, he was principal investigator of the NASA-sponsored Program in Remote Sensing. As a consultant, he conducted engineering and remote sensing projects for private, government and international agencies in some forty countries — transportation route assessment in Alaska, Australia, Canada and East Africa; pipeline route assessment in the Arctic; land evaluation studies in Liberia, the Caribbean, and the Philippines; and the review of national remote sensing programs in several developing countries.

Among the unique contributions made by Ta and Daisy to Cornell and the Ithaca community are the countless dinners they held for new and old faculty, visitors, students and “friends”. Almost singlehandedly they created a community spirit, earning the respect, admiration, friendship and love of an unbelievably large number of people.

Ta is survived by a son, Jack, of Gross Pointe, Michigan; two grandchildren; a brother in Chicago; and two sisters in Hong Kong. His warmth, friendship, quiet strength, and approach to life — the best of the American, the best of the Chinese — will never be forgotten.

Donald J. Belcher, Floyd O. Slate, Warren R. Philipson

Sol Sidney Lichtman

October 15, 1898 — June 15, 1961

Dr. Sol Sidney Lichtman, long a member of the staff of the New York Hospital and Cornell University Medical College, died on June 15, 1961, at the age of 62.

Dr. Lichtman was born in New York City on October 15, 1898. He was a graduate of the City College, and of Cornell University Medical College in 1921. He interned at Mount Sinai Hospital from 1921 to 1923. During his graduate education he became interested in biochemical approaches to clinical medicine, an area that engaged his attention throughout his professional life. For approximately ten years, from 1929 to 1938, he was active in research at the biochemistry laboratory at Mount Sinai Hospital. During this period his primary interest centered in diseases of the liver and nutrition; this led to the publication of his book entitled *Diseases of the Liver, Gall Bladder, and Bile Ducts*, one of the first comprehensive compilations of information on this important subject. Dr. Lichtman was on the staff of Cornell University Medical College from 1942 until his death. In his role as Assistant Professor of Clinical Medicine and Assistant Attending Physician he was respected by his colleagues as a resourceful physician. In his later years his interest in research continued, and at his death he was working on a chemical method of detecting metabolic alterations in neoplastic disease.

E. Hugh Luckey, M.D.

Howard Scott Liddell

November 9, 1895 — October 24, 1962

Professor Liddell, born in Cleveland, Ohio, died after a brief illness. Although three years earlier he had suffered a so-called mild coronary ailment, his death was quite unexpected.

Most of Professor Liddell's elementary and secondary education was received in Erie, Pennsylvania. The officials of Erie, being aware of his status as a scientist, in June 1951, invited him, as a distinguished former resident, to attend the centennial celebration of that city's founding.

Howard Liddell did his undergraduate work at the University of Michigan, graduating in the Class of 1917; there he also received the Master's degree in 1918, his major subject having been psychology. In May 1920, he married Elzie Goodnough of Erie. He entered Cornell in 1918, as a graduate student and instructor in physiology, receiving the Ph.D. in 1923. He continued his interest and preparation in psychology by selecting that as a minor subject, principally under Professor E. B. Titchener. In these early years, however, most of Liddell's interest was devoted to the experimental analysis of thyroid functions in the sheep and goat. These experiments on thyroidectomized animals were continued at the Physiological Field Station, established in 1922 by Professor Sutherland Simpson, the physiologist who was Liddell's teacher.

In 1926, Liddell was promoted to Assistant Professor in Physiology, at the Ithaca branch of the Cornell Medical College. In 1930, he was appointed Professor and Chairman of the Department of Physiology, a post he held until 1939, when the Ithaca branch of the medical school was discontinued. From 1939 to 1947, Liddell was Professor of Psychology. Although he had been the originator and founder, and from its beginning the director, of the Behavior Farm Laboratory, in 1947 he was given the official title of director of that laboratory and he was named Professor of Psychobiology — a title much more appropriate to the nature and distinctive character of his research, and the subject matter of his teaching.

As a scientist, Dr. Liddell's distinction rests in part upon the fact that he established the first laboratory in the United States (1923) for the study of conditioned reflexes, and that he became one of the two outstanding American investigators and developers of Pavlov's theories of the conditioned reflex. In connection with his research, Liddell made two extended visits to Pavlov's laboratory in Leningrad (1926 and 1934). In his own research and thinking, however, he went well beyond Pavlov's work and ideas. Liddell was too flexible, too resourceful, too independent to be a slavish follower.

The Behavior Farm Laboratory now has been named the Liddell Laboratory of Comparative and Physiological Psychology; for not only did Liddell create it through his own resourceful scientific imagination, but also, through his own efforts and research results, he obtained substantial research grants for his work continuously over a period of twenty-four years (1936-1960) from the U.S. Public Health Service, the Rockefeller Foundation, and the Josiah Macy, Jr., Foundation. For nearly forty years, significant research studies have been conducted there on animal behavior and learning, with special reference to the causes, behavior symptoms, physiological manifestations, and curative techniques of experimental neuroses. In recent years, research with lambs and kids has provided significant information and principles for the understanding of the mother's role in protecting her young from psychic stress. Some pediatricians have found the techniques and results so significant that they are conducting studies with infants and are applying the Laboratory's findings to the handling of infants. And, naturally, these researches with lambs and kids have evoked wide interest and enthusiasm among psychiatrists and psychologists. Liddell moved from the conditioned-reflex technique, as a method of studying learning, to its employment as a precise and refined method for studying anxiety and emotional stress. He wrote that "the persevering use of this powerful and exact method (conditioning) in the field of experimental medicine can disclose the biological basis of many fundamental problems concerning mental health and disease." W. Horsley Gantt of Johns Hopkins University—a distinguished scientist in the field—has called Liddell the "Father of American Experimental Psychopathology."

The Laboratory's work and publications achieved such international distinction as to stimulate widespread research elsewhere on experimental neuroses with a variety of animals. Consequently, the Laboratory was visited by scientists from abroad, as well as from other states, who were studying progress being made in research in the behavioral sciences. And, as was to be expected, the research conducted in this Laboratory and the findings and theories reported in Liddell's publications have become established, in current textbooks in neuropsychiatry and psychology, as standard material.

Professor Liddell was a member of scientific societies in the fields of biology, medicine, psychology, and psychoanalysis. He held offices in them: president of the American Psychopathological Society, and president of the Pavlovian Society of America, which he helped create, as he did the American Psychosomatic Society. He also served as an editor of some of their journals. In these societies, one of Liddell's goals, at which he worked successfully, was to remove the barriers between psychoanalysis and the study of conditioned responses.

The broad significance of Liddell's research is indicated by his appointments: Visiting Professor, Institute for Training and Research in Psychoanalysis (New York City); Visiting Professor, New York Psychiatric Institute; Scientific Advisory Board, Jackson Laboratory, Bar Harbor, Maine; consultant to the Army Operations Research Office; member of the Commission on Selection and Training of Aircraft Pilots, National Research Council; chairman, Committee on Group Processes, Josiah Macy, Jr., Foundation; member, Conference on Science, Philosophy, and Religion. Dr. Liddell was invited to participate in and often to organize and conduct symposia, both in the United States and abroad, on the behavior of humans and infrahuman animals, particularly those dealing with the causes and prevention of excessive strain and anxiety. In fact, he had leading roles in two such conferences only a short time before his death. The last of these was an International Symposium on Comparative Medicine, at the dedication of the Animal Medical Center in New York City. There he was chairman of the Animal Behavior Section, whose program he organized.

For years, Dr. Liddell believed that comprehensive applications of his research findings and theories to the understanding and interpretation of *human* behavior would be premature. Many others, though, believed otherwise. The dramatic and acute turning point in his own attitude was reached during his assignment to Korea, at the height of the war, to study stress and self-control of the soldiers. For his contribution, he received the Service Medal of the United Nations Command. This assignment was a traumatic experience for him. He was not content to remain in Tokyo, as he might have, to interview men who had returned from the front. Instead, he went to the front himself, at the age of fifty-seven; he was under fire while he interviewed and visited with the men; for he knew that was where he must be, if his observations and conclusion were to be valid. Few persons, other than his immediate family, were aware of the effect of this experience upon this sensitive and perceptive man. Liddell then became fully convinced that research in the behavioral sciences, to justify itself, must be applicable to the understanding and elevation of *human* behavior and welfare. Those persons who saw only his gay, his ebullient exterior, or his brief periods of brusqueness, always followed by a contrite, self-conscious smile—those persons could have no inkling of the depth of his concern, or of his emotions. He did not believe in wearing his heart on his sleeve.

One result of his Korean experience was that Dr. Liddell accepted the many invitations to lecture before groups of sophisticated laymen (as, for example, under the auspices of the New York Academy of Medicine), as well as before psychologists, psychoanalysts, and general medical practitioners. The full significance of his work has yet to be described.

His scientific papers and his lectures were distinguished not only for their substance, but also for the style of writing and delivery. He wrote with what is called an “easy style,” which, as all writers know, is the result of hard work. The serious scientific materials of his writings and lectures were leavened by a quiet sense of humor and were often accompanied by philosophical observations of insight on science and on mankind. His publications should be required for all graduate students in the behavioral sciences. Regrettably, he never offered a seminar on “How to Write Scientific Papers.”

Howard Liddell’s capacity for friendship was broad. It is not surprising that as a scientist he was held in high regard by those with whom he was associated in all fields; but it was evident, also, that they had a warm personal affection for him, shown in person and in many of the letters he received commenting on his lectures, scientific papers, and conference participation. His friendships, however, were not restricted to scientists. He was a member of the Ithaca Savage Club, a light-hearted group, and of a small informal Saturday luncheon group, good-humoredly calling itself the Lambs Club, consisting predominantly of business and professional men, among whom he was held in high regard as a raconteur.

Liddell’s essential generosity of spirit was manifest in his encouragement of graduate students and young colleagues who were fortunate enough to have been associated with him. One of his outstanding graduate students writes: “Impatient as he was of trifling obstacles, his presence in the laboratory swept everyone to fresher, stronger efforts. His widely varied knowledge often drove the dismayed student back to the library time and again, finally to emerge the wiser.” Perhaps he was not severe enough in his evaluation of others. This trait, however derived not from lack of high standards, but from an inherent quality that prompted him to accentuate the positive. Faced with ungenerosity of judgment in others he refused to fight back; his response was withdrawal.

A brief article cannot provide as full a portrait as should be given; but we can sense Howard Liddell’s essential humanism from the following quotation from his small book, *Emotional Hazards in Animals and Man*, published in 1956. These words could not have been written by a man whose approach to humanity was based on strict adherence to behavioristic psychology. Here is the closing paragraph.

“Our contemporary conformities, with the mechanization of thought and feeling they impose, enhance the baleful operations of the neurotic process in thwarting the strivings of the human spirit. But every individual possesses a secret weapon with which to combat neurosis and gain freedom. That weapon is the creative impulse, which provides vigor and enchantment; buoyancy and elegance; or incisiveness of thought and flexibility of spirit, whichever pair of terms one may choose. Perhaps all should be included. From our point of view, it is this creative impulse which generates zest and insures mental health.”

We take leave of Professor Liddell with a deep sense of indebtedness to him for his friendship and his scientific contributions.

William C. Dilger, A. Ulric Moore, Frank S. Freeman

Siegfried Eric Lienk

October 16, 1916 — June 25, 1988

From 1949 to 1983, Professor Siegfried E. (Sieg) Lienk had a productive career as an entomologist in Cornell's New York State Agricultural Experiment Station at Geneva, New York. He not only made a number of important contributions to his science, but he also was much appreciated by the fruit growers of New York for providing them with effective means of coping with their mite and insect problems.

Born in Gary, Indiana, he attended grade and high school in South Chicago. Over the following six years, his time was divided between working as a mechanic for an equipment manufacturing company, and attending the Chicago Christian Junior College. (His father was a Lutheran pastor.) Having developed a deep interest in insects, he decided to seek a career in that field. In 1940, he entered the University of Idaho where, two years later, he received a B.S. degree in entomology.

In June 1942, he was appointed an agent in the U.S. Bureau of Entomology and Plant Quarantine. His primary duties were to locate new infestations of the pear psylla in pear orchards of the states of Idaho and Washington. However, later in 1942, after our nation became involved in World War II, he resigned his Bureau job and enlisted in the Army. Because of his entomological training, he was assigned to the Army's Medical Corps. From late 1942 to 1946, he saw service in North Africa, Italy, Okinawa and Japan. Perhaps his most important experience was the part he played in controlling a massive outbreak of typhus in Naples, Italy. This louse-transmitted disease was controlled by the use of a then-new pesticide—DDT. After returning to civilian life in 1946, he became a graduate student at the University of Illinois. In 1948, he spent six months in Alaska as a member of a team which conducted biological and control studies on mosquitoes, black flies, and punkies for the U.S. Bureau of Entomology and Plant Quarantine.

On June 16, 1949, Sieg was appointed a research associate in the Department of Entomology of the New York State Agricultural Experiment Station. After receiving his doctorate degree from the University of Illinois, he was advanced to an assistant professorship on March 1, 1950. Initially, he conducted studies on the biology and control of cherry pests and on the species of spider mites that are pests of apple and the other tree fruits. He and a colleague, E.H. Glass, also started a new project. Its objective was to evaluate the effectiveness of the various kinds of equipment being used to apply pesticidal dusts and sprays to fruit trees.

Of the cherry pests, he gave most attention to the two species of fruit flies which produce wormy cherries, and to the European red mite, an apple pest. Before Sieg joined the staff, several local workers, in their studies of petroleum oils as pesticides, had found that the overwintering egg of this mite became increasingly susceptible to oil sprays up to the start of tree growth in the spring. Following up on this lead, Sieg was able to demonstrate that a single oil spray applied just ahead of egg hatch can give commercial control of this six- or seven-generation pest for the year. A succession of new acaricides then became available. In testing these, Sieg found that while most of them gave good control, initially, the mite eventually became resistant to them. Up to the present time, however, this mite has not been able to develop resistance to oil sprays. Its mode of action is physical—it “smothers” the eggs.

In addition to the foregoing work, Sieg found time to assemble and maintain a collection of local insects for the use of the department. His skill as a taxonomist was really challenged, however, in a project he and a colleague, P.J. Chapman, started in 1974. Its objective was to learn when the flight period(s) of the larger species of moths (*Macrolepidoptera*) occurred in the Geneva, New York area by use of black light traps. Over a five-year period these traps were visited daily from mid-April to early November. Of the 30,000 moths collected annually, 600 species were represented. In addition to the scientific value of these data, information was provided for determining when control measures should be used for species of economic importance.

The Lienk-Chapman team also conducted another large-scale project. Sought was an update on the number of native species that had adopted apple as a host after this plant was introduced to North America in colonial times. Since all pests, old and new, had been reduced to low levels after growers started using pesticides near the end of the 19th century, these workers conducted their studies in abandoned orchards and in cow-planted stands of wild apple trees. Species found feeding on apples were classified as using them as a primary, secondary or accidental host. A number of potentially new apple pests were discovered. This study was reported in a book published by the Geneva Station in 1971.

Professor Lienk retired in 1983 and was named professor emeritus. In retirement he continued to make Geneva his base of operations. While he did some traveling and was active in several community organizations, he spent a considerable amount of time at his office and laboratory at the Geneva Station. In fact, he visited his office just a week before his death.

Sieg was a friendly, cooperative, department-loyal person who was well liked by the staff at all levels. For his fun-making talents, he usually became the life of the party at departmental social affairs. He will be missed by his

many friends. That there were many, was evident from the unusually large numbers of persons who attended his memorial service.

He is survived by his widow, Mary, and a daughter, Laura Lee Lienk, of Watsonville, California. He was predeceased by his first wife, Laura Irene Ross Lienk, and a daughter, Marta Ross Lienk, who were killed in an automobile accident in 1965.

Edward H. Glass, George A. Schaefers, Paul J. Chapman

Paul Martyn Lincoln

January 1, 1870 — December 20, 1944

Paul Martyn Lincoln, Professor Emeritus and former Director of the School of Electrical Engineering, died on December 20, 1944. He was born in Norwood, Michigan on January 1, 1870, and was educated at Western Reserve and at Ohio State Universities, from the latter of which he received the degree of M. E. in E. E. in 1892. Immediately after graduation he joined the Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pa., and entered upon his chosen life work of Electrical Engineering.

In 1895 Professor Lincoln was selected for the position of Electrical Superintendent in Charge of Water Power Development with the Niagara Falls Power Company at Niagara Falls, N. Y. Hydroelectric development was then in its infancy, and the amount of power generated, transmitted and distributed by this first plant was so far in excess of anything accomplished up to that date as to be unique; there were many problems and the success of the venture was due in no small degree to the initiative and judgment of Professor Lincoln. The first transmission line was constructed under his supervision and was used to transmit power from Niagara Falls to Buffalo. Also while with this company he developed the synchroscope, an instrument universally used since that time by all power companies.

In 1902 Professor Lincoln returned to the Westinghouse Electric and Manufacturing Company, and for some years was in charge of the Power Division of the Engineering Department. In 1910 he was appointed General Engineer for the company and he held that position until 1919. From 1911 to 1915 he was also a staff member in the Electrical Engineering Department of the University of Pittsburgh. In 1919 he resigned his position with the Westinghouse Electric and Manufacturing Company and joined the Lincoln Electric Company of Cleveland as a Consulting Engineer. In 1922 he was called to Cornell University as Director of Electrical Engineering and served in that capacity until 1938 when he was appointed Professor Emeritus.

Professor Lincoln organized the Lincoln Meter Company, Ltd., of Toronto, Canada and the Lincoln Meter Company, Inc., of Springfield, Ill., to develop commercially his demand meter patents. This work was highly successful, particularly in Canada where his type of demand meter became the standard. In 1938 he organized the Therm Electric Meter Company in Ithaca, N. Y., to develop commercially a new form of thermal demand meter.

Professor Lincoln was a member of several scientific and engineering societies and of the Board of Management of the Worlds Congress of Engineers (1923-25). In 1902 he received the John Scott Medal Award from the City of

Philadelphia, upon the recommendation of the Franklin Institute, for his invention of the Synchroscope. In 1933 he was awarded the degree of Doctor of Engineering from Ohio State University.

Professor Lincoln was always very active in the American Institute of Electrical Engineers. He served successively as Manager, as Vice President and as President in 1914-15. He was active on many of the Institute committees, particularly those pertaining to power stations, protective devices, transmission and distribution of electricity. He was also a member of the Edison and Lamme Medal Committees and the Board of Award of the John Fritz Medal.

By his high standards of professional and personal ethics, Professor Lincoln won the respect of students and faculty alike, yet he was close to the hearts of all who knew him in warm human understanding, friendship, and loyalty. He will long be remembered for his indomitable courage, his steadfastness in pursuit of truth and his sincerity of purpose throughout all the pursuits of his life.

Paul Lincoln gave unstintingly of his energy whether at work or play. He was ever concerned with the welfare of humanity, and brought himself to the task of discipline only when no alternative might be found. He was most sensitive to the suffering of people in war and in peace, and was all in all a man in the highest and broadest sense of the word. Cornell and the engineering profession will long remember the influence of his full devotion to their welfare and progress.

Ethel S. Little

April 10, 1892 — February 3, 1985

Ethel Little was born in the town of Tolono, in Champaign County, Illinois. She grew up with three brothers on the family farm and attended the University of Illinois, where she earned the degrees of Bachelor of Arts in 1917 and Bachelor of Science in 1919. She received the degree of Doctor of Medicine from the University of Illinois College of Medicine in 1921. Following an internship at the Henrotin Hospital in Chicago, she began a lifetime career in student medicine at the University of Illinois Health Service, where she practiced from 1922 to 1929. She then moved to the State Teachers College at Minot, North Dakota, where she remained until 1941, when she returned to Illinois to become a member of the Health Service at the State Teachers College at Charleston. She came to New York in 1943 to join the staff at the Cortland State Teachers College. In February 1945 she was appointed an assistant professor of clinical and preventive medicine at Cornell University.

At Cornell Dr. Little practiced general medicine with a particular interest in hearing disorders. For many years students with hearing complaints were referred to her for audiometry and evaluation. She was an enthusiastic participant in the Freshman Camp Orientation Program conducted by the University for several years. She became an associate professor in 1959. As a colleague she was a reliable, conscientious, and congenial partner. She was a member of the Tompkins County Medical Society and the Medical Society of the State of New York.

Dr. Little retired as professor emeritus in 1962. Following her retirement she maintained an interest in the library at Sage Hospital and worked for several years at keeping it up-to-date. She also returned to work at the Gannett Clinic on a temporary basis to substitute for regular staff members during times of illness. Her avocations included gardening; she was particularly interested in roses and was often seen in her garden on the shore of Fall Creek in Forest Home. Dr. Little was an avid bird-watcher and joined other like-minded persons in local and distant trips to observe them. She was a member of the First Unitarian Church of Ithaca.

In 1973 Dr. Little moved from Ithaca to a retirement center in Santa Fe, New Mexico. There she maintained her interest in gardening and was instrumental in obtaining the allocation of garden plots for members of her retirement community; her own was reportedly outstanding. She continued to take excursions for the observation of birds. She also worked as a volunteer in the gift shop of the Palace of the Governors Museum in Santa Fe.

Dr. Little remained active until November 1984, when she was hospitalized for an illness from which she did not recover. She died at the age of ninety-two. She was the last surviving member of her immediate family and is survived by a niece and several nephews.

We remember her as a diligent and conscientious physician and a good friend.

Paul H. Darsie, M.D.; Norman S. Moore, M.D.; Raymond Haringa, M.D.

Ta-Chung Liu

October 27, 1914 — August 14, 1975

Ta-Chung Liu, the Goldwin Smith Professor of Economics from 1964 to 1975, was born in Peking. After graduating in civil engineering at the National University of Communication in 1936, he came to Cornell to study railway engineering, earning the M.S. in 1937. At this time he began the study of economics with Fritz Machlup, who was then a visiting professor here. Machlup, who was a master teacher, so fired Ta-Chung's interest that he decided to become an economist, obtaining his Ph.D. here in 1940. After a year with the Brookings Institution, he joined the commercial section of the Chinese Embassy in Washington, rising to become deputy commercial counselor, in which capacity he participated in the Bretton Woods Conference in 1944.

In 1947 he went back to Peking as professor of economics at National Ching-Hwa University. Less than two years later, with the fall of Peking impending, he felt compelled to leave China at the end of 1948, returning to Washington to join the staff of the International Monetary Fund. Subsequently, Machlup brought him to Johns Hopkins University, where he was lecturer in economics until 1958. That fall he accepted appointment as professor of economics at Cornell.

Professor Liu's second period at Cornell proved enormously productive, earning him an international reputation in quantitative economics and as a specialist in the economics of mainland China. Besides at least a dozen papers in leading professional journals, he published three books: *Manufacturing Production Functions in the United States, 1957* (with George H. Hildebrand); *The Economy of the Chinese Mainland* (with Kung Chia Yeh); and *Economic Trends in Communist China*. At the time of his death, he had developed the only monthly econometric model of the United States economy in some pioneering work supported by the National Science Foundation. His estimate of the separate influences of labor, capital, and technology upon output was also a highly original undertaking, while his work concerning the national income of Communist China remains the basic study in the field a decade after its publication.

Mention should also be made of his major contributions to economic policy in Taiwan, for which he was awarded the Order of Bright Star with Grand Cordon, Second Class, in 1970. Together with Professor Sho-Chieh Tsiang of Cornell, he laid the basis for the substitution of a floating exchange rate for the earlier system of exchange control, adopted as policy in 1958. In 1964 he was invited to assist in planning policy, which led him to devise ways to improve basic economic statistics. In turn, these led to his refinement of estimates of national income, to the

building of an input-output table, and to the development of an econometric model of the economy of Taiwan. During 1968-70 he served as chairman of the Commission on Tax Reform. Among his many accomplishments in this last office were reform of the income tax law, liberalization of depreciation allowances, and computer control of tax-law enforcement. Beyond these significant contributions, Ta Chung also made many other major proposals, among them a value-added tax, a free money market, and deferral of a scheme for building an integrated steel industry until the economy had grown large enough to support one on an economical scale.

Professor Liu's standing as an expert economist was also signaled by his service as consultant to the Rand Corporation; as a member of the Committee on the Economy of China, established by the Social Science Research Council; and as a fellow of the Econometric Society.

Finally, his administrative services to the University also went well beyond the minimum call of duty. During 1966-69, he created and directed the Cornell Program on Comparative Economic Development. In 1970, at a time of upheaval in the University, he generously responded to the urging of his colleagues and reluctantly accepted the post of chairman of the Department of Economics. For nearly five years he strove with all of his remarkable reserves of energy and intelligence to build an organization of the highest professional standards.

Ta-Chung left a very substantial professional legacy of international importance. He also left an unmistakable and lasting impression upon those who knew him, as a man of ebullience and good temper, not without an American sense of humor, yet driven by fidelity to his professional goals and complete devotion to duty. He was never without fresh and important ideas. He was also a stern critic, a severe disciplinarian, and a rigorous economic theorist—all in the service of the best standards of scholarship. There was nothing mediocre about him.

T.-C. Liu served this University loyally and with great distinction during his many years on the campus.

Sho-Chieh Tsiang, Peter D. McClelland, George H. Hildebrand

J. Randall Livermore

December 16, 1890 — April 22, 1982

J. Randall Livermore was appointed professor of plant breeding emeritus on February 1, 1955. He retired after thirty-three years of service in extension, teaching, and research at the New York State College of Agriculture and Cornell University Agricultural Experiment Station. He was born on December 16, 1890, at Watertown, Massachusetts, and received his B.S. degree from Cornell University in 1913. Following graduation he was engaged in farming, returning to Cornell in 1921 as a graduate student in the Department of Plant Breeding with an additional interest in plant physiology and agronomy. He received his Ph.D. degree in 1927.

Dr. Livermore's first professional assignment was as an assistant in extension, a position he filled from 1922 to 1928. He was made an assistant in research the following year, and in 1929 he was appointed assistant professor of plant breeding. In 1939 he was promoted to associate professor.

His principal interests for the following quarter of a century were research on the Irish potato and teaching biometrics. In his efforts at plant breeding he endeavored to produce potatoes with excellent eating and cooking qualities as well as high-producing, disease- and insect-resistant types. He was particularly successful in obtaining a high percentage of potato seed set, a problem that at that time required specialized techniques. For a while he gave attention to the study of mutations in the potato and to the isolation of superior strains of the then common varieties of potatoes. Selection work was done directly with potato growers in various parts of the state.

For about twenty years Professor Livermore taught a graduate course in biometry, the organization and teaching of which was pioneering work in the application of statistical method to the analysis of biological data. During that period graduate students from most departments of the College of Agriculture other than those in the social sciences regularly received their initial instruction in statistical methods in Dr. Livermore's course. They numbered well over one hundred a year during the years when the writers were among the students. It is likely that Professor Livermore's most lasting contribution was the training of students from many fields in the proper use of statistics as an aid in the interpretation of experimental results.

In all his work Professor Livermore showed keen analysis and sound judgment, all of which led to numerous publications on his potato-breeding results and on the methodology of experimentation and plot technique.

Dr. Livermore twice served as president of the Potato Association of America. He was a member of Phi Kappa Phi and Sigma Xi and a fellow of the American Association for the Advancement of Science.

One extracurricular activity should be mentioned. Dr. Livermore was a longtime member of the Ithaca Bowling Association and an efficient secretary for a period of time. He was a member of the self-styled university team that topped the league for six years. Two cups in the Cornell trophy room testify to this effort.

Following his retirement in 1955 Professor Livermore lived in Melbourne and Altoona, Florida, until his death, on April 22, 1982, in Eustis, Florida. He was married to Helen Myers Fraser, who died on February 4, 1985.

Henry M. Munger, Royce P. Murphy, Robert L. Plaisted

Harry John Loberg

October 28, 1905 — February 22, 1965

Cornell University, on February 22, 1965, was deprived of a dedicated and erudite scholar, teacher, and administrator in the death of our cherished colleague, Professor Harry John Loberg, fifty-nine, Professor of Mechanical Engineering and the Director of the University's Sibley School of Mechanical Engineering. His absence from the council chambers of the University will be keenly, soberly, sorrowfully and genuinely felt. The sudden death of Professor Harry John Loberg of a heart attack was a melancholy occurrence to his numerous friends in this community, his family, and his professional colleagues. He will be deeply missed by all who knew him.

Funeral services were held at Cornell's Sage Chapel Thursday, February 25, 1965. A large number of his friends shared the solemn ceremony with his beloved family.

Professor Harry Loberg was born in Norway, October 28, 1905, and became a naturalized citizen of the United States in 1913. He attended the United States Naval Academy from June, 1923, to June 30, 1926, and resigned because of faulty eyesight. He received the M.E. degree from Cornell in 1929 and the M.S. degree in 1936.

After working as a sales and methods engineer for five years in Massachusetts and Michigan, he joined the Cornell staff in 1934. From 1946 to 1950, he was head of the Department of Industrial and Engineering Administration. He was named Director of the Sibley School of Mechanical Engineering in 1950, a post he held until his death.

For three years during World War II, Professor Loberg was in charge of the Navy Diesel School and Navy Steam School on campus, which trained about 2,200 naval officers. As a director of training of the National Machine Tool Builders' Association and National Machine Tool Distributors' Association, he developed a program to meet the needs of the small firms in the industry, with the objective of training qualified sales engineers through annual programs at Cornell and Purdue Universities.

Professor Loberg served as chairman of the governing board of the Center for Housing and Environmental Studies (formerly the Housing Research Center) from the time that Center was established in 1950 until his death. Many of his colleagues will also remember him for his significant contributions and deep interest in the improvement of the Statler Club, of which he was president. He also rendered important services to the University over the years by serving on many committees.

Professor Loberg was the author of three books in his field, a member of the American Marketing Association, Pi Tau Sigma, Tau Beta Pi, and Phi Kappa Phi.

Professor Loberg was elected a fellow of the American Society of Mechanical Engineers in 1963; he served that group in 1954 as chairman, Materials Handling Division; in 1956 as chairman, Safety Division; and in 1959 as chairman of the Southern Tier Section. He was also a member of the Production Engineering Division.

Until moving to Ithaca about ten years ago, he served in the Township of Ulysses on the Boy Scout committee and the school board.

Professor Loberg is survived by his wife, Aline Johnson Loberg; four sons, Paul W. of Staten Island; Harry J. of Los Angeles, California; and Peter E. and Eric L., both now attending Cornell; two granddaughters; two brothers, Arthur T. of Muskegon, Michigan, and Ole M. Loberg, Syracuse; two sisters, Mrs. Esther Allen of Muskegon, Michigan, and Mrs. Constance Vanderwier of Fremont, Michigan; and several nieces and nephews.

Professor Harry John Loberg will be remembered not only for his leadership in his field, but also because of his friendliness, boundless enthusiasm, patience, and humor. He was an avid follower of Cornell sports. His engaging and genial personality and his sound judgment, unquestioned dependability, and integrity endeared him to everyone.

We share with his family our deep sense of personal loss and the memory of a faithful, loyal, and gracious friend.

*There is nothing so precious as a faithful friend and
no scales can measure his excellence.
A faithful friend is an elixir of life and those who
fear the Lord will find him.*

N. W. Abrahams, G. H. Beyer, J. R. Moynihan

Franklin Asbury Long

July 27, 1910 — February 8, 1999

Frank Long's research made fundamental, unique contributions to a surprising variety of important scientific subjects by applying his extensive background and deep intuition in physical chemistry to organic reactions, in combination with his creative instrumentation skills and keen awareness of new experimental techniques. These emerging research areas included basic reaction mechanisms of organic molecules in solution and unimolecular dissociation of gaseous ions. He was elected to the National Academy of Sciences in 1962. However, these broad interests also led him into leadership positions in academe, government, industry, and public affairs, especially his advocacy of international arms reductions. He served on the President's Science Advisory Committee for Presidents Eisenhower, Kennedy, and Johnson. Probably his most publicized appointment was the one that he did not receive as Director of the U.S. National Science Foundation when President Nixon learned at the last minute of Long's criticisms of the antiballistic missile system.

Professor Long, born in Great Falls, Montana, received B.A. and M.A. degrees from the University of Montana in 1931 and 1932. He did graduate work in physical chemistry at the University of California, Berkeley. After receiving his Ph.D. degree in Chemistry in 1935, he was an Instructor there, and at the University of Chicago, becoming an Instructor in the Chemistry Department at Cornell in 1937. He served as a research supervisor for the Explosive Research Laboratory of the National Defense Research Committee from 1942-45. He returned to Cornell as an Associate Professor and was promoted to full Professor in 1946. When Peter J.W. Debye stepped down as Department Chair in 1950, Long took over and served a record ten years. He was Faculty Trustee, 1956-57, and he served as Vice President of Research and Advanced Studies at Cornell, 1963-69. In 1969, he began a four-year tenure as Director of the new Cornell academic program, Science, Technology and Society, designed to study the impact of science and technology on the problems facing U.S. society. Between 1969-79, he was Henry R. Luce Professor of Science and Society, and between 1976-79, he was Director of the Peace Studies Program. He was a member of the corporate Board of Directors for the Carrier Corporation, United Technologies Corporation, and the Exxon Corporation, for which he was also a member of the Executive Committee. In 1985, he "retired" to serve as Adjunct Professor of Chemistry and Social Sciences at the University of California, Irvine, continuing to be active on national and international committees.

Frank Long was one of the pioneers who showed organic chemists that they had to think carefully about such physical chemistry concepts as nonideality, activity coefficients, and ion pairing if they were interested in the

mechanisms of aqueous reactions. These concepts formed the foundation of the worldwide interest in mechanisms of solvolysis reactions that began in the late 1940s and continued for nearly three decades. Because many aqueous organic reactions occur in media of high acidity, it soon became clear to mechanistic chemists that a supplement to the pH scale of dilute solutions would be necessary. When Louis Hammett proposed the H_0 acidity function to accomplish this end, Frank immediately saw the power of the approach, and put it to good use in his studies of the hydrolyses of lactones, esters, and acetals. He extended the concept to mixed and nonaqueous solvents, and proposed alternative acidity functions for use under specialized conditions.

Many of the mechanistic descriptions that we teach our undergraduates can be traced back to Frank Long's work. Long and his coworkers used the then little-known technique of nonradioactive isotopic labeling to tackle these problems. Early isotope labeling studies relied on the use of radioactive tracers, with chemical degradation of reaction products being used to locate the labels. Avoiding the problems of radioactive labeling, Long was an early user of mass spectrometric techniques with stable isotopes to get the same information faster by degradation of the labeled molecule within the instrument.

Long also studied the change in kinetics that could accompany the introduction of such stable isotopes either into the molecule of interest or the solvent in which it was undergoing reaction. His work on H_2O/D_2O solvent isotope effects showed the way to generations of researchers studying the mechanisms of biologically relevant aqueous reactions. The important "proton inventory" techniques that have elucidated some essential enzymatic mechanisms can trace a good part of their ancestry to Long's work.

Mass spectrometry was previously used largely for the determination of accurate atomic weights and for quantitative analysis of hydrocarbons. Characterizing the products of Long's organic reactions involved vaporizing these into the mass spectrometer to form gaseous organic ions; Long was one of the early pioneers studying the unimolecular decompositions of these ions, particularly for lactones, alcohols, and esters. In a first for spectrometry, he and Friedman used this chemistry in 1953 to help define the molecular structure of ketene dimer, a highly publicized controversy of the time. His pioneering physical chemistry studies of these ions included appearance potentials, heats of formation, and the statistical theory of their dissociation. Notable was his classical example of the nonergodic dissociation of ionized fluoroethylene that occurs before the input energy can be statistically randomized.

Frank Long's interests in arms control and other public issues began early, focused by his World War II research for which he was awarded the U.S. Medal of Merit. In 1949-52, he was member and Chairman, Advisory Committee for Chemistry, Office of Naval Research; and Trustee of Associate Universities that oversaw Brookhaven National

Laboratory. In 1953-59, he was Consultant, Ballistics Research Laboratory, Department of the Army, Aberdeen, Maryland. In 1956-60, he was a member, Science Advisory Board, Department of the Air Force. In 1957-60, he was a member, Ballistic Missiles Advisory Committee, Office of the Secretary of Defense; and in 1959-63, Chairman, Chemistry Advisory Committee, Air Force Office of Scientific Research.

He was a member of the President's Science Advisory Committee under Presidents Eisenhower, Kennedy, and Johnson. When the U.S. Arms Control and Disarmament Agency was formed in 1962, he was its first Assistant Director for science and technology. As a member of the U.S. group that went with Averell Harriman to the Soviet Union in 1963, he took a leading role in the effort of the U.S., the UK, and the Soviet Union to negotiate a comprehensive nuclear test ban treaty. Intense negotiations over an extended period resulted in agreements on almost everything except the number of on-site inspections; the Soviets insisted on three per year versus the U.S. demand of seven. The historical compromise, the Limited Test Ban Treaty, prohibited testing in the atmosphere, the oceans, and in space, but permitted underground testing. He was a Director of the Arms Control Association, 1971-77, and Co-Chair of the U.S. Pugwash Steering Committee, 1974-79. The 1995 Nobel Peace Prize was awarded to the Pugwash Conferences. He was a member of the Board of Directors of the Albert Einstein Peace Prize Foundation and a member of the Board of Trustees of the Fund for Peace.

His aggressiveness in arms control efforts is best illustrated in his opposition to the antiballistic missile project, as delineated in a 1968 publication stating that the ABM missile development would create "strong pressure toward acceleration of the arms race." In 1969, he was nominated by a board of scientists to be Director of the National Science Foundation. He went to Washington, D.C. one morning, presumably to receive the appointment from President Nixon in the White House Rose Garden that afternoon. However, upon arrival, he was told that the ceremony was cancelled. International publicity of the event produced an immediate outcry from a variety of concerned citizens as well as scientists. Later the White House relented but Long declined the President's offer.

Long also played a major role in science and technology transfer to underdeveloped nations, including India, South Korea, Latin America, Malaysia, and Indonesia, in part as a member of the National Academy of Sciences Board on Science and Technology for International Development. He was U.S. Co-Chairman for the Indo-U.S. Subcommittee on Education and Culture; a member of the U.S. Overview Committee for Indo-U.S. Science and Technology Initiative of the U.S. National Research Council started in 1983 by Prime Minister Indira Gandhi and President Ronald Reagan; a member of the Council on Foreign Relations of the American Association for the Advancement of Science, 1964-89; and Co-Chairman, 1972-76, of the Joint U.S.-Korea Advisory Committee for

Science. In 1975, he received the Order of Civil Merit and Dongbaeg Medal from the President of the Republic of Korea for contributions toward the development of science and technology in Korea.

Only a few prizes are available to scientists for outstanding public service. Two of the most prestigious are the Charles Lathrop Parson Award from the American Chemical Society that Long received in 1985, and the Philip Haug Abelson Prize of the American Association for the Advancement of Science that he received in 1990. His wife, Marion Thomas Long, died in 1992. He is survived by a son, Franklin, a chemist, of Claremont, California; a daughter, Elizabeth, a Professor of Sociology at Rice University; a brother, George, of Portland, Oregon; and a grandson.

Barry K. Carpenter, Jerrold Meinwald, Fred W. McLafferty

Karla Longrée

September 7, 1905 — September 26, 1996

Karla Longrée was born in the Rhineland area of Germany and received college training there leading to the degree of Doctor of Agriculture. She served as a research associate in the Biological Reichsinstitute at Berlin-Dahlem before immigrating to the United States in 1933. She received a Ph.D. degree from Cornell in 1938 and became a United States citizen in 1939.

Beginning in 1941, Dr. Longrée taught in the area of food science at the Hampton Institute in Hampton, Virginia. She returned to Cornell in 1950 as a research professor in the Department of Institution Management (New York State College of Human Ecology). Her research efforts were directed at the microbial quality of food prepared in quantity and she studied conditions under which potentially hazardous menu items might lead to food poisoning outbreaks. She devised methods that would assure microbiological safety of food items prepared under conditions of large quantity food service and developed quick cooling devices which cut the time required to cool cooked foods to a point where they could be refrigerated. She also discovered that high acid ingredients such as citrus juice and salad dressing inhibited bacterial growth and on this basis developed procedures for quantity cooking that minimized the dangers of food poisoning.

Results of Dr. Longrée's research were published in professional journals such as *The Journal of the American Dietetic Association*, *The Journal of Food Protection*, *Food Technology* and others. She also was a consultant in the development of a film on food sanitation.

She developed and taught courses in food sanitation and served as a major professor for many graduate students who were preparing to work in that area. These students have filled leadership roles in this country and abroad.

She is the author of two books, one a college text entitled *Quantity Food Sanitation*; now in its fifth edition in collaboration with Gertrude Armbruster. This book provides basic information for the understanding of the factors which contribute to foodborne illnesses and shows ways to reduce or eliminate this threat by suggesting appropriate methods of storage, preparation, heating and hot-holding, cooling and cold-holding of foods with emphasis on institutional applications. Pertinent literature is cited and discussed. Emphasis is given to time-temperature control, an area that was the focus in much of Dr. Longrée's research. *Sanitary Techniques in Food Service*, a second book was written in cooperation with Professor G. Blaker of Colorado State University and is written for the vocational level of teaching.

Dr. Longrée had many interests and was a talented craftsman using silver and enameling techniques to design jewelry. She also enjoyed the outdoors, hiking and gardening. She had a great love for music, in particular the classics. After retirement, she traveled widely including Europe and Central America.

In 1986, Dr. Longrée moved to the Highland Farms Retirement Community in Black Mountain, North Carolina, where she continued to reside.

Raymond Fox, Bernice Hopkins, Gertrude Armbruster

Clifton W. Loomis

January 28, 1914 — December 2, 1994

Clifton W. Loomis, Professor Emeritus of Farm Management, died December 2, 1994, at the age of 80. He was born and raised in the rural New York community of Burlington Flats. Much of his professional life was spent in educational work with farm families in Upstate New York communities similar to the one where he grew up.

Clif received his Bachelor's degree from the College of Agriculture at Cornell in 1937. His first employment was as an Assistant County Agriculture Agent in Delaware County, New York. He was called to active military service in 1940 and returned to Agricultural Extension work in 1946, serving five years as County Agriculture Agent in Schenectady County, New York.

Returning to Cornell for graduate study, he received his M.S. degree in 1951 and Ph.D. degree in 1953. Part of the degree requirements were fulfilled at the University of Illinois. From 1953-55, he was a member of the faculty of Agricultural Economics at the University of Missouri. Clif was appointed Assistant Professor of Farm Management at Cornell in 1955, was promoted to Associate Professor in 1957, and became Professor in 1964. He served as Department Extension Leader in Agricultural Economics from 1971-75.

In 1964-65, while on sabbatical leave, Professor Loomis taught and conducted research at The American University of Beirut in Lebanon. In 1970-71, while on leave, he served as Advisor to the President of The Agricultural Development Fund of Iran.

Work in Cooperative Extension was at the center of Clif's professional career. He spent most of a decade as a County Extension Agent. From the time he joined the faculty at Cornell in 1955 to his retirement in 1975, the bulk of his time was spent teaching and counseling with County Extension Agents and farm families. He was extremely effective in helping farmers recognize business problems and improving their management skills.

Professor Loomis provided the leadership in developing the electronic farm accounting system known as CAMIS (Cornell Agricultural Management Information System), used by the New York State Extension Agents in their work with farmers and agribusiness persons. CAMIS proved to be an efficient computerized accounting system and management tool. He shared his experiences with CAMIS with other professionals who were developing similar computerized systems for farmers and agribusiness persons in the Northeast and throughout the United States.

Clif had a long and deep rooted commitment to the military. When he graduated from Cornell in 1937, he was commissioned an R.O.T.C. officer and was called to active duty in 1940. From 1940-42, he served as an Instructor in Military Science at Cornell. During World War II, he was an operations officer with a field artillery battalion in France and Germany, receiving decorations including The Purple Heart and The Bronze Star and rising to the rank of Colonel. Following World War II, he remained active in the Army Reserve. As late as 1969 and 1970, he spent leave time with the New York State Headquarters of the Selective Service System. With an ongoing commitment of his own time, he backed his belief that a strong military is essential to the well being of the Country.

Professor Loomis, a bachelor, is survived by a brother, two sisters, nieces, and nephews.

C. Arthur Bratton, James C. Pratt, Robert S. Smith

John Kasper (Jack) Loosli

May 16, 1909 — June 30, 2002

John Kasper (Jack) Loosli, Professor of Animal Nutrition, Emeritus, renowned researcher and former Head of the Department of Animal Science, died in Gainesville, Florida on June 30, 2002 at the age of 93.

Born in Clarkston, Utah, Jack graduated with a B.S. degree from Utah State College in 1931. He continued his studies at Colorado A and M College, receiving the M.S. degree in 1932. After a three-year stint as an Instructor at the College of Southern Utah, he came to Cornell to study animal nutrition under Professor L.A. Maynard, earning his Ph.D. degree in 1938. He spent a year with the Bureau of Biological Survey. His distinguished 35-year career on the faculty at Cornell began with his appointment as an Assistant Professor of Animal Nutrition in the Department of Animal Husbandry in 1939. In 1945, he succeeded Maynard as leader of the department's Animal Nutrition Laboratory, which was housed in Stocking Hall before Morrison Hall was built, a responsibility he held until 1963 when he became head of the department.

A modest, unassuming, tactful and very patient man with an extremely high sense of duty, Jack was respected by students, faculty and colleagues worldwide. A prolific researcher and writer with over 400 scientific and popular publications, he trained some 50 graduate students, many of whom assumed important positions in various parts of the world. His research interests and activities were diverse and often involved fundamental questions related to nutrition and metabolism. He was not satisfied that research had been completed until the results of experiments were published in reputable journals, and was especially happy when they were applied in the animal industries to improve the efficiency of livestock production. Examples of contributions by Loosli and his team include development of clear experimental evidence that rumen bacteria synthesize all of the essential amino acids; establishment of the relationships of selenium and tocopherol to nutritional muscular dystrophy in animals; determination of amino acid requirements for growth of swine; assessment of the value of antibiotics as growth stimulants in dairy calves; demonstration of the importance of fat in the diets of lactating cows; and determination of the value of urea in ruminant feeds.

He was honored by both the American Society of Animal Science and the American Dairy Science Association with their most prestigious research awards, and later served as president of both professional organizations. He also served as Editor of the *Journal of Animal Science*, and Associate Editor of the *Journal of Nutrition*. Other professional societies of which he was a member include the American Institute of Nutrition, the American Chemical

Society, the Society for Experimental Biology and Medicine, the American Association for the Advancement of Science and the British Society of Animal Production. As a widely recognized authority, he played an active role as a member and chairman of subcommittees of the National Research Council of the National Academy of Sciences charged with preparation of bulletins on the nutrient requirements of animals. In 1956, he joined L.A. Maynard as co-author of the then widely used text *Animal Nutrition*, a relationship that continued through several subsequent editions. For many years, he taught an upper class and graduate level course in fundamentals of animal nutrition.

Jack Loosli was a master at training and developing graduate and postdoctoral students. Some of his methods of encouraging careful observation and independent thought are legendary, and among his former students stories of individual encounters and lessons learned abound.

Jack's modus operandi while serving as head of the department reflected his philosophy of hiring faculty with outstanding potential and giving them the freedom to pursue their own research interests. His expectations were high but except in unusual circumstances, he did not attempt to direct even the newest members of the faculty in anything but the broadest sense. He was, however, keenly aware of the importance of getting new faculty off to a good start, and some of us benefited from his generosity in steering our way graduate students who had been attracted to Cornell by his reputation. It was during Jack's administration that the name of the department was changed to Animal Science, acknowledging the fact that much of the ongoing research and other activities were more accurately described as science than as husbandry. He was also department head when fire destroyed the dairy barns behind Morrison Hall, triggering a move to purchase a large tract of land and develop off-campus dairy and livestock facilities at a new Teaching and Research Center south of Dryden.

Over the years Jack devoted a lot of time and personal concern to service activities at local, national and international levels. He was a Rotarian and an active member of his church. He and his wife, Reha, frequently entertained colleagues and guests, often including international scientists. Many of us as young faculty members met famous researchers from abroad in a social setting while dinner guests at the Loosli home. Jack was a Fulbright lecturer in Australia, a Visiting Professor at the University of the Philippines, the University of Ife and the University of Ibadan in Nigeria, as well as the IRI Research Institute in Brazil. He served on many committees, including the Secretary of Agriculture's Committee on Agricultural Science, and was a consultant to the Walter Reed Medical Center, and to USAID.

When he retired from Cornell in 1974 he moved to Gainesville, Florida, where for several years he was affiliated with the University of Florida in a number of capacities that utilized his administrative and editorial talents and

experience. During much of his life, even at retirement, his youthful appearance belied his chronological age.

Jack was preceded in death by his wife of 52 years, Reha Johnson Loosli. Survivors include his three children, Ellen Loosli Farnsworth of Murtaugh, Idaho; John A. Loosli of Gainesville, and Anna Loosli Langford of Gainesville; twenty-one grandchildren and ten great-grandchildren.

Ruby M. Loper

January 12, 1901 — January 17, 1990

Ruby M. Loper was born in rural Douglas, Nebraska, where she developed a positive work ethic and a strong and sympathetic understanding of her fellowman. A dedication to teach others in ways to improve their lives was formally begun in 1925 when she became a student and draftsman in the College of Engineering and Architecture at the University of Nebraska, Lincoln, Nebraska. It is believed she is the first woman to be graduated from that college, and in 1934 was appointed assistant agricultural engineer, a position she held until 1946. She was a member of the Nebraska extension staff for 21 years. She owned Nebraska farmland all of her adult life and identified with the problems of farm ownership and management. One part of her early Nebraska extension career was to survey farms for contours and terraces, a new practice at that time, to prevent soil erosion.

In 1946 Professor Loper joined the Cornell faculty as extension architect with a dual appointment in the Department of Housing and Design in the New York State College of Home Economics, and the Department of Agricultural Engineering in the New York State College of Agriculture. She was the first woman to hold this position in New York State.
