Background

A Brief History of the Cornell University Faculty Memorial Statements

Prologue

An Essay by Gould Colman (former Cornell University Archivist)

Comprehensive Index <http://ecommons.library.cornell.edu/handle/1813/17811>

A. All Statements (1868 thru 2009)

A composite file (30 MB) contains all the volumes and an embedded catalog that uses the Search command to make rapid, full-text searches. These searches can be for any substring of text, e.g., to locate individual memorial statements, text within the statements, the names of the authors of the memorials, birth and death dates.

Bookmarks and hyperlinks are provided. Double-click an entry in either column 1 or 2 to locate that entry within this composite file; double-click within column 3 to retrieve just that individual memorial statement as a separate PDF file (if you have an active Internet connection).

B. All Statements by Decades (1868 thru 2009) – formatted as books to be printed

The memorial statements have been assembled into volumes of a size that can be bound conveniently as books: Vol. 0, Prolog and Index; Vol. 1, 1868-1939; Vol. 2, 1940-1949; Vol. 3, 1950-1959; Vol. 4, 1960-1969; Vol. 5, 1970-1979; Vol. 6, 1980-1989; Vol. 7, 1990-1999; Vol. 8, 2000-2009.

Bookmarks and hyperlinks are provided. Only in the CD version may you double-click an entry within columns 1 or 2 to open that memorial in another file on the CD (all of which are stored within a common folder or directory).

C. All Statements Individually (1868 thru 2009)

With an active Internet connection, use the comprehensive index (page viii, Vol. 0) to open CD-based files for individuals.

Bookmarks and hyperlinks are provided. Double-click an entry in the Index listing to retrieve that individual memorial statement as a separate PDF file (if you have an active Internet connection).

A Brief History of the Cornell University Faculty Memorial Statements

From its founding, the Cornell University Faculty has had a practice of recording a tribute to its members upon their deaths. The first and second such entries in the faculty minutes were for [William C. Cleveland](#), Professor of Civil Engineering (d: January 16, 1873) and [Ezra Cornell](#), Founder of the University and President of the Board of Trustees from its founding in 1863 until his death on December 9, 1874. Since 1938, rather than formulating these tributes as resolutions that were adopted by the Faculty and by the Board of Trustees, these memorials have been published in a booklet that is shared with the families of the deceased faculty member and with the University Faculty. With the 1971-1972 booklet, the name was changed from *Necrology of the Faculty of Cornell University* to *Memorial Statements: Cornell University Faculty*.

The memorial statements are authored by colleagues of the deceased faculty member. The chair of the authoring committee (usually the last-named of the authoring committee) is identified in the Faculty Records (minutes) or in the booklets. In some of the earlier memorial statements, the committee memberships were not listed in the booklets but can be found in the original faculty minutes. Some of the earlier statements are accompanied by statements prepared at the time of the person's retirement.

For many years after the Ithaca Division of the Cornell Medical College was transferred to New York City, the deceased members of the Medical College Faculty were included in the Memorial Statements. Since about 1980 the deceased members of the Cornell University Medical College (now Weill Cornell Medical College) are no longer included.

In 1941, following the transition from resolutions to booklets, Cornelius Betten, the then Dean of the Faculty, assembled all of these earlier memorial resolutions into a volume named *Necrology of the Faculty*, which has been preserved by the Division of Rare and Manuscript Collections of the Cornell University Library. In recent years these booklets have been prepared by Jean Morehouse, Judy Bower, Diane Lalonde and Karen Lucas.

That retrospective volume and all the memorial statement booklets since 1938 have been carefully restored as editable text and prepared in a common format for this collection as a project by the Internet-First University Press, led by J. Robert Cooke and Kenneth M. King. The scanning and optical character recognition services were provided by the Cornell University Library.

With permission of the present Dean of the University Faculty, William E. Fry, and the sponsorship of the Cornell Association of Professors Emeriti, all the memorial statements have been assembled and made readily accessible online. Proofreaders included: Barry B. Adams, Royal D. Colle, Gould P. Colman, P.C. Tobias de Boer, Ronald B. Furry, Donald F. Holcomb, Malden C. Nesheim, Porus D. Olpadwala and Milo E. Richmond.

This compilation includes all of the 1,463 memorial statements available and occupies about 3,500 pages.

J. Robert Cooke

Prologue

Cornell's University Faculty: Past as Prologue?

Cornell University Faculty resolutions recognizing a member's death began January 16, 1873, with "Whereas" being the prelude to citing the sterling qualities of the late Professor of Civil Engineering William C. Cleveland, among which were a "pure and amiable character." The resolution also names a faculty member who will join Mrs. Cleveland in accompanying the deceased to the cemetery. Resolution writing soon became routine, however, and several decades later drafting committees were preparing short biographical sketches, usually giving commendable personal qualities more attention than professional accomplishments, and directing a copy of the resolution to the subject's family.

Three categories of merit were noted when scholarly Professor of American Constitutional History Moses Coit Tyler died in 1899: academic knowledge ("wise conservatism with openness of mind"), social circle ("courtly of presence"), and daily life ("tender and loyal friend"). During the eighteen nineties when faculty families enjoyed lifetime use of forty-two homes located between Cascadilla and Fall Creeks, frequent contacts due to living in close physical proximity informed drafting committee members about their subjects' many facets. But that social cohesion gradually decreased after a trolley line constructed in 1898 opened the area north of Fall Creek to additional faculty families. With downtown Ithaca readily accessible by trolley, faculty social activity became intertwined with that of Ithaca families, notably at the Town and Gown Club. Located at the intersection of Cascadilla Creek and Stewart Avenue, it offered meals, reading material, and a game room to members until the "Great Depression" closed this facility.

"Manliness," frequently cited and considered highly commendable in nineteenth- and early twentieth-century memorial statements, reflects the status of campus women as supportive rather than primary actors in many campus activities. Their progress to academic positions approximating those of men, although aided by obtaining the right to vote in 1920, remained fitful. When the University's first female faculty member, Martha Van Rensselaer, died in 1932, the memorial resolution addressed its subject as "Miss" and "Director" (of the College of Home Economics) but never "Professor," as if President Schurman's refusal to endorse her 1905 appointment -- until Cornell's all male Board of Trustees approved admitting women -- still carried weight. In like manner the eminent author of *The Handbook of Nature Study*, Anna Botsford Comstock, is addressed solely as "Mrs." in a 1930 resolution that does not mention her belated appointment to a professorship only a year before retiring in

1922. However, appointments creating a department's first female professor have been commonly noted since the nineteen fifties, as was the case when Professor of Physics Barbara Cooper died in 1999. Eleanor Gibson's being the sole female faculty member in the College of Arts and Sciences in 1965 is attributed to ending a nepotism rule, James Gibson having also been a Professor of Psychology.

While most memorial statements cite classroom and research performance, faculty membership has not been a requirement. State college deans and directors have been members ex-officio, as have senior university librarians, military officers heading ROTC programs, medical doctors in the Cornell clinic, and prominent central university administrators. Faculty membership was not required, for example, when long-time University Registrar David Hoy ("Give My Regards to Davy") died in 1930, when long time University Secretary Woodford Patterson died in 1948, when Dean of Men Frank Baldwin died in 1979, and when Jack Lewis, beloved Director of CURW for nearly twenty years, died in 2002; all were commemorated with a resolution. Since Cornell University has extended far beyond the Ithaca campus for more than a century, teaching and research at the Medical College in New York City and Geneva Agricultural Experiment Station have been cited in numerous memorial statements; effective teaching in unconventional settings in every part of New York State also recognizes the educational outcome of extension-oriented faculty appointments in the state supported colleges.

The memorial statements range from a single paragraph, revealing next to nothing about its subject, to ten pages that recognize the many talents of Morris Bishop, the University historian who made meeting others a privilege for those so fortunate; and James Perkins, the University President whose significant contribution to Cornell's racial diversity, was recognized for a job called "demanding." Birth dates appear except in early statements that treat their subject's faculty appointment as a "call to Cornell," as if life began upon receiving a call that a graduate school mentor often initiated -- calls in the sciences and psychology having often followed additional studies in Germany.

While most professional activity reported in these memorial statements is entirely Cornell-related, lengthy Medical College memorials often cite accomplishments that combine a private practice with appointments at various medical organizations, among them Cornell; and College of Engineering memorial statements commonly include extensive industrial consulting activity among the subject's noteworthy accomplishments. Faculty members contributed to the expansion of America's economic and cultural interests in distant lands as well; CALS plant breeders and economists did noteworthy work in China during the nineteen thirties, and during the nineteen fifties thirty-five faculty members from various departments served in the Philippines.

Nineteenth-century statements rarely mention faculty ranking and dates of promotion, but these matters acquired greater significance among twentieth-century faculty members when the subject's service in various ranks was usually recorded. For rapid movement from initial appointment to full professor the two-year passage of William I. Myers, longtime CALS dean, may be unique; and George L. Coleman's single step from Instructor to Assistant Professor of Music Emeritus is also remarkable; while Medical College Professor William R. Williams thirty-three-year advance from lecturer may represent the other extreme.

Frequently mentioned personal interests include the welfare of Cornell's athletic organizations, bird watching, fishing, playing musical instruments, golf (especially in recent statements), religious organizations, and genealogical research. Authors aware of their subject's interest in family accomplishments may mention preceding generations ("illustrious family," "good English stock") and what adult children are doing. Lacking evidence of such interests following the death of Professor Halddor Hermannson in 1958, the author wrote: "Learning was his only bride, his business and his joy."

Heart attacks lead the count where cause of death is indicated, and the nine listed as dying from automobile accidents puts the machine atop other natural causes that usually pass without mention, such as suicide, cited only once, and alcohol not at all or only indirectly for those who understood an otherwise cryptic reference. Apparently Alzheimer's disease also carried a stigma; that affliction first appears in a 1992 resolution. Holding death at bay, however, is mentioned in two 1968 resolutions, once by living with gallstones "for about thirty years," and again through "heroism of Cyrano—proportions."

Memorial resolution authors, who number one to five, are named in the resolutions in the faculty minutes. Sometimes the Office of the Dean of the Faculty is credited with authorship. Consistent with the century-long trend toward academic specialization, recent resolutions are usually written by the subject's disciplinary colleagues, for a limited rather than general audience, although perhaps inadvertently by using technical language appropriate for a research paper and by referring to the subject with a familiar nickname. Omitting matters interesting to the university at large, Stuart Brown's service as Dean of Arts and Sciences and Vice President of Cornell, for example, and Marvin Glock's successful lawsuit to end mandatory retirement at sixty-five, reflect the author's own interests and concerns, such as noting the subject's ability to attract graduate students and outside funding, which in recent resolutions reflect current measures of academic success. The latter resolutions often end like a newspaper obituary by suggesting a monetary expression of remorse.

Where unusual characteristics receive attention, those considered desirable include the mind of George Lincoln Burr (“keen as a Damascus blade”), “a great character,” said of George Hamilton; “a lovable cuss and an unforgettable one,” described Cornell’s only Professor of Physical Education, Charles Young. George Suci’s encompassing compliment was “a mensch.” And Edward Misner’s pleasure from being “with a herd of good dairy cows” was apt. Where noted, undesirable qualities have been stated obliquely. “Best known as an orator at alumni functions” and “while not a prolific writer” cite the absence of publications; “no stranger to the Tompkins County Airport” refers to reputation-building through book tours and lectures (a quality cited elsewhere in the positive, “never assertive of self”); and “not easy” describes relations between a highly competent but strong-minded professor and fellow department members. Other strong-minded faculty members were said to be “unswayed by the pressure of vulgar opinion” and “impatient with the customary veneer of human civilization.” Like other university faculties, Cornell’s has experienced continuing tension between members trying to filter challenges to the existing order through Robert’s Rules and those who treat unfettered freedom of inquiry and expression as professional privilege. “Difficult though such individuals may be” one resolution states, on balance “the University would be a poorer place without their presence”; but references to thriving “on controversial issues” and to “wild ideas” are more pointed. As to the chief administrator’s position on such matters, the memorial resolution for long-serving Cornell President Jacob Gould Schurman asserts “in few American universities has the academic atmosphere been as free from strife and bitterness.” However, President Edmund Ezra Day apparently reacted to excessive academic complacency during the nineteen forties; his memorial resolution says, “He liked to shock, unsettle, disturb.”

If past is indeed prologue, as words engraved in stone on the National Archives building in Washington, D.C., suggest, these memorial statements demonstrate that Cornell University’s faculty will not fall prey to single-mindedness.

Lynne Snyder Abel

October 25, 1940 — November 29, 2006

Professor Lynne Abel (Classics), who served for a quarter of a century (1977-2003) as Associate Dean for Undergraduate Education in the College of Arts and Sciences, passed away after a courageous struggle with multiple myeloma. She is survived by her husband of 42 years, John Abel (Professor Emeritus of Civil and Environmental Engineering at Cornell), by her sister, Karen Lee and brother, William Snyder, by her daughter, Britt and son, William, and by her grandchildren, Will and Natasha. In accordance with her wishes, there was no memorial service after her death. Her memory was, however, honored posthumously by the College of Arts and Sciences Advisory Council on September 27, 2007, when the creation of the Lynne S. Abel College Scholar Endowment was announced. Another fund at Cornell, the Virginia K. and William Snyder Cornell Tradition Fellowship for under-represented students, was created by Lynne in collaboration with her mother and bears the names of her parents. It reflects the determination to support education and to work for social justice through which Lynne Abel, loyal to her parents, chose to give meaning to her life.

Lynne graduated from Cornell with a B.A. degree in 1962, a major in History and German, and spent a DAAD fellowship year in Freiburg, but her growing interest in ancient Greece led to graduate study in Classics at Stanford, where she studied Greek history with Antony Raubitschek and earned an M.A. degree in 1966 and a Ph.D. degree in 1974. When her husband, John, accepted a position in Civil Engineering at Cornell, she began working as an assistant to the Dean of Arts and Sciences in 1974 and an Adjunct Assistant Professor in Classics soon thereafter. In 1977, she assumed the position of Associate Dean for Undergraduate Education, adding to her duties as the dean in charge of the College Scholar and Independent Major programs, the responsibility of supervising the college's Academic Advising Center and Office of Records and Scheduling, as well as the task of chairing the two most important faculty committees of the college, Educational Policy and Academic Records. Over the years, Lynne became well known not only to the college's entering students, but also to their parents, conducting a legendary orientation session for parents and family members, and eventually developing a printed guide for parents that continues to serve the greater Arts College community. Countless students have testified to the importance that Lynne's kind, insightful, yet exigent counsel had for them both personally and academically.

During the late 1990s, Dean Abel's position was further enlarged to include the direction of the Arts College's Office of Admissions. In that role, she presided over an unprecedented merger that brought together the staffs of Admissions and Advising in a single organization, redesigning the positions of the assistant deans so that they

could be involved in all the stages of undergraduate students' careers. Lynne's incisive direction thus touched every aspect of the college's work—managing admissions and advising, guiding faculty members in their work on the curriculum and as academic advisors, and counseling the five deans with whom she worked on all the affairs of the college, including alumni relations, collaborations with the other undergraduate colleges at Cornell, and interactions with the university administration. She was, in sum, a leader of consummate judgment and all-pervasive influence.

Dean and Professor Abel was a scholar (her monograph on the Athenian legal procedure of Prokrisis was published in 1983) and teacher at heart, member of the Classics Department and the program in Women's Studies. Amidst her administrative work, she took great pleasure in teaching courses on the Greek historians and Ancient Constitutions, and co-teaching Women in Antiquity with Judith Ginsburg, Aristotle's Constitution of Athens with Kevin Clinton (who will never forget their conversations on classical antiquity during their 100-mile bicycle trip around Cayuga Lake), and the freshman honors seminar, "Initiation to Greek Culture," with Pietro Pucci. On her retirement from the Dean's office in 2003, she turned exclusively to teaching, and became Director of Undergraduate Studies in Classics.

In her classes, she sought to convey to students the understanding and pleasure she drew from a vast historical and artistic culture anchored in her devotion to opera, theater, music, literature, and disciplined scholarship. With John Abel's confident partnership, Lynne nurtured a far-reaching network of colleagues and friends whose bonds were an invaluable institutional resource for Cornell and Ithaca. Her personal generosity and her exemplary commitment to the academic community's well-being and integrity set an uncompromising standard. For the colleagues who survive her, the memory of Lynne Abel—reinforced by the self-effacing dignity she asserted in dying—will remain a source of inspiration.

Philip Lewis, Chair; Kevin Clinton, Pietro Pucci

Noble Wayne Abrahams

August 1, 1900 — February 15, 1991

Noble W. Abrahams began his second career in 1957 when he left his well-earned retirement as Captain in the U.S. Navy, to accept an appointment as assistant professor in the then Department of Engineering Drawing in the Sibley School of Mechanical Engineering. Noble was born in Dublin, Texas. He attended grammar school and high school in Washington, D.C. and in 1920 received an appointment from the State of Texas to the U.S. Naval Academy. Upon graduation from the Academy in 1924, he began his long and productive career as an officer in the U.S. Navy.

Until the end of World War II, his duty assignments were highly engineering oriented. He served at sea in many capacities, including being engineering officer on a number of ships—from destroyers to cruisers to battleships. His major shore-duty assignments were to the Philadelphia and New York Navy Yards, the San Francisco Damage Control School for Naval Officers, and the Philadelphia Naval Damage Control Training Center. At the navy yards he was responsible for the installation of machinery and the testing of all systems during the construction of a number of cruisers, and he commissioned and fitted out several other major vessels including the battleship U.S.S. Iowa. He organized, commissioned, and commanded both the damage-control schools. His last sea-going assignment was as Commanding Officer of the U.S.S. Amphion, a Fleet Repair Ship and the Flagship for the Commander of the Service Force, U.S. Atlantic Fleet.

Noble's post-war assignments included duty as Senior U.S. Naval Liaison Officer to the European Command Headquarters, Frankfurt and Heidelberg, Germany; Head of the Coordinated Procurement Branch of Procurement, Policy Division, Washington, D.C.; Chief Staff Officer, Military Sea Transportation Service, Western Pacific Area, Tokyo; Chief Naval Staff Officer with the High Command in Tokyo; and, finally, Intelligence Officer, Headquarters Potomac and Severn River Naval Commands.

Upon his retirement from the Navy in 1954, the Abrahams chose Trumansburg for their permanent residence and built a home overlooking Cayuga Lake, high on the hill just North of Taughannock Park. After a relatively short time, Noble decided that he was too young to simply sit and enjoy the view and that there should be some place nearby that would offer an interesting and challenging opportunity for using some of his experience and expertise. Fortunately for Cornell, he made contact with the Sibley School of Mechanical Engineering—where just such

an opportunity existed in teaching first-year mechanical engineering students descriptive drawing, mechanical drafting, and freehand drawing.

Professor Abrahams was a dedicated teacher who took a personal interest in each student. One result of his efforts and concern was his being a runner-up in the balloting, by freshmen, for one of the 1965 Philip Sporn Teaching Awards in Engineering. Another result was the founding of numerous life-long friendships with students and their families.

Noble officially retired from Cornell in 1967; but his talents were in such demand that he continued to work, on a year-to-year basis, until June 1970.

He continued to be very active as a citizen, devoting time and money to the development and growth of community institutions, the Church of the Epiphany, the Philomathic Library, and the Cornell ROTC.

Professor Abrahams is survived by his wife, Mary Barlow Abrahams; one daughter, Elaine Abrahams; a sister, Virginia Alleman; a brother, Otis; two grandchildren; and two great-grandchildren.

Bart Conta, Dennis G. Shepherd, Richard M. Phelan

Bristow Adams

November 11, 1875 — November 19, 1957

After an illness of nearly a year, Bristow Adams, Emeritus Professor in Extension Teaching and Editor for the Colleges of Agriculture and Home Economics, died November 19, 1957, at Ithaca, New York. Thus he ended a long and full life, for more than half of which he served Cornell University.

Professor Adams was born in Washington, D. C, November 11, 1875. He attended Washington Central High School and having early shown marked artistic ability, he studied at the Spring Garden Institute in Philadelphia and the Corcoran Art School in Washington. He later enrolled at Stanford University, graduating in 1900 with the A.B. degree.

Talents for both journalism and art found expression early in the life of Professor Adams. In 1892, at the age of seventeen, he was co-founder of the Pathfinder magazine and its associate editor until 1896. Following his freshman year at Stanford in 1897, he was appointed artist for Bering Sea Fur Seal Commission. The official report carried illustrations based on life sketches which he made on the Pribilof Islands. Also, while at Stanford, he founded the Chaparrel, the College humor magazine.

On his return to Washington in 1902, Professor Adams was engaged in a number of editorial activities. He was co-founder, and from 1903 to 1905, managing editor of Washington Life; he was editor of American Spectator 1905—1906; and at the same time, from 1902 to 1906, he was associate editor of Forestry and Irrigation, a position which brought him into close association with the Forest Service of U. S. Department of Agriculture and its leader Gifford Pinchot. This awakened his life-long interest in forestry and conservation.

In 1906 he joined the Forest Service as Forest Assistant and was soon promoted to Forest Examiner. His time was divided between field work, which included inspection of National Forests and the direction of fire fighters, and editorial duties under the direction of Dr. Herbert A. Smith. Adams was later put in charge of the office of information.

Adams came to Cornell University in November 1914 to be in charge of publications and information in the College of Agriculture, taking over the work in that field which had hitherto been handled as a part-time task in the Office of the Secretary. Here he started the mimeographed news service and changed the dress of the Extension Publications and Experiment Stations bulletins to make them more attractive. During the succeeding

thirty years, Cornell won more awards for excellence of output in the printed word than were awarded to any other Land Grant College.

The College was fortunate indeed in that its first full-time editor and head of information services should be a person with Adams' broad training, experience, and talents.

One of his first contributions to the profession was to establish the agricultural editor as a "service man." His philosophy of how an agricultural college editor can best serve his institution was best expressed in his own words at the annual meeting of the American Association of Agricultural College Editors at Wisconsin in 1915. Here he said, "The best form of publicity in connection with extension work is that which is farthest from the generally accepted use of that word. Truth which will aid the reader carries its own validity." It is more than a coincidence that the third resolution of that meeting reads: "BE IT RESOLVED that this Association recommend that the words 'information service' be substituted for the word 'publicity'."

Professor Adams established courses in journalism at the College of Agriculture which at the time of his retirement numbered 13 credit hours toward agricultural electives. Although the primary purpose of these courses is to help train extension workers, many of his former students have made outstanding careers of journalism and related fields. He also taught a two-hour course in Conservation of Natural Resources. In 1930 he taught a similar course at the University of Hawaii on invitation from that University.

Because of his interest in student enterprises outside of the class room, he was a member of the board of directors of the Cornell Daily Sun, unofficial adviser of the Cornell Countryman, and member of the Board of Managers of Willard Straight Hall. Also, for twenty-five years, he was faculty advisor for track athletics.

Adams traveled extensively, observing agricultural practices in many countries. He visited England in 1924 and continental Europe in 1926. In 1930 he traveled around the world north of the equator; again he went around the world south of the equator in 1937-38. Through many public addresses, he shared the experiences of these trips with students and colleagues on the campus and with both urban and rural audiences throughout New York State. He also gave a series of monthly radio talks under the title of "The World and Us" from radio Station WGY at Schenectady. Another regular radio activity was his weekly book review called "Let's Read a Book" from the Cornell Radio Station.

During his last year in active service, he was made a member of the administrative committee of the Cornell Plantations and editor of its quarterly publication of the same name. He continued in both of these capacities from the time of his retirement in 1945 until his last illness.

Adams was a member of the following professional and fraternal organizations: National Press Club, Washington, D. C, Society of American Foresters (Secretary, 1913); New York Press Association (life member and director-at-large); Sigma Delta Chi, professional journalism society (National honorary president, 1920) ; American Association of Agricultural College Editors, (president, 1921) ; American Association of Teachers of Journalism; Sigma Xi; Alpha Gamma Rho; Epsilon Sigma Phi (Chief, 1939) ; Savage Club of Ithaca.

While outstanding for his national leadership in college editorial and information services, Bristow Adams, or “BA” as he was universally known, will best be remembered for his teaching and counseling of students. The Monday night receptions which he and Mrs. Adams held for more than thirty years are treasured memories of many generations of Cornell students. His door was always open to students and colleagues alike. To share his wisdom and human understanding was always a profit and a delight.

G. S. Butts, G. E. Peabody, R. S. Hosmer

George Plimpton Adams, Jr.

April 27, 1909 — November 13, 1977

George Plimpton Adams, Jr., was born in Berkeley, California, on April 27, 1909, and died in Ithaca on November 13, 1977. He was a member of the Cornell faculty for thirty-seven years, including the years after his emeritus status was conferred when he retired in June 1974.

Adams came from an academic family. His father was the Mills Professor in Moral Philosophy and Civil Polity at the University of California, where he taught for some forty years. The senior Adams was keenly interested in the history of ideas and in political economy (in the older sense of that term), and these also became the dominating intellectual interests of George Adams, Jr. After having been privately educated at Berkeley, he spent a year at the University of California, where he studied classical Greek. Then he transferred to Harvard, where he graduated in philosophy in 1929. He spent the next three years at Robert College in Istanbul, Turkey, where he taught both secondary school and college students, mainly in languages. At the time, Robert College was one of five different campuses of the old Near East College Association, which also included the American College for Girls, whose head for many years was Kathryn Newell Adams, who was his aunt.

Those who knew him felt that George Adams's tour of teaching in Turkey was a lasting influence on his life. The youngsters he taught there came from Turkey, Greece, Bulgaria, Albania, Syria, Iran, Egypt, and even Soviet Georgia. He was thus exposed to enormous cultural variety while making his home in the cultural center of the old Byzantine and later Ottoman empires.

During his tenure at Robert College, Adams met Evelyn Howell Yonker, to whom he became engaged in June 1932, while she was teaching secondary school in the American College for Girls in Istanbul. So great was their love for Turkey and their interest in the rich culture of the entire Near East that Professor and Mrs. Adams returned time and again to Istanbul to spend their sabbatical years.

They were married on June 13, 1934, in Philadelphia, Mrs. Adams's native city. Shortly after, they departed for California, and they lived in Berkeley until 1939. During these years they created a small private school based on the principle of the unity of all learning. In this same period Adams began graduate study in economics at the University of California, where he obtained his Doctor of Philosophy degree in the spring of 1940. During the spring semester of 1940 Adams attended the Brookings Institution in Washington, where he completed his dissertation, later published under the title *Wartime Price Control*.

The Adamases came to Cornell the following fall to begin an association with Cornell and its Department of Economics that remained intact until 19/4, when he retired. Adams served as chairman of the department for the lengthy period from 1947 to 1958, and during that time he added several distinguished economists to the department. Perhaps the innovation of which he was most proud was the three-semester honors seminar in economics that he introduced after the war. The first semester of this program was devoted to the study of the history of economic ideas, the second to a study of contemporary literature in the field, and the third to the preparation of a senior thesis. This seminar was unvarying in its popularity among the ablest students in the department, and Adams's main problem was to keep its numbers within manageable limits. Some of these students have gone on to academic careers themselves, such as George Wilson, professor at the University of Indiana, and Jack Livingston, professor at Ripon College. Adams took much pride in this seminar because it reflected the deeper interests of his own intellectual life.

Through the influence of his father and the late Frederick J. Teggart, Adams was strongly attracted to the Scottish moral philosophers and to the history of the social sciences. In consequence his classes were both broad and deep in their intellectual content and their sense of history — indeed, the kind of classes that are almost impossible to find in today's academic environment.

Among other influences that shaped his outlook was his family background. Adams was a descendant of an old American puritan family that had its seat in Plimptonville, Massachusetts, where an uncle served as directing head of Ginn and Company, the publishers. Other relatives were *-alvin Plimpton, formerly president of Amherst, and the late Preserved Smith, professor of history at Cornell.

George Adams was at home in many fields of knowledge. He read extensively in history, philosophy, and literature. In economics his central interest was the history of economic ideas from the classical Greek period to modern times. His favorite figure was Alfred Marshall. Like Marshall, Adams understood pure economic theory but at the same time was impatient with abstractions lacking factual content. He was deeply concerned with the institutional arrangements that distinguish particular economic systems and with issues of economic policy in various contexts. He watched with growing impatience and vocal disquiet the contemporary narrowing of economic analysis to a rigid mathematical structure. To him, Keynes's General Theory was not a general theory at all but a rationalization for a particular program of political and economic action appropriate to the special context of the Great Depression.

What kind of man was Adams? Tall in stature, abrupt and rather gruff in speech, and direct in address, Adams was the very model of the authority figure represented by the great professors of all time. In keeping with that

model, he was a diligent, resourceful, and thorough scholar. His lectures were meticulously prepared and intricate both in organization and in scope. As a bibliophile, he knew his literature, how to use it, and how to refer to it. He was an influential teacher, loved by his students, whom he loved in return. It was his rare good fortune to have these students return for visits again and again through the years. Thus his rather formidable personal demeanor, while it served to establish his authority in the classroom, did not conceal the genuine affection that he held toward young people.

Adams was a man of high principles and strong convictions. He could be stern and cutting when faced with what he considered to be palpable nonsense, particularly of the kind that is all too common in faculty politics. Yet he was never petty and he held no grudges. Even his opponents in debate readily conceded his strength of character. He enjoyed a broad measure of respect. By many of us he was loved. We continue to need badly men of his sort and we shall not forget him. He was a strong and positive force, and the University was indeed fortunate to have him in its service for thirty-seven years.

M. Gardner Clark, Paul M. O'Leary, George H. Hildebrand

James Alfred Adams

September 2, 1906 — March 1, 1988

J. Alfred Adams, professor emeritus, died March 1, 1988 in Cary, North Carolina. He was born in Ventnor, Ontario, Canada, on September 2, 1906. He spent his childhood on his parents' farm and attended local schools. His early interests in the study of birds, plants, and nature in general never flagged during his eighty-one year life span. Dr. Adams received his Bachelor of Science degree in agriculture from the University of Toronto, Agricultural College, Guelph, in 1931. He obtained his Master of Science and Doctor of Philosophy degrees from Iowa State University in 1933 and 1935, respectively, with specializations in entomology, zoology, and biological chemistry. His Master of Science dissertation was on the "Biological Investigations of the Firebrat, *Thermobia domestica* (Packard)". His doctoral thesis was *Thermobia domestica* (Packard) and its gregarine parasites". He married Ruth Dudgeon of Ames, Iowa in 1936 and became a naturalized U.S. citizen in 1939.

Dr. Adams' academic positions included instructor in biology at Iowa State College, 1935-37, instructor in zoology from 1937 to 1941, and assistant professor in zoology at Grinnell College in Iowa from 1941 to 1943. He taught during the summers of 1941 and 1942 at the Lakeside Laboratory of the University of Iowa, Okoboji Lake, where he made observations on aquatic insects. He joined the faculty of Cornell's New York State Agricultural Experiment Station at Geneva as assistant professor in 1943 and was promoted to associate professor in entomology in 1947. He retired in late 1971 and was awarded the title of professor of entomology, emeritus, effective December 8, 1971.

Dr. Adams worked at the Hudson Valley Laboratory located earlier at Poughkeepsie and later at Highland, New York throughout his tenure at the New York State Agricultural Experiment Station. During the early years, he concentrated his research efforts on the biology and control of the Japanese beetle and the oriental beetle in the Hudson Valley and Long Island. He developed effective control procedures for these turf insect pests through the utilization of diseases, parasites, and chemicals. In 1952, he assumed additional responsibilities for developing suitable control procedures for sweet corn pests in the Hudson Valley. His detailed and precise studies on the biology and phenology of these pests enabled sweet corn growers to apply their control measures only when needed and at times to yield maximum benefits. He determined the temporal relationship between such flowering plants as lilacs and the development of insect pests. He was an early practitioner of what is now termed "integrated pest management" (IPM). In recognition of his valuable services, the sweet corn growers of the Hudson Valley honored Dr. Adams with a retirement banquet in December 1971.

Dr. Adams was elected to Phi Kappa Phi in 1933 and Sigma Xi in 1935. He was a member of the Entomological Society of America, American Association for the Advancement of Science, American Institute of Biological Sciences, Iowa Academy of Science, New York State Horticultural Society, and the American Society of Parasitologists. His life-long love of nature prompted him to be active in Hudson Valley conservation, natural history, and ecological programs. At the time of his retirement in 1971, he was president of the John Burroughs Natural History Society, a director of the John Burroughs Memorial Society, a member of the Dutchess County Mosquito Control Committee, the committee in charge of the Slabsides Nature Sanctuary, West Park, New York, and the Hyde Park Shade Tree Commission.

Following retirement, Dr. Adams and his wife remained in Hyde Park where they continued their interests in natural history and preservation. Because of his failing health, they moved to Cary, North Carolina in 1986, to be close to one of their children. Dr. Adams is survived by his wife, Ruth Dudgeon Adams; two sons, Gordon D. Adams and Donald W. Adams; one daughter, Carolyn Adams Garcia; and ten grandchildren.

Edward H. Glass, George A. Schaefers, Paul J. Chapman

Leonard P. Adams

October 8, 1906 — March 12, 2000

Leonard P. Adams was born October 8, 1906, in Angelica, New York. His parents were Frederick Adams and Ada Palmer Adams. Both his parents and his two sisters died before Leonard's 10th birthday. Leonard was raised by relatives and earned a Bachelor's degree in Music at Alfred University.

After working his way through Alfred College, he went on to get his M.A. and Ph.D. degrees in Economics from Cornell, where he was elected to Phi Beta Kappa. From 1929-34, he was an Instructor in Economics at Cornell, then spent a half-year on the faculty of Colgate. In 1935, he went to Washington as an Associate Research Assistant on the U.S. Government Central Statistical Board. From 1936-42, he was Associate Economist for the New York State Department of Labor. From 1942-46, he assumed the positions of Principal Economist of the State and Federal Employment Service in Albany and New York City and Director of the Bureau of Business Research in the State Department of Commerce.

In 1947, he joined the ILR School where he was a Professor of Labor Economics. He also served as the Director of Research and Publications for 20 years until his retirement in 1967. Under Leonard's administration, Research and Publications became a full-fledged unit of the ILR School program. He was also chair of the Editorial Board of *The ILR Review* for approximately the same period of time. Both of these were major contributions to the identity of ILR as a scholarly institution.

Leonard's own publications included, *Workers and Industrial Change*, with Robert Aronson (1957), *Commuting Patterns of Industrial Workers*, with Thomas Mackesey (1955), *Wartime Manpower Mobilization*, (1951), and *Agricultural Depression and Farm Relief in England 1813-1852*, published in England. All of these represented his continuing interest in the employment problems of workers, reflecting in part also his practical contact prior to joining the ILR faculty.

Following his retirement, Professor Adams continued an active professional life including a book, *The Public Employment Service in Transition, 1933-1968* (1968), as well as several articles and bulletins.

He retired to North Fort Myers, Florida and spent his last few years with his son, Leonard II, in Davenport, Iowa. He is also survived by a son, Samuel.

Although he had no apparent interest in organized sports, Leonard was physically vigorous. He enjoyed gardening and the tasks of maintaining a home against normal wear and tear. At the second of the residences in which he lived in Ithaca, he started a Christmas tree farm. Much of his nonprofessional life, however, was devoted to the care and raising of his two sons. Given the circumstances of his own early life, his compassion for those in need was unmistakable. Most notable in this regard, was his assistance to his Cornell graduate mentor during Professor Royal Montgomery's difficult last years.

Leonard had a good sense of humor, marked by jokes that addressed absurd situations rather than the expense of an individual or a group. Perhaps more than any other facet of his character was Leonard's fortitude in the face of adversity. He coped successfully twice with widowhood, drawing in both cases of remarriage on relationships from earlier periods of his life.

One remembers Leonard Adams as a gentle, soft-spoken, amiable and congenial colleague and friend.

George Hildebrand, Milton Konvitz, Lawrence Williams

The committee wishes to acknowledge the assistance of Robert Aronson in the preparation of this statement.

Howard Bernhardt Adelman

May 8, 1898 — July 25, 1988

“Professor Howard B. Adelman represents a splendid type of scientist and scholar. He is a Cornellian if there ever was one. Born in Buffalo, he came to Cornell in 1916 and with short interruptions ... he has resided on the lovely hills of Ithaca ever since.” So wrote Henry E. Sigerist, the eminent scholar, editor, and historian of medicine, in his enthusiastic review of Adelman’s 1942 edition of *The Embryological Treatises of Hieronymus Fabricius of Aquapendente*. Yes, Howard was indeed a Cornellian, one of Cornell’s greatest teachers and scholars. His affiliation with our institution spanned seventy-two years, sixty-seven of them as a member of the faculty—a tenure that in the entire history of Cornell is surpassed only by the seventy-three years of Walter F. Willcox! At the time of Howard’s death, at the age of ninety, only Willcox had ever served longer as a member of the Cornell faculty.

Howard graduated from Cornell with an A.B. degree in 1920, an A.M. in 1922, and a Ph.D. in 1924. He began his long and distinguished teaching career here in 1919 when he was appointed assistant in histology and embryology while still an undergraduate. Until the mid-1960s one climbed the academic ladder to a tenured position at Cornell very slowly. Even so, Howard moved upward more rapidly than many of his peers, becoming an instructor in 1921, an assistant professor in 1925, and professor in 1937. He was appointed professor emeritus in 1966.

While still an assistant professor, Howard won international acclaim as an experimental embryologist for his pioneering studies of cyclopia and the development of the amphibian and the avian eye. These attracted the attention of Professor Hans Spemann, who in 1927 invited Howard, as a National Research Council Fellow, to work in his laboratory at the University of Freiburg. Thus began a long and inspiring friendship.

In the early thirties, during a two-year sojourn in New York City as a visiting professor in the Department of Ophthalmology at Columbia’s College of Physicians and Surgeons, Howard was repeatedly urged to leave Ithaca and permanently join the department’s staff at a most tempting salary—offers he steadfastly refused, for his heart was at Cornell.

Very early in his academic career Howard began collecting rare books dealing with the history of embryology, anatomy, and general biology. His extensive private library of more than 4,800 volumes subsequently became the nucleus of the History of Science Collections established by the Cornell Library in 1961. With continuing support from Howard, the Adelman Collection has prospered, and today it is one of the finest of its type in this country. Included in this remarkable collection are nearly all of the great classics in anatomy and embryology from the 16th

through the 19th century. A life-long friend of the University Library, Howard was also a founding member of the Library Associates and in 1942-43 served as the second chairman of that group.

Howard's respect for history was pervasive and unusual— unusual, at least, among his colleagues in the sciences. He read at least six foreign languages, including Greek and medieval Latin, and he always insisted on reading “the old masters” in their original language to be certain of the essence of their arguments. It is thus not surprising that Howard's scholarly interests turned increasingly to the history of anatomy and embryology. His handsome volume on Hieronymus Fabricius was published in 1942 by the Cornell University Press and received that year's F.S. Crofts Prize for the most distinguished work by a member of the Cornell faculty. In recognition of Howard's outstanding contributions to its collections, and to the history of anatomy and embryology in general, the University Library in 1988 celebrated Howard's ninetieth birthday by acquiring in his honor a magnificent copy of Fabricius' *De venarum ostioliis* (Padua, 1603)—one of the rarest of all the great classics in the history of science.

Extending his earlier work on Fabricius, Howard subsequently produced two internationally acclaimed studies on the life and work of another of the founders of modern embryology, the 17th-century Italian scientist Marcello Malpighi. His monumental five-volume work, *Marcello Malpighi and the Evolution of Embryology*, was published by the Cornell University Press in 1966; his second multivolume work on Malpighi, *The Correspondence of Marcello Malpighi*, was published by the Cornell University Press in 1975. For the first of these definitive studies Howard was awarded the History of Science Society's Pfizer Award in 1967 for the outstanding book on the history of science published during the previous year. Appropriately, Howard traced his own intellectual heritage directly back to Malpighi. “At surprisingly few removes he [Malpighi] was the forebear of many of us who are teaching and studying today. He was, for example (if I may be personal for a moment), the teacher of Antonio Maria Valsalva; Valsalva, of Giovanni Battista Morgagni; Morgagni, of Antonio Scarpa; Scarpa, of Ignaz Döllinger; Döllinger, of Louis Agassiz; Agassiz, of Burt Green Wilder; Wilder, of Simon Henry Gage; Gage, of Benjamin Freeman Kingsbury; and Kingsbury, whose rare qualities I take this opportunity to extol, was my teacher.”

More than twenty-five glowing reviews of Howard's magnum opus, *Marcello Malpighi and the Evolution of Embryology*, appeared in professional journals. A sampling of but a few comments is sufficient to convey the enthusiasm generated by the publication of this magnificent study which was hailed by both scientists and historians from around the world:

Imbued throughout with a passionate enthusiasm for the historical past and for the science of embryology, these five immense volumes will be a permanent monument to the underlying unity of the scientific and cultural traditions. When in future generations, men shall read *Marcello Malpighi and the Evolution of Embryology*, they may be led to remark both of science in the 17th century and of scholarship in the 20th, “there were giants in those times.” [Leonard G. Wilson, Yale University]

There can be no dispute that this is the most monumental contribution of our century to the “fine structure” of the history of biology in general and embryology in particular . . . The sheer mass of the result looks at first sight intimidating, but the writing is so lively and the facts revealed so curious and entertaining that anyone who dips into any of the volumes at random will probably be sufficiently intrigued to keep on reading. An infinite amount of unravelling has gone into this, the digging out of the details of Malpighi’s somewhat harassed life at Bologna, Messina, and Rome, the identification of the meanings of hundreds of obsolete technical terms of the old biologists to show what they intended, and the dissection of Malpighi’s own theoretical thinking, central as it was to the general unfolding of the perpetual opposition of epigenesis and preformation. The scholarship is meticulous. [Joseph Needham, Cambridge University]

Nearly twenty years later, Daniel Boorstin, the Librarian of Congress, summed it up best in his book *The Discoverers*: “A good introduction to Malpighi is Luigi Belloni’s article in the *Dictionary of Scientific Biography* . . . supplemented by Joseph Needham, *A History of Embryology* (1934). But there is no competition anywhere else in the history of medicine for the delights of reading and browsing than in Howard B. Adelman’s monumental *Marcello Malpighi and the Evolution of Embryology*.”

Numerous honors came to Howard for his scholarship during his illustrious career at Cornell, among them the degree of Doctor of Science *honoris causa* from Ohio State University in 1962, the Order of the Star of Italian Solidarity in 1962, the William H. Welch Medal from the American Association for the History of Medicine in 1967, the degree of Doctor of Medicine *honoris causa* from the University of Bologna, Italy, in 1972, and the Galileo Galilei Prize from the University of Pisa, Italy, also in 1972.

Early in his career, Howard was acclaimed by his undergraduate students as the “best” and “toughest” teacher at Cornell. The full measure of his inspiration as a teacher, however, is reflected in the dozens of tributes from his former graduate students on the occasion of his eighty-fifth birthday and at his death. A short sample follows:

Howard never did things casually. He insisted on punctiliousness and practiced the old aphorism that if a thing is worth doing it has to be done well. [William Montagna, Oregon Regional Primate Research Center]

My association with Howard as student, colleague and friend was the most important and influential personal relationship of my professional life. [Harold F. Parks, University of Kentucky Medical School]

My memories of Dr. Adelman are personal ones; walking round and round the Arts & Sciences' Quadrangle on a summer's evening listening to him talk about Malpighi; Sunday evening dinners at his apartment with good food, Mozart, chess, and reading aloud. He was a living example of what he preached—determine what is most important and then pursue it with complete disregard for the trivialities of life. [A. Duncan Chiquoine, Hamilton College]

I have never forgotten the positive effects you had on my personal and professional life, all that I owe you for your steadfast belief in my potential, the generous and often critical advice that helped mould my personal and professional outlooks. [William A. Wimsatt, Cornell University]

Howard's love and understanding of young children was also a delight to the families of many of his graduate students and young colleagues. He would often invite a family of five or six to a Sunday evening dinner and entertain all in his apartment with good food, fine music, and readings from Grimm's *Fairy Tales*. In addition, Howard was always a source of sound counsel and sympathetic reassurance when it came to the problems a youngster of two to five posed for a young mother.

During all these years, Howard also carried his full share of Cornell committee and administrative assignments. He served as chairman of the Department of Zoology from 1944 to 1959 and was a faculty representative on the Cornell Board of Trustees from 1947 to 1951.

Howard and Dorothy May Schullian were married on July 6, 1978, each for the first time—he at age eighty, she at seventy-two! His wife was herself a distinguished historian of medicine, as well as the first curator of the History of Science Collections in the Cornell Library. Having been professional colleagues for many years, they shared together for the last decade of their lives both the burden of declining health and the continuing joy of common interests.

Howard leaves for all of us a rich legacy of scholarship that includes not only his own publications but, also, his commitment to preserving and understanding those of his predecessors. This legacy will be a source of reference and inspiration for his students—and his students' students—for generations to come.

John M. Anderson, David W. Corson, Perry W. Gilbert

Julia Blundell Adler

October 17, 1912 — April 17, 1976

Mrs. Julia Blundell Adler came to Cornell in 1957 as assistant professor in the Department of Housing and Design (now Design and Environmental Analysis), College of Home Economics (now the College of Human Ecology). She readily found her place at Cornell, and as a valued member of the department was promoted to the associate professorship in 1960. She continued as a member of the faculty until 1965, when she was forced to retire due to reasons of health.

Mrs. Adler was born in Yazoo City, Mississippi. She was awarded the Bachelor of Arts degree by Agnes Scott College, Decatur, Georgia, in 1933, and then moved to New York City where she pursued her interest in the field of design. She studied at Parsons School of Design, 1934; Cooper Union, 1937-38, 1939-40; and at the University of the State of New York. She received the Master of Arts degree from Teachers College, Columbia University, in 1955.

She had a varied background of experience in both the practice and the teaching of design. As a designer, she worked with designer Scott Wilson, New York City, 1934-36; with designer Paul Snow Tilden, New York City, 1938; and for nine years, 1940-49, was assistant designer at Bertha Schaefer Interiors, New York City, as well as working as a free-lance designer during this period, designing fabrics, wallpapers, packaging, and displays. During the years 1953-57 she was design instructor at The Art Career School, Department of Interior Design; The City College of New York, Department of General Studies; and The Art School of Pratt Institute, Brooklyn. In the summer of 1959, Mrs. Adler assisted the director of the Bertha Schaefer Gallery and was in charge of the gallery while the director was in Europe. In 1960 she was design consultant for Chemstrand, New York City; Noyes Lodge (redesign of interiors), Cornell; for Ithaca Hotel (lobby), Ithaca.

Mrs. Adler's strength and academic contribution to the Department of Housing and Design at Cornell lay in her professional point of view, her interest in students, individually, and in the quality of her teaching. She came to us with considerable teaching experience, as well as specialized training for the teaching profession. Both undergraduate and graduate students enjoyed working with her and sought out her classes and her supervision. She had the ability to bring out the strengths in each one, as well as to press students toward better scholarship and accomplishment. Mrs. Adler was interested in the professional future of her students and often kept in touch with them after they were graduated.

Mrs. Adler is survived by two daughters, Mrs. Graham of San Francisco, California, and Mrs. Conklin of Moscow, Idaho; a grandson, Michael Graham; a brother, Dr. George P. Blundell of Rockville, Maryland; and a sister, Mrs. Julius Allen of Kensington, Maryland.

Kenneth W. Evett, G. Cory Millican, Virginia A. True

Frederick B. Agard

September 23, 1907 — May 11, 1993

Fred (“Fritz”) Agard came to Cornell as assistant professor of linguistics in the fall of 1946, to be one of the “founding five” of the then newly established Division of Modern Languages. He had earned his A.B. and A.M. degrees at Brown in 1928 and 1930 respectively. His Ph.D. degree, awarded by Princeton in 1935, was in Romance philology and Old French literature. After ten years as instructor and assistant professor at Princeton, he abandoned philology and literature for linguistics, both Romance and general. Immediately after the war’s end in 1945, Fritz went to the University of Chicago’s School of Education to participate in a research investigation of foreign-language teaching. This work served as a transition to his enduring association with Cornell, where he was promoted to associate professor in 1947 and to full professor in 1953, retiring as emeritus in 1974.

At Cornell, Fred was an essential member of the new D.M.L.’s senior staff, all of whom, despite diverse specializations, had simply the title “Professor of Linguistics”. At the outset his work concentrated on Spanish and Ibero-Romance, but in time it expanded to include other Romance languages, particularly Roumanian, as well as comparative Romance. In the 1960s he was in charge of a special program for teaching Roumanian to selected Army personnel; this involved extensive preparation of classroom material and led to descriptive analyses of, eventually also to fieldwork in, that language.

Like many other members of the D.M.L., Fritz spent considerable time in overseas assignments, especially in connection with the Ford-Cornell project for the teaching of English in Italy, where he was a Fulbright lecturer in 1956-57 and directed the program from 1963 through 1966. Other assignments included a year in Bucharest in

1969-70 and a summer at the Cuarto Instituto Lingüístico Panamericano at the University of Puerto Rico in 1971. After Fred's retirement, he was a visiting professor in Konstanz, Germany in 1976-77 and in Edmonton, Alberta in 1985. In addition, he served for a number of years as examiner in French and Spanish for the College Entrance Examination Board.

During the nearly three decades of Fritz's association with Cornell, there were continual developments in linguistic theory and in its application to language teaching. He took an active interest in new approaches and devoted himself to their exploration. At first, in the late 1940s and early 1950s, he turned for this to creolized languages: Papiamentu (spoken on Curaçao and neighboring islands) and Ladino (the Judaeo-Spanish of Thrace, for which he found a source of information in a family living in Rochester). His 1958 sketch of Roumanian, developed from a structuralist approach, was followed by further studies of that language from a transformational-generative point of view. His last and in some ways most outstanding work was *A Course in Romance Linguistics* (1984), in which he employed several modern approaches to the reconstruction of the ancestral form of speech known to historical linguists as "Proto-Romance" (close to, but not identical with, classical Latin), from which the various Romance languages developed. In addition to these works, he produced several outstanding language-teaching texts and reference works: *The Sounds of English and Italian* and *The Grammatical Structures of English and Italian* (both with Robert J. Di Pietro, 1955); *Speaking and Writing Spanish* (1951, with Angela Paratore and Raymond P. Willis, Jr.); *Modern Approach to Spanish* (1964); *Spoken Roumanian* (1974); and, for speakers of Spanish learning English, *El Inglés Hablado* (1953).

In the classroom and out of it, Fritz was a greatly beloved teacher and mentor. He was the chairman of the Ph.D. committees of a number of candidates in Ibero-Romance, Italo-Romance, comparative Romance, and general linguistics, and a member for numerous other candidates who had a minor in one of those fields. On his retirement, his students presented him with a diploma extolling him as a "native speaker of Proto-Romance". At social gatherings Fred was a stand-up comedian, his monologs exploiting his remarkable ability to mimic all manner of strange dialects and accents. In both professional and social matters, he was one of the most active and inspiring contributors, from 1946 onward, to the work of the D.M.L. and of its successor the Department of Modern Languages and Linguistics.

Fred is survived by his wife Hildegard, his son Stephen, and his stepdaughter Leigh Jones, as well as by four grandsons and one great-granddaughter.

Robert A. Hall Jr., Charles F. Hockett, J Milton Cowan

Ralph Palmer Agnew

December 29, 1900 — October 16, 1986

Ralph Palmer Agnew was born in Poland, Ohio, on December 29, 1900. He was the eldest of five brothers in a farming family. Throughout his life his absorbing interests were farming (later in the watered-down form of gardening) and mathematics. He obtained an A.B. degree in mathematics and engineering at Allegheny College and a master's degree in the same subject at Iowa State College. In 1925 he came to Cornell as a graduate student and became a Doctor of Philosophy in 1930. From 1930 to 1932 he was a National Research Fellow and worked at the University of Cincinnati, at Brown University, and at Princeton University.

Agnew's outstanding ability had greatly impressed the Cornell faculty while he was still a graduate student. They were determined to hire him, and he was appointed to an assistant professorship in 1931, while still a National Research Fellow. From then on Agnew was at Cornell (he became a professor in 1938 and emeritus in 1968) except for accepting a variety of short, prestigious, visiting appointments at other institutions.

Agnew was the chairman of the Department of Mathematics from 1940 to 1950. We can do no better than to quote the following description from Mark Kac's *Enigmas of Chance*:

“During his ten years as chairman, Ag, as he is called by his friends, brought about at times, at considerable personal sacrifice, changes in outlook and attitude which prepared the way for the mathematics department to become one of the leading departments in the country. Ag was a very good mathematician and a superb administrator. By the latter I do not mean that he was universally popular. Quite to the contrary, he was at times severely criticized, but he stayed with his convictions, and in the end most of his controversial decisions were vindicated. Ag avoided emergencies by anticipating them and acting before they had a chance to arise. After our entry into the war he foresaw that sooner or later large numbers of soldiers and sailors would be sent to the universities for some kind of technical training, and that there was bound to be a tremendous demand for elementary mathematics courses. So, very early in the game he began to collect information about faculty members throughout the university who remembered enough of their high school and college mathematics to be able to teach high school algebra, plane geometry, and possibly a little trigonometry.

“Sure enough, six hundred army recruits arrived in June 1943, to be followed by more than sixteen hundred navy V-12s, including three hundred marines. The army contingent came, if I remember correctly, on

Friday, and the following Monday twenty or so as yet unscheduled sections had to be met. They all were, after Ag spent the weekend telephoning his 'reserves.' Because of his genius for organization and his foresight, that Monday proceeded in a reasonably well-ordered way instead of being the chaos that one might have expected."

During Agnew's term as chairman Cornell became a world center in the field of probability because his skill and foresight enabled him to bring Will Feller and Mark Kac to the university.

After the war, when the rapid expansion of universities created an acute shortage of teachers, Agnew cast his net wide. One of us (W. H. J. F.) gratefully records that he owes his association with Cornell to Agnew's invitation.

Agnew had a sharp, clear, incisive, and original mind. He abhorred prevarication and always went straight to the heart of the matter both in his thinking and in his conversation. He was a tremendous teacher and a prolific and successful research mathematician, a world authority in the field of summability of series. He published two excellent text books, one on calculus and one on differential equations. These books clearly display the qualities that made him such an outstanding teacher: The central part of an argument is stated with crystal clarity and without fussy detail. Interesting applications are exhibited and motivated, often with a dash of quick humor.

In 1927 Agnew married Anne Wright, who survives him. They had one son, Palmer Wright Agnew, who is a successful engineer at IBM. Agnew died on October 16, 1986.

G. Roger Livesay, Anil Nerode, Wolfgang H. Fuchs

Harry Robert Ainslie

December 2, 1923 — May 1, 2000

Harry Robert Ainslie was born on a dairy farm in Hartwick, Otsego County, New York, on December 2, 1923, the fifth of seven children. As a child, he worked on the dairy farm and lumber mill owned by his father. He played basketball and baseball at Hartwick High School, graduating in 1941. The following year, he worked in the railroad yards to earn money so that he could begin college studies at Cortland State Teachers College in Cortland, New York. However, after only one semester there, he entered the military and served as a gunner in the United States Army Air Corps on B-17 and B-29 aircraft. He was honorably discharged as a Sergeant in 1946.

Following his military service, Harry entered Kansas State College in Manhattan, Kansas where he met and married Virginia Linn. He graduated with a B.S. degree in Animal Husbandry in 1949 and immediately enrolled in graduate school there, earning his M.S. degree in the same field in 1950. While a graduate student he served as the Superintendent of Official Testing in Kansas, a position with responsibility for oversight of programs involved with the testing and recording of milk production and composition in dairy herds in the state.

On September 1, 1950, Harry was appointed Assistant Professor of Animal Husbandry at Cornell University and began a distinguished career, which was devoted primarily to the improvement in production and management of dairy herds. At that time, milk production per cow in New York was very low and the management of dairy farms was primitive and inefficient. Harry's focus was on the development and successful implementation of practical systems of recording milk production of individual cows as well as other measures of management efficiency, so that farmers would have a rational basis for comparison and action. He was appointed Superintendent of Official Testing in New York in 1954 and was promoted to Associate Professor in 1956. He continued graduate work at Kansas State during vacations and leaves of absence, completing his Ph.D. studies in 1965.

Shortly thereafter, as part of the "Cornell University-University of the Philippines Project", Harry served as a Visiting Professor and Consultant in Extension Education at the University of the Philippines, Los Banos; a Consultant to FAO on Agricultural Extension for Asia and the Far East; and a Consultant to the Joint Commission on Rural Reconstruction in Taipei, Taiwan. Returning to Cornell in 1967, he led the effort to reorganize the New York Dairy Herd Improvement program into what was to become the outstanding model of such programs in the United States.

In 1969, Harry was promoted to full Professor and appointed Department Extension Leader for the department, a position he held until his retirement in 1983. In 1978, Harry Ainslie started advising undergraduate students in the Animal Science Department. Advising and interacting with students was one of his greatest pleasures.

In recognition of his outstanding leadership of the Cornell Dairy Extension Program, Professor Ainslie received the DeLaval Extension Award in 1979 from the American Dairy Science Association. In 1981, the National Dairy Herd Improvement Association honored Harry for his leadership with their Outstanding Service Award for his “significant contributions to the progress of the dairy herd improvement system” in the United States. At his retirement, the Harry R. Ainslie Dairy Herd Improvement Leadership Fund was established at Cornell to honor his dedication and service as “an invaluable leader and innovator in the dairy industry.”

Harry served on 16 college committees, 9 New York State committees and 11 regional and national committees. For DHI, he served on the Coordination Group, Rules Committee, ad hoc Committee on Administration and Regulation of the Program, National DHIA’s President’s Committee and the NCDHIP Data processing Committee. In addition, he served on the American Dairy Science Association Dairy Cattle Improvement Committee. He is the author or co-author of over 20 scientific publications and 75 extension publications.

Harry’s professional and community activities gained him loyal friends through the state and nation. He had a keen sense of humor, which he retained throughout his long and difficult struggle with Parkinson’s disease. He was an accomplished story teller who enjoyed the camaraderie of both colleagues and family, and sometimes the instigator of clever practical jokes and similar mischief aimed at his closest friends. A devoted husband and parent, Harry exercised a strong presence in his closely-knit and caring family. He was very active in community affairs. He served as a member of the Official Board of Trustees of St. Paul’s United Methodist Church in Ithaca; was a Paul Harris Fellow; and was a Past President of the Ithaca-Cayuga Rotary Club.

Professor Ainslie was a gentleman, always kind and thoughtful of others. His sense of humor and high sense of integrity made him a true friend to all his colleagues and associates. His wife of 53 years, Virginia Linn Ainslie; his two sons, Gregory and Timothy; three daughters, Nina, Mary and Julie; and eight grandchildren survive Harry.

J. Murray Elliot, R. David Smith, R.W. Everett

Andrew J. Akelaitis

July 11, 1904 — November 24, 1955

Dr. Andrew J. Akelaitis, Assistant Attending Physician to The New York Hospital and Psychiatrist to Out-Patients in the Payne Whitney Clinic, died in The New York Hospital on November 24, 1955, at the age of fifty-one. He was a graduate of Johns Hopkins University in 1925, and Johns Hopkins Medical School in 1929. From 1930 to 1931 he was resident physician in psychiatry at the Strong Memorial Hospital in Rochester. He instructed in psychiatry in the University of Rochester School of Medicine from 1930 to 1936, and was assistant professor in psychiatry from 1936 until 1943. He took an active part in World War II from 1943 to 1947, and served successively as Lieutenant Commander and Commander of the U. S. Naval Reserve Medical Corps. In 1947 he came to our Center, where in addition to his hospital appointments he held the title of Assistant Professor of Clinical Medicine (Neurology), Cornell University Medical College.

Andrew Akelaitis was an able and kindly man, who influenced many of us in his quiet way. He was an effective teacher of small groups of students; he was an amateur botanist and an enthusiastic horticulturist. He was beloved by all who knew him well, and his presence among us will be greatly missed.

D. P. Barr

Ernest Albee

Professor of Philosophy

1865 — May 15, 1917

Ernest Albee came from his New England home and schools to Cornell University in 1891, the year following the establishment of the Sage School of Philosophy and his connection with the University was continuous from that time until his death on May 15th, 1917. He was appointed instructor in 1892, assistant professor in 1902, and professor of philosophy in 1907. During this long period of service he was for eight years coeditor of *The Philosophical Review* and a frequent contributor to its pages. From the beginning of his association with the Department of Philosophy he was pre-eminent in training of graduate students and in rigorously directing historical research. Few professors have exercised a deeper or happier influence on graduate instruction. He was profoundly convinced of the fundamental value of the historical approach to philosophy, of its illuminating significance for problems of contemporary thought; to that historical background he applied scrupulously exact methods of inquiry. Into this spirit of precision he persistently and patiently inducted generation after generation of advanced students, and with it he inspired his colleagues.

In addition to many articles on philosophical subjects and reviews of current works on philosophy, he wrote twenty-five years ago "A History of English Utilitarianism," which has become a classic and is still the standard and authoritative exposition of that subject.

Dr. Albee was a man of distinguished manners, of gentle courtesy, temperamentally conservative in his point of view, restrained and precise in word and phrase, a searching analyst of ideas and dogmas, but withal a just and appreciative critic of doctrines differing from his own. His career was lived out mainly in the world of books and speculative thought. Although rarely an active participant in administrative or civic affairs, he was an interested and wise observer of their trend. In him were incarnate the scholar's detachment and other-worldliness and, in the finest sense, the aristocracy of learning.

Calvin Dodge Albert

November 17, 1876 — September 23, 1959

Calvin Dodge Albert, Professor Emeritus of Machine Design died in Tompkins County Hospital, Ithaca, September 23, 1959.

Professor Albert was born at White Haven, Pennsylvania, on November 17, 1876, the son of Frank Henry and Ella (Wood) Albert. He prepared for college at Brooklyn Polytechnic Academy and at Media Academy, Media, Pennsylvania; in 1902 he received the degree of Mechanical Engineer from Cornell University.

After graduation, he entered the design field at Columbia Iron Works, St. Clair, Michigan. Later he was employed by Great Lakes Engineering Works at Detroit, Michigan.

In 1904 he returned to Cornell University as an instructor of mechanical laboratory in Sibley College.

On July 5, 1905, he married Claudia Louise Agnew of Hillsdale, Michigan.

From 1906 until his retirement in 1944 he served in the Department of Machine Design of Sibley College as instructor (1906-1908), Assistant Professor (1908-1916), and Professor (1916-1944). He was head of that department from 1919 until his retirement.

During World War I he was granted a leave of absence to accept a position with the United States Shipping Board, District 3, Washington, D. C His duties included supervision and inspection of wood and steel ship programs. He became senior engineer and rose to executive assistant before returning to Cornell July 31, 1919.

Professor Albert was the author of *Machine Design Drawing Room Problems*, first published in 1923. The fourth edition, revised, of this eminently successful work was reprinted in 1951, seven years after his retirement. He was co-author of *Machine Design Questions and Problems* in 1924 with Professor E. F. Garner, and of *Kinematics of Machinery* in 1931 with Professor F. S. Rogers.

He was active in several technical societies, including the American Society of Mechanical Engineers, American Society for Metals, American Society of Engineering Education, American Gear Manufacturer's Association, Society of Sigma Xi, and Phi Kappa Phi. He was a licensed Professional Engineer, State of New York.

Professor Albert's interests, outside his intense devotion to the field of machine design, included art, architecture, theater (both the legitimate theater and the cinema), and the working of metals and woods. He traveled in Europe

extensively in 1924 and again in 1932. In his later years he was active in local politics, as a member of the Democratic Party.

Professor Albert's teaching ability influenced many people. Several staff members under his direction developed into outstanding teachers who are now serving in responsible assignments throughout the land. He was a loyal and warm friend to all within his acquaintance, which was extremely broad. The privilege of conversing with him was always rewarding and refreshing since he kept well informed in matters both technical and cultural.

He will long be revered as a most sincere, earnest, and productive faculty member. The contributions he made to engineering education at Cornell will long be evident.

R. L. Geer, W. H. Burkholder, S. F. Cleary

Andreas C. Albrecht

June 3, 1927 — September 26, 2002

Andreas C. Albrecht was born in Berkeley, California, but spent early parts of his childhood in Vienna, where his father, an anthropologist originally from Germany, pursued his doctoral research. He earned the B.S. degree in Chemistry from the University of California, Berkeley, in 1950, and the Ph.D. degree in Chemistry from the University of Washington in 1954. Following postdoctoral work at the Massachusetts Institute of Technology, he began his long career at Cornell at the rank of Instructor in 1956. Progressing rapidly through the academic ranks, he was appointed Professor of Chemistry in 1965.

Andreas Albrecht built a highly distinguished career in the field of molecular spectroscopy, the determination of the structure and motions of molecules through their interaction with light. His work uniquely combined theoretical analysis with laboratory experiments to elucidate phenomena ranging from Raman scattering to photoconductivity in organic solids to nonlinear electronic spectroscopy carried out with incoherent light sources. His most recent work, in progress at the time of his death, treated spectroscopic phenomena unique to chiral (left- and right-handed) molecules.

Numerous awards, fellowships, and lectureships recognized his research accomplishments. He was a Fellow of the Japanese Society for Promotion of Science, a Fellow of the American Physical Society, and a Fellow of the American Academy of Arts and Sciences. He was a Frontiers in Chemistry Lecturer at Texas A&M University and the Gillespie Lecturer of the Royal Society at University College, London. He received the 1986 Polychrome Corporation Award from the New York Academy of Sciences, the 1988 E.R. Lippincott Medal for Spectroscopy from the Optical Society of America, and the 1990 Earle K. Plyler Prize from the American Physical Society.

He took an interest in the practice of scientific research under more difficult circumstances than those prevailing at Cornell, in countries including the Soviet Union and Cuba. He was several times an exchange scientist in the United States-USSR Academy of Sciences Program.

A long list of graduate students, postdoctoral associates, visiting scientists, collaborators, and Cornell colleagues have benefited from his warmth, gentle humor, and keen scientific intuition. An outstanding teacher in the classroom and in the laboratory, he guided the undergraduate and graduate careers of generations of Cornell students. His discussions with coworkers and colleagues characteristically went beyond scientific matters to include music, the outdoors, and politics. His enthusiasm, counsel, and insight will be missed.

Paul L. Houston, Benjamin Widom, Roger F. Loring

Raymond Albrechtsen

October 12, 1904 — August 13, 1976

Raymond Albrechtsen, professor emeritus of animal science, died of cancer in Ithaca, New York, on August 13, 1976. He was born in Chicago but grew up on a farm near Marathon, New York. He studied civil engineering two years at the Pennsylvania State College and then farmed for two years before entering the College of Agriculture at Cornell University in 1928. He received his B.S. degree in 1930 and the M.S. degree in 1931. After college, he returned to dairy farming and, with the help of his wife, developed a fine herd of Holstein cattle, which carried the farm name Ray-Lou Farm.

In 1938, Ray returned to Cornell as a member of the Department of Animal Husbandry with major responsibility in dairy cattle extension work. The remainder of his professional career, until his retirement from Cornell in 1969, was devoted to the improvement of dairy cattle through the application of sound genetic principles and good herd management.

In one of his early leadership roles as a dairy farmer, Ray was instrumental in organizing the first artificial breeding association in New York State, the second one in the United States, and he served as its first president. Later he was active in the organization of the statewide New York Artificial Breeders' Cooperative and assisted in its merger with several New England units, when it became the Eastern Artificial Insemination Cooperative.

Ray's practical farm experience and his knowledge of the subject matter, combined with his understanding of farm people, enabled him to make the complex simple and understandable to his audiences. These traits, along with his wit and his clear and forceful presentation, made him very popular as a speaker for New York dairymen.

Ray was appointed extension division leader in the Department of Animal Husbandry in 1958, a position he held until his retirement. This assignment involved the development, coordination, and conduct of extension educational programs of the department.

Recognition of Ray's accomplishments was given on many occasions during his career. In 1955 he received the Superior Service Award of the United States Department of Agriculture.

In 1959 the American Dairy Science Association awarded Ray the DeLaval Extension Dairymen's Award and Citation. He served on the board of directors of the American Dairy Science Association from 1961 to 1963 and was elected association president in 1966. In 1975 the association bestowed upon him its highest award, the

Award of Honor. In 1976 Ray was honored by the New York Holstein-Friesian Association in recognition of his contributions to the association and his outstanding achievements in the dairy industry.

During his tenure, he served on numerous committees of the college and department and the United States Department of Agriculture and was acting head of the Department of Animal Science for six months in 1966.

Ray will long be remembered by those who knew him for his services to the dairy industry of New York State and his fine personal qualities and talents.

He is survived by his wife, Louise. In recognition of his dedication to agriculture in New York State, she has asked that a memorial scholarship be established in his name. Contributions designated for the Albrechtsen Fund may be sent to the Cornell University Development Office, 205 Roberts Hall, Ithaca, New York 14853.

Kenneth L. Turk, Myron D. Lacy, Robert W. Spalding

H. Darkes Albright

July 24, 1907 — August 12, 1988

Darkes Albright was born into the small Pennsylvania community of Lebanon Valley to Harry J. and Bertha Albright. He was given his father's first name, Harry, and his mother's family name, Darkes, though as an adult he reduced the first to "H." and became known to all as "Darkes." He was educated in Lebanon schools through an A.B. at Lebanon Valley College in 1928, then came to Cornell to take an A.M. in 1931 and a Ph.D. in 1935. His teaching career began at Iowa State Teachers College in the years from 1934 to 1936, after which he accepted the offer of his teacher and friend Alexander Drummond to return to Cornell and take up the career that continued to his retirement in 1971.

During the years of Darkes' tenure as a senior figure in the then Department of Speech and Drama he was a dominant force in the theatrical life of the University. Always faithful to Drummond's vision of academic theatre and theatre studies in an academic context, he and the departments he led stressed work and study that drew students, and most of them undergraduates, from all over the University. It was certainly in large part his achievement that the corridors of Goldwin Smith and, later, Lincoln Hall were alive in that time with student interest in drama. Of course the play productions during those years reflected both the advantages and disadvantages of student actors and backstage workers. But they were always stamped by the quality of amateurs in the best sense of that tradition, of persons who loved what they were doing, and at their best they were miraculously fine.

In other respects more visible to the world outside Cornell, Darkes was seen as a preeminent professional. His publications consisted of *Working Up a Part* (1947), a manual for beginning actors, the still durable *Principles of Theatre Art* (1955) with Lee Mitchell and William Halstead, and a translation of Adolph Appia's *The Work of Living Art* (1960). He edited *The Story of Meininger* (1963), *Memories of the Theatre Libre* (1964), and Meyerhold's *Theatre of the Grotesque* (1971), and he served as an associate editor of the *Educational Theatre Journal* from 1952-1954. He was a member and for a time the president of the American Theatre Association.

But for those who worked with him at Cornell it is the extremely collegial, vigorously good-humored, extraordinarily dedicated Darkes who is primarily remembered. Darkes Albright had an unusually close relation to students; he cared about them deeply, and they knew it. Rare indeed was the tireless attention he gave to graduate students whose talents were better suited to acting or directing than to writing their dissertations. Rarer still was his unflagging devotion to a cross-fertilization between the art of theatre and the rigors of theatre studies. His warmth, concern,

and finely tuned sense of responsibility were in fact evident in everything he did: in his and his wife's involvement for many years in the Coop Food Store, one of the city's most popular and successful community ventures, in their later work with McGraw House, and in his continuing work after retirement with senior citizens.

These activities and the qualities they imply were in some sense extensions of his life with his family. From the time of his marriage to Elizabeth Nelson in 1936 until his death, his center was his family. From that nucleus, characteristically, he reached out—to the community in his many community activities, to students and colleagues in classes, rehearsals, supper parties, and picnics—all facets of a life he never would have lived differently. Although his last years were darkened by Elizabeth's death in 1985, and then his son Stephen's at age 44 in 1987, he continued to be comforted by the encouragement of others through their readings and visitations. He is survived by a daughter, Judith Gaetani of Binghamton; a grandson, James; and three step-grandchildren, Joseph, John, and Margaret.

Don Fredericksen, Marvin Carlson, Anthony Caputi

Frank DeWitt Alexander

November 16, 1903 — November 20, 1983

Frank DeWitt Alexander, professor of cooperative extension and of rural sociology, spent the last thirteen years of his professional career at Cornell. He was brought to Cornell in 1956 as an associate professor to be head of the Office of Extension Studies, a newly created unit within the College of Agriculture and a part of the Office of the Director of Extension. He was promoted to professor in 1961. On June 30, 1969, he retired from Cornell and moved to Evansville, Indiana, where Mrs. Alexander had family ties.

Professor Alexander was a native of Nashville, Tennessee. He graduated from Peabody College in Nashville in 1927 with a Bachelor of Science degree and received a Master of Arts degree from Peabody in 1929. He earned a Doctor of Philosophy degree with a major in sociology in 1935 at Vanderbilt University. A summary in printed form of Frank's doctoral dissertation, "Owners and Tenants of Small Farms in the Life of a Selected Community: A Cultural Analysis," may be found in Mann Library. This work is marked by the meticulous attention to detail and by the insightful observation of social reality that typically characterized Professor Alexander's research.

Frank's professional career was almost equally divided between research and teaching in an academic setting and research in federal government agencies. Prior to coming to Cornell he held academic appointments at Peabody College as an instructor (1927-32), at Vanderbilt University as an instructor (1933-35), at Kansas University as an assistant professor (1935), and at Clemson College as an associate professor (1939-41). He served as a social science researcher with the Tennessee Valley Authority, initially during 1936-39 and again from 1949, until he came to Cornell in 1956. He was on the staff of the Natural Resources Planning Board, located in Atlanta, Georgia, during 1941-43. From 1943 until 1949 Frank was a social science analyst in what was then the Division of Farm Population and Rural Life, Bureau of Agricultural Economics, within the U.S. Department of Agriculture, working on a regional basis at different times in Atlanta and in St. Paul, Minnesota. While on sabbatic leave in Jamaica in 1962-63, Professor Alexander was a research evaluation consultant in the Division of Economics and Statistics for the Ministry of Agriculture and Lands.

Professor Alexander became a national leader in the evaluation of the informal educational programs conducted by cooperative extension. Initially, at Cornell, he had leadership responsibility for studies concerned with the activities of the extension service in adult and 4-H agriculture. Later this responsibility was extended to all extension research in the New York Extension Service. The studies were designed to serve the extension director

and his immediate staff, extension specialists in the two colleges (Agriculture and Home Economics), and the agent and specialist field staff. A major responsibility during the early years was a Kellogg Foundation-funded five-year evaluation of a newly inaugurated Farm and Home Management Program. Skillful application of social science research techniques was exemplified in the printed summary report on the farm management phase of the program, issued as Extension Study no. 1 in 1962. Under Frank's leadership the Office of Extension studies produced more than one hundred reports. Nearly all of these were distributed in mimeographed form for decision making, program planning, and informational purposes to key audiences within cooperative extension in New York State. Consistent with his great concern that the findings and implications of evaluation studies enter the lifeblood of the agency whose activities had been studied, Frank prepared a comprehensive self-evaluation of the activities of the Office of Extension Studies covering the entire period of his tenure; this report, *Office of Extension Studies, New York Cooperative Extension: A Case Study*, offers a rare example of historical documentation and critical self-analysis for an operating unit within a university.

Because of his technical knowledge and his objective approach, Frank became known as a helpful counselor for college and field staff in cooperative extension on issues of evaluation, organization, and other matters. On occasion he offered a graduate course in evaluation research.

Any statement about Frank Alexander's professional career would be incomplete if it failed to note that his research while on the staff of the Bureau of Agricultural Economics inadvertently involved him in a raging political controversy, an involvement and a controversy that has been permanently recorded in the scholarly literature on agrarian politics. Frank had been assigned to prepare a reconnaissance report on rural life in Coahoma County, Mississippi, one of seventy-one counties carefully selected by his agency to represent major type-of-farming areas across the United States. Coahoma County was a cotton-growing plantation area, whose population had been predominantly black for a century. Frank's preliminary report on his survey in the county, prepared in March 1944, followed the outline used for each of the seventy-one county reports. The content for the Coahoma report, however, reflected Frank's observations and conclusions that black-white relations and the plantation system were dominant features of the county's culture. One of the few copies of the report circulated for critical review and marked "for administrative use" fell into unfriendly hands. The report provided further ammunition for those already strongly opposing some activities of the Bureau of Agricultural Economics, namely, a number of southern congressmen and the American Farm Bureau Federation. Frank was blocked by influential agricultural leaders in Mississippi from returning to the state to participate in a cooperative project with the Mississippi Agricultural

Experiment Station. By summer 1946 the political furor had led to prohibition by Congress of the bureau's conducting any further "cultural" surveys, the closure of the bureau's regional offices, a demotion of the agency within the Department of Agriculture, and the resignation—in frustration—of the bureau's chief. The preliminary Coahoma County report contributed greatly to raising large and continuing issues about the politically acceptable role of social scientists in the U.S. Department of Agriculture.

Professor Alexander was a member of the Rural Sociological Society, serving as chairman of its program committee for the 1958 annual meeting. He was also a member of the American Sociological Association, Phi Delta Kappa, Kappa Delta Pi, and Epsilon Sigma Phi. While living in Ithaca, he was an active member of the Congregational Church.

Frank will be remembered by his friends and colleagues as a kind and gentle man with great integrity. Death came on November 20, 1983, after prolonged hospitalization, of Parkinson's disease, in Evansville, Indiana. He is survived by his wife, May, and by three nieces and one nephew.

George J. Broadwell, James E. Lawrence, Olaf F. Larson

Ralph William Alexander

March 14, 1911 — September 17, 2001

Ralph William Alexander of Englewood, Florida, died September 17, 2001. He was born March 14, 1911 in Washington County near Newport, Ohio to William Harvey and Bertha (Lorentz) Alexander. He received his B.A. degree from Marietta College, Marietta, Ohio in 1932 and his M.D. degree from the University of Rochester, School of Medicine, in 1936. He completed his internship at Jefferson Medical College Hospital in Philadelphia, Pennsylvania in 1938, and his residency at the University of Pennsylvania Hospital, Philadelphia, in 1939. Dr. Alexander was a staff physician at the Student Health Service at the University of Pennsylvania, Philadelphia, from 1939-46. He joined the Department of University Health Services at Cornell University, Gannett Medical Clinic and Sage Infirmary in 1946 as Assistant Professor and Attending Physician. He became Professor of Clinical and Preventive Medicine in 1961 and served as the Deputy Director from 1969-71. He was named Professor of Clinical Medicine, Emeritus, in 1977.

Dr. Alexander's fields of specialization were student health and internal medicine. In 1952, Dr. Alexander, in cooperation with Dr. Norman S. Moore, then Director of University Health Services, became the founding editor of the Cornell publication, *Student Medicine*, the first publication in the country devoted primarily to the health of college students. This publication became the official *Journal of the American College Health Association* (ACHA) in 1958 and Dr. Alexander then served as Editor until 1973. He received the Ruth E. Boynton Award for distinguished service from the ACHA in 1970, and the Edward Hitchcock Award for outstanding contributions to the field of College Health in 1973. He was a Fellow of the ACHA, member of the American College of Physicians, American Medical Association, New York State, and Tompkins County Medical Associations.

Dr. Alexander will be missed by his wife of 64 years, Gladys, and their four surviving children: Ralph, Jr. of Rolla, Missouri; Judith Robin (Goodloe) of Ithaca, New York; Nancy (Davison) of Peoria, Illinois; and David, also of Peoria, Illinois. One daughter, Anne (Koehler), preceded him in death. Seven grandchildren and two great-grandchildren also survive him.

Janet Corson-Rikert, Allyn Ley

William H. (Hub) Allaway

April 12, 1916 — May 2, 1995

William H. (Hub) Allaway was born in Homer, Nebraska, and died in Lexington, Virginia. He received a B.S. degree in Agriculture from the University of Nebraska in 1938.

He received an M.Sc. degree in 1939 and a Ph.D. degree in 1945, both in Soils from Iowa State University. He was an Assistant Professor of Soils at the University of Nebraska from 1943-45, an Assistant Professor of Soils at Iowa State University from 1945-47, an Associate Professor of Soils and of Chemistry at Iowa State University from 1947-49, and a Professor of Soils at Iowa State University from 1949-50.

In 1950, Hub joined the U.S. Department of Agriculture (USDA) and worked in Beltsville, Maryland, and Washington, D.C. He was responsible for national programs on interpretation and use of soil surveys and for certain phases of soil management research. In 1954, he moved into administrative work for the Agricultural Research Service (ARS) of the USDA, where he served as Head of the Soil-Plant Relationships Section and as Assistant Director of the Soil and Water Conservation Research Division.

He came to Ithaca in 1961 as Director of the U.S. Plant, Soil and Nutrition Laboratory, which is located on the Cornell University campus. He also held a courtesy appointment as Professor of Soils in the Department of Soil, Crop and Atmospheric Sciences. After his retirement from the ARS-USDA in 1976, he taught at Cornell and did research in Agricultural Extension. During this time, he served as a Senior Lecturer in the Department of Soil, Crop and Atmospheric Sciences from 1976-83 and as a Visiting Fellow for the same Department from 1983-88.

Hub's impact as a research leader and Director of the U.S. Plant, Soil and Nutrition Laboratory, is evidenced by the statement by Dr. Robert W. Holley in *Science* magazine on April 27, 1973: "...the Director of my lab, W.H. Allaway, thought my work was important and gave me the support to do it full time. But for Allaway I would not have finished the structure [of the nucleic acid] before someone else did, and I would not have gotten the Nobel prize."

In addition, Hub encouraged initiation of a number of new programs during his tenure as Laboratory Director, including work on grass tetany, magnesium metabolism in plants and animals, zinc absorption by plants, zinc in animal reproduction, absorption of other trace metals by plants and animals, plant requirements for chromium and vanadium, value of plants as dietary sources of trace minerals, control mechanisms in plants, improvement of nutritional quality of soy protein, and absorption of cadmium by plants and availability of cadmium from plants to animals. Many of the Laboratory scientists made notable advances in these fields. Hub's research leadership at

Ithaca has directly affected both the quality and quantity of food sources, and he played a major role in informing the general public on the relation of soil quality to food quality.

At the start of Hub's research on selenium (Se) at the Nutrition Lab, it was already known that very small amounts of dietary Se could correct certain diseases of livestock and that higher levels of dietary Se could be toxic. Through his own research, with a small group of associates, he developed a method for measuring the very low concentrations of Se in biological materials that were associated with Se deficiency. Then they prepared a map of the U.S. showing the areas where crops were likely to contain less Se than is required in animal diets. This map has been very widely used by feed manufacturers, veterinarians, medical epidemiologists, and public health officials. Hub also led the group that established the nutritional value of Se in forages and grains, and showed that animals on a Se-adequate diet could accumulate body reserves of Se that would protect them for as long as one year on Se-deficient diets. When the American Feed Manufacturers applied for permission to supplement animal diets with Se, their application was to a large extent based upon the work of Hub and his associates. The environmental impact statement, issued by the Food and Drug Administration in approving this application, was based almost entirely on the research of Hub and his collaborators. The addition of Se to animal rations is now very widely used in the U.S. and is clearly responsible for increases in the total production and nutritional value of foods of animal origin.

Hub and his associates established that Se was universally present in human blood and that the blood levels showed a relationship to local levels of Se in foods. Hub's work on Se distribution among the U.S. population provides additional evidence of the importance of Se in crops in the U.S. for human health problems. In September of 1979, Hub participated in a week-long workshop he helped organize that was directed toward examination of the role of Se in human health. The workshop was sponsored by the World Health Organization.

Hub's work in informing the general public on the relationship between soil quality and human nutrition is evidenced by the large number of citations to his Agr. Inf. Bulletin 378 — "The Effect of Soils and Fertilizers on Human and Animal Nutrition." These citations include popular magazines, newspapers, textbooks and court hearings on food quality. Almost sixteen thousand copies of this bulletin were distributed. A predecessor to this bulletin (also authored by Hub) was translated into Spanish by AID for use in their Latin American programs. Hub was the author of approximately 100 publications.

In honor of his research, he received the Soil Science Research Award of the Soil Science Society of America in 1971. In the same year, he also received an Honorary Doctor of Science degree from the University of Nebraska (his

undergraduate alma mater). In 1976, he was made an Honorary Member of the American Society of Agronomy, an honor reserved for very distinguished individuals. He was made a Fellow of the American Society of Agronomy in 1958.

In 1985 and 1986, Hub served as a member of a committee of the National Research Council of the National Academy of Science. That committee prepared recommendations for the U.S. Department of Interior and the State of California, on how to deal with the Se toxicity problems in the Kesterson Reservoir in California. Similar environmental problems are now developing elsewhere, and the advice of that committee may help in solving these problems also.

Hub is survived by his daughters, Susan LaRue and Nancy Lindsley; and his son, William H. Allaway, Jr. His wife, Mildred Holland Allaway, died on September 2, 1995.

David L. Grunes

David Jepson Allee

September 13, 1931 — April 17, 2003

David Jepson Allee, Professor of Resource Economics and Leader of Cornell Local Government Program, New York State College of Agriculture and Life Sciences, Department of Applied Economics and Management at Cornell University, died on April 17, 2003.

Aged 71, he was approaching his Cornell Class of 1953 Fiftieth Reunion and his Golden Wedding Anniversary. David was a devoted husband to his wife, Martha; and father to his daughters, Leslie, Lisa and Elizabeth (Liddy); his son-in-law Emerson Jumbo; and to his grandchildren Emelia, Ariel, Casey, Tyler, Arianna and Wilson. He was a loving son to Ruth and Ralph Allee; and brother to sisters, Ruth Ann and Susan Abigail. Other family members close to his heart include sister and brothers-in-law, nieces and nephews. A warm-hearted, genial, friendly person, Dave was eternally optimistic, compassionate and humorous.

Born September 13, 1931 in Caribou, Maine, David traveled the world with his parents and sisters, living in Turkey, Greece, Albania and Costa Rica. Boarding with a local family while his parents remained in Costa Rica, he graduated from Woodrow Wilson High School in Washington, D.C. in 1949, and received his Bachelor's and Master's degrees from Cornell in 1953 and 1954. After marrying Martha Ladd, a high school classmate, on June 30, 1953, he served in the USAF from 1954-56. Following his discharge from the service, he studied at Oxford University on a Fulbright Scholarship, receiving a diploma in Agricultural Economics, then returned to Cornell University for his Ph.D. degree, completed in 1960, under the guidance of Dr. Howard Conklin.

David began his academic career as an Assistant Professor of Agricultural Economics at the University of California, Berkeley, from 1960-64 and then returned to Cornell as an Associate and full Professor with responsibilities in teaching, research, and extension. David was the author or co-author of more than 300 significant articles and reports. As Principal Investigator on numerous externally funded grant awards, David led research and extension projects that brought millions of dollars to Cornell and Tompkins County. As Leader of the Local Government Program, he directed a staff that consisted of up to ten professionals. He also advised more than 185 graduate students in broad areas of Resource Economics, Public Policy, and Water Quality related concerns.

A strong believer in the power of organizations and collective action, David served on numerous professional and related community organizations and advisory committees. At the time of his death, Dave was President of the Adirondack Research Consortium. Prior to leading the Local Government Program, Dave spent a decade as

Associate Director of Cornell's Water Resources and Marine Sciences Center. He was an active member of the Economic Vitality, Water Resources, and Environmental Stewardship/Land Use Statewide Program Committees at the University. David was a founding member and officer of the Board of the New York Main Street Alliance, led Cornell's U.S. Economic Development Administration University Center, and served on the Board of the National Association of Management and Technical Assistance Centers which represents 140 federally supported, university-based economic development programs.

David was known, both in the academic community and in the field, for his unique blend of civic engagement and research. A keen student of federal, state and local public policy, he served the University as Special Assistant to the Provost for State Relations. He served as Water Policy Task Force Chair for the American Society for Public Administration. He led the American Water Resources Association's project on "Unified River Basin Management," and was College Project Leader for the study of the social and economic characteristics of New York's Adirondack Region. He was part of program and policy reviews of the soil and water conservation programs of the USDA, environmental policies of the U.S. Bureau of Reclamation, and state and local groundwater protection programs for the U.S. Environmental Protection Agency. He managed a large four-year Kellogg Foundation supported project stressing different strategies, especially multi-community collaboration, to build economic development capacity in rural areas.

David's interests ranged from natural resource and watershed management/protection, economic and community development, to telecommunications infrastructure and e-government. Much of his career was dedicated to the goal of capacity building, or helping people and communities to help themselves by strengthening the functions and capacities of local organizations, governance, and leadership. His intellectual and theoretical frameworks were often informed by his grounded, action research involvement in dozens of rural communities across the State of New York. His knowledge of the environmental and political landscapes, particularly in the northeast, was exceptional, as anyone who had the opportunity to travel with him on his frequent trips to the field can attest. Wherever the end of the day found him, he seemed to always know a scenic alternate route back to Ithaca with a notable diner or cafe on the way. And he would often relate interesting anecdotes about the local environmental, economic or political history of rural communities as he drove through them.

Always close to his heart was his devotion to improving the local capacity for decision making by communities to resolve environmental issues, especially those related to water quality. Along these lines his most recent work included a very successful regional EPA conference which brought state, regional and local managers and

representatives of policy makers together to resolve one of the leading concerns of managing non point source pollution affecting ground and surface waters. As an officer and current President of the Adirondack Research Consortium, he activated the group to focus on various environmental and water quality concerns threatening the integrity of the Adirondack Park. Through his effort, he received funding for a project to enhance the capacity of local governments and lake associations to develop a regional framework to manage invasive species such as Eurasian water milfoil in the Adirondack Region by adopting integrated pest management strategies as a means of effecting control while preserving the integrity of the “forever wild” character of the Adirondack Park and its surrounds.

Dave never failed to rise to new challenges. In recent years, he was one of several who helped found the Cayuga Lake Watershed Network and later served as the representative of Cayuga Heights on the Intermunicipal Organization to manage the Cayuga Lake Watershed Restoration and Protection Plan.

David served on the Hangar Theatre Board for 23 years, the Finger Lakes Library System Board since 1958 and several committees in the Unitarian Church. He was an elected Trustee of the Village of Cayuga Heights and currently was serving as the chairman of the Cayuga Heights Board of Zoning Appeals, and as State Committee Member of the New York State Liberal Party from 2002. As a member of the League of Women Voters, Dave moderated numerous local candidates meetings. He supported the Family Reading Partnership as an active volunteer. David enjoyed cooking, eating, reading, sailing, gardening, skiing and the study of Native American culture.

He lived by Margaret Mead’s dictum, which appeared on his email signature, “Never doubt that a small group of thoughtful, committed citizens can change the world; indeed it’s the only thing that ever does.”

A celebration of his life was held on Sunday, June 1, 2003, at the First Unitarian Church. Contributions may be made to the Family Reading Partnership or the Hangar Theatre.

Olan D. Forker, Michael Hattery, Nelson Bills

Arthur Augustus Allen

December 28, 1885 — January 17, 1964

It can be truly said that birds filled the life of Arthur Allen. He was the first professor of ornithology in America and devoted a lifetime to teaching and research in ornithology at Cornell. His devotion to the field was paramount, and there was no corner of the discipline into which his curiosity did not take him with enthusiasm.

Although Dr. Allen specialized in birds, his breadth of training and his experience in biology were exceptional. He developed an inimitable style of writing and speaking which enabled him to share his knowledge and discoveries with others in a delightful manner. One didn't need to be an ornithologist nor even know anything about birds to enjoy his lectures, his stories, or his books. His ease in writing, his charm as a lecturer and teacher, his unique ability as a raconteur, his sense of humor, and his quickness of response were characteristics which endeared him to all.

Dr. Allen was born in Buffalo, New York. His early years were spent there. He entered Cornell in 1904 and received the A.B. degree in 1907, the M.A. degree in 1908. In 1908 and 1909 he received a fellowship in zoology, and in 1911 he was awarded the Ph.D. degree in zoology.

In 1912 Dr. Allen collected for the American Museum of Natural History in Colombia where he discovered over fifteen species of tropical birds new to science. His expeditions and discoveries in ornithology from tropics to arctic, almost too numerous to mention, resulted in his election to membership in the Explorers' Club of New York. Outstanding was the discovery of a nesting pair of Ivory-billed Woodpeckers in Florida in 1924. In 1935 he led an expedition for Cornell and the American Museum of Natural History in search of vanishing birds, during which the rare Ivory-bill was again located, this time in Louisiana. The birds were photographed in motion and still pictures, resulting in the best series of studies ever made on this almost extinct species, and the only sound recordings made to date. Three separate trips to Hudson Bay (1934, 1944, 1954) gave him an unusual familiarity with arctic birds, their songs and problems. With the Office of Scientific Research and Development in 1944-1945 he renewed his acquaintance with tropical birds in Panama in the interest of the armed forces and helped clear up many mysteries of the tropical jungles and their sounds.

His doctoral thesis on the life history of the Red-winged Blackbird was recognized immediately as a new and effective approach to the study of living birds and became the pattern for similar studies all over the world. His research on diseases of the Ruffed Grouse won for him the Outdoor Life Medal in 1924. While conducting his

eminently successful experiments on raising Ruffed Grouse in captivity, he discovered a basic sex rhythm. His paper on this subject is a classic, which has stimulated much research in avian ethology. In 1948 he found the hitherto unknown nest of the Bristle-thighed Curlew in Alaska, for which he was awarded the Burr Prize by the National Geographic Society.

Though his scientific contributions to ornithology through teaching, research, lecturing, and writing were many and varied, it was his warm personality which endeared him to thousands of students who remember his courses and field trips, his counsel and the lovable example he set for all who came in contact with him. He guided his students toward making outstanding contributions of their own with an informality that put them at ease. His willingness and ability to share his knowledge, his enthusiasms, and his inspirations with others were outstanding.

Dr. Allen's popular writing about birds began with stories written for *Bird Lore*, which was edited by his friend, Dr. Frank M. Chapman of the American Museum of Natural History. Dr. Allen soon became assistant editor of the magazine and for years contributed regularly to the publication, which later became the *Audubon Magazine*. These stories about birds became later the basis for two volumes, *American Bird Biographies*, published in 1934, and *The Golden Plover and Other Birds*, published in 1939. These books present life histories of forty-seven American bird species in which scientific facts about the birds are woven into most charming tales.

In his text, *The Book of Bird Life*, published in 1930, the aspects of the subject are presented from paleohistory, anatomy, physiology, and function to techniques for study of them in the field and laboratory. This introduction to general ornithology had eleven reprintings during its first thirty years of use. In April, 1961, a revised edition of the book was published which included new material on ethology and migratory behavior, and on the recent progress made in recording the songs and calls of birds.

In 1951 the National Geographic Society published his *Stalking Birds with Color Camera*, a monumental collection of 331 bird photographs in color, mostly by the author, and stories of the making of the photographs. In this and other publications Dr. Allen has done much to help others who aspire to perfection in bird photography.

The first course in wildlife conservation given in the United States was taught at Cornell in 1919 by Dr. Allen. His deep interest in this field caused him to assist in organizing the professional Wildlife Society in 1935, and to serve as its second president.

His ear for bird sounds was phenomenal. His ability to quickly coin little verbalizations helped him and his students to become adept at learning songs and calls and at passing the knowledge on to others. When sound

recording was introduced about 1925 in the motion picture world and it became electronically practical, Dr. Allen immediately showed interest in the possibility of using this new tool in biology and especially to expand interest in ornithology. The first “Cornell Bird Songs” were recorded in May, 1929, in Renwick Park in Ithaca. Beginning in 1930 with Albert R. Brand and others, he led the team, which created the Cornell Library of Natural Sounds and a long series of published records of birds and other animals.

Cornell thus became the first American university concentrating on bioacoustics studies—and the present size of its sound collection attests to his long encouragement of the work in which he took an active, keen part. The collection now contains some 20,000 recordings of approximately 1500 bird species from all zoogeographic regions of the world.

The Laboratory of Ornithology, which was one of Dr. Allen’s proudest achievements, may be thought of as beginning with his appointment as Assistant Professor of Ornithology in 1915. In 1955 the Laboratory was officially recognized as a part of Cornell University and Dr. Allen became its co-director. Later he was named honorary director but always remained most active in its operation and management.

Dr. Allen was a Fellow of the American Ornithologists’ Union and a member of the International Ornithological Congress, the Wilson Ornithological Club, the Cooper Ornithological Club, the American Society of Naturalists, American Wildlife Society (president, 1939), the Society of Mammalogists, Sigma Xi, Gamma Alpha, the Explorers’ Club, the Savage Club, and others.

His wife, Elsa Guerdrum Allen (Ph.D. Cornell) was closely associated with him in his fieldwork and writing and for many years assisted him with his Summer School classes in ornithology.

Dr. Allen’s many talents, his tremendous energy, his accomplishments, his wonderful spirit, and his generosity in sharing his great knowledge have left an indelible stamp on the field of ornithology, on his students, and on Cornell.

E. C. Raney, O. H. Hewitt, P. P. Kellogg

Flora Thurston Allen

December 22, 1890 — April 17, 1976

Flora Thurston Allen was an idealist and a theorist. Her broad background in education and her wide experiences with many types of persons in a variety of situations prepared her to play a unique role in the field of education. After her early education in Toledo, Ohio, where she lived as a child and young woman, she entered Teachers College, Columbia University, where she earned her bachelor's and master's degrees and where she continued her graduate studies in the areas of philosophy, sociology, psychology, and other fields that enriched her background and broadened her point of view. During her study periods Miss Thurston held both a National Research Council Fellowship and a Laura Spellman Rockefeller Scholarship. Between 1925 and 1937, she held positions at Vassar College, at Oregon State University, in the National Council of Parent Education, and at the U. S. Office of Education.

From 1917 to 1925, Miss Thurston was a member of the Cooperative Extension Service of the College of Home Economics at Cornell University in the area of child development and family relationships. After her period of graduate study and her positions in other institutions she returned to Cornell in 1937, first as professor of rural education in the College of Agriculture and later as professor of home economics education in the College of Home Economics. Her teaching and research in the Field of Home Economics Education at the graduate level, as well as her vision of future possibilities, resulted in the creation of a strong graduate program in that area.

Professor Thurston was an exciting teacher, stimulating many students, frustrating some, but provoking all to explore wider horizons of knowledge. Although she was very aware of practical problems faced by families in rearing their children and by educators in their development of family life programs, she never took a purely pragmatic view. Rather, she would encourage both colleagues and students to probe all aspects of an idea for soundness and worth as bases for examining possibilities for implementation. She stimulated students to learn for themselves; those who expected to be spoon-fed were disappointed. She had little use for conformists and was inclined to take an opposing point of view during discussions in order to encourage a wide sphere of thought concerning a problem.

While at Cornell, Professor Thurston opened a new world to many of her students, particularly those from other countries, through her Sunday evening gatherings in her home. At these informal supper parties, students were given an opportunity to share in discussions of current world problems with distinguished faculty members and University visitors. Thus they were spurred on to further animated and constructive discussion among themselves.

After Professor Thurston retired from Cornell as professor emeritus of home economics education, she continued her professional activities. At first she taught human development at Chatham College in Pittsburgh; later she moved to California and there engaged in a wide variety of family-oriented educational interests which culminated in particular concern for the needs of the aging. During this later period she married Walter Allen and shared several happy years with him until his death.

Flora Thurston Allen's former colleagues and students who have had contact with her in recent years have expressed delight and amazement at her memory of their individual concerns and ambitions and at the renewal of warm personal relationships with her. Those who had the privilege of talking with her during the last months of her life, when she was in pain and knew that her death was imminent, were deeply impressed by her continued interest in the professional activities of her friends and in her concern for the American family. This stimulating, attractive, and intelligent woman will be greatly missed by her friends.

Margaret Hutchins, H. Irene Patterson, Kathleen Rhodes

Robert N. Allen

October 21, 1917 — December 14, 2002

Professor Emeritus Robert N. Allen died after a brief stay in hospice care. His wife, Patricia; daughters, Jennifer and Kathleen; son-in-law, Robert; two grandchildren and many extended family members survive him.

Bob Allen was born on October 21, 1917. He attended Cornell University and received a B.S. degree in AE (ME) in 1940. Upon graduation and until entering the Army, he was a lab instructor in the accounting courses in the former Department of Industrial and Engineering Administration. He retired from the Army as a Captain and returned to Cornell in 1946 as an Instructor, teaching accounting. He was appointed Assistant Professor in July 1951 and Associate Professor in July 1957. He retired and was appointed Emeritus Professor in 1977.

Bob Allen taught the first course in Cost Accounting and Control in the Department of Industrial and Engineering Administration in the Sibley School of Mechanical Engineering. From its inception, this was a required course for students taking the industrial option within ME. The importance of this course is illustrated by the fact that it is still a requirement in the undergraduate curriculum in the School of Operations Research and Industrial Engineering. Bob regularly taught this course as well as others in this area until his retirement. There are many returning alumni who speak with high regard for what they learned from him; the material he taught was both practical and necessary for understanding and solving real-life industrial problems.

From 1967 until his retirement, Bob was also the Director of the Cooperative Engineering Program in the College of Engineering. This Program remains an important optional component of the College's undergraduate curriculum. During Bob's tenure, the number of companies participating grew from 9 to 40, and in his last year as Director, the number of participating engineering students had increased to 125. During a student's first Coop assignment, a faculty member, often Professor Allen himself, would visit the site of the student's work, assessing the appropriateness of the job and the adequacy of company mentoring for the student. Again, many students remember him fondly for his efforts to ensure them the best Coop assignment possible. He also was instrumental in bridging the Coop experience in the transition from a five to a four-year baccalaureate engineering degree.

Bob was an avid golfer and student of the game. He could often be seen in the corridors of Upson Hall practicing his golf stroke.

Sidney Saltzman, Leslie Trotter, William Maxwell

Archie Randolph Ammons

February 18, 1926 — February 25, 2001

In 1963, Archie Ammons—an editor of a magazine for businessmen and a former executive of a chemical glassware firm—was invited to Cornell to give a reading of his poetry during the summer session. Poetry readings were popular events in those days, whether the poet was famous or not; this one, held in Willard Straight Hall, so crowded the room that some members of the audience sat on the floor. Ammons, who then was relatively unknown as a poet, probably never expected so many auditors, and may have been painfully shy. With its gentle North Carolinian accents, his voice was engaging; but it was so soft that some listeners had to cup a hand to an ear to capture the words. Oddly enough, the concentration required of everybody to hear the poems abetted their effect. The reading so impressed the writers in the English Department's Creative Writing Program that they hoped Ammons would renounce his business career to teach with them at Cornell. To Cornell's good fortune, he did, and soon became one of the writers most revered by students in creative writing.

At the time of his first reading at Cornell, Ammons' single volume of poetry was *Ommateum*. Published in 1955 by Dorrance & Co., it had received little attention. In 1964, Ohio State University Press published his *Expressions of Sea Level*, poems that had appeared in *The Hudson Review*, *Poetry*, and other magazines. Soon after he moved to Ithaca, his productivity was such that a series of books quickly followed, all of them published by Cornell University Press: *Corsons Inlet* and *Tape for the Turn of the Year*, both in 1965; *Northfield Poems*, 1966; and *Selected Poems*, 1968. Beginning with *Uplands* in 1970, W.W. Norton became his publisher, and remained so for the rest of his career. His numerous books included *Collected Poems 1951-1971*, published in 1972; *Sphere: The Form of a Motion*, 1974; *The Snow Poems*, 1977; *A Coast of Trees*, 1981; *Lake Effect Country*, 1983; *Sumerian Vistas*, 1987; *Garbage*, 1993; *Brink Road*, 1996; and *Glare*, his final book, 1997.

The awards and honors bestowed upon Ammons became almost as numerous as his books. He won a Guggenheim Fellowship in 1966-67; a Traveling Fellowship of the American Academy of Arts & Letters in 1967-68; and the Bollingen Prize in 1973-74. He won the National Book Award on two occasions, for *Collected Poems 1951-1971* in 1973, and for *Garbage* in 1993. He was a MacArthur Prize Fellow in 1981, the first year those awards were given. In 1982, he won the National Book Critics Circle Award for *A Coast of Trees*. He was the recipient of the Lannan Literary Award for Poetry in 1992; the recipient of the Frost Medal for Distinguished Achievement in Poetry over a Lifetime in 1994; and in 1998, recipient of the Tanning Prize, a \$100,000 award for "outstanding and proven mastery in the art of poetry."

Long before his death at his home in Ithaca at the age of 75, Ammons was recognized by such eminent critics as Harold Bloom and Helen Vendler as one of the major poets of the twentieth century, an inheritor of the tradition defined by Emerson, Whitman, and others. Phyllis Janowitz, a poet in the Cornell program who had a particularly close association with Ammons over the years, has said that, given the complexity of his character, it is nearly impossible to say anything about him that is not contradicted by an opposing view. If he indeed is a poet of nature in the transcendental tradition of Emerson, he also is one who acknowledges the finality of death as well as the indifference of nature to human desires or aspirations. During an interview with a reporter for the *Cornell Daily Sun* in 1993, Ammons said that it seemed to him that

“the dynamics that caused nature to be there became part of the dynamics that produced us.... If you’re angry, or you don’t like certain people, you can take a walk and then the impersonality and indifference and loveliness of things quiet you down.”

And yet, as his acquaintances and students knew, he was generous and friendly, a person who thrived on conversation. For years, he was the center of a group of students and faculty members who regularly met in the Temple of Zeus to talk about poetry and everyday topics. His office door was always open to students and others. Kenneth McClane, a poet and essayist in the English Department, was, as undergraduate, one of those students who came to Ammons’ office for advice, and later became his student in a writing class. He feels that what he and the other students learned from Archie was that “we had something precious to relate, if only we could honor it.” From his presence, “we could sense that poetry was the highest calling.... It was wonderful to be taught by an elder who saw us as knowledgeable, sacred, in-process, and gifted.”

As McClane and many others have noted, Ammons’ conversation was closely allied to his poetry, which often has the quality of a person expressing and developing (and sometimes contradicting) his thoughts. In conversation as in his poetry, he could be succinct, making some unexpected analogy or insight as lyrical as it was profound; but he also could be playful or ironic, his language sometimes intentionally outrageous, as if he realized that anybody’s transcendent impulses and social or intellectual refinement need to be balanced against, say, the awareness of biological imperatives.

Ammons’ unique contribution to American poetry is best revealed in his longer poetry. In their very length—many of them constitute books—these poems are reminiscent of Whitman; and reminiscent of him, too, in their inclusiveness as well as their democratic or egalitarian bias. (Ammons grew up on a small farm in North Carolina, his family’s struggle to earn a living taking precedence over everything else, including reading.) In other ways, though, his long poems are distinct from Whitman’s *Leaves of Grass*. They are humbler, in that the poet never

calls attention to himself as one containing multitudes; and yet they are far more complex and philosophical, often moving from details to abstraction. Two of his book-length poems—*Tape for the Turn of the Year* and *Garbage*—were composed on rolls of adding machine tape; they were preceded by *Sphere*, which achieves some of the same self-imposed discipline through narrow margins, the end of a line dictated by the typewriter bell. The effect of such poems, as Ammons' younger colleague Roger Gilbert has said, is that "of an endlessly unspooling meditation" in which the reader is listening in on a fascinating mind in dialogue with itself as the poem is in the process of creation.

Garbage—the title itself is outrageous—was set in motion by Ammons' sighting of a huge mound of refuse as he was driving along Interstate 95 in Florida. The poem becomes a lengthy, often self-ironic and moving meditation on nature and transformation, ambition and mortality, memory and dissolution. In an interview published in the November 1993 issue of *The Bookpress*, Ammons makes a remark that is as applicable to this just-published poem as it is to everything that precedes or follows it. He says that any structure the poet may create—as in a sonnet, or in his own characteristic use of short lines—is "arbitrary; it has the indifference of nature, the quality of being imposed. It's a very great feeling." The arbitrariness, though, is part of a more encompassing artistic process: "I am always in search of unity, and frequently, so frequently, correspondences come up that are startling."

Ammons is survived by his wife, Phyllis, of Ithaca; a sister, Vida Cox, of North Carolina; his son, John Ammons, and daughter-in-law, Wendy Moscow, and two grandchildren, Matthew and Jasmine, all of California. Since his poems reveal his presence to a remarkable degree, any reader of them will have at least some awareness of the loss that his family members have experienced. It is some solace to know that, through his poetry, that presence endures.

Alfred Leonard Anderson

November 19, 1900 — January 27, 1964

Alfred Leonard Anderson, Professor of Geology since 1952, died on January 27, 1964, in the Robert Packer Hospital at Sayre, Pennsylvania. He had been taken to the hospital for a brain operation after collapsing on the path above the Suspension Bridge over Fall Creek while on his way to his home in Cayuga Heights.

Professor Anderson was born in Moscow, Idaho, and studied at the University of Idaho where he received the degrees of B.S. Chemical Engineering, *cum laude*, 1921, and M.S. in Geology in 1923. He was awarded the Ph.D. degree in geology by the University of Chicago in 1931. Meanwhile he had been from 1924 to 1926 Assistant Professor of Chemistry in the Idaho Technical Institute at Pocatello. He was geologist for the Idaho Bureau of Mines and Geology in 1927-1928, and in 1928 went to the University of Idaho where he became head of the Department of Geology in 1939.

That year he came to Cornell as Assistant Professor of Economic Geology.

For many summers Professor Anderson worked in the field for the Idaho Bureau of Mines and Geology and the United States Geological Survey.

He was a fellow of the Geological Society of America, the Mineralogical Society, and the Society of Economic Geologists, and a member of the American Institute of Mining Engineers, the Geochemical Society, the American Geophysical Union, Sigma Xi, Phi Beta Kappa, Tau Beta Pi, and Delta Tau Delta.

Professor Anderson was of a retiring disposition. His graduate students thought highly of his ability as a teacher.

His research career was devoted quite exclusively to the geology of his native state. His published titles number nearly 100. It happens that no one of this committee is especially familiar with the area of his special interest, the discovery and mapping of deposits of metallic minerals of igneous and metamorphic origin and their genesis. It is reported that he was responsible for the location in Idaho of some of the largest reserves of cobalt in the United States.

In recognition of his theoretical and practical contributions to the study of Idaho geology he was awarded, in 1961, a citation of Outstanding Northwest Scientist by the Northwest Scientific Association.

He looked forward to his summers of fieldwork in Idaho for the Idaho Bureau of Mines and Geology and endeavored through the year to keep physically fit for the strenuous climbing over the Idaho mountains this activity entailed.

Professor Anderson was a very enthusiastic and able amateur photographer; the subjects of his pictures: Idaho scenery and geologic phenomena. He showed the geologic color slides that resulted to his university classes and thus provided his students with a first-hand contact with striking illustrations of geologic features as encountered in the field.

In 1934 Professor Anderson married Evelyn Bennett. Mrs. Anderson regularly accompanied him on his field expeditions to Idaho. Of their two children the daughter, Patricia Evelyn, has an A.B. and an M.A. degree from Cornell and is at present (1964) teaching English in the American International College in Springfield, Massachusetts. The son, Alfred Bennett, is majoring in chemistry at Cornell.

W. Storrs Cole, J. W. Wells, O. D. Von Engeln

Walfred Albin Anderson

November 26, 1892 — November 11, 1961

Walfred Albin Anderson, Professor Emeritus of Rural Sociology, died in Ithaca of a heart attack on Saturday, November 11, 1961. For twenty-nine years prior to his retirement in June 1960, “Andy” Anderson had been a prominent member of the rural sociology staff of the New York State College of Agriculture at Cornell. His passing marked the end of a distinguished career, which had its influence on the science of sociology and its application throughout the world.

Professor Anderson was born in Kansas City, Missouri, November 26, 1892, the son of Andrew J. and Anna Rosenlof Anderson. He graduated from Garrett Theological Seminary in 1917 and served for five years as a rural minister in Iowa. In 1921 he received the B.S. degree and in 1922 the M.S. degree from Iowa State College. From 1922 to 1924, he taught rural sociology at North Carolina State College and in 1925 became head of its Department of Sociology. In 1929, he was awarded the degree of Ph.D. at Cornell University. During 1930-1931 he was a member of the research staff of the Laymen’s Foreign Missionary Inquiry, which made a special study of rural conditions in China. In September 1931, Professor Anderson joined the staff of the Department of Rural Sociology at Cornell, and from 1943 to 1945 he was acting head of the department.

Professor Anderson’s career at Cornell was devoted to teaching and research. Some 6500 students in agriculture and home economics were in his undergraduate course in general sociology. He also served as chairman and member of many graduate student committees. He offered seminars in sociological theory and developed courses dealing with farmers’ organizations, rural life in other countries, and research in rural sociology. He also contributed frequently to the special training programs held annually for rural missionaries.

His research interests were wide. He pioneered in the areas of social participation and the urban fringe, and he specialized in social change. Researchers in several countries have used the value scales, which were developed by him. His publications number approximately one hundred. His bulletins on the population of New York State prepared after each decennial census have been widely used. A few days before his fatal heart attack, he completed the manuscript for an introductory textbook in general sociology, which will be published posthumously. During a sabbatic leave in 1939-1940, Professor Anderson studied rural communities in England and Scandinavia. In 1947-1948 he investigated rural reconstruction projects in the Middle East and Asia for Agricultural Missions, Inc. In 1950-1951, at the request of the Economic Cooperation Administration, he served as consultant with the

Joint Commission on Rural Reconstruction in Taiwan. For his services leading to the reorganization of farmers' organizations vital to the economic development of Taiwan agriculture, he was awarded a gold medal by the Chinese Nationalist government.

In 1947, he was elected president of the Rural Sociological Society. He was a Fellow of the American Sociological Association, and also a member of the Population Association of America, Sigma Xi, Phi Kappa Phi, and Gamma Sigma Delta.

While devoted to his teaching and research, Professor Anderson also contributed generously of his time to civic and community projects in Ithaca and Tompkins County. He was a past president of the Ithaca Rotary Club, and during the year 1960-1961, he served as governor of Rotary District 717. At the time of his death he was chairman of the Ithaca City Planning Commission. A testimony to Professor Anderson's influence on the field of rural sociology is the large number of outstanding sociologists who were his students.

Charles E. Ramsey, Howard E. Thomas, Robert A. Polson

William Cook Andrae

July 30, 1894 — June 27, 1965

William Cook Andrae was appointed Professor Emeritus of Engineering June 12, 1962. He had served Cornell for more than four decades. He died suddenly June 27, 1965.

Professor Andrae's early training was at the Baltimore Polytechnic Institute, from which he entered Cornell with advanced standing. In 1915 he obtained his Bachelor's degree in mechanical engineering after three years study. After a period of service as chief draftsman at the National Bureau of Standards and in research in various industrial organizations, he earned a Master's degree in mechanical engineering in 1924.

While working for his Master's, Professor Andrae held the Edgar J. Meyer Fellowship for one year and was an instructor in experimental engineering from 1921 on. He was promoted to the rank of Assistant Professor in 1927. His promotion to Associate Professor came in 1944, and he was made Professor of Mechanical Engineering in 1961.

During the three years of his high school career he served as an assistant scout master in Baltimore. His interest in scouting came to the fore again during the period from 1936 to 1946 when he was a member of the troop committee 1 in Ithaca. He was also a member of the scouting leadership committee for a year during that period, and served as an instructor of first aid for the American Red Cross.

Professor Andrae's church interests were centered in the First Presbyterian Church of Ithaca. In the period 1929-1946, he was elected to three four-year terms as deacon. He was then elected elder in 1948 and served actively for four years. He also took part in many other activities in the church.

Professor Andrae's professional life during all but the first of his years at Cornell was devoted to the Department of Experimental Engineering, which later was merged with the Heat Power Department to become the Department of Thermal Engineering. His teaching was mainly of testing and laboratory methods in mechanical engineering and of the application of thermodynamic principles to operation of equipment in practice. He also taught during two years of World War II in Ground School Aeronautics, Civilian Pilot Training.

In 1930 Wiley and Sons published a valuable work of reference known as *Experimental Mechanical Engineering* which was the joint effort of Professor Andrae and a former dean of engineering at Cornell, Professor Herman Diedrichs. This book was widely acclaimed and was used in the world of engineering for many years. Other

publications included several articles for the *Sibley Journal* and an article “Measurement of Power by Means of Dynamometers” for the American Society of Mechanical Engineers Power Test Code. In 1959 he published in photostat form, mainly for the use of the department, “Reference Tables of Thermal Properties of Fluids.”

Professor Andrae was a member of the American Society for the Advancement of Science, and he served for a time as chairman of a subcommittee of the American Society of Mechanical Engineers Test Code Committee. He was active in an organization for foreign students in Ithaca known as the International Association of Ithaca.

Masonic activities were one of Andrae’s interests for some 49 years of his life. He attained the position of Master in the Hobasco Lodge and was Assistant Grand Lecturer for three years.

Professor Andrae was married to Ida Harris Reed of Ithaca on June 21, 1920. His family consisted of a son, Reed, and a daughter, Margehne. Reed, a graduate of the School of Hotel Administration, is now purchasing agent for Northern Illinois University. Margehne married Albert Hoefler, Jr., and lives with her family in Ithaca. Among the favorite family occupations were travel and camping and Professor and Mrs. Andrae visited many parts of the country during vacations and leaves.

David Dropkin, Dennis G. Shepherd, Frederick S. Erdman

Albert LeRoy Andrews

December 27, 1878 — November 1, 1961

Albert LeRoy Andrews was born at Williamstown, Massachusetts, into a family descended from early New England settlers. He received his education in Williamstown and at Williams College, graduating in 1899. In that year he was elected to Phi Beta Kappa and later to Sigma Xi. His childhood interest in plants was partially frustrated by inadequate instruction in botany at Williams, so he majored instead in languages. Following graduation he taught languages briefly in Vermont and Pennsylvania, at the same time studying for the Master of Arts degree, which he received from Williams in 1902. That year and the next he pursued graduate work in German at Harvard University, where he became particularly interested in the comparative and historical philology of the Germanic languages and their relation to the Indo-European languages generally. This interest led, following receipt of the degree of Master of Arts from Harvard and a brief period of instructing in German at West Virginia University and Dartmouth College, to advanced study in Europe at the Universities of Berlin, Kiel, Christiania (now Oslo), and Copenhagen. He received his doctorate from Kiel in 1908.

In 1908, LeRoy Andrews came to Cornell as teaching fellow in German, and an association commenced which was to last for fifty-three years. He became instructor in German and Scandinavian languages in 1909, Assistant Professor of German in 1919, Professor of Germanic Philology in 1931, and Professor Emeritus in 1946, serving also as chairman of the German Department from 1924 to 1928.

LeRoy Andrews achieved distinction in two academic disciplines related only in rigorous methods of analysis and classification. His work was the product of devotion and unusually painstaking effort. He believed sincerely that what was worth doing was worth doing right. A bibliography of his publications has been prepared through the efforts of several persons for a memorial article to appear in a future issue of *The Bryologist*. With more than one hundred and fifty titles of which he was sole author, it demonstrates uninterrupted output about equally divided in number of pages between philology and bryology. It is noteworthy that his work in the two fields progressed side by side, that in a single year he produced some studies in the *Fornaldarsogur Nordrlanda* and remarks on additions to the flora of Iceland, Bermuda, and Alberta.

In philology he contributed major articles on the Old Norse *Hervarvar* and *Hromundar Sagas*, and a series on the relationship of Ibsen's *Peer Gynt* to the writings of Molbech and others. In bryology he prepared the standard

monograph of *Sphagnum*, one of the taxonomically most difficult genera of mosses, for *North American Flora*, and definitive treatments of Bryaceae and Miniaceae for Grout's *Moss Flora of North America, North of Mexico*. He also published an annotated list, augmented by keys and critical comment, of all species of bryophytes known to occur in the upper Cayuga Lake Basin (Cornell Memoir 352) in 1957. That publication summarized his own studies and those of others in this area, and it had significance far beyond its geographical bounds. In both subjects he prepared many penetrating reviews of the publications of others, reviews, which frequently embodied original results and conclusions.

The interests, which in publications were clearly divided between philology and botany were complementary in the man and intimately associated throughout his life. While studying languages at Williams, Andrews published a list of mosses and hepatics of the Mt. Greylock region. His interest in the Old Norse language in literature took him on several trips into Scandinavia and Iceland, during which he familiarized himself also with the botany and especially the bryophytes of those areas. Similarly, while teaching at West Virginia he collected extensively and contributed materially to knowledge of bryophytes of that state. When he came to Cornell, he immediately made contacts in the Department of Botany (then a division in the College of Arts and Sciences) and conducted field trips for students interested in the moss flora of the local area. His volunteered services to the Department of Botany, including identification of specimens of mosses and hepatics and development of the bryophyte collections in the Wiegand Herbarium, continued after the transfer of the department to the College of Agriculture and were not interrupted by his retirement from the German Department. In 1953 he was appointed honorary curator of the Bryological Collection in the Wiegand Herbarium and was provided an office in Mann Library near the collections. He used that office daily until the time of his death. The last field trip he led was in May 1961, at which time he took a group of students from the rim of Coy Glen to the bottom of the gorge and back up again, a scramble which might not be attempted by many persons half his age.

Through his meticulously prepared, thorough, and productive studies of difficult groups of bryophytes, Professor Andrews was recognized at the time of his death as one of the world's foremost bryologists and the American authority on Sphagnaceae. His extensive and invaluable personal collection of bryophytes has been given to Cornell University, where it will be available to future students of the bryophytes.

Despite his retiring and self-effacing nature, LeRoy Andrews was a friendly person and would go to considerable trouble to offer sound advice to those who consulted him. He remained interested in teaching and the problems

of the academic world throughout his life and was a source of insight for younger faculty members and graduate students who came to know him. He brought painstaking accuracy and good sense to vexatious committee tasks, and, as in his publications, no effort seemed too great to have the report just what it ought to be.

To combine so harmoniously and fruitfully two interests as unlike as bryology and Germanic philology does not fall to the lot of many scholars.

Morris G. Bishop, Walter H. French, John M. Kingsbury

Eugene Plumb Andrews

November 9, 1866 — September 21, 1957

Eugene Plumb Andrews, Emeritus Professor of Archeology, died September 21, 1957, a few weeks short of his ninety-first birthday and twenty-two years after his retirement from Cornell.

He was born in Oswego, New York, November 9, 1866. After graduating from the Osewgo Normal School in 1887, he taught for four years at Hoboken Academy and a boys military school before entering Cornell as a freshman in 1891. He found expression for varied interests in athletics, as a miler on the University team; in music, as chimes master; and in his studies, being heralded by his classmates as the “most brilliant professor in the class.”

It was the experience of studying under Benjamin Ide Wheeler and George Prentice Bristol that aroused in him that love of the ancient Greek world which animated his lifelong interests and activity. Upon his graduation in 1895, he received a travelling scholarship which permitted him to spend the next year in Greece. There a combination of scholarly curiosity, mechanical ingenuity and athletic ability enabled him to make impressions of the peg holes of an inscription of Roman date which had once been set upon the architrave of the Parthenon, and so to decipher the inscription. This feat brought him immediate recognition among students of Classical antiquity.

After the renewal of the fellowship for another year, he was called back to Cornell as Curator of the Museum of Casts. He was appointed Instructor in Archeology in 1900, Assistant Professor in 1911, Professor in 1919, and Emeritus Professor upon his retirement in 1935.

Not seeking to exercise his interests in archeological excavation in the field, Professor Andrews exploited his unusual talents for teaching Greek art and antiquities. The eminent success he attained was attested by the great popularity of his courses and of the public lectures he gave throughout his long service. The Museum of Casts in the basement of Goldwin Smith Hall, the display of which he arranged when the collection was moved from McGraw Hall, became a familiar spot not only to students but also to townspeople. He offered what must have been for years the only course in Greek numismatics given in the United States, and one whose thoroughness so impressed a visiting officer of the American Numismatic Society that Professor Andrews was elected as an Honorary Member for Life. During many summers he continued his lecturing and renewed his acquaintance with classical antiquity by visits to Greece, often serving with the Bureau of University Travel. On one of these trips he met Helen Putman of Chicago whom he married in 1919 and who survives him. The warm hospitality of their home is recalled gratefully by a host of students. Professor Andrews shared fully in the life of the Ithaca

community, and with special zeal in the activities of the Savage Club and the Town-and-Gown Club. For many years he was organist of the Baptist Church and of the Masonic Lodge, of which he was a member for half a century. Furthermore, he loved boating, which provided him with opportunities to enjoy the loveliness of this region; for all his life he was devoted to the beauty of nature.

Professor Andrews was one of those in whom the Hellenic culture inspired not only a strong historical interest but also a deep emotional attachment. The warmth which this love of things Greek lent to his teaching stirred generations of students to an interest which they would otherwise not have obtained and induced many of them to travel abroad to see for themselves what they had heard so fervently described. He saw our age in relation to the past. He treasured the best of the past, and taught how Greek art was the precious distillation of the human spirit in one of its finest forms. He was heir to the Greek spirit in that he loved the beautiful, and in his classes the beautiful became real.

Frederick Waage, Henry Caplan, James Hutton

Howard G. Andrus

July 17, 1915 — July 21, 1998

Howard G. Andrus was born on July 17, 1915, in Chemung, New York, the son of the Reverend Frank Andrus and Ethlyn Mighells Andrus. During his early years, he moved about the southern tier of New York State where his father served various pastorates. He attended Genesee Wesleyan Prep School in Lima, New York and earned a B.A. degree from Houghton College, Houghton, New York in 1938.

Following five years of teaching social studies at Rushford Central School, he entered the U.S. Army in 1943 where he served as a personnel placement officer in the European Theater. He was decorated with the American Campaign Medal and Ribbon, European, African, and Middle Eastern Medal, and two Bronze Service Stars. He was discharged in 1946 following distinguished service as a counselor to many G.I.s of World War II.

Howard met his future wife, Helen Shindledecker, while both were teaching at Rushford. They were married on November 3, 1945, while he was still in military service. To this union, three children were born: Duane, Richard and Sharon. He was a loving husband and father. His dedication to his wife during her prolonged illness was strongly evident. She (Helen) predeceased him on September 13, 1985.

Howard was the first student to matriculate under the G.I. Bill at Cornell University in 1946. He received his M.S. degree in Counseling in 1947 and immediately joined the staff as a Veterans Counselor. His outstanding service in this capacity led to the establishment of the University Guidance and Testing Center. Under his tutelage, many hundreds of veterans and non-veterans were privy to his outstanding advice on a variety of topics — from career choice to job placement. During this same period of time, 1947-51, he worked part-time on his Doctoral degree, receiving a Ph.D. in Guidance and Personnel Administration in 1951.

Despite all his professional and academic accomplishments, Howard was best known for his friendship and quick wit. He was always positive in his outlook and prone to pull a prank on his colleagues at unexpected times. His favorite saying, “You never get a second chance to make a first impression”, became his hallmark while serving as Director of Teacher Placement. In addition to his friendliness and wit, he had a passion for the New York Yankees and could cite statistics on every player going back to 1920!

Professional responsibilities did not keep Howard from serving his community. As a member and later President of the Ithaca City School District Board of Education, he rendered invaluable counsel during the turbulent 1960s

and 1970s. His ability to bring disparate groups together for the common good was evident throughout his time on the Board. He was also very active on the board of various Library Associations.

Let us continue our discussion about his contributions in teaching. While advancing from Assistant Professor to full Professor, he maintained a strong schedule of graduate courses for students in Counseling, Psychology, and general fields of Education. He was particularly sought out by international students to serve on Master's and Doctoral committees. His keen insight into their concerns and problems in our different culture made for a great mix. He always made time for students whether or not they had an appointment. His theme was, "If they are here and want to see me, send them in." He continued his total load of teaching, advising, and counseling through 1981 when he retired as Professor Emeritus of Education and as founding Director of the University Guidance and Testing Service.

Surviving are a son, Duane (Alessandra) Andrus, of Cortland, New York; a son, Richard Andrus, of Ithaca, New York; a daughter, Sharon (Dan) Andrus Trembley, of Freeville, New York; and two step granddaughters.

Marvin D. Glock, Verne Rockcastle, Joe P. Bail

William DeWitt Andrus

February 28, 1896 — January 20, 1951

At the peak of a brilliant and distinguished career, Dr. William DeWitt Andrus died at his home in Bronxville, New York on January 20, 1951 following an illness of over a year. He was 55 years of age and one of the outstanding men in American surgery. At the time of his death he held the positions of Attending Surgeon at The New York Hospital, Professor of Clinical Surgery at Cornell University Medical College, and Director of the Second (Cornell) Surgical Division at Bellevue Hospital.

Dr. Andrus was eminent as a progressive, courageous and well balanced surgeon. His ability first to evaluate carefully a complex surgical problem and then quickly to think through its possible course was part of his unusual clinical acumen. Continually and untiringly he pursued his quest for better methods to improve the end result. He was always the clinical surgeon in the operating room, and, keeping the overall problem ever before him, he followed his objective with courage and dexterity. The good surgeon is also the good physician. That he was always such is evidenced by his devotion to his patients and his concern for their welfare regardless of their status in life, his recognition of the need to treat the whole patient, mind and heart as well as body, and his attention to the development of the young men who were working with him. Although he was particularly known for his accomplishments in thoracic surgery, to which he made many contributions, he was also renowned for his work in vascular surgery and for his competence as a general surgeon.

It might be said that Dr. Andrus' principal interest, teaching, began with the medical students. He was singularly successful in the various phases of their instruction in surgery throughout his entire career at The New York Hospital—Cornell Medical Center, from 1932 to 1951. Instruction and direction of the house staff through their graduated training program under the resident system was a continuation of his work with the undergraduates. This work culminated in his responsibilities as a member of the American Board of Surgery, for in reviewing and examining candidates for certification by the Board he had an opportunity to evaluate the results of his own efforts and to compare them with those of other surgical training programs throughout the country. This experience was the basis of his often stated conviction that facilities for the training of surgeons in this country were inadequate and that more residencies were needed. He emphasized the importance of maintaining high standards for such residencies and decried the tendency of many hospitals to claim a resident program that was such in name only. He never failed to stress the importance of maintaining not only facilities for the complete care of patients, but

also the necessity of providing opportunity for research into clinical problems and the development and testing of new methods of treatment.

William DeWitt Andrus possessed more of the admirable traits desirable in a man than it is usual to find in one individual. He was a man of unique character and presence, sincere, honest, and generous. Frank and forthright in his everyday dealings with people, he sometimes evoked an adverse reaction, but usually it was shortly transformed into unequivocal support. Working in close association with Dr. George J. Heuer over the years placed upon him direct responsibility for a large number of medical students and young men in surgical training, the residents and assistant residents. Such a group can be quite ruthless in their demands. Yet throughout his entire service at The New York Hospital his sound teaching and personal guidance reaped for him only gratitude, respect, loyalty, and admiration. The burden of the day's work which he carried so well over the years at The New York Hospital is known best to the resident staff and has become legend in the annals of the institution.

Dr. Andrus was born at Saugerties, New York on February 28, 1896, the son of Reverend Jonathan Cowles Andrus and Margaret DeWitt Andrus. He is survived by his wife, Lucy Huber Andrus, four children, Margaret Lucy, William DeWitt Jr., Carl Huber, and Elizabeth Anne, and by his sister, Dr. Ruth Andrus (Ph.D.) of Saugerties, and his brother, Dr. E. Cowles Andrus of Baltimore, Maryland. No account of his life would be complete without mention of his family interests. He valued the love of his family and participated in the activities of each member to a far greater extent than many surgeons are able to do. His position on the school board of Bronxville and his interest in his summer place at Lake Memphremagog attest to his clear vision and sound investment for his children's future. Believing as he did that life should be lived as a game as well as a challenge, he felt that humor and fun were necessities, and thus his family possess a memory that is rich in the happy experiences of the life they shared.

In 1916 Dr. Andrus received his A. B. degree from Oberlin College. In 1941 he returned there to receive an honorary degree of D. Sc. He was graduated from Johns Hopkins Medical School in 1921, where he was a member of Alpha Omega Alpha and Sigma Xi fraternities. He began his surgical training as an intern in surgery on the service of the late Dr. William S. Halsted at Johns Hopkins. The following year, at the invitation of Dr. Heuer, he joined the resident surgical staff at the Cincinnati General Hospital and was resident surgeon in 1925. Thereafter he held various senior staff positions there until 1931. During 1931 and 1932 he travelled extensively in Europe and devoted considerable time to the study of surgery in Berlin and Vienna. In 1932, when The New York Hospital—Cornell Medical Center opened its doors at its present address, he joined the staff here as Associate Professor of Surgery

and Attending Surgeon. In this dual capacity he played a leading role in the development of the Department of Surgery in both clinical and investigative work. During World War II he carried a major share of the heavy and demanding responsibilities of this large surgical service. On Dr. Heuer's retirement, he became acting head of the Department until the formal appointment of the present incumbent. In 1947 he was advanced to Professor of Clinical Surgery and in 1949 he was appointed Director of the Second (Cornell) Division at Bellevue Hospital. He was also Consulting Surgeon to the Lawrence Hospital in Bronxville and St. John's Riverside Hospital in Yonkers.

Dr. Andrus was president of the New York Society of Thoracic Surgery in 1946 and at the time of his death he was vice-president of the New York Surgical Society. He was also a member of the American Surgical Association, the Society of Clinical Surgery, a Founder Member and Member of the American Board of Surgery, and a Founder Member of the Board of Thoracic Surgery. He was a Fellow of the American College of Surgeons and the New York Academy of Medicine, a member of the Southern Surgical Association, the American Association for the Advancement of Science, the American Association for Thoracic Surgery, the Harvey Society, the Society for Experimental Biology and Medicine, the New York County Medical Society, and the New York Society for Cardiovascular Surgery.

He published a large number of papers on the physiology and surgery of the chest, surgery of the arteries, the heart, the sympathetic nervous system, and of the thyroid. His experimental investigations were concerned chiefly with wound healing and with substances affecting the growth of tissue hemorrhagic disease and the physiology of the gastrointestinal tract.

Dr. Andrus was also a member of the Century Association of New York, the Siwanoy Country Club of Bronxville, the Board of Education from 1937 to 1943, and president of the Bronxville Public Schools from 1941 to 1943.

Frank Glenn

Paul Denzil Ankrum

August 14, 1915 — August 27, 2005

Paul Denzil Ankrum, born in Hamlin, Kansas on August 14, 1915, died at age 90 on August 27, 2005 in Ithaca, New York. Paul received the B.S.E.E. degree in 1935 from Indiana Technical College in Fort Wayne (now the Indiana Institute of Technology) and was an Instructor in mathematics at Ashland College in Ashland, Ohio, for a year. In 1936, he became an Instructor in electrical engineering at Indiana Tech and in 1938, was appointed Chairman of their Radio Engineering Department, a position he held until 1942. He received the A.B. degree in Mathematics from Ashland College in 1939. Paul came to Cornell in 1942 as an Instructor and graduate student in the School of Electrical Engineering where he taught Naval officers for the duration of the war under the National Engineering Science and Management War Training (ESMWT) program. Paul received the M.S. degree in Engineering from Cornell University in 1944 and in the same year, joined the Electrical Engineering School faculty as an Assistant Professor. He was promoted to Associate Professor in 1949, became a full Professor in 1963, and retired as Professor Emeritus in 1982.

Paul's 38-year career at Cornell was characterized by conscientious attention to undergraduate education, advising, and service to the EE School, the College of Engineering, and the University. During the war years in ESMWT, he taught laboratory courses in electric circuits and electric machinery in Rand Hall until 1946 when he transferred to electronics circuits, his major area of interest. In 1948, he was given complete charge of instruction in basic electronics in the EE School. In the following year and again in the 1956-57 academic year, he served as acting supervisor of communications area courses. During this period when the EE School began to require courses in electronics, Paul found no suitable textbooks available for his courses. To fill this need he developed his own text, *Principles and Applications of Electron Devices*, that was also used by 16 other colleges and universities.

Paul's career took a dramatic turn when he returned from a sabbatical leave as a member of the Technical Staff of Hughes Aircraft Company in Culver City, California where he was responsible for germanium transistor evaluation, specifications and applications in the semiconductor division of the Product Engineering Department. He effectively introduced the field of semiconductor electronics in the school by assuming responsibility for course EE 4529, Transistors, which he subsequently expanded into a popular elective two-course sequence. In 1971, Paul published *Semiconductor Electronics*, a textbook that became a standard in the new field. His demonstrated expertise in the semiconductor discipline caused him to be in demand as a consultant to several industries in the field.

Paul's dedication to teaching was evident by his interest and commitment to teach in several academic areas. For a number of years, he taught in the School program for New York Telephone employees, and in the Engineering Problems and Methods course for freshmen. He was responsible for the development of many laboratory experiments in the electronics area and in basic measurements. Throughout his career, Paul was an active participant in faculty discussions on educational programs and made many valuable contributions to curriculum development. During the period when a senior project was a required component in the EE curriculum, Paul's services as a senior project advisor were in constant demand. He was a popular student advisor who was known for his knowledge of and his concern for his advisees and their problems, both curricular and personal. He served as chairman of the Ithaca Section of the Institute of Electrical and Electronic Engineers (IEEE) and, for the five years before his retirement, was faculty advisor of the student section of IEEE. Paul was a senior member of IEEE and a member of the American Society for Engineering Education.

Over the years, Paul had a remarkable record of service to the school, the college, and the university. For a time, he was an elected member of the Faculty Committee of the school, a formidable group that established policies on curricular and educational matters, and in other periods he served on the EE School Committee for Design, the EE School Student-Faculty Committee, and as class advisor to the Division of Basic Studies. He was secretary of the Engineering College Faculty for a number of years and an Engineering College member of the Faculty Council of Representatives (FCR). In the latter capacity, he served as chairman of the University Faculty Committee on Prizes and as chairman of the FCR Committee on Physical Education. He was also a member of the Radio Station WHCU Advisory Board.

There is one aspect of Paul's contributions to the EE School that may not have been known by most of the hundreds of students who inadvertently benefited during the years that Paul taught in the school. Paul's master's thesis is entitled "Electronic Voltage Regulator for a Direct-Current Generator." Master's theses generally lead on to doctoral theses or stimulate the author to enter a particular field and, of course, satisfy a requirement for a degree. Finally they end up in the library stacks and are forgotten. The latter was not the case with Paul's thesis. When Paul arrived at Cornell and became an Instructor in electric machinery in Rand Hall, dc power for the laboratory experiments was supplied by two 50 kW motor-generator sets. Since machinery experiments in the laboratory are highly dependent upon a reliable power supply with constant voltage, it was necessary for the two machines to have some kind of voltage regulator, either mechanical or manual. Paul's thesis involved an early application

of power-electronics control that set him upon his eventual career and, as a side benefit, provided an advanced solution to the voltage regulation problem of the Rand Hall laboratory power supply. Based on his thesis research, Paul constructed two power electronic systems that used early mercury-vapor gas-discharge tubes called ignitrons to monitor and control the field currents of the two dc generators. When the School moved into Phillips Hall in 1955, the two generators and Paul's regulators were installed in the basement and continued to perform admirably until the machines were retired in 1986.

Paul generated a quiet respect among his students who liked his professional sincerity and the relevance of his lectures to the understanding of material for which he held them responsible. His laboratory experiments seemed to reach out and present the application of fundamentals in a clear, interesting and important way. The subject matter was always up to date in the application of solid-state electronics. Highly regarded by faculty and students alike as an effective teacher and advisor, Paul also helped several young faculty members to choose their ultimate careers. Well known for his careful preparation of lecture and laboratory presentations, his meticulous attention to detail, and his particular concern that the laboratories should offer useful exercises, it is not surprising that he was asked to teach part-time for several years after he retired. During reunions, returning alumni would ask about Paul and were always glad to see him.

Paul and Laura Frances Kiracofe, married on August 18, 1940 in Linwood, Maryland, spent 63 years of their life together principally in Ithaca. Paul is survived by his wife, Frances, of Ithaca, New York; his son, David Lee and his wife, Laura, of Ithaca, New York; his son, John Paul, of Ithaca, New York; two grandchildren; three great-grandchildren; and his sister, Mary Alice and her husband Willard Bowman, of Boones Mill, Virginia. His siblings Laird Ankrum and Genevieve Shidler predeceased him.

Paul Ankrum will long be remembered as a conscientious and dedicated teacher and advisor, a respected colleague, and a devoted friend.

Lester F. Eastman, Norman M. Vrana, Simpson Linke

William Arnold Anthony

— *May 28, 1908*

“Whereas, In the death of William Arnold Anthony, Ph. B. Professor of Physics in Cornell University from 1872-87, who departed this life on the 28th of May, 1908 in his 73rd year, many members of this faculty who were his colleagues or his pupils have suffered a personal bereavement; and

Whereas, He was a notable figure among the earlier engineers in America, a man of science, of rare gifts, a pioneer in technical and scientific education, a teacher almost unequaled in his power of inspiring and influencing his pupils and a man admired and beloved by all who knew him;

Be it Resolved, That we the members of the University Faculty desire to give expression to our sense of the great loss sustained by science and the cause of education in the death of this untiring devotee of sound scientific learning whose long life was spent in the service of mankind: this strong hearted generous, single-minded man, our former associate, whose friendship we have ever cherished and whose memory we delight to honor.

Be it Further Resolved, That these resolutions be entered on the minutes of the faculty and that copies be sent to the faculty of the Cooper Union and to the surviving members of his family.”

Sydney Arthur Asdell

August 23, 1897 — February 21, 1987

Sydney Arthur Asdell was a pioneer in the science of reproductive biology, and his fundamental research findings are widely recognized for their contributions to the remarkable development that has occurred in this field. Born in Bramhall, Cheshire, England, he attended King Edward VI Grammar School in Birmingham and then Cambridge University, where he received his B. A. degree in 1922, his M. A. in 1925, and his Ph.D. in 1926. At Cambridge he was the first student to receive a Ph.D. degree from F. H. A. Marshall, the leading physiologist of his time. Fittingly he was awarded the Marshall Medal by the Society for the Study of Fertility, in Dublin in 1977.

In 1927-28 Dr. Asdell served as a fellow in the laboratory of Dr. G. W. Corner at the University of Rochester, in Rochester, New York. During this time progesterone, one of the two major ovarian steroid hormones, was isolated and crystallized. In 1928, following a brief fellowship at the University of California, Berkeley, he became a lecturer in the physiology and nutrition of farm animals at Massey Agricultural College in New Zealand. In 1930 he joined the faculty of the Department of Animal Husbandry (now Animal Science) at Cornell University as assistant professor in animal physiology. He was promoted to professor in 1936 and served as Fulbright Professor in Animal Physiology at the Royal Veterinary and Agricultural College in Copenhagen in 1952-53. In 1923 he was married to Muriel Marrack, who died on February 24, 1972.

Professor Asdell's early experiments helped to establish the basis for a number of the major advances in the field, including artificial insemination, superovulation, in vitro fertilization and embryo transfer, and estrous cycle regulation. He established the time of ovulation, the rates of passage of sperm and ova through the reproductive tract, and the important physiological effects of estrogen and progesterone on the reproductive tracts of farm animals. He organized much of the research that eventually led to measurement of blood concentrations of all of the major hormones controlling reproduction in cattle. He carried out a number of experiments to elucidate the hormonal control of lactation.

He was intensely interested in the role of nutrition in reproductive performance and played a major role in the large-scale experiments conducted at Cornell in this area from 1950 to 1965. In his later years he became interested in the effects of hormones on longevity. The breadth of his interests in the biological sciences is perhaps best illustrated by his analysis of the relation between inbreeding and intelligence in the royal families of Europe, his discovery of the linkage of intersexuality, and the gene for hornlessness in goats.

Although much of his work was basic in nature, he had a good appreciation of how to carry out applied research, and promoted the use of a mobile laboratory to visit farms to survey and study the causes of infertility in cattle in New York State. This survey revealed several important nutritional, managerial, and disease factors that contribute to infertility, and subsequent research resulted in elimination or improvement of those conditions. He was the prime mover in organizing the first cooperative regional research project in the northeastern United States. This project, entitled NE-1—A Regional Approach to Problems of Fertility and Breeding Efficiency in Dairy Cattle—although revised and renumbered several times, is still in existence.

Professor Asdell's use of a mobile laboratory to survey causes of cattle infertility eventually led to production of a widely read book, *Cattle Fertility and Sterility*, in 1955, with a second edition in 1968. However, his major contribution as a writer was his book, *Patterns of Mammalian Reproduction*, in which he combined his great knowledge of reproductive physiology with his ecological interests to produce an extremely useful compendium of the essential facts known about reproduction in a large number of mammalian species. In a third book, *Dog Breeding*, written after his retirement, he was able to distill his experience and knowledge of physiology and genetics into a deceptively simple book useful to dog lovers, dog breeders, and scientists interested in different aspects of dog reproduction.

Dr. Asdell had a subtle sense of humor that enlivened his lectures and endeared him to graduate and undergraduate students alike. Over the years, he taught a number of courses, beginning with "Animal Breeding," a course that was concerned with Mendelian genetics and the physiology of reproduction. At the same time, he taught a course in the physiology of lactation. Later he taught "Reproductive Physiology," a course taken by most graduate students in biological fields at Cornell. He also taught an advanced course dealing with the physiology of growth, lactation, aging, and adaptation. He had a phenomenal memory and a remarkable mastery of the language. He rarely used lecture notes, even when discussing highly detailed information. He was perhaps most effective as a teacher in a seminar setting. The seminar in reproduction and endocrinology that he started just after the end of World War II is still being given. He was a strong advocate of the study of physiology at Cornell and was the first representative for the newly formed field.

Dr. Asdell did an outstanding job in training graduate students, and it was through these students and their students that he exerted a continuing influence on his field. He demanded originality and initiative of his students, yet he was always encouraging and supportive. He had a keen insight into the important problems and concepts in his field and an uncanny ability to reduce those problems into their major components. He was a modest,

quiet person, but he did not hesitate to speak out when faulty information or poorly conceived hypotheses were promulgated. As one of the grand old men of reproductive physiology, he knew many people, and he made it a point to introduce students and new faculty members to the members of the “establishment.” Above all else he was scrupulously honest in both scientific and personal matters. He served as an example to his students of the importance of critically evaluating data and publishing the facts with the best possible interpretation.

Professor Asdell is survived by a son, Philip Tregarthen, and a daughter, Mary Kathleen, both living in Frederick, Maryland.

Robert H. Foote, Ari VanTienhoven, William Hansel

Henry Asmus

June 2, 1875 — March 1, 1939

With the sudden death of Henry Asmus on March 1, 1939, the University lost an outstanding authority in a unique field, for Professor Asmus was the last professor of Farriery in the veterinary colleges of America. Born in Germany's province of Hanover in 1875, Professor Asmus studied horseshoeing under Professor M. Lungwitz at the Imperial Veterinary Hochschule. In 1907 he came to America and set up a shoeing establishment in Lowville, New York. This he relinquished in 1913 when he joined the staff of the New York State Veterinary College, serving as instructor in Farriery until 1914, when he was appointed to an assistant professorship. Owing to his early German training Professor Asmus had ingrained a marked intolerance for lack of initiative and for careless work. In consequence he held the respect of students and alumni.

Aside from his college duties, Professor Asmus contributed to farriery magazines, addressed horseshoers' meetings, consulted with owners of valuable horses, and was an adviser of the United States Army. He was past president of the American Horseshoers' Association and an official judge of the American Horse Show Association. In hours of leisure Professor Asmus wrought in iron beautiful objects of master craftsmanship which it delighted him to give to his college and his friends.

The contagion of Henry Asmus's cheerful disposition, the generosity of his nature, and his warm friendliness will long be remembered by his many friends and associates.

George Francis Atkinson

January 26, 1854 — November 14, 1918

The University Faculty desires to express its profound sorrow and its sense of great loss, through the death, on November 14, of George Francis Atkinson.

Since his return to his Alma Mater in 1892, he had been a member of this faculty. In 1896 he was appointed a professor of Botany. During this period of more than a quarter of a century, which was devoted unceasingly and enthusiastically to research, he became an active working member of numerous scientific societies and attained an eminent position among the botanists of the world. In mycology, particularly, he had an international reputation and he was regarded as the foremost authority on the fleshy fungi of this country. In June, 1917, the Board of Trustees generously relieved him of all further teaching and administrative duties in order that he might devote his time entirely to his researches in this field. His exceptional ability and high place among American men of science was formally recognized by his election to the National Academy of Sciences in April, 1918. To his services as a teacher in that higher sense of the word which implies ability to impart enthusiasm and love for research, the success of the large number of botanists throughout the country who have been his pupils bears glowing testimony.

His end came suddenly as the result of influenza followed by pneumonia, incurred during a collecting trip on the Pacific Coast in pursuance of the great monographic study of fleshy fungi upon which he had been engaged for many years, and which was nearing completion. In the death of Professor Atkinson, not this faculty alone, but the whole community of working men of science have lost a gifted colleague, a man of genius who contributed much to the world's knowledge of botany. His work lives after him not only in his writings but in the inspiration imparted to a younger generation of investigators in the field in which he was an honored master.

Willard Austen

University Librarian

— *July 8, 1934*

Announcement was made of the death, on July 8, 1934, of Willard Austen, Librarian Emeritus since 1929.

Source: Faculty Records, p. 1592, 1846

RETIREMENT STATEMENT

In the retirement of Willard Austen, its Librarian, Cornell University loses an old and tried servant. Entering the library's service in 1888 as a page while still an undergraduate, he has for more than forty years been a member of its staff. Coming to the University more mature in years than do most of its students, he brought an experience in printing and in publishing that from the first were of great worth. In 1892 he was made an Assistant Librarian, and for many years there devolved upon him the care and oversight of the general reading room, a post in which his courtesy and tact and his ready sympathy with the needs of students made him invaluable. Especially during the troubled period when the privilege of drawing the library's books for home use was being extended to undergraduates, his tact, patience, and good temper were of the highest service to the whole University. On the business side, too, his contributions have been notable. His devices for the registration of borrowers and for the recording of loans, making it possible to know at any time the whereabouts of any volume, have revolutionized our methods and have been the envy of other libraries. In all matters, also, involving the use of taste, his sensitiveness to form and color have been of constant value. With these qualities it was inevitable that he should take much interest in library affairs at large and become a leader in the organizations and enterprises of librarians throughout the state and the country; and these associations brought him invitations to other posts. He was, however, too loyal to be tempted from the work begun at Cornell; and when, in 1915, Mr. George William Harris retired from the headship of the Cornell University Library Mr. Austen was promoted to his place. Long before this he had, with Mr. Harris's approval, added to his administrative duties lectures to students on the use of the library; and now he inherited, in addition, Mr. Harris's own course on the history of books and their making. In the early history of typography his own experience as a printer led him to take a special interest, and in this field he has added much to the resources of the library.

Now that his time for retirement has come it gratifies us to hope that the beauty of the site which he so wisely selected for his home will keep him still our neighbor, and we rejoice that his health gives us promise of years of fruitful companionship.

William Weaver Austin

January 18, 1920 — March 15, 2000

William Weaver Austin was born in Lawton, Oklahoma. After preparatory education in Kansas City, Missouri, Great Falls, Montana, and Minneapolis, Minnesota, he entered Harvard at fifteen as a National Scholar and graduated four years later with honors in American history and literature. During his undergraduate years, he studied harmony with Walter Piston and served as accompanist for the Harvard Glee Club. Staying on for graduate study in music, he received his M.A. degree in 1940 and fulfilled the course requirements for a Doctorate during the next two academic years. He spent the summer of 1940 at the Berkshire Music Center (“Tanglewood”) in Lenox, Massachusetts, coaching in the opera department and studying counterpoint with Paul Hindemith, and then the subsequent summer at the MacDowell Colony in Petersborough, New Hampshire, where he composed a string trio. After serving in the U.S. Navy from July 1942 to March 1946, he taught at the University of Virginia for three semesters. Harvard awarded him the Ph.D. degree in 1951 for a dissertation entitled “Harmonic Rhythm in Twentieth-Century Music.”

Bill joined Cornell’s music faculty in 1947 as Assistant Professor and University Organist, rising to Associate Professor in 1950 and full Professor in 1959. He served as Chair of the Music Department from 1958 to 1963. He was elected Goldwin Smith Professor of Musicology in 1969, and then Given Foundation Professor of Musicology in 1983. The American Council of Learned Societies and the Guggenheim Foundation awarded him fellowships in 1952-53 and 1960-61 respectively. In addition, Bill was a member of the International Musicological Society, Royal Musical Association, Society for Ethnomusicology, Gesellschaft für Musikforschung, Australian Musicological Society, International Webern Society, International Berg Society, Centre de Documentation Claude Debussy, Music Library Association, Society for Music Theory; the College Music Society, of which he was president in 1961-62; and the American Musicological Society, of which he was elected an Honorary Member in 1996.

To say that Bill’s intellectual interests were broad can scarcely do him justice. Although he was an expert on twentieth-century music, his knowledge was far-reaching both in and outside of music. Almost every academic endeavor attracted him. His way of keeping up with developments in many fields was extraordinary: he not only read, or at least browsed, everything that came into the Music Library, but he regularly visited other libraries on campus to examine their latest acquisitions. When anything struck him as particularly thought provoking or potentially useful to his own work or that of a student or friend, he would note it on a 3 x 5 card. It was not

uncommon for members of the Music Department to find in their mailboxes cards in his hand on the subjects of their current research, often leading to sources that might otherwise have been overlooked. His card file made Bill a bibliographic court of last resort: after other means of investigation had failed to turn up some badly needed but obscure information, he frequently located it.

Bill's magnum opus, *Music in the 20th Century from Debussy through Stravinsky* (1966), received considerable acclaim, winning the Kinkeldey Prize of the American Musicological Society and the Dent Medal of the International Musicological Society. His "Susanna," "Jeanie," and "The Old Folks at Home": *the Songs of Stephen C. Foster from His Time to Ours* (1975)—a study that crossed boundaries between musicology, ethnomusicology, reception history, and American history—was much admired, and he was eventually asked to produce a second edition. His Norton Study Score of Debussy's, *Prelude to "The Afternoon of a Faun"* (1970), remains in wide use. He was also the author of over 50 articles, which appeared in the *Musical Quarterly*, *Journal of the American Musicological Society*, and other publications here and overseas.

Bill taught a wide range of graduate and undergraduate courses, but it was his legendary introductory course, called "The Art of Music" in the early years and "Bach, Rock and Folk" later on, that consistently attracted a large and enthusiastic following of undergraduates. He taught these young music lovers to broaden their views, to listen with discrimination, and to think critically. The following account from a former teaching assistant in the course nicely illustrates one side of Bill's distinct brand of pedagogy:

Mr. Austin entered from a door at the side of the stage. Without a word, he went to the piano, sat, and played the first page or so of the slow movement from Beethoven's "Pathétique" Sonata. The students were quiet and attentive; clearly this was going to be a course about great music...exactly what they expected. At the end of a passage, Mr. Austin stood and walked to the stereo and turned it on. The music absolutely exploded—it was dance-club loud. The selection was Prince's "1999," and the abrupt change electrified the room. He played a minute or so of the song, turned it off, and walked to the front of the stage. In his quiet voice he said, "The purpose of this class is to help you learn what those two things have in common." He had us all in the palm of his hand for the rest of the term.

Bill was a devoted teacher to graduate and undergraduate students alike. His office door was always open, and he seemed to have time to listen and discuss seriously and at length any subject a student brought up. Many of them felt they learned as much from him outside the classroom as in it. His friendship with numerous students continued for years after they left Cornell, and he generously offered encouragement and suggestions whenever they sought his advice.

Although he did not pursue a career as a professional performer, Bill was a prodigious keyboard player. Besides playing the organ at Sage Chapel, he performed regularly on the piano. His repertoire included such solo and chamber music works as Beethoven's "Diabelli" Variations, Copland's Variations and Sonata, Elliot Carter's Cello Sonata, and Fauré's Piano Quartet. As capable of realizing figured bass as the best professional harpsichordists, he enjoyed collaborating with colleagues in performances of Baroque music.

Bill's musicianship was towering. He had an almost supernatural ability to play accurately at first sight the most difficult pieces—not just piano works but also orchestral full scores—and to transpose music to any key. He also had absolute pitch, that is, the ability to identify (or sing) specific notes in the absence of any musical context. At one point, a colleague heard something unusual coming from Bill's office: it was the middle section of a movement of a piano sonata by Beethoven, played over and over, each time in a different key. Unable to contain his curiosity, the colleague knocked at the door to ask Bill what he was doing. Bill's characteristically iconoclastic explanation was this: he had decided that "true" understanding of modulations (changes of key) probably should occur by judging one key relative to the next. He feared that absolute pitch was getting in the way of this type of perception, so he had been experimenting with playing Beethoven's modulations transposed to all twelve keys, in the hope of disorienting his too-accurate ear so that he might hear in the way those without absolute pitch did.

Bill's modesty was combined with an extreme dislike of hyperbole, especially in the sphere of human relations. As his 70th birthday and retirement were approaching, he came into a colleague's office to beg that, were any plans for ceremonies, speeches or a Festschrift being mooted, they be squelched. When he was gently remonstrated by being told that a number of colleagues and former students would like to do something to express their affection and admiration for him, his face darkened and he responded that on such occasions people always exaggerated in embarrassing ways and he wanted none of it. If any individual wished to talk to him privately, that would be fine. His colleagues settled on a dinner with good food, drink, and camaraderie—no speeches.

What was left unsaid at his retirement should now be said. During forty-three years of teaching at Cornell, Bill Austin had an immense influence on his students, his colleagues, and his department. The breadth of his knowledge and the scope of his interests were a constant source of inspiration and encouragement to his students. Instilling in them a deeper love and a broader understanding of music, he led some of them to successful careers that they themselves had not envisioned. For his colleagues, his loyal friendship provided much of the warmth that pervaded the Cornell Music Department. His universal view of music, his uncompromising standard of

excellence, and his innate sense of fairness were constant guides in much of the department's deliberation and planning.

Bill is survived by his wife, Elizabeth; daughters, Ann Smock, of Berkeley, California, and Margery Turner, of Washington, D.C.; and three grandsons: Ned Smock, and James and Benjamin Turner.

Malcolm Bilson, Neal Zaslav, John Hsu

Olav Austlid

July 9, 1906 — September 2, 1966

It is with great sadness that we record the death of our friend and colleague, Dr. Olav Austlid.

During the early years of his medical career he was devoted to the rehabilitation care of poliomyelitis victims. His work resulted in several outstanding publications in the *Archives of Physical Medicine and Rehabilitation*.

Later he also contributed to the improved care of disabilities resulting from postural defects.

A native of Oersta, Norway, he had to leave his homeland during the hostilities of World War II.

He obtained the degree of Doctor of Medicine from the University of Vienna in 1944. At the end of the war he returned to his homeland to engage in general practice. He came to the United States in 1948.

After serving an internship at the Lutheran Medical Center he received a Baruch Fellowship for Physical Medicine and Rehabilitation and served his residency at the Presbyterian Hospital—Columbia Medical Center in New York City. His training years were followed by a two-year teaching appointment in kinesiology at the same institution. He joined the staff of The New York Hospital-Cornell Medical Center and Hospital for Special Surgery in 1953 and served as Associate Director of Physical Medicine and Rehabilitation in both institutions.

At the opening of the Lawrence Hospital in Bronxville, New York, he was appointed clinical director of its Physical Medicine and Rehabilitation Department.

As a Clinical Assistant Professor of Medicine he participated in the teaching of physical diagnosis to undergraduate students of Cornell Medical College.

He was also well known to the physical therapists for his lectures on hydrotherapy.

Dr. Austlid also entertained a successful private practice.

He was a Diplomate of the American Board of Physical Medicine and Rehabilitation, a Fellow of the American Academy of Physical Medicine and Rehabilitation, and a member of the Congress for Rehabilitation Medicine.

Besides his publications and teaching, Dr. Austlid is in our memory for his loyalty to the Hospital and his dedication to his patients who still speak in reverence of him.

His counsel in disabilities and defects of the skeletal-muscular system was much valued by many distinguished physicians in New York City who asked for his service to their patients. He was always willing to help and advise—in short, he was a very fine man to work with.

He is survived by his widow, Mrs. Eleni Austlid; two daughters, five and six; and a sister in Norway.

Willibald Nagler, M.D.

Alfred William Avens

March 31, 1901 — October 4, 1976

Alfred William Avens was professor of chemistry in the Department of Food Science and Technology at the New York State Agricultural Experiment Station, Geneva, New York, until his retirement on June 30, 1967, after forty-one years of distinguished service with the University.

Dr. Avens was born in Water Mill, New York, where he attended elementary and high school. He entered Colgate University in 1919 and received his B-S. degree in 1923. Dr. Avens served as an instructor in chemistry at Colgate from 1923 to 1926, at which time he was awarded the Master of Science degree. He entered Cornell University as an assistant in chemistry in 1926, became an instructor in 1930, and received his Doctor of Philosophy degree in 1935 under Dr. Wilder Bancroft. Later in 1935, Dr. Avens was appointed to the staff of the New York State Agricultural Experiment Station, where he fulfilled a fruitful and distinguished career. His excellent qualities were recognized by the University in 1961 by his appointment as head of the Analytical Division of the Department of Food Science and Technology.

He was the corecipient of the Association of Economic Entomologists Eastern Branch Award in 1940 and again in 1942. He was a member of the American Chemical Society, Entomological Society, the American Association for the Advancement of Science, Association of Official Analytical Chemists, the Association of American Feed and Fertilizer Control Officials, Alpha Chi Sigma, and Sigma Xi.

Dr. Avens's career was devoted to analytical chemistry, and he was a highly respected leader in the field. He contributed to the methodology of measuring traces of pesticides in and on foods and adopted many established methods to eliminate interference of naturally occurring plant materials. His classical collaborative work with Dr. G. W. Pearce on arsenicals, including phase-rule studies on calcium arsenate, and with Drs. P. J. Chapman and G. W. Pearch on petroleum oil sprays were pioneering efforts in the field of pest-control chemicals.

Professor Avens's interest was not limited to pest-control agents, as he was instrumental in the development and operation of that section of the Analytical Division responsible for analysis of feed, fertilizer, and liming material inspection samples submitted by the New York State Department of Agriculture and Markets. During his tenure, this section became one of the leading state control laboratories in the country. He was the author of fifty technical publications, several patent descriptions, and numerous short articles.

No resolution about Dr. Avens would be complete without mention of his cooperative spirit. Fellow faculty members gratefully remember his willingness to help in their analytical problems and data evaluation, and his careful, fair, and constructive aid in developing and testing new analytical procedures. His friendly counsel, criticism, and advice to the many persons who have sought his aid will be long remembered.

John B. Bourke, James C. Moyer, Willard B. Robinson

Winfred Enos Ayres

October 29, 1882 — September 5, 1951

Winfred Enos Ayres, Associate Professor of Dairy Industry, Emeritus, died September 5, 1951, in Albany City Hospital.

He was born October 29, 1882, in Brier Hill, a small town in St. Lawrence County. After attending the local schools, he worked in a creamery in Rensselaerville and was placed in complete charge of the plant in 1901. In 1903 he quit the creamery business to seek employment in the automobile industry, and for a time he was employed in Syracuse building Franklin cars. He felt the need for more education and one year later he came to Cornell.

At Cornell, his natural ability, and the value of his practical experience, were recognized by the Department of Dairy Industry and he was soon assisting in the Winter Dairy Course and then working as an extension agent when the Winter Course was not in session. This continued from 1905 until 1909 when he became a butter inspector in the New York State Department of Agriculture and Markets. In 1913 he left New York State and became a dairy plant inspector for the State of Vermont.

In 1914 Cornell recognized his outstanding ability as a teacher by inviting him to return and take charge of the Winter Dairy Course. That was no small task. During his first year there were 240 Winter Course students who elected courses in Dairy Industry.

As the years passed, interest in winter courses of all kinds diminished. However, Professor Ayres assumed increasing responsibilities for the teaching of four-year students as the burden of the Winter Course became lighter. He continued in charge of the Winter Course in Dairy Industry until it was finally discontinued during World War II.

By that time, he had assumed complete responsibility for the four-year courses in the manufacture of cheese, ice cream, condensed and evaporated milk, and milk powder. Because of ill health he asked to retire in 1947. At that time it did not appear possible to replace him and his sense of responsibility kept him at work for two more years until his duties could be taken over by a younger man. He retired in June of 1949, after 39 years of service to Cornell. Two years later he died from coronary thrombosis following an operation which he hoped would restore him to health. He was survived by his wife, Lena, a son, Kenneth, and by one grandchild and two great grandchildren.

Professor Ayres was a member of the American Dairy Science Association, of I.O.O.F., and of Epsilon Sigma Phi national honorary extension fraternity. For several years he was secretary-treasurer of the local chapter of this fraternity. He was a deeply religious man. He attended and supported the First Methodist Church faithfully.

Throughout his life, Professor Ayres maintained a keen interest in mechanical things. As a young man, he learned watch repairing for the fun of it. He was always interested in automobiles. He loved to discuss the latest models and to compare them with cars of long ago. It was only natural that he should become the acknowledged authority on dairy machinery in his own Department. Many investigators are indebted to him for aid in the mechanical phases of their work as well as for his aid in judging the quality of the products under investigation. His skill as a judge of dairy products was of immeasurable value in the training of the University's Dairy Products Judging teams. In addition to his teaching, Professor Ayres prepared a number of bulletins on the manufacture of frozen desserts and different kinds of cheeses.

Professor Ayres will be remembered by the thousands who knew him as an outstanding teacher and a warm friend. His kindly sympathy, his cheerful philosophy, his sense of humor, and his personal integrity earned him a warm place in the hearts of his associates who remember him with affection and respect.

A.M. Goodman, B. L. Herrington

Charles Babcock

— *August 27, 1913*

The following memorial minute was adopted by rising vote :

“On August 27th, a month before our reassembling, there passed from this life, in his eighty-fifth year, our oldest colleague, Professor Charles Babcock, for a quarter-century the head of our school of architecture.

“He was not a member of the original Faculty of Cornell; but it was only because his department had first to be called into existence. With its establishment, in 1871, he became its head; and from that day of poverty, when for long he was its sole instructor and with his own hands created much of its equipment, to that other in 1896, when he surrendered it, a full college of the University, to his successor, he was not only its guiding intellect, but its soul. His devotion to his art and to his students, the broad humanity of his interests, his sane and quiet judgment, that masculine gruffness in his deep voice which veiled his kindly heart and lent a piquancy to his playful humor, the sound culture and sturdy manhood that breathed in all he said or did, made him beloved by his pupils and by his fellow teachers. His influence was not confined to the work of instruction. As architect he gave us noble buildings which still adorn our Campus—Sage College, Sage Chapel with its memorial annex and apse, Lincoln and Franklin Halls—and as administrator he had a weighty, though always modest, voice in the shaping of the University as a whole.

“Nor can his colleagues forget his long career as rector to that little group which, in the days of our isolation, met weekly in the transept of Sage Chapel, or that frequent service at the Chapel’s lectern when any accident deprived us of a preacher, or yet that kindly thought for others’ needs, which, even more than these perhaps, made him in those days almost a college pastor.

“Since his retirement, he has dwelt among us still, a thoughtful, genial friend and neighbor, lending to our Campus the quiet dignity of his presence and to our social life the ripe charm of his reposeful character. They have been to us a benediction which we shall sadly miss, and of which we here record our grateful memory.”

I. P. Church, G. L. Burr, C. A. Martin, Chairman

Joe Paul Bail

May 12, 1925 — May 7, 2006

Joe Paul Bail was born in Herold, West Virginia, May 12, 1925, one of five brothers. Joe graduated from Nicholas County High School, receiving the Balfour Award, the highest honor awarded by the school. After graduating from high school, Joe enlisted in the U.S. Army Air Corps in 1943 and served through the rest of the war in Europe as a B-17 bomber navigator in the 8th Air Force. He flew 33 combat missions in the European Theatre of Operations and rose to the rank of Captain. During that time, Joe was forced to parachute behind enemy lines on two separate occasions and both times he was able to make his way to Allied lines to return to action. When he was discharged at the conclusion of the war, Captain Bail had received the Soldiers Medal and the Army-Air Medal with three oak leaf clusters.

Joe married Nelma Rapp in October of 1945. They remained very close, celebrating 56 anniversaries, until Nelma passed away in February of 2002. Joe is survived by a son, David J. Bail, and daughter-in-law, Charlyne, who reside in Largo, Florida; a grandson, Damon S. Bail, who resides in Tarpon Springs, Florida; and a brother, Steve, who lives in Mansfield, Ohio.

Joe attended West Virginia University, receiving his Bachelor's degree in 1946 and his Master's degree in 1947. He taught high school vocational agriculture in Spencer, West Virginia; then in 1948, he received an appointment to Glenville State College, Glenville, West Virginia, where he served as head of the Agriculture Department until 1951. He was appointed Assistant Professor of Agricultural Education at West Virginia University where he served as a vocational agriculture teacher educator from 1951-57. In 1957, Professor Bail received his Ph.D. degree from Michigan State University, and joined the Department of Education at Cornell University as an Associate Professor. He was subsequently promoted to Professor in 1967.

Joe was recognized as a leader at Cornell. He served as Program Coordinator for Agricultural Education and subsequently as Chair of the Department of Education from 1978-87, overseeing the move of the department from Stone Hall, where it had been housed for many years, to Roberts Hall.

During his years at Cornell, Professor Bail was instrumental in the development of the Cornell Instructional Materials Service (IMS). IMS created and provided curriculum materials and professional development services for agricultural educators in New York, nationally, and internationally for almost 50 years from 1957 until its close in 2004.

Professor Bail also provided leadership for the establishment of the Rural Schools Association (RSA) of New York in 1978. According to the RSA web site,

“The Rural Schools Association is a statewide organization representing the interests of, initiating research for, and providing service and information to the small and rural school districts of New York State.”

As of today, approximately 300 school districts and BOCES units are RSA members. The RSA offices are still housed in the Department of Education at Cornell.

Another focus of Professor Bail’s work at Cornell was international agriculture. Among other accomplishments, in collaboration with the University of Hawaii, he helped develop the South Pacific Regional Agriculture Development (SPRAD) program at the University of the South Pacific. The SPRAD was funded by the United States Agency for International Development to stimulate agricultural development in twelve English-speaking island countries served by the University of the South Pacific.

Upon his retirement, Joe and his son David, a Hotel Management graduate, operated the Elm Tree Restaurant and Inn, which is still located in McLean, New York. Joe was an active member in the Ithaca Rotary Club and served as its President. With his son, Joe was active with the Boy Scouts of America, and was an active member of the First Baptist Church in Ithaca, New York.

Professor Bail was a member of numerous professional and honorary societies, including Alpha Zeta, Kappa Delta Pi, Alpha Tau Alpha, the American Association for Teacher Educators in Agriculture, and the American Vocational Association. He was listed in Who’s Who in America and received the Honorary American Degree from the National Association of Future Farmers of America (FFA). In 1990, Professor Bail was recognized as the Distinguished Alumnus for the College of Agriculture and Forestry of West Virginia University. His Award Citation noted,

“In addition to his teaching, Joe has advised 279 undergraduates, and has served as major advisor for 68 Master’s candidates and 22 Ph.D. candidates. Many of his former students became ambassadors, deans, department chairpersons, and administrative officers in state, regional, and national agricultural or educational organizations.”

Describing Joe and his wife Nelma, one of his former colleagues wrote,

“Joe was a private person, which was in contrast to his long time late wife Nelma, with whom he was very close. For me, Nelma’s outgoing, bubbling personality represented the ‘Southern Belle.’ Nelma’s passing and Joe’s subsequent heart surgery was a very difficult time for him. My memories of Joe are both as a personal friend and as a valued and respected professional colleague from whom I learned a lot. Joe Paul will both be missed and remembered.”

Arthur L. Berkey, Harold R. Cushman, Richard E Ripple, William G. Camp

Liberty Hyde Bailey

March 15, 1858 — December 25, 1954

On Christmas evening, 1954, death came to one of Cornell's great men, the venerable Liberty Hyde Bailey, then ninety-six years of age. Most great men can be classified by the profession or field of activity whereby they achieved their greatness. This is not so easy with Liberty Hyde Bailey, for his greatness is due to his manifold contributions produced almost concurrently in many fields. To some persons, his renown is as a botanist, explorer and horticulturist; to others as an educator, administrator and rural sociologist; to a third group as an editor, lecturer and writer; while still a fourth group knows him best as a poet, philosopher and counsellor. He was all these things, and, moreover, he was a man of forceful character, personality and energy.

Bailey was a precocious son of the wilderness. Through his boyhood he traversed the forests about his father's farm in Michigan and learned early the ways of wild-life, of the plants and animals that composed it. He knew the migrant Indians, watched the slaughter of the passenger pigeon, and practiced the art of rail-splitting. His early knowledge of literature was limited, but being an avid reader, he knew well the Bible, Bunyan's *Pilgrim's Progress*, Milton's poems, Baker's *Exploration of the Nile Tributaries of Abyssinia*, and Darwin's *On the Origin of Species*, to mention a few. The first book he knew of botany was one by Asa Gray. It was from a country-school that he received the only formal instruction he ever had in grammar, Latin, and geometry; a one-room school from which he entered directly into college. From this background he became a leader in college life. Academically he stood at the top of his class, and as the first editor of the *College Speculum* he was prominent in directing the thinking of his fellow students.

Professor Bailey was a horticulturist by birthright and upbringing. His greatest activities in this field were during the last two decades of the nineteenth century—a time of great expansion in this country, when botanical research in the field of plant physiology had scarcely commenced and the pathology of plants was little known. It was a period when few if any horticulturists had received formal instruction in botany, and a period when sympathy from the botanist for the horticulturist's needs was conspicuously absent. Trained in botany under Beal at the Michigan Agricultural College and later associated with Asa Gray at Harvard, Bailey early was imbued with the conviction that horticulture must reflect the application of basic botanical knowledge.

After he came to Cornell from Michigan in 1888, Bailey's early horticultural papers dealt with physiological aspects of growth. During his first decade at Cornell, Bailey wrote twelve books on horticultural subjects, excluding those

on plant-breeding and genetics, and during the last years of this decade he planned and commenced his first horticultural encyclopedia. Bailey dominated the American field of horticultural books during this period. He preached and practiced a new horticulture. He held the conviction that horticulture must be an applied science based on pure biology, just as engineering was then accepted as an applied science based on the theoretical sciences of mathematics, physics, and chemistry. This innovation was unacceptable to some natural scientists, and this concept of horticulture has reached its present predominance largely by the dogged persistence and crusading of Bailey and his supporters. His founding, with S. A. Beach of the Geneva (N. Y.) Experiment Station, of the American Society for Horticultural Science in 1903, and his serving as its President for its first four years, did much to organize and bring recognition to a growing group of botanists that had become horticulturists.

Bailey was an evolutionist and plant-breeder, active in an era before there was knowledge of genes or genetics. He was also a taxonomist. As a plant-breeder, Bailey was an experimentalist, who made controlled crosses and kept accurate records, not only of his crosses but by placing in the herbarium vouchers of the plants concerned. It was his breeding researches in bramble-fruits, cucurbits, and grapes that led him in later years to intensive taxonomic studies of these genera. Four different books of his authorship were published on the subject before the turn of the century. In 1907 Dean Bailey established a Department of Experimental Plant Biology, which later he renamed the Department of Plant Breeding.

In his middle years, Dr. Bailey was active in the effort to bring the science of botany before students at the secondary school level. Six botany text-books were written by him between 1898 and 1909. In fact, one of his first books, *Talks Afield*, published in 1886, was a book of botany written for the understanding of the farmer, horticulturist, and non-scientist. He was an active leader in the founding in 1899 of the Botanical Society of America.

Bailey's principal contributions to botanical science were his taxonomic studies, contributions for which his academic training well equipped him. In 1886 he was a member of a botanical survey-party in Minnesota. For several decades in middle life Bailey was an acknowledged authority on the American sedges (*Carex*) and his photographing of type specimens in European herbaria in 1888 was pioneer work of that nature. His first *Carex* study was published in 1884, his last in 1900.

Following his *Carex* studies and a few early papers on the systematics of cultivated blackberries, over two decades passed before he was able to resume taxonomic work. From 1923 to 1949 he published over one hundred scientific papers. These were mostly extended papers, concerning revisions of genera. Bailey became a specialist in the systematics of the palms and the blackberries. He also published revision of such genera as *Vitis* (the grapes),

Brassica (the cabbages and kales), Cucurbita (the pumpkins, squashes), Hosta (the plantain-lilies), and horticultural monographs of lesser botanical import on Dianthus, Delphinium, Campanula, and the gourds.

His renowned interest and work in the palms is alleged to have had its beginning in an occasion in 1910 when Mrs. Bailey teased him while they were in Jamaica, for not knowing the kinds of palms in the gardens of Kingston. His collection of palms began in 1917, and extensive trips for this purpose were made for many years before he wrote his first paper on them in 1930. He lived to see his palm herbarium become one of the best in the world. His studies of Rubus in North America covered a life-span of effort and culminated in a thousand-page monograph of the genus, completed in 1945. It is the only work of its kind for the genus in this hemisphere, and serves as a monument to his endeavor. By 1935 his private herbarium of 125,000 specimens and library of 3,000 volumes reached proportions beyond his ability to maintain and perpetuate. He and Mrs. Bailey gave them to Cornell University as the Liberty Hyde Bailey Hortorium, an institution devoted to studies on the systematics of cultivated plants.

For a generation he was remembered as a great teacher, of the 1880's and 1890's. He exerted an influence not only on his students but on the hundreds of persons who in turn became pupils under them. As a teacher he not only carried his zest and vigor to the classroom, but he changed the approach and emphasis in teaching. Whereas he had found it to consist of a formal lecture augmented literally by formal parades to visit and view the activities of the university farm as conducted by hired hands and foremen, he rejected this routine and substituted for it the laboratories, inside and outdoors, where the professor mixed with his students while demonstrating a principle or setting up a planned experiment in which they took part. Today, this is commonplace. Sixty years ago, it caused comment and some consternation, Bailey lectured on the merits of his teaching procedures, defended from the rostrum and through the press the teaching of agriculture as a science, and its place as a technology at the graduate level in a university.

On the retirement of Isaac P. Roberts in 1903, Bailey became the second Director of the College of Agriculture, financed largely by the University (whose funds for the College were supplemented by federal monies). Long before this he had been active throughout the state and worked for the day when Cornell's College of Agriculture should be largely state supported and become the New York State College of Agriculture at Cornell University. This goal was achieved in May 1904. For the next decade his major contributions were those of an administrator. During this period he set up many new departments: Experimental Plant Biology (but later coined for it the new name of Plant Breeding), Soils, Plant Pathology, and Ornamental Horticulture. A department of Plant Physiology was founded by him which, early in 1913, he expanded into a balanced Department of Botany. Following his change

of the name domestic science to home economics, there was his successful effort in 1912 to get University faculty approval for his promotion of a woman, for the first time in Cornell history, to the rank of full professor (in home economics). The Department of Home Economics within the College of Agriculture he had established in 1907.

As an administrator he was a leader in New York state in the establishment of agricultural extension courses for men and women on the farm. This was before federal support was authorized for the work. He convinced state officials in 1905 that agricultural courses taught in high schools throughout urban and rural New York state should be accepted by the Board of Regents and given equal academic recognition with other high school subjects. Two years later the College of Agriculture voted to accept agriculture as an entrance subject, thus placing vocational agricultural work on a par with other entrance subjects. Early in his career Bailey announced his plan of life, wherein he proposed to divide it into three parts and to spend twenty-five years in preparation, twenty-five in earning a livelihood, and twenty-five in using his abilities as he chose. This was no idle pronouncement on his part. Despite the urging of his faculty and students that he remain, Bailey resigned from the College, in July, 1913.

Agriculture during the last half-century owed much to Bailey the editor. Just as there was a lack of modern horticultural books when he came to Cornell in 1888, so also was there a comparable lack of books in other fields of agriculture. During the period of 1890-1940 he edited 117 titles by 99 authors from all over the country, covering subjects in agronomy, economics, botany, pomology, animal husbandry, dairy industry, soils and fertilizers, plant pathology, commercial floriculture, and home economics. In 1890, Bailey accepted the editorship of the popular monthly, *American Garden*. Again in 1901 he accepted the editorship of *Country Life in America*.

Bailey was a man of vigorous, direct, and driving personality, but he was also a man of aesthetic sensitivity—reflective, and considerate of his fellow man. The deeper qualities have appeared over the years in his poems and philosophical writings. Bailey's philosophical writings covered a wide range of topics; his best is acknowledged to be *The Holy Earth*, a book about man's debt to the earth, and the earth's goodness to man.

Students at the College during Dr. Bailey's twenty-five years as Professor and Dean remember to a man his personable and understanding affection for them as individuals. Sunday evenings his home was open to his students, who came and were inspired by his informal talks, recitations of poetry, and readings from such men as Poe, Whitman, Arnold, Lanier and Emerson. Later, as the group became too large, these gatherings became bimonthly "Assemblies" first in Barnes and later in Roberts Hall, patronized by students and faculty alike.

By many admirers, Dean Bailey has been thought of as a plant explorer extraordinary, but he never wrote of his travels, preferring to continue his researches than to devote effort to recounting his past. His travels after retirement were for scientific purposes, for observation and collection of plants. For the most part, the trips to the tropics were in quest of palms and to temperate parts for blackberries and their kin. His searches took him to every major island of the West Indies, southern Brazil and the upper Amazon, British Guiana, Venezuela and Colombia. He knew Mexico intimately and had collected several times in Panama. In 1917, while he and his family were in the Orient, he went inland to Honan in search of prototypes of cabbages and their relatives. On another occasions he collected in New Zealand, with stops in Tahiti, Fiji, and Raratonga. Many trips were made by him to European agricultural and botanical centers, the last in 1919. In December, 1949, when he fell and broke his upper leg in a New York bank, he had in his pocket a set of one-way airline tickets to Dakar, Leopoldville, and other points in tropical Africa.

Liberty Hyde Bailey was a great driving force, a rugged individualist who ruthlessly cut impeding fetters of regimentation and bureaucracy, and a man who had the capacity to develop his visions into reality. Basically, he was a humanist, always considerate of his fellow man, and of his improvement by a better knowledge and use of that which is science. He could be, and on occasion was, an egoist, a man of quick decision and action, intolerant of delay or procrastination, and one who often considered the overall significance of the result before measuring the cost of the achievement. At the same time, he was poetically and philosophically aesthetic, sensitive to the finer qualities of life, and a man who lived a life of high personal integrity.

Liberty Hyde Bailey was born March 15, 1858, in South Haven, Michigan, the son of Liberty Hyde Bailey, Sr., and Sarah Harrison Bailey. He was educated at Michigan Agricultural College, receiving his B.S. degree in 1882, his M.S. in 1886. On June 6, 1883, he married Annette Smith, who died in June 1938. They had two children, Sara Bailey Sailor (born June 29, 1887, died April 1936) and Ethel Zoe Bailey (born November 17, 1889) ; and two grandchildren, Annette Sailor Page and Samuel Sailor. Dr. Bailey died in Ithaca, New York, December 25, 1954. His name is commemorated by Bailey Hall and the L. H. Bailey Hortorium at Cornell, Bailey Hall at Michigan State College and the Liberty Hyde Bailey High School at East Lansing, Michigan, Bailey Hall at Morrisville Technical Institute, Morrisville, New York, and the Liberty Hyde Bailey Palm Glade at the Fairchild Tropical Garden, Coconut Grove, Florida. Portraits of him hang in Bailey Hall, Mann Library, and the Plant Science Buildings at Cornell, and in Bailey Hall, Michigan State College. A bust of him is at the Bailey Hortorium.

Lewis Knudson, G. H. M. Lawrence, W. I. Myers

Thomas Jefferson Baird

March 1, 1902 — March 21, 1993

Tom Baird, professor emeritus, died on March 21, 1993 at the age of 91. He was involved for almost 74 years with Cornell and the Ithaca area in activities ranging from being an undergraduate student to becoming a significant benefactor to Cornell, financially and professionally, after his retirement.

Tom spent his early years in Cleveland, Ohio where he was born, the son of Frederick Baird, a prominent Cleveland architect, and Mamie Zangerle Baird. In 1919, he entered Cornell University as an undergraduate student in the College of Arts and Sciences. Two years later he transferred to the College of Architecture, where he entered the five-year bachelor's program. An outstanding student, in his senior year he received the American Institute of Architects medal for excellence and placed first in the preliminary round for the International Paris Prize in Architecture. He received his Bachelor of Architecture degree in 1925 and was awarded a fellowship for continuing studies in architecture.

In 1926, Tom joined, as designer and draftsman, the Ithaca office of Bryant Fleming, architect and landscape architect. Mr. Fleming was responsible for many fine estates throughout the U.S. and for introducing landscape design courses into the curriculum of the College of Architecture at Cornell. The demand for estate designers decreased greatly in the Depression and the firm was dissolved in 1932 after the death of Mr. Fleming. There was little demand for the services of architects, and Tom took the opportunity to study landscape design at Cornell in the period 1932-34.

In 1935, Mr. Baird accepted a position with the Finger Lakes Park Commission as Architect and Landscape Architect to supervise the design and construction of Stony Brook Park in Western New York. On one of his return visits to Ithaca, he met Kerstin Thorin, a former member of the Swedish Olympic Swimming Team, who was teaching in the Women's Physical Education Department at Cornell. They were married in 1936.

Upon completion of the facilities of Stony Brook Park in 1939, Tom returned to Ithaca to enter private practice in architecture and neighborhood planning. At this time he was also hired as an instructor in the Department of Floriculture and Ornamental Horticulture in the College of Agriculture. In 1940, he received a prestigious fellowship to study at the renowned Cranbrook Academy of Art in Bloomfield Hills, Michigan, where he interacted with some of the most famous architects, designers, and artists of the time, including Saarinen, Eames, Bertoia, and Milles.

Imbued with the spirit of the contemporary art movement, Tom returned to Ithaca in 1941 to begin graduate study in regional planning in the College of Architecture at Cornell. During the next five years of part-time study he continued his private practice, on a greatly reduced scale, while serving as an instructor in landscape planning in the College of Agriculture (1940-42), a research associate in housing in the College of Home Economics (1941-45), and an instructor in engineering drawing in the Sibley School of Mechanical Engineering (1941-46). The latter part-time position was the direct result of his interest in helping Cornell meet its educational commitment during the war years, when engineering instructors were scarce, and was instrumental in setting the direction for his life's work in the years to come.

In addition to the more than full-time work load described above for the period 1942-46, Tom found time to redesign the Baird's small lake cottage near McKinney's Point on a slope overlooking Lake Cayuga. His design was very modern in concept—using cantilevered decks, window walls, secluded terraces, and ingenious noise shielding. The home received national recognition and was praised in two professional architectural magazines. He also published some ten papers and articles in professional and popular architectural magazines, such as *House and Garden*, *America Home*, *American Nurseryman*, *Progressive Architecture*, *House Beautiful*, and *The Ideal Home Magazine*. The articles covered topics ranging from “Spatial Planning in the Community”, to “Remodeled American Homes”, “A Plan for the Great Lakes Region”, and “Homes—Small, Medium, and Large.”

In February, 1946, Tom was awarded the degree of Master of Regional Planning from the College of Architecture. Professor C.E. Townsend, head of the Department of Engineering Drawing in the Sibley School, with great foresight relative to the direction in which post-war mechanical engineering education should head, immediately offered Tom a promotion to the full-time position of assistant professor of engineering drawing. To mechanical engineering's great good luck—and most likely to Professor Townsend's happy surprise—Tom accepted the offer.

A new elective course in freehand drawing and perspective drawing was introduced by Professor Baird. This course—with its goal the stimulation of habits of creative thinking and imagination by using freehand drawing and other techniques—was a pioneering effort in the area that would be called “creative design.” The course content and method of presentation changed throughout the years with his increasing knowledge and interest in mechanical engineering design. His collaboration with Professor George B. Du Bois, of the Department of Machine Design, was of great value to both men and to the Sibley School. Professor Baird continued his association with the College of Home Economics by teaching courses on house planning in summer school from 1946-50.

Tom was promoted to associate professor of drafting and industrial design in 1952. In 1953, the title of the elective course was changed to “Creative Sketching” In 1967, the title was changed again, to “Introduction to Industrial Design” and a project course in industrial design was added. In 1961, the programs in the College of Engineering were restructured and the Department of Engineering Drawing disappeared. The course announcements no longer included drawing, descriptive geometry etc.—only Creative Sketching, Introduction to Industrial Design, Special Investigations in Industrial Design, and Industrial Design Project, all of which were Professor Baird’s courses. In 1965, the students recognized his excellence in teaching freshmen by voting him as one of the two winners of the Philip Sporn Prize. Tom became a member of the Department of Machine Design. In 1966, he was promoted to professor of machine design and in 1967, to professor emeritus.

Professor Baird was a member of Tau Beta Pi, the American Institute of Planners, the Industrial Designer’s Society of America, and the American Association of University Professors.

Beneficence to Cornell by the Baird family began in 1927 when Professor Baird’s mother established the Baird Prize Fund in the College of Architecture (currently the College of Architecture, Art, and Planning). The prize was awarded in open competition to a second-year student in the college and the fund has been maintained up to the present by Professor Baird.

For many years, after retirement, the Bairds maintained an active life at Cornell, especially enjoying the concerts and other musical events. They spent their summers in Maine, part of their winters in Sweden and part touring Europe, especially Italy and Sicily. When Mrs. Baird’s health declined they settled down in their Ithaca apartment and devoted themselves to Cornell and to activities with their local friends.

In 1981 Professor Emeritus Baird and his wife made a bequest of half a million dollars to Cornell University, \$400,000 of this amount to create the Thomas J. Baird Visiting Critic Fund to sponsor visits to Cornell by architecture scholars and practitioners in the College of Architecture, Art and Planning. The remaining \$100,000 was bequeathed to the Music Department of the College of Arts and Sciences to support the Thomas and Kerstin Baird Concert Fund for free public concerts, lectures and related presentations of classical and chamber music sponsored by the Department of Music. A plaque in their honor was dedicated in 1982 in Barnes Hall, the site of the annual Baird Concerts.

In 1986, the Bairds suggested that a terrace be placed on the north side of Sage Chapel where they frequently rested after their usual Sunday morning walks on the Cornell Campus. In August of 1987, Professor Baird dedicated the

Kerstin Thorin Baird Garden Courtyard in honor of his wife who died earlier in the year. The garden courtyard has been described as a “haven of beauty—a particularly appropriate memorial to a woman who was a devoted supporter of the cultural arts of Cornell.”

In 1989, seeing the need to balance the overall design of the Sage Chapel exterior, Professor Baird dedicated a matching terrace, which bears his name, on the south side of the chapel.

Still looking for projects that might benefit his beloved Cornell, Professor Baird was introduced to the newly created Newman Arboretum by his longtime friend and former student, Raymond Fox, professor of floriculture and ornamental horticulture. Professor Baird was immediately attracted to the Arboretum because it gave him a quiet place of beauty to walk and to contemplate nature in its changing moods. Inspired by Autumn drifts of goldenrod and bedstraw growing on the slopes of the natural bowl-shaped Arboretum, and encouraged by Professor Fox, Professor Baird approached the director of Cornell Plantations and suggested that similar effects with other wildflower plantings could provide colorful effects throughout the growing season. Thus was born the Baird Field Flower Meadow Project, to which he gave his generous support.

Professor Baird also contributed a substantial sum to help establish a memorial grove of white birches in the Cornell Arboretum in honor of his and Kerstin’s longtime friend, Mrs. Ruth Cavetz.

Professor Baird’s talents in architectural design were greatly admired by his college roommate and great friend Mr. Richard Belcher, class of ‘28, Bachelor of Architecture ‘30 at Cornell. Mr. Belcher also worked in Bryant Fleming’s office before moving to New York City eventually becoming chief architect for the R.H. Macy Company enterprises. To honor his good friend, Mr. Belcher recently established a \$100,000 fellowship bequest for students enrolled in the Master of Architecture Program at Cornell. It will be an annual award to “inspire, encourage, and reward fine architectural talent at Cornell” and is to be known as the Richard G. Belcher-Thomas J. Baird Award for Architectural Design.

Professor Baird was predeceased by his three brothers. He is survived by his sister-in-law, Mrs. Mary Baird Hefner; his nephew, Mr. Lincoln Baird and wife Carol; a niece, Miss Lucy Baird; two grandnephews, Lincoln and Graham Baird—all residents of California; a cousin, Mr. Willis Zangerle of Cleveland, Ohio; and by his wife’s nephew, Mr. Bengt Thorin, and his family of Sweden.

His friends and relatives will greatly miss Tom Baird for his gentlemanly, courtly manner, his sincere interest in his students, his caring ways, his ability to observe and to point out the beauty of nature and the aesthetics of good

taste and, not-the-least, for his enjoyment of a good joke, his sense of humor, and his ability to laugh at himself—all too rare attributes in today's world.

Bart Conta, Raymond T. Fox, Richard M. Phelan

Donald Wyckoff Baker

April 15, 1899 — May 14, 1978

Donald Wyckoff Baker died at his winter home in Guaymas, Sonora, Mexico, on Sunday, May 14, 1978. Although he was born in Navarino, Onondaga County, New York, he spent his early years (from two to seventeen) in southwestern Virginia and graduated from Damascus High School, Damascus, Virginia.

In 1924 Rutgers University awarded him a Bachelor of Science degree in agriculture and appointed him university herdsman. It was while working with the university dairy herd that he became acquainted with Dr. Theobald Smith of the Rockefeller Institute at Princeton, New Jersey, and Dr. R. N. Gordon Darby of Somerville, New Jersey. They urged Don to get a veterinary degree and suggested that he apply to Cornell. He entered the New York State Veterinary College in the fall of 1925 and was granted the Doctor of Veterinary Medicine degree in 1929 as well as a Doctor of Philosophy degree in 1933.

While still a student, he was placed in charge of the Diagnostic Laboratory. He held the title of director from 1928 to 1933. His first appointment was as instructor of diagnosis. In 1933 he was appointed assistant professor of parasitology and became the first professor of Parasitology at the New York State Veterinary College. He was appointed associate professor in 1940 and professor in 1947.

Dr. Baker served as consulting veterinarian to the Institute of Interamerican Affairs in Central and South America from July 1950 to February 1952. His principal station was in Paraguay, but his work also took him to Peru, Haiti, Costa Rica, Bolivia, and Brazil. While in Brazil, he was consulted by the president of that country, who operated a large livestock establishment and wanted to learn more about disease control. In 1958 and 1959 he was called upon by the National Foundation for Infantile Paralysis to serve as a consulting and research veterinarian. He traveled to the Philippines and to India to study the problems connected with shipping monkeys from these countries to the United States for testing the Salk vaccine.

Always active in organized veterinary medicine, Dr. Baker was a member of the American Veterinary Medical Association and had been an honor roll member since 1973. He belonged to the New York State Veterinary Medical Society and served as its president in 1964. The Southern Tier Veterinary Medical Association claimed his services for seventeen years as secretary-treasurer. He also held membership in the American Veterinary Association of Parasitology, the Livestock Sanitary Association, the Council of Official Research Workers of America, the

Albuquerque Veterinary Medical Association, and the Intermountain Veterinary Medical Association. For fifteen years he gave devoted service to the Veterinary College Alumni Association as its secretary.

Among his fraternal affiliations were Chi Phi and Alpha Psi. His membership in honorary societies included Sigma Xi, Phi Kappa Phi, the Rutgers chapter of Alpha Zeta, and Phi Zeta, of which he was national secretary from 1941 to 1943.

Don Baker was devoted to people, the Veterinary College, and Cornell University. This dedication was exemplified by his frequent trips to various Parts of the Northeast to assist graduates with their problems. It might be said that he was the unofficial public relations officer or the extension veterinarian for the Veterinary College. His warmth and friendliness brought him a multitude of friends. To these friends and colleagues as well as his two alma maters he showed a great loyalty for which he was loved and respected. He was generous to a fault and had great empathy with students, young associates, and visitors to the college. Professional meetings held a special attraction for Donald, and he often made a presentation, promoted a cause, or participated in some other way. He added much to the professional knowledge through published papers and talks at hundreds of meetings.

As a teacher, he had a practical turn of mind. While he realized the importance of taxonomy, he chose to emphasize the problem that parasitism presented to the clinician. His examination often consisted of confronting students with a specimen or a parasitized patient.

His chief hobby was photography, and the files and archives of the Flower Veterinary Library contain many of his fine portrayals of his countless friends. This hobby began with the specimen photographs he made for teaching purposes. He also had a consuming interest in railroads and was extremely knowledgeable about the entire national network. His collection of timetables was amazing.

In 1965 the trustees of Cornell University appointed him professor of parasitology emeritus, and he retired after thirty-seven years of meritorious service to the Veterinary College. He was still not ready to rest on his laurels. Moving to Albuquerque, New Mexico, he joined the Agricultural Research Service and there continued his work in parasitology until 1970.

Surviving him are his wife of forty-eight years, Ruth Thompson Baker; two sons, Bruce Wyckoff Baker and Neil Darby Baker; and a daughter, Jean Boynton Baker.

Ellis P. Leonard, A. Gordon Danks

James Andrew Baker

December 16, 1910 — April 14, 1975

Rich is the man who sees things newly, as if eyes had never before looked upon the earth. Richer is he who learns to look through the eyes of men who have gone before, and adds to their vision the freshness of his own insight.

K. L. Patton

James A. Baker, founder and late director of the Veterinary Virus Research Institute and the Cornell Research Laboratory for Diseases of Dogs, died suddenly on April 14, 1975. With his passing, not only veterinary virology but the many owners and fanciers of dogs who benefited from his advice have lost one of their most distinguished and dynamic personalities. It is impossible to abbreviate a life so full of vigor into a simple statement, for those who knew him as a fellow scientist, educator, or adviser could not fail to recognize his genius. He was, like many men ahead of their time, not without controversy but nevertheless universally respected for his accomplishments. His creation and pursuance of novel ideas have guided the course of infectious disease research in the veterinary field for more than two decades. He was never bound by traditional thinking—he was an innovator and stimulator. The force that drove him was legendary.

Drew, as he was known to his intimates, received his undergraduate education and the M.S. degree at Louisiana State University. In 1938 he received the Ph.D. degree from Cornell, where he worked under the tutelage of the late Dean William Hagan. His research was unique for the times, employing for the first time animals (platyfish) free from bacteria and other microorganisms for infectious disease study. The term *axenic* (“without strangers”) was introduced into the biological literature by Baker; a decade later germ-free animals became recognized as essential to many aspects of infectious disease research. After graduating from the New York State Veterinary College in 1940, the first Ph.D.-D.V.M. graduate, “Fish” Baker joined the Rockefeller Institute at Princeton, New Jersey, where he became greatly influenced by the thinking and attitudes of such distinguished scientists as Peyton Rous and Carl Ten Broek. During World War II he served with the U.S. Army on Grosse Ile, where he succeeded in developing attenuated viral vaccines against two of the most feared diseases of domestic animals—rinderpest and hog cholera. At the time of his death, he was still attempting to perfect immunization methods against the latter disease—in Mexico, for the disease has been declared eradicated in the United States. To preserve the United States free of hog cholera, Dr. Baker believed it necessary to maintain a vaccination belt to the south of the United States, where the disease is still common.

In 1947 Drew Baker returned to Cornell at the invitation of Dean Hagan to become a professor of bacteriology. At that time virology was not a major subject in veterinary schools, but Baker recognized its importance and the need for research as well as teaching. By the force of his unique personality he gained financial support to found in 1950 the Veterinary Virus Research Institute (VVRI) and the Cornell Research Laboratory for Diseases of Dogs. He became director of the institute in that year, a position he held until his death. Several important personalities assisted Drew Baker both in gaining initial support for the institute and in bringing to his attention important disease problems occurring in the field. The help and counsel of John and Spencer Olin, Colonel and Mrs. Lee Garnet Day, Geraldine Rockefeller Dodge, Mrs. Walter Teagle, Mr. Robert Woodruff, the Richard King Mellons, and others who gave encouragement in the early days continued to influence Dr. Baker in his attempt to improve animal health through field and laboratory research.

Over the succeeding twenty-five years, with resources derived largely from private subscription, the institute expanded and flourished under his leadership to become one of the leading veterinary research institutes of the world. Work concentrated primarily on the canine and bovine species, and many of the advances in veterinary virology had their origins in the VVRI, including the development of modern combined distemper-hepatitis vaccines; heterotypic vaccination concepts, using measles virus for distemper; discoveries involving canine adenoviruses and canine herpesvirus, bovine viral diarrhea and infectious bovine rhinotracheitis, and bovine chlamydial infections; discovery of canine brucellosis; identification of viruses and bacteria associated with respiratory illness in dogs and cattle; relationships between nutrition and disease; and the role of colostral protection. All of these areas required the development of new technologies.

Under Drew Baker's guidance the VVRI grew to its present state, a modern and well-equipped laboratory complex dedicated to solving disease problems arising from the field as well as to basic biomedical research. Dr. Baker always planned for the future. His greatest pride was in the fulfillment of his ideals through the scientific and humane accomplishments of his colleagues and students, six of whom became deans of veterinary colleges here and abroad. He demanded hard work from his staff but always gave generously of his time, advice, and enthusiasm for novel ideas. He never used the accomplishments of his students or colleagues for his own benefit, for he took greater satisfaction from their accomplishments—a trait derived, he said, from Dr. Ten Broek. Dr. Baker's eminence in infectious disease research was marked by many awards, including the Borden Award and the Gaines Award for his studies on cattle and dogs, respectively. Many students and scientists from various parts of the

world received training at the VVRI and were always welcomed and treated with his characteristically generous “southern hospitality.”

Drew Baker was known to members of the veterinary profession throughout the world, both in the United Kingdom and in Central and South America, where he presented talks at congresses and special symposia, and in the lesser traveled areas such as West Africa, where he received in 1965 a commendation from the president of the Republic of Mali for his efforts in establishing in that country a modern research and vaccine-production laboratory. He was due to retire in December of this year, and it is particularly sad that he was not spared to see the celebration in September marking the twenty-fifth anniversary of the institute he built and to which he devoted the major portion of his life.

As most who knew him recognize, Dr. Baker’s wife, Dudley, played a key role throughout the institute’s development. Her encyclopedic knowledge and interest in the laboratory, its history, and the people who helped in its inception and growth and her tireless devotion both to the scientific accomplishments and to the people who have worked and studied at the institute are recorded both in mind and in the many reports and articles she has written and edited over the past twenty-five years. We join Dudley, whose interest in the institute and Cornell went far beyond those of “wife of the director,” and their son, Andrew, in mourning the loss of this man who literally became a legend in his own lifetime.

A. O. Betts, L. E. Carmichael

Robert Carl Baker

December 29, 1921 — March 13, 2006

A man unequaled in generosity of spirit and nature, Bob Baker was known as the “Edison of the poultry industry” for his work in the development of new food products. Just as he “added value” to chicken and turkey meat and eggs and to underutilized fish for Sea Grant in his work, he added value to and greatly valued all those around him. A caring man of great honesty and integrity, he helped his family, students, employees, colleagues, and friends to achieve their greatest potential. In addition to food product development work, he contributed much to the body of applied research on the microbiological and chemical properties of poultry meat and eggs, as well as the quality and safety of these foods. And what New York summer would be complete without chicken barbecues cooked with his famous Cornell Chicken Barbecue Sauce that he invented?

Dr. Robert Carl Baker was born in Newark, New York and moved to a fruit farm (where they also had chickens) in Sodus, New York when he was twelve years old. Thus began a lifelong interest in apples and poultry. Bob Baker received a B.S. degree in Pomology from Cornell in 1943, and then served in the U.S. Army. After his honorable discharge from the Army, he became an Assistant County agent in Orange County, New York. From 1946-49, he was an Assistant Professor of Poultry Husbandry at Pennsylvania State University, where he also received his M.S. degree in Agricultural Economics in 1949. Bob began his distinguished career at Cornell in 1949 as Assistant Professor of Poultry Extension in the Department of Poultry Science in the College of Agriculture and Life Sciences. He received a Ph.D. degree in Food Science from Purdue University in 1956 and upon returning to Cornell in 1957, he initiated the Poultry Food Science program. This program became an active and integral part of the department as well as the Institute of Food Science, where Bob was fully engaged in extension, research and teaching activities. This is where he and his staff developed over 58 new poultry, egg and seafood products, many of which are still marketed today.

Dr. Baker advised, mentored and befriended many domestic and international graduate students and influenced the lives of many young food scientists during his tenure at Cornell. Over 75 graduate students have studied and conducted research under his tutelage. These students are now prominent food scientists who are employed in the food industry, academic institutions and government agencies throughout the world. Bob was the first graduate field representative (now called the Director of Graduate studies) for the Graduate Field of Food Science and Technology at Cornell and served in this position for 12 years. He personally met and counseled all incoming graduate students, thus enabling them to smoothly embark on their graduate careers. During his tenure as field

representative, the number of graduate students in Food Science increased from 10 to nearly 100. In addition to helping them academically, he regularly invited students to stay at his home when they needed help with housing. Students and his staff took part in many Baker family get-togethers, dinners and outings at his Cayuga Lake beach in Lansing, New York. Bob had a keen sense of family and together with his wife Jacoba (Jackie) and children Dale, Myron, Kermit, Regina, Maureen, Johanna, and Karen they hosted many sporting activities at their home including ice hockey, basketball, and softball with Bob encouraging everyone to get involved in whatever game was being played. He was certainly unselfish with his time and talents and made everyone feel welcome in his home.

Dr. Baker gave lectures, taught workshops and consulted on the development of new food products and the start-up of poultry operations in more than 20 countries. He was the Director of the Cornell Institute of Food Science (1970-75) and the Chairman of the Poultry and Avian Sciences Department (1980-87) prior to his retirement in 1989, and was inducted into the Poultry Hall of Fame in 2004. He developed and for many years taught a popular course entitled "Food Science for Industry"; one week he and staff presented a lecture and a laboratory on the scientific basis for preparation of a food product and the following week students toured a commercial food processing plant where the food product was manufactured on a large scale.

Dr. Baker was a Fellow of the Institute of Food Technologists, a member of the Poultry Science Association, the American Association for the Advancement of Science, the New York State Agricultural Society and many other professional societies. He also served on the American Egg Board Scientific Advisory Committee and on the American Poultry Historical Society. Bob was also a dedicated member and supporter of the Cornell chapter of Alpha Zeta fraternity (an agricultural honorary fraternity). In addition to his full and successful academic career and his many contributions to Cornell University, Dr. Baker started a food service business, Bakers' Chicken Coop, in 1949 at the New York State Fair, featuring chicken barbecued with the Cornell Sauce, which thrives to this day. In retirement, with his wife and daughter, he ran Bakers' Acres, a Lansing, New York nursery and apple orchard. A lifelong community leader, he was involved with many activities in Ithaca and Lansing, New York. He was a founding member of the Lansing Lions Club and the Lansing Housing Authority, which planned and built the Woodsedge retirement apartments in South Lansing, New York. He helped initiate the Lansing Community Council and was very active in the Lansing Methodist Church. Dr. Baker was also a member of the Ithaca Rotary Club, was a member of the Lansing School Board and the North Lansing Fireman's Auxiliary.

Bob Baker's enduring work ethic in academics and science was great and far-reaching, but it was matched equally, if not surpassed by, his deep love for his wife and family and friends. He possessed many outstanding qualities

and will be remembered for his trust, integrity, honesty, and generosity with loved ones, as well as with colleagues, friends, and even strangers and his great sense of humor.

He certainly made a difference in the lives of many people who he touched and will be fondly remembered by all of them.

Charlotte Bruce, Donna Scott, Robert Gravani

William Charles Baker

November 17, 1872 — February 20, 1958

William Charles Baker, artist and Emeritus Professor of Freehand Drawing in the College of Agriculture, came to Cornell as a student in 1894 and, except for a year of art study in Paris after graduation, spent the next sixty-four years painting in Ithaca and teaching at Cornell, ever awakening in those about him an appreciation for the beauty to be found in the world of Nature. It was his belief that education should be for living as well as for making-a-living and he was convinced, to use his own words “that nurture can supplement Nature in developing appreciation of beauty, material or artistic.” For him, Nature was lavish with her beauty and he was eager, both as artist and teacher, to awaken in others awareness of this bounty. He never doubted the worth of teaching appreciation and was ready to take issue with anyone who expressed the belief that appreciation of beauty is innate and cannot be taught. The many students for whom he opened new realms of enjoyment are staunch and grateful supporters of his view.

Professor Baker was born on November 17, 1872 in Buffalo, New York. He worked as a bank clerk in Buffalo for two years before coming to Cornell. As an undergraduate, his drawing ability was so outstanding in biological courses that various professors called upon him for illustrations for their publications. This work helped him to earn his way through college. Although he majored in chemistry and graduated in 1898 from the College of Agriculture with a BSA degree, he began his career by teaching drawing in Sibley College for four years. It was during this period that he decided to make a career of Art. In 1904 he went to France where he studied drawing and painting for a year. At the request of Liberty Hyde Bailey, he returned to Cornell in 1905 to make illustrations for Dr. Bailey’s American Encyclopedia of Agriculture. In 1907 he was appointed assistant professor of drawing in the College of Agriculture by Dr. Bailey who considered drawing to be an indispensable aid in teaching accuracy of observation in biological sciences. In 1914 he was advanced to a professorship which he held until he became an emeritus professor in 1938.

Professor Baker was not only an expert illustrator, skilled in the graphic arts, but a painter of note. He loved the Finger Lakes countryside and captured on canvas its seasonal changes and atmospheric qualities in a way that has caused countless others to see it with new appreciation. His paintings have been exhibited in Paris and many American cities, including New York, Philadelphia, and Buffalo. Ithacans and the Cornell community have been privileged to enjoy them many times.

The versatility and broad, general culture of W. C. Baker, his love of Nature and his alert, inquiring mind all combined to make him an inspiring teacher. He delighted in awakening interests and stimulating students to think. An avid and thoughtful reader himself, he was ever anxious to share with others the ideas and discoveries he gleaned from wide acquaintance with literature, art, philosophy and natural science. His zest for living, his enjoyment of beauty and his warm humanism in regard to the foibles of mankind left indelible imprints on his students.

Retirement meant for Professor Baker an opportunity to concentrate on painting. He was a frequent contributor to “The Cornell Plantations”* magazine of poems, photographs and articles in which he reiterated his belief that “we live in a beautiful world and those who live in the Finger Lakes region dwell in one of the finest parts of this beautiful world.” He died on February 20, 1958 at the age of eighty-five. He is survived by his wife, Anna Wagner Baker; a son, Robert W. Baker; a daughter, Mrs. Elizabeth Baker Wells; a granddaughter and a great-granddaughter. The community shares both their loss and a wealth of memories of this artist, scholar and man who did so much to open our eyes and help us see with new vision.

Elizabeth Burckmyer, R. W. Curtis, Clara Garrett

Frank C. “Ted” Baldwin

October 4, 1900 — April 30, 1979

Ted Baldwin was a man of integrity, broad culture, dignity, and warmth; he served as a model for ever so many admirers. One of the most loyal of our alumni, “he was a giver, and gave himself to all of us”; he always wished to help people. Distinguished for his great good will towards mankind, his kind and generous disposition, his fine sense of humor and fame as a storyteller, and the effectiveness of his counsel to students, he won exceptional popularity, regard, and affection. For example, the Chilean refugees that his devoted wife, Anne, aided in bringing to Ithaca have written: “We are extremely appreciative of the warm, quiet, kindly way in which he offered us jobs, recreation, and friendship during a difficult period in our lives. Ted Baldwin gave us hope in the new life facing us.”

Ted was born in Providence, Rhode Island, where he lived until 1915, when his family moved to Pennsylvania. He attended school in Trenton, New Jersey, and spent one year at Blair Academy in Blairstown, New Jersey.

In 1918 he entered Cornell in the Class of 1922, College of Agriculture. During his undergraduate life he was active in Cornell United Religious Work, fraternity affairs (Phi Kappa Psi), Sphinx Head, and Cornell crew, rowing for three years. One of our committee recalls clearly the very good work Ted did in the class in public speaking. After graduating with a Bachelor of Science degree, he held a position for two years with the Dairymen’s League, but decided to leave business for a career in teaching; and after receiving a master’s degree in education in 1924 from the University of Pennsylvania, he taught mathematics, first at Blair Academy, and then at Pingry School in Elizabeth, New Jersey. In 1936-40 Ted was academic dean of Penn Hall Preparatory School and Junior College, then, in 1940-42, headmaster at Harrisburg Academy.

With the coming of World War II, Ted joined the Army Air Corps and was stationed in Florida. Honorably discharged with the rank of major at the war’s conclusion, he returned to Cornell where he found a position as counselor in the Office of the Dean of Students, later becoming dean of men, a position he filled for fifteen years. In addition to his competent counseling of individual students, Ted worked with faculty and student committees, as well as with the dean of the faculty and the proctor of the University. As dean of men, he served with memorable distinction and in 1953 was elected president of the National Association of Deans and Advisors of Men.

In 1960 Ted was made secretary of the University. He retired in 1966. As a citizen of Ithaca he was active in the Ithaca Youth Bureau, the Rotary Club (president in 1961-62), the Torch Club, the Economic Opportunity

Corporation, as alderman of the Fifth Ward, chairman of the Mayor's Citizens Advisory Committee (winning an award for his services), elder of the First Presbyterian Church. He was chairman of the Ithaca Housing Authority for several years; projects were initiated wherein Cornell pupils studied city problems. Further, he wrote the Class of 1922 column for the Cornell Alumni News and was chairman of four reunions of his class.

Ted travelled widely—to Panama, Israel, Egypt, Greece, Yugoslavia, Austria, England, Spain, Holland, and to Poland, Australia, and New Zealand on trips with members of the Smithsonian Institute.

He is survived by an admirable family—his wife, Anne Gaillard (they were married in 1928); two sons, Frank C, Jr., Cornell Class of 1955, prominent Ithaca physician, and Nathaniel P. “Tad” Baldwin of Washington, D.C.; two daughters, Nancy B. Tenny of Bethesda, Maryland, and Polly B. Gott, of Marshall, North Carolina; twelve grandchildren; and a sister, Elizabeth B. Healey, of Washington, D.C. They have our deepest sympathy in their, and our, great loss.

W. Jack Lewis, Deane W. Malott, Harry Caplan

William Cyrus Ballard, Jr.

September 1, 1888 — June 11, 1952

William Cyrus Ballard, Jr., professor of electrical engineering, suffered an attack while fishing on Cayuga Lake and died without regaining consciousness in Memorial Hospital on June 11th.

Professor Ballard was born September 1st 1888 in Baltimore, Maryland; attended Baltimore city schools and graduated from Baltimore City College. He entered Cornell University in 1906 and received the degree of Mechanical Engineer in 1910, majoring in electrical engineering. After a summer with Bell Telephone Company he returned to Cornell as instructor in the fall of 1910; became Assistant Professor of electrical engineering in 1917, and Professor in 1924. In December 1910 he married Ruth M. Murphy of Ithaca He is survived by three daughters, Grace, (Mrs. E. H. Lotspeich, of Terrace Park, Ohio) ; Ruth, (Mrs. R. O. Klausmeyer, of Cincinnati, Ohio) ; and Evelyn, (Mrs. Henry O. Dunn, of Ithaca).

As a teacher, he was noted specially for his lectures. He had an unusual ability to present technical material in clear and simple terms. Over the years, literally hundreds of alumni have remarked about this. This special ability made him much in demand as an expert witness in patent litigation, where frequently rather highly technical material must be explained to judge and jury, usually without much scientific background. He served a long list of industrial concerns and research organizations as consultant.

Directly connected with his teaching, and laboratory work, he organized and taught the first courses in communication engineering at Cornell, became interested in wireless telegraphy as an undergraduate and obtained the first license for an experimental radio station in 1915. This eventually became a broadcasting station in 1923, known as W.E.A.I. and has been operated almost continuously by the University to the present time. He started the vacuum tube laboratory in the School of Electrical Engineering in 1921, and this development led to pioneering work in the field of talking motion pictures in association with T. W. Case of Auburn, New York. The Case Research Laboratory was later organized into Fox-Case Corporation, producers of Movietone pictures.

Professor Ballard was a musician of unusual accomplishments for an amateur. Gifted with absolute pitch and a good tenor voice, he sang in several quartets and church choirs, and in Sage Chapel. In the years when the Cornell Summer School gave courses specially for public school music teachers he taught courses in harmony and counterpoint. As an undergraduate he played the University Chime, and in later years was occasionally called to play it in emergencies when no one else could be found. He played alto horn in the famous Patsy Conway's Band

for some time when its headquarters were in Ithaca. He served as organist for a time in the Baptist Church, and completed 20 years of service as organist of the First Presbyterian Church. In this assignment he combined his electrical vocation with his avocation by designing a complete new electrical action for the Church organ when it was rebuilt.

The author of one of the earliest books on Radio Telephony, (McGraw-Hill, 1922), Professor Ballard was honored by membership in the Sigma Xi, Eta Kappa Nu, and Phi Kappa Phi.

R. F. Chamberlain, True McLean, B. K. Northrop

Wilder Dwight Bancroft

October 1, 1867 — February 7, 1953

Professor Bancroft was associated with Cornell University for fifty-eight years. Coming to Ithaca at a time when physical chemistry was emerging as a major branch of the science, he was the guiding spirit that created here an outstanding center of teaching and research in this domain. He played an important role in the development of physical chemistry in this country through his own contributions and through his students who became leaders in teaching and research, as well as in the application of physico-chemical principles in chemical industry.

Wilder Bancroft was born in Middletown, Rhode Island, the son of Louisa Mills and John Chandler Bancroft. He was a grandson of George Bancroft, American historian and statesman, who was responsible for founding the U. S. Naval Academy at Annapolis. After taking his A.B. at Harvard University in 1888 he remained there for a year of post-graduate work and then studied abroad at the Universities of Strasbourg, Leipzig, Berlin and Amsterdam. He received his Ph.D. at Leipzig in 1892 and returned to Harvard in 1893 as instructor in chemistry.

In June 1895 Wilder Bancroft married Katherine Meech Bott of Albany, New York, and in the autumn of that year the couple came to Cornell. Two years later he purchased from Charles Evans Hughes the house at No. 7 East Avenue, which he lived in for fifty-five years. The Bancrofts were gracious hosts and entertained many guests. They played a lively part in the social affairs of the community and rarely missed any party, dance or dinner. He was an enthusiastic participant in and follower of sports, especially football, baseball and golf. The Bancrofts had five children, three of whom are now living in the University community.

Wilder Bancroft came to Cornell as Assistant Professor of chemistry and in 1903 became Professor of physical chemistry. He was named World War Memorial Professor of Physical Chemistry in 1919 and appointed Professor Emeritus in 1937. He was a brilliant theorist and a forceful exponent of new ideas arising from the application of physico-chemical concepts to chemical problems. The difficulty of securing publication of new and unorthodox ideas in the conventional scientific journals led him in 1896 to found the *Journal of Physical Chemistry*, which he edited and supported personally for more than thirty-five years. This journal, which grew to be one of the leading publications in its field, was absorbed by the American Chemical Society in 1932.

His imaginative and unconventional approach and his vigorous presentation of new ideas led naturally to lively controversies with his colleagues, in the scientific journals and at scientific discussion meetings. He was a master of the art of argument and rarely was he obliged to retract. He read omnivorously and seemed to remember

everything that he had ever read. He was familiar with all of the significant published work in his own field and well abreast of developments in other fields. Apart from many scientific papers and reviews published in the current journals, he wrote two books which were outstanding in their influence: *The Phase Rule* (1897) and *Applied Colloid Chemistry* (1921). He was a pioneer in the latter field and was awarded the Nichols Medal for his contributions to colloid chemistry. The 18th National Symposium on Colloid Chemistry held at Ithaca in 1941, honored him by designating the meeting “The Wilder D. Bancroft Symposium.”

At one time Bancroft caused a minor tempest in the scientific teapot by the bold assertion that experimental observations are too often wrong or misleading. He expressed the view that an experimental result appearing to be at variance with a promising new theory should be critically re-examined and, if need be, repeated before the theory should be abandoned. Although he was handicapped physically in his later years as the result of an automobile injury, he remained alert and active mentally until the end of his life.

During the course of his life he received many professional honors. He served as president of the American Chemical Society (1910) and twice as president of the American Electro-chemical Society (1905, 1919). He was elected to membership in the National Academy of Sciences and was an honorary member of the Chemical Society (London), the Polish Chemical Society and the Societe Chimique de France. He was the recipient of honorary degrees from Lafayette University (1919), Cambridge University (1923) and the University of Southern California (1930).

Wilder Bancroft will be remembered as a scientist of pioneering spirit and as a man of great personal charm and wit.

J. R. Johnson, C. C. Murdock, F. C. Prescott

O. Ernest Bangs

September 17, 1903 — August 10, 1995

O. Ernest Bangs, Professor Emeritus of Hotel Administration, died after a lengthy illness at his home at 731 Cayuga Heights Road, Ithaca, New York. Ernie's career was not unusual for the time; he moved from industry to academia in his mid 50s, then served the School well into retirement. He is remembered with affection by a generation of hotel faculty, staff, and students as a valued colleague and friend.

Ernie was born in Cameron, Missouri, in 1903—though he later changed this to 1905 in order not to be too old to enlist in the service. He was the oldest of five children and attended local schools and college in Missouri. His first career included over two decades in hotel and food-service management for the Fred Harvey Company and others, followed by service with the U.S. Navy supply corps during World War II. While stationed in the Mediterranean, Ernie was injured in an attack and was hospitalized for three months. After the war, Ernie married Isabelle Engle, and they had two daughters. They settled in Cleveland where, first, he managed an apartment hotel and then took a job with Porter Equipment Company, a career move that set the stage for his later work. At that time, the equipment supply companies often designed commercial kitchens and Porter found in Ernie an enthusiastic and able designer and engineer. Among his first projects was a major installation for National Cash Register in Dayton, Ohio, followed by a wide variety of industrial, hospital, school, and hotel projects.

Ernie, much like the “hotelies” he would later teach, had an entrepreneurial talent and, in the early 1950s, he established his own food-service design company. In 1954, he received the Annual Food Service Merit Award from *Institutions* magazine, honoring his design for the U.S. Army Finance Center in Ohio. As business grew, he merged his company with another to create Stephens-Bangs, for many years among the country's largest food-service design firms. In the following years, Ernie completed dozens of projects including major installations for the University of Michigan; for many Detroit-area manufacturers including Ford, Chrysler, General Motors, AT&T, and General Electric; and for the State Department and National Health Institutes in Washington, DC.

Dean Howard Meek invited Ernie in 1958 to teach a professional seminar in food-service engineering in the Hotel School's summer school. His efforts succeeding immediately, Ernie quickly joined the Cornell faculty that Fall as Acting Associate Professor of food-facilities engineering. He greatly expanded the Hotel School's course offerings in food facilities, a new subject area begun by Professor (emeritus) Paul Broten who recalls “I planted the seeds in the garden, but Ernie tilled the soil and PRODUCED.” Professor Broten remembers Ernie writing to him later to

thank him for his help in initiating the course and referring to himself and Paul as “brothers under the skin.” Paul also fondly characterizes Ernie as “extremely cooperative yet strong, and an unusual GENTLEMAN in that he was GENUINE and really did care about his associates and students.”

In his classes, Ernie continually challenged his students to think through problems, to consider an array of alternative solutions, and to prepare professional documents before there were any national standards. But Ernie taught much more than food-service design. In his strong mentoring role with his students, Ernie epitomized the highest standard of business and personal ethics. Ernie’s remarkable influence is recalled by William Eaton, a former student who, with a group of classmates, enrolled in Ernie’s first food-facilities course at Cornell, the beginning of a long sequence of design and engineering courses:

It really wasn't six terms. It was one very long class with five breaks, almost seamless. The key was that it allowed the group of us ... to grow to know each other . . . and [several of us] are still together! It never would have happened without Ernie Bangs. He taught us the Industry as no one else could have and, even more importantly, he taught us to think, to plan, and, above all, he taught us ethics. He was, and I do not exaggerate, the most ethical man I ever knew, and only hope that a fraction of what he taught has become a part of me.

It is not an overstatement that Ernie Bangs, single-handedly, educated a whole generation of industry leaders: in 1990, eighty percent of the executive committee of the International Food-Service Consultants Association were former students of Ernie’s. He is recognized, too, as the person who created the academic area of food-facilities design. In addition to those who hold leadership roles today in the industry, many of his former students now are teaching food-service facilities design at leading hospitality programs around the world.

Ernie continued to teach at the Hotel School until 1971 when he reluctantly retired. In the late 1960s, Ernie had successfully represented the Hotel School in helping fledgling hospitality programs in Korea and the Philippines establish departments of tourism and hotel management. Therefore, Dean Robert Beck invited Ernie to assume the directorship of the Hotel School’s new joint venture program in San Juan, Puerto Rico, where he served for eight more years. When he left in 1979, the students gave him a plaque reading, “For Professor O. Ernest Bangs: Our heartfelt gratitude, to one whose personal expertise and highest standards of both work and conduct kindled in all of us just one goal ... to strive for excellence.” Paul Gaurnier, Associate Dean during that period, recalls Ernie’s outstanding contribution:

Ernie truly came into his own in Puerto Rico. He was Cornell’s ambassador extraordinaire to the fledgling program, serving as professor, counselor to the students (for many of whom he became a surrogate father), and a public and governmental relations expert—overall an outstanding representative of Cornell. Ernie truly loved people and was at his best in helping

people advance their careers, even to the point of offering optional evening courses to those who could not attend his daytime classes. It was a joy to visit him there and watch the program bloom under his tutelage and guidance.

Ernie retired a second time in 1979 when he and Isabelle returned to Ithaca where they lived until Ernie's death in the mid-19th century farmhouse they had bought in 1960. Still full of energy and ideas, Ernie served as a volunteer counselor for the Small Business Administration where he advised local entrepreneurs on setting up their business and helped them deal with a variety of operating issues. In retirement, Ernie had more time to read, especially books on history and philosophy and religion. As his sight failed in his later years, he continued his lifelong education by "reading" more than one hundred books on tape.

When the new Statler opened in 1989, Ernie and Isabelle attended the grand opening. Although virtually blind, Ernie wandered off to explore the building that had been for so many years his professional home. He knew Statler Hall so well in his mind that he had no difficulty finding his way up the stairs to examine and critique the reconstructed food labs designed by his former students. He remained mentally sharp, always ready for a lively conversation, and inspired those around him with his curiosity and spirit.

Ernie is survived by his wife, Isabelle, in Ithaca; a son, Robert Bangs of Seattle, Washington; and two daughters, Connie Bangs of Brooklyn, New York, and Christine Hall of Inverell, Australia; five grandchildren; and five great-grandchildren. Ernie's faculty colleagues at Cornell fondly remember him as a gentleman of the utmost integrity; a consummate professional demanding the highest standards; a pleasant, knowledgeable, and highly valued friend; and a significant contributor to the success of the Hotel School's programs in Ithaca and Puerto Rico. He will be missed.

David C. Dunn, Richard H. Penner, Jack J. Clark

Harlan Parker Banks

September 1, 1913 — November 22, 1998

Harlan Parker Banks, Liberty Hyde Bailey Professor Emeritus in the College of Agriculture and Life Sciences, died on Sunday, November 22, 1998, at his retirement home in New Hampshire after a short illness.

Professor Banks was born on September 1, 1913, in Cambridge, Massachusetts, and graduated in 1930 from Classical High School in nearby Lynn. He received his B.S. degree in 1934 from Dartmouth College where he spent three further years as Instructor in Botany and held a Cramer Fellowship for Graduate Study. A Cornellian there, Professor Carl L. Wilson, interested him in plant anatomy and morphology and this expanded into the study of fossil plants. Most of his subsequent research was done in paleobotany, commencing with a doctoral dissertation at Cornell under the tutelage of the late Professor Loren C. Petry.

From 1940, he taught at Acadia University, Wolfville, Nova Scotia, where he became Associate Professor of Botany before leaving in 1947 for a similar position at the University of Minnesota. Upon retirement of the late Arthur J. Eames in 1949, Banks returned to Cornell as Associate Professor of Botany, Professor (1950-77), and as Liberty Hyde Bailey Professor (1977), retiring in 1978. During this period he also served as head of the Department of Botany, 1950-61, and upon formation of the Division of Biological Sciences, was associated with the Section of Genetics, Development, and Physiology.

Professor Banks and most of his 34 graduate students literally and figuratively quarried the rich Devonian fossil deposits of early land plants in New York for notable contributions to our understanding of the origin, structure, and evolution of these plants. Authorship or joint authorship of over 150 scientific papers, reviews, films, and one book on paleobotany—*Evolution and Plants of the Past*—led to his international recognition as a major authority on the earliest land plants. An effervescent lecturer, he was invited to lecture at some 70 universities and colleges in the continental United States and Puerto Rico, at 20 universities or scholarly societies in Europe, Asia, and Australia, as well as to numerous science clubs, museums, research institutions, and other departments within Cornell. He also was the paleobotany Lecturer at the Centennial Celebration of the Peabody Museum of Natural History at Yale University in 1966; held the David French Lectureship, Pomona College, in 1971; was guest lecturer at the Third International Gondwana Conference, Canberra, Australia, in 1973; and the W.W. Rubey Lecturer at UCLA, in 1976. He was awarded an honorary Doctor of Science degree from Dartmouth College in 1984,

and in 1987, he was elected as one of 50 foreign members of the Linnean Society of London and received the Paleontological Society's U.S. gold medal, awarded to a paleobotanist for the first time since 1970.

Despite many obligations, and always with good humor, he served as minor advisor to over 25 graduate students a year. In addition to his major graduate students, he averaged a dozen undergraduate advisees a year, and he kept an open door to countless other students and colleagues who sought his advice.

In the tradition of distinguished teaching in botany at Cornell, Harlan Banks was recognized within and without the university as not only exceedingly popular but also as a truly great teacher in his generation. This was particularly so in the introductory courses at Cornell, although he also taught upper-level courses and was associated with various short courses in summer institutions or commissions on education sponsored by the Botanical Society of America, the National Science Foundation, and American Institute of Biological Sciences. In 1961, he received the Certificate of Merit from Seniors in the College of Agriculture, and in 1975, the SUNY Chancellor's Award for Excellence in Teaching. Further honors for teaching and research came in the form of selection by the Faculty of the University of Liège to be a Fulbright Research Scholar in Belgium in 1957-58; election as Corresponding Member, Société Géologique de Belgique in 1959; as John Simon Guggenheim Memorial Foundation Fellow with tenure at the University of Liège and at Cambridge University in 1963-64; as Fellow of Clare Hall, Cambridge University in 1968; and as Honorary Vice President, XII International Botanical Congress, Leningrad, in 1975. In the same year, he was awarded a Certificate of Merit by the Botanical Society of America, which he had served as member of the Editorial Board, Secretary Pro-tem (1952-53), Treasurer (1964-67), Vice President (1968), and President (1969).

He was a fellow of the American Association for the Advancement of Science, and he also served in various capacities with the International Organization of Paleobotany (Vice President, 1964-69; President 1969-75), Paleontological Society (Councilor-at-Large, 1974) and was a member of the Paleontological Association, International Society of Plant Morphologists, International Association for Plant Taxonomy, Torrey Botanical Club, Paleontological Research Institution, Commission Internationale Microflore Paleozoïque, Asociacion Latinamericana de Paleobotanica y Palinologia, Sigma Xi (President, Cornell Chapter 1954-56), Beta Beta Beta, Gamma Alpha, and Ho-Nun-De-Kah (Honorary Member, 1959). From 1977-83, he served on the United States National Committee for the International Union of Biological Sciences sponsored by the National Academy of Science, and was elected to the National Academy of Science in 1980. Continuing his activities after he retired, he published 11 papers

during the 1990s. In December 1997, he delivered the monthly lecture at the New England Botanical Club in Cambridge.

His wife, Rosamund L. (Kit) Shurtleff Banks and a daughter, Jane Angstrom, survive him. Funeral arrangements will be private. Donations in memory of Professor Banks may be made to Cornell Plantations.

John Kingsbury, Karl Niklas, Natalie Uhl

John Peleg Barlow

November 6, 1918 — November 17, 1985

Rhode Island terms itself “the Ocean State.” John Peleg Barlow, a native Rhode Islander, was among the earliest students in this country to undertake graduate study in the new science of oceanography. Following undergraduate work at the University of Rhode Island (where his father, a professor of entomology, had become well known as a colorful dean— “Buggy Barlow”), and after a wartime interruption for service in the European theater, in which he was wounded, John went to Harvard University. There, with some difficulty, but with the constant help of Alfred Redfield, his graduate adviser, he put together a program in oceanography that leaned heavily on the facilities and support of the Woods Hole Oceanographic Institute, since Harvard itself then had few appropriate resources in Cambridge.

While working on his doctoral project, John held the titles of visiting investigator and research fellow at the Woods Hole Oceanographic Institute. Harvard University awarded him master’s and doctoral degrees based on his work there. He received the latter in 1953. He then moved rapidly from the position of research associate in oceanography at the University of Washington to professor of oceanography at Texas Agricultural and Mechanical College. Cornell soon beckoned, and he joined this faculty in 1956. He taught oceanography at Cornell from 1956 to 1985, first in the Department of Conservation (now Natural Resources) and later in the Section of Ecology and Systematics when the Division of Biological Sciences was created.

John Barlow’s consistently focused research interest was to examine and explain effects of physical and chemical factors in the environment on the waxing and waning of populations of phytoplankters, those microscopic, usually photosynthetic, inhabitants of natural bodies of water, fresh or marine. In doing so, he was faced with the need to develop new methodology on occasion and constantly to learn more about the important consequences and significance to the human environment of discharges of nutrients or toxicants into natural waters. Thus, although retiring by nature, John Barlow found himself in the forefront of those who challenged the wisdom of siting a nuclear generator on the shores of Cayuga Lake and waged effective battle. He also served enthusiastically on a Cornell committee to investigate the feasibility of a marine field station at the Isles of Shoals and was a member of the initial faculty of the program Cornell established there.

During John’s tenure at Cornell his interests and abilities, increasingly recognized by his colleagues nationally and internationally, led to important opportunities in consulting and study. He was a Fulbright research scholar

at the University of Oslo; a consultant on the San Francisco Bay Project at the University of California, Berkeley; a research fellow at the University of Southampton, England; a visiting investigator at the Graduate School of Oceanography, University of Rhode Island; and a visiting investigator at the Institute of Microbiology, University of Amsterdam.

Never intimidated by contemporary pressures to publish, John unvaryingly wrote scientific papers of substantial content. They were solely his at first but increasingly coauthored with his students.

In teaching, Professor Barlow's forte was a one-on-one relationship. To the undergraduates in class, particularly those (the majority) who were opaque to occasional sallies of his characteristically dry New England wit, Professor Barlow's lectures could be demanding, even daunting. But to each of his twelve graduate students over the years (all of whom but one were doctoral candidates), to the many others for whom he served as a minor adviser, to undergraduate advisees in large numbers, and to his colleagues, John Barlow's door was always open, his time never limited, his insights sound, and his advice warm and generous. His personal standards were always of the highest level.

John's subtle humor occasionally made trouble for him. Early in his career he prepared a paper for oral presentation to a distinguished international symposium on estuaries. The paper presented his research into the effects of Long Island duck-farm effluent on the major south-shore embayments into which it discharged. Somehow ducks and John's reputation for wry humor led his audience to seeing meanings that were not intended in his sentences. Soon the entire gathering, perhaps also reacting to previous tedium, was in full mirth. John, realizing what was happening, joined his listeners in enjoying his own paper in a new light. At its conclusion he received a thunderous ovation.

On his retirement, in 1984, John and his wife, Caroline—their two children, Maria and David, having fledged—returned to ancestral property in Rhode Island. Unfortunately John's days and comfort were limited by a battle with cancer, which had been forced on him before retirement. He remained of good spirits to the end, and his final months were filled with reborn interest in the land of his roots and his youth.

John M. Anderson, William N. McFarland, John M. Kingsbury

William Nichols Barnard

April 24, 1875 — April 3, 1947

William Nichols Barnard died in the Ithaca Memorial Hospital on April 3, 1947. He had retired from active service in 1946 having served on the Faculty of Sibley College for forty-five years. His death removes from the Faculty of Cornell University, one of its oldest and most faithful members. He was born in Canton, Illinois on April 24, 1875, entered Cornell in 1893, and graduated with the degree of Mechanical Engineer in 1897. His attachment to Cornell was quite natural; for his father, William Stebbins Barnard, graduated from Cornell in 1871, studied there for his Ph.D. and was, for some time, an Assistant Professor in the Department of Entomology.

Professor Barnard's interest in his chosen field, steam engineering, was no doubt stimulated by his work under the famous Director of Sibley College, Robert H. Thurston, who was great authority of his day on thermodynamics and kindred subjects, and also by his contacts with John H. Barr, Professor of Machine Design, whose course in steam-engine design was the outstanding senior design course in the college.

Professor Barnard remained at Cornell for two years after graduation as an instructor in Machine Design, assisting Professor Barr in the course of steam engine design. During the years, 1899 to 1903, he worked as a designer with the Russell Engine Company of Massillon, Ohio, returning to Cornell in 1903 as Assistant Professor of Machine Design and Steam Engineering. In 1907, he was promoted to a full professorship in Steam Engineering, a position he held until 1915. In that year, he was made Professor of Heat-Power Engineering, a position he held until his death. Professor Barnard's contribution to the academic life of Sibley College of Mechanical Engineering was noteworthy. From 1907 to 1915, he served as Secretary to the College and from 1938 until his retirement, he was Director of the Sibley School of Mechanical Engineering.

His contribution to our war efforts was also noteworthy. During the First World War, he served with distinction as President of the Academic Board, U. S. Army School of Military Aeronautics at Cornell University, and organized and directed the great ground school for army fliers that was housed in Barton Hall, one of the most successful schools of its kind. During the Second World War, he served again as coordinator of civilian pilot training. Although he spent the greater part of his life in university work, he was no recluse but kept himself well informed on world events.

Professor Barnard was widely known by his writings. In 1907, he published a book on Valve Gears. In 1912, he collaborated with C. F. Hirshfeld in issuing a volume on Heat-Power Engineering. In 1926, he collaborated

with C. F. Hirshfeld and Frank O. Ellenwood in Part I of a volume on Heat-Power Engineering, Parts II and III appearing in 1933. These books are classics in their field. He was a member of a number of scientific and honorary societies, namely, The American Society of Mechanical Engineers, The Society for the Promotion of Engineering Education, Cornell Society of Engineers, Sigma Xi, Tau Beta Pi, Phi Kappa Phi, and Atmos. He was also a Registered Professional Engineer in New York State.

Professor Barnard will long be remembered by a host of students and graduates not only as a close friend, but more important as a kindly, helpful, cheerful teacher and administrator. No student went to him for help and advice and came away empty handed. By his colleagues, he will be remembered as a hardworking, scholarly and cheerful man, easy of approach and very companionable. He will be greatly missed by all who knew him and particularly by those who worked with him for so many years.

On April 17, 1919, he married Edith Nourse Robinson who survives him.

H. B. Adelman, F. O. Ellenwood, D. S. Kimball

Fred Asa Barnes

June 17, 1876 — April 5, 1950

Fred Asa Barnes, Professor Emeritus of Civil Engineering, died on April 5, 1950 at Pleasant Valley, Connecticut, where he and Mrs. Barnes lived since leaving Ithaca in 1949. He was born in Stockbridge, Massachusetts, June 17, 1876, the son of Albert W. and Una M. (Thompson) Barnes. He graduated from Cornell University, obtaining the C. E. degree in 1897 and M. C. E. in 1898. He was married on April 15, 1903 to Bertha Lula Birdsall, who survives him together with one daughter, Mary Louise Hall also of Pleasant Valley, and two grandsons, Nicholas B. and Stephen M. Eddy, both of whom attended the School of Civil Engineering to which Professor Barnes devoted more the forty years of his life.

Before entering his real life work of teaching Professor Barnes spent four years in a variety of engineering positions, first in the District Engineer's Office at Washington, D. C, and later in Cuba, working successively for the Hydrographic Office at Santiago, for the Ponupo Mining Company, and for Hugh Reilly, consulting engineer. In September 1902 he was appointed an instructor in what was then the College of Civil Engineering, thus beginning a teaching and administrative career that continued until his retirement in 1944. He was promoted to the grade of assistant professor in 1905 and was made Professor of Railroad Engineering in 1915. When in 1920 the College of Civil Engineering became the School of Civil Engineering, Professor Barnes became the School's first Director which position he held until 1930.

Throughout his many years of service he played a prominent part in solving the educational and administrative problems of the College and School, being particularly interested in his own department of Railroad Engineering.

He was responsible for the initiating and organizing of many new courses in the curriculum, including Railroad Operation and Management, Railroad Construction and Maintenance of Way, Costkeeping and Management, Engineering Construction, and Transportation.

Professor Barnes was joint author with Professor C. L. Crandall of two textbooks, one on "Railroad Surveying" and another on "Railroad Construction". He also wrote many articles dealing with the design, operation and management of railroads, and with other aspects of the transportation field. He was an enthusiastic and active member of numerous professional and honorary societies. The honorary societies included Sigma Xi, Tau Beta Pi, Phi Kappa Phi and Chi Epsilon; and his professional affiliations included life membership in the American Society of Civil Engineers, honorary membership in the Steuben Area Chapter of the New York State Society of

Professional Engineers, and membership in the American Railway Engineering Association, the American Society for Engineering Education, and the American Association for the Advancement of Science. He was particularly interested in the Ithaca Section of the American Society of Civil Engineers, and it was through his personal efforts that this local section was founded in 1932. He was one of the Section's early presidents and his enthusiasm and wise counsel contributed in a large measure to its continued successful operation.

One of Professor Barnes' remarkable characteristics was his ability to remember the names and faces of Civil Engineering alumni. For many years he kept up to date a file of their addresses and occupations. It is probably true that no member of the faculty has ever done more to create and maintain a strong bond between the alumni group and the School of Civil Engineering and Cornell University. As a consequence few faculty members were ever more popular with returning alumni on their visits in Ithaca.

Cornell alumni have lost a real friend, and the faculty a highly regarded colleague, in the passing of Professor Barnes. He will be kindly and gratefully remembered for his genial personality, his warm sympathy, his willingness to advise and help all who came to consult him, and his strong loyalty to the School and to the University.

W. R. Cornell, J. E. Perry, R. Y. Thatcher

LeRoy Lesher Barnes

October 23, 1902 — June 11, 1981

After forty years of devoted service to Cornell students and thirty-eight years of pioneering collaborative work in bridging the gap between physics (always his home base) and each of many different aspects of biology, Professor Barnes retired in 1967 to the status of professor of physics and biophysics emeritus. Then, his physical health, robust throughout all but the last of these years, gradually ebbed away. Having been of late essentially confined to his home or to the hospital, he has now passed on. But by thousands who benefited from his kindly, artful influences in our own lives and in the life of our community, his passing is mourned and his achievements during his many years of service are celebrated.

He was born and reared in Wakeman, a small town in northern Ohio. He attended nearby Oberlin College and was there granted the Bachelor of Arts degree in June 1926. The next year he distinguished himself as a graduate student and teaching assistant in physics at Amherst College in Massachusetts and transferred to Cornell in 1927. At Cornell he was appointed instructor in physics in 1929, a title which he held until 1938 (his Doctor of Philosophy degree was awarded in 1932). However, in 1936 the instructorship in physics (in the College of Arts and Sciences) was supplemented with a research position in animal nutrition (in the College of Agriculture). Note his succession of appointments thereafter (all bridging between the two colleges): assistant professor of biophysics in 1938, associate professor of biophysics in 1943, professor of physics in 1948, and, finally, his emeritus title.

In those days, bridging the gap between academic disciplines was somewhat novel, although believed to be a highly desirable enterprise for anyone who could do it. LeRoy could and did. First, in teaching: Soon after obtaining his doctorate, he was placed in charge, in accord with his budding interests, of designing and teaching a second-year physics course for students of biology, especially for premedical and pre dental students. Cornell, as well as LeRoy, was pioneering in this effort. He annually revised the course, after picking the brains of both physicists and biologists, and continued to teach it until his retirement. Second, in research: His Ph.D. thesis research was in pure physics (thesis title: "Emission of Positive Ions from Heated Solids") and, of his forty research publications, the first five (1931 through 1934) were in this tight area. His next publication, in 1938, was titled "Calcification of the Aorta, Heart and Kidneys of the Albino Rat." All of his subsequent research publications were in the areas of animal nutrition, physiology, pathology, or animal (including human) gerontology, and in all these publications, except for one, he was a joint author. He was a superb catalyst in collaborating with biologists, with his own infusion of

innovative contributions from physics. Both in teaching and in research he was one of the very few true pioneers in the field that is now, at last, fully legitimized as biophysics.

But that is not all. Perhaps the most outstanding aspect of Professor Barnes's contributions to Cornell involved his work with the Advisory Board for Premedical Students. He served as chairman of this board for some twenty-five years. During the last ten years of his tenure the board prepared letters of evaluation for an average of about 130 students each year—students in the College of Arts and Sciences who were applying for admission to the study of medicine or dentistry. These letters, each painstakingly drafted for the board by Professor Barnes, were models of care and conciseness; they drew not only upon the applicant's record of academic performance but also upon the personal acquaintance which Professor Barnes sought to establish with each student, beginning with the freshman year. He was a kind and patient man, genuinely interested in students and their welfare. But he held them to high standards, and his hopes for their success were balanced by a strong concern that each applicant be honestly and fairly evaluated for consideration by admission committees at the professional schools.

Finally, a comment about music, which, either vocal or instrumental, was a joy to Professor Barnes: blessed with a fine bass voice, he loved to sing. He sang in college choirs and choruses, and in church choirs during most of his years in Ithaca. As a young man he had been a trombonist but later learned to play the cello, which became his favorite instrument. His wife, Lucy, herself a talented musician, accompanied him on piano or violin. The Barneses also enjoyed playing string quartet music with informal groups of friends either from Cornell or from the community at large.

Yes, his passing is mourned, but his life is celebrated.

John M. Anderson, Kenneth Greisen, Lyman G. Parratt

Richard Henry Barnes

June 29, 1911 — November 16, 1978

Richard Henry Barnes came to Cornell in 1956 as director of the School of Nutrition, which was then an endowed unit of the University. From that time onwards his guiding role in the development of nutritional science became increasingly apparent. Under his leadership an outstanding program of graduate education in nutrition was established at Cornell. Soon after Dick arrived on the Ithaca campus, the name of the School of Nutrition was changed to the Graduate School of Nutrition. Dick was dean of the school from 1956-73. The graduate teaching and research program of the school flourished through his foresight in bringing together a multidisciplinary core faculty including not only nutritionists with expertise in animal nutrition, public health nutrition, and international nutrition but also biochemists, physiologists, physicians, a food economist, and a psychologist.

In 1973, when it was decided to amalgamate the Various nutrition units at Cornell to form the Division of Nutritional Sciences, Dick stepped down as dean and was appointed the James Jamison Professor of Nutrition.

Born at LaJolla, California, in 1911, he received the Bachelor of Arts degree in chemistry at San Diego State College and then worked for four years as a research chemist at Scripps Metabolic Clinic at LaJolla. In 1937 he went to the University of Minnesota where he was granted the Doctor of Philosophy degree in physiological chemistry in 1940. After obtaining his doctoral degree, he stayed at the University of Minnesota until 1944, first as an instructor and then as an assistant professor.

Dick joined the Medical Research Division of what was then the Sharp and Dohme Company in 1944 as a biochemist, where he became associate director of research in 1950. In 1955 he was appointed director of biochemical research for the combined laboratories of Merck, Sharp and Dohme.

From his early career onward, Dick maintained a deep interest in the role of microorganisms on the nutritional state of the host. After he came to Cornell, his work in this field was carried out with outstanding success due to Dick's genius for meticulous experimental design and the outstanding technical skills of his associate, Eva Kwong. Major advances made through this research program were in the development of a better understanding of the limitations as well as advantages of using the laboratory rat in nutritional research. While it was previously known that the intestinal microbial synthesis of vitamins contributes positively to the nutritional economy of the rat because these vitamins are recycled by the process of coprophagy, Dick discovered the extent to which coprophagy prevention as well as administration of antibiotics altered the rat's nutrient requirements. In the course of these

studies, he devised methods to monitor changes in gut microflora by examination of urinary metabolites. These techniques were later applied to studies of factors influencing the microbiological degradation of nutrients in human subjects.

Dick taught that major problems in nutrition can best be solved by a multidisciplinary approach, and in his further studies he put his teaching into practice. About five years after he came to Cornell, Dick developed an interest in relationships between early malnutrition and learning disability. Tracing the development of his own investigations in this field serves to illustrate his particular genius for collaborative research. Through a close association with the distinguished Mexican nutritionist, Dr. Joaquim Cravioto, he learned of the defect in cognitive and emotional development that follows severe protein-energy malnutrition in infants and young children. In the early 1960s when Dick first addressed this problem, the causes of retardation in these children were not well understood. Current theories were that early food deprivation caused damage to the developing brain or that infants and children who were malnourished were also socially disadvantaged because they came from impoverished households where there was a lack of stimulation and a reduced opportunity to satisfy their emotional needs. Dick believed that a new understanding of the respective roles of malnutrition and other environmental factors in determining mental development could be gained by animal experimentation. Choosing weanling rats and pigs as animal models for the human condition, he had to develop techniques to produce states of protein-energy malnutrition that were analogous to those occurring in children, and he had to have testing procedures available that would permit valid behavioral testing.

In order to produce marasmus and kwashiorkor in baby pigs, Dick obtained the collaboration of Wilson Pond, who had broad experience with nutritional studies in swine. Behavioral tests for use with the pigs were newly developed by Ulric Moore, whose experience was in psychological techniques, and later David Levitsky, who was also trained as an experimental psychologist and worked with Dick to develop sensitive tests that indicated change in the exploratory activity of young rats that had been malnourished.

Important findings were that the effects of early malnutrition resembled those of environmental isolation and that animals that have been malnourished are less accessible to training. Evidence was also obtained that environmental stimulation may reverse or diminish the adverse effects of early malnutrition on behavioral development.

Although most widely recognized for his research, Dick became interested in the 1970s in nutrition policy and the translation of scientific studies into public policy. His work on various committees, including the Food and

Nutrition Board of the National Academy of Sciences National Research Council, and his consulting work reflected these new interests.

From 1959 to 1969 Dick was editor of the *Journal of Nutrition*, and the editorial office was in Savage Hall.

Dick made outstanding contributions to a number of professional organizations. He was chairman of the Division of Biological Chemistry of the American Chemical Society from 1951 to 1953. During 1968-69 he was president of the American Institute of Nutrition, and during 1973-74 he was president of the American Societies for Experimental Biology.

Honors conferred upon him included the Borden Award of the American Institute of Nutrition in 1967 and the Conrad Elvehjem Award for Public Service to the American Institute of Nutrition in 1975. Also in 1975, a special symposium was held in Dick's honor at Cornell, at which outstanding investigators in the field of malnutrition and mental development were brought together.

Dick maintained a deep interest in his graduate students and kept up a lively correspondence with many of them after they completed their studies at Cornell.

His wonderful family life was an inspiration to all of us who visited him in his home. He died on November 16, 1978, after an extended illness most bravely borne. He is survived by his devoted wife, Marjorie, their three daughters, Kyle, Anne, and Lisa, and four grandchildren.

Milton L. Barnett

January 16, 1916 — June 17, 1994

On a pleasant summer afternoon in mid-August, close to a hundred people gathered near the Old Mill at Upper Enfield, Robert Treman State Park, to celebrate the life of Milton L. Barnett. In words and music, the celebration reflected the many facets of Milt's life and enabled a sharing of the man as he saw himself and as others saw him.

Born in New York City in 1916, Milt described his grade school and high school education as standard American. When very young, he was introduced by his mother to a variety of books on Asia, and by the time he was a teenager, he knew that he was going to study Chinese language. However, his entry into Asian studies took a very circuitous route. Early in his undergraduate life, uncertain of the merits of further academic training, he dropped out of college and later joined the Army. Volunteering for language training in Chinese, in 1943 the Army Specialized Training Program sent him to Cornell. Here he first met Knight Biggerstaff and Lauriston Sharp, two Cornell faculty members who would become lifelong friends and colleagues and would have a marked influence on Milt's professional career.

After a year of language training at Cornell, Milt was sent to Ft. Riley, Kansas, to be trained in horsemanship and small weapons for China. But the war ended before he could put this training into practice and, with Lauri Sharp's encouragement, he returned to Cornell to complete his undergraduate and graduate studies in anthropology (A.B. degree 1947, Ph.D. degree 1952). While at Cornell, he undertook fieldwork with the resettlement of the Hopi Indians among the Mohave in the Southwest and began a long-term interest in the lives of Native American peoples. However, his thesis research continued his commitment to Chinese where he undertook a study of the pattern of alcoholism among the Chinese in Boston, New York, Atlanta, and Phoenix.

In 1950, even before completing his Ph.D. degree, Milt was hired as an Instructor in Anthropology at Wisconsin. His years on the Wisconsin faculty established his reputation earlier-on as an outstanding teacher and advisor of students. This reputation was built upon a pedagogical style of using stories and personal experience to make conceptual and theoretical arguments and engage students in new ways of thinking about particular issues and ideas. This style also built upon a view of scholarly activity that combined theory and practical work. But for Milt, it was fieldwork that provided the excitement.

Milt's first overseas assignment was in 1953 as a member of an interdisciplinary team working on the solution of community development problems in Venezuela. Closer to home, he maintained his contact with the Hopi

and Mohave, and he and his students studied the Ojibway and Chippewa in Wisconsin. His interest with Native American issues continued during later years at Cornell where he played a critical role in the development of the American Indian Studies Program.

It was not until 1960 that Milt made his first trip to Asia. He went to Indonesia for six months to investigate the feasibility of establishing a training center for community development. Although he recommended against such a center, in his own words he “fell in love with Java”. This was not, of course, his first love (China), but it was nonetheless deep and abiding.

Not long after this trip, Milt accepted the offer of Arthur Mosher, President of the Agricultural Development Council (ADC), to join the field staff in Asia. The ADC, in which Milt served for over a decade, was created in 1953 to counterbalance the support given to the “hard sciences” by the Rockefeller Foundation’s overseas programs. His first assignment was in the Philippines where he served from 1962 to 1966 as advisor to the Philippine government on community development while simultaneously teaching at the University of the Philippines. He then moved to Malaysia where he served as advisor to Prime Minister Tun Razak on rural development and was involved in teaching and research at the University of Malaya. In recognition of his services, Milt was honored with the Government’s Panglima Setia Mahkota Award, an award normally reserved for Malaysian citizens.

Characteristically, however, Milt had serious reservations about his role as an expatriate advisor. On the one hand, he felt that anthropologists had an obligation to interpret the broad shifts that were coming to characterize life in Asia and to help buffer the impact of change on peoples who had limited contact with the industrial west. On the other hand, however, he was concerned lest the interpretations be misguided and the advice he offered inappropriate.

In 1973, Milt returned to Cornell for the third and final time, now as a Professor in the Department of Rural Sociology. He was concerned to find on his return to academia that in too many ways the exchanges between students and faculty that had characterized his own student and professional experiences had been transformed into a mode of lecturing which distanced students from faculty. For Milt, these new exchanges excluded the possibility of professors learning from their students and eroded the give and take that enabled special and long-term relationships to develop and sustain professional life. Another important change which Milt often fought was the declining appreciation of fieldwork and social practice and their connection to theory building. As Astri Wright, one of Milt’s students, acknowledges: “Professor Milton L. Barnett(s)...many years in anthropology and

international development enabled him to ceaselessly insist that there were ways to bridge the academic world with the ‘real.’”

Milt Barnett’s sustained commitment to what was a rapidly declining form of exchange between students and faculty and his appreciation of the connection between the practical and the academic were critical aspects of the Department of Rural Sociology’s reputation as a leading arena of development studies in the U.S. during the 1970s and 1980s. And, it is likely that it is because of these pedagogical and intellectual commitments that Milt attracted a steady stream of graduate students, some would say far too many students. But with Milt, students were the first priority, and there was always time for advice or council on professional or personal matters. In fact, students frequently shared in family events well beyond the confines of Warren Hall or the University. As Charlie Mehl, a graduate student during that period, recalled: “And then there were the nights of smelting, the evenings of collecting maple sap, and the good conversation and companionship.” And, as many of his students and colleagues also came to appreciate, we all received our reading assignments from Milt and talked on and on about a novel, a critical essay or the sharing of a recent trip. As a long-term friend and colleague, Cliff Wharton recalls:

I first met Milt in 1953 when he visited Venezuela as a part of an interdisciplinary team from the University of Wisconsin supported by Nelson Rockefeller for whom I was working. From the beginning I had a lasting impression of Milt as a caring scholar. He was genuinely concerned about people in all walks of life. Whether he was working with Native Americans, selecting ADC fellows to study in the United States, or advising prime ministers and presidents, he was always himself—Milt Barnett, the scholar, the advisor, the colleague, and the friend.

And, as Nancy Peluso says, in capturing what many of our recollections bring to mind: “I will remember with affection: the smile, the twinkle, the raised eyebrow, the adjustment of the pipe; the warmth, the concern, the moral support, the man.”

One need only add that despite the assurance and comfort he gave to others, Milt often saw himself in a different light. As a person whose mind (and office) was not always organized, he wondered why others sought his advice and trusted his judgment; he was sometimes uncertain as to whether he was indeed being helpful; he hoped that at the very least he was doing no harm; he had a deep sense of humility about his role and accomplishments in life.

Randy Barker, E.W. Coward, Jr., Shelley Feldman

Stuart Moffett Barnette

March 20, 1905 — November 5, 1992

Stuart M. Barnette, son of the late Mr. and Mrs. John Stuart Barnette, of Dover, Delaware, died on November 5, 1992.

He attended the Naval Academy at Annapolis, Maryland, Ecolé de Beaux Arts of Paris, France, and was graduated from the Massachusetts Institute of Technology.

At Cornell University, Professor Barnette was appointed Associate Professor of Architecture in July 1947, and promoted to Professor in July 1954. He retired on June 30, 1970 and was appointed Professor Emeritus of Architecture.

Office of the Dean of the University Faculty

Donald J. Barr

May 7, 1935 — January 24, 2008

Donald J. Barr, Professor Emeritus of Policy Analysis and Management in the College of Human Ecology, died January 24, 2008 in Ithaca, due to complications following a stroke.

Born May 7, 1935 in Geneva, Ohio, Barr earned a B.S. degree (1957) in Social and Earth Sciences at Miami University in Ohio, an M.A. degree (1959) in Sociology and a Ph.D. degree (1964) in Guidance and Counseling, both at Indiana University. Before teaching at Cornell, he taught at the University of Michigan and in elementary, middle, and secondary public schools in Ohio and Indiana. He led numerous workshops and educational programs for such organizations as the Telluride Summer Program and Childhood Program Development.

When he first came to Cornell in 1971, he was the Director of the College's Office of Counseling and Admissions. Later, he moved over to the Department of Human Service Studies (HSS), now called Policy Analysis and Management (PAM). He served a term as chairman of the HSS Department and after stepping down, he spent full time in teaching, outreach and scholarship in the Human Service Studies and Policy Analysis and Management Departments until retirement. He was widely in demand as an advisor to students because of his interest in helping them to succeed at Cornell.

Known as "Don" to all, Professor Barr published numerous articles and a handbook on the topic of power and the way it was used in teaching and in a variety of social programs. His many publications included *Liberalism to the Test: African-American Migrant Farm Workers and the State of New York*, *Transforming Power: A Thirteen-Week Program for Democratic Change in Your Community*, and *Educational Change for In-School Administrators*.

But his great love was teaching, which he did at every level of formal education from elementary school right through the Human Ecology undergraduate program and into the graduate school as well as outside the university. His focus was always on education, the nature of power, racism and social justice and he found opportunities in the local Ithaca community beyond the University, as well as elsewhere in the United States, Canada and South Africa. For almost ten years, with Dr. James Turner, Don co-taught a course in the College of Human Ecology, *Racism in American Society*, which was widely recognized. Barr and Turner also taught an annual racism/multi-cultural training seminar for Ithaca School District staff and administrators.

Professor Barr's interest in teaching led him to participate in numerous workshops and educational programs for the National Teacher Corps, National Training Laboratories, the Summer Institute for the University of Victoria, UNICEF, and the National Executive Service Corps in New York City. Under the auspices of the NESC and local Boards of Education, Don co-taught a series of leadership seminars for public school principals in Schenectady, New York, New York City and Philadelphia. He also spent a summer in Durban, South Africa working with government officials and schoolteachers and principals on how to improve teaching in local schools.

Professor Barr's reputation for teaching excellence was recognized by his receipt of the National Danforth Teaching Award, the Human Ecology Distinguished Teaching Award, the Telluride Association through its Summer Program and the key to the City of Cincinnati for his work on empowerment in low-income communities.

Don was always especially interested in the anti-apartheid movement in South Africa. He was a leading faculty member in the movement at Cornell to stop investing in companies that operated in South Africa, and he spoke frequently and with eloquence about the injustices of apartheid and the damage it was doing to people of color and to society in general.

Don believed that the improvement of education at all levels went hand-in-hand with social justice. His passion for both served as a model for what a university professor could be. He was always available to help those in need. He will be greatly missed.

His wife Judi and her two children, his own four children, David, Chris, Lori and their children, and his daughter Jana survive him.

Jerome M. Ziegler, Chairperson; Robert Babcock, Andrea Parrot

John Hall Barron

June 28, 1883 — August 10, 1943

John Hall Barron, Extension Professor of Field Crops, Emeritus, in the New York State College of Agriculture at Cornell University, died August 10, 1943, at his farm home near Dansville, New York, after a long and trying illness. For thirty-three years he strove for the betterment of New York agriculture and he lived to see the maturity of many of his plans and hopes.

Professor Barron was born June 28, 1883, at Tuscarora, New York. He was educated in the Nunda High School, and received the B.S.A. degree from Cornell University in 1906. Following his graduation he was a member of the Department of Agronomy at the Pennsylvania State College for two years, after which he went back to his farm in Western New York for three years. In 1911 he was appointed County Agricultural Agent in Broome County, New York, the first of such agents to be employed in the Northern States.

In 1936, in commemoration of the twenty-fifth anniversary of the establishment of county agricultural work in Broome County, a bronze plaque was cast and placed on the wall of the County Court House in Binghamton. It is a fitting tribute to the ability and vision of John Hall Barron.

Following his two years of pioneer work in Broome County, John Barron was appointed Extension Professor of Field Crops in the State College of Agriculture at Cornell University, a position which he held until his retirement as Emeritus Extension Professor on February 28, 1943.

For a man who spent so much of his time and energy in the field, Professor Barron had many contacts of a technical nature. He was a member of Sigma Xi, The American Society for the Advancement of Science, and The American Society of Agronomy. He also held membership in Epsilon Sigma Phi and Sigma Phi Sigma. His publications included both bulletins and journal articles and, while not numerous, they showed a wide range of interest. Although Professor Barron was unable to engage in technical research himself, he possessed a keen appreciation of fundamental investigation of all kinds.

Those who casually met John Barron perhaps never realized, unless they heard him speak, the enthusiasm of the man for his chosen work or his tenacity of purpose. Nor would they, because of his modesty, at first catch his spirit of loyalty and sacrifice. Born and raised on a farm and educated in a rural community, he understood farm folk. He knew that to them his message was vitally important. To them, his duty was clear. As a result, John Barron was

one of the most popular and effective extension specialists ever to represent Cornell University, possessing in his prime a reputation and a following in New York State of which anyone would have been proud. And underlying it all was a mellow good fellowship and a spirit of helpfulness that won friendship as well as respect. John Barron, the man, will be remembered as long as the advice of John Barron, the specialist, is treasured.

During his life, Professor John Hall Barron devoted himself with singleness of purpose, backed by an unusual capacity for hard work, to the solution of the agronomic problems of New York State farmers. His understanding of the livestock problems was broad and practical, and his contributions to the production of more and better feed crops did much to improve livestock feeding practices in New York. In working with these various problems he carried his solutions to the field with a clarity and earnestness that won him a host of followers and friends. The imprint of his work on the economic welfare and agricultural interests of New York will endure for years.

Mortier Franklin Barrus

March 17, 1879 — January 8, 1962

After fifty-four years of association with Cornell University as a graduate student, teacher, and Emeritus Professor, Dr. Mortier Franklin Barrus died January 8, 1962, in Warsaw, New York. He had retired from his active service in the Department of Plant Pathology on June 30, 1945.

Dr. Barrus was born at Forrestville, Chautauqua County, and spent his boyhood on the farm. A winter short course at the College of Agriculture in Ithaca stirred his desire for training in agriculture, and later he came to Cornell as an assistant in the newly founded Department of Plant Pathology and for graduate study under H.H. Whetzel. He was advanced to instructor in 1910, became Assistant Professor in 1911, and in 1914 was awarded the degree of Doctor of Philosophy and the appointment of Extension Professor of Plant Pathology. He was the first official Extension Plant Pathologist in the United States, and in 1911, before New York had any county agents, Professor Barrus lectured at Farmers' Institutes and Granges, staged exhibits at fairs, gave talks and demonstrations on agricultural trains, and taught at winter extension schools.

His skill at interpreting plant disease research and making it understandable and useful to farmers became well recognized and was soon to bring demand for his services outside New York State. He served as a specialist in the U.S. Department of Agriculture in 1916 and again from 1917 to 1919, during which time he visited nearly every state, urging the introduction of extension methods in plant pathology. During World War I he served as a First Lieutenant 1918-1919 and later in the Army Reserve until 1929. During 1927-1929 he was again a specialist for the U.S. Department of Agriculture and the Department of Labor in Puerto Rico. In 1934-1936, having been appointed Director of Agricultural Extension there, he helped to initiate the Extension Service in Puerto Rico. The following year he spent in Venezuela as adviser to the Ministry of Agriculture. Other foreign assignments after his retirement included work as agronomist at the U.S.D.A. Rubber Plant Station in Turrialba, CR. (1945-1947) and as extension specialist with the Rockefeller Foundation in Mexico (1947-1949).

Dr. Barrus was the author of numerous articles on plant pathology, both technical and popular. His earlier studies of the bean anthracnose disease were brought together in Cornell Memoir 42 in 1921, which is now a classic. He made the important discovery of the existence of strains of the causal fungus. Among other crops in which he was interested were potatoes, cereals, and ornamentals.

He was affiliated with the American Association for the Advancement of Science, Mycological Society of America, Phi Beta Kappa, Gamma Alpha, Epsilon Sigma Phi, Sigma Xi, and the American Phytopathological Society. In the latter society he served for many years as councilor, chairman of the advisory board, and vice president, and was president in 1927.

Dr. Barrus' engaging personality and love of life made his circle of friends large; it included students, colleagues, and overseas personnel. Even the little concerns of co-workers seemed always to be of great interest to him. In attempting to characterize Dr. Barrus as a person, we can do no better than to quote from the resolution passed by his College of Agriculture faculty colleagues at the time of his retirement in 1945: "His forthrightness of character engendered respect and confidence among all who knew him, and his genial personality endeared him to a wide circle both in and beyond the Cornell campus. His fine gift of sympathetic understanding made his professional contacts especially effective with farmers and also with his co-workers in the College and with men in other and more distant fields."

He married Delia Wintrode September 17, 1910; she died in January 1948. Their children are a daughter, Mrs. Benjamin C. Craft of Castile, New York and two sons, Benjamin of San Diego and Merton of Santa Anna, California. Other survivors of Dr. Barrus are his widow, Maria O. Barrus; a sister, Mrs. Bessie Hall of Silver Creek, New York; and seven grandchildren.

Charles Chupp, Ora Smith, Arden Sherf

Frank Arthur Barton

Colonel Frank Arthur Barton, Commandant and Professor of Military Science and Tactics

July 5, 1869 — August 5th, 1921

On August 5th, 1921, during the vacation period of the University, Frank Arthur Barton, Colonel United States Cavalry, died in the City Hospital of Ithaca. The Faculty at its first session on the reopening of the University places upon its minutes this record of its sense of loss and of its appreciation of Colonel Barton as Commandant and Professor of Military Science, as loyal Cornellian, and as colleague.

Colonel Barton was graduated from the Sibley College of Mechanical Engineering in 1891, was commissioned in the United States Army the same year, served as officer during the Spanish-American War and through the Philippine pacification campaign at the end of the nineties, and in 1904 the War Department detailed him to his Alma Mater as Commandant and Professor of Military Science and Tactics. After four years of successful service as Commandant, he returned to his regiment and later pursued with distinction advanced military studies in the School of the Line at Fort Leavenworth. During the World War the Government returned him to the University as Commandant, although on account of ill health he was retired from active service in 1917 with the rank of Lieutenant Colonel. As head of the Students Army Training Corps and as officer in charge of the inspection of the S.A.T.C. units in the Department of the East, he rendered the University and the nation invaluable assistance. On conclusion of the war he resumed his duties as Commandant of the Cornell unit of the Reserve Officers Training Corps, continuing in this capacity until the time of his death, and the high rating of the Cornell unit is largely due to his personality and administrative skill,

Colonel Barton exemplified the finest ideals of officer, gentleman, and citizen. In a rare degree he combined rigorous disciplinary standards with an instinctively genial tact which enabled him to maintain in the Corps an exceptional morale. He had an extraordinary insight into the hearts and minds of young men, and the breadth of his education brought him sympathetic contact with a great range of men in every walk of life. He had a genius for comradeship. With the buoyant, forward-looking spirit of youth, unshaken by ill health, he united the wisdom and sound judgment of a man ripened by wide experience. In his passing the Corps has lost a gifted and sympathetic leader, his fellow officers a genial comrade, and the faculty a beloved counselor and associate.

Source: Faculty Records, p. 1248 Resolutions Adopted by The Faculty of Cornell University October, Nineteen Hundred and Twenty-One

Colonel U. S. Cavalry, Retired; In Cornell University, 1904-1908, 1917-1921

Hubert Eugene Baxter

September 21, 1887 — February 19, 1976

Hubert Eugene Baxter, professor emeritus, taught in the College of Architecture at Cornell for forty-four years, from 1911 until 1955. He died in Ithaca at the age of eighty-eight.

He was born in Tonawanda, New York, and received his early training in the public schools there and in neighboring Buffalo. A recipient of a New York State scholarship he entered the College of Architecture at Cornell in September of 1906, following in the footsteps of an older brother Roland, a 1908 graduate of the Cornell Law School. Hubert received the degree Bachelor of Architecture in June 1910 and returned to Buffalo where he joined the firm of Kahn and Kahn Architects. With the encouragement of the partners he returned to Cornell in 1911 to undertake a graduate program with a concentration in architectural illustration. His return coincided with the offer of an instructorship, not in the field of his choice but in geometry and mechanics. He continued in graduate studies for a few years but the die was cast, and Hubert was launched in a long and distinguished career in architectural education.

The only interruption to this career was a two-year stint in the Signal Corps of the U.S. Army. He was commissioned a first lieutenant in October of 1917, served in a number of locations in the United States, and in November of 1918 reported to Kelly Field, San Antonio, for flight training. In September of 1919 flying officer H. E. Baxter received his discharge— whether this was in the dress uniform of signal corps airmen, which included boots and spurs, we do not know.

Shortly after his return to Cornell he was promoted to assistant professor, and the next thirty-six years saw continuous and uninterrupted service in the teaching of architecture. He was one of those dedicated individuals who are the very foundation of a successful school of architecture. As a teacher of descriptive geometry and structural design he came in close contact with every student who passed through the college during those years. For these, the memories of that basement drafting room and of the professor will always be strong. Circulating from board to board, he would, on the one hand, urge on the slow and bewildered with fatherly encouragement and, on the other, cut the brash down to size with a few words of devastating sarcasm. His insistence upon high standards of accuracy and performance started many young men and women on a road that has led to success and distinction in their professions.

His course in descriptive geometry was legendary. This was the freshman architect's introduction to spatial

visualization and comprehension which lie at the very heart of architecture. Baxter never permitted the how of the discipline to ever gain the upper hand over the why, and thus an experience here was always stimulating and never easy. Over the years the course was brought to an ever higher degree of polish. Those faculty who worked with him discovered, to their surprise, that the course had many levels and that they, just as the students, were enjoying a very special kind of educational experience.

He brought the same concern to the courses in structural design. Here, students in the later years of the curriculum were exposed to the same high standards and discipline they found in their freshman year. Woe to the unfortunate student who appeared before a review jury, of which Baxter was a part, with an “interesting” structural idea that he was unable to explain in terms of the principles involved. Here again his interest was in principles not formulas, understanding not clichés.

Baxter was a coauthor, with Professor George Young, Jr., of textbooks on both descriptive geometry and mechanics of materials. The material he prepared on perspective for *Architectural Graphic Standards*, the most widely used reference book in the profession, has survived every edition and revision in its original form.

Few faculty have played such a large part in University affairs over a long period of time. Always interested in students and broad in his understanding, he served with distinction on many University committees including those on student affairs, student conduct, secondary schools, and entrance credentials. He was for some years chairman of the Committee on Student Activities, which dealt with all student organizations, and his interest in intercollegiate athletics was reflected by his membership on the Council of Physical Education and Athletics, on which he served as vice chairman. In this latter capacity he was largely responsible for the codification of the University’s eligibility rules for athletics, a report that contributed to the high standard of sports at Cornell. He served on the board of directors of the Campus Store and, for a time, was its director.

In community affairs, he served for eight years on the board of trustees of the Village of Cayuga Heights, six years as chairman of the zoning board, and was elected mayor for a period of four years. He was a member of the First Presbyterian Church of Ithaca.

Baxter was listed in *Who’s Who in America*, a member of Gamma Alpha, graduate science fraternity, Tau Beta Pi, engineering honorary, and Gargoyle, architectural honorary. He was recognized by the College of Fellows of the American Institute of Architects, receiving special citation in recognition of important contributions made to the profession of architecture through effectiveness in teaching.

Although he did not carry on a formal practice of architecture he did occasional consultation. For the University there was a weather kiosk, a remodeling of the dining room at Sage, and work for the theatre, then located in Goldwin Smith. For his assistance on the latter he was made an honorary member of the dramatic club. There was also his own residence in Cayuga Heights.

A rather reserved facade was a thin veneer over a warm and compassionate human being. His students realized this, and many were those who turned to him for help and advice during difficult periods, never failing to find sympathy and assistance. His life was an eloquent testament to his total dedication to his university, his community, and his family.

He is survived by his wife, Phebe Poole Baxter, M.A. Cornell 1926, of Ithaca; a daughter, Mrs. Robert H. (Louise) Gerrity of Great Falls, Montana; a son, Daniel P. Baxter of Moraga, California; six grandchildren; one great-grandchild; and a brother, Faber Baxter of Atlanta, Georgia.

John A. Hartell, James W. Yarnell, Thomas H. Canfield

Thomas L. Bayne

December 31, 1891 — December 16, 1983

Thomas L. Bayne was born in New Orleans, Louisiana, on December 31, 1891. He attended the public schools of his native state until 1908, when he was admitted to Phillips Academy, Andover, Massachusetts. After two years in this institution he graduated with a science diploma in June 1910. In the fall of the same year, he was admitted to the Sheffield Scientific School of Yale University. After two years he transferred to North Carolina State College, where he graduated with a Bachelor of Science degree in 1914. After teaching science from 1914 to 1917 in the North Carolina public schools, he joined the army and served with the infantry in France. From the conclusion of the armistice in 1917, he served as first lieutenant in the army of occupation in Germany until he received an honorable discharge.

With the conclusion of his war service, Bayne returned to North Carolina and was appointed instructor in vegetable crops and horticulture at North Carolina State College. As a result of this year of experience he decided to continue his education and was admitted to the Graduate School at Cornell with an appointment as a graduate assistant in the Department of Rural Education from 1920 to 1924. While serving as a graduate assistant, Bayne completed work for a Master of Science degree in 1923 and a Doctor of Philosophy in 1926 with a major in educational psychology and mathematics and statistics. He was appointed instructor in 1924, assistant professor in 1926, and associate professor in 1946. With the exception of one summer session at the University of Michigan and two summer sessions at Duke University, he taught continually at Cornell for thirty years, retiring in 1950.

Professor Bayne assisted with the statistical work in a variety of surveys and research studies and served as executive secretary of the newly created University Faculty Committee on Scholastic and Aptitude Testing from 1930 to 1946. In this capacity he directed the University's testing program for sixteen years and helped the various divisions of the University interpret and evaluate the results of these tests. During World War II, in addition to his regular teaching in the Department of Rural Education, he taught mathematics for the Department of Mathematics.

Though teaching was his main preoccupation, still he served as a consultant on public school surveys and participated in research projects dealing with measurement, statistics, educational psychology, and animal behavior. His publications dealt with educational measurement and statistics, as well as with experimental studies in human and animal learning. His sound judgment and intellectual honesty were respected by all his co-workers.

His many students remembered him for his poise, his insistence on democratic procedures, his willingness to listen to their problems, his unfailing courtesy, and his espousal of unpopular sides in discussions.

His colleagues in the Department of Rural Education remember him as a reserved but very cooperative fellow worker, who always willingly contributed generously to good causes and needs. They recognized, behind his dignified demeanor, an inherent kindness and affability that needed only to be tapped to produce sympathetic understanding and good will.

Professor Bayne died in Fairhope, Alabama, where he had been a resident for many years. He is survived by his wife, Janet Bayne of Fairhope; four daughters: Margaret B. French of Orlando, Florida; Caroline N. Ulrich of Glendora, California; Mrs. Cary E. Kendrick of Wickenburg, Arizona; and Elinor Castaguola of Fort Lauderdale, Florida; thirteen grandchildren; and sixteen great-grandchildren.

J. P. Bail, Walter Pauk, Marvin D. Glock

Alvin Casey Beal

Professor of Floriculture

November 30, 1872 — May 6, 1929

The sudden death on May 6, 1919, of Dr. Alvin Casey Beal came as a great shock to the University community and is deeply deplored by his colleagues of the University Faculty. Born in Mt. Vernon, Illinois, November 30, 1872, Dr. Beal was graduated from the University of Illinois in 1897 with the degree of B. S. A. During the next two years he was foreman in the Horticultural Department of the Illinois Experiment Station in which capacity he gained experience in the practical side of the profession which he later followed. During the academic year of 1899-'00 he engaged in graduate work at Cornell University toward his M. S. degree, completing his studies later and receiving the degree in 1903. From 1900 to 1908 he was instructor in Floriculture in the University of Illinois. In 1909 he came to Cornell for further study and received the degree of Ph.D. in 1911. He became Assistant at this University in 1910, Assistant Professor of Floriculture in 1911, and Professor of Floriculture in 1913.

Professor Beal was greatly interested in the historical aspects of his science. He conducted a course for advanced students on the history and literature of floriculture and ornamental horticulture, devoted time to studies in this field during a recent leave of absence spent in Europe, and was at the time of his death planning to make the results of these studies available in book form.

He was primarily a research worker and devoted years to a monographic study of the types and varieties of the sweet pea and of the botany, history and evolution of the gladiolus. He had also made similar studies of the rose and the iris and had accumulated a great amount of data on these plants. He was a recognized authority on these groups.

Dr. Beal loved flowers and spent much of his time in the gardens watching them develop, noting their habits and variations, and with the prescience of a true investigator seizing upon those qualities that go to the making of a superior variety. In his death, Floriculture has lost a zealous investigator, and members of the Faculty a loyal and faithful colleague.

Robert Eric Bechhofer

March 11, 1919 — May 13, 1996

Professor Emeritus Robert Bechhofer died in Ithaca, after a six-year struggle with Parkinson's disease. He is survived by his wife of 43 years, Joan Lebrecht Bechhofer; son David; daughters Robin, Laurie, and Ellen Kitchen; as well as three grandchildren, a sister, two sons-in-law, a nephew, nieces, and cousins.

Robert Bechhofer was born in New York City, and his family moved to Teaneck, New Jersey when he was a young child. He was educated in the Teaneck public schools. He entered Columbia College in 1937, and graduated in 1941 with the degree of A.B., majoring in mathematics and statistics. From 1941-45, he was Assistant Chief of the Analytical Section, Arms and Ammunition Division, Aberdeen Proving Ground, Maryland. In 1945 and early 1946, he was a Technical Engineer with Carbide and Carbon Chemical Corporation, Oak Ridge, Tennessee. In June 1946, he started graduate study in statistics at a summer session at North Carolina State College in Raleigh. He continued his graduate studies at Columbia University. After receiving the Ph.D. degree in mathematical statistics from Columbia in 1951, he was appointed Assistant Professor in Columbia's Department of Industrial Engineering. In 1952-53, he was at Cornell as a Research Associate in the Department of Mathematics and Visiting Associate Professor in the Department of Plant Breeding. From 1953-57, he was Associate Professor in Cornell's Department of Industrial Engineering; from 1957-67, Professor in the Department; from 1967-75, Chairman of the Department; and from 1975-77, Director of the newly-created School of Operations Research and Industrial Engineering. He became Professor Emeritus in June 1989.

During leaves from Cornell, Professor Bechhofer was Visiting Professor in the Stanford Medical School and Research Associate in Stanford's Department of Statistics (1958-59); Visiting Professor, Statistical Laboratory, University of Cambridge (1966-67); and Visiting Professor, Department of Management Science and Department of Mathematics, Imperial College of Science and Technology, London (1973-74).

Professor Bechhofer's research was in statistical theory and led to fundamental advances. Much of it was in a branch of the theory known as ranking and selection procedures, in which the goal is not merely to estimate the values of parameters, but also to rank them with the goal of selecting entities with the most desirable values of the parameters. He was one of the originators of this branch of research, and his contributions to it brought him many professional honors, including election to the International Statistical Institute and as Fellow of the American Statistical Association, the Institute of Mathematical Statistics, the Royal Statistical Society, the

American Association for the Advancement of Science, and other professional organizations, and selection as the first recipient of the Samuel S. Wilks Award for contributions to statistical methodologies in Army research, development, and testing.

Professor Bechhofer was an excellent teacher and lecturer, and gave many invited talks at meetings of professional societies, and several short courses outside of Cornell. Several students who took his courses were attracted into doing research in ranking and selection, and became collaborators on papers published jointly with him. Since his death, the School has received a very large number of letters from alumni, praising Professor Bechhofer as an outstanding teacher and an inspiring mentor.

Robert Bechhofer was a man of wide interests. As an undergraduate at Columbia, he was a member of the chess team, which was a powerhouse at the time. He was a connoisseur of classical music, with a particular liking for the compositions of Berlioz. He was widely read in literature in general, and an avid reader of the *New York Times* and other publications that kept him up with current events. He collected stamps. He and Mrs. Bechhofer collected prints, and Inuit carvings. In 1992, they donated a large collection of prints to the Herbert F. Johnson Museum of Art.

Two volumes of essays in honor of Professor Bechhofer were published in 1984 and 1985. On May 18, 1992, the Ph.D. computer laboratory and library of the School of Operations Research and Industrial Engineering was named in his honor as the Robert E. Bechhofer Graduate Resource Facility. This was made possible by the generosity of a group of alumni of the School. On this occasion, several friends, colleagues, and students of Professor Bechhofer shared their memories of his life and work.

Robert Bechhofer was an exceptionally generous and sweet-tempered man. Nobody can remember an occasion when he lost his temper. Even during his final illness, when walking became very difficult, he would walk several blocks to his office and exhibit the same cheerful and pleasant outlook. He worked almost to the end on his final publication, a Wiley volume written jointly with David M. Goldsman and Thomas J. Santner, extending the theory to which he had devoted his professional life.

David M. Goldsman, Bruce W. Turnbull, Lionel I. Weiss

Carl Lotus Becker

September 7, 1873 — April 10, 1945

Carl Becker was born on a farm in Iowa in 1873. He spent one year as a student in Cornell College, 1892-93. From then until 1907 when he was admitted to the degree of doctor of philosophy, he was student, graduate student and fellow at the University of Wisconsin, one year fellow in constitutional law at Columbia, three years instructor in History at Pennsylvania State College and Dartmouth, and five years assistant professor of European History at the University of Kansas. For one year, 1907-08, he was associate professor at Kansas, then professor until 1916. After a year as professor of History at Minnesota he came to Cornell as professor of Modern European History, where he became successively John Stambaugh Professor, 1922, John Wendell Anderson Professor, 1940, Professor Emeritus, 1941, and was from then until his death University Historian.

Early in life the future historian discovered his bent—not for history at first, but for the investigation of truth. In a notebook he kept as an undergraduate at Wisconsin, he records his belief that the sole end of education is an informed understanding. The field for its exercise was not long to remain in doubt, for he came immediately under the influence of a gifted master, Frederick Jackson Turner, the historian of the American frontier. In a warm and appreciative but discriminating tribute to Turner published many years later, he records that by Turner he “was infected with a desire to study history.” Here, he found, was a historian devoted to the investigation of truth, one who accumulated facts indeed, but only to discover their meaning. The youthful ambition of the quiet, retiring, studious Iowa farm boy was fed by this example and this teaching, and further fortified by Haskins at Wisconsin and by Robinson and Burgess at Columbia. Later, as a professor, he was himself to inspire successive generations of students with this love of free inquiry, and to send forth in to the academic world many teachers imbued with his own high aims.

He was well on the way to become a seasoned writer when his thesis was published in 1909. Articles and reviews from his pen began to appear in the learned journals within three years after his graduation. In his thesis he is on the threshold of his career as historian and interpreter of eighteenth century Europe and America. Under the title, *The History of Political Parties in the Province of New York, 1760-1774*, he is dealing with the momentous prelude to the American Revolution in England and America. Notes and bibliography abundantly show the command he had gained of the “sources” for this period. They were to him the raw materials out of which he was to construct his view of man in society. This command and this knowledge he was to extend, to deepen and to widen, until his

period, starting from this center, was to reach backward to the Renaissance and forward to the present moment, and even onward, in some tentative efforts to forecast the future; his method, with the growth in power of his penetrating mind, was to be increasingly informed with philosophical thinking; his style to be polished until it came to be the perfect instrument of his thought.

In his first book, *The Beginnings of the American People*, he sought, in a consideration of the economic movements and the political thought in Europe before the discovery of America and after its colonization, to make clear the intellectual heritage of the American people; in his penetrating and pregnant essay *Kansas*, to inquire into the modifications of that heritage and the development of American democracy by the pioneering spirit and experience. His book *The Eve of the Revolution*, as later his essay *The Spirit of '76*, is a creative effort to find the Revolution in men's minds. He does not disdain to borrow a device from fiction and to assign words and thoughts to historical characters. Based as this effort is on profound and critical knowledge, it succeeds in bringing the revolutionary period to life and enables the reader to realize and feel it in all its aspects. Of the personages of this era he has left memorable portraits, as of Franklin, Hutchinson and Samuel Adams, in the *Dictionary of American Biography*.

Professor Becker's ripened philosophical powers have their monument in his subtle, penetrating and illuminating book *The Heavenly City of the Eighteenth Century Philosophers*. Proceeding from this study of the inception of American democracy, he was for the rest of his life to make the democratic ideal the end of his thinking. His efforts to understand in their larger aspects the findings of modern science, his profoundest philosophical thinking, were devoted to assessing its faults and failures and to finding a cure. His contemplation of philosophies of the state that enunciated tyranny, repression and cruelty as the proper means and aims of government, brought him to a reaffirmation of the faith he had declared in his first book:

In the history of the western world, the American Declaration of Independence was an event of outstanding importance: glittering or not its sweeping generalities formulated those basic truths which no criticism can seriously impair, and to which the minds of men must always turn, so long as faith in democracy shall endure.

He gained wide recognition both here and abroad. Always modest and self-deprecating, honors yet sought him out. He was made a doctor of letters by Yale, Rochester, and Columbia. Various universities solicited series of lectures from him. In 1931 he became a member of the editorial board of the *Yale Review*. In addition to the usual learned societies, he was made a member of the American Academy of Arts and Sciences, of the Institute of Arts and Letters, and of the American Philosophical Society. By that society, founded by Thomas Jefferson among

others, he was invited as the conspicuous interpreter of Jefferson's thought to deliver the commemorative lecture on the 200th anniversary of Jefferson's birth.

Near the end of his life he devoted his ripened powers of research and interpretation to the early history of Cornell University. He had found in Cornell his congenial home, he flourished in its atmosphere, he was grateful for the encouragement to freedom of thought that it provided. He undertook this project, therefore, with enthusiasm and found his research rewarded by the discovery of significant facts not before known to Cornellians. His sympathy with the aims of Ezra Cornell and Andrew D. White, his ability to give their contribution its proper setting in the history of American education, his easy, witty, and felicitous presentation of the lives of the founders and of the early difficulties of the founding, make this book unique surely among the histories of American universities.

From beginning to end his was a singularly consistent life—the life of the mind. He put no value on mere learning, but his reading was wide though never paraded. All that he read was literally food for his thought. It was either immediately assimilated, or after discussion with friends and colleagues became part of his thinking, or was discarded. After his thesis, published in 1909, he never indulged in the apparatus of erudition, but the discerning reader was aware of it, aware that it underlay all the easy and felicitous discourse. Fearless searcher after truth, willing to follow where it led, deeply versed in the genesis of ideas, in the triumphs and defeats of human history, well aware of the ever recurring and unregarded traces of old beliefs, old superstitions even, in the confident and self-satisfied thinking of modern men, he dealt with human strivings *sub specie aeternitatis*. He gave small comfort to convinced partisans on either side of public questions. Making human welfare his test of progress, he was constrained to find it often defeated by human ineptitude.

He envied the experimental sciences their much more tractable material. He knew that they have made the modern world, that in the light of their findings forevermore the philosopher and the historian must make their way. No doctrinaire in his criticism of contemporary politics, always ready to sympathize with the difficulties of statesmen in their dealings with conflicts of opinion and with mass stupidity, he could temper his criticism of their blunders with the understanding that progress and reform are achieved only by faltering steps forward and inevitable steps backward. But still he was no counsellor of despair. His wit and irony playing on the human scene seemed to say “this is most deplorable, but we must not be downhearted. We must refuse to blink these futilities and by our very admission of them we may gain strength to correct them.” Kindly by nature and human in his sympathies, but searching in his intelligence, he made us richer by his sojourn among us, and deeply to mourn his untimely end at the height of his powers.

Robert F. Becker

August 9, 1931 — July 23, 1996

Robert Becker died July 23, 1996, after a tragic and sudden accident. Bob died doing what he truly enjoyed, helping other people. He was painting the roof of the First United Methodist Church in Rushville, New York, when he slipped and fell onto the cement sidewalk 12 feet below.

Bob was born in New Jersey on August 9, 1931. He received his undergraduate degree from the University of New Hampshire in Horticulture in 1954 and his Master's degree in Botany from the same university in 1956. He worked towards a Ph.D. degree in Horticulture at the University of Missouri, and then spent two years in the military, reaching the rank of Captain.

In 1959, he joined the Cornell community as an Assistant County Agricultural Agent in Ontario County. In 1960, he was appointed Regional County Extension Specialist, and in 1970, Extension Specialist, located at the New York State Agricultural Experiment Station. The rapport he developed with growers and processors was well appreciated and he was named the Extension Specialist for processing vegetables for the College of Agriculture and Life Sciences. He held that position from 1970-86. But Bob was much more than an advisor on vegetable production. He was an advisor to many Cornell administrators on the direction the university should take in regard to vegetable and extension programming. He was respected and admired by the vegetable farmers of New York, and also by his peers around the nation. He was in widespread demand as a speaker at vegetable production meetings across the nation. In 1986, he was promoted to Associate Professor in the Department of Horticultural Sciences. Bob retired in 1992.

Bob developed and promoted the NYS Processing Vegetable Conference which later became the NYS Vegetable Conference, one of the major such conferences in the country. In 1980, Bob initiated the commodity advisory committees for sweet corn, snap beans, cabbage and tomatoes. It was a result of Bob's influence that growers and processors began to contribute research funds to the university through these commodity research committees. The cumulative value of these contributions to vegetable crop research at Cornell is in excess of \$1,000,000.

Bob's list of friends was many, not only within the Cornell community, but also throughout the entire nation. The awards given to him by the many organizations with which he was connected evidence this. He received a special award for 33 years of service from the New York State Cabbage Research Association in 1992, the Outstanding

Leadership Award from the New York State Vegetable Conference Planning Committee in 1992, and the Extension Division award of Excellence from the American Society for Horticultural Science in 1989.

Even in retirement, Bob devoted considerable time to the Experiment Station. He continued to serve as a resource person and provided support for the vegetable extension field staff and, during the season, would often be seen with them in different counties as they worked with growers and processors. He also helped the Experiment Station's vegetable variety evaluation programs on snap beans, sweet corn, and cabbage. He participated actively in the planning process for the NYS Vegetable Conference, and continued to participate in some of the commodity advisory committee meetings.

Bob had many interests beyond vegetable crops research and extension. He was a specialist on the history of vegetable production and varieties grown in the U.S. He advised many of the vegetable garden projects at historic centers around the country, such as Williamsburg and Sturbridge Village. He was on the advisory board of the Genesee Country Museum and active in developing its historic vegetable garden, including growing seed of some of the old outdated vegetables. During the centennial year for the Experiment Station, he was in charge of designing and planting a Heritage Garden. This garden had examples of varieties of vegetables grown for 100 years previously and compared them to the kinds of vegetables grown today.

Bob was also a great wood worker and specialized in carving shore birds. He and his wife, Fay, scoured the countryside for rare decoys and had a large collection at home. He was very active in his local church, the United Methodist Church in Rushville, New York, and was chairman of the church board.

Some of the professional organizations to which Bob belonged included the New York State Association of County Agricultural Agents where he had been secretary and vice president, the National Association of County Agents, the American Society for Horticultural Science, the Association of Living Historic Farms and Agricultural Museums, and the Empire State Soil Fertility Association.

His wife, Fay, and three children, Nancy, Dale, and Sheryl, survive him. He was very fond of his six grandchildren, and enjoyed making most of their Christmas presents. Bob will be remembered as a leader, a scholar, a mentor, and a lifelong friend by all whom knew him well.

Helene Dillard, Michael Dickson, Hugh Price

Frederick Bedell

April 12, 1868 — May 3, 1958

Frederick Bedell's long teaching life of 45 years was given entirely to Cornell University. Beyond that active professional life, he enjoyed a score of years of happy retirement and had passed his ninetieth birthday when a cerebral hemorrhage brought to a close the life of the last surviving member of the group that had guided Cornell's Physics Department through its first decades of significant growth.

Coming to Cornell in 1890, just after graduation from Yale University, Bedell won his advanced degree in Physics in 1892, the very first year that the Ph.D. degree was given in the Physics Department, then developing rapidly under the guidance of Professor E. L. Nichols.

Little is known about his parents and his early life, probably because his innate modesty kept him from talking to his associates about himself. An article about him, written in his most active period (*Electrical Review*, 1914), tells that he was born in Brooklyn; that his father was an iron manufacturer; that as a boy he lived in Montclair, N. J.; that he took the classical course at Yale, winning honors in Physics and ranking third in his class of 150 men. He referred to his work at Yale in a letter that he wrote only a few years ago expressing his impatience with red tape and administrative routine, which he was happy to have been spared. He said, "I never had knowledge at Yale of any registrar or dean, nor until graduation did I ever know my grade in any class or examination. I only knew that if I failed I would be notified. How very simple.!"

The impulse that brought Bedell to Cornell to study came from his reading a thesis by a Cornell graduate student—he felt that he "wanted to do that kind of work." He came when, as he recently wrote, "the battle between direct and alternating currents in the distribution of electrical power was coming on." He chose that field for his studies, his researches, and his teaching. His title in the Physics Department was Professor of Applied Electricity. The students who elected his course on Alternating Currents or Aerodynamics were drawn from both the Physics Department and the Engineering School, and he was voted, by the Faculty of Mechanical Engineering, a member of that faculty as far as the supervising of graduate work was concerned.

Throughout his whole career at Cornell, Professor Bedell was in close touch with the development of Electrical Engineering in this country. He served as Vice-President of the American Institute of Electrical Engineers in 1917-18, after having served as Manager during 1914-17. He also was a member of many principal committees of the Institute. His most important contributions in Electrical Engineering were in experimental investigations

and theoretical studies in connection with alternating currents. In his first paper before the Institute in 1892, he introduced the use of ' j ' as an operator in the solution of alternating current problems. This and other papers, developing analytical and graphical methods for solving alternating current problems, formed the first systematic treatise in its field. Bedell and Crehore's "Alternating Currents" was an outgrowth of this work and was for many years a standard text on the subject, receiving world-wide circulation in several languages. This book laid the foundation for much that is now basic in curricula in Electrical Engineering, and the principles first enunciated therein have been included in nearly every book on alternating currents that has since appeared.

Bedell wrote two other books on alternating currents: in 1896, "Principles of the Transformer"; later, "Direct and Alternating Current Testing." He presented papers before the Physical Society of London and the British Association for the Advancement of Science, and was a member of international congresses: in Chicago in 1893; and in St. Louis in 1904. In 1942, after his retirement, at the A.I.E.E. convention in Vancouver, he gave a paper on the history of alternating current wave form, just 50 years after the first paper (by Bedell and Crehore) on the same subject before the Institute.

Among the physicists of this country, his name was long associated with "The Physical Review." This journal, originated at Cornell by Professors Nichols and Merritt, was begun in 1892. Bedell, newly appointed Assistant Professor, was at once made a member of the editorial board of the Review and assisted in the preparation of its very first number, issued in 1893. This board of three editors continued to publish the Review for twenty years, with the financial backing of the University; and when the journal was then given to the American Physical Society and made the society's official organ, Bedell continued for another ten years as managing editor.

The use of airplanes in World War I turned Bedell's thought in a new direction. The result: a textbook on "The Airplane and the Principles of Flight" and a lecture course on that subject. Later he made a study of audition, with especial concern over the problems of the deaf. The result: the invention of a "bone conduction" hearing device which, held between the teeth, enabled the deaf to hear their radios.

In his study of alternating current wave forms, working with oscilloscopes, Bedell patented various improvements on the oscilloscope, being the first to stabilize the figures seen on the screen and the first to show several curves simultaneously. His work in this field continued for a number of years after his retirement.

Science could be said to be a part of the Bedell family life. First, Bedell married Mary Crehore, sister of the engineer who was co-author of "Alternating Currents." Of their two daughters Eleanor is the wife of Robert C.

Burt, an engineer in California, while Caroline is a physician and the wife of a physician, Dr. Henry M. Thomas of Baltimore. Professor Bedell is also survived by his second wife, Grace Bedell, who was with him in Pasadena during most of his years of retirement.

Professor Bedell was a quiet, unassuming teacher, warm, receptive, and always ready to listen to a student and to give advice when asked. Toward his associates and friends he displayed a kind thoughtfulness that stemmed from his innate sense of truth and justice. These qualities made him a gracious host in his home and a helpful counselor on matters of concern to the department of which he was for so long an active member.

H. E. Howe, G. E. Grantham, W. E. Meserve

Vaughn Crawford Behn

November 15, 1922 — June 8, 1976

Vaughn came to Cornell from the University of Delaware in September 1960 to join the faculty of the School of Civil Engineering as an associate professor, after a successful early career in sanitary engineering. Prior to his appointment as an associate professor of civil engineering at the University of Delaware in 1955, Vaughn had worked first as a development engineer for the National Council for Stream Improvement and later as a sanitary engineer for the Atlas Powder Company.

Born in Brooklyn, New York, the son of George and Alice Ruth Behn, Vaughn grew up and attended schools in Brooklyn and New Jersey. He received a bachelor's degree in engineering from Rutgers University, an M.S. degree in industrial hygiene from Harvard University, and the D. Eng. degree from Johns Hopkins University. He was a member of Sigma Xi and Chi Epsilon.

Vaughn's entire career as an engineer was marked by equally strong interests in the academic and the professional aspects of environmental engineering. Before coming to Cornell he had demonstrated excellence in his research into the properties and behavior of non-Newtonian fluids and sludges. He continued and expanded these studies with his graduate students at Cornell, subsequently redirecting his research interests to the theoretical and experimental analysis of the performance of trickling filters and, more recently, to the analysis of the gravity thickening of sewage sludges.

Since coming to Cornell, Vaughn had been associated professionally with the Tompkins County Health Department, Greely and Hansen Engineers in Chicago, and Lozier Engineers in Rochester, the U.S. Public Health Service, and the University of Texas at Austin.

Further professional interests were manifested in his active role as a fellow in the American Society of Civil Engineers, in which he was serving on the Industrial Waste Practice Committee, and as an active member of the American Water Works Association and the Water Pollution Control Federation.

Vaughn's concern for the professional practice aspects of the education of environmental engineers made him a natural choice to take charge of the design project that the environmental engineering students in the master of engineering program carry out as a key requirement for the degree. The special attention that he gave to this design project, and to each of the students in the professional master's program, has been a major factor in the program's

success. The close relationships that sometimes develop between professor and students were exemplified in these projects that were done during recent January intersessions.

His many students, undergraduate and graduate, will recall Professor Behn as an understanding and devoted teacher, advisor, and friend, continually concerned about their academic progress and their welfare, always ready to answer questions and help with problems. He was generous with his time to everyone who came to him for assistance, which they got, together with an opportunity to see just how a cigar should be enjoyed.

His colleagues remember Vaughn Behn as a loyal and dedicated member of our faculty who never overlooked a chance to help in redefining the educational objectives and improving the curriculum of the school. He was forever eager to play a part in the education of young civil engineers at the undergraduate, graduate, and professional levels.

The misfortune of an early illness, which would have destroyed lesser men, hampered his efforts to reach the personal successes that his early research had suggested would be within his reach. His determination to regain a level of physical fitness that enabled him to rejoin the midday runners won our admiration. Similarly, his response to the deterioration of his health more recently seemed to have been a redoubling rather than a lessening of his efforts. Vaughn's enthusiastic participation in ongoing school activities and his anticipation of future programs never flagged. Only those who knew him well realized the heavy burden that he had been carrying. His refusal to give up in his struggle to overcome illness, along with his unceasing devotion to the school, the students, and to the environmental engineering profession, will remain as an inspiration to all of us who knew and worked with him.

Vaughn found time to contribute to the community in numerous roles, most importantly as a member of the mayor of Ithaca's advisory council, and for years as an assistant leader of Boy Scout Troop 99.

We will remember Vaughn as a warm and kind companion, gentle and mild-mannered. He had patience, sympathy, and understanding for the problems and difficulties of those around him. His fifteen years in Hollister Hall will be fondly recalled; his absence from Hollister Hall will be keenly felt.

Professor Behn is survived by his wife, Vida M. Behn of Ithaca; a son, Vaughn C. Behn, Jr., of Ithaca; two daughters, Penelope Behn of Brooklyn and Vida Alice Behn of Ithaca.

James J. Bisogni, Jr., Wilfried H. Brutsaert, Walter R. Lynn, Charles D. Gates

Donald J. Belcher

February 11, 1911 — February 8, 2005

Donald J. Belcher, Professor Emeritus of Civil and Environmental Engineering, died February 8, 2005, in Papa'loa, Hawaii, three days short of his 94th birthday. Don's lifelong exploration of the practical engineering applications of aerial photography—a discipline that became known as aerial photographic interpretation and, more recently, remote sensing—placed him as the foremost pioneer in this field.

At a celebration near Belcher's 90th birthday, CEE Professor Emeritus Floyd O. Slate, who knew Don as a university colleague and friend for 62 years, said this:

"There are lots of internationally eminent researchers who make enormous contributions that advance our fundamental knowledge in engineering and science disciplines. Yet very few start an entirely new discipline and then continue to develop it as Don did. That legacy places Don's life work squarely in the annals of engineering history."

Born in Chicago, Illinois, on February 11, 1911, he was the son of the late Ova Clarence and Helen Edson Jenks Belcher. He earned the Bachelor of Science in Civil Engineering degree in 1934, the Master of Engineering degree in 1939, the Master of Science degree in 1940, and in 1941, the professional degree Civil Engineer, all from Purdue University. His main research interest at Purdue was the mapping and engineering characterization of soils for highway projects. By the early years of World War II, Don had already acquired a strong expertise in aerial photography applied to practical problems, and he wrote to General Douglas MacArthur to offer his services. As a result, he became a civilian consultant who worked to improve the military's intelligence of battlefield conditions, especially landing beaches for the army's Pacific campaign. Later, using his skills in interpreting aerial photographs, he helped locate landmines in Western Europe and consulted with U.S. military and civilian agencies and foreign governments.

In 1947, after seven years of teaching and research at Purdue University (interrupted only by his consulting with the military), he joined Cornell's School of Civil Engineering. He was hired to strengthen the School's programs in transportation and geotechnical engineering. He soon founded the Center for Aerial Photographic Studies and directed it until his retirement in 1976. This center spawned an entirely new division within CEE, the group now known as remote sensing. Among his distinguished colleagues in this effort were Professors Ta Liang and Arthur J. McNair, both of whom predeceased Professor Belcher.

Don Belcher distinguished himself as an educator, scholar, innovator, and consultant. Known for his excellent teaching, he welcomed generations of students from diverse fields into his courses on airphoto interpretation. His graduate students have gone on to assume leading positions in the field of remote sensing. He also played a formative role in the early years of the CEE Master of Engineering Program. In October 2000, the Donald J. Belcher Master of Engineering Fellowship for graduate students in Civil and Environmental Engineering was established at the initiative of one of his former graduate students. At that time, a luncheon was held to celebrate the launching of the fellowship endowment and to honor Belcher for his outstanding career.

Belcher's list of accomplishments and contributions include the following notables. He was credited with locating the site for Brasilia, Brazil's capital city that was created in virgin territory. Don was called upon to find a site for the world's largest radio telescope and he identified the 1,000-foot-diameter bowl in the karst cockpit country of Puerto Rico that now supports the dish of the Arecibo Observatory (still administered for the NSF by Cornell). As the exploration of space advanced, he helped interpret surface conditions on both the moon and Mars and used satellite photos to identify sources of industrial pollution. At the dawn of the information age, Belcher also pioneered a computer-based land-use and natural-resource inventory system that was adopted by New York State, Puerto Rico, South Africa, Australia, and Venezuela.

We include here excerpts from an eloquent memorial written by one of Don's first graduate students, J.D. (Jack) Mollard:

"I arrived at Purdue in early September 1945, not long after Don returned from a stint as advisor to General Douglas MacArthur in the Philippines. Don had already published an impressive list of research papers and one larger co-authored volume that would launch his illustrious career. At the time, Don was 'breaking new ground,' detecting permafrost features in Alaska for the U.S. Army Corps of Engineers, and I assisted Don in the lab. I was Don's third graduate student at Purdue, and there were scores to follow, mostly at Cornell.

"Although Don would not have known it at the time, he is responsible for two wonderful happenings in my life: meeting my wife, Mary Jean, and a lifelong fabulous career that I still love after 60 years, and am practicing actively at 81 years of age.

The first thing Don said when I arrived at Cornell was, 'You've got two jobs: 1) finding placer gold in northern California, and 2) locating diamond pipes in South Africa.' Don handed me a huge bundle of airphotos and I went to work. A few months later, I met Mary Jean pouring punch (non-alcoholic!) at a graduate student party, and I couldn't resist striking up a conversation. I was wearing cowboy boots. Later in the evening, Mary Jean rushed back to her apartment she shared with five other graduate students to say, 'I met this fellow from a place called Saskatchewan. He says he's a cowboy, and he's locating gold and diamonds from the air.' She had the veracity of my comments checked out at the Registrar's office. I passed! A few nights later, Mary Jean, Don and I had a beer around 5:30 p.m., on the way home from class.

“Don had a list of diverse research contracts with several different clients. One was to design a camera having an extraordinarily long focal length (96-inches) so that U.S. Air Force pilots then engaged in the Korean War could fly above enemy anti-aircraft guns and still take pictures of enemy troop movements. I had the job of estimating how high and how often the flights should be made. Another project entailed predicting beach sand softness for off-landing troops and vehicles without getting bogged down. Still another was designing a nuclear densometer to determine the moisture content and density of soil for civil engineering works, particularly transportation projects.

“Don enjoyed a good joke. He would bury a case of beer in an esker gravel pit and send a class under the direction of a graduate student, dowsing and then, spade in hand, digging in the gravel pit for water. Eureka! That was a happy surprise on a hot summer day.

“Don was happiest when interpreting stereoscopic airphotos to discover some object hidden below ground surface. Often the airphotos were taken from 6 or so miles above ground, and at locations hundreds to thousands of miles from where Don was making the search.

“During the end of WWII, Don located dozens of Civil Aeronautics Administration (CAA) airstrips around the USA. They were used to train war and civilian pilots. He not only located the airstrips, he found gravel to construct the runways —and all done remotely from 3-D airphotos. A few years later, he started searching for diamonds, gold, and base metals, often-in faraway places. And in the last 10 years, I’ve been looking for diamonds in four different locations in Canada, using Don’s clues.

“I recall him looking for oil-bearing structures, called diapirs, along the southern coast of Louisiana and Texas. As things turned out, I was the beneficiary of those studies because one of the first contracts I got in the Canadian Arctic Islands (Bathurst, Melville, and smaller islands), in 1957, was looking for oil and gas structures from airphotos. Dr. J.D. Bateman, Toronto, said he gave me that contract because I was a Belcher protégé.

“Stories of Don’s unique abilities to find, outline, and evaluate natural resources and sites spread far and wide with his increasing fame: locating groundwater beneath the desert in Iran, locating the site for the new capital city in Brazil (Brasilia), locating the site of the radio-telescope at Arecibo in Puerto Rico.

“Don was always at the forefront of new developments in aerial and space remote sensing, analyzing 3-D black-and-white panchromatic airphotos, true-color and false-color airphotos, black-and-white and false-color infrared photos, and thermal infrared and radar imagery. When the first poor-quality planetary imagery came out, Don was probably the first to interpret surface features on Mars. I have one of his early research publications on Mars interpretation, in which he describes permafrost and glacial features. He was senior author on a co-authored pioneering paper with Carl Sagan.

“Don’s interpreted airphotos, maps and reports included international consulting projects the world over: every continent and, in some cases, several countries on the same continent. Don was also a recognized pioneer in the multidiscipline applications of computer processing and mapping, beginning with natural resource maps of several counties in New York State.

“Two things remain inscribed in my memory from our celebration of Don’s career at Cornell a few years ago. Those of us who were his students from the very first, including his first graduate student Bob Frost, gave our memories of Don: researcher, mentor, good man, and friend.

“Another alumnus at that celebration, an anthropologist from Cambodia, got up to say that he had read some of Don’s work and wanted to take his introductory course. He said that he had absolutely no background that would allow him to take it. But, when he asked Don if he could take his course because he felt he could learn something new that he could apply in his own research work in Cambodia, Don replied, ‘Why not?’ The gentleman said it was the best course he’d ever attended—a common remark from Don’s students. I wasn’t surprised at Don’s reaction because in the first class of Don’s I took at Cornell, there were students from the faculties of engineering, agriculture, forestry, geology, town planning, and perhaps others. If someone had a genuine interest in applied airphoto interpretation, was keen to learn, and could apply the information that Don taught, they were accepted.”

Donald Belcher was preceded in death by his wife, Nancy Foote Belcher; and daughter, Helen Stacy Belcher. He is survived by daughters, Marilyn Kay (Gerald) Whisman of Goddard, Kansas, and Candace Brann of Hiram, Ohio; and by sons, Dr. Mathew Belcher and his wife, Dr. Emily Claspell of Kamuela, Hawaii, Mark Belcher and his wife, Anne Marie Thurber of Washington, D.C., and Neil Belcher, and his wife, Ailish of Ithaca. Eight grandchildren and eight great-grandchildren also survive him.

Charles Edwin Bennett

Professor of Latin In Cornell University

April 6, 1858 — May 2, 1921

It is with dismay and deep grief that we have learned of the sudden death, on the morning of Monday, May the second, at his home on our campus, of one of our most revered scholars, professor Charles Edwin Bennett. Almost without a premonition he passed in his sleep from life into death.

His quiet and studious career is known to us all. A graduate of Brown, the University of his native state and city, he carried further his scholarly training at Harvard, at Leipzig, at Berlin, at Heidelberg; then, after a brief apprenticeship as teacher and principal in secondary education and two or three years as a professor at the University of Wisconsin and at Brown, he entered, at thirty-four, on his long service as professor of Latin at Cornell. Since the summer of 1892, almost thirty-nine years, he has with rare distinction held that chair among us, honored and loved by all.

How high and rigorous were his standards as a teacher, how exacting his methods, how discriminating and sensitive his scholarship, need no pointing out. His books on Latin grammar and Latin composition, keep abreast of scholarship by revision and republication, his great work on the syntax of early Latin, his editions of classical authors, his exquisite translation of Horace, his many learned papers in philological journals, have made his name a household word throughout our land and widely known beyond the sea and have drawn to his class room a growing throng of students, many of them now in college chairs. He found time to collaborate with his colleague, Bristol, in an influential manual on the teaching of Greek and Latin in secondary schools and with his colleague, Hammond, in a charming version of the Characters of Theophrastus. Yet this large fruitfulness of his pen was never at sacrifice of attention to his students or his full share in the management of the University.

Less known, even to his colleagues, has been his good citizenship, his kindly civic helpfulness, his large and efficient part, as chairman of the Belgian Relief Committee of his county, in the activities of the great war, his genial comradeship in club and social circles. We shall miss his stately figure and his scholar's face; we shall miss his sincerity, his ripe judgment, his clear and chosen words; but most of all shall we miss his earnest, high and self-reliant manhood.

Charles Edwin Bennett

Frederick T. Bent

November 13, 1921 — March 2, 1987

Throughout its history the faculty of Cornell University has been blessed with many members of quiet dignity for whom the word gentleman has been an apt descriptor. Frederick T. Bent was such a man. He was a man of principle who lived by, and fought for, what he believed in. But win or lose, he was loyal to his school and to his university.

Fred Bent was a private person but one who established deep and lasting friendships. He could put others at ease. He was a good listener. Open-minded. Receptive. Responsive. Warm. Humorous. Unpretentious. An effective advocate. Competent. Articulate. Diplomatic. Reasonable. Fair.

Fred was a person who inspired trust and one who trusted others. He tried to see the best in people, and that is what he was able to bring forth from them. His integrity showed through in all his dealings. Those factors, combined with his intelligence and good judgment, made him a candidate for assignments of responsibility, leadership, and trust throughout his career.

One of his most visible achievements was the founding of the new School of Management at the American University of Beirut, Lebanon, where he served as the first director. A further monumental achievement was the organization of its Executive Development Program, a program that succeeded in drawing clientele from, and achieving harmony among, the many diverse factions in the Middle East.

These assignments followed many prior ones. Fred was a member of the initial survey team that established the relationship of what is now Cornell's Johnson Graduate School of Management with the Middle East Technical University of Ankara, Turkey (METU). He served as the school's liaison with METU for the first two years of the contract with that university. He then exchanged jobs with Seymour Smidt, taking over as the Cornell faculty member in residence at METU. Later Fred was a member of the school's survey team that established the exchange program with the University of Leuven in Belgium. He was the faculty coordinator for that program for years, as well as an exchange professor.

Fred worked for the Ford Foundation as a consultant to the government of Bahrain in the Persian Gulf, serving several tours in various assignments. He also worked with Robert Nathan Associates on assignments in Africa and the Middle East.

Fred was asked to be the director of the Johnson School's International Programs, a position in which he served until his death. He was a recognized authority on the Middle East and appeared often in the media in that role.

Most recently Fred worked energetically—despite his illness—to develop a comprehensive new yearlong course entitled “The Manager in the International Environment.” He was to have offered that course for the first time in the fall of 1987. The course was to have been the centerpiece in the Johnson School's increased emphasis on international business.

Fred Bent's family, their church, and their extended circle of friends formed a central focus in his life. He took great pride in the achievements of his wife, Nancy, and of all their children, each with his or her own unique flair. Holidays always signaled the time for a gathering of the clan for festivities and feasting. And there was plenty of both, as we would learn from Fred when work resumed.

Fred Bent was also proud of his midwestern background. No doubt it was those roots that nourished his labor and love for the Bent “spread” in Lansing. He was at his happiest when reclaiming grass from encroaching stubble or protecting gardens and shrubs from marauding deer. Fred Bent was one of the few among us for whom four hours of mowing was a true labor of love and source of renewal rather than a chore.

A member of the Johnson School's faculty since 1958, Fred received his B. A. degree from Ohio State University in 1943, his M. A. degree from the University of Chicago in 1947, and his Ph.D. degree—for which he majored in political science and minored in industrial relations—from the University of Chicago in 1954.

He was the social science representative on the Fulbright Selection Committee in 1959 and a member of the executive committee of the Social Science Research Council in 1959-60. He was the associate director of the Center for International Studies in 1963-64 and in 1968-69. In 1970-71 he was a senator in the first Cornell University Senate. In 1986 he was a member of the University Committee on Freedom of Teaching and Learning. At the Johnson School he was the acting editor and book review editor of *Administrative Science Quarterly* in 1959-60 and in 1963-64. Bent served in the army from 1943 to 1946. He was married to the former Nancy Pettingill. The couple has three children, Rodney, Laurie Angiolillo-Bent, and Timothy.

Frederick Bent was a whole man who lived life to the fullest. To paraphrase a current saying, “Nobody didn't like Fred Bent.” And many loved him.

John McClain, Seymour Smidt, Alan McAdams

John Bentinck-Smith

January 24, 1919 — May 12, 2005

John Bentinck-Smith was born and raised in Boston, Massachusetts, as one of the four children of William and Marion (Jordan) Bentinck-Smith. He attended Harvard University and graduated with an A.B. degree in Biology in 1941. He was one of the first who, with a basic interest in further studies in comparative biological sciences, recognized the significant opportunities veterinary medicine had to offer. While at that time significant experience in the husbandry of farm animals was normally a prerequisite for admission, John was admitted to the first year class of the New York State Veterinary College at Cornell in the Fall of 1941, even though his animal husbandry experience consisted solely of that received from “living in a household with the family cat, raising Gordon Setters, and a brief adventure with twelve rabbits!” Thus, even at this early age, the faculty recognized the academic potential that John brought to the College and the profession.

As was the case for almost all veterinarians graduating during World War II, John entered the U.S. Army Veterinary Corps as a 1st Lieutenant immediately after graduation and was honorably discharged in 1946 with the rank of Captain. Thereafter, he spent two years in small animal practice at the Angell Memorial Animal Hospital of Boston and Springfield followed by six months at the Bronx Zoo as a Research Fellow of the New York Zoological Society in Comparative Pathology.

In the fall of 1949, Dr. Bentinck-Smith returned to his veterinary roots, being appointed Assistant Professor of Pathology at the New York State Veterinary College. His duties included determining both the gross and histologic pathology of animals that had either died in the veterinary clinic or were sent to the autopsy room by veterinarians in practice outside the college. At the end of his first year on the faculty, John found his true academic niche when he and Dr. Charles Rickard, then a recently appointed Assistant Professor of Clinical Pathology, changed academic roles. From then until the end of his academic career, John was actively involved in teaching, clinical service and research in clinical pathology. He is widely recognized as one of the “founding fathers” of this clinical discipline in veterinary medicine.

Dr. Bentinck-Smith was promoted to full Professor in 1958 and remained at the College until 1981 when he retired and was awarded the title of “Professor of Clinical Pathology Emeritus.” During his tenure at Cornell, he spent one sabbatical year at the Royal Veterinary College, Stockholm, Sweden in 1955-56, another at the Armed Forces Institute of Pathology in 1966-67, and a third at the University of Edinburgh, Scotland in 1973-74. For the

last several years of his career, Dr. Bentinck-Smith was also the Chief of the Clinical Pathology Section of the Department of Clinical Sciences and the Veterinary Medical Teaching Hospital.

From the start of his career, Dr. Bentinck-Smith found the academic atmosphere stimulating. His research interests involved studies to ascertain normal electrolyte physiology as well as abnormalities in electrolyte metabolism occurring during disease processes in domestic animals. He also described the microbiological basis of several dermatologic and other diseases of domestic animals. For many years, with Ms. Louise Barr as his only technician, Dr. Bentinck-Smith directed the clinical pathology laboratory of the College, providing superb support for the clinical pathology needs of clinicians in the large and small animal clinics as well as the ambulatory service. John was known to have said that he enjoyed the academic atmosphere because: "I have good colleagues working with me." There is no question that the success of many of his colleagues was due, in large part, to the encouragement and support that Professor Bentinck-Smith provided to them!

During his time at Cornell, Professor Bentinck-Smith made significant contributions to research and to improvements in clinical medicine; however, his primary interest and devotion was teaching. This he did essentially full time, not only in the didactic teaching program but by involving his students in the day to day activities in the clinical pathology laboratory, e.g., analyzing the myriad blood, tissue, culture and other specimens submitted by clinicians from both inside and outside the college. This "hands-on" experience provided superb training to over two thousand Cornell veterinary students taught by Dr. Bentinck-Smith. He was quoted as saying: "I never object to teaching people, if they are anxious to learn." The enthusiasm that he showed for his work was infectious, assuring that all of his students were anxious to learn. He demanded much from his students, but was always present to provide the necessary assistance to assure that each student met those demands.

After retiring from Cornell, John accepted a position as the first Professor of Clinical Pathology at the newly opened College of Veterinary Medicine at Mississippi State University in Starkville, Mississippi, retiring from that position in 1990.

Outside of his academic career, John had several interests. He loved sailing, a sport he was involved in since childhood. He recounted a racing experience during his youth when that of another participant in the race, John F. Kennedy, rammed his boat. With a wry smile, John reported that Kennedy paid for the damages! During the summer of 1957, John was sailing on Cayuga Lake with a veterinary student as his first mate. A thunderstorm arose suddenly capsizing John's 24 four foot racing sloop! Fortunately, both survived and the boat was recovered.

He was also interested in woodworking. For many years he had the desire to construct a 'classic' sailboat from raw materials. After retirement from Mississippi State University, he took a course in small boat building on Cape Cod and built, from scratch, a gaff-rigged sailing sloop, the envy of Cayuga sailors that, unfortunately, he had the opportunity to sail only a few times. The joy of completing the task was sufficient for John.

In 1961, John married Marjory (Ellis) Bentinck-Smith, a Tompkins County 4-H Extension Agent. They shared a loving 43 years together, and raised four children. He was extremely devoted to his family and he and Marge had many friends. He was always anxious to chat amiably with friends and colleagues, but never about himself. Despite his myriad accomplishments, he was a very humble and private person and very few, if any, of his acquaintances were aware of his accomplishments as clinician, researcher, teacher, husband, father, and friend.

Dr. Bentinck-Smith is survived by his children: Laura, Alan, Roger, and James; two grandchildren, Tyler and Davis Bentinck-Smith; and a sister, Joan Bentinck-Smith. His wife, Marjory, died on June 21, 2005, one month after her husband.

Leland E. Carmichael, Francis A. Kallfelz

John Bentley, Jr.

Professor of Forest Engineering

June 8, 1880 — July 26, 1933

He was an able and stimulating teacher, beloved by his students and respected by his colleagues; a useful citizen. So may be summed up the life of John Bentley, Jr., Professor of Forest Engineering, whose death on July 26, 1933 terminated a span of more than twenty years of active, devoted, and loyal service to Cornell University and to education in forestry. It is impossible to measure Professor Bentley's influence, but it is certain that many foresters are today being guided by the force of his ideas and ideals. He had a clear, keen mind and a disciplined imagination. He played his part in the formative period of forestry in America. To Cornell University and to this community he contributed in many helpful ways. He will be missed by a wide circle of those who knew and loved him.

John Bentley, Jr. was born in Brooklyn, New York on June 8, 1880. In 1904 he was graduated from Wesleyan University, Middletown, Connecticut, with the degree Bachelor of Science, and in 1907 from Yale University with that of Master of Forestry. At Wesleyan he was awarded Phi Beta Kappa. At Yale he was elected to Sigma Xi.

Like many another graduate of the Yale Forest School of that time, Bentley soon joined the Federal Forest Service. For the next four years he was stationed in Colorado, serving in turn on several National Forests as Deputy Forest Supervisor, for much responsibility then rested on the shoulders of the younger men. He was one who helped to set the foundations. This experience gave him a background which was of great value to him in later years.

In January 1912. he came to Cornell, shortly after the reestablishment of forestry at this institution. In 1918 he was advanced to the rank of full professor. In his work in the Department of Forestry he contributed to all its activities, served faithfully on various college committees, and also bore his part in the affairs of the technical association of his profession, the Society of American Foresters. He wrote a number of bulletins in the College of Agriculture series and collaborated with two of his colleagues in a book, Forest Management, which is widely used in schools of forestry and by forest owners. During two of the World War years Professor Bentley, while on leave from Cornell, served as lecturer on lumbering at the Yale School of Forestry.

In civic activities Professor Bentley was never one to shirk responsibility. He served acceptably in local offices in the Village of Cayuga Heights and was active in movements for community betterment in Ithaca. But it was the teaching of students of professional forestry that lay nearest his heart. He had the happy faculty of quickly gaining the interest of his classes, and then by informal, comradely leadership, of drawing out latent abilities and guiding

these men skillfully in their preparation for their life work. On occasion he could be strict, for he was always actuated by high standards of accomplishment, to which he held himself rigidly. Professor Bentley's interest in the students did not, however, end with the classroom, nor with those in forestry. He was ever alert to lend a hand to any who needed encouragement or friendly counsel. Particularly was he concerned with those from other countries. For many years he was a faithful member of the Board of Directors of the Cornell University Religious Work.

By his ability as a teacher and by the sterling qualities of his character, John Bentley made a distinct place for himself in the life of Cornell University. His were substantial contributions. He will be gratefully remembered by his students, his colleagues, and the still wider circle of his other friends.

Madison Bentley

June 18, 1870 — May 29, 1955

Madison Bentley, Professor of Psychology, Emeritus, entered Cornell in 1895 as one of the early graduate students in Psychology, having completed his undergraduate training in the University of Nebraska. After receiving the Ph.D. degree in 1898, he remained as a member of the Cornell Faculty until 1912, when he was called to the University of Illinois as Director of its Laboratory of Psychology. Upon Professor Titchener's death, Professor Bentley returned to Cornell in 1928 as Susan Linn Sage Professor of Psychology and Chairman of the Department, remaining in this position until 1938. After his retirement he served for two years as consultant on the staff of the Library of Congress and then moved to Palo Alto, California. He continued to be active in writing and editorial duties throughout his remaining years.

Professor Bentley's interests within psychology and in related disciplines were always very broad. His early research ranged from sensory and perceptual problems in man to the learning capacities of one-celled animals. He was long concerned with the psychological disorders in man, and edited a volume on this subject which brought together the views of neurologists, psychoanalysts, psychobiologists and experimental psychologists. The early history and development of man as a species was another of his continuing studies, and he was widely informed in the field of anthropology. He directed psychological fieldwork among the Indians of New Mexico during many of his summers. Another major interest lay in the physiological and biological bases of psychological activity, and he kept abreast of developments in the fields of neurology and endocrinology. For many years he was active in the affairs of the American Otological Society as well as in psychological organizations.

During the years at Illinois, Professor Bentley began to develop a point of view in psychology which diverged more and more sharply from that which prevailed at Cornell under Professor Titchener. The first glimpses from this point of view appeared in *The Field of Psychology* published in 1927. The new features of this view became more clearly distinguished in *The New Field of Psychology* (1934) which was a completely new book rather than a revision of the former *Field*. He continued to develop this approach to his subject in many articles appearing in the *American Journal of Psychology* during his years at Cornell and later when in retirement. The view of psychology which he developed was distinct, not only from the earlier Cornell approach, but also from most of the theoretical trends in American psychology at large.

In formulating his point of view, Professor Bentley insisted that psychology was an independent discipline, with problems and concepts of its own. As he viewed the current developments in psychology, it was losing its identity and its central aims through the pressures from medical treatment of the disordered, from educational problems of learning, from biological approaches to animal behavior, and from sociology. Instead of providing an independent base from which these related disciplines might borrow needed facts and principles, and to which they might contribute their own findings, psychology was borrowing its concepts and methods intact from these other disciplines. These other disciplines were developing their own partial or one-sided psychologies (for example, psychoanalysis) which were deficient in that they did not pay proper regard to the problems and research of psychology as a whole. "Modern psychology" was a sort of potpourri of these partial theories with no clear central theme or integrating principles.

Psychology, he thought, must therefore secure its independence from these related but distinct concerns, just as it had earlier broken away from philosophy. Psychology was not ready for theories and systems yet, for it did not even have its own body of descriptive data uncontaminated by these accessory subjects. Professor Bentley therefore set out to formulate the problems of psychology in an independent manner, and to gather a body of descriptive data from this same point of view. He aimed to describe as clearly as possible what the organism does, and what the results of this activity are. At the same time, what we know about bodily structures and mechanisms could be related to the descriptive data in order to begin a formulation of how the organism performs its functions and what controls its activities. Professor Titchener's psychology had also been largely descriptive, but it had been conceived along much narrower lines and with restrictions which had been dictated by earlier philosophical distinctions, distinctions which would not withstand an unbiased scrutiny.

It was for the graduate students who worked directly with him that this approach to psychology had its greatest effect. Although the point of view was so broad that these students were not obviously labeled as "Bentleyites" or "Cornell Functionalists," their subsequent research and writing shows the kind of critical and independent spirit which Professor Bentley instilled in them during their years at Cornell. These students found Professor Bentley ever ready to discuss their research and ideas with them, to give them searching but fair criticism. Those whose ideas had been clarified by these conferences could have confidence that their ideas were ready for the most careful inspection by the profession.

Professor Bentley also devoted a large portion of his time over many years to editorial activities. He was an editor of the *American Journal of Psychology* from 1926 through 1950, of the *Journal of Experimental Psychology* from 1926

through 1929, and of *Psychological Index* from 1916 through 1925. He regarded his editorial duty as much more than the routine preparation of manuscripts for the printer. Authors were given detailed critiques for guidance in rewriting, and Professor Bentley himself made detailed revisions of many of the manuscripts. For the writing of his students he set a high standard of critical evaluation and of style, insisting that careless usage and laboratory slang had no place in a published report of research, any more than did illogical or muddled thinking. The influence of Professor Bentley's editorial labors, even though it cannot be measured, must have been very great, and it must have played a substantial part in raising the standards of research and publication in American psychology.

Among the honors which he received in recognition of his contributions to psychology were the presidency of the American Psychological Association (1925), election as fellow of the National Institute of Psychology, the Chairmanship of the Division of Anthropology and Psychology of the National Research Council (1930-31), and an honorary LL.D. from the University of Nebraska (1935).

H. S. Liddell, R. M. Ogden, T. A. Ryan

Clifford Osburn Berg

August 9, 1912 — April 6, 1987

Clifford Osburn Berg, professor of entomology emeritus, died on April 6, 1987, at his home in Ellis Hollow, near Ithaca, New York. He was born on August 9, 1912, in Stoughton, Wisconsin, where he attended the public schools. He entered Luther College in 1930 and in 1934 was granted a Bachelor of Arts degree cum laude. After his graduation he taught science in the high school of Mohall, North Dakota, until he began graduate study at the University of Michigan in 1937. He was awarded a Master of Science degree in 1939. His graduate studies were interrupted by World War II, during which he served in the South Pacific area as a malaria control officer with the U.S. Navy. After the war he returned to his studies at the University of Michigan and received his Ph.D. degree in 1949. He was appointed assistant professor of zoology at Ohio Wesleyan University and promoted to associate professor before he accepted his position at Cornell in 1953. He was promoted to professor in 1959, and he retired on July 1, 1978.

During the summers of 1950 to 1952 he was a consultant entomologist for the Arctic Health Research Center of the U.S. Public Health Service at Anchorage, Alaska. In 1957 he spent the summer as a reserve officer of the U.S. Public Health Service, studying household insects on Indian reservations in the north central states. Sabbatic leaves in 1960 and 1967 were spent in Europe and in South America collecting, rearing, and studying sciomyzid flies. From October 1970 to June 1971 he served as resident geologist with the Office of Environmental Sciences, Smithsonian Institution, continuing his studies of the sciomyzid flies and snail-borne diseases.

A Guggenheim Fellowship was awarded to Professor Berg in 1966 in support of his research on the sciomyzid flies in South America, and he was a Fulbright scholar doing similar research in Brazil in 1970. He accepted an honorary D.Sc. degree from his alma mater, Luther College, in 1970.

Professor Berg was a member of the Entomological Society of America, the Entomological Society of Canada, and the Entomological Society of Washington. As a member of the Ecological Society of America he was the associate editor of the journal *Ecology* from 1956 to 1958. He also held memberships in the American Society of Limnology and Oceanography and in the International Association of Theoretical and Applied Limnology. He was vice president of the American Microscopical Society from 1953 to 1956, a member of its editorial board from 1957 to 1959, and a member of its executive committee from 1957 to 1959.

Clifford Berg was the first to discover that marsh-dwelling flies of the family *Sciomyzidae* prey on snails, and after that discovery his own research turned mainly to a careful elucidation and expansion of our knowledge of the varied life-history relationships between the sciomyzids of the world and their molluscan prey. The diversity of these prey soon grew to include slugs, freshwater clams, and many kinds of gastropods, including the snails serving as intermediate hosts for such important diseases of humans and mammals as schistosomiasis and sheep liver fluke. Thus was born the notion that certain *Sciomyzidae* might be useful in the biological control of these snail-borne diseases. Most of what we now know about the complex biology of sciomyzid flies we owe to Professor Berg and a number of his students. Also on the long list of degree holders whose thesis research Professor Berg directed are some who studied the biology of other families of insects, some who worked on snail systematics and ecology, and a few who were more general limnologists; they have developed reputations that reflect their careful training in the meticulous research and reporting methods of their mentor. Clifford Berg's publications have always been models exhibiting the highest professional standards.

Professor Berg also made himself indispensable as a teacher of more-formal courses and seminars in aquatic entomology and limnology, serving with equal enthusiasm and skill in the classroom, at streamside, and in the marsh. Students, both graduate and undergraduate, benefited from his instruction and showed their appreciation of it.

After his retirement he continued his research and continued to publish. He became interested in the work of the Nature Conservancy and was very active in that organization, serving in various administrative capacities.

His wife, Peg, predeceased him in 1978; two daughters, Karen and Kathy, survive.

W. L. Brown, Jr., E. M. Raffensperger, J. G. Franclemont

Emmett Norlin Bergman

May 6, 1929 — October 11, 1989

Emmett N. Bergman, professor of veterinary physiology, died October 11, 1989, in Tompkins Community Hospital, Ithaca, NY.

He grew up on a farm in southwestern Minnesota, the youngest of a family of eight brothers and one sister. After completing pre-veterinary studies at Worthington Junior College, Worthington, Minnesota, he earned a Doctorate in veterinary medicine and a Master of Science in veterinary physiology in a five-year combined degree program at the University of Minnesota. He spent two years in active duty at the Walter Reed Army Medical Center, Washington, DC, then returned to the University of Minnesota as instructor in veterinary physiology. His early interest in metabolic diseases in ruminants begun as his doctoral thesis was maintained throughout his career. Appointment as assistant professor followed completion of the Ph.D. degree in 1959. He taught mammalian physiology to second-year veterinary medical students until 1961, when he joined the Department of Veterinary Physiology, New York State College of Veterinary Medicine at Cornell University, as an associate professor. Full professorship followed in 1966.

His systematic, carefully controlled studies of metabolic disorders became recognized throughout the world. His laboratory attracted graduate students and postdoctoral fellows from the United Kingdom, the Union of South Africa, Israel, New Zealand and North America.

Over the years Emmett achieved an exceptionally harmonious balance between his two major professional activities, research and teaching. His clear, authoritative lectures to the veterinary medical students were revised each year to incorporate confirmed new knowledge of organ function that became parts of textbook chapters and review articles. His lecture preparation, together with illustrative material, required many hours. The laboratory exercises he devised and his personal commitment to their presentation were exemplary. Always softly spoken, he delivered his lectures at an even pace, well suited to his students. Concepts were presented in a clear, straightforward manner, easily understood by all. His lectures were occasionally interrupted by a humorous remark—so dry and smoothly integrated into his delivery that there was always a pause—a gentle laugh from Emmett, partly at his success in slipping in a little joke with the students hardly being aware—then general laughter as the students finally caught on. Few realized that he had earlier had a stutter, so successfully had he overcome the impediment.

His relationships with co-workers, whether in teaching or research, were marked by courtesy and concern. His preparation for any task was always timely and meticulously organized, reflecting his own conscientiousness. His colleagues admired him for his fairness and integrity, and found in him a staunch friend and dependable supporter.

Long-time service as referee for the *American Journal of Physiology*, the *Journal of Nutrition*, the *Journal of Dairy Science* and the *American Journal of Veterinary Research* reflected the high opinion of him held by his peers, as did his service on the Metabolism Study Section of the National Institutes of Health, Bethesda, Maryland. He was much sought after as a speaker to address international audiences. He had been surprised and delighted to find his work translated by students into Asian languages. He was returning from a conference in Japan, and a lecture tour in China when his final illness overtook him.

Born into a large family, he was a devoted family man himself. He is survived by Mary, his wife of 36 years; three daughters, Margaret, Patty, and Susan; and a son, Emmett Jr. He was particularly proud of his four young grandchildren, Brandon Scott, Ryan Wyatt, Travis Piper and Caitlin Bergman Wentzel.

The career of Emmett Bergman spanned an unparalleled period of advancement in veterinary medicine; he will be long remembered by a grateful profession for his contributions to that advancement. A man of honor as a scientist and in private life, he is sorely missed by his family, his friends and colleagues. His many students, graduate and professional, to whom he was such a sound example, will remember him as a dedicated, approachable and effective mentor.

Alan Dobson, T. Richard Houpt, Alvin F. Sellers

Karl Berkelman

June 7, 1933 — February 26, 2009

Karl Berkelman, the Goldwin Smith Professor Emeritus of Physics and an internationally recognized leader in elementary particle physics, died in Robert Packer Hospital in Sayre, Pennsylvania, after a brief illness. He was director of Cornell's Laboratory of Nuclear Studies (now the Laboratory for Elementary-Particle Physics) from 1985 to 2000. Under his leadership, the laboratory prospered and maintained a prominent position at the frontiers of elementary particle physics that was exceptional for the size of the laboratory and its financial resources.

Karl was born in Lewiston, Maine, the son of Robert and Yvonne Langlois Berkelman. After graduating from Lewiston High School, he obtained a B.S. degree in Physics from the University of Rochester in 1955. He began his Cornell career as a graduate student in the physics department, earning his Ph.D. degree in 1959. Karl joined the Cornell physics faculty following a year as a NSF Postdoctoral Fellow at the Instituto Superiore di Santa in Rome, Italy. He rose rapidly through the professorial ranks, becoming a full professor in 1967 and the Goldwin Smith Professor of Physics in 1995. On sabbatical leaves from Cornell, he conducted research at the CERN laboratory in Geneva, Switzerland, and the DESY laboratory in Hamburg, Germany. Although he retired in 2006, he remained active in research until his death.

Karl came to international attention in 1965 when he made the first significant measurement of the size of an elementary particle called the charged pi meson, a measurement at the frontier of elementary particle physics. The experiment was a tour de force because it was not at all clear to the physics community how to turn a theoretical suggestion into a realistic experiment. Karl was exceptionally able to identify what was most important in complex mathematical expressions, and to utilize that insight to obtain the best results possible with available technical resources. Furthermore, he always focused on getting the job done. These techniques and this ability to concentrate his effort served him well throughout his career.

Over the years, Karl contributed significantly to the design and construction of a sequence of electron accelerators at Cornell and the associated experiments and he exploited the new physics opportunities that they provided. His first experiment at the Cornell 10 GeV electron synchrotron was a study of the production of very high energy x-rays by electrons in this new energy regime. This was a crucial and very sensitive test of the theory developed by Bethe and Heitler in the 1930s, and indeed the theory survived this stringent test. During the 1970s, Karl was a leader in a series of experiments on the production of other particles by beams of photons and electrons incident on hydrogen targets, again topics that were on the frontier of elementary particle physics. A world leader in this

field, he was frequently invited to review progress at the major international scientific conferences. He also served on the most important committees that advised the National Science Foundation, the Department of Energy, and the other principal international laboratories for elementary particle physics. He was elected to Fellowship in the American Physical Society.

In the late 1970s, the laboratory constructed CESR, an accelerator that stores electrons and their antiparticles, positrons, and collides them in a detector called CLEO. During this period, Karl was responsible for the design and construction of the complex system that extracted electron and positron beams from the 10 GeV synchrotron and injected them into CESR. Simultaneously, Karl developed a track-finding program the momenta of charged particles in the CLEO detector based on their paths. The results of Karl's effort were the basis for all physics results produced by the CLEO collaboration; nothing could be discovered or measured without these momenta. Karl had identified a task that was absolutely necessary, realized that nobody else was doing it, and focused his effort so that his computer program was ready and working as soon as data were available.

CESR was the best facility at which to explore the new field of elementary particle physics called heavy flavor physics, particularly the physics of an elementary particle called the B meson. The early 1980s were an exciting time, with the CLEO collaboration leading the discoveries and measurements in this field. However, the collaboration soon recognized that further progress required substantial upgrades of the CLEO I detector, and CESR luminosity, the rate at which CESR provided the events that CLEO collaboration was studying. Just before Karl became director of the laboratory in 1985, the NSF approved a proposal for the CLEO II detector and a substantial upgrade of CESR. The CLEO II detector broke new ground in detector technology and capability, and has served as the model for later detectors in the field. In his role as laboratory director, Karl oversaw the construction and operation of the CLEO II detector, the luminosity upgrades of CESR, and the exploitation of the two to produce a host of important discoveries in heavy flavor physics. Members of the CLEO collaboration fondly remember Karl's 15 years as director of the laboratory as a golden age. Younger colleagues particularly appreciated the attention that Karl paid to the development of their careers and to their sense of belonging to the laboratory. Furthermore, Karl accomplished all of this in the frugal style of operation that he inherited from the previous directors, Bob Wilson and Boyce McDaniell. Cornell and CLEO were recognized internationally as being especially efficient in utilizing relatively modest financial resources to obtain the most scientific productivity per dollar spent and per member of the collaboration. Without question, Karl's scientific leadership of the laboratory during that period was crucial for the success of the program.

While most of the effort of the laboratory was concentrated on CESR and CLEO, Karl also ensured that other programs thrived. Perhaps the most notable of these is the Superconducting Radio Frequency program, called SRF. This research program develops devices that accelerate particle beams very efficiently, minimizing the electrical energy used and the operating costs. The laboratory had been involved in SRF research and development since the early 1970s. By the mid 1980s, the Cornell program had been so successful that a large fraction of the SRF group left to build an accelerator in Virginia based on that technology. At that time, termination of the program and employment of the resources elsewhere would have been relatively easy. However, Karl made a very wise decision to rebuild the Cornell effort with the core group that remained, and to concentrate on advanced research and development for the future. The result is continuing international leadership in the field. Accelerators around the world, including CESR, utilize technology developed by this group.

While he was the laboratory director, Karl remained heavily involved in the CLEO physics program. He continued to be the thesis advisor for graduate students, and he contributed his physics insight, his clarity of thought, and his wisdom to many of the most significant discoveries and measurements made by the CLEO collaboration. Karl's participation in the laboratory and CLEO did not end with his retirement as director, or his later retirement as the Goldwin Smith Professor of Physics. He remained involved in CLEO, and even participated actively in a monthly CLEO collaboration meeting only three weeks before his untimely death.

One of Karl's significant legacies is his book, *A Personal History of CESR and CLEO*. In it, he describes the history of the CESR/CLEO program from its beginning in the 1970s until 2002, when he finished the book. The book is a fitting tribute to CESR and CLEO to which he contributed so much, and to Karl's style as a scientist, as a leader of scientists, and as an expositor of science. In accord with his style in research and leadership, his description is succinct and accurate: not too much, not too little, just right. Karl's wisdom and scientific leadership are sorely missed as the collaboration completes the final stages of the CESR/CLEO program, and members of the CESR/CLEO community wish that he were able to write a final chapter for his book.

Karl is survived by his wife of 49 years, Mary; his sister, Ann Berkelman of New York; sons, Tom Berkelman and his partner, Nathan Waldon, of Oakland, California; Jim Berkelman and his wife, Elisabeth, of Madison, Wisconsin; Peter Berkelman of Honolulu, Hawaii; and two grandsons, Felix and Frederick Berkelman.

Karl's scientific accomplishments and leadership left an indelible impression on scientific research at Cornell and on the broader elementary particle physics community. We greatly miss his calm wisdom and insightful leadership.

David G. Cassel, Chairperson; J. Ritchie Patterson, Maury Tigner

Matthew Bernatsky

February 19, 1906 — July 20, 1981

Matthew Bernatsky served on the faculty of the School of Hotel Administration from September 1960 to June 1972. Prior to 1960 he served on the summer school faculty of the Hotel School. Professor Bernatsky taught courses in the area of restaurant management, and it is believed that he taught the first course in a university in the area of beverage management-wines. Before coming to Cornell, Professor Bernatsky was director of the Hotel Department at the University of Denver.

Mat Bernatsky had a most interesting career. He was born in Budapest, Hungary, and apprenticed on the Orient Express during its days of glory. He later worked as executive chef in some of the finest hotels in Europe and North America, including the Radisson Hotel in Minneapolis, where he participated in a research study with Professor William F. Whyte. A frequent lecturer to industry and military groups, Mat Bernatsky was more than a teacher of techniques. He was, more importantly, a food historian and, to a real degree, a philosopher in his field.

Peter Rainsford, Laura Lee Smith, Donal A. Dermody

Israel Berstein

June 23, 1926 — September 22, 1991

The death of Israel Berstein on September 22, 1991 brought to a sad conclusion the heroic battle he had waged against Parkinson's Disease for over twenty-five years. He left behind a personal legacy of sparkling humor, mathematical breadth and brilliance, and a professional and personal generosity and optimism that will always be treasured by those who knew him.

Israel Berstein was born in 1926 in the town of Briceni, Bessarabia, which was then part of Rumania. The Soviet Union occupied Bessarabia in 1940, and in the same year the K.G.B. deported Berstein's father, Ephraim, to Siberia. He was never heard from again. A Rumanian and German occupation followed. The Berstein family, which consisted of Israel, his mother Hannah, and his sister Gita, took refuge with Rumanian friends and was thereby able to escape the roundup of Jews that routinely accompanied such occupations. With the reversal of German fortunes in the war came another Russian occupation in 1944. This liberation resulted in Berstein's induction into the Red Army. In the first week of action, however, he was severely wounded. Not only did those wounds cause major back injuries and the amputation of his right leg, but they also led to a severe case of bone tuberculosis, which kept him continuously hospitalized well into 1947. His family credits Berstein's survival at that time to the assistance of American relatives, who were able to supply desperately needed antibiotics. But Berstein did more than survive. He continued his school studies in the hospital and was so successful that shortly after his release he was admitted to the University of Bucharest, from which he received a degree in September, 1954.

Israel Berstein's professional career began in 1954 at the Institute of Mathematics of the Rumanian Academy of Sciences, where he was the star pupil of Simion Stoilov, the leading Rumanian mathematician of his generation. He specialized in analytic function theory and topology, and later exclusively in topology, receiving his doctorate on June 13, 1958. Already at that point he and his mentor, Tudor Ganea, were the two leading algebraic topologists in Rumania. Later that year at an international conference on geometry and topology in Iasi, Rumania, both Berstein and Ganea made the acquaintance of the British mathematician Peter Hilton. This encounter was the beginning of long mathematical collaborations for the three as well as lifelong friendships. Each of the three emigrated soon thereafter, Berstein to Israel in 1961, Ganea to Western Europe in the same year, and Hilton to the United States, to Cornell University, in 1962. In fact, in the year prior to coming to Cornell, Hilton had succeeded in arranging for Berstein to accompany him. Thus, in Fall 1962 Israel Berstein was appointed an Assistant Professor in the

Mathematics Department at Cornell. It was immediately clear to colleagues both at Cornell and outside that this position was insufficient for someone of his mathematical stature and talents. And so in 1963 Berstein was promoted to an Associate Professorship, and four years later he became a Full Professor.

Israel Berstein's mathematical work was primarily in the area of homotopy theory, a subbranch of algebraic topology that studies the properties of spaces remaining invariant under continuous deformation. His earliest contributions, which were collaborative efforts with Ganea, involved the study of so-called Lyusternik-Schirelman (L-S) category, a numerical measure of the homotopy-theoretic simplicity of a topological space. This notion has applications to many areas of topology, as well as to other subjects, notably to the study of singularities of real-valued functions. In his work on L-S category, first with Ganea, and later on his own and in collaboration with Hilton, Berstein contributed many important insights, extensions, examples and applications, becoming the foremost authority in the world on this subject.

It would be inaccurate, however, to leave the impression that Berstein's career was characterized by a single-minded devotion to one topic. On the contrary, his interests in topology were very diverse and his knowledge of the literature and the state of the art in many areas was extraordinarily deep and accurate. In addition to his work on L-S category and related topics in homotopy theory, Berstein made significant contributions to differential topology, the theory of group actions on manifolds, and to the theory of branched coverings.

A quick glance at the list of Berstein's published papers will reveal that close to two-thirds of his postdoctoral papers were collaborative efforts. This was because Berstein loved mathematics in both its human and personal aspects and its theoretical aspects. He loved to talk about mathematics and to discuss and share mathematical ideas. From this point of view, he was extraordinarily generous with his time, energy, and talent. Certainly a significant number of his collaborative publications arose from the many such discussions held in his office. But the published record does not show the countless suggestions, queries, tips, ideas, and attempted proofs that arose in that forum to the benefit of all who were there, both students and colleagues.

With a similar spirit and expertise, Berstein ran the Department's Senior Honors Seminar and a topology literature seminar for graduate students. This last, known informally as "The Berstein Seminar," was of great importance in the education of several generations of topologists, including one (now senior) member of the faculty. The Department has continued this seminar, now formally naming it "The Berstein Seminar" in his honor.

Israel Berstein's mathematical breadth, insight, and sharpness were widely known and appreciated. A story is often told about a former colleague who was advising a prospective visitor to Cornell as to how one organizes a general mathematics colloquium talk at Cornell. "For the first half hour," the ex-colleague advised, "make sure that everyone can follow you. The next fifteen minutes are for the experts. Then, the following ten minutes are for you and Berstein. And the final five minutes are for Berstein alone." This story not only captures some of the brilliance of Israel Berstein, as well as the humor that was always part of his life, but also, it accurately suggests the high esteem in which he was held by his colleagues and the affection they felt for him.

Throughout a life constantly plagued with serious misfortunes, Israel Berstein was always an optimist. He considered himself a very lucky man. Lucky in the family, friends, and colleagues that he had, in the opportunities that he had, and in the life he was able to lead here at Cornell. And in turn, he was generous to all who knew him. From childhood on he was a major source of help and support for his mother and sister. He also assisted a number of Rumanian mathematicians, former school friends, in emigrating to the West. He was devoted to students throughout his career, and, they returned his sentiments. One of his happiest teaching moments, for example, occurred when a group of students awarded him a plaque of appreciation which read:

"BERSTEIN EVER GEOMETRIZES"
For your humor, kindness, and patience, to you
Professor our lasting admiration and gratitude.
With fondness, Math 452, 1966.

The 1992 Cornell Topology Festival was dedicated to the memory of Israel Berstein. The keynote lecture was given by Peter Hilton who finished his talk with the statement, "I do not expect in my lifetime to meet someone comparable."

Israel Berstein is gone, and we shall have to work our way through "the last five minutes" without him.

Marshall M. Cohen, Peter J. Hilton, Thomas W. Rishel, James E. West, Peter J. Kahn

Hans A. Bethe

July 2, 1906 — March 6, 2005

Hans Bethe joined the Cornell faculty in 1935. Although only 28 years old, he had already achieved international renown as one of the most brilliant and productive theoretical physicists of the generation that entered the field immediately after the discovery of quantum mechanics in 1925-26. At that time, Cornell's Physics Department was ambitious and far-sighted, but it was not among the leading centers in the United States, let alone internationally. That was to change very quickly, and Hans was to be the crucial factor in that transformation.

Hans was born in Strasbourg into a German academic family; his father was a prominent physiologist and his maternal grandfather a professor of medicine. Hans became a student of Arnold Sommerfeld, the outstanding teacher of theoretical physics in Europe, joining his Munich seminar in 1926 just as Erwin Schrodinger's papers on wave mechanics were appearing. He swiftly mastered the entirely new concepts and techniques, and by 1931, his rapidly growing publication list included groundbreaking papers on atomic spectroscopy, penetration of particles through matter, and magnetism. Hans was also quick to establish himself as his era's premier synthesizer of new knowledge with two encyclopedic review articles in the *Handbuch der Physik* on atomic spectroscopy and solid-state physics.

When the Nazis came to power in 1933, Hans lost his post because his mother had been born Jewish. Before coming to Cornell, he spent two highly productive years in England, partially in collaboration with Rudolf Peierls, another émigré, brilliant Sommerfeld product, and life-long friend. Together they wrote some of the very first papers applying quantum mechanics to nuclear phenomena.

Hans felt at home very quickly at Cornell. In the fall of 1935, he wrote to Sommerfeld that when he first arrived he had felt "like a missionary going to the darkest parts of Africa [but by now] I would hardly return to Europe even if I would be offered the same amount of dollars as at Cornell."

In the years between 1935 and Pearl Harbor, Cornell became an outstanding center in both theoretical and experimental nuclear physics. Hans's presence helped to attract a number of brilliant young physicists, who built the world's second cyclotron and pioneered in cosmic ray physics. Partly in collaboration with his Cornell colleagues, he wrote the Bethe Bible, three encyclopedic articles in *Reviews of Modern Physics* that were the basic texts in the rapidly growing field of nuclear physics for a generation. And as an integral part of his research, Hans

guided a succession of doctoral students and post-docs, and with his new colleagues established Cornell as an institution that attracted outstanding young physicists ever since.

Hans's prime Cornell achievement of the pre-war years was his theory of energy production in stars, published in 1939, which *inter alia* created the field of nuclear astrophysics. After nearly 30 years, he was awarded the 1967 Nobel Prize in physics for this work—the first ever on a topic in astrophysics.

Also in 1939, Hans married Rose Ewald, the daughter of his former professor at the Technical College of Stuttgart. Rose's support was crucial to Hans's later achievements, as he struggled to balance the demands of research, teaching, and advising the government.

The fall of France proved to be the second watershed in Hans's life, the first having been his emigration to America. Although he was officially still an enemy alien in 1940, he embarked on free-lance military research: first on armor penetration with another refugee at Cornell from Europe, George Winter, and then with Edward Teller on shock waves. After becoming a citizen, he joined the radar project at MIT, and after a while he succumbed to Robert Oppenheimer's entreaties to join the newly born Manhattan Project. At Los Alamos, he was selected to be the director of the Theoretical Physics Division, which was to play a key role in the bomb project. This was because so many of the processes involved in designing a nuclear explosive were not accessible to laboratory experimental physics and hinged on parameters that were still unknown. Hans's division housed a galaxy of outstanding theorists, very young and not quite so young. Hans's unique combination of technical mastery, gravitas and unimpeachable integrity allowed him to lead a team that was not predisposed to teamwork.

After the war's end, Hans returned to Cornell, and brought two brilliant young theorists with him from Los Alamos, Richard Feynman and Philip Morrison. He had grown to love Cornell and its setting in Upstate New York, for he had other attractive offers, and not only at that point. The University added a critical inducement by creating a front-line experimental physics facility, the Newman Laboratory of Nuclear Studies. A bit later, Hans and Dale Corson attracted Robert Wilson, who had headed experimental nuclear physics at Los Alamos, to leave Harvard and to become the director of the new laboratory. Together with other young Los Alamos veterans—John DeWire, Kenneth Greisen, Boyce McDaniel and William Woodward—they elevated Cornell into a world-leading center in the new field of elementary particle physics.

In the spring of 1947, Sommerfeld retired and asked Hans whether he would be willing to succeed to his chair in Munich. Hans felt very honored but declined, writing that

“unfortunately it is not possible to extinguish the last 14 years ... perhaps still more important ... is my positive attitude towards America. It occurs to me (already since many years ago) that I am much more at home in America than I was in Germany. As if I was born in Germany only by mistake, and only came to my true homeland at 28.”

The first big post-war breakthrough in basic physics came in the spring of 1947 with the discovery by Willis Lamb at Columbia of a small but critical discrepancy between the spectrum of atomic hydrogen and the prediction of Dirac’s relativistic extension of quantum mechanics. There were speculations in the air that this could be accounted for by quantum fluctuations of the electromagnetic field, but that this is actually valid was first shown by Hans during his train ride from the conference where Lamb announced his result. Hans’s somewhat slapdash but basically correct calculation was the opening shot in a revolutionary transformation of quantum electrodynamics in which Feynman at Cornell, and independently Julian Schwinger at Harvard, played the central roles. Hans, his students and post-docs participated in the very complex calculations that applications of the theory required. With one of us (EES), Hans developed the first fully relativistic quantum-mechanical description of the two-body problem, and later a completely new edition of his 1933 *Handbuch* article on atomic spectroscopy.

The complex technical and political controversies that surrounded the invention and deployment of thermonuclear weapons—the “hydrogen bomb”—faced Hans with a set of ethical dilemmas and perplexing decisions in which he relied on Rose for advice. Although he had no regrets about the development of the fission weapon at Los Alamos, because he had feared that Germany would do so, after the war he was deeply worried by this new means of destruction, and far more worried by the prospect of the H-bomb, a vastly more destructive weapon.

At first he publicly opposed development of the H-bomb, but after the first Soviet test of a fission weapon prompted President Truman to order a crash H-bomb project, Hans joined in the hope that he could demonstrate it was infeasible. When Teller and Ulam discovered how it could be done, he decided that the Soviets would also invent it and that the U.S. could not afford to be without. But he was always to be distressed that this development was not averted by a political bargain with the Soviets, and for decades continued to devote considerable effort to arms control.

This effort was both inside and outside the councils of government. The former was pursued as a member of the President’s Scientific Advisory Committee in the Johnson and Kennedy administrations, in which setting he played a critical role in the creation of the Atmospheric Test Ban Treaty, signed in 1963. But Hans did not confine his advocacy of arms control to the “inside.” Of the senior veterans of the Manhattan Project, he was the most

persistent and vocal participant in the public debates about policies regarding nuclear weapons and the related issue of ballistic missile defense.

While Hans always took an active interest in planning for the Physics Department and Newman Laboratory, he rarely took part in university-wide governance. But that changed during the campus unrest following the Willard Straight student takeover in April 1969. He co-chaired a faculty “crisis” committee, which produced an important paper, “The Academic Responsibilities of the Faculty.” This document appears as the first Appendix in the current Faculty Handbook. The following year, a University Senate was formed, and Hans agreed to serve in its first year.

Hans continued to teach and to supervise a large number of graduate students and post-docs, primarily on theoretical nuclear physics, until his official retirement in 1975. But his retirement was, indeed, only official. He devoted the ensuing three decades to front-line research in astrophysics, largely in close association with Gerald Brown of SUNY Stony Brook. Their work featured long sequences of papers on supernova explosions and on neutron star black hole binaries. Hans also wrote a number of important papers on neutrino emission from the sun, a topic closely related to his 1939 theory of stellar energy production.

Hans’s career was unique in many ways, and we mention but two. No other physicist has ever produced front line research for over 70 years. And no other faculty member has served Cornell for fully half the entire existence of the University—an institution to which he was deeply committed, and whose surroundings, culture and ambience he loved.

Edwin E. Salpeter, Saul Teukolsky, Kurt Gottfried

Cornelius Betten

November 13, 1877 — August 23, 1962

The death of Professor Emeritus Cornelius Betten gives us cause to reflect on a Cornell personality of wide and constructive influence, who left Ithaca and the campus some seventeen years ago, shortly after his retirement in 1945.

Dr. Betten, as he was generally known regardless of his other titles, began his administrative duties at Cornell University in 1915 as secretary and registrar in the College of Agriculture. When Dean Mann reorganized the administration in the College of Agriculture by placing each of the three areas of college responsibility under the jurisdiction of a vice dean, Dr. Betten was made Vice Dean of Resident Instruction, a title which was changed in 1923 to Director.

A well-trained and careful worker in biological science, Dr. Betten exhibited similar interest and ability in the problems and techniques of undergraduate instruction. His arrival in 1915 came soon after the rapid growth in the student population following the establishment of the New York State College of Agriculture, the construction of new buildings for the college, and the great increase in subject matter resulting from expanding research in agriculture. Dr. Betten sought to find thoroughly logical and scientifically based solutions to questions of organization and administration in resident instruction. It was probably disappointing to him that problems involving people and their reactions did not lend themselves to the same sort of treatments he had used in his biological studies.

His administration was characterized by hard work and much progressive improvement. Following a proposal by senior students, he organized an orientation course for freshmen in 1922 that is still being offered with various changes dictated by experience and circumstances. He fostered closer relationships between Faculty and students through a much-improved advisory system. Under his leadership the two-year program of courses in agriculture was organized and first offered in 1929. He gave strong support to the use of exceptionally good teachers for instruction, particularly in freshman courses. He had a keen interest in the development of techniques for selecting students who were qualified for instruction in agriculture and the sciences related to it.

Because of his sound judgment and dependability, Dr. Betten was a logical choice for Acting Dean of the College during the absence of Dean Mann from 1924 to 1926 and again in 1931 to 1932. He became an active leader in the

resident instruction section of the Association of Land-Grant Colleges and Universities, where he was called upon frequently for suggestions and advice.

On July 1, 1932, Dr. Betten was appointed Dean of the University Faculty. This responsibility was carried on in addition to the directorship in resident instruction until July 1, 1940, when he resigned as director to become full-time Dean of the Faculty. In this position he was extremely sensitive of the prerogatives of the Faculty. He felt keenly that he represented and was responsible for the interests of the Faculty and that he must never compromise with conflicting points of view. With him in that office the interests of the Faculty were assured full consideration. He retired from the University on June 30, 1945.

As a graduate student, Dean Betten had given major attention to the caddis flies, and this study was continued, as time permitted, for many years. He was the author of New York State Museum Bulletin 292, *The Caddis Flies or Tricoptera of New York State*, published in 1934. Some years ago he gave to the Department of Entomology at Cornell his entomological library and collection of Tricoptera from worldwide sources. The latter consisted of 4931 pinned specimens, 3123 vials of specimens preserved in alcohol, and 2833 slides.

Dean Betten was a graduate of Lake Forest College, having received the B.A. degree there in 1900 and the M.A. in 1901. He continued graduate study at Cornell University and was awarded the Ph.D. degree in 1906. This was followed by an honorary D.Sc. from Lake Forest College in 1923.

From 1915 to 1945, Dean Betten and Mrs. Betten were prominent and popular members of the University community, occupying with distinction leading roles in the academic and social life of the campus.

Henry Dietrich, William I. Myers, A. Wright Gibson

Glenn H. Beyer

August 11, 1913 — November 4, 1969

Professor Glenn H. Beyer joined Cornell University in 1947 as one of the first professors in the field of housing in the United States. Although Professor Beyer had been ill for a number of years, often working under conditions of severe personal discomfort, he provided great strength to the department program, contributed in important ways to the college and the University, and achieved a position of national leadership and international stature in the field of housing.

Professor Beyer was born in Chester, South Dakota. He received his A.B. degree from Augustana College, South Dakota, in 1935. He completed work for his Master's degree at George Washington University in 1937, with a major in economics and with minors in political science and geography. Between the years of 1937 and 1947, he served the United States government in a variety of important posts, including that of housing market analyst for the Division of Housing Coordination, becoming director of the Market Research Section of the National Housing Agency. He then went on to serve as economic and housing analyst for the Federal Housing Administration. In addition, he served as an economist in the United States Office of Housing Expediter. During this period he also lectured at the American University in Washington, D.C.

He joined the staff of the Department of Housing and Design in 1947, where he was instrumental in establishing a strong research and graduate teaching focus in the area of the socioeconomic aspect of housing.

Professor Beyer's background, scholarship, and inquiring mind provided the impetus for important research studies within the Department which have expanded the horizons of the field as well as providing basic information about the relationship of individuals, families, their housing needs, and the social and economic factors which are instrumental in satisfying these needs. He also played a key role in the creation of the Housing Research Center and was its first director. This later became Cornell's Center for Housing and Environmental Studies. He was director of the Center from its establishment in 1950 until his death. He was elected to the College of Architecture faculty at the time the Center was established. His research involvement included social science applications to housing design, marketing and distribution, consumer preferences, needs of special groups such as the aged, farm housing and problems of the rapidly growing urban-rural fringe area as well as other social and economic factors in housing.

Professor Glenn Beyer was also a prolific and excellent writer, with six major publications to his credit, including *The Urban Explosion in Latin America*, which summarized a major international meeting which brought to the Cornell campus top figures in Latin American housing and urban affairs as well as prominent scholars in these fields in the United States. His book, *Housing the Aged in Western Countries*, coauthored with F. H. J. Nierstrasz and published in Holland, called attention to the special problems revolving around an important and growing segment of many populations. His book, *Housing and Society*, has become the basic textbook for many housing courses offered in colleges and universities throughout the United States. This 600-page book covers all aspects of the role of housing in society. *Housing: A Factual Analysis* provided pertinent, basic, and valuable data useful to all those in any way connected with the problems of policy needs.

Other books dealt with the specific problem of rural housing. *Farm Housing* was prepared for the Social Science Council in cooperation with the United States Bureau of the Census. This followed a publication entitled *Farm Housing in the Northeast*. In addition to these major publications, Professor Beyer was also the author of numerous monographs, bulletins and articles dealing with housing economics, home financing, and the problems of interdisciplinary research. He was active professionally as a member of the National Committee of the National Academy of Science, from which he received a special citation for service.

Professor Beyer's major professional activities engaged him not only in national concerns relative to housing but involved him in many international aspects of housing. In 1968 he was nominated by the United States government to represent the United States as a leading authority in the United Nations Stockholm Conference of Senior Officials of National Bodies concerned with Urban and regional research.

Glenn Beyer contributed in important ways to problems of international aspects of housing, the first two assignments involving Venezuela and Mexico. He carried on under the auspices of the U. S. State Department at a time when our relations with these countries were somewhat strained, and his efforts contributed greatly to reducing these tensions. Similarly, he contributed in important ways to equally difficult problems involving Puerto Rico and Yugoslavia.

From November 1964 to January 1965 he served as a member of the Ford Foundation mission to India to advise on national housing policy. He was equally active on the national scene, where most recently he was selected as a member of the special three-week summer study group convened at Woods Hole, Massachusetts, by the Department of Housing, the Office of Science and Technology, and the executive offices of the president of the United States. He participated in national conferences and important educational institutions throughout the

country. He served as consultant to industries and government agencies, and was called as expert witness for various congressional committees on housing and related federal legislation.

Among his many honors and awards was his receipt of a one-year award from the Ford Foundation to study housing for the elderly in twelve Western European countries. He also received the Centennial Award for Distinguished Services to Profession and Education from Augustana College and a special citation awarded by the National Academy of Sciences Building Research Advisory Board for his services to the field of housing. He was listed in *Who's Who in America*, *Who's Who in the East*, *American Men of Science*, *Who Knows and What*, *Contemporary Authors*, and *The American Honorarium*. Although the facts and figures concerning Professor Beyer's professional life are relatively easily acquired and listed, the more subtle and perhaps more important contributions which Professor Beyer made in respect to improving man's environment are easily missed. His personal commitment to the field, his relentless concern for quality, his persistent pursuit of new knowledge brought to his department a position of leadership in this field and drew to the college brilliant, able, and equally dedicated young people who were guided, taught and inspired by Professor Beyer's professional concern and scholarly standards. Perhaps more than anything else these young people and their contributions to the study of human habitation will remain as the greatest tribute to this man's life pursuit.

Earl Morris, Ruby Loper, Joseph Carreiro

Knight Biggerstaff

February 28, 1906 — May 13, 2001

Knight Biggerstaff, Cornell Emeritus Professor of Chinese History and Asian Studies, died on May 13, 2001, in Ithaca, New York. Born in Berkeley, California in 1906, he belongs to a distinguished generation of scholars who, after studying together in Peking, launched Chinese studies in the universities of this country. His particular contribution was to establish Asian Studies at Cornell in addition to teaching Chinese history. He chaired the Department of Asian Studies from 1946-56, helping to create Cornell's China (later East Asia) and Southeast Asia Programs, and he chaired the History Department from 1956-63. On the national scene, he played a major role in founding the Association for Asian Studies and was its President in 1965-66. He was a pioneer in almost everything in which he was involved, and his passing marks the end of an important era in American international studies.

He completed his Bachelor's degree at the University of California in 1927, and when he began his graduate career at Harvard in the same year, he decided to concentrate on Chinese studies. At the time, his teachers told him that his should be the first generation of American scholars to learn Chinese well enough to study original historical texts. Since Harvard did not provide the necessary language training, he was sent to China.

In 1928, with no financial aid from Harvard, he borrowed \$1,000 from his father and sailed across the Pacific on the S.S. Jefferson. Upon reaching China, he took a train to Peking and from the train's window he saw, as he later recalled, "busy farmers and carefully cultivated fields, crowded villages, grave mounds, everywhere a totally new world to me." From then on, his life was centered on learning about China.

After spending a year in Peking at the North China Union Language School, he applied for a new two-year fellowship which was offered jointly by Harvard University and Yenching University, and he was selected as one of the first two Harvard-Yenching Fellows. He used this fellowship to support his language study and research at Yenching University in Peking, 1929-31. During these years, he met and courted Camilla Mills, head of the Department of Home Economics, who had been at Yenching University since 1922, and they were married in 1931. A few days after their wedding in Peking, they returned to the United States and set up a household in Cambridge where Knight completed his Ph.D. degree in 1934. At the time, Harvard's History Department had no faculty members specializing in China, so Knight was admitted to the Government Department, which approved his doctoral dissertation, "The Change in the Attitude of the Chinese Government Toward the Sending of Diplomatic Representatives Abroad, 1860-1880," and granted his degree.

On completing his Ph.D. degree, Knight received a two-year postdoctoral fellowship from the Social Science Research Council, and he used it to do research in Peking, 1934-36. For him as a research scholar, these were perhaps the most productive years of his life. He gained an impressive command of Chinese materials—historical reference works, private collections of documents, and archival materials—and he produced significant scholarly publications based on his knowledge of these sources. He and a Chinese colleague, Teng Ssu-yu, prepared the path-breaking compilation, *An Annotated Bibliography of Selected Chinese Reference Works*, which was published in 1936. Subsequently they published revised editions in 1950 and 1971 with Harvard University Press. In their lucid annotations for this volume, they set a standard for bibliographical work on China that has still not been surpassed. In addition, Knight used his research as a basis for biographical sketches which he contributed to a classic compendium, *Eminent Chinese of the Ch'ing Period (1644-1912)*, edited by Arthur W. Hummel.

During these same years, 1934-36, Knight and his circle of Chinese and Western scholars in Peking generated stimulating ideas that have had enduring significance. Completely absorbed, they made no distinction between serious academic research and the pleasures of everyday life. As Knight fondly recollected,

“It was a wonderful time to be in Peking. We consulted helpful Chinese scholars, familiarized ourselves with reference works and documentary collections, practiced the colloquial Chinese that most of us had started in the very good North China Union Language School, visited imperial palaces, temples, bookstores, and markets, walked on the city wall, hiked in the Western Hills, and took occasional trips to other parts of China.”

On their return from China, Knight and the other members of this group proceeded to create the field of Chinese studies in the United States during the late 1930s and 1940s.

In 1936, Knight became Instructor of Chinese language and History at the University of Washington and came to Cornell two years later as the first full-time faculty member specializing on China. During World War II, he directed a Cornell training program in Chinese, served in the State Department as a China specialist for six months, and was Chinese Secretary in the Chungking embassy from 1945-46. There he had the opportunity of assisting, and admiring at close quarters, General George C. Marshall, who was negotiating an interim cease-fire between the Nationalist government and the Chinese Communist Party. In the course of his duties, he met Chiang Kai-shek, Mao Tse-tung, Chou En-lai, and other prominent figures of that time.

In 1949, the year of the Communists' victory over Chiang's forces, Knight was back in China once again—this time on sabbatical from Cornell at Nanking University, where he combined his powers of observation with his sense of history to record in letters home the People's Liberation Army's takeover of the city of Nanking. Published three decades later under the title *Nanking Letters, 1949* (Cornell University East Asia Papers, 1979; reprinted 2000), the

letters are fresh, lively, and remarkably prophetic. Like several other astute American observers in China, Knight became a target of Senator Joseph McCarthy's crusade against diplomats accused of the "loss" of China. With support from Cornell's administration and help from an able civil rights lawyer, however, he was fully vindicated. In the 1950s, after weathering the political storms in his own country as well as in China, Knight resumed his scholarly work on a subject that preoccupied him throughout his career: Chinese education. His book, *The Earliest Modern Government Schools in China* (Cornell University Press, 1961), established his reputation as the acknowledged authority in this field. The durability of Knight's scholarship was evident in the decision to republish his collected essays in 1975 under the title, *Some Early Chinese Steps Toward Modernization*.

Knight's scholarly efforts to apply the concept of modernization to Chinese history helped him achieve a major breakthrough in teaching. Immediately after World War II, he became the first teacher ever to offer a course entitled, "The Modernization of China," thus introducing an approach that has been widely used by Chinese historians.

Knight's colleagues and many others will remember him for his keen sense of duty, the encouragement he invariably gave, and his generous hospitality. He was a devoted teacher of both undergraduate and graduate students, and he was among the first graduate advisors in the country to have a large number of women complete their Ph.D. degrees in Chinese history under his supervision. When Knight finally ceased to teach at Cornell, teaching was so much a part of his life that he volunteered to give a course on China at Ithaca High School, and he did so for thirteen years, 1974-87.

In his long life, Knight received many tributes to his teaching, and he was deeply touched by one that arrived unexpectedly only a few months ago. The letter came from a former student, a member of the Cornell Class of 1958, who had seen a photograph of Knight in *Cornell Magazine* in the spring of 2000. The student was prompted to express his gratitude to Knight for courses that had continued to serve as his inspiration for more than forty years.

At age ninety-four and suffering from poor vision and Parkinson's disease, Knight was unable to write, so he dictated this reply:

It was that wonderful old Chinese philosopher Wang Yang-ming (1472-1529) who said "Knowledge is the beginning of conduct; Conduct is the completion of knowledge." I take the liberty to add what he might also have said, "The student who takes the time and has the thoughtfulness to, in later years, contact his teachers, provides the teacher with his greatest reward and the student elevates himself to a best scholar status."

Knight's students and friends will not be surprised to see that he valued thoughtfulness in others and remained thoughtful himself to the end.

Knight is survived by his wife, Nancy, who is also the widow of John Echols, former Professor of Linguistics and Asian Studies at Cornell, making her the first woman to have been married to two presidents of the Association for Asian Studies.

Charles A. Peterson, David K. Wyatt, Sherman Cochran

Paulus Pieter Bijlaard

December 2, 1898 — March 9, 1967

Professor Bijlaard was a civil engineer with an international reputation in such diverse fields as civil, mechanical, and aeronautical engineering; theoretical and applied mechanics; and geophysics. His original writings are in Dutch, German, French, and English. They deal with practical problems in structural engineering, analytical and experimental research in plasticity and elastic stability, and research in the formation of folds in the earth's crust. He left more than a hundred papers covering his work in the Netherlands, East India, and the United States. He was a pioneer in the basic theory of plasticity.

Paul Bijlaard was born in Rockanje Province, Holland, December 2, 1898, and was graduated as a civil engineer from the Technical University, Delft, in 1920. During the next eight years he was a bridge engineer for the Netherlands East Indies State Railways, working on the design of bridges and other important structures. In 1928 he was appointed Professor of Bridge and Structural Engineering at the Technical University at Bandoeng, Java, a position he held until 1947. During that period he served as consultant on many steel and concrete bridges for railway and highway use, and on large dry docks and other structures for a naval base. He also investigated the plastic behavior of steel and pioneered in the theory of plasticity and its use in geophysics and in structural design. In 1936 and again in 1946 he served the University as Rector Magnificus.

Because of great savings which he was able to effect through ingenious and novel designs in the consulting services rendered the government, Queen Wilhelmina in 1941 conferred upon Professor Bijlaard knighthood in the Order of the Netherlands Lions, the highest civil award of Holland.

During much of the Japanese occupation of Java in World War II, Professor Bijlaard was a prisoner of war and was confined three years in a concentration camp. It was characteristic of him that although his diet was scarcely sufficient to sustain life, after a day of sawing logs by hand, he would devote the evening to studies in his professional field. Before his escape he found it necessary to burn his notes in order to avoid giving information to the enemy.

He was appointed in 1947 Professor of Advanced Problems on Structural Engineering, a special chair created for him, at the Technical University at Delft, Holland.

Professor Bijlaard came to Cornell as Associate Professor of Civil Engineering in February, 1949, and was made Professor in 1951. In 1957 he transferred to the Department of Mechanics, becoming Professor of Theoretical and Applied Mechanics. In 1966 he became Professor Emeritus.

Since coming to the United States Professor Bijlaard made significant contributions to several branches of engineering in connection with his consulting work. His researches into thick and thin shells have led to a more accurate analysis of pressure vessels, which is now in general use. It has immediate application to high-pressure steam generators, large chemical reaction vessels, and nuclear reactor vessels. He was able to analyze the stresses in the “sandwich plate”—two metallic sheets held apart by a light, relatively weak filler—now in use to produce locally a rigid, smooth skin for supersonic aircraft. He extended his theory of plasticity into the determination of buckling strength of plates and columns in the range beyond the elastic limit.

Professor Bijlaard’s writings are characterized by a keen insight into the actions involved, together with strict and rigorous reasoning of his analysis. His treatments were developed with the need of the engineer designer in mind. He always considered himself an engineer.

Professor Bijlaard became a naturalized citizen in 1954. On September 16, 1931, he married Claire Raden Ajoe Poean Radjainten of Bandoeng. Besides his widow, he leaves three children and two grandchildren.

His colleagues will remember Paul Bijlaard for his warm friendliness, his enthusiasm for his field of work, his eagerness to be helpful to colleagues and students, his insistence on high standards both for himself and his students. His memory will be cherished with warm affection and deep respect.

Nephi A. Christensen, Solomon C. Hollister, Edmund T. Cranch

Arthur Bing

April 18, 1916 — February 15, 2006

Professor of Horticulture, Arthur Bing, led his life and career with exceptional energy and vitality. He inspired countless students and practitioners of horticulture and taught hundreds of classes infused with wisdom and practicality. Dr. Bing brought passion and high personal standards to any situation, whether troubleshooting a problem on tulip bulbs, attacking weeds in a field plot or his vegetable garden, seeking orchid stamps for his collection, sharing chocolates with coworkers, bowling with his buddies, or having great times with his two grandsons. He was devoted to his wife, Iris, and daughter, Corinne and her family. During 34 years of employment with Cornell University, Dr. Bing was generous with his knowledge and time in support of Cooperative Extension educators and the ornamental horticulture industry. Art was feisty and unforgettable, dependably on time for everything, with a remarkable enthusiasm for life.

Born in Springfield, Massachusetts, Art attended the University of Connecticut, receiving a B.S. degree with distinction in Botany. From 1934-41, he operated his own business, Bing's Gladiolus Gardens, in Hartford, Connecticut. He attended Trinity College from 1939-40 and began studies at Cornell University in 1940—but six months later was drafted and served from August 1941 to February 1946 with the U.S. Army Corps of Engineers. He was commissioned as First Lieutenant in 1942. Art taught camouflage and demolition at Ft. Belvoir and served in the South Pacific during World War II. Returning to Cornell after the war, Art was awarded a Ph.D. degree in Plant Physiology in 1949 with minors in Plant Breeding and Floriculture.

Art was hired by Cornell in 1949 as an Assistant Professor in the Department of Floriculture and Ornamental Horticulture, and promoted to Professor of Floriculture in 1967. He initially taught courses and conducted research on culture and post-harvest handling of flower crops at the Ithaca campus. In July 1951, he relocated to Long Island to direct the Cornell University-USDA Ornamentals Laboratory on the campus of the SUNY Agricultural and Technical College at Farmingdale. Art was very effective at securing financial support (from NYS Flower Growers, Inc. and the NY Florists Club, in particular) for construction of a new laboratory there. In addition to his administrative duties, he conducted research on weed control in gladiolus and other flower crops.

The last part of Art's career focused mainly on extension and research on weed control of ornamental plants in nurseries, greenhouses, turf and landscapes. When the Cornell ornamentals program was moved east to the Long Island Horticultural Research Laboratory in 1977, he continued an active research and extension program in

Riverhead. He was named Professor Emeritus at his retirement on May 31, 1983 and was honored at a testimonial dinner at Planting Fields Arboretum. Art taught at SUNY Farmingdale and the New York Botanical Garden both before and after his retirement, continuing to teach at Farmingdale until 2000.

An irrepressibly sociable person, Art was a supportive member of many professional societies, serving as president of the New York Florists Club, the Long Island Flower Growers and the Northeastern Weed Science Society. Art was chairman of the research committee of the North American Gladiolus Council and research editor of their bulletin for many years. Art was also active in his community and contributed in many ways to the beautification of his town: he belonged to the Friends of Planting Fields and the Cornell Club of Long Island, was a member of the Huntington Beautification Council and served as president of the Huntington Festival Concert Society. He was also a member of the South Huntington Public Library Board of Trustees.

Many awards followed from Art's exceptional commitment and service to numerous organizations. To mention just a few: in 1961, he received the Gold Medal Award from the North American Gladiolus Council for his efforts in the culture, weed control and post-harvest handling of cut flowers; in 1983, he received the Award of Merit from the Northeastern Weed Science Society; and in 1986, he became the fifth recipient of the NYS Gold Medal of Horticulture award, given jointly by the NYS Dept. of Agriculture and Markets and the NYS Nurserymen's Association—his name is inscribed in the Horticulture Court of Honor at the State Fairgrounds in Syracuse. Rhododendron breeder, Nat Hess, also named a beautiful white rhododendron "Art Bing" after his fellow horticulturist and friend.

Art's weed science research included studies of the effectiveness and crop safety for many different herbicides used in the production of ornamental plants in greenhouses and nurseries, as well as for hard-to-control weeds in lawns. He was truly a pioneer in the use of herbicides in ornamentals, and made strong contributions to the federal government's IR-4 program that facilitates pesticide registrations for minor crops. He also conducted trials comparing turfgrass varieties under Long Island conditions, and worked collaboratively with USDA-ARS scientists on studies of reflective mulch to repel aphids from gladiolus.

Art authored over 120 research publications. His articles were published in many places including *American Nurseryman*, *Greenhouse Manager*, the *Bulletin* of the North American Gladiolus Council and *The New York Times*. Art was a very popular and effective speaker at Cornell Cooperative Extension and horticultural trade meetings. The knowledge of weed control practices that he generated and disseminated continues to serve

horticultural professionals throughout the Northeast. Art will be long remembered for his extensive and freely shared horticultural expertise and for his irrepressible, high-kicking spirit.

George Good, Andy Senesac, Margery Daughtrey

Raymond R. Birch

March 30, 1881 — July 26, 1959

In the death of Professor Emeritus Raymond R. Birch on July 26, 1959, Cornell lost a distinguished educator of nearly forty years' service, and the veterinary profession a wise counselor and leader. Dr. Birch retired in 1949 as Professor of Veterinary Research and head of the Veterinary Experiment Station. A life-long lover of the soil and animals, he spent the ten years of his retirement managing his farm in a near-by community. No land received better care or responded more bountifully; it was a case of mutual love and understanding.

Basically conservative, Professor Birch never reported a research project or propounded a basic principle of disease or disease control unless it was based on sound scientific evidence. He brooked no deviation from truth. Expediency was never permitted to compromise fact. Because he was a lover of lucid, understandable English, readers of his numerous publications were never at loss to understand his meaning. His research reports were clear, concise, and capable of exact duplication. His wise and friendly counsel was often sought and at all times freely given.

Dr. Birch was born on a farm, March 30, 1881, at Zeandale, Kansas. He was continuously associated with farming and animal production. In 1906 Kansas State College granted him the degree of B.S. Agr.; he had majored in animal husbandry. Immediately after graduation he went to the Philippines where, for two years, he did outstanding work in the control of foot-and-mouth disease and rinderpest. Realizing his lack of education and training in animal diseases he resigned the position and entered the New York State Veterinary College. Dean Moore in 1910 appointed him, while he was still a student, instructor of pathology and head of the Experiment Station, then little more than an abandoned farm. In 1911 he married Olive McKeeman and lived at the Station until his retirement. Cornell University granted him the degree of D.V.M. in 1912 and Ph.D. in 1916.

Hog cholera studies engaged most of his time from 1909 to 1921. Together with Dr. Milks he initiated hog cholera serum and virus production in New York. He conclusively proved that hog cholera is transmitted by uncooked pork trimmings, and that standard meat inspection methods failed to prevent spread of the disease by this means. The tenets laid down in his book on hog cholera are as sound today as the day they were written.

After the retirement of Dr. W. L. Williams in 1921, Dr. Birch changed his major research from diseases of hogs to brucellosis of cattle. Brucellosis had been for many years a widespread disease resulting in great economic loss to cattle owners. Against great opposition, he proved that brucellosis was a true infectious disease and that it could be controlled by the application of the basic principles his research revealed. Not content with an experimental herd,

he carried his methods to the farm and put them into practical application. At one time he supervised fifty-two herds containing over five thousand cattle scattered throughout the state. Use of these so-called “demonstration” herds illustrated his principle of leadership by example and education. Dr. Birch was often criticized for his conservatism in the acceptance of vaccination against the disease. Early attempts by others had resulted in failure. He demanded that the method be economically and biologically sound before its widespread use in the field. When his research and that of others proved the method to be sound he was one of the first to advocate its use. He formulated the early official regulations for state control of the disease. As a result, New York and many other states are now virtually free of the disease.

For almost thirty years he saw almost continuous duty on disease control committees. His teaching of the subject of animal health to agriculture students was widely praised and appreciated by animal owners and veterinarians alike. He was the author of numerous publications on hog cholera and reproductive diseases of cattle. Many graduate students serving under him later assumed positions of responsibility in teaching, research, and official disease control agencies.

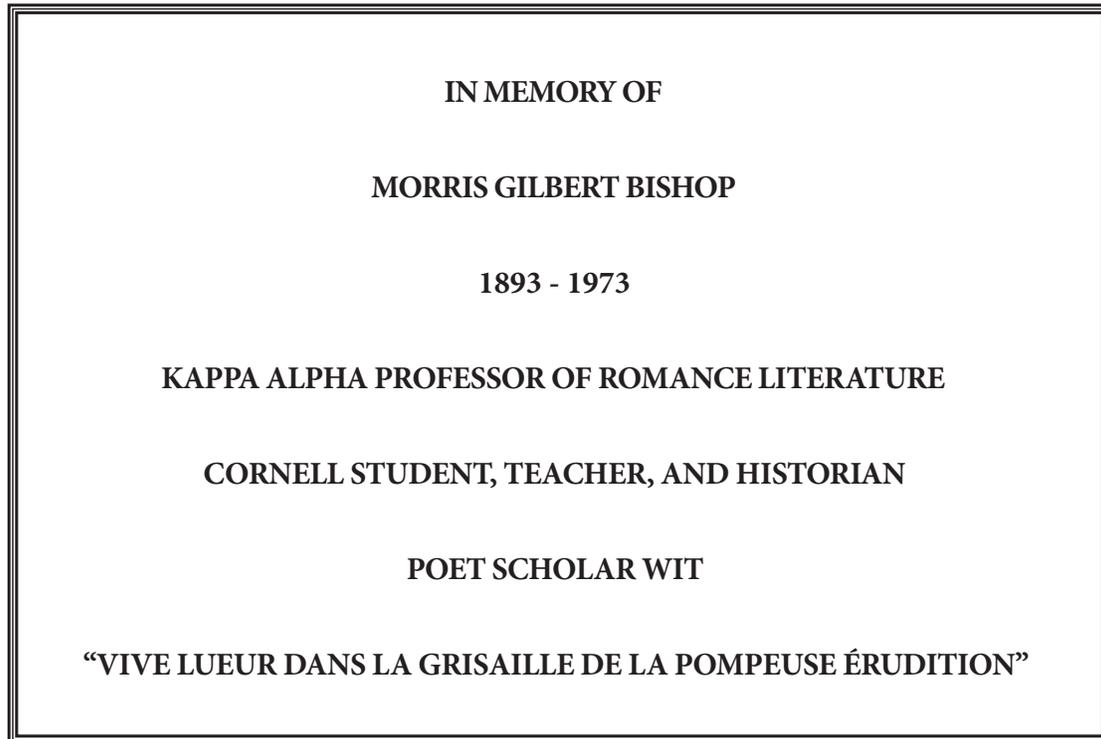

Dr. Birch was the first member of the Faculty of the New York State Veterinary College to receive the Borden Award for distinguished work in the control of disease in dairy cattle. In 1926 he was awarded a Rockefeller Foundation scholarship for study in Europe. He was a member of the Procurement and Assignment Service, Second Call Area, U. S. Army, from 1942 to the end of World War II, accomplishing his task with distinction. Soon after the war, he served as a member of a commission to survey veterinary colleges and services in Europe.

Dr. Birch was past master of Hobasco Lodge 716, Free and Accepted Masons, and past president of the Ithaca Rotary Club.

H. L. Gilman, D. W. Baker, M. G. Fincher

Morris Gilbert Bishop

April 15, 1893 — November 20, 1973

So reads the bronze plaque placed on the wall of Sage Chapel as a tribute to Morris Bishop's association with Cornell, his long and devoted service to the University, and to the rare quality of the man. The plaque reminds us that he did, indeed, as writer and teacher enliven his most serious scholarship with shafts of wit and gentle irony.

Born in Willard, New York, the son of Dr. Edwin R. Bishop, he entered Cornell with a scholarship in 1910, earned the Bachelor of Arts degree in 1913, and the M.A. a year later. His first employment was in Boston with the educational publishers, Ginn and Company (1914-17). The concern kept his position for him throughout his military service. First, he joined a Boston cavalry troop and served under the command of General Pershing during the Texas border war against Pancho Villa (1916). Then he was a lieutenant in the infantry in World War I, after which he worked with the American Relief Administration in Finland. His third wartime experience was during World War II when he served for three years in the Office of War Information in New York, London, France and Luxembourg.

After World War I Morris Bishop worked in advertising in New York. He returned to Cornell in 1921 and received the Ph.D. in 1926. Appointed instructor in the Department of Romance Languages, promoted to professor in

1936, he was named two years later to the newly created Kappa Alpha Chair in Romance Literature. Retirement as emeritus professor in 1960 ended neither his association with Cornell nor his remarkable productivity as a writer. In anticipation of the centennial celebration, President Deane W. Malott commissioned Morris Bishop to write a full-scale history of Cornell. The result was an eminently readable combination of research, anecdotes, memories and wit.

Morris Bishop's professional career was varied and rich with honors. In 1951 he was chosen Fulbright Visiting Professor in American Literature and Civilization in Athens, Greece. Deeply involved for many years in the work of the Modern Language Association, he was elected president of that large and heterogeneous body in 1964. He was named to the American Academy of Arts and Sciences and to the National Institute of Arts and Letters. After his retirement he held visiting professorships at Wells College, Rice

University and the University of Indiana. For his work with the American Relief Administration he was named a Knight of the White Rose (Finland); France honored him as Officier d'Academie (1938) and as Chevalier de la Legion d'Honneur (1947). He was awarded honorary degrees by the University of Rennes in France, Laval University in Quebec, and several American institutions.

Cornellians tend to think of Morris Bishop as particularly their own, as in a sense he was. As an undergraduate he was an outstanding student, graduating in three years, was honored by membership in Phi Beta Kappa, and won the Morrison Poetry Prize, an award which so encouraged him that he recently contributed funds to ensure annual awards in the future. Both as undergraduate and as a young faculty member he wrote for the *Cornell Daily Sun* and was a star contributor to the *Sun's* once famous Berry Patch column. For over sixty years he took part in University activities that ranged from the frivolous to the ceremonial, from a hilarious "Masque" in the White Art Museum, or a reading of "Peter and the Wolf" in Bailey Hall, to reading Scripture at Christmastime in a crowded Sage Chapel. His colleagues nominated him a faculty trustee, in which capacity he served from 1957 to 1961. For a number of years Morris Bishop acted as marshal at the Commencement exercises, pronouncing the names of doctoral candidates, regardless of their nationality, in stentorian tones of great style and authority. Asked by a colleague how he managed such a feat, he responded, "Why, I just pronounce the names as though they were correct," adding that it was perhaps the first time the candidate realized how his name should sound. Later, and on one occasion with notable drama, Morris Bishop was Commencement macebearer. Still later, he opened the ceremonies with welcoming comments, usually on some Cornell theme. In 1972, for example, he spoke of the

Cornell character, the belief “in the fundamental goodness of men and women, in the world’s betterment through the individual’s struggle for good, in the reality of duty and decency and self-sacrifice, in the rejection of meanness and cruelty and double-dealing, in personal honor as a sufficient guide and goal of behavior.”

Morris Bishop was a conscientious citizen of Ithaca. He was a member of the Unitarian Church, and he supported with his presence and his purse the causes he believed in. Among these were the Tompkins County Historical Society and Historic Ithaca.

Very early Morris Bishop began writing light verse and prose for the old *Life*, *Judge* and *The Saturday Evening Post*. Later, like his friends Frank Sullivan and E. B. White, he was for many years associated with the *New Yorker* magazine to which he contributed chiselled and charming light verse as well as frequent prose pieces. Three books of his verse resulted, and many of the *New Yorker* writings have reappeared widely in anthologies.

But it was as a scholar and man of letters that Morris Bishop was especially esteemed in this country and abroad. A man of wide culture, at home in many languages, he cared deeply about good literary style and practiced it with elegance and deceptive simplicity all his many years. His special forte was history cast in the biographical mold, so written as to bring the past and its actors to a broad literate public. Frank Sullivan was so impressed by his energy, enthusiasm and breadth of interest as a writer and scholar that he believed Morris Bishop had “been privately blessed with a 48-hour day.” His output was indeed prodigious, numbering more than four hundred published works, including sixteen books. Among these one may single out his biographies of Blaise Pascal, of Samuel de Champlain, of the Spanish explorer Cabeza de Vaca, of Ronsard, the poet of the French Renaissance, and of the French ironist and writer of maxims, La Rochefoucauld.

During the last dozen years of Morris Bishop’s life he wrote historical and biographical articles for *Horizon* and *American Heritage*, and was the author of the *Horizon Book of the Middle Ages*. At the time of his death he had just completed a study of St. Francis of Assisi, soon to appear, and was working on a biography of Cola di Rienzi.

Among Morris Bishop’s most memorable contributions was his work on Petrarch. A series of lectures at the University of Indiana in 1962 grew into a book, *Petrarch and His World*, a remarkably perceptive study of that complex and humane genius with whom, both as scholar and poet, he had a profound affinity. This affinity made him not only a splendid portrayer of Petrarch the man, but translator of his *Letters* and many of the *Rime*. Late in his retirement Morris Bishop was an obvious choice to be curator of Cornell’s great Fiske Petrarch collection, of

which he finished a new annotated catalogue. For his contributions to Petrarch scholarship, at a World Petrarch Congress held in Washington in April 1974, on the 600th anniversary of the death of the Italian poet and humanist, Morris Bishop was awarded posthumously a commemorative gold medal as one of six great American “Italianisti.”

A humanist in the real sense of the word, Morris Bishop looked upon the world with perception and an ironic eye, with kindness and a saving sense of the absurd — including some of the absurdities of academic life. He was a warm friend, a stimulating companion, ever generous in his encouragement to aspiring writers. Not the least of his legacies must be a heightened and lasting appreciation of good writing among those who admired him.

In all of his interests he was ably assisted and encouraged by his wife, Alison Mason Kingsbury, an artist who illustrated many of his books. His wife, their daughter, Alison (Mrs. A. R. Jolly of the class of 1958), and four grandchildren survive this much loved teacher.

John C. Adams, Henry Guerlac, Deane W. Malott, Paul M. O’Leary, Blanchard L. Rideout

Harry Bitner

July 22, 1916 — May 5, 2001

Harry Bitner had a profound influence on law librarianship as a profession and legal research as a faculty specialization. He is responsible for some of the key elements and essential features of law librarianship that the profession now takes for granted. Many of Harry's innovations occurred while he was at Cornell.

Harry received his J.D. degree in 1939 and his A.B. degree in 1941, both from the University of Kansas City (where he was a member of the University of Kansas City Law Review); and his B.S. L.S. degree from the University of Illinois in 1942. He served as Law Librarian, 1939-42, and Instructor in Law, 1942-43, at the University of Kansas City Law School. His academic career was interrupted by Army service, with successive promotions from private to technical sergeant, 1943-46. Following his return to civilian life, he served briefly in 1946 as Reference Law Librarian, Biddle Law Library, University of Pennsylvania Law School. In the same year, he had the good fortune to become Associate Law Librarian at the Columbia Law School, under Miles O. Price, the recognized Nestor of law school librarians. During eight years at Columbia, he co-authored with Price their magisterial book, *Effective Legal Research* (1953). It was the first standard work on legal research, and, with its later editions, is still widely considered to be the best book in the field.

Harry next became Librarian for the Department of Justice, 1954-57; Law Librarian, Yale Law School, 1957-65; Professor of Law and Law Librarian, Cornell Law School, 1965-76, retiring as Professor of Law and Law Librarian, Emeritus, 1976. Following his Cornell retirement, he and his wife, Anne, moved to New York City's suburbia, where they could be closer to their daughter, Lorraine Gilden and her family. At the same time, Harry continued his professional work as a bibliographer and law library consultant, first as Head of Bibliographic Services at Fred B. Rothman & Co., 1976-78, and then as Legal Bibliographer at Columbia University, 1978-89.

In 1960, Harry had his first major contact with Cornell and its Law School. With the strong support of both the Cornell administration and the University Librarian, the Law School invited a team of two outstanding law school librarians, Price of Columbia and Bitner of Yale, to come to Ithaca, review the Law Library and its problems, and advise us what would be necessary in order to make the library and staff fully competitive with the best law libraries at the top ranked smaller university law schools (i.e. University of California at Berkeley, University of Chicago, Stanford and Yale). They spent several days and prepared a very comprehensive and helpful report of their recommendations, including the estimated costs of additional books to be added to our collection and

the substantial increase in the number of properly trained staff members. With President Malott's enthusiastic support, the law library budget became a part of the University library budget and would no longer be dependent on funds from law student tuition.

In 1965, Professor Lewis W. Morse retired as librarian. The first choice to succeed Lew was, of course, Yale's Harry Bitner. The invitation to Harry included an appointment as Professor of Law, together with a commitment to finance every recommendation that Miles Price and he had made in their 1960 report. He promptly accepted.

When Harry Bitner arrived at Cornell in 1965, it was definitely his goal to implement the 1960 consultants' report that he and Miles Price had written together. As the Law School's first professionally trained Law Librarian, he played a particularly vital role in the development of both the book collection and the staff. He introduced scientific methods and standards to library processes, and brought professional acumen to the organization and staffing of the library. He substantially improved all areas of the law library, expanded and reorganized the staff, increased and classified the collection, and developed services to faculty and students. He started a new program of instruction in legal bibliography as part of the first-year curriculum. He was also responsive whenever feasible to student requests, including keeping the library open for more hours and providing copy services.

Harry gave his immediate attention to the preparation of the budget and the organization of the law library. He promptly increased the size of the staff from eleven to sixteen, and at the height of his Cornell career, the library staff totaled twenty-six. In strengthening the collection, he increased the number of legal treatises and related material in the social sciences with substantial emphasis on the acquisition of international and foreign law materials, particularly those of Latin America. In 1966-67, the total number of volumes in the collection was 205,456 and book expenditures were \$119,678. In 1974-75, the collection passed the 300,000-volume mark and annual book expenditures had increased to \$208,800.

In the words of his secretary, Crystal Hackett, who has worked at the Cornell Law Library from 1964 to date:

"He had a commitment to his staff. He fought to raise the status of the professional librarians with the University and improve working conditions for the staff. And he won! He would listen to the faculty, students, and staff. He cared about them."

Crystal Hackett remembers him as a

"quiet, gentle giant. People who did not know him were afraid of him at first, but were quickly put at ease when he started talking. He enjoyed getting to know people, and would ask about their families."

During his eleven years as Cornell's Law Librarian, as well as his preceding eight years as Law Librarian at Yale, Harry was active as a leading figure in the American Association of Law Libraries (AALL), serving a term as its President, as had his mentor, Miles Price. He also was responsible for other important Association projects earning wide respect among AALL members. Professor Morris L. Cohen, one of Harry's successors as Yale's Law Librarian, stated:

"Harry Bitner must certainly be counted among the giants of law librarianship. He was a quiet and gentle man, but a giant in mind and heart and in his many contributions to our profession."

Even in an era of wide sweeping, revolutionary changes in the production and dissemination of legal information, Harry Bitner still epitomizes the qualities that make for a great academic law librarian:

- serving faculty and students, first and foremost;
- building strong collections—in his time books were only printed, now increasingly they are digital—of Anglo-American law, and also international and foreign law;
- critically evaluating legal scholarship and using expert bibliographical skills; and
- sharing knowledge about legal information and teaching legal research methods.

He is remembered as a man of many talents who was most generous in sharing his vast knowledge with younger librarians. His law library colleagues remember him as a librarian extraordinaire and a fine gentleman. The Cornell alumni remember Professor Bitner as a beloved and enthusiastic teacher whose impact was felt by all of his students.

All in all, Harry Bitner is an inspiration to us all, and a model to follow. His memory lives with us every day.

Faust Rossi, Gray Thoron, Claire Germain

James Adrian Bizzell

April 13, 1876 — November 1, 1944

After 43 years of association with Cornell University, James Adrian Bizzell, successively graduate student and fellow, experiment station chemist, assistant professor, professor, and professor emeritus, died on November 1, 1944 at the age of 68 years. During a long period he has served New York State and Cornell University faithfully and well. Primarily engaged in research work Professor Bizzell's investigations contributed notably to the chemistry of soils and crops. His publications are universally recognized as authoritative and conclusive. Many graduate students are proud to have worked under his direction and are sorrowed by his death but will cherish their association with him in classroom and laboratory.

James Adrian Bizzell was born on a farm near Fayetteville, North Carolina, on April 13, 1876. Here he spent his early years and here he acquired an agricultural background that served him well in later life. His first formal education was obtained in the country school of his district. Later he attended the Fayetteville grade schools and at the age of 15 years entered the State Agricultural and Mechanical College at Raleigh, North Carolina. His Alma Mater, recognizing his abilities, retained him for a time as an instructor of chemistry and as an assistant chemist in the State Agricultural Experiment Station. During this four-year period he completed the requirements for a Master of Science degree, which was conferred in 1900.

Due to the influence of his professor of chemistry, Dr. W. A. Withers, who had been an enthusiastic and admiring student of Professor George C. Caldwell at Cornell University, James A. Bizzell decided to continue his chemical studies at Cornell. Consequently he enrolled in the Department of Chemistry in the fall of 1901. Early in the semester he was granted a fellowship on the recommendation of Professor Caldwell, then chairman of the department. His chemical studies during the next two years were under the direction of Professor George W. Cavanaugh, who later succeeded Dr. Caldwell as Professor of Agricultural Chemistry. In 1903 James A. Bizzell received the degree of Doctor of Philosophy from Cornell University.

From 1903 to 1907 Dr. Bizzell, still under the direction of Professor Cavanaugh, served as assistant chemist in the Cornell Agricultural Experiment Station. During this time his interest and experience in agricultural chemistry developed in such a way as to make him the logical selection for a position in the New York State College of Agriculture—that of Assistant Professor of Soil Technology in the Department of Soil Investigations established in 1906. In this more highly specialized field he was associated from the very first with the late Dr. T. Lyttleton

Lyon, a Cornell Graduate who at that time returned to the University as head of this newly created department. The joint research of these two men during the succeeding thirty years was destined to make history in the field of soil science. Their names are irrevocably linked by the joint authorship of their publications. Advanced to a full professorship in 1912, Professor Bizzell continued active in his chosen research until July 1, 1944, when he retired as Emeritus Professor of Soil Technology.

The published research of James Adrian Bizzell in association with T. Lyttleton Lyon is well known to every soil scientist both at home and abroad. Written with scrupulous care, each publication, whether a memoir, bulletin, or journal article, attests the accuracy and completeness of the project and the soundness of the conclusions drawn. Of highest merit perhaps are the studies of the losses of plant nutrients in soil drainage as measured by lysimeters, the influence of plants on nitrate accumulation in soils and upon succeeding crops, the intricacies of nitrogen mobilization in soils, and the economic fertilization of crop rotations. These investigations have contributed greatly to the solution of various important agronomic problems both practical and theoretical. With the death of James Adrian Bizzell the associated research of Drs. Lyon and Bizzell comes to a close, their accomplishments leaving the science and practice of agriculture immeasurably richer.

In disposition James Adrian Bizzell was modest and retiring, in his opinions, cautious, yet tenacious once his decisions were made. He never pushed himself forward or commented on his own accomplishments, yet he was the type of man who could do unusually well whatever he chose to attempt. Cheerful, kindly, and of even temper, he made friends readily and was always a welcome addition to any group. There is a deep feeling of loss in the passing of Professor Bizzell.

Max Black

February 24, 1909 — August 27, 1988

A world-renowned philosopher, Max Black, the Susan Linn Sage Professor of Philosophy and Humane Letters, Emeritus, and Senior Member of the Program on Science, Technology and Society, died on August 27, 1988. He had taught at Cornell for thirty-one years, and had a marked influence on countless students, and as the founding director of the Society for the Humanities, and the Program for Andrew D. White Professors-at-Large.

He was born on February 24, 1909 at Baku, now capital of the Azerbaijan Soviet Socialist Republic. When he was three years old, his parents emigrated and settled in England, which they cherished as a land of freedom and religious toleration. He attended a free school in north London, but at the age of nine he was, on the recommendation of the school's headmaster, admitted to Owen's School, an ancient and well-regarded public (in the English sense) school, where he remained until the age of eighteen. He then went to Queen's College, Cambridge, on scholarships, and received the B.A. degree with honors in mathematics in 1930. In college he concentrated heavily on mathematics. He spent the following academic year at the University of Göttingen, where he studied under Paul Bernays, Hermann Weyl, and David Hilbert, and other famous mathematicians and logicians. He spent the following five years as a mathematics master at the Royal Grammar School at Newcastle upon Tyne, and then for four years was a tutor in mathematics at the teacher-training Institute of Education, at the University of London.

In his second year as a undergraduate student at Queen's, some students at Girton College stimulated Black's interest in philosophy, and he became a member of the Moral Science Club, where he met Bertrand Russell, G.E. Moore, Frank Ramsey and the other leading philosophers. He also met I. A. Richards, C.K. Ogden, and William Empson. He became a close friend of Susan Stebbing, who was a major influence in his life. He also attended many meetings of the Aristotelian Society. Thus his interests broadened out of mathematics and the philosophy of mathematics to logic, semantics, philosophy of science, logical positivism, and literary theory and criticism. During the years when he was teaching at the Institute of Education, he took graduate work at the University of London, and was awarded the Ph.D. degree in 1939 for his dissertation on theories of logical positivism. As a graduate student his concentration was on mathematical logic. Perhaps it was through Ramsey, who was one of the first to expound the early teachings of Wittgenstein, that Black met Wittgenstein and read his *Tractatus Logico-Philosophicus*.

An especially notable event in Black's life occurred in his last year at Queen's. Ogden, who was General Editor of the International Library of Psychology, Philosophy and Scientific Method, published by Kegan Paul, asked Black if he would write a book for the series. He was then twenty-one years of age. Black accepted the offer, and three years later, in 1933, *The Nature of Mathematics* was published in the series. The book is still in print.

While still a student at Owen's School, Black taught himself chess from an article in the *Encyclopedia Britannica* (11th ed.), and before long he was good enough to compete in British and international tournaments. At Queen's he was captain of the Cambridge chess club, and was on his way to becoming a chess master, but he could not afford to become a professional player; besides, his other intellectual pursuits would not allow exclusive concentration on chess; however, chess-playing remained a life-long interest and enjoyment. He collected and knew the contents of about a hundred books on chess.

A sharp turning point in Black's career came about in 1940, when he received an offer of a full professorship in philosophy from the University of Illinois at Urbana. Until then he had taught mathematics, and held no professorship. Teaching positions in Great Britain at that time were scarce, as they were also in the United States. The position at Illinois became available because Arthur E. Murphy, head of the department, was in England on a sabbatical and had instructions to rebuild the department by appointing outstanding young scholars. He recognized in Black all of the qualifications for which he was searching. Black readily accepted, and he and his family (Michal, whom he had married in 1933, and their two children) moved to Urbana, with the expectation, however, that they would return to England after a few years. But in September 1939 Britain declared war on Germany, and in December 1941 the United States entered the war, so naturally Black's expectations of an attractive offer from England weakened considerably. In 1946 Murphy became head of the Philosophy Department at Cornell, and he invited Black to join him. Accordingly, Black accepted an appointment as full professor of philosophy at Cornell, and began to teach in September 1946. Two years later he became a naturalized United States citizen. In 1954 Black was named the Susan Linn Sage Professor of Philosophy and Humane Letters, and in 1971 he became also Senior Member of the Program on Science, Technology and Society. After thirty-one years of teaching, he retired in 1977 and was named professor emeritus; however, he retained his position at STS until his death.

During his teaching years at Cornell, Black offered a total of fifty-five courses in logic, semantics, philosophy of mathematics, philosophy of science, philosophy of social science, philosophy of logic, philosophy and literary criticism, and philosophy of choice and decision.

Before coming to the United States, Black had published *The Nature of Mathematics* and articles and reviews in the *Proceedings of the Aristotelian Society*, *Mind* and other leading philosophical journals. He also translated works of Gottlob Frege and Rudolph Carnap. While at Illinois he wrote numerous articles and reviews for *Mind*, the *Journal of Philosophy*, the *Journal of Symbolic Logic* (of which he was an editor), the *Philosophical Review*, and other scholarly philosophical journals. In 1946 he published *Critical Thinking*, a widely-used textbook that appeared in numerous editions.

Black's major creative years as a scholar were those that he spent at Cornell. During those years he published an additional eight books, including *Language and Philosophy* (1949), *Models and Metaphors: Studies in Language and Philosophy* (1962), and *A Companion to Wittgenstein's Tractatus* (1965). The bibliography of Black's publications lists 242 items through only 1979. He continued to write, edit, and publish during the remaining nine years, including *The Prevalence of Humbug* (1983). At his death, he left another book—his eleventh—*Perplexities*, composed of previously published articles, which was being prepared for publication in 1989. Black also edited five books, including *The Social Theories of Talcott Parsons* (1961) and *The Morality of Scholarship* (1967). He was General Editor of the Contemporary Philosophy Series of fifteen books published by Cornell University Press. He wrote numerous articles for leading encyclopedias, and was philosophy consultant for *Random House Dictionary of the English Language*. Over a period of two decades Black served frequently as an editor of *The Philosophical Review* and played an important role in making it one of the leading philosophical journals in the world. Black's writings have been discussed and cited innumerable times, and several of his books have been translated into Spanish, Italian, Hebrew, Japanese, Greek, French and German.

His writings brought Black invitations to teach or lecture at many American and foreign universities. He was in Israel eight times and taught and lectured at the Hebrew University in Jerusalem, where he established firm friendships. He also lectured in Australia, the Scandinavian countries, Japan, and India. In 1978 he delivered the Tarner Lectures at Trinity College, Cambridge, and was a visiting fellow of Clare Hall, Cambridge, at St. John's College and Wolfson College, Oxford. In recent years he was a visiting professor at Hamilton College, the University of California at Irvine, and the University of New Mexico. He was a member of the Institute for Advanced Study at Princeton, and a fellow at the Center for Advanced Study of the Behavioral Sciences at Stanford, and the National Humanities Center in North Carolina. He was also a Guggenheim Fellow in 1950-51.

Black was a Fellow of the American Academy of Arts and Sciences. He was president of the American Philosophical Association (Eastern Division), and was the first American member to be president (1981-84) of the

Institut International de Philosophie (an international academy with a membership limited to about a hundred philosophers, based in Paris and supported by the French government).

At Cornell, Black served on numerous faculty and presidential committees. In 1965, as a member of a presidential commission to help plan the centenary of the founding of the University, Black proposed the establishment of the Society for the Humanities, broadly conceived as “embracing not only literary studies and the fine arts, but all subjects ... to the extent that they concern themselves with human values and problems of moral decision.” Black served as director of the Society from its founding in 1965 to 1971. At the same time Black also proposed the establishment of the Program for A.D. White Professors-at-Large, for persons “who have achieved outstanding international distinction in the humanities, the natural or social sciences, or the learned professions, or have achieved such distinction ... in such fields as public affairs, literature, or the creative arts.” Black served as director of the Program from the time of its founding in 1965 to 1978.

In a retrospective statement of his conception of his work and position as a philosopher, Black wrote in 1987:

On the whole I see my work as having been marked by concern for reasonableness, restrained by a conviction that rationality is not enough; commitment to common sense of a kind that does not shy away from science and philosophy; appreciation and distrust of abstract models; as much interest in unformulated stratagems and implicit understandings of speech as in the normative codes of grammar and logic.

Though no enemy of theory, I have always been interested, like a poet, in minute particulars. Striving to live in “uncertainty, mysteries, doubt, without any irritable reaching after fact and reason” (Keats) is occasionally rewarded by calm and exhilarated contemplation: it is a well-kept secret that philosophical investigation, like music, can be enjoyable. For glimpses of my own “way of life”, a curious reader is referred especially to the essays on humaneness and humbug in *The Prevalence of Humbug* (1983)], with their emphasis on “fellow feeling” and respect for the integrity of other human beings: my moral position can be crystallized in the ... maxim, “Do no harm.”

Max Black belonged to no philosophical school and created none. Although often referred to as an ordinary language philosopher, he preferred to think of himself as a logician, as someone devoted to conceptual clarification and to combatting “muddle and confusion.”

When Morris R. Cohen was reproached by a student for being so overly critical or negative, he replied: “You have heard the story of how Hercules cleaned the Augean stables. He took all the dirt and manure out and left them

clean. You ask me: 'What did he leave in their stead?' I answer: 'Isn't it enough to have cleaned the stables?'" Max Black could very well have offered the same answer. He devoted the major part of his life to combatting muddle and confusion. That was certainly time well-spent. Two months before his death, the Provost's Commission on Undergraduate Education sponsored a public lecture by Black on the question: "Is There a Crisis in Higher Education?" The audience that came to hear him filled the Kaufmann Auditorium in Goldwin Smith Hall. Black's reputation for incisive thought, critical acumen, studied analysis, common sense and creative insight will persist as his writings continue to attract and be studied by a world-wide family of thinkers.

M.H. Abrams, Sydney S. Shoemaker, Benjamin M. Siegel, Milton E. Konvitz

Richard Black

November 2, 1926 — September 27, 1998

Dick Black came to Cornell from the University of Illinois in 1959, at a time when the Agricultural Engineering Department (now Agricultural and Biological Engineering) was in transition from a department that was very applied, to one that could meet the needs of the rapidly changing agricultural sector in New York and the country. It was a time with increasing emphasis on research as well as strengthening the department's teaching program. Dick brought an unusual combination of skills very appropriate to the period. He coupled a genuine interest in the problems farmers faced with a willingness to address those problems through research in the field setting. He had a special skill in designing and implementing research that involved the real-world complexities of the natural environment. Dick was an artisan, with a range of skills unusual for an academic. He was an accomplished machinist, metalworker and carpenter, and used all of these skills in carrying out his research program. This program, centered on the drainage problems characteristic of New York, was one of the earliest that linked theory with the realities of a very heterogeneous physical situation characteristic of much of the state.

In addition to his research on agricultural drainage, Dick carried heavy teaching and advising responsibilities. He taught in both the department's technical program in the College of Agriculture, and the relatively new professionally oriented program carried out cooperatively with the College of Engineering. While he contributed substantially to the latter, including the development of the department's hydraulics laboratory, Dick's special forte was working with the department's "transfer" students in the technical program. These students, many from the state's agricultural and technical institutes, had special needs that Dick was able to meet. He was faculty advisor to most of these students, and was instrumental in their success.

With his boundless energy, Dick also was involved with the Department's Extension program. He was a strong advocate for the formation of the New York State Land Improvement Contractor's Association, and served as Secretary to the Association for a number of years.

Dick was an outdoorsman, with an avid interest in hunting and fishing. He shared these interests with youth in the community, through service as a leader in the Boy Scouts. He was a warm and generous individual, always willing to assist others.

In 1982, a combination of increasing interest in the area of extension, and the lure of returning to the mid-west, caused Dick to accept a position of Professor of Extension at the University of Kansas, where he remained until

retirement. He was a Professor Emeritus at both Cornell University and the University of Kansas. Following retirement, Dick and his wife, Marilyn, indulged in a favorite pastime, traveling with their recreational vehicle. It was on a visit to their daughter, Carolyn, in Alaska that he took ill and died soon after on September 27, 1998. His wife, Marilyn; son, Jim; two daughters, Carolyn and Barbara; and eight grandchildren survive Dick.

He was a good friend and colleague, and is missed.

Tammo Steenhuis, Gilbert Levine

Eric A. Blackall

October 19, 1914 — November 16, 1989

Eric Albert Blackall, the Jacob Gould Schurman Professor of German Literature Emeritus, was born in London, England, on October 19, 1914; he died in Ithaca on November 16, 1989. Eric earned the B.A. degree in 1936 and the M.A. degree in 1940 from Cambridge University. The University of Vienna (Austria) awarded him the Ph.D. in 1938, and Cambridge University granted him the Litt. D. in 1960. He taught briefly at the University of Basel, Switzerland (1938-39). From 1939 till 1958 he served as assistant lecturer, then university lecturer, in German at the University of Cambridge. He was a fellow of Gonville and Caius College, Cambridge, from 1945-58.

In the fall of 1957 he came to Cornell as a visiting professor of German literature; he accepted an offer to stay and became professor of German and chairman of the department in 1958. In 1963 he was appointed to another five-year term. But by 1965, eight years into his chairmanship, he had had enough. He handed the administration of the department to Tijs Jolles, whom he had hired away from the University of Chicago, took a whole year off and enjoyed a Guggenheim Fellowship. But he did not enjoy the respite as much as he had thought he would. After his many years of ceaseless pedagogical, scholarly and administrative activity, both here and in England, the sudden slowdown came as a jolt and at one point he confided that he didn't know what to do with himself. The cause of his discomfort was an acute sense of obligation and service that was for the moment uncommitted. With this realization he was able to respond, time and again, readily and without fuss, until his retirement and beyond, to multiple claims made upon his time and talents, including the directorship of Cornell's Society for the Humanities from 1980-83.

Much-deserved honors had come in swift succession: the Avalon Foundation Chair in the Humanities in 1965, the Jacob Gould Schurman Chair in 1967, membership in the American Academy of Arts and Sciences in 1970, and membership in the American Philosophical Society in 1971. In 1973 the Republic of Austria awarded him the Cross of Honor, mainly for a deed of daring committed in 1938 when, as a graduate student in Vienna, he saved the papers of the Jewish writer Arthur Schnitzler from certain destruction by the Nazis. Eric retired in 1985. During a symposium in his honor at the Society for the Humanities he was awarded the Order of Merit of the German Federal Republic. In the spring of 1989 Eric was to have traveled to Vienna at the invitation of that university to celebrate the fiftieth anniversary of his Ph.D.; illness, however, kept him away. (The renewed diploma arrived in the mail shortly before his death.)

Those are some of the mileposts of a long and productive life. There were, of course, many more along the path of this very special pilgrim. He was what the Germans call *musisch* in the best sense of the word, i.e., endowed with a keen appreciation, both intellectual and sensual, of the fine arts, literature, and music in particular. He was a skilled and enthusiastic pianist. And he loved to teach the things he loved. He liked the tangible in literature and found it fitting that, after his final *Faust* seminar, the students should present him with a stuffed black poodle.

But what was really the measure of the man, even more than his teaching and his impressive scholarship, was his bearing. As a child, Eric had had polio, which left him partly crippled. On his best days one noticed hardly a trace of it; he carried himself magnificently. But his achievements are the result of a persistent and heroic struggle—heroic here not a manifestation of excessive and naturally abundant vitality and strength, but a daily display of courage and perseverance in overcoming weakness, a triumph of the spirit in spite of a fragile physical base. To this came his wit, which ranged from the funny to the devastating and which made him, like Mephisto, the black poodle, a master of the put-down. Once accused of being a prima donna, he replied that he hadn't come to Cornell to join the chorus.

Early conditioning in self-discipline helped him overcome occasional career setbacks as well. A German publishing house once rejected a manuscript it had solicited, perhaps because while Eric was completing it there was a change in personnel and editorial policy. Eric was dejected at first; then angry; then he breathed contempt which, with him, took the form of a swift and audible dismissal of air through the nose. He rewrote the book, this time in English and for a more general audience and for the Cornell University Press: *Goethe and the Novel*, followed by another volume, on the romantic novel, dedicated to his son Roger; followed by a volume of Goethe in translation: *Wilhelm Meister's Apprenticeship*. That was Eric: resilient, stubborn, triumphant.

Cambridge University Press published his *Adalbert Stifter: A Critical Study* in 1948, as well as *The Emergence of German as a Literary Language*, which has become a point of departure for work in the 18th century. First published in 1959, it appeared in German translation in 1966, and in a revised English version by Cornell University Press in 1978. He lectured from Texas to Toronto, from London to Berkeley, and gave the invitational lecture to the Canadian Association of University Teachers of German at Quebec in 1976. He published in most of the leading journals in the field, both here and abroad. He translated, with Vida Harford, the libretto to Alban Berg's *Wozzeck*, that is used at Covent Garden, the Metropolitan Opera and elsewhere.

Amidst all this activity he found time and inclination to be generous to colleagues. So, in the end, he was the man for whom the proper epitaph was written long ago:

He was the noblest of them all.
His life was gentle and the elements,
So mixed in him that Nature might stand up
And say to all the world: this is a man.
According to his virtue—let us remember him.

Ave, cara anima.

Jonathan Culler, Leonard Olschner, Herbert Deinert

Beulah Blackmore

April 6, 1886 — July 29, 1967

Miss Beulah Blackmore joined the faculty of Cornell University in 1915 as the first full time clothing instructor in what was then the Department of Home Economics. She became Assistant Professor in 1916 and Professor in 1923. In 1925 when Home Economics became a separate college with its own departments, she was appointed Head of the Textiles and Clothing Department. She retired in 1951 as Professor Emeritus after thirty-six years of teaching and administration.

Professor Blackmore was born in Vassar, Michigan. She received the B.S. degree from Teachers College, Columbia University, following two years of study at Michigan State Normal School, Ipsilanti, Michigan, where she obtained a teaching certificate. Before coming to Cornell Miss Blackmore taught in the public schools of Howard City, Michigan, and Tacoma, Washington. After her appointment at Cornell University she continued with additional professional study at Oxford College for Women, Oxford, Ohio; University of Washington at Seattle; University of California at Berkeley; New York School of Fine and Applied Arts in New York City and in Paris, France; Grace Cornell Art School in Maine; Academie de Coupe de Paris; and Massachusetts Institute of Technology.

At the time the School of Home Economics became a college, the Department of Textiles and Clothing was well established. Prior to 1925 and in the following years, Miss Blackmore made an intensive study of areas relative to the field of textiles and clothing for the purpose of planning the breadth and scope of the future program of the Department. For several months she worked with a nationally famous hotel, studying the use of textiles by hotels, their selection, care and durability; she visited textile industries in search of implications for textile research appropriate for the College; she worked for a year in New York City department stores; she spent a half year as an extension specialist to observe textile and clothing needs of families. As a result of her wide formal and informal study of the arts, science and industry, together with the needs of consumers, her Department expanded from an offering of three courses in clothing construction to more than twenty-five offerings and to a faculty of nineteen persons in the total program of research, resident and extension teaching. She saw the teaching of clothing change from that of clothing construction primarily to teaching in which design and consumer selection were the major components. A like change occurred in textiles which moved from the study of a few natural fibers to that of a vast array of man-made fabrics and finishes.

Four widely separate innovations occurred during her years as administrative Head of her Department at Cornell University: the establishment of a costume shop; the introduction of courses for undergraduate men students; the collection of historic and native costumes and textiles; and research in textile science and the psychological aspects of clothing.

The purpose of the Costume Shop, which flourished for many years, was to give students experience in designing and producing apparel for a varied clientele. This clientele was composed of faculty wives, staff members, and women from all over the United States and other countries. Among the most popular and steady customers was the colorful wife of Cornell's President, Livingston Farrand. In preparation for offering such a course Miss Blackmore worked in a number of retail clothing establishments including Lord and Taylor and Bonwit Teller in New York and William Filene Sons Company in Boston. Increased enrollment, lack of space and staff, changing trends in curriculum brought to a close an experience that many students of that era will long remember as one which called upon their skills and abilities to work with and understand people whose ages, desires, and community environments differed from their own.

Since the forerunner of the present School of Hotel Administration was housed in and administered by the College of Home Economics, students in that school were familiar with the value of courses in the College. For many years Miss Blackmore taught a course in the selection and purchase of hotel textiles. It is not surprising, therefore, that some of these male students, particularly those returning to college life after a period in uniform during World War II, initiated the demand for a "consumer" course in men's clothing selection. The registration in this course was by no means limited to men from the School of Hotel Administration.

To Miss Blackmore clothing and textile fabrics were vital forms of art. She saw them as expressing bold and subtle differences of culture and times. Moreover, they were forms of art that could be created and enjoyed at all economic levels. She started a collection of American and foreign costumes, fabrics, and accessories. In 1935 she brought to the Department from a trip around the world carefully selected native costumes and fabrics as well as colorful stories of interest to students who at that time did not have the opportunity of wide travel as they do today. The costume collections have continued to expand and provide students in apparel design with inspirations for designs, and through use in the history of costume courses have given understanding of clothing as an indicator of the economic, cultural, technical, and social life of other times and other places.

To an already valuable collection Miss Blackmore's final gift to the Department was her personal historic collection of some 200 items including rare textiles and books now out of print and unobtainable.

A realization of the significant but inadequately understood part that clothing plays in the lives of individuals prompted her in the late forties to appoint a psychologist to the faculty to study and develop research on clothing as it affects attitudes and behavior of individuals. Concurrently with this appointment, textile chemists also were appointed to develop this area of textiles and to provide the bewildered consumer with information in this highly technical realm through a research program. New York State, then perhaps more than even today, was the major center for clothing and fabrics in the United States.

Miss Blackmore will long be remembered with deep appreciation as an administrator who constantly encouraged and supported exploration of new ideas for program development and who recognized and nurtured the special abilities and assets of individual faculty members. They also remember her knowledge of the world of arts as well as her abiding respect for the unique quality of each human being and her expectation that others would also recognize and respect this uniqueness. In her years of teaching and travel she made a host of friends around the world who remember fondly her charm, gaiety, poise, quick wit, and humor.

Mabel Rollins, Elsie McMurry, Margaret Humphrey

Sara E. “Sally” Blackwell

August 9, 1916 — January 4, 2009

Professor Sara E. “Sally” Blackwell was born in Dunbar, Pennsylvania and graduated from Dunbar Township High School as valedictorian. She received a Bachelor’s degree in 1938 and a Master’s degree in 1944 from Pennsylvania State University. After teaching in Pennsylvania high schools, she studied home economics education and child welfare at the University of Minnesota. Her research dealt with the effectiveness of home economics education in Minnesota high schools. While at Minnesota, she participated in the Food Production War Training Program that involved establishment and supervision of a community cannery. She helped plan and participated in conferences for student teachers, teachers in service, school administrators and school community groups. In 1947-48, she consulted on tests and surveys on nutrition for General Mills and authored a bulletin, “Nutrition Education Pays Dividends.” She received the Ph.D. degree in 1950.

Professor Blackwell joined the Cornell University faculty in the College of Home Economics in 1948 as an Assistant Professor to develop a research program in the Department of Home Economics Education. She taught research design, analysis, and program evaluation, and she had a special interest in curriculum development. She was promoted to the rank of Associate Professor on July 1, 1954 and Professor on July 1, 1958. Sally served as Chair of the Department of Community Service Education from 1959-69, and advised graduate students and served on many graduate committees. She has a national reputation for her work in graduate education, research, and curriculum development in home economics education. During a sabbatical leave in 1955 in the Research Division at Education Testing Service in Princeton, New Jersey, she worked on projects in the area of personality measurement. Her general area of research was education evaluation. Her work addressed factors in school and communities that related to the effectiveness of high and junior high school home economics programs.

In 1965-67, Sally chaired President James Perkins’ College of Home Economics Study Committee. The resulting Blackwell Report, according to Professor Jerry M. Rivers,

“documented the concerns, provided the framework, and solidified the goals of a college longing and needing to struggle with the challenges of a changing world.”

She described Sally as combining “scholarly skepticism, wisdom, patience, humility, and the perseverance of a pioneer in a masterful and compassionate manner.” The challenges associated with the committee were legion, and Professor Rivers, as a member of the committee, described Sally undertaking the effort to,

“amalgamate the divergent thinking of eight committee members, temper the grandiose verbiage of six outside consultants who were leaders in their respective fields, and see that a document was drafted that incorporated vision, imagination, and common sense!”

The committee report provided an academic and substantive guide to the future College mission. It documented the concerns and provided the framework for solidification of the future goals of the college as it addressed the challenges of a changing world.

The follow-up committee to propose a restructuring of the College departments and administration, chaired by Henry Ricciuti, relied heavily on the Blackwell Report so that the recommended reorganization reflected many of the priorities and goals from that report. Further, the Blackwell report had a national and international impact, charting new directions for education and research in home economics and the new human ecology.

Professor Blackwell was a member of the University Faculty Council and served on a number of committees that dealt with major university problems during a turbulent decade at the university. Dean David Knapp wrote in 1972, “She has gained a deserved reputation for academic leadership, both on and off campus”. She served as a consultant to the Department of Home Technology of the University of the Philippines, establishing relationships with faculty that lasted for many years. She was an active member in the American Home Economics Association, the American Educational Research Association, and the American Vocational Association serving in various top-level capacities, and served as a consultant to the Office of Education, and U.S. Department of Health, Education and Welfare. She was on the Editorial Board of the *Home Economics Research Journal*. One of her colleagues wrote at the time of her promotion in 1954, “She has proven herself to be an excellent teacher, a creative research leader, and a most helpful colleague”.

She received the Outstanding Achievement Award from the University of Minnesota in 1973. The award is given to alumni who have attained distinction in their fields. She was named Professor Emerita by Cornell University in 1980.

Sally will be remembered for her grace and courage, wit and humor, her humility, and her compassionate concern for humankind. She was generous to Cornell, to her church and to many organizations in Ithaca. Concern for the environment led her and her beloved sister, Louise, to donate their Pennsylvania homestead land to the Central Pennsylvania Conservancy. Her unassuming manner and her small frame belied her strong political opinions and her belief in women’s rights and choices. Her love of chocolate and enjoyment of televised figure skating were unfailing!

She is survived by cousins, many friends, and former graduate students.

Francille M. Firebaugh, Chairperson; S. Kay Obendorf, Henry N. Ricciuti

George David Blanpied

June 29, 1930 — November 4, 2007

George David Blanpied, Cornell Professor Emeritus of Horticulture, passed away in Chestertown, Maryland on November 4, 2007. Dave is survived by his wife, Eloise, their children, George David Jr., Peter Raymond, Elizabeth Mott, and three grandchildren.

Dave was born in Ridgeway, New Jersey on June 29, 1930. He earned his B.A. degree in Botany from Dartmouth College in 1952 and served as a line officer in the Navy during the Korean conflict. In 1954, he began his Master's program in Pomology at Cornell, working in the department that would be his professional home for the next 39 years. During his Master's program, Dave was appointed as Assistant Professor of Pomology and he earned his Cornell degree in 1955. He completed his Ph.D. degree in Pomology and Fruit Marketing at Michigan State in 1959 and resumed his Cornell faculty responsibilities of pomology research and extension. Dave retired from Cornell in 1993, and he and Eloise later moved to Maryland where he resided at the time of his passing.

Dave totally devoted himself to research and serving the fruit industry, working mainly on the postharvest physiology of apples. He viewed his responsibility and that of his department as one of scientific support and problem solving for production horticulture. Early in his career, he described his approach as “a series of five-step programs” where he would (1) observe commercial problems in harvesting, handling and storage of apples and pears, (2) plan scientific experiments to resolve the problems, (3) conduct the experiments, (4) demonstrate successful practices on growers' farms, and (5) troubleshoot new practices as they were implemented. Not all of his research projects generated a steady source of grant money, but he passionately pursued those he knew were vital to the growth and success of the industry. His approach earned the respect of the apple storage industry in the Northeast and beyond, and virtually every fruit grower in New York and New England knew Dave personally and many collaborated in his postharvest research and demonstration projects.

Dave began his career working with Professor Robert Smock who was instrumental in establishing commercial controlled atmosphere (CA) storage technology in the United States. At the time, this technology was new to the industry and previously undiagnosed postharvest physiological disorders were observed in the stored produce. Professor Blanpied visited the growers, observed their practices and identified their problems, and conducted research in Ithaca and at the growers' farms to understand the fundamental issues. In addition to addressing the physiological problems, Dave often needed to solve technical problems with the harvesting and handling

procedures and the cold storage operations associated with CA storage. He used his academic expertise to address the physiological problems, he drew upon his natural problem solving creativity to “engineer” harvesting, handling and storage solutions, and his sincere, trusting demeanor enabled him to persuade growers to adopt the results in a timely manner. He could not only identify and explain physiological disorders in stored apples, but he could also provide succinct and relevant comments on historical discoveries relating to the disorder in question. As a result, when Dave Blaupied talked, people listened and everyone was enriched. Extension specialists implicitly trusted Dave’s recommendations because they trusted him and they were often involved in the research. Growers willingly hosted meetings where Dave would demonstrate the improvements that had been developed and explain the cautions that were needed to make the improvements work.

Dave published his practical and fundamental discoveries widely in extension literature and research journals and presented his practical findings and recommendations to countless extension audiences throughout the northeast during his tenure at Cornell. In 1986, he received the Cornell Cooperative Extension 75th Anniversary Program Achievement Award. In 1991, he was honored with the Western New York Apple Growers’ Gold Apple Award. Dave was selected as one of the “100 innovative horticulturists” by *American Fruit Grower* and he was a member of Epsilon Sigma Phi honor society and a recipient of the ASHS Carl A. Bittner Award. He was also a member of both the American and the International Society for Horticultural Science and the American Society of Plant Physiologists.

During the course of his career, he worked on many aspects of fruit physiology and storage technology that improved stored fruit quality, reduced losses, extended market and shelf life, and added market value to the product. When the beneficial effects of low oxygen, low ethylene CA storage became known, Dave arranged a sabbatical to East Malling, England to work with the scientists and practitioners who were among the first to use this technology. His work at East Malling also accelerated the transfer of computer based atmosphere analysis and control technology to the North American fruit storage industry. Dave’s quest for practical information brought him to research centers and commercial production areas throughout the United States and to British Columbia, Iran and Europe, and always involved collaboration with producers, scientists and students.

Perhaps his most lasting contribution involved predicting the optimal harvest date and maturity for New York apples intended for long term CA storage. Working many years with growers and extension specialists across New York, Dave and his collaborators developed an apple maturity model that used varietal, geographical and environmental factors during the growing season to predict the optimal harvest date for best long-term keeping

quality of the fruit. Commercial trials in the different growing regions validated the model locally, and the “Blanpied-Silsby model” continues to be a valuable harvest management tool used by the New York fruit industry. In addition to maturity prediction, the work led to the development of the “Generic Starch-Iodine Index Chart for Apple Maturity” that has become the standard reference used throughout the Eastern United States and Canada.

Dave’s commitment to helping others is also exemplified in his service to the university and greater Ithaca community. He served as Department Extension Leader; and he patiently and willingly mentored younger faculty and graduate students who worked in related disciplines. Although his academic appointment was in research and extension, he made time to advise undergraduates and serve on the CALS Academic Achievements and Petitions Committee. Early in his career, he was a volunteer fireman in the Cayuga Heights Fire Department and later he served on the board of the Finger Lakes Land Trust. Dave was an avid cross country skier and active in the Cayuga Nordic Ski Club that named a Hammond Hill ski trail for him.

Dave loved the outdoors and worked to preserve nature for future generations. He and Eloise enjoyed their woodland property southeast of Ithaca, and Dave worked with the Land Trust and the Nordic ski club to maintain public areas for all to use. After he and Eloise relocated to Maryland, he continued these activities working with the Eastern Neck National Wildlife Refuge near Chestertown.

He was a serious and competitive cyclist and skier who enthusiastically pursued these activities well into his retirement. Le Creasy recalls,

“A new graduate student (Raymond Chee) came to the department from France where he owned a bicycle shop. He considered himself to be an accomplished cyclist. He agreed to go on a ride with Dave at lunch (frequently Dave did 60 miles at lunch). Raymond’s wife told us later that when Raymond got home, he could hardly move and was in pain for several days.”

Marvin Pritts, Chairman of the Cornell Department of Horticulture writes,

“Dave was a competitive cross-country skier, but he would often go to the Adirondacks with some of his buddies and just ski around the mountains. They would rent a cabin for several days, and the group would set off in the morning and not return until dark. Usually their goal was to ski up a mountain trail as far as possible, then put on snowshoes and climb to the peak. The views at that time of the year were fantastic, and the challenge was great.”

From the perspective of his professional colleagues and fruit grower friends, Dave was a quiet, diligent, multi-dimensional scientist who enjoyed life and was not afraid to make fun of himself. He once told how, while contemplating his research projects during one of his frequent road trips to the Hudson Valley, he was startled to see exit signs for the city of Scranton, Pennsylvania and only then realized that he had missed an exit an hour earlier.

Ken Silsby writes,

“David Blanpied was one of the most inspiring people I have ever met in my professional career. While Dave’s passing was our great loss, his contributions to apple storage technology continue to live on.”

We all feel this loss, and remember fondly Professor Blanpied’s unassuming personality, willingness to listen, love of discovery, dedication to service, sense of humor and trusting friendship.

Jim Bartsch, Chairperson; Le Creasy, Dave Rosenberger

William Ernest Blauvelt

July 2, 1903 — February 2, 1953

William Ernest Blauvelt, Professor of Entomology, and member of the Cornell Staff for twenty five years, passed away at his home on the west shore of Cayuga Lake on February 2, 1953. Though troubled by periods of ill health during recent years, his sudden passing was unexpected. He was born at Mt. Vernon, New York on July 2, 1903.

After graduation from the high school at Haverstraw, New York, he entered The College of Agriculture at Cornell and by 1926 had completed work for the Bachelor of Science degree. There followed two years as an assistant county agricultural agent in Orange and Niagara Counties. Returning to Cornell in 1928 as a graduate student, he spent four years working toward the Ph.D. degree and during a part of this time served as extension instructor in entomology. His doctorate was conferred in 1935; he remained on the staff of the Department of Entomology, and successively became assistant professor in 1935, associate professor in 1945, and professor in 1947. Professor Blauvelt was a pioneer and became a recognized leader in the long neglected field of insect control on ornamental crops. For many years he was assigned to extension work in this field and his services soon became invaluable to the important nursery and florist industries not only in New York but in all the United States and Canada. During these years as an extension specialist he devoted much of his personal time to research on methods of control, and investigations on the effectiveness of the many new materials that entered the field following the advent of DDT. In 1945 his assignment in the College of Agriculture was modified so that he might use a greater part of his time in research.

Professor Blauvelt's career as an investigator may justly be appraised as brilliant. His work invariably was planned and carried out according to the highest traditions of scientific research. With him there was never the quick rush to the press after a few preliminary tests. New methods or materials that appeared promising after laboratory trials always were given large scale tests in commercial greenhouses before recommendations were issued. He developed the use of selenium as a systemic material for the control of spider mites on roses, azobenzene for the same purpose, and metaldehyde for slug control. He was a leading investigator in the use of the newer phosphate systemics on florists' crops. He trained several students who followed him into the field of insect control on florists' crops. He was in constant touch with industrial research in the field of insecticide development and therefore had access to new materials as soon as they were available. Frequently industry came to him for advice on the development of new insecticides. But his work was by no means directed entirely toward the interests of the florists' and insecticide

industries. The home gardener, or the housewife with insect problems on a few potted plants were as welcome in his office, and received the same careful consideration as the large industries.

Although a specialist in florist crop insects he was deeply interested in the whole broad field of entomology. His information was so complete, and his memory so extraordinary that one often suspected he had read and remembered the entire literature of his science. His friendly and cooperative nature made this great store of information readily available not only to his immediate coworkers but to the many who kept in touch with him through correspondence.

During the war years, Professor Blauvelt gave less attention to the problems of flower growers and devoted the major portion of his time to extension work on the protection of Victory Gardens from noxious insects. This, he felt, was a more realistic use of his talents during the period of national emergency when the production of every possible ounce of food was a necessity.

Professor Blauvelt's noteworthy accomplishments brought recognition and honors from several sources. The Society of American Florists Award was his in 1949 as a result of his studies on the use of Parathion aerosols against greenhouse pests. For several years he was entomological consultant for the American Rose Society. He held honorary memberships in the National Chrysanthemum Society, the American Carnation Society, The New York State Flower Growers, and other amateur and professional florists' organizations. He was a member of Alpha Zeta, Sigma Xi, Epsilon Sigma Phi, the Entomological Society of America, and the American Association of Economic Entomologists.

Professor Blauvelt was held in highest esteem by his students, his coworkers in entomology, and his many friends in the industries he served so well. To all of them his passing was deeply regrettable.

R. W. Leiby, Kenneth Post, H. H. Schwardt

Henry David Block

February 22, 1920 — October 6, 1978

Henry David Block, professor of applied mathematics, suffered a heart attack in early October, 1978, and died in Tompkins County Hospital less than a week later. He was in the midst of preparations for a four-month visit to Japan, at the invitation of the Japan Society for the Promotion of Science; he had been invited also to spend the 1979 Easter term as a visiting scholar at Corpus Christi College, Cambridge. Several hundred people attended a memorial service for David held in Anabel Taylor Hall a few days after his death. His warm, expansive, humorous presence, his wisdom and discernment are keenly missed by his family, his students and colleagues, and his many friends.

David Block was born in New York City, the son of Isaac Block, a businessman, office worker for the I.R.S., and, in the depths of the Depression, gasoline-station manager; and of Cecilia Gottschall Block, who worked as a nurse with the Godmothers' League, an association caring for abandoned children. At the encouragement of his teachers, he took a city-wide competitive entrance examination and was admitted to Townsend Harris Hall, a special high school for gifted students. The first member of his family to attend university, he went on to City College, where in 1940 he was granted the B.S. in literature and psychology. As that degree elicited no offers of jobs, he first worked as a nighttime accountant for a bonding company, then returned to City College to take a second degree in civil engineering (B.C.E., 1943). During the war he worked as a flight test engineer for Goodyear Aircraft in Akron, Ohio, and developed a lasting mistrust of airplanes. In Akron he met Phoebe T. Goggin, a British physician trained in Edinburgh; they were married in May 1946. When Dr. Goggin was offered a position at Iowa State University, David accompanied her to Ames, and more or less by accident (to judge by his own lighthearted account) undertook graduate studies in mathematics. But that accident was bound to happen: David's deep-seated feeling that learning is more fun than anything had led him to the bulletin boards of the mathematics department where, surveying the semester's course offerings, he was spotted, interviewed, and, as it were, conscripted by the chairman. He took his M.S. in 1947, his Ph.D. in 1949, and stayed at Iowa State for four years as an assistant professor. He taught for two years at the University of Minnesota and in 1955 came to Cornell where, after two years in the Department of Mathematics, he joined the Department of Theoretical and Applied Mechanics, in which he served until his death.

David Block was the author of a much-admired book on tensor analysis, a mathematical subject of basic importance in mechanics; he published some forty papers in mathematics and several adjacent fields. He was the holder of coveted fellowships (including a Guggenheim) and of visiting professorships which honored both him and Cornell; a member of numerous honor societies and learned associations. Those facts do little to suggest the range and variety of his knowledge, the freshness, originality, playful seriousness, and lucidity of his thought, or his deep irreverence for learned pretension and the compartmentalizing of disciplines. His earliest investigations bore mainly on classes of nonlinear integral equations and the properties of mappings on Banach spaces. In 1956-57 he was coauthor of two papers on chemical reactors which, as a colleague has recently written, "give the earliest sign of what was to emerge: Block, the mathematician by training, taking a significant contribution to a field of application at its earliest stages, using no more mathematics than would be understandable to the practitioners: i.e., a true applied mathematician." Thus in 1959 he Published, with L. Hurwicz and K. Arrow (a Nobel Prize-winning Economist), a paper on the stability of markets out of equilibrium, which specialists in the field consider to be a fundamental contribution, indeed a landmark in economic theory; a widely known article on differential equations with hysteresis, published in 1960 in a journal of electrical engineering, provides an application of the very theoretical subject of functional analysis.

In more recent years, David's work was focused on problems of learning, Pattern recognition, artificial intelligence, self-reproducing machines and, later, the design of robots capable of acquiring natural language. He collaborated with Frank Rosenblatt, the builder of the "Perceptron," a self-organizing learning machine which provides a deliberately simplified model of the human brain; David derived mathematical statements analyzing the machine's behavior, and proved theorems about the convergence of learning algorithms. He published numerous papers on related subjects. Some are highly technical and mathematically demanding (for example, his masterful review of Minsky and Papert's *Perceptrons*); others, equally rigorous and elegant, are accessible to readers having virtually no mathematical culture. His work was often based on reasoning about machines, but he was very much a theoretician, more at home with the logic of what's possible than with tools or elaborate engines; one typical Block machine, which exhibits a starting ability to learn, consists of twelve paper cups and some numbered chips of cardboard. He devised and taught a comprehensive course on bionics and robots, which over the years was taken by large numbers of students from all quarters of Cornell. Demanding, generous, endlessly patient, he proved to be a superbly effective teacher of mathematics for students in fields such as biology and engineering. He was coauthor of a mathematics textbook for engineering students which has been used in mimeographed form at Cornell for some fifteen years, but unfortunately never published; those in the field feel that the book might have

set the accepted style for all such teaching. In his last years, he directed a research group of students and colleagues studying neural networks and perceptual problems related to vision. His influence on the intellectual growth of his many graduate students was deep, rich, and emancipating. In his Cornell years he went on avidly studying; he attended courses and seminars in economics, biological sciences, environmental management, linguistics, and (his first love) literature, reading widely and well, sharpening discussion by the pertinence of his remarks, encouraging other participants by his attentive acknowledgement of their points of view.

For all his exceptional intelligence and accomplishments, David Block was a deeply modest, indeed, humble person, tolerant of everything save smugness. He had a genius for talk, and in his wonderfully funny stories would portray himself as a naive, somewhat anxious figure of no particular consequence, fussed and helpless in the face of circumstance; listening and laughing, one felt better about oneself, somehow. In conversation he always behaved as though his interlocutor, and not he himself, was the interesting, remarkable person. He took a special interest in young minds, and his learned papers contain mock-pedantic footnotes citing his friends' children as subjects or authorities; the conceptual apparatus includes monsters, fairy godmothers, dismal swamps, and baby robots. He was a prudent, frugal man, meticulous and hardworking, but always quick to say that work, as a lesser form of play, is not to be taken too seriously. He was beset by misgivings about those who put colleges, departments, or government contracts ahead of human values. Authority, as David saw it, is seldom beneficent, and tends to corrupt. With fine comic detachment, he would represent (a part of) himself as outraged by commands like "Use Other Door": by what right was somebody ordering him around? His own charming way with people was all gentle concern, respect, and compassion. Concern for others, and scrupulous insistence on doing things right, could distract David from concern with his own well-being; it is characteristic that at the onset of his illness he was engaged in the writing of an elaborate grant proposal intended to procure financial support for friends and associates. David Block is survived by his wife, Phoebe, of Ithaca; his son, David Lee, of Charlestown, Oregon; his sister, Florence (Mrs. Edwin L. Pool), a nephew, and two nieces, all of Middlebury, Vermont.

Geoffrey S. S. Ludford, Lawrence E. Payne, Richard H. Rand, Edward P. Morris

Forest Milo Blodgett

July 15, 1885 — June 11, 1951

The sudden death of Forest Milo Blodgett following a cerebral hemorrhage brought to an untimely close a long career of service to Cornell University and to agriculture. Surviving are his wife, Elsa James Blodgett, three children, and three grandchildren.

Professor Blodgett was born and reared on a farm near Brocton, New York, the son of Silas and Clara Jane Blodgett. After receiving his preparatory education at Stockton High School and Fredonia Normal, he came to Cornell and graduated in 1910 with a degree of Bachelor of Science in Agriculture. As an undergraduate, he studied under the late Professor H. H. Whetzel who induced him to undertake graduate work in the field of plant pathology. He spent the next four years in graduate study as a Hermann Frasch research fellow and received his doctorate in 1914.

During the year 1914-15, Professor Blodgett was Associate Botanist at the New York (Geneva) Agricultural Experiment Station but he returned to Cornell in 1915 to become an Assistant Professor in the Department of Plant Pathology. Subsequently, he was raised to the rank of Professor. He spent his sabbatic leave for the second term of the year 1923-24 at the University of Wisconsin.

Professor Blodgett was a member of Sigma Xi, American Association for the Advancement of Science, American Phytopathological Society, and the Potato Association of America, serving the latter association as vice president in 1940 and president in 1941.

In the early years of his professional life, Professor Blodgett devoted his time to research on the control of hop mildew and apple diseases. He is better known for his extensive work and writings concerning virus diseases of the potato, the use of sprays and dusts for potato pest control, and the development of potato varieties resistant to scab and virus infection. He originated the tuber-index method of testing tubers for the presence of virus diseases. He was a student and ardent advocate of modern biometrics as a means of increasing the worth of field and laboratory experimentation. His strict obedience to biometrical practice, always a pattern for his research, earned for him a reputation for sound conservative judgment. Colleagues and graduate students frequently sought his advice on planning their experiments and in the statistical analysis of their data.

Quiet and unassuming, Professor Blodgett had no propensity for classroom or extension teaching. He preferred the field and the out-of-doors not only as a stage for his research but for the pursuit as well of his favorite hobbies,

skiing, hunting, and especially fishing. He leaves behind a rich heritage in his many students, well trained under his guidance in the field of plant pathology.

M. F. Barrus, W. H. Burkholder, W. A. Rawlins

Mary Kiefer Bloetjes

December 28, 1904 — November 21, 1987

Mary Kiefer Bloetjes, professor emeritus of institution management, died at her home in Ithaca, November 21, 1987. She was born in Ramsey, New Jersey. As a young girl she frequently accompanied her father as he visited patients, and this, combined with the enthusiasm for the emerging field of nutrition expressed by a hospital dietitian with whom she had contact, influenced her choice of dietetics as a career. Throughout her life she maintained an interest in dietetics, nutrition and institution management, and promoted the dietitian as a member of a team of specialists in health care.

After receiving her diploma in dietetics from the Pratt Institute in Brooklyn, New York in 1925, she became affiliated with Dr. Frederick Allen, a specialist in diabetes. Subsequently she established her own diet consulting service in her father's office. Following this she joined the nutrition staff at the Hospital for Joint Diseases in New York, and became director in 1934, a position she held until 1949. During this time she obtained both a bachelor's and a master's degree in institution management at Columbia University and taught dietetic administration courses at Hunter College.

Following the death of her husband in 1949, she enrolled in Cornell's School of Industrial and Labor Relations and received her doctoral degree in 1953, the second woman to receive this degree in ILR.

She became professor and head of the Department of Institution Management at Florida State University at Tallahassee in 1953 and in 1955 came to Cornell as professor and head of the Department of Institution Management succeeding Katharine Harris who had been a minor member on her doctoral program. Professor Bloetjes retired in 1970.

During Professor Bloetjes' tenure as head of the department she initiated an allied health professions program at the graduate level in administrative dietetics under a traineeship grant from the Department of Health, Education and Welfare. She also developed a course on the theory of quality menu item production which applied the concept of data processing and industrial engineering principles. She recognized at a very early date the need for data processing as a tool for use in quantity food management, in production, cost accounting, and employee scheduling. This goal has now been achieved in the many computer analyses programs available.

Professor Bloetjes stayed professionally active after retiring from the university. She taught a graduate level summer session course at New York University, audited industrial engineering and operations research courses at Cornell, and served as a professional mentor to industrial engineering graduate students as well as acting as a consultant to hospital dietetics departments.

Although retired, Professor Bloetjes felt that emeritus and retired professors had much to offer to the university. She considered that the contributions this group could make were being overlooked. She was a driving force in the establishment of the Association of Cornell University Emeritus Professors. The aims of the organization are two-fold, first to establish social and professional communication among retired individuals who share the experience of being Cornellians; and secondly, to facilitate the utilization of their skills and knowledge in the service of the university. The Office of the Dean of the Faculty is the focal point and resource for the association.

Throughout her life Professor Bloetjes was an active participant in dietetics associations at the state, national and international levels. She held several offices in the New York State Dietetic Association. She was a pioneer promoting licensure for dietitians, and had the satisfaction of knowing that this has been adopted in some states. She was a member of the Program Planning Committee for the 2nd International Congress of Dietetics and a participant in the two later International Congresses. She was an honorary member of the Danish Dietetic Association, an elected affiliate member of the Royal Society of Medicine, and a member of the Royal Society of Health in the United Kingdom.

She was also a member of the American Academy of Political and Social Sciences, International Council of Women, American Association for United Nations, American Association of University Professors, American Home Economics Association, and the American Association for the Advancement of Science.

She was the author of about twenty-two professional publications that have appeared in *The Journal of the American Dietetic Association*, *Hospital Management*, *Bulletin of the Danish Dietetics Association*, and others. Her major research interests were in food cost accounting and scheduling of menu items in the food service units in hospitals.

Mary never lost the excitement of learning new things and the challenge of new ideas. She was always looking to the future. She was an extrovert who added sparkle to any group. She liked people and people liked her.

Undergraduates and graduate students remember Professor Bloetjes as an innovative and exciting teacher; colleagues and staff members had a mentor who was interested in their professional development and in their personal lives.

Professor Bloetjes came to Ithaca from New York City where she had an interest in the arts and opera. The present Tompkins County Arts Council includes her name among the founders. She was a member of the Ithaca Opera Association Board of Directors and a life-long supporter.

Professor Bloetjes' contributions to the university, College of Human Ecology and other teaching institutions are far-reaching. The Ithaca community has been enriched by her contribution.

Bernice Hopkins, Karla Longree, Mary Morrison

Alfred Theodore Blomquist

November 16, 1906 — January 15, 1977

Alfred T. Blomquist, one of the outstanding organic chemists of his generation, had a relatively unconventional career compared to that of most academic scientists. A native of Chicago, he received his B.A., M.S., and Ph.D. degrees all from the University of Illinois. It was also at the University of Illinois that he met and married Sara Moffat. He had always been a brilliant student, and on completing his doctorate under the supervision of Professor Carl ("Speed") Marvel, he was awarded a prestigious National Research Council Postdoctoral Fellowship. He used this fellowship to pursue organic chemical research at Cornell and had intended to follow a career as a research scientist. The death of a key person in his father's clothing business, however, caused him to revise his plans; he declined an attractive offer from the DuPont Company when his fellowship appointment came to an end in order to return to Chicago as a partner in his father's firm. He spent the next eight years in the family firm and undoubtedly gave up any hope of being able to use his organic chemical training again.

World War II, however, brought Al Blomquist back to the academic world by temporarily depleting Cornell of its entire organic chemistry faculty. Professor J. R. Johnson had always wanted to bring Al back to chemistry, and he was finally successful in an appeal to Al to forsake his life in Chicago and to return to Ithaca to help out in this emergency. When Al claimed that he had forgotten most of his chemistry and had certainly failed to keep up with any new developments, Professor Johnson simply sent him a set of Chemical Society annual reports for the appropriate years, along with some recent texts and monographs, and told him to do some homework. While the practice of organic chemistry had not changed significantly during the 1930s, there had been very important advances in electronic theory and in the understanding of reaction mechanisms. The task of digesting these new developments in a few months must have been enormous. Nevertheless, Al Blomquist prepared himself the best he could, joined the Cornell University faculty as an assistant professor of chemistry in 1941, and soon found himself teaching all the organic chemistry courses and directing the research of all of the organic chemistry graduate students. It was under these strenuous circumstances that Professor Blomquist launched his academic career.

During the war years, Professor Blomquist was deeply involved in a number of research projects closely connected with problems of national defense. His true love, however, was organic chemistry per se, and he soon developed an international reputation on the basis of his many investigations in this field. His principal contributions to science were largely concerned with organic synthesis, and he published classical series of papers dealing with

the preparation and reactions of strained, small-ring molecules, the chemistry of many-membered rings, and the synthesis of novel monomers and polymers. Later in his career, he became interested in the chemistry of amino acids and of low-molecular-weight peptide hormones. He edited an excellent series of monographs on selected topics in organic chemistry. In 1960, he became the third member of the Cornell department of chemistry to be elected to the National Academy of Sciences.

Professor Blomquist served as a chemical consultant to the B. F. Goodrich Company for twenty-five years, and he received a grant from Goodrich in support of his own research program at Cornell during most of that time. Especially in its early years, when federal funds in support of chemical research were not yet readily available, this grant provided invaluable support to a succession of very able graduate students.

Al Blomquist's prime personal qualities were his warmth, his generosity, and his empathy with students and younger colleagues. He consistently attracted a bright, diverse, and dedicated research group, and the Blomquist research group was always one of the largest and happiest in the chemistry department. He paid particular attention to helping his students get the best and most appropriate positions upon leaving Cornell, and he kept track of and helped each one during the subsequent years whenever necessary. He could count among his coworkers Bob Holley, who went on to become a Nobel laureate in chemistry, and Liang Huang, the woman who now leads a major research effort on the synthesis of antifertility steroids in the People's Republic of China.

As a colleague, Al was especially helpful to the younger members of the chemistry department. He understood the special insecurity that most assistant professors feel, and he was always available for an unhurried discussion of any problem, from the most personal to the strictly professional. In this quiet and totally unobtrusive way, he contributed greatly to faculty morale and to the well-being of the entire department.

Al Blomquist's life appeared to be dominated by his professional activities. In his earlier years, however, he was an avid stamp collector, and he and Sara were enthusiastic ballroom dancers. He always took great pride in his family. While he had few hobbies, he was a devoted gardener, and he derived particular pleasure from the cultivation of his roses. Throughout his life he maintained a certain elegance in his style of writing, in his speech (which he would occasionally grace with an apposite Latin phrase) and in his dress that marked him as a scholar and a gentleman. Those who knew him will long remember him with deep affection.

Harold A. Scheraga, Charles F. Wilcox, Jerrold Meinwald

Nicholas Cleaveland Bodman

July 27, 1913 — June 29, 1997

Nicholas Cleaveland Bodman, known to his colleagues as Nick, came to Cornell in 1962 as a Professor of Chinese Linguistics in the then Division of Modern Languages. Even prior to that, he had enjoyed an active and varied career that had contributed to his stature as an eminent figure in his field.

Nick was born in Chicago in 1913. His father was a successful businessman and his mother wrote a series of romantic novels with titles like *Castle of Doubt*, *The Guttering Flame*, and *The Nymph was Mortal*. He was educated at the Middlesex School in Concord, Massachusetts, and entered Harvard as a member of the class of 1935. He left after only one year, however, and spent several years doing clerical work and vacationing in Europe, which further stimulated his curiosity about languages. He joined the navy in 1941, and in early 1942, he was posted to FRUPAC (Fleet Radio Unit Pacific Fleet) at Pearl Harbor, Hawaii, where he served in the group that deciphered the Japanese naval code. There also, two events crucial to his future life occurred: he met and married his wife, Frances Sorrel Wainwright, and he took his first formal lessons in Chinese. At the end of the war, he retired from active duty and while on terminal leave was promoted to Lieutenant Commander. In the fall of 1945, he entered Yale University as a junior, and by 1950 had completed his B.A., M.A., and Ph.D. degrees in Chinese and Linguistics. While at Yale, he studied with Leonard Bloomfield, George Kennedy, and Lo Ch'ang-P'ei, who subsequently returned to China to found the Institute of Linguistics in the Chinese Academy of Social Sciences. On completing his Ph.D. degree, he joined the Foreign Service Institute of the Department of State (FSI) where he remained until joining the Cornell Faculty in 1962. All of that time was by no means spent in Washington, however. In 1951-52, on loan to the British Government, he was posted to Malaya during the emergency there to establish and run a language school for British police and civil servants, where he created a still unrivaled course in the Hokkien or Amoy dialect of Chinese. From 1955-57, he founded and ran the still existent Language and Area Training Center in Taiwan. He subsequently served as head of the FSI Department of Far Eastern languages. In 1961 and 1962, he was awarded Guggenheim and National Science Foundation fellowships for linguistic fieldwork in Darjeeling, India, where he collected first hand material on the Tibeto-Burman languages spoken in the Himalayan region, including the little known Lepcha. In 1962, he joined the Division of Modern Languages at Cornell, where he remained until his retirement in 1979, primarily teaching courses in the Chinese language, Chinese dialects and the history of Chinese. In 1967, he was a visiting professor at the School of Oriental and African Studies, University of London, and in 1968-69, on sabbatical leave, he carried out research in Hongkong on the Min dialects and in Kathmandu,

Nepal on Tibeto-Burman languages. In 1972, he spent a semester at the University of Hawaii teaching and carrying out research on Chinese dialects.

After retiring from Cornell as Professor Emeritus, he continued his active scholarly career for more than a decade. He made trips to Mainland China in 1980 and 1983, at the invitation of the Institute of Linguistics, Chinese Academy of Social Sciences. While there, he gave talks, met with colleagues, and continued his work in Fujian and Guangdong provinces on five southern Min dialects. His son, Richard, also a scholar in Chinese, accompanied him on one of these trips and recounts Nick's lively engagement in these activities, including his joy in interacting with local farmers and others in their own dialect including, characteristically, at least one humorous story.

In 1986, he was presented with a festschrift, *Contributions to Sino-Tibetan Studies*, edited by two of his former students who had become active scholars in Chinese Studies.

In 1993, Nick and Sorrel celebrated both his eightieth birthday and their fiftieth wedding anniversary. In the following year, as his health was declining, they left Ithaca, and moved to Northfield, Minnesota, to be nearer their family.

Nick was a formidable scholar in Chinese linguistics, and a name to be reckoned with in that field. He was the author of magisterial and pioneering works, especially in his special field of Sino-Tibetan historical linguistics, including four books and numerous papers and reviews in learned journals. He was a pioneering figure in the description and analysis of Chinese dialects, starting with southern Min and the reconstruction of Proto-Min and extending this into the reconstruction of Old Chinese and still further into Sino-Tibetan. His work on this was widely recognized and a collection of his work was translated into Chinese and published in Beijing in 1996, which fortunately was in time to be a source of satisfaction to him before he passed away. As one prominent young scholar remarked to one of us admiringly, Nick was a walking encyclopedia on Chinese dialects without peer.

Nick was unsparing in his concern for his students and unselfish in sharing his work and insights with them on which they could build their own. He extended his seminars and classes by inviting them to his home for meals and discussion, and a significant number of the active and important scholars and teachers in Chinese language and linguistics were formed to a great extent under his tutelage. He was also supportive of younger colleagues, a characteristic that extended to those outside his own special field.

Nick was in love with and fascinated by language, its complexities, and the interplay of sound and symbol. This manifested itself in many ways in addition to his multiple language competence: in his attachment to ciphers,

puzzles and music, as well as in writing light verse and, perhaps all, in a marvelous capacity for puns (to the benefit of many an otherwise unmemorable meeting). Though he could sometimes appear to those not well acquainted with him to be aloof and even imperious, those of us who were his colleagues and who enjoyed the company of Nick and Sorrel along with their hospitality on so many gracious and often imaginatively conceived occasions (which continued after his retirement), knew him as a witty, thoughtful and generous companion, who loved conversation, entertaining, cruises, and cats. In particular, he possessed a puckish but non-destructive wit, which frequently expressed itself in outrageous but apt puns. With all of his knowledge and experience, he revealed on occasion an almost childlike and fetching curiosity and capacity for surprise about the new, and even the ordinary, that came to his attention. He also possessed a strong sense of order and propriety, and when confronted by meanness or unfairness, was sometimes not only disturbed, but even surprised by its very existence, since it was so far removed from his own outlook and code of conduct.

He was survived by his wife, Sorrel; his son, Richard; and daughter, Ann; and he survives as well in his work and in the memories of many of us who were his colleagues, friends, or students.

Richard L. Leed, Frans Van Coetsem, James W. Gair

Carolyn Olson Boegly

July 29, 1927 — June 6, 2008

Professor Carolyn O. Boegly (Cooperative Extension Administration) passed away at home after an extended illness with cancer. She was born in Camden, New Jersey, the daughter of Caroline O. and William J. Boegly. Her parents and brother William J. Boegly, Jr. predeceased her. She is survived by nephews William G. Boegly (Carla), John R. Boegly and Thomas L. Boegly (Glenanne) of Tennessee; great nephews, nieces and cousins in Pennsylvania and New Jersey.

Following graduation from high school in Mason, Michigan, she received a B.S. degree in Home Economics from Michigan State University and later, an M.S. degree in Extension Administration from the University of Wisconsin at Madison. Additional coursework at North Carolina State University at Raleigh addressed a broadening interest in adult education.

In 1952, she joined the Cornell Cooperative Extension system, first in Rensselaer County, and later in Broome County. There she developed programs adjusted to local economic, social and educational conditions—programs reaching a cross-section of citizens, public and private agencies and organizations. In Broome County, she also served as a “trainer” for new Extension Educators, implementing an intensive educational in-service program, with observations of work in action. She came to the Cornell campus in 1964 as an Assistant Professor in Human Ecology/Assistant State Leader for Home Demonstration Agents (currently Extension Educators). Promoted to Associate Professor in 1971, she served as an Extension Program Leader (1979) and then, Program Specialist in Staff Development (1986) where her leadership skills were needed for staff orientation, in-service planning and counseling. She also received a courtesy faculty appointment in the College of Agriculture and Life Sciences.

As a master teacher and counselor, she was one of the innovators in the design of new statewide programs and in-service education offered by College faculty to Cooperative Extension field staff. She helped maintain two-way communication between Cornell faculty, staff and local citizens that would accompany the changing and growing subject matter base of the College. In essence, she worked effectively with local staff as well as College faculty to match local program requirements with the interests and resources of the College. She led the development of a pioneer media effort initiating Cooperative Extension into Educational Television in the eleven-county Albany area. She earned the respect of both professional colleagues and local citizens as she supervised both urban and rural programs.

Professor Boegly was active in state and national professional organizations: New York State Association of Extension Home Economists (President, 1962), New York State Home Economics Association (Secretary; Advisor/Chair to Student Section). She was also active in the National Adult Education Association and Zonta (Binghamton). The National Association of Extension Home Economists honored her with the prestigious Florence Hall Award in 1961 and a Distinguished Service Award in 1962. She received a Farm Foundation scholarship in 1960 and a fellowship to the National Extension Agricultural Center for Advanced Study at the University of Wisconsin (1963-64). She retired in 1991 as an Emeritus Professor.

A memorial service was held for colleagues, family and friends at St. Luke Lutheran Church in Ithaca.

Bettie Lee Yerka, Chairperson; Barbara Eshelman, Lucinda Noble

Albert Wilhelm Boesche

November 3, 1874 — November 30, 1973

A man of rare integrity, Professor Albert Wilhelm Boesche stands out in the memory of those who knew him for the generosity and kindness of his nature, the vigor and humor with which he expressed himself on an infinite variety of subjects, and the thoroughness with which he treated the matter in hand. Colleagues in the German Department, students, neighbors, friends in town and gown — all were touched and enriched by his unique qualities.

A. W. Boesche, as he signed himself even when writing to close friends, was born in the little seaport of Leer in northwestern Germany. His father and both grandfathers were lawyers and he would have followed their profession had not his father's prolonged invalidism made this financially impossible. After completing his secondary schooling in the local "Gymnasium," he emigrated in 1892 to America in the hope of finding an opening in the still flourishing German newspaper field here. He was disappointed in his expectations, however, and after some brief journalistic experience, he drifted about until he found employment with the mayor of Watertown, New York, Hiram Foote Inglehart, whose son was enrolled at Hamilton College. While earning his keep in the Inglehart home, he was encouraged to attend high school to improve his English. The principal, Eugene W. Lyttle, a Hamilton graduate and later Regents inspector, took a special interest in the young immigrant, urged him to prepare himself for a teaching career, and together with the Ingleharts loaned him the necessary funds.

Admitted to Hamilton College as a sophomore, the young Boesche graduated as valedictorian of his class in 1897, but remained another year to earn his A.M. while serving as tutor in Latin. From 1898 to 1900 he taught Latin, Greek, and German at Plattsburg Normal School, then studied in Germany for a year at the University of Munich before proceeding to Rutgers College as instructor in German. In 1903 he went to Harvard University as part-time instructor and graduate student for a year, and in 1904 he went again to Munich, where he obtained his Ph.D. in 1905. There followed his first year at Cornell, as instructor in German, before he resumed his duties at Harvard in 1906. In 1910 he was called to Cornell as assistant professor, and he advanced to full professor in 1915. Named professor emeritus in July 1942, he gave a final year to Cornell as lecturer in his department. He was a member of Delta Upsilon, Phi Beta Kappa, the Modern Language Association of America, and the American Association of Teachers of German.

While his main field of interest was German syntax and style, Professor Boesche periodically gave courses in German literature and, before World War I, in German history and politics. In one of its 1932 issues, the *Cornell Daily Sun* praised his painstaking methods, through which, “the alert student acquires considerable faculty in writing and speech.” He was a dedicated teacher who took a keen interest in his students, and who preferred to pass on to others in verbal rather than printed form the conclusions reached by his own voluminous reading. His publications consist mainly of newspaper articles and reviews, and include a translation into English of a play by Frank Wedekind. While still at Harvard, he coauthored a booklet of exercises in German composition and contributed a literary appreciation of Carl Spitteler to the “German Classics” series, for which he served as one of the revisers.

Early in his career, Professor Boesche had at the request of the Berlin publishers made a stylistic revision of a translation into German of Archibald Cary Coolidge’s *The United States as a World Power*, though he asked that his name not appear on the title page. When approached in 1908 by Albert B. Faust, however, for a translation of the latter’s prize-winning work, *The German Element in the United States*, he declined the honor on the grounds that the 1,050 hours he figured it would take him to do a thorough job would prevent him from conscientiously performing his duties at Harvard and leave him no time for self-improvement. Nonetheless, he offered whatever help he was able to give, a generosity he extended continuously throughout his long life. Thus, while the name A. W. Boesche may rarely appear on a title page, it will be found in numerous prefaces as testimony to the countless hours he spent in proofreading, correcting, and refining the manuscripts of other authors.

Describing himself as a follower of Schopenhauer, Professor Boesche nonetheless made constant efforts to combat his innate pessimism and to capture the moments of joy granted to mortal man. When world events justified his worst fears, he avoided any discussion that might cause hurt, although criticism on his part was always couched in kindly terms. Saddened and frustrated by what happened to the land of Goethe and Schiller to which he remained attached, and of which he felt himself a representative, he yet refused to become bitter. Behind his North German reserve, there pulsed a deep sensitivity and a compassion with all creation. His faithful companion, a fox terrier named Toby, seemed for some time to be part of the staff at Goldwin Smith Hall.

“The sweetest guy in the world - not a mean streak in him,” is the way he was characterized by a neighbor in Forest Home, where he lived for thirty-six years with his wife, Hermine, nee Rossolt, formerly of Hanover, Germany, whom he had married in 1905. The Boesche home, in which their three sons grew up, remained a center of hospitality and

community activity even in difficult times, while garden and fruit trees benefited friends and neighbors almost as much as the family. Customers around the cracker barrel and pot-bellied stove in Forest Home's former country store could sit for hours spellbound by Professor Boesche's lively accounts of his experiences and the jokes he liked to tell on himself. Adults and children alike were fascinated by his dramatic manner of discoursing on any topic from Goethe's encounter with Napoleon to the latest acquired gadget.

So intent was Professor Boesche always on the subject of his current special interest that accepting his generous invitations to a ride in his Ford or Star could involve a certain risk: one hand was constantly leaving the wheel as he gestured his points. On one occasion, while approaching a railroad crossing with a load of children, he interpreted a signalman's frantic waving as merely a friendly greeting and, stopping neither discourse nor the car's progress, he barely made it across the tracks in front of the oncoming locomotive.

It was felt as a big loss when in 1948 Professor and Mrs. Boesche moved to Boonton, New Jersey, where all three sons, Frederick (called Fritz), Otto, and Enno were settled. Here Mrs. Boesche succumbed the following year to a protracted illness, a blow which affected Professor Boesche very deeply. Yet he was fortunate in that he could stay in his new home next to Enno's and enjoy the devoted care of his sons and their families, today his survivors.

He continued to be an avid reader of chiefly philosophical and scientific works and to follow world events with interest. He kept in touch with his old friends through frequent letters, never forgetting a birthday once it was noted down. Although he became housebound a year or two before his death, his thoughts and penmanship remained clear and beautiful until the end. He will always be remembered with affection and gratitude.

Elfrieda Pope Bestelmeyer

Marvin Bogema

May 29, 1911 — July 25, 1962

Marvin Bogema, Professor of Civil Engineering and Professor-in-Charge of the Applied Hydraulic Laboratory at Cornell University, died suddenly of a heart attack on July 25, 1962, in Ithaca, New York. He was fifty-one years old at the time of his death and had served Cornell and its students continuously for twenty-one years.

Professor Bogema was born in Muskegon, Michigan, and received his early education in that city. After he was awarded the degree of Bachelor of Science in Engineering from Michigan State College in 1933, he gained a wide variety of practical engineering experience by working, in turn, with a construction company, the City of Muskegon, the United States Coast and Geodetic Survey, the National Park Service, and then, for five years, with the Chicago consulting engineering firm of Greely and Hansen. There he was engaged in planning and designing numerous hydraulic and sanitary engineering projects and structures. It is probable that this experience confirmed his choice of hydraulics and hydraulic engineering as his major field of interest. While still employed with Greely and Hansen he pursued graduate studies in sewage treatment and stream pollution at the Armour Institute of Technology in 1939-1940. The desire to prepare himself still further for work in his chosen field prompted him to come to Cornell in 1940 where he received the degree of Master of Civil Engineering in 1942. During this period he also served as an instructor in engineering mechanics in the Sibley School of Mechanical Engineering. After receiving his Master's degree he became an Assistant Professor of Civil Engineering in 1942 and advanced to the rank of Associate Professor in 1947 and to Professor in 1951.

During his years at Cornell he maintained an effective balance between theory and practice and took a great interest in laboratory work. He organized and taught numerous courses in the areas of fluid mechanics, hydraulic engineering, and hydrology at both the undergraduate and graduate levels and served at various times as head of the Hydraulics Department. In this connection he devised many novel methods and pieces of apparatus, which served to demonstrate the principles covered in his lectures and to motivate his students. In addition, he devoted a large part of his time and energies to planning major alterations to the laboratory at Beebe Lake and to designing and building an entirely new laboratory in Hollister Hall. It was not unusual to find him in his working clothes in one or the other of these facilities at all hours, expediting the work with his own hands. Those two modern laboratories are truly his creations. With them he developed the Applied Hydraulics Laboratory into a going

activity and obtained and directed many projects, which involved tests, calibrations, and research studies. Along with all this he managed to keep in touch with industry and with the realities of professional practice.

Early in his teaching career he published a "Report on Current Practice in Teaching Hydraulics and Fluid Mechanics in the United States." This was followed by other publications on such subjects as "Friction Loss in Aluminum Pipe," "Head Loss in Irrigation-Line Quick Couplers," and "The Quadrant Edge Orifice-A Fluid Meter for Low Reynolds Numbers." He also prepared numerous reports of tests and model studies. One of the latest of these was a report on a study of deflection jetties for a major power plant on the Kanawa River in West Virginia. In his private consulting work as an individual and as a member of the firm of Bogema, Giffit, and Jenkins, which he organized, he made surveys and prepared plans and specifications for water and sewer systems in the Ithaca area and in Penn Yan and Interlaken, New York, and served as a consultant to several pump manufacturers as well as an adviser and expert witness for the Department of Public Works of the State of New York in various damage claims cases.

Professor Bogema was always mindful of his responsibilities to his profession and to his community, and he gave freely of his time to these aspects of his life. His service on numerous University and College committees included the chairmanship of the Policy Committee of the College of Engineering and a charter membership of the Joint Committee to Administer the Agricultural Engineering Curriculum. He was a Registered Civil Engineer in Michigan (1937) and was the first Licensed Professional Engineer in New York (1943) who received his license by endorsement. He was also a Fellow of the American Society of Civil Engineers and a past president of its Ithaca section; a member of Phi Kappa Phi, Tau Beta Pi, the American Society of University Professors, the American Society for Engineering Education, the American Society for Mechanical Engineers, the Institute of Hydraulic Research, and the American Academy of Sanitary Engineers. He took a great interest in the affairs of his community and, among other things, served as chairman of the board of trustees of the First Congregational Church of Ithaca and as a member of the board of directors of the Varna Fire Company. Always a builder, he was the guiding force in the planning and construction of the Varna Community Center.

His friends and associates remember him for yet many other things: for his strong convictions and high ethical principles, and for his forthright support of them; for the high standards of performance which he demanded of himself and his students and for his wholesome influence on his students; for the zeal, initiative, and hard work that he applied to everything he undertook, and for his ability to get results at low cost; for his love of flowers and his skill in growing them, and, most of all, for his fine devotion to his work, his school, his profession, his community, and his home and family.

He was survived by his wife Vivian Clark Bogema; a son, William Derk Bogema; a daughter, Valerie Clark Bogema; his mother, Reka Bogema; a sister, Mrs. James Tregoning; and two brothers, Manna and Carleton Bogema. He was buried in Muskegon, Michigan.

George B. Lyon, James A. Liggett, John C. Gebhard

Ralph Bolgiano, Jr.

April 1, 1922 — May 11, 2002

Ralph Bolgiano, Jr., Professor Emeritus in the School of Electrical and Computer Engineering, died at Kendal in Ithaca on May 11, 2002 from complications following a bicycle accident several weeks before. He is survived by his wife, Elizabeth; four children: Randy of Wyoming, Douglas of Seattle, Christopher of Ithaca, and Elizabeth of Princeton; their partners; five grandchildren; and a sister, Charlotte Oliver, of Locust Grove, Virginia.

Ralph was born and raised in Baltimore, Maryland, matriculated at Cornell University as a McMullen Scholar in 1940, received the B.S. degree in 1944, the B.E.E. degree in 1947 after serving as an officer in the U.S. Army Signal Corps during World War II, and the M.E.E. degree in 1949. Subsequently, he worked for the General Electric Company as a Development Engineer until he returned to Cornell as a graduate student and completed his Ph.D. degree in 1958. In the same year, Ralph was invited to join the faculty as an Associate Professor in the School of Electrical Engineering, and was promoted to full Professor in 1968.

Ralph did his Ph.D. work at Cornell University in the School of Electrical Engineering (now the School of Electrical and Computer Engineering) under the direction of Professor W.E. Gordon. His 1958 thesis, entitled “A meteorological interpretation of wavelength dependence in transhorizon propagation,” had a major impact on the then new field of over-the-horizon propagation via radio wave scattering from turbulent irregularities in the refractive index of the atmosphere. This work, in particular, dealt with the importance of buoyancy forces and how the associated added term in the nonlinear Navier-Stokes equation altered the spectral shape of the turbulence, i.e. how the strength of the turbulent irregularities decreases with decreasing wavelength. Radio wave scattering is controlled by a distinct wavelength (determined by the radio frequency and the scatter geometry), and so it is crucial to know what physical parameters control the wavelength spectrum and, in particular, what the short wavelength “cut off” is, since there will be very little scatter at radio frequencies requiring wavelengths shorter than this. In other words, there is a high frequency cutoff in the scatter process, and the buoyancy forces are important in determining this cutoff. All of Ralph’s subsequent research built upon and expanded on his thesis work, dealing with various aspects of turbulence in the atmosphere, anisotropies in tropospheric structure, and the interaction between radio waves and atmospheric turbulence, including transhorizon radio propagation.

For years, Ralph was associated with the Cornell Center for Radiophysics and Space Research and his sabbatical leaves were directly related to his research interests. In 1964-65, as a Guggenheim Fellow and Fulbright Travel

Fellow, he was a Visiting Research Scientist at l'Institut de Mechanique Statistique de la Turbulence, Universite d'Aix en Provence, Marseille. In 1971-72, he was Research Engineer at the Radio and Space Research Station at Ditton Park, Berkshire, England. In 1979-80, he did research in his field at the University of Colorado.

Ralph was a Senior Member of the Institute of Electrical and Electronics Engineers, a Fellow of the American Association for the Advancement of Science, as well as a member of the IEEE Antennas and Propagation Society, the American Geophysical Union, and the American Meteorological Society.

During his faculty career in the School of Electrical Engineering, Ralph taught a wide variety of courses. At the graduate level, he taught courses based on his research interests in electromagnetic wave phenomena in the atmosphere, as well as a course on radio systems engineering. In his early years on the faculty, Ralph taught several courses on electrical circuits to non-electrical engineers. At that time, most of the undergraduate students in the College of Engineering were required to take a course in electrical engineering as part of their curriculum, and these courses were specially tailored to meet their needs.

During the early part of the 1960s, Henry Booker, then Director of the School of Electrical Engineering, led a thorough renovation of the Electrical Engineering curriculum. As part of this, he developed a two-semester course in Electrical Science to be taught to all electrical engineering students at the sophomore level. Ralph was a participant from the beginning, and he taught this course and its successors several times throughout his career. He also was involved with the development of a two-semester, junior-level, required sequence of laboratory courses. These courses required the participation of several faculty members and overseeing the operation was a considerable task. Over the years, Ralph was in charge of one, or both, of these laboratory courses many times, and he was highly successful in directing the operation.

As part of the renovation of the curriculum, a two-semester sequence of courses on electromagnetic fields and waves was developed. These courses, previously only taught at the fifth year level, were designed for juniors. Ralph was a major participant in the development of this sequence and over the years, he taught one or the other of these courses many times.

In all of Ralph's courses, students could expect exacting requirements, carefully developed lectures of outstanding clarity, thought-provoking problems, and challenging examinations. Indeed, faculty members who helped in teaching courses with Ralph were also frequently challenged by the problems he set. Ralph, however, was a popular teacher and greatly appreciated by students for his dedication to their education. As a consequence, Ralph was

the first recipient, in 1983, of the Ruth and Joel Spira Excellence in Teaching Award. He was also the co-winner of the Student Teaching Award for the School of Electrical Engineering in May 1985. Teaching was a major focus of Ralph's life, and he loved to interact with students. He set high standards, and was dedicated to meeting them. Ralph accepted the challenges of student advising with characteristic integrity. He always took the opportunity to enrich this interaction with students by giving his time and wisdom unselfishly. Similarly, Ralph accepted election as Graduate Field Representative of the School several times, again giving of his time for the benefit of others.

Throughout his life, Ralph was an avid sailor. From boyhood, he sailed and raced his Star Class sailboat first on Chesapeake Bay and later on Lake Cayuga. He had a natural sense for the rhythm of the water, wind and boat, and was a true "seat of the pants sailor." Ralph was a welcome guest on others' boats and successfully passed his love of sailing to his children. Ralph was also an enthusiastic bicyclist who explored much of Tompkins County on his bike and through the years cycled around the Lake and developed an impressive knowledge of the County roads and highways. After retirement from Cornell, Ralph became an active member of the Cayuga Heights Volunteer Fire Department and accepted the responsibilities thereof with characteristic devotion. At the Memorial Service held at Kendal in his honor, the presence of two Fire Department trucks and many of his fire fighting comrades was a tribute to Ralph as a valued fellow volunteer and friend.

Above all, everyone whose life Ralph touched remember him as a true gentleman.

Donald T. Farley, Paul R. McIsaac, George J. Wolga

Gary Robert Bolton

September 21, 1942 — February 10, 1982

Dr. Gary R. Bolton was born and raised in Racine, Wisconsin. His early interest for the outdoors, sports, and music became his lifetime characteristic. Gary attended the University of Wisconsin and Iowa State University and received his Doctor of Veterinary Medicine degree from Iowa State University in 1967. He received an appointment as intern at the Animal Medical Center in New York City in 1967, followed by two years of residency in internal medicine and cardiology.

Dr. Bolton was appointed to the faculty of the New York State College of Veterinary Medicine as an assistant professor of small animal medicine in 1970 and was promoted to associate professor in 1974. His primary interest was cardiology, which he developed into a productive referral service and teaching program for students and practitioners. He became board-certified in the specialty of cardiology in the American College of Veterinary Internal Medicine in 1979.

A gifted teacher with a unique ability to pinpoint essential clinical aspects while radiating interest and enthusiasm for his students and a deep sense of confidence and trust to the pet owner, he became known and respected as a compassionate veterinarian who exhibited empathy to both his patients and their owners. Because of these qualities he was a popular lecturer at local, state, and national meetings. His dry sense of humor, his mimicking sounds and signs of various ailments, as well as his practical approach to clinical problems always kept his audience's attention. In 1978 his continuing education lectures were enthusiastically received by the veterinary practitioners in Japan. In 1977 he was awarded the Norden Distinguished Teacher Award by his students.

Dr. Bolton contributed over thirty publications to textbooks and periodicals. In 1975 he authored the *Handbook of Canine Electrocardiography*, which quickly brought him international recognition. This text became a leading reference in veterinary cardiology and subsequently was translated and published in Japanese. Gary was a pioneer in veterinary ECHO cardiography and in the development of the feline cardiovascular research section of the Cornell Feline Health Center.

Dr. Bolton's administrative positions included membership on the Curriculum Committee, the Annual Conference Committee, the Student-Faculty Liaison Committee, and the Expanded Admissions and Admissions Committee. He served also as student chapter of the American Veterinary Medical Association faculty adviser and American Animal Hospital Association faculty adviser, as well as faculty adviser and president of Phi Zeta. He was a member

of the Academy of Veterinary Cardiology, the American Animal Hospital Association, the American Veterinary Medical Association, the New York State Veterinary Medical Association, and the New York State Southern Tier Veterinary Medical Association.

Dr. Bolton generated such a lasting impression that an endowed award, the Gary Bolton Memorial Cardiology Award, arose from funds and donations in memory of his outstanding contributions to the field of small animal cardiology. The first presentation was made at the 1982 Honor Day banquet.

He is survived by his wife, Jean Bolton, and their two children: a son, Kerry (ten), and a daughter, Mickey (eight).

Maurice Bond

July 5, 1897 — February 22, 1992

Dr. Maurice Bond, Professor Emeritus of Agricultural Economics, died February 22, 1992 at the age of 94. He played a leading role in the development of cooperative extension programs, particularly in the marketing of agricultural products and marketing information for consumers. His leadership made a difference in extension at both the state and national levels. He believed strongly in extending the knowledge base generated at the College of Agriculture to the agricultural community of the state and nation and to the consuming public. He served as project leader for extension programs within the department and was Director of the New York State Cooperative Extension Service from 1954 until his retirement in 1962.

Extension work with the farming community had been firmly established in the department under the leadership of Dr. George Warren when Dr. Bond joined the faculty in 1928. Bond, together with his colleagues, L. C. Cunningham and V. B. Hart, broadened the scope of agricultural economics programs in extension using field surveys and farm accounts as an integral part of their work. His personal characteristics contributed strongly to his effective leadership and administrative skills. He was outgoing but firm in his convictions. He enjoyed people and his interactions with them. He had boundless energy and displayed high moral principles and integrity in all that he did. He paid close attention to details but did not lose sight of his objectives. He dealt with difficult problems without becoming emotionally involved and was an effective mediator. He was frugal in handling personal as well as public resources.

Maurice Bond was born on a farm in Orange County, Vermont, on July 5, 1897, beginning a lifelong association with agriculture. He grew up in Thetford and graduated from Thetford Academy. His professional association with agriculture began with his graduation from the University of Vermont in 1920 with a B.S. in agriculture. After graduation he spent six months as a second lieutenant in the U.S. Army Infantry. He taught high school for a year and a half and spent two years at the New York State School of Agriculture, Morrisville, where he taught courses in dairy husbandry and dairy science; he also coached football. He spent a year with the New York Holstein-Friesian Association before returning to the University of Vermont for his M.S. in 1924-25. He came to Cornell for a Ph.D. in 1926 working with H.A. Ross and W.I. Myers. His dissertation, *Marketing Milk Through Ice Cream*, was completed in 1928.

Dr. Bond chose to stay at Cornell and was appointed Assistant Professor and Extension Economist in 1928. He spent his entire career at Cornell in extension. Some time was spent working outside the department on a variety of special assignments. Many organizations appreciated his willingness to help them for a few weeks or months with a particular problem or project.

Dr. Bond authored more than 150 numbered departmental publications as sole or joint author. An important part of his early work was with vegetable growers. Specialized account books were developed to encourage growers to keep production and financial records. The account books were collected at the end of the year and summarized. This information provided an essential part of extension programs with growers. He published situation and outlook materials for New York agriculture and the dairy industry.

During the 1940s Maurice concentrated his efforts in making agricultural census data more useful and broadly available to agricultural and rural communities. He published data from the 1935 and 1940 agricultural censuses for individual townships within each county of the state including acreage, production and yields for individual crops, and livestock numbers and output. He continued these efforts for the agricultural censuses of 1945 and 1950. Several publications were authored showing trends in agricultural production over periods up to 100 years. Other studies examined vegetable production in New York and in competing areas of other major states.

Dr. Bond co-authored a widely used book with his colleagues, Hart and Cunningham, entitled, *Farm Management and Marketing*. This book, published in 1942, was written as an introductory text and was generally adopted throughout the Northeast in agricultural schools. More than 36,000 copies were sold with modest profit to the authors. Public service was the major objective in writing the book.

Dr. Bond was project leader for extension programs in agricultural economics during the 1940s and early 1950s. He directed a major expansion in the extension marketing staff and programs during his tenure as project leader. The new work in marketing perishable farm products, including fruit, vegetables, poultry and dairy, and the development of a consumer food marketing information program, were especially important. This latter program, initially developed in Ithaca, was extended to New York City with a special office and program in 1948.

Maurice was appointed Director of Cooperative Extension in 1954. He continued to demonstrate the same creative leadership in this new appointment. He administered the separation of Cooperative Extension from the Farm Bureau shortly after becoming Director. He was able to avoid the difficulties encountered commonly in other states by his openness and skills in communicating with farmers, agricultural leaders and rural communities.

This separation necessitated the formation of new extension structures at both the state and county level. A state advisory council was established representing extension's different clientele groups to review program objectives and plans for the year ahead. Local extension associations were formed in each county. Agricultural, 4-H and home economics programs were brought together under a single county administrator. This organization improved working relationships among the three divisions and simplified the administration of county programs and interactions with county governments. County associations were developed as membership organizations with an elected board to advise county staff and to represent the association in dealing with state and county officials. This structure has proven to be effective over time.

While Director, Dr. Bond opened up the process of selecting candidates to be considered for positions on his staff and at the county level. This made the process more competitive and increased the likelihood that the most qualified individual would be selected for each position. Many of the individuals chosen in this process provided effective leadership for Cooperative Extension in the 1960s and 1970s after he had retired. He also provided leadership at the national level in developing extension programs in marketing. He was a member of the national Extension Committee on Organization and Policy (ECOP). He chaired the ECOP subcommittee on marketing and helped establish new national initiatives in marketing across the country. During his tenure as Director he spent 1956-57 reviewing the Cornell Project in the Philippines and assisting the organization of extension activities in that location.

Dr. Bond was a member of Sigma Xi, Phi Kappa Phi, Epsilon Sigma Phi, and Alpha Zeta. He received the Superior Service Award from the United States Department of Agriculture. He retired in 1964 after more than 36 years of service to the University and Cooperative Extension. His professional activities did not end with his retirement. He spent 1963-64 as a Visiting Professor at the University of the Philippines, Los Banos, and as an Extension Consultant. He continued to travel and consult for more than a decade after his retirement including trips to Peru, Spain, Portugal, Yugoslavia, Turkey, Greece, and Mexico.

He was predeceased by his wife, Flora, a classmate at Thetford Academy, and survived by three sons: Philip, Bradford, and Robert. He had fourteen grandchildren and fifteen great grandchildren at the time of his death. During his residence in Ithaca, he was active in many local organizations, including the First Congregational Church of Ithaca, the Ithaca Rotary, and the Baden-Powell Council of Boy Scouts. He held a variety of positions in these organizations and received scouting's highest award, the Silver Beaver, in 1969. Other public service activities included the United Fund, Senior Citizens Council, and Friends of the Library. His long-time colleagues

in the Department of Agricultural Economics and Cooperative Extension remember him with great fondness and respect. He was a true public servant, who left an enduring mark on the fields he did so much to fashion and sought to serve with dedication and principle.

R.S. Smith, B.F. Stanton, C.E. Wright, R.P. Story

Carl W. Boothroyd

January 15, 1915 — May 7, 2000

The Plant Pathology Department lost a dear friend and admired colleague with the passing of Carl William Boothroyd on May 7, 2000 at the Cayuga Medical Center in Ithaca. A memorial service was held May 13 at Sage Chapel on the Cornell campus.

Carl was born on January 15, 1915 in Woodsville, New Hampshire. He graduated with an A.B. degree from Dartmouth College in 1938 and proudly acknowledged his allegiance to his alma mater forever after by donning his green and white sweater whenever a Big Green team was in town (even at Cornell hockey games!). Carl received the M.S. degree from Washington State University in Pullman in 1941. From 1942-46, Carl served in the U.S. Army Medical Corps, and thus his matriculation at Cornell University extended from 1941-50, whereupon he received the Ph.D. degree in Plant Pathology.

He joined the Department of Plant Pathology in 1949 as Assistant Professor and Extension Plant Pathologist with responsibilities for potatoes and forage crops, a position he held for 4 years. His long association with teaching graduate and undergraduate Introductory Plant Pathology began in 1952 and continued till 1980. Carl teamed up with Dr. Dan Roberts of the University of Florida to author the book, *Fundamentals of Plant Pathology*, which was used in his undergraduate class. During this same period, his research responsibilities were with diseases of corn. He took great pride in the training of many students, including many international students that have subsequently gone on to high positions in their home countries (e.g. Dan Mukunya, Kenya; Mario Contreras, Honduras; Rafael Jimenez Diaz, Spain, to name a few). Dr. Boothroyd retired on June 30, 1980 and held the title of Emeritus Professor of Plant Pathology thereafter.

Carl was best known recently as the Emeritus Professor “guardian” of the Plant Pathology Newsletter. He was a regular provider of news items, and was the recognized contact by department alumni. Like anything Carl did in his life, he paid serious attention to this responsibility, and the department will sorely miss his efforts.

Carl was aptly described as the “Gentleman’s – Gentleman,” but one would be mistaken to assume that with this complement, Carl was easily taken advantage of. He could be extremely rigorous when it came to teaching Introductory Plant Pathology and to testing students on their mastery of the subject via oral exams – both of which he did for many years. He was also a serious participant at the monthly “Bankers Meeting”, in which he skillfully used his poker playing talents to separate his competitors from their money. And then there was his

prowess for fishing! For many years, Carl was always willing to help organize and compete in the Annual Student-Faculty Fishing Derby, but he was never willing to divulge the trade secrets that often netted him first prize.

Carl was a charter member, past president, and Paul Harris Fellow of the Ithaca-Cayuga Rotary Club, where he was tremendously active in selecting and hosting international students through the club's International Foundation.

Carl is survived by his wife of 18 years, Mrs. E. Sureyya Boothroyd; a son, Richard; a daughter, Margaret; a stepdaughter, Yasemin; his twin sister, Mrs. Charlotte Boothroyd Chase of Durham, New Hampshire; and several grandchildren, nephews, and nieces. Carl was predeceased by his first wife, Loretta (Lannie) Ranney Boothroyd, and his brothers, Clifton and Ken Boothroyd.

George W. Hudler, H. David Thurston, Thomas A Zitter

Samuel Latimer Boothroyd

August 10, 1874 — April 4, 1965

Samuel Latimer Boothroyd, Professor Emeritus of Astronomy, died suddenly at the age of ninety on April 4, 1965, at his home in Cayuga Heights Manor. Active throughout his long life and rarely acknowledging infirmity, he had attended a meeting of the Senior Citizens group the day before his passing.

Professor Boothroyd was born on a ranch near Loveland, Colorado, on August 10, 1874, the son of Philip H. and Edith M. Boothroyd, immigrants from England. His mother was a woman of outstanding mental ability, and except for three years, his early education and training were received from her at their pioneer home. He attended Colorado Agricultural College and received the Bachelor of Science degree in Irrigation Engineering in 1893. Two years (1894-95) of graduate work at the University of Chicago were followed by two years (1895-97) of teaching as Professor of Mathematics and Astronomy at Mount Morris College, Mount Morris, Illinois. The next two years were spent as an assistant at the Lowell Observatory, Flagstaff, Arizona. It was here that he developed an interest in the observation of binary stars and the analysis of their orbital motion. His contact at Lowell was to serve him well when, many years later, he led two scientific expeditions from Cornell to this famous observatory.

After a year (1901) as Professor of Mathematics at Bellvue College, Bellvue, Nebraska, he returned as Associate Professor of Physics and Engineering at Colorado Agricultural College. There he received the degree of Master of Science in Astronomy in 1904. In this same year he began his association with Cornell as an Instructor in Civil Engineering. From 1908 to 1912 he was Assistant Professor of Geodesy and Topographical Engineering. It was during this period that he was the official surveyor for the University. Among his numerous activities in this capacity were the surveying of the Alumni Field and of an area on Fall Creek above Varna where it was proposed to build a reservoir.

In 1912 he became Associate Professor of Mathematics and Astronomy at the University of Washington, Seattle, remaining there until 1921 when he was recalled to Cornell as Professor of Astronomy and Geodesy in the School of Civil Engineering. In 1932 astronomy was established as a department in the College of Arts and Sciences, and Boothroyd became Professor of Astronomy, a title he held until retirement as an Emeritus Professor in 1942 at the age of sixty-eight.

Professor Boothroyd loved the out-of-doors, and his early home training and education as an engineer combined to make him an excellent leader of expeditionary investigations. His earliest endeavor of this nature occurred during the years in Seattle when he was for several summers (1905-09) a surveyor on the Alaskan-Canadian Boundary Survey. Accounts of his experiences were retold in later years on many occasions, always to the delight of his listeners.

On January 24, 1925, the Ithaca area was the scene of a total solar eclipse. Elaborate arrangements, in which Dr. E. C. Slipher of Lowell Observatory and Professor Boothroyd participated, were made to observe at Fuertes Observatory. Weather partially favored the occasion, and excellent photographs of the corona were obtained.

In 1931-32 he was field director of the Harvard-Cornell Meteor Expedition to the Lowell Observatory. His personal research was devoted to the measurement of meteor velocities by the oscillating mirror method, and his results indicated the presence of considerable numbers of meteors with hyperbolic velocities, that is, those entering the solar system from outer space.

In 1933 he again led a group of Cornell scientists to the Lowell Observatory to secure ultraviolet stellar spectra with the then new aluminized mirrors. Work was carried on at the Observatory and at 10,500-foot altitude on the nearby San Francisco volcanic peak. One hundred and seventy-four spectra of ninety-seven stars were obtained. Boothroyd's ability to adjust to primitive conditions and to improvise when funds and materials were lacking made him an outstanding expeditionary leader. Needless to say, his stock of stories from unusual experiences served to enliven many an occasion when circumstances were disheartening.

Although Professor Boothroyd published during his career numerous technical papers on binary stars, meteors, and stellar spectra, it is not unfair to say that the bulk of his writing was educational in nature. He collaborated with O. M. Leland on a booklet, *Determination of the Area of Land*, in 1916. His contribution on astronomy in the Comstock *Handbook of Nature Study* is noteworthy. He contributed regularly to *Annual Supplement of the Book of Popular Science* (Grolier Society) edited by Dexter S. Kimball, Dean of the College of Engineering. His *Workbook on Field Astronomy* was used for many years by students in civil engineering, as was *Astronomy Questions—The Solar System*, by students in arts and sciences. In spite of his extensive writings Professor Boothroyd once remarked that he favored the spoken word in comparison to the Written, a characteristic amply borne out by his many public lectures and his talks during the public nights at Fuertes Observatory when he patiently told of the wonders of the heavens to young and old. His listeners enjoyed his evident personal enthusiasm and sincerity of manner.

Students and colleagues alike respected Professor Boothroyd as a teacher. He was both a gentleman and a gentle man. There were a kindness and a friendliness about him that brought encouragement to many an inexperienced and struggling student. He would recognize and point out a weakness, yet find something to commend.

He took great interest in and often became personally involved with causes he felt worthy of support, frequently at more than prudent sacrifice. For years he was active as a member of the board of managers of the Cooperative Consumers Society and of the Reconstruction Home, serving each organization as president.

Beyond his professional achievements and community activities, Professor Boothroyd is remembered for his personal characteristics. His tall, lean, almost frail figure was frequently seen at evening lectures and campus affairs. He was one of Cornell's inveterate walkers and even in the last years of his life he frequently walked from his home to downtown Ithaca. In the matter of food he held what many persons would regard as odd ideas. He ate no meat although it was served to his guests. He was also very definitely the "pure" water man. Since he strongly opposed the use of alcoholic beverages he was greatly upset when the Consumers Co-op, on which he had labored for years, began selling beer. He ground his own flour while bemoaning man's injustice to the wheat grain in conventional milling. He grew vegetables in quantity and was much opposed to the use of "poisons" in the garden—organic fertilizers, cleanliness and diligent effort would do the job, he felt.

His interest in astronomy continued to the last. While he did not enthusiastically support the large expenditures in space research, he nonetheless took great interest in and became quite excited over the feats achieved. He felt, however, that far better things could be done with similar expenditures of money and effort on other than scientific fronts. Something of his search for basic truth can be sensed in these attitudes, and a little of the pioneer spirit and idealism characteristic of the man is evident. There is a feeling that he typified a changing old order which yields place to the new. To many of us has come a personal loss in the knowledge of his absence.

Professor Boothroyd was a fellow of the American Association for the Advancement of Science, a member of the American Astronomical Society, the International Astronomical Union, the American Association of Variable Star Observers, the Society of the Sigma Xi, Phi Kappa Phi, and the Statler Club.

He was survived by his wife, Alice Bell, whom he married January 12, 1892, while she was a school teacher at Loveland, Colorado. (Mrs. Boothroyd died June 9, 1965, at the age of 91). He was also survived by two sons, Philip D. and Robert S., and by two alumnae daughters, Lucy (Mrs. Evert C. Abbe) '28 and Mary Alice (Mrs. Raymond V. Hemstreet) '35.

Carl Crandall, Paul L. Hartman, R. William Shaw

Francke Huntington Bosworth

November 29, 1875 — April 27, 1949

Francke Huntington Bosworth, Emeritus Professor of Architecture and former Dean of the College of Architecture died, after a prolonged illness, in New York City on April 27, 1949.

Dean Bosworth was born in New York on November 29, 1875, the son of Dr. Francke H. Bosworth and Mary Hildreth Bosworth. After attending the Cutler School and graduating from Yale University in 1897 as Bachelor of Arts, he went on to Paris where he received his formal training in architecture during four years at the Ecole des Beaux Arts. Returning to the United States, he entered professional practice with Frank H. Holden, this association continuing successfully until 1918 when Dean Bosworth left for service in France with the American Red Cross. In the fall of 1919 he came to Cornell as Professor of Design and Dean of the College of Architecture, and served with distinction in both capacities. He relinquished the deanship in 1927 as a result of severe illness. Returning several months later, he resumed his teaching and associated activities until his retirement in 1940.

Dean Bosworth was a man of high ideals, of wide interests and intense and contagious enthusiasm, mentally alert and physically active. He had read widely and traveled extensively; intellectually and socially he was cosmopolitan and mature. He was impatient of sham or pretense and of stodginess or mental inertia, but usually this quality was tempered by a ready sense of humor. Though thoroughly schooled professionally in the classic tradition, and never hesitating to champion its educational disciplines, he was essentially liberal in thought and action. In his teaching as a critic in architectural design, his professional abilities and stimulating personality made him outstandingly effective and also highly respected and popular with his students.

In the years just following the first World War, when he was the administrative head of the College of Architecture, several significant changes were made in the organization and functioning of the College. The curriculum was extended to five years, Cornell being the first of the schools of architecture to take this step. A substantial thesis was made a requirement for graduation. The curriculum leading to the degree in Fine Arts was introduced. The department of Landscape Architecture was transferred from the College of Agriculture to that of Architecture. Physical accommodations were expanded and improved. Though the wisdom of some of these actions was questioned at the time, all have long since proved their soundness, and to Dean Bosworth's foresight and energy can be attributed a major share of the credit for their adoption.

His publications were few, but one should be noted. About 1930, the Association of Collegiate Schools of Architecture, with the support of the Carnegie Corporation, undertook a survey of the status of professional training in architecture in the United States and Canada, and to Professor Bosworth, collaborating with Professor Roy Childs Jones of the University of Minnesota, was entrusted the laborious and delicate task of obtaining the necessary information and drafting the report. During the fall and winter of 1930-31 they visited forty-nine of the fifty-eight schools at that time accredited by the state and provincial licensing authorities. The report was a model, comprehensive and penetrating, yet tactful and readable.

Dean Bosworth was a Fellow of the American Institute of Architects, a past Director of the Beaux Arts Institute of Design, past President of the Association of Collegiate Schools of Architecture, a member of the New York State Board of Examiners and Registration of Architects, and of the Architectural Advisory Council of Cornell University. He was also a member of Tau Beta Pi, Phi Kappa Phi, Psi Upsilon, and the Century and University Clubs of New York City.

H. E. Baxter, J. A. Hartel, W. F. Willcox

Harold Eugene Botsford

July 18, 1887 — October 4, 1958

Harold Eugene Botsford, Professor Emeritus of Poultry Husbandry, and for many years extension project leader in the Department of Poultry Husbandry, died after a short illness, on October 4, 1958, while visiting his daughter in Denver, Colorado.

Professor Botsford was born in Bridgeport, Connecticut, in 1887. He spent his boyhood on his father's home farm near Newton, Connecticut. Although dairying was the major farm activity, the care of the farm poultry flock apparently was largely responsible for the development by Professor Botsford of an early interest in poultry husbandry. After graduation at the Newton High School in 1907, he used the profits derived from the poultry flock to support college work at the Connecticut Agricultural College at Storrs, from which he received a diploma in 1909. At that institution he was president of the senior class, president of the college Shakespearean club, and first in the Hicks Prize Speaking Contest.

After graduation, there was an interval in which Professor Botsford managed a poultry establishment near New York City, ran a poultry and general farm in Connecticut, and taught high school agriculture in Massachusetts. Then he entered Cornell University in 1915, where he specialized in poultry husbandry under the direction of Cornell's internationally known Professor James E. Rice. He completed his training for the B.S. degree in 1918.

Professor Rice quickly recognized the superior qualifications and ability of this mature student and made him an assistant on the staff at Cornell in 1916. On graduation, Botsford was made extension instructor in poultry husbandry in 1918, Assistant Extension Professor in 1920, and Extension Professor in 1925. He retired July 1, 1952, after 36 years of highly successful extension teaching. As a teacher Professor Botsford exerted a major influence in the development of the poultry industry of New York State.

The chief interests of Professor Botsford in poultry husbandry were, at first, largely in poultry farm management, and later in poultry marketing. In 1929-1930 and again in 1944-1945, he did special work for the United States Department of Agriculture, studying consumer preference for eggs, and as a marketing specialist for the War Food Administration. He initiated the Cornell Egg Grading School, which was the forerunner of many similar schools throughout the United States. He also served in 1933-1937 as chairman of the egg marketing committee of the Northeastern Poultry Producers Council.

After retirement, Professor Botsford supervised the Egyptian postwar poultry project financed by the Christian Rural Overseas Program of which he was subsequently New York State Director, and the Heifer Project, Inc. Later he took part in a similar project in Greece and there toured the poultry centers of the country at the request of the Greek government.

Professor Botsford was the author of numerous bulletins and articles dealing with poultry farm management and poultry marketing problems. He was coauthor with Professor James E. Rice of the textbook *Practical Poultry Management*, which has been one of the most popular poultry texts, widely used in teaching vocational agriculture to high school students. He was also the author of a textbook entitled *The Economics of Poultry Management*.

The organizations of which Professor Botsford was a member included the American Association for the Advancement of Science, the Poultry Science Association, the World's Poultry Science Association, Epsilon Sigma Phi, the honorary agricultural society of Ho-Nun-De-Kah at Cornell, and the Ithaca Rotary Club. He served the Baptist Church of Ithaca in many capacities and taught the men's class there for twenty-five years.

Professor Botsford was a pleasant and friendly person and a devoted family man. His wife and five of his six children survive him. His many friends and colleagues at Cornell and elsewhere greatly regret his passing.

J. H. Bruckner, F. B. Hutt, L. C. Norris

Raymond Bowers

July 11, 1927 — April 29, 1979

Raymond Bowers, professor of physics for nearly twenty years at Cornell, was born and educated in England. He gained his first degree at the University of London in 1948 and his doctorate in physics at the Clarendon Laboratory, Oxford, in 1951. After two years postdoctoral study at the University of Chicago, he joined the Westinghouse Electric Corporation in 1953 and was a research physicist there for seven years. In 1960 he came to Cornell as a member of the Department of Physics and of the Laboratory of Atomic and Solid State Physics.

Raymond Bowers gained national and international prominence as an outstanding research physicist and as a commentator and analyst on science and public policy. His research interests were in the areas of solid-state and low-temperature physics, and his discoveries at Cornell included the first detection of the helicon, a magnetoplasma mode in metals akin to the ‘whistler’ signal observed in the ionosphere. He was aided in this work and in his work over the years on liquid helium, luminescence, semiconductors, and thermoelectric phenomena by many gifted research students and postdoctoral associates. The experimental metals physics group he built up at Cornell was highly regarded in the United States and abroad.

In the middle and late 1960s Bowers developed what became an abiding interest in the impact of science and technology on national and international affairs. He was an astute and perceptive observer in this area and was a frequent participant on national task forces and committees. He served, for example, on the staff of the Office of Science and Technology in the Executive Office of the President in 1966-67, in 1968 on the National Academy of Sciences Panel to Study Science and Regional Development, from 1972 to 1975 on the Committee on Science and Public Policy of the American Association for the Advancement of Science, and in 1977 on a task force to study national communications policymaking. In addition he served as a consultant to industry and to government, most recently to the Department of State and to the National Science Foundation. His knowledge, skill, and experience in questions relating to science and public policy were made available to the Cornell community at large through the establishment in spring of 1969 of a new program in science, technology, and society in which he served as the founding deputy director. He involved himself in the activities of this new venture with great intensity and effectiveness and he played a very important role in formulating the policies and guiding the development of the Program in Science, Technology, and Society at Cornell, especially during his period as director, from 1973 to 1978. His special interest was technology assessment, a field in which he became one of the world’s experts.

The value of Raymond Bowers* work in many different areas of human endeavor has been widely recognized. He was a fellow of the American Academy of Arts and Sciences, a fellow of the American Physical Society, a fellow of the Physical Society of London, and member of many other professional societies.

His activities and interests at Cornell encompassed both the sciences and the arts. During his years on the Cornell faculty, Bowers served on the editorial board of the Cornell University Press, on the executive committee of the Society for the Humanities, and on the Faculty Committee on Music. He was an excellent teacher and throughout his career at Cornell was deeply involved in teaching programs at both undergraduate and graduate levels, first in the Department of Physics and then in the Program on Science, Technology, and Society. In 1965 he was coauthor, with Alfred Kahn, of a major report on undergraduate education at Cornell.

In recording the great qualities of Raymond Bowers as a scholar, a teacher, an innovator, and a wise man, we are likely to miss his marvelous personal attributes. He was a remarkably decent and kindly person, one who worried deeply about interpersonal relationships and one who had a particular concern for young people, whether students, postdoctoral associates, or junior faculty. He had about him humor and wit which he used with great effectiveness in illuminating even the most serious of issues.

Just before his untimely death he was awarded a Guggenheim Fellowship, which he had planned to take up in England; he had been due for a well-deserved sabbatic leave in the fall of 1979.

Frank A. Long, Neil W. Ashcroft

Clyde I. Boyer

July 21, 1913 — April 12, 2003

Clyde I. Boyer, Professor Emeritus of Veterinary Medicine passed away on April 12, 2003 in Tucson, Arizona. He was married for 61 years to his wife and companion, Ethelder “Sell,” who died in 2005. His two daughters, Gail Moore and Sandra Boyer, a son, Clyde Boyer III, and a grandchild, Tiffany Moore, survive them.

Clyde was born in 1913 and grew up in Philadelphia. He attended the University of Pennsylvania, graduating in 1940 with the V.M.D. degree from the Veterinary School. He performed active duty in the military from 1941-46 and subsequently served for many years in the Medical Corps. Reserves, rising to the rank of Full Colonel. In 1946, he was appointed Assistant Professor in Clinical Pathology at the University of Pennsylvania, a post he held until 1950 when he moved to Georgia as an Associate Professor at the Experiment Station in Tifton. However, it was at Cornell that Clyde made his major career contributions. He joined the faculty in the College of Veterinary Medicine as an Associate Professor in 1952 to specialize in studies of turkey diseases. While in that position, he developed a program of immunization against erysipelas, a serious bacterial infection of turkeys, and also introduced the method of drinking-water-administration of procaine penicillin for the prevention of epizootics of the disease. Additionally, he studied salmonellosis and encephalomalacia in turkeys and worked on nonspecific enteritis of chickens and turkeys. His contributions were of great value to the turkey producers in New York State and elsewhere. He was promoted to Professor in 1960. In 1958, Clyde undertook a one-year sabbatic leave at Texas A&M University where he conducted research on psittacosis/ornithosis and where he was subsequently awarded an M.S. degree.

Dr. Boyer was a member of the American College of Laboratory Animal Medicine and became the College’s first Professor of Laboratory Animal Medicine in 1966. To assist him in his new endeavors, he took a second sabbatic leave to study at Johns Hopkins University School of Medicine with particular emphasis on laboratory animal medicine. In September 1972, Dean George Poppensiek appointed him to the new position of Director of Laboratory Animal Medicine. In this position, he assumed responsibility for the teaching programs, research, and for the administration of laboratory animal care in the College. He also supervised the development of a University-wide program of laboratory animal care that had just been mandated by the United States Public Health Service. The program he initiated has developed into one of the nation’s most exemplary programs of laboratory animal care.

Clyde Boyer was meticulous and curious, qualities that were admired by his colleagues and were of considerable value in his approach to his job. He is remembered for his humility, kindness, gentle disposition, and for his understanding and concern for others. And, he had high personal standards. For example, as Director of the Diagnostic Laboratory, he was required to obtain a license to practice veterinary medicine in New York State. True to form, he refused the opportunity to obtain a license through the reciprocity agreement between Pennsylvania (where he was licensed) and New York State, and so he undertook the difficult task of sitting the exams in New York many years after graduation. Few of his colleagues would have suffered that trial!

Although his professional life was full, Clyde found time to indulge other interests, among them hiking, fishing and spelunking. He also thought skiing would be fun and once decided to show his children the “ins and outs” of the sport on a hill near their home. On a downhill “demonstration” he broke his leg (full length cast for six months), which prompted his wife to burn his skis in the fireplace! His sense of humor, which he maintained in spite of it all, along with his scientific and personal contributions are missed by his many friends, colleagues and family members.

Katherine Houpt, Bud Tennant, Bruce Calnek

James Ernest Boyle

November 22, 1873 — September 18, 1938

James Ernest Boyle was born November 22, 1873, on a farm near Boyle, Jefferson County, northeastern Kansas, the son of John and Mary Ann (Searl) Boyle. His family were pioneers in that region and the nearest town was named after them. His early years until he entered the University of Nebraska were spent on the farm, and he received the degree of A.B. in 1900. The A.M. he received from the University of Kansas in 1902 and the Ph.D. from the University of Wisconsin in 1904. From 1904 to 1916 he was professor of Economics and Political Science and head of the department in the University of North Dakota at Grand Forks. Here he was one of the founders and first president of the university co-operative store, the organizer and first president of the North Dakota Tax Association and State director for North Dakota at the National Conference on Marketing and Farm Credit. He was led more and more into the study of marketing and particularly of farm marketing problems. He was field agent in marketing for the North Dakota Experiment Station at Fargo during 1916-17, and the next year, 1917-18, he was a member of the Bureau of Markets of the United States Department of Agriculture. In 1918 he returned to teaching and came to Cornell as extension professor of Rural Economy and thus became the University's first teacher of marketing. Since 1923 he had been professor of Rural Economy, devoting all his time to teaching and study.

His early and continued contact with the marketing problems of agriculture made him a world authority, particularly on the produce exchanges, and resulted in such special publications as *Speculation and the Chicago Board of Trade*, 1920, and *Cotton and the New Orleans Cotton Exchange*, 1934. He had lately been commissioned by the Cuban government to study the Cuban sugar industry. He was chairman of a committee of the National Association of Manufacturers investigating the relation of chain stores to farmers. Another side of his teaching activities resulted in his *Agricultural Economics*, 1921. In late years the results of his studies have been presented to more popular audiences in the *Atlantic Monthly*, the *Saturday Evening Post*, and other journals. In these and other articles he appears as a keen critic of the governmental agrarian policy in this country. His criticism brought on attacks and threats in both state and nation.

Among his activities at home was his presidency of the Research Club. In the town, during the existence of the National Recovery Administration, he was the permanent chairman of the Ithaca Compliance Board. For some years he was the presiding officer of the open forums conducted by the First Presbyterian Church.

His relation with students was of the closest and most intimate nature and particularly to foreign students, Chinese and other Orientals, he was a guide and mentor. Toward his colleagues he was generous, kindly, and unassuming. Though he had strong convictions he always sought the honest opinions of others. Where he saw intellectual dishonesty or chicanery he was a fearless and vigorous critic.

Professor Boyle died September 18, 1938, at his home, 115 Cayuga Heights Road, after a long illness. He had married Mary Effie Lytle of Topeka, Kansas, September 13, 1902. Surviving with the widow are two daughters, Elizabeth (Vassar, 1929), the wife of Arthur B. Rogers (Cornell, D.V.M., 1934) and Louise (Vassar, 1931).

Damon Boynton

September 27, 1908 — August 24, 1986

Damon Boynton was the son of a well-known professor of American literature at the University of Chicago. When he was ten or eleven, his mother, acting on a doctor's advice that she introduce her boys to country life, bought and began to run a small general farm in Old Mystic, Connecticut. There were cows and horses, chickens and ducks, a fine old barn, a beautiful New England pasture with boulders and poison ivy, a pond, and fertile fields, as well as the Mystic River and access to boats and saltwater. Here began a love affair with farm life from which Damon never recovered.

A couple of years at Loomis (now the Loomis-Chafee School) prepared him for Amherst College, where he stayed for one year, and the University of Chicago, where he stayed for another. He finally found himself at Cornell in the College of Agriculture and in the Cornell Dramatic Club, where he also found Mary Fuertes (the daughter of Louis Agassiz Fuertes '97), whom he married when they graduated in the class of 1931. As an undergraduate he majored in agricultural economics (in the days of Warren and Pearson), but as a graduate student he studied pomology under A. J. Heinicke and L. H. MacDaniels. After he got his Ph.D., in 1937, he was appointed assistant professor of pomology in the College of Agriculture and in due course was promoted to full professor, and for the next twenty years or so he was actively involved with extension, research, and teaching in the Department of Pomology.

Boynton made two major contributions to pomology. The first was a detailed study of the soil environment that provides the nourishment and support for woody perennial fruit plants. In it he identified the effects of various physical features of the soil matrix at different depths and different times of the year on water drainage, pore space, and soil aeration. His research showed that those soil-drainage characteristics influence oxygen levels in the pore space and hence have a profound effect on root growth and the absorption of mineral nutrients and water. This pioneering work enhanced the department's ability to advise growers in New York about site selection and dictated the selection of new sites after the heavy tree losses on the poorer sites following the freeze of 1933-34.

His studies of the relationship between the availability of mineral nutrients in the soil and the composition of leaves led to the establishment of the leaf-analysis service, offered by Cornell to New York fruit growers as a means of identifying nutrient deficiencies and excesses before they could adversely affect fruit production and fruit quality. He developed a leaf-color chart that growers could use to measure the nitrogen status of the tree and determine appropriate fertilizers, and he later refined his studies of the effect of various kinds of orchard cultivation on nitrogen levels in fruit trees and developed guidelines for the use of foliar sprays for supplementary nutrition.

In his research and teaching Boynton's interest soon turned to the pomology of regions other than New York State. In 1939 he won a College of Agriculture traveling fellowship to study orchard management and plant nutrition in Great Britain. In 1945, on a Guggenheim Fellowship to study citrus fruits, he spent some time in Puerto Rico, and for the next forty years his chief professional interest was in subtropical and tropical fruits, in their culture, and in the lives and cultures of the people who lived by their cultivation. In 1951-52 he offered a course called "Fruits of the World." Then, in 1953, he was able to combine his interests in pomology, tropical fruits, agricultural education, and Latin American culture during a year's work as acting head of the Crops Department of the Instituto Interamericano de Ciencias Agrícolas at Turrialba, Costa Rica. It was a great year for Boynton and for the scientific study of agriculture in Latin America. At the institute he introduced the first spectrophotometer to improve the analysis of element deficiencies in plant tissue, and he expanded the coffee collection, now the largest in the world. More significant, he focused attention on ways to improve the teaching and research programs in this, the first graduate program in the Southern Hemisphere, and to link them with the development issues of the countries of Latin America. The challenges of rural development, the role of agriculture in improving the lives of millions of poor rural people, and the difference that a few good people could make in this process—these were the themes that Boynton inspired his colleagues with and that he is still remembered for. But the precepts were nourished by the example of a man who had time to supervise the introduction of new varieties and new rootstocks of apple, peach, plum, and pear in the highlands of Guatemala.

When he returned to Cornell and resumed his heavy load of teaching, he also became a member of a committee appointed to reassess the Graduate School, and in 1959 he became dean of the Graduate School. During his five-year term Dean Boynton conceived and directed the creation of the Sage Graduate Center and thereby gave a local habitation to what had been only the name for an administrative, record-keeping academic unit of Cornell with offices tucked into Day Hall. Previously graduate students had discovered one another only in seminars, libraries, and laboratories, and sought in Willard Straight Hall (and in Pop's and in Johnny's) congenial space in which to waste a sullen day together or to brighten one another's perceptions. When the remodeling of old Sage College was completed, the new Graduate Center contained 147 dormitory rooms, several reading rooms and lounges, a music room, a new dining room, and a suite of offices for the dean and administrative staff. The center went far towards identifying and humanizing the Graduate School as an entity of the university, especially for first-year students. (Thanks to Boynton's insistence, the center housed both men and women—in separate wings—and became the first of Cornell's sexually desegregated dormitories.)

But Boynton's chief concern was with the academic quality of the students, of their work, and of the instruction and guidance they received from the faculty. In performing his decanal duties, he won the respect of the faculty and students by his fair-mindedness, by his "total grasp of the job," and by what another of his colleagues later called "his marvelous calm and his dry sense of humor." One of the policy issues he took a strong stand on was the Graduate School's requirement that candidates for a Ph.D. degree present evidence of the ability to read two foreign languages; he opposed those who would reduce or abolish the requirement. More generally, he favored high standards of scholarly discipline in an educational program that enlarged rather than narrowed the lives and the vision of its students.

Among the many extramural committees he served on, two were especially successful because of his leadership: the Committee on Testing of the Association of Graduate Schools and the National Council on the Testing of English as a Foreign Language, both of which he chaired. The second of these eventually solved a difficult problem for graduate schools that drew students from all over the world—some of whom arrived on campus not knowing enough English to do good work in an American university. Boynton had brought to his job as dean an old and abiding interest in educating young scientists from developing countries.

In 1964, at the end of his term as dean of the Graduate School, Boynton resigned from Cornell to become manager of a United Nations project under the Food and Agriculture Organization designed to strengthen advanced programs in scientific agriculture in Latin America. From the project's headquarters in the Tropical Research Center of the Organization of American States at Turrialba, Costa Rica, he traveled to universities and experiment stations all over Latin America, sharing his professional experience with agricultural scientists and teachers. In 1966 he became chief of party of a similar project based in Lima, Peru, and six years later he moved to Santa Tecla, El Salvador, as adviser to a U.S. Department of Agriculture Project in agricultural research. During ten years in the role of an academic and scientific Johnny Appleseed, Boynton made a lasting impression on agricultural education and research in Latin America—and enhanced the fame of Cornell.

Boynton always enjoyed getting out and talking with farmers and seeing how they worked and lived. In the course of such field work in Latin America he became interested in, and impressed by, some of the small farmers who seemed to him to be doing extraordinarily well under very difficult conditions. By this time he had come to recognize that although the Green Revolution had done wonders for increasing world food production, the benefits of these scientific advances had been largely gained by large landholders. Having become especially interested in discovering how research in the agricultural and social sciences could help small farmers build on their own

indigenous knowledge and experience, he welcomed an opportunity to spend his last year in Latin America back in Costa Rica, where, with a team of specialists from Chile, Guatemala, El Salvador, Venezuela, and Costa Rica, he worked on the development and implementation of programs for small farmers.

After returning to Cornell, Boynton helped organize a series of faculty seminars with the Rural Development Committee to exchange ideas and information regarding problems and potentialities of small farmers in the third world in the hope that ideas of practical value would emerge. The series was so successful that someone proposed that the contributions be collected and published in a book to be edited by professors emeriti William F. Whyte and Damon Boynton. While assuming particular responsibility for the contributions of his colleagues in the College of Agriculture and Life Sciences, Boynton took a strong interest in all of the chapters and was especially helpful in suggesting how social scientists could make their contributions most useful to readers who were not social scientists. The book, *Higher-yielding Human Systems for Agriculture*, was published by Cornell University Press in 1984. At the time of his death he was making good progress on a history of horticulture at Cornell.

Damon Boynton was a quiet, modest, wise, capable, and passionate man, in love with life in all its natural forms and fascinated by its symbiotic associations with humanity.

Scott B. Elledge, Walter H. Stainton, William F. Whyte, Louis J. Edgerton

Jessie Austin Boys

March 1, 1881 — June 18, 1965

Born in Webster City, Iowa, Jessie Melissa Austin grew up in the Midwest. She taught in rural schools for several terms and studied at Iowa State College where she earned her Bachelors degree in 1908.

On February 10, 1909, Miss Austin married Samuel B. Boys, and the couple immediately homesteaded a claim in Oklahoma. But in 1911, even before the claim was proved, the husband died, leaving the young widow to carry on alone for the remainder of the required term.

To keep things going Mrs. Boys joined the Iowa Extension Service as a lecturer. As soon as she could she came east to further her education at Columbia University. In the meantime she continued her teaching. She was an instructor at Miss Farmer's School and at Morningside College.

In 1917 Mrs. Boys was appointed an instructor in the School of Home Economics in the New York State College of Agriculture at Cornell University. Upon the receipt of her Master's degree from Columbia in 1920 she was promoted to Assistant Professor. She became an Associate Professor in 1945 and held that rank until her retirement in 1949.

On the inception in 1922 of the new Department of Hotel Administration Mrs. Boys was assigned to work with the first class of twenty-one students. She worked closely with them and quickly won their respect and affection. Always a skilled technician she was highly appreciated as a teacher.

In 1925 the School of Home Economics was separated from the College of Agriculture to become the New York State College of Home Economics. The Department of Hotel Administration moved along with it but in due course became a "school" in its own right, though still under the aegis of the College of Home Economics. Mrs. Boys continued working with the Hotel students throughout these changes. She gradually gave them more and more of her time until she was fully assigned to the Hotel School, much to the benefit of its students.

Mrs. Boys wrote extensively in her field. She was the author of, and with Professors Brewer and Fenton, co-author of a number of bulletins published in the *Cornell Bulletin for Homemakers*. Associated with others of the Home Economics faculty she co-authored the 1924 revision of the Butterick Cook Book. During the years 1924-26 she contributed a series of monthly articles on menus and food preparation to the *Delineator*. And she had a variety of other articles in women's magazines. In 1928 she was accorded "Le Cordon Bleu" diploma in Paris.

The October, 1965, issue of the *Bulletin of the Cornell Society of Hotelmen*, recalling Mrs. Boys's contribution in the early days of the Hotel School, points out: "The tremendously loyal group spirit for which the Hotel School has become so famous found its beginnings in the informal gatherings, in her experimental kitchen, of the 'Coffee Hounds.' Upon her retirement the School lost a dedicated and inspiring teacher. Now, upon her death, those of us who worked with her and studied under her have lost a valued friend."

Lillian Shaben, Charles Inglehart Sayles, Howard Bagnall Meek

Richard Bradfield

April 29, 1896 — May 1, 1981

It is fitting that Cornell's most impressive laboratory building is named for the late Professor Richard Bradfield, whose accomplishments were as impressive as they were unique. Committed to the idea that civilization was born when agricultural returns rose above the level of bare subsistence, he regarded the symbiotic relationships between science and farming as the foundation of prosperity and progress of world society. To this proposition he devoted his enormous energy, his remarkable talent for innovation as a chemist-agronomist, and his forceful personality.

Reared on a farm in Ohio, he graduated from Otterbein College in 1917 to find himself farming to support his sisters and widowed mother while teaching high school science and pursuing graduate studies at Ohio State University. With the postwar collapse of farm prices, he accepted an appointment as an instructor in the Soils Department of the University of Missouri in 1920. Two years later his Doctor of Philosophy degree from Ohio State was awarded, and his reputation as a physical and colloidal chemist was already rising rapidly. In 1927, as a Guggenheim Fellow in the laboratories of H. Freundlich at the Kaiser Wilhelm Institut für Physikalische und Elektrochemie in Berlin, and of G. Wiegner at the Technische Hochschule in Zurich, he developed concepts of the nature of soil colloids and techniques for evaluating their role in the acidic characteristics of soil.

Called back to Ohio State University as a full professor in 1930, he and his students expanded the application of physical and colloidal chemistry to oxidation-reduction potentials in soils and to the reactions of lime in soils.

In 1937 he moved to Cornell as professor of soil technology and head of the Department of Agronomy. He served as faculty representative to the Cornell University Board of Trustees, 1943-48. While building an expanded department, he taught dynamic courses in the physics and chemistry of soils as well as in soil fertility. The latter was, in fact, more nearly a course in philosophy for world agriculture. His lectures drew students from many disciplines and many countries, and their impact will not be forgotten by those who attended.

A trusted adviser to two deans of his college, he served on committees that recommended policies that are now Cornell traditions. A prime mover in development of the International Agricultural Development Program, he was a leading advocate for the Cornell project for rehabilitation of the College of Agriculture of the Philippines after its devastation in World War II.

Meanwhile, his influence had grown in his own country and abroad. The American Society of Agronomy sent him as its delegate to International Congresses of Soil Science in the USSR in 1930 and in England in 1935, and elected

him president in 1941-42. He was elected the first president of the Soil Science Society of America (1935-36) and was later to be president of the International Society of Soil Science (1956-60). He chaired the Colloids Division of the American Chemical Society (1936-37) and served as vice president (agriculture) of the American Association for the Advancement of Science.

He served as acting assistant chief, Bureau of Plant Industry, in 1939 and soil scientist (consultant) to the U.S. Department of Agriculture (1943-55). He chaired a Joint Land Grant College-USDA Committee on the National Soil Survey (1942-48) and was a member of the Agronomy Advisory Committee on Fertilizers, War Food Administration (1943-45). He was a member of the Advisory Committee on Agricultural Education, U.S. Department of State (1944), and chaired National Research Council Committees on Agronomy (1933-37) and on Training of Agricultural Research Workers (1944-46). He was a member of several other NRC committees and served NRC as a consultant on their Africa Foreign Aid Project. He was a member of the NRC National Agricultural Policy Board.

He was a member of the Visiting Committee on Biology, Brookhaven National Laboratory, and of the Committee on International Relations of the American Institute of Biological Sciences.

He was a member of the Standing Advisory Committee on Agriculture, Food and Agriculture Organization of the United Nations, and of FAO's Technical Research Committee, Freedom from Hunger Campaign. He served as an adviser to government bodies in Central and South America.

The above listing is incomplete but gives an impression of Richard Bradfield's involvement, as a Cornell professor, in affairs of his country and of the world. His major activities on the international scene, however, go far beyond the foregoing.

In 1941 Richard Bradfield was one of a party of three consultants dispatched to Mexico by the Rockefeller Foundation. They were to investigate the feasibility of an experimental program in the development of agriculture in an underdeveloped country. Their report was accepted and their recommendations put into effect. It was the opening gun of the green revolution. As consultant to the Rockefeller Foundation from 1941 to 1955, he was a principal adviser on the Mexican project, whose successes included breeding crop varieties adapted to the needs of Mexico and similar areas around the world, an achievement that was to win the Nobel Peace Prize for a member of the Mexico project team. By then, however, Richard Bradfield had been made the Rockefeller Foundation's regional director for the Far East (1956), and shortly thereafter he was elevated to the foundation's Board of Trustees.

Although still a Cornell professor, he was instrumental in the founding of the International Rice Research Institute in the Philippines in 1960 and in the foundation's assistance projects in Viet Nam, Thailand, Indonesia, Taiwan, Burma, Japan, and the Philippines. He was a leader in the development of an international program for training agricultural scientists and extension workers in Southeast Asia at the University of the Philippines and in the initiation of the Rockefeller Foundation's Indian Agricultural Program. During this period plans were developed for programs that are now operative in Central and South America and Africa.

On December 31, 1961, his term as trustee of the foundation completed, he retired from his professorship at Cornell and took up residence in the Philippines to work on a project of his own. He had long insisted that small farmers in underdeveloped tropical climates could, by clever systems of overlapping planting, produce more abundant and better balanced food supplies for themselves and their nations. What was needed was an appreciation of agronomic principles as they would apply to multiple cropping, with concrete examples as models. He went to the field to show with his own experience, his own hands, and his own imagination how it could be done, thereby initiating the next wave of the green revolution.

In 1971, at the age of seventy-five, he left his successful development-demonstration project to reside, for a time, as a senior fellow at the East-West Food Center of the University of Hawaii. From there he went as a visiting professor to the University of Florida's Center for International Agriculture in Gainesville. Finally, in 1978, he retired to private life near the home of his eldest son, and on May 1, 1981, a few days after his eighty-fifth birthday, his heart abruptly failed.

His wife, the former Hannah Stillman, his six children, eleven grandchildren, one great-grandchild, and four of his sisters survived him. His remains were interred in West Jefferson, Ohio, whence he came.

Marlin G. Cline, Douglas J. Lathwell, Robert D. Miller

Eugene F. Bradford

March 5, 1889 — February 21, 1972

Eugene F. Bradford, registrar emeritus, died in Ithaca on February 21, 1972, forty-four years after he joined the University Faculty. He is survived by Marjorie Campbell Bradford, his wife, and their son, Edwin Campbell Bradford.

A lineal descendant of William Bradford, the founder of Plymouth Plantation and longtime governor of the colony, Gene Bradford was born on March 5, 1889, in Bangor, Maine. He carried throughout his life the imprint of New England north of Boston — its traditional conscience and its code, felicitously blended with a dry and discriminating humor.

His scholarly mind and promise were abundantly evident during his under-graduate years at Bowdoin College, where he was elected to Phi Beta Kappa. Upon his graduation in 1912, Bowdoin awarded him the Henry Wadsworth Longfellow Fellowship in support of his advanced studies at Harvard. There he became pupil and disciple of George Lyman Kittredge. The bond remained a strong one until Kittredge's death in 1941, and the imprint of Kittredge and his ideals of scholarship — like the imprint of northern New England — was eloquently reflected in the exemplary standards and style that marked the career of Gene Bradford.

He earned the degrees of Master of Arts and Doctor of Philology from Harvard and was a member of the Department of English at Syracuse University. His professional career was interrupted when America entered the First World War. Gene Bradford served as first lieutenant with the 308th Infantry in the Oise-Aisne and the Meuse-Argonne campaigns, was wounded in action, and in later years wore his veteran's emblem as conscientiously as he wore his Phi Beta Kappa key. After study at Oxford for a year, he returned to Syracuse and in 1926 took charge of the admissions program there.

President Livingston Farrand invited Bradford to Cornell two years later as the University's first director of admissions, and in 1931 he became registrar as well as director of admissions, serving in both capacities until after the Second World War.

His years at Cornell revealed him as a meticulous administrator, whose orderly mind and dispassionate approach to the complexities of his assignment qualified him well for the duties which he had assumed. But there were other aspects of his nature which came to light soon after he reached the campus. He was essentially an academic man

by temperament and by inclination, and his heart never really left the classroom and the library after he went into administrative work. Moreover, he was an academic man of unusually independent spirit and point of view, well adapted to the rigorous professional climate of a Faculty celebrated for having a redoubtable and even fierce independence of its own.

It was in character for a man such as Gene Bradford to insist upon teaching, no matter what else he might be doing, and he taught until the burgeoning pressures of the late 1930s and the early '40s made him give up his thrice-weekly pilgrimages to Goldwin Smith. It was also in character for his active interest in research to persist. One of his abiding satisfactions was the monthly meeting of The Circle, an informal group which gathered to hear an original paper read by Howard Adelman, Carl Stephenson, Leonard A. Maynard, Gene Bradford himself, or one of the other members — and submitting the author to an uninhibited grilling afterward.

At his desk in Morrill Hall, near a window which looked out across the valley towards West Hill, Gene Bradford seemed to personify the integrity and the underlying warmth of the institution. Even his manner and his appearance were congenial to his role. Well remembered are the unobtrusive and relaxed dignity of speech and bearing, the gray suit (usually with vest, except in hot weather) that was part of his careful grooming, the level gaze which — under provocation — could turn frosty behind the rimless glasses, the generous growth of eyebrow, the strong line of chin and jawbone. And with it all, a small forelock that refused to stay in place during the course of a hard day's work and helped relieve any impression of austerity.

He was primarily a quiet force in University affairs, and (there is really no other way to express the almost esoteric quality) he commanded respect. His style in speaking and writing was sparse and to the point. He might encounter debate over a substantive issue on the infrequent occasions when he addressed a meeting of the University Faculty, but he invariably received a measure of attention over and beyond the demands of parliamentary courtesy. Along with George Holland Sabine, Cornelius Betten, A. W. Gibson, and others, he was a member of the Faculty who never had to explain what he meant after he finished talking.

The recognition which Gene Bradford was accorded by his campus associates was also manifest in the professional circles in which he moved. He was elected vice-chairman of the Executive Committee of the College Entrance Examination Board, and for many years he played an important part in the affairs of the Middle States Association of Colleges and Secondary Schools, its Commission on Higher Education, and the American Association of Collegiate Registrars and Admissions Officers. He was a member of the Modern Language Association, the American Association of University Professors, and his social fraternity was Delta Kappa Epsilon.

A strong-minded as well as a high-minded man, Gene Bradford on occasion found himself engaged in differences of opinion with another strong-minded and high-minded man, President Edmund Ezra Day, who succeeded Livingston Farrand in 1937. The differences were a bit sharp at times, but over the years they were of small consequence on a campus where high-minded men often found themselves ranged against colleagues who thought otherwise, without lasting impairment of professional regard or personal esteem on either hand.

The end of the Second World War and the onrush of applications for admission brought to the fore irrepressible questions of policy and procedure in handling the awesome work load. The booming expansion of the administrative complex, an inevitable result of the booming expansion of everything else, symbolized the rapid and enforced changes that the postwar years brought upon the University. In 1946 the outward and visible signs of the new era included the recently completed administration building (later to be named for Edmund Ezra Day), the sprawling and allegedly temporary quarters for veterans beyond Judd Falls Road, and the mushrooming Faculty housing development on the slope of East Hill. In that year the Office of Admissions was established as a separate organization under Director Herbert H. Williams. Gene Bradford continued to serve as registrar until his retirement in 1957 and in the process experienced one of the most productive phases of his service to Cornell.

In his time as director of admissions and as registrar, he had a critical and continuing part in the University's effort to maintain the quality of its student body and its standards in the wake of the stock market crash of 1929, the hard years of the Great Depression, recovery, and a devastating war and its aftermath. He was witness to the establishment of the School of Nutrition in 1939, the School of Industrial and Labor Relations in 1945, and the School of Business and Public Administration in 1946. In connection with each of these benchmarks along the way of Cornell's academic growth and development, Gene Bradford played a greater or lesser role as circumstance and his responsibilities directed. All in all, his contribution to the increasing strength of the University was invaluable and, in many respects, unique.

He was a conservative in the finest sense of the term, yet without trace of the stark rigidity too often mistaken for good New England conscience. His convictions with respect to the mission of the University were rooted in a sophisticated understanding of the genius or spirit of the place, and his concept of the University interest, which he had served with such singleness of purpose, was as timeless as that view across the valley towards West Hill.

Blanchard L. Rideout, Harry Caplan, Howard B. Adelman, Edward K. Graham, Walter A. Snickenberger

James Chester Bradley

February 11, 1884 — February 25, 1975

The death of James Chester Bradley shortly after his ninety-first birthday brought to a close nearly seventy years of devoted service to Cornell University.

Professor Bradley was born in West Chester, Pennsylvania, where he attended Friends Graded School, and in 1903 he graduated from Philadelphia Central High School. He early showed an interest in the natural sciences and is said to have collected spiders at the age of three. He was fifteen and still in high school when he published his first scientific paper. When he was sixteen, he became editor of *The Entomological Student*.

He entered Cornell in 1903 and received his A.B. degree in 1906. He received his M.S. from the University of California in 1907, returned to Cornell, and received his Ph.D. in 1910. From 1905 to 1909 he held various assistantships and fellowships at Cornell and the University of California. He served as special assistant to the state entomologist of Georgia in 1909, 1910, 1911, and 1913. He was in Georgia when Professor John Henry Comstock wired him an offer to return to Cornell as an assistant professor. Bradley said, "I didn't walk, I ran to the nearest telegraph office to wire acceptance." He served as assistant professor from 1911 until 1920, when he was appointed professor of entomology and curator of invertebrate zoology. He became professor emeritus in 1952.

Professor Bradley was a true field biologist, and his extensive trips to collect insects began in 1905 when he went to the Selkirk Mountains of British Columbia. He was on the Cornell expedition to Okefenokee Swamp in Georgia in 1912 and on the famed joint Cornell-Harvard transcontinental trip in 1917. He, with the late Professor W. T. M. Forbes, led the Cornell Entomological Expedition of 1919-21 to South America. Species new to science are still being found among the vast collections made on this last trip. Specimens collected by Bradley throughout North and South America as well as in Europe and Africa did much to enhance the stature of the already extensive Cornell University Insect Collection. After World War I he purchased with his own funds a number of collections of European insects, which he turned over to Cornell.

His grasp of the subjects he taught was phenomenal, and his expectations of the knowledge students were to acquire made his courses a challenge. Graduate students found Bradley a hard taskmaster. His concern with detail and insistence on a complete grasp of the subject and related subjects caused many to fall by the wayside. Those who survived are leaders in their fields.

His scientific publications began in 1899, continued in an almost unbroken stream until his death, and consisted of about 260 titles; at least one paper was in press at the time of his death. Since he was primarily a hymenopterist, the majority of his papers deal with wasps, but he was by no means restricted to this field. His book, *A Manual of the Genera of Beetles of America, North of Mexico*, was a standard text and reference work for many years. Others of his works cover insect morphology and evolution and biogeography. A few years before his death he developed an interest in the Phasmidae, a family of insects related to the grasshoppers, and was preparing an extensive paper on this group.

Professor Bradley had an abiding interest in young people. He founded and for many years was scoutmaster of Troop 15 in Ithaca and was chairman of the committee that secured the site for Camp Barton. He was a member of the National Council and the Louis Agassiz Fuertes Council of the Boy Scouts of America. He was coauthor, with the late Professor E. Laurence Palmer, of the manual *Insect Life* for the Boy Scouts.

He was a member of numerous scientific societies in the United States and abroad, many of which made him a fellow or honorary member. He was president of the Entomological Society of America in 1951. He served on the International Commission on Zoological Nomenclature from 1944 to 1963 and was its president from 1953 to 1963. For many years he was on the executive committee of the International Congress of Entomology. In 1972 he was asked to be a guest of the International Congress held that year in Australia, and it was an occasion of deep regret to him that he was not well enough to travel that far.

In 1940 Professor Bradley married Ruth Stephens Baker, a childhood friend who had made a distinguished career in education. Mrs. Bradley died in 1965.

J. G. Franclemont, C. E. Palm, L. L. Pechuman

Clarence G. Bradt

June 2, 1898 — June 2, 1977

Clarence G. Bradt, professor emeritus of animal science, Cornell University, died June 2, 1977, at the age of seventy-nine.

Professor Bradt retired January 1, 1960, after thirty-eight years of extension work as a county agricultural agent and animal husbandry specialist. After graduating from Cornell with a B.S. degree in agriculture in 1922, he entered extension work as assistant agent in St. Lawrence County. He became county agricultural agent in Schenectady in 1923 and in Delaware County in 1925. Under his leadership, Delaware County greatly expanded its Farm Bureau membership, ranked first in Dairy Herd Improvement Association record keeping, and first in the TB-testing program.

In 1930, Professor Bradt joined the staff of the New York State College of Agriculture as assistant professor of animal husbandry. His first responsibility was the organization of dairy record clubs, a type of mail-order milk testing. This was the forerunner of the present-day county central testing laboratory and owner-sampler record.

Professor Bradt was most noted for his work on and leadership in herd health programs. He had remarkable ability to coordinate the efforts of the innumerable persons, diversely employed, whose efforts were required to achieve disease eradication and control and to promote the idea of healthy herds. He was a prolific writer and had to his credit numerous extension bulletins and leaflets, special reports, scientific articles, and articles in farm magazines. He was also a regular contributor to the County Farm News Service and wrote more than one thousand individual articles for the service.

In 1936 he was granted a year's leave of absence to serve with the Agricultural Conservation Program during its organization in New York State and, for a time, served as its state executive officer.

During World War II, another year's leave was granted for service on the wartime food production program. He helped with the development and promotion of the state farm labor program and gave major attention to farm labor relations and training. In this period he was author of two widely circulated publications, *Training Farm Workers* and *Are You A Good Boss?* In 1945, he made a survey of dairy cattle housing and milk production methods in the Seattle, Washington, milkshed and, upon his return, made detailed reports on pen stabling and parlor milking.

While on sabbatical leave in 1951, he completed a thorough study of public livestock health programs in the United States. In making this survey, he visited twenty-four states, and the final report was circulated widely by the United States Department of Agriculture.

After retirement from the College of Agriculture, Professor Bradt worked as a consultant for the James A. Baker Institute for Animal Health in the area of dairy disease research. His duties with the institute included research reviews, public relations, and research funding. He retired from the institute on January 1, 1969.

In addition to holding membership in the American Dairy Science Association and the U.S. Livestock Sanitary Association, Professor Bradt was a member of Alpha Zeta, an honorary agricultural fraternity, and Epsilon Sigma Phi, an honorary society of extension workers from all states.

Professor Bradt was a native of Rome, Oneida County, and spent most of his life in New York State, with the exception of two years on a farm in the Red River Valley in North Dakota*

Professor Bradt is survived by his wife, Sara (Howe) Bradt; two sons, Robert H. Bradt of Mentor, Ohio, and J. Herbert Bradt of Buffalo, New York; and eight grandchildren.

Harry R. Ainslie, Kenneth L. Turk, James D. Burke

James Lewis Brann, Jr.

June 24, 1913 — July 29, 1990

James Lewis Brann, Jr. was born in Norwood, Massachusetts, a small town near Boston. As a youth, he was active in the 4-H Club program and participated in the training program in gardening and woodworking. He received a state award for outstanding service as a 4-H instructor. This was a prophetic indication of his future professional role as teacher.

He attended Boston University for a short time before transferring to Massachusetts State College where he majored in entomology and graduated in 1939. He then came to Cornell to continue his studies in entomology. He was appointed assistant in research in the Department of Entomology at the New York State Agricultural Experiment Station for the summers of 1939 and 1940 working on Long Island on the biology and control of insect pests of corn. He held a research fellowship in the Department of Entomology at Cornell, 1941-42, conducting research on the control of spider mites and insects affecting florist crops. He was appointed assistant in research, New York State Agricultural Experiment Station on March 16, 1942, assigned to the Poughkeepsie Substation. Cornell awarded him the Ph.D. degree in 1944.

Dr. Brann continued his career at the Poughkeepsie Substation being appointed assistant professor April 1, 1945. The commencement of his faculty career coincided with the post World War II surge in agricultural technology. Fruit growers were faced with serious problems in pest control because of the expanding pest complex, high labor costs, time-consuming application procedures and in some cases, inadequate water supplies. What was needed was an overhaul of traditional pesticide application technology.

Dr. Brann accepted this challenge, bringing to these problems an unusual combination of skills. He was thoroughly grounded in his own discipline, entomology. His mechanical aptitudes enabled him to incorporate principles of agricultural engineering and lastly, he could balance concepts and methodology of scientific research with technology which could be incorporated into grower practice. It was in the framework of these disparate considerations that Dr. Brann forged his fruitful career. His professional aptitudes and his personality enabled him to work comfortably at the interface between scientific colleagues and grower clientele.

He resigned his position on March 31, 1948 to move to Cornell at Ithaca as associate professor to teach and continue his research on equipment for the efficient application of pesticides. He was promoted to professor in

1954. The same year, he was awarded a U.S. patent for a very novel "Spraying Apparatus". A few prototypes of his design were built, tested and used commercially. Even though the design did not catch on with growers, in part because it was developed a little before its time, Dr. Brann's work served as a stimulus for continuing efforts to improve the efficiency of orchard sprayers. These efforts eventually resulted in smaller machines designed for low volume sprays on the smaller trees planted in recent years. He also studied the potential of electrostatically charging dust particles to make them deposit more effectively on target plants. He determined that charged dust particles deposited very unevenly due to a basic underlying problem and dismissed the concept as impractical. Years later, the same principle was tried for spray droplets. After extensive research and testing, the concept was judged to be impractical. Again, Dr. Brann was in the forefront.

In 1964 Dr. Brann assumed a new assignment, Professor of Entomology-Extension, as a specialist on fruit insect control and pesticide application. He also became Department of Entomology Extension Leader. Here his teaching and training abilities, which he demonstrated so ably as a youth, were put to excellent use. His outgoing personality, ability to communicate plus his careful conservatism with his recommendations to farmers made him very effective. He was respected and popular with growers, county agents and commercial field men. He was sensitive to the environmental and health implications of pesticide use and worked industriously to insure full compliance of Cornell's pesticide recommendations with regulation emanating from the Environmental Protection Agency. His commitment and foresight did much to reduce health, legal and publicity problems. When the concept of integrated pest management (IPM) became popular and many zealots were making exaggerated claims for what it could do, Jim endorsed its application but only for proven systems. Throughout his twelve years of service to extension, Jim maintained his devotion to Cooperative Extension and to his fruit grower clientele whose adaptability and sense of responsibility won his loyalty and respect.

Dr. Brann visited most fruit growing regions in the United States and Canada to visit colleagues and study fruit insect problems and control practices. As a consultant to the United Fruit Company while on sabbatical leave in Panama in 1954-55, he developed a much needed method for control of red rust thrips on banana. In 1959 he went to Israel and Greece to advise workers on new methods and equipment for use in fruit pest control.

Although deeply committed to the heavy demands of his professional assignment, Jim struck a happy balance between work and play. Prime time was reserved for family fellowship and the sharing of common interests. Levity and humor infused his work routine and his democratic philosophy and personal style engendered a cordial rapport with students, staff, faculty colleagues, industry representatives and grower clientele.

Jim was a skilled outdoorsman whose mobility by van and canoe placed the fresh waters of the eastern seaboard within his range. Jim combined his love for the out-of-doors with his keen sense of environmental responsibility. He was a strong advocate of the Nature Conservancy.

Dr. Brann retired in September, 1976. He and his wife, Doris (Toby), moved to Sopchoppy, Florida in 1981. They were quickly accepted in the community and around their beautiful home, Jim raised blueberries, pecans and chestnuts and maintained a fine garden. He also pursued his special hobby, fishing.

Dr. Brann died at his home on July 29, 1990. He is survived by Doris, his wife of 48 years; one daughter; one son; two brothers; five grandchildren; and one great grandchild.

E.H. Glass, E.H. Smith, L.L. Pechuman

Karl Dietrich Brase

May 5, 1903 — August 12, 1966

Karl Dietrich Brase, Associate Professor of Pomology at the New York State Agricultural Experiment Station at Geneva, died at his home in Geneva, August 12, 1966, after a long illness. He is survived by his wife, Boydy Brezina Brase, whom he married April 16, 1938; a daughter, Barbara Anne Brase; a sister in Rochester, New York; and a brother in Germany.

Professor Brase was born in Bucheberg, Germany, May 5, 1903. He received his early horticultural training in Germany and was employed as assistant manager of a commercial nursery in Zurich, Switzerland. He came to the Experiment Station in 1928 as Plant Propagator. From 1931 to 1937 he studied at the College of Agriculture at Cornell, receiving the B.S. degree in 1935 and the M.S. degree in 1937. During this time he was part-time assistant in Pomology at Geneva. He advanced to the position of Associate Professor of Pomology in 1955.

Professor Brase's major scientific interest was the scion-rootstock relationship in tree fruits, and he conducted experiments with the size-controlling Mailing rootstocks for apple trees. He was one of the first to work with the Mailing stocks in America. He became a leading authority on fruit tree rootstocks in America. In addition to his orchard experiments with rootstocks, he worked extensively on the vegetative and seed propagation of rootstocks.

During Professor Brase's lifetime, research on fruit tree viruses began and developed into a field of great importance. He contributed to this research by more than a decade of productive cooperation with plant pathologists at Geneva and Ithaca. He traveled extensively in America and in Europe to keep up with rootstock and virus research at other institutions. He was well-known wherever research on fruit-tree rootstocks was being done.

As one of the pioneers and principal workers in this field, he lectured frequently at meetings of fruit growers in the apple-growing regions of the United States. The well-kept orchards under his care at the Experiment Station in Geneva were visited by many groups each year. He was the author, either Jointly, or singly, of ninety-three scientific papers and popular articles on his work with rootstocks, fruit tree propagation and viruses.

Professor Brase was a devoted student of propagation techniques for fruit trees. He was more often found in the nursery and orchard than in his office. He initiated orchard testing of variety and rootstock combinations and cooperated extensively with growers in this testing. He was particularly interested in size-controlling qualities of

the different rootstocks and their suitability for different soils. He was continually integrating wide areas of fruit physiology into his specialty, stock-scion relationships.

John Einset, Richard Wellington, George L. Slate

Richard Duane Brasfield

October 13, 1919 — May 3, 1970

Richard Duane Brasfield, born October 13, 1919, and reared in Eastern Tennessee, carried with him through life the industry and perseverance characteristic of this former frontier country, mellowed by the friendliness and charm of his southern heritage. While an undergraduate at Vanderbilt University he was awarded the General John J. Pershing Medal, and from Vanderbilt University he received both an A.B. and an M.D. degree. His internship and residency in surgery in Nashville Hospital was interrupted by a two-year tour of duty as a medical officer in the U.S. Navy.

His long association with Cornell University began with his acceptance of a fellowship and residency at Memorial Hospital in New York City, with which institution he remained throughout the rest of his life, holding the position of associate attending surgeon on the gastric and mixed tumor services, as well as that of clinical assistant professor of surgery, Cornell University Medical College, at the time of his death.

He was the author of more than sixty scientific articles having to do with various aspects of the diagnosis and treatment of cancer. He investigated the possibilities of thermography in the differential diagnosis of cancer. He devised an ingenious method of irradiation of the internal mammary lymphnodes to extend the scope of surgery in patients with cancer of the breast. He was the first surgeon ever to perform elective right hepatic lobectomy for cancer of the gall bladder, his patient surviving for seventeen years and actually outliving her benefactor by several months. His interest in major hepatic resection, not only for tumors of the gall bladder but for tumors of the liver as well, continued and gained him widespread recognition for skill and competence in this taxing area of surgical endeavor.

He was engaged at the time of his death in a systematic review of the diagnosis, treatment, and prognosis of sarcomas of soft-tissue origin.

His interests and activities were not restricted to medicine: Dick Brasfield liked nothing better than to hike into uncharted wilderness with a gun in his band, a pack on his back, and a friend at his side. His devotion to nature, to the great out-of-doors, to hunting, to fishing, was life-long and led him to productive membership in nonprofessional societies concerned with nature and wildlife, and in particular to affiliation with the Boy Scouts of America, in which he was scoutmaster of Pelham Manor Troop 5.

He was active in organized medicine and served as treasurer of the Medical Society of the County of New York for the two years before his death. Never sparing himself in rendering expert and devoted care to patients, he had little time for purveyors of medical care subsidized by disinterested third-party agencies, and was an articulate spokesman for the ideals of medical care based on individual doctor-patient relationship.

Afflicted with the disease against which he had directed his lifelong efforts, he courageously continued all his activities, fully aware of his limited time, until a few weeks before the end and, with Christian fortitude and confidence and without rancor, accepted death when it came on May 3, 1970.

Lemuel Bowden, M.D.

Muriel Brasie

March 18, 1895 — September 1, 1975

After retirement in 1950, necessitated by crippling arthritis, Muriel Brasie continued to share her teaching talents and enthusiasm with others just as she had at Cornell University where she attained the rank of associate professor in the New York State College of Home Economics (now the College of Human Ecology), Department of Textiles and Clothing. She was a creative contributor and an active participant in all phases of the college's program: research, resident teaching, and extension teaching.

Born in Monticello, Minnesota, Miss Brasie earned a teaching diploma from Stout Institute, Menomonie, Wisconsin, in 1916. At Teachers College, Columbia University, New York City, she earned the Bachelor of Science degree in 1922 and the Master of Arts degree in 1928. Her deep interest in progressive education prompted further study at Columbia and Cornell Universities during two sabbatical leaves.

Muriel Brasie came to Cornell University in 1928 following several successful teaching experiences in Illinois and Wisconsin, the last five years at Stout Institute. Former students recall her as a real friend, as deeply interested in their personal welfare as in their academic achievement. The return of one loan given to help a student in financial need was refused with the comment, "That was money well spent; pass it on to help another person in need."

After nine years of resident teaching, during which she and a departmental colleague experimented with exchanging assignments in resident instruction and extension teaching, Miss Brasie began to direct her energies and teaching expertise to extension and its 4-H Club program. For seven years before she again returned to resident teaching and research, 4-H Club members and their leaders were captivated by her enthusiasm and ability to help them solve difficult problems by separating the problems into easily achieved tasks. She did this during our nation's great depression when individuals and family groups were working to conserve and reuse every available textile and clothing resource. For years, teaching materials and bulletins developed by Miss Brasie at that time were among the most widely distributed by the college.

In teaching, both resident and extension, Miss Brasie valued quality workmanship in all that she did, and she expected the same from her students. She encouraged them to see themselves as individuals with unique and varied qualities and to choose or design clothing that expressed the style and personality of each. To her, clothing, with its color, design, and construction, was truly an art form.

In research as a collaborator in *The Consumer Speaks* project, a federally funded pilot study conducted in twenty-two states during the mid-1940s, Miss Brasie, writing in *The Journal of Home Economics*, concluded that the study, though limited in scope, provided “a valuable technique for consumer education and an excellent method for focusing consumer opinion and making consumers articulate as a group.” Business considered the findings significant, and the data released were in demand among manufacturers, retailers, trade associations, and advertising agencies, according to editorial comment in the journal.

Miss Brasie maintained memberships in educational and professional organizations, among which were Pi Lambda Theta, Kappa Delta Pi, American Home Economics Association, and the National Education Association. She traveled to Russia, Southeast Asia, the Pacific Islands, Guatemala, and Mexico, studying textiles and accessories as art forms.

Upon retirement she moved to San Francisco where in spite of her painful affliction she was actively engaged until a few months before her death in volunteer work. Sharing her talents were the United Nations Information Center, Indian Affairs Council, American Friends Service and Legislative Committees, and the Crafts Department of the United States Public Health Hospital.

At her request her ashes were scattered on a slope of the Marin Headlands near Golden Gate. A friend’s tribute on that occasion included: “... you yearned for distant horizons ... to learn and then to lead the way for others toward a life with meaning and a growing understanding among earth’s people”

A sister, Robin Bruce, Mill Valley, California, survives.

Orrilla W. Butts, Natalie D. Crowe, Vera A. Caulum

C. Arthur Bratton

November 3, 1914 — January 25, 2000

C. Arthur Bratton died at his home at Kendal at Ithaca on January 25, 2000 at the age of 85, having completed a full, creative, and productive life with his wife, Esther Crew Bratton. He was much admired and appreciated by his many friends and acquaintances at the University, in Cooperative Extension, in the many Ithaca and Lansing community organizations to which he contributed, and at Kendal where he was a charter member and officer of its Resident Council.

Professor Bratton was born and reared on a general livestock farm near Delta in Northwestern Ohio. He was an active member of his local 4-H Club, Grange and Future Farmers of America. His lifelong interest in rural communities and farm people stems from these early associations.

He attended the College of Agriculture at Ohio State, was editor of the *Agricultural Student*, and graduated in 1937 majoring in Rural Economics. He came to Cornell as a graduate student in Agricultural Economics and completed M.S. and Ph.D. degrees in 1938 and 1942 respectively. He was an Extension Economist and Instructor in local government at Cornell until 1943 when he joined the US Army. He was discharged as a Captain in field artillery in 1946.

Art began his long and effective career in farm management at Cornell when he was appointed as an Assistant Professor in 1946. He rose rapidly through the ranks and was promoted to Professor in 1954. He was the department's Extension Leader for nearly 20 years over two different time spans, 1954-68 and 1975-79. He served three terms in the University Senate and was a member of a number of college and university faculty committees.

Throughout his professional career, Art worked tirelessly and effectively to improve the quality and breadth of extension education in agricultural economics. He was a teacher's teacher. He saw as one of his most important roles the education of Cooperative Extension's county and regional field staff as well new faculty colleagues. He was always available to help in program planning or implementation. He believed in team teaching. Although a major proportion of his professional time was spent in administering and conducting extension programs, he strongly believed that good teaching programs must be based on research. He was a mentor. His driving force was to be helpful to the agricultural community.

He was a leader in the college's farm records programs and the analysis of farm income and expense summaries. He coordinated the preparation and distribution of the annual *New York Economic Handbook – Agricultural Situation and Outlook*. He was the author of more than 200 extension and research publications as well as numerous articles for county extension and farm magazines. One of Bratton's lasting legacies in Cooperative Extension was his effort to work across department lines in solving problems and developing teaching programs. He was a pioneer in the farm and home development programs of the 1950s, bringing together faculty and agents in agriculture and home economics to work with farm families in programs to help them reach their goals.

The Brattons participated in the University of the Philippines–Cornell project at Los Banos in 1952-53, as Cornell's first Visiting Professor to that campus. He was a Fulbright lecturer at Kyoto, Japan in 1959-60, teaching farm accounting and farm management. In the summer of 1964, he was Visiting Professor at Seoul National University in Korea and worked again with Asian graduate students as Visiting Professor at the East-West Center University of Hawaii in 1968. He regularly hosted and planned programs for visiting agricultural economists from Asia and worked with many graduate students in farm management from these countries.

Professor Bratton was a member of the American Agricultural Economics Association, the International Association of Agricultural Economists, The American Society of Farm Managers and Rural Appraisers, and Torch International. He was elected to membership in Phi Kappa Phi, Gamma Sigma Delta, Alpha Zeta, Phi Eta Sigma and Epsilon Sigma Phi. He received the Superior Performance Award for Community Service from the Ithaca-Cayuga Rotary Club. He was an active member of the Presbyterian Church where he served as an elder, deacon, and usher. He is survived by his wife, Dr. Esther Crew Bratton, formerly a faculty member in the college of Human Ecology, and two married daughters: June Bratton Arden and Judy Bratton MacManes.

R. Brian How, Gerald White, George J. Conneman

Alvin J. Braun

July 10, 1915 — June 7, 1999

Alvin J. Braun, Professor Emeritus of Plant Pathology at Cornell University's New York State Agricultural Experiment Station in Geneva, died June 7, 1999 at the age of 83.

Professor Braun began his career at Cornell in July 1945, and retired in January 1977. For 31 years, Al studied diverse fungal and bacterial diseases of grapes and other small fruits and how to control them. Most of his work was of a very applied nature and was of direct benefit to the growers of New York State. He was responsible for developing up-to-date disease control spray schedules that could be used by New York grape and berry growers. Determining what new fungicides were best to use, he analyzed and made recommendations related to the proper spray equipment growers should be using.

Al also studied virus diseases to determine whether control measures could be developed either through the use of cultural practices or through the breeding of resistant varieties. He worked cooperatively with scientists in what was then the Department of Pomology at Geneva on developing disease-resistant varieties of grapes and small fruits.

Early in his career, Al developed an interest in nematodes and how they affect grape and berry crops. He conducted surveys of the nematodes associated with those crops in New York State. He also conducted research studies on transmission of viruses by nematodes in raspberries and other crops.

Not only was Professor Braun a distinguished scientist with a worldwide reputation on the biology and control of grape and small fruit diseases, he also was a fine human being. He was a quiet individual, but he had a way of communicating with people that made them listen to what he had to say. He annually gave detailed reports of his research to New York grape and berry growers, and interpreted them so that the growers could improve their practices productively. His information was always helpful, and the growers used his recommendations for disease control routinely.

Al received a B.S. degree in Biological Sciences from the University of Chicago in 1937, and a Ph.M. degree in Botany from the University of Wisconsin in 1938. He received his Ph.D. degree in Plant Pathology from Oregon State College in 1947.

Prior to coming to Cornell, Al was a research assistant in the Department of Plant Pathology at the University of Wisconsin in 1937-38; a nursery inspector in the Department of Agriculture and Markets, State of Wisconsin, Madison during the summer of 1938; a research assistant in small fruit disease investigations at the Oregon Agricultural Experiment Station, Corvallis, 1938-42; an analytical chemist with Sherwin-Williams Company, Chicago, Illinois in 1942-43; an assistant pathologist with the United States Department of Agriculture in Salinas, California (studying the use of guayule for the war effort) in 1943-44; and continued with the USDA as a pathologist conducting surveys of plant diseases in Ohio and Michigan in 1944-45.

At Cornell, Al was appointed Assistant Professor of Plant Pathology in 1945. He was promoted to Associate Professor in 1950 and to Professor in 1957.

In 1956, Al spent a sabbatical leave in the nematology section of the USDA Agricultural Research Center, Beltsville, Maryland. In 1966-67, he spent 18 months as a consultant in plant nematology for the United Nations F.A.O. rice project in Bangkok, Thailand. His final overseas assignment was in 1975, when he spent six months on sabbatical leave at the Research Institute of Pomology at Skierniewice, Poland.

In addition to his highly successful professional career, Al was also an active leader in the community, especially within the Presbyterian Church, where he served as an elder among other positions. He was very active particularly in insuring the well being and upkeep of the church buildings.

In retirement, however, Al's roles were primarily as a devoted husband and dedicated grandfather to his five grandchildren. He and his wife, Edith, made countless trips across the eastern states to visit and help with the care of the grandchildren.

Al had a broad circle of friends in Geneva. He was an avid and accomplished poker player, and also occasionally played bridge. His friends from those happy evenings together remember him with great affection.

Surviving Al are his wife, Edith; two sons, Ken (Gail), Naperville, Illinois, and Robert, Billerica, Massachusetts; a daughter, Andrea (David) Gransee, New Canaan, Connecticut; grandchildren Abigail and Katherine Tarbox, Caroline Gransee, and Karen and Stephen Braun; a brother, Joseph Braun, Port Orange, Florida; and numerous nieces and nephews.

George S. Abawi, James E. Hunter, Herb S. Aldwinckle

Olaf Martinus Brauner

February 9, 1869 — January 3, 1947

After fifty-two years of association with Cornell University, Olaf Martinus Brauner died at his home in Ithaca on January 3, 1947. He had served the University and the community as teacher and as artist all his mature life.

Professor Brauner was born in Christiana, Norway on February 9, 1869. He came to this country with his parents when he was fourteen years old. He received his art training in the Massachusetts Normal Art School and the Boston Museum of Fine Arts and shortly after finishing that training received his first appointment in Cornell University as Instructor of Industrial Art in the Sibley College of Engineering. He was soon promoted to Assistant Professor of Drawing and Painting and received the rank of Professor of Drawing and Painting in 1909.

During the entire period of his association with the College of Architecture, beginning in 1896, he served as head of the Department of the Fine Arts. He retired from active duty in 1939 and received the title of Professor Emeritus. At different times he taught each course given in the Department, sculpture as well as drawing and painting. For over four decades every student of the College of Architecture came under his tutelage.

From the first, and even during those years when his teaching schedule was excessively heavy, Professor Brauner unceasingly pursued his professional creative work. He early established himself in the American art world as a landscape and portrait painter of distinction. Cornell University and Ithaca are rich in the series of portraits he painted during his long career. His productivity continued beyond his retirement until illness made further work impossible.

He was represented in the major national exhibitions for many years and was commissioned to do many portraits of prominent men in America and abroad.

Through his personal associations, he brought the work of many outstanding artists to Ithaca for exhibition. The one which he arranged here for the American Impressionist, Childe Hassam, was the most comprehensive ever held of that artist's work. These exhibitions in Cornell University were possible only because of Professor Brauner's devotion to his art and his untiring efforts to extend its influence.

Olaf Brauner's most important contribution, however, is not revealed or defined by the cataloging of his individual works or the listing of his professional services to the University. It was the status he achieved and the great monument erected for him by the affection and respect that he earned from all who knew him and who studied

under him. For them his memory inevitably includes the many lovable personal and admirable professional qualities that endeared him to all, his breadth of view and his tolerance for diverse approaches, his respect for and encouragement of talent wherever it appeared, his transparent honesty in all matters, and his insistence on the highest standards.

W. K. Stone, O. D. Von Engeln, K. L. Washburn

Robert Stanley Breed

October 17, 1877 — February 10, 1956

Robert Stanley Breed, Professor of Bacteriology Emeritus, died unexpectedly at his home in Geneva February 10, 1956.

Professor Breed entered upon his career in 1902 when he was named Professor and Head of the Department of Biology at Allegheny College. He served in this capacity until 1913, when he became Head of the Department of Bacteriology at the New York State Agricultural Experiment Station at Geneva. In 1945, the Departments of Bacteriology and Chemistry at the Experiment Station were merged into the present Department of Food Science and Technology. At that time and at his own request, Professor Breed was relieved of administrative responsibilities and devoted his full time to research. He retired October 31, 1947, and was made Professor of Bacteriology Emeritus in Cornell University November 1, 1947.

Professor Breed was graduated from Amherst College in 1898. He received the M. S. degree from the University of Colorado in 1899 and the Ph.D. degree from Harvard University in 1902. He also studied at the University of Göttingen in 1910, at the University of Kiel in 1911, and at the Pasteur Institute in 1923.

Early in his career Professor Breed focused attention on dairy bacteriology, with emphasis on problems of dairy sanitation. He was also interested almost from the beginning of his professional life in bacteriological nomenclature. This led to his appointment as Permanent Secretary of the International Commission on Bacteriological Nomenclature. He also played a prominent part in World Dairy Congresses in Washington, London, Berne, and Rome.

Professor Breed held membership in the American Association for the Advancement of Science, the Society of American Bacteriologists of which he was President in 1927, the American Public Health Association, the American Dairy Science Association, the Society of Applied Microbiology, the International Association of Milk Sanitarians, and the International Society of Microbiology. He was also a member of Sigma Xi, Phi Beta Kappa, and Phi Gamma Delta.

Author of numerous technical articles in Experiment Station publications and scientific journals, Professor Breed also made notable editorial contributions. Chief among these was his service since 1937 as Editor of *Bergey's Manual of Determinative Bacteriology*, a revision of which he had just about completed and upon which he did some work on the morning of his death.

Professor Breed also served as Associate Editor of the *Journal of Bacteriology*. For many years he was chairman of the Editorial Committee of the American Public Health Association having to do with the *Manual of Standard Methods for Dairy Products*. This manual passed through nine English editions and was translated into French and Spanish.

The milk supply of the City of Geneva afforded Professor Breed a fertile field of research close at home. Here it was that he perfected the technique which came to be known around the world as the "Breed Method" for the direct counting of bacteria in milk and cream. He also demonstrated, in close cooperation with the Geneva Board of Health of which he was long a member, the benefits to be derived by producers, distributors, and consumers of dairy products of a city-administered quality control laboratory operating under the supervision of one of his wide knowledge of public health matters. For more than 25 years the City of Geneva held a unique place for communities of its size in the State and nation for the high standards of its milk supply.

With all of his varied professional activity, Professor Breed still found time for many civic duties as well. He was a former President and moving spirit of the Geneva Historical Society. He was a former President of the University Club of Geneva. He was a member of the Geneva Rotary Club for more than 25 years. He was an elder in the First Presbyterian Church of Geneva. For many years he also assisted Mrs. Breed in Girl Scout work and delighted in citing as his reward the privilege of chaperoning girls who won trips to the circus for meritorious work in Scouting.

In 1941 he was singled out by the Geneva Kiwanis Club for its award for outstanding service to the community.

Professor Breed married Louise Miller Heim of Binghamton, N. Y., in 1899. She died in 1905. He later married Emma Margaret Edson of Meadville, Pa., who survives him, together with a daughter Alice, now Mrs. Girard Laviano of Woodside, Long Island.

Many notable achievements of lasting value stand as monuments to Professor Breed's memory in his chosen field of science. Probably nothing would have pleased him as much, however, as the many expressions of indebtedness for inspired leadership and helpful direction voiced at the time of his passing by those who were associated with him as students and co-workers. In mourning his loss, we rejoice that he was given the rare privilege of pursuing to the very end of his days the constructive work in which he found such profound satisfaction.

J. D. Luckett, C. S. Pederson, J. M. Sherman

Charles W. Breimer

1911 — July 28, 1960

Dr. Charles W. Breimer died on July 28, 1960, in the New York Hospital, after an illness of several months. In his passing the Hospital for Special Surgery has lost a devoted and outstanding member of its staff.

Dr. Breimer became an assistant to Dr. Raymond Lewis in 1947 and in addition to carrying on a busy private practice devoted several hours a day to the X-ray department. He was director of the Department of Roentgenology from 1955 to 1957 and associate director from 1957 until his death. He was appointed Assistant Professor of Clinical Radiology at Cornell University Medical College in 1955.

All who have known Dr. Breimer will remember his wide range of medical knowledge and his exceptional perception in the interpretation of radiographs. This ability permitted him to make a positive statement, which is indeed a rare quality among radiologists.

Dr. Breimer's devotion to duty was another of his outstanding qualities, and for many months in 1955 he carried on as the only radiologist at the hospital. Those of us who had the privilege of being associated with him at the New York Hospital-Cornell Medical Center can attest to his teaching ability and clinical acumen.

Richard H. Freyberg, M.D.

Dalai Brenes

January 8, 1907 — April 7, 1997

Dalai Brenes, Professor of Romance Studies, Emeritus, died peacefully in Amherst, New York, at the age of 90. He came to the United States in 1920 after early schooling in Costa Rica, where he was born in Heredia into a distinguished and culturally active family. His father, Roberto Brenes-Mesén, who held academic posts in this country, was a well-known poet and essayist. Dalai was predeceased by his wife, Eleanor, and their daughter, Uday Hoffberg; and he is survived by his grandchildren, Claudia and Kevin Hoffberg of Lafayette, California; and Eric Hoffberg of Rochester; and two great-grandchildren.

Dalai received his B.A. degree from Northwestern University in 1936 and an M.A. degree from the University of Chicago a year later. He then interrupted his education to take on teaching posts at Pennsylvania State College from 1938-40 and at the YMCA College of Chicago during the war years. One of the founding faculty of Roosevelt University in Chicago, he rose in its ranks and chaired the Department of Modern Languages from 1945-54, when, at the invitation of Morris Bishop, he came to Cornell as an Instructor and doctoral candidate. He completed the degree in 1957 with a dissertation on “The Sanity of Don Quijote: A Study in Cervantine Deception,” at which time he was appointed Assistant Professor. He was promoted to Associate Professor in 1962, to Professor in 1965, and he retired in 1972.

Dalai read and studied avidly all his life. He was never wanting for projects and spent many hours in remote Spanish archives, from which he sent back detailed and enthusiastic letters, and he would discourse at length about his innovative, even idiosyncratic, readings of classical texts. But, ever the perfectionist, he aired few of his ideas and discoveries in print. Early on, he collaborated on an article concerning manuscript problems in the *Song of Roland*, and published a piece on *Cervantes*. Later, he authored a pair of essays on Spanish language and culture. After his retirement, when one would often see him in Olin Library, he devoted himself to the complex and debated question of the authorship of the picaresque narrative, *Lazarillo de Tormes*, publishing some of his findings in *Hispania*, a journal widely circulated in the field. As recently as 1987 and 1992, two of his puzzle breakers appeared in a distinguished journal in Spain, the *Boletín de la Biblioteca de Menéndez Pelayo*.

Teaching was Dalai’s true passion, undergraduate teaching in particular, and it had for him an almost sacramental attraction. He held strong and unwavering views on how language should be taught, involved himself in university-wide committees on teacher preparation in foreign languages, and monitored teacher-trainees at Ithaca High

School. For many years, as the lone instructor in Spanish literature, he carried an overload in order to sustain the severely understaffed offerings, yet, approachable and generous to a fault, he maintained an open-door policy with students, devoting hours of conference time to them and much energy to program development. The core structure of the undergraduate major in Spanish still bears his stamp. He also helped to guide the occasional graduate student towards a successful career; those who worked with him recall him as a wise and worldly mentor. Once during the 1960s, he accompanied a student talent group on an adventurous Latin American tour designed to promote relations between the United States and its neighbors. He served several terms as acting chair of the department, but his most vigorous service contribution to Cornell was as a member of the Arts College Admissions Committee. He labored devotedly in this capacity for many years both before and after his retirement and, according to the testimony of the director of admissions, interviewed more applicants than any other faculty member.

Perhaps because he came late to the academy, Dalai always had an unorthodox take on things. Just as he never lost the lilt of his first language, he carried with him his upbringing in Central America and often clashed with a conformist world. There was a mystical side to Dalai, and conversations with him could be both rewarding and baffling. Whether the scene was Cornell faculty meetings or community school board sessions, he was outspoken and sometimes embattled, and from his home in Lansing he fired off long, thoughtful, and impassioned missives to the local newspapers, where his name regularly graced the editorial pages. Highly principled and a defender of academic freedom, he held committed political views and championed causes like freedom of speech and social justice.

Dalai was a gentle man and a gentleman. He embodied the remnants of a now bygone age of civility, and in the last years of his career he was witness to dramatic growth and to entirely new directions in his department at Cornell and in his discipline. He believed in courtesy, punctuality, attentiveness, personal responsibility, and other virtues whose diminished currency he deplored and which he saw fit to defend with patience but persistence. Although he would be able to indulge his bent for travel and photography, he retired from teaching with great reluctance at a moment when the institution, not the individual, still determined the timing of that final step. Yet he exited the academic stage with a record of humane traits—humility, honesty, elegance, rigor—that are to be prized even in the face of changing fashions in teaching and scholarship.

David I. Grossvogel, Alain Seznec, Maria N. Stycos, John W. Kronik

Julian Pleasant Bretz

December 29, 1876 — June 15, 1951

After a long illness Julian Pleasant Bretz died on June 15, 1951. Born in St. Joseph, Missouri, he was graduated in 1899 from William Jewell College. For some six years he was in the employ of the Burlington Railroad, an experience of which he always spoke with pride and to which, at least in part, one may perhaps attribute an early interest, maintained throughout his life, in the history of transportation, as well as in the relations between Employer and Labor. During the greater part of that period he was also a graduate student in the University of Chicago. There, after obtaining his doctorate in 1906, he was for two years a junior teacher of history. He joined the Cornell Faculty as an assistant professor in 1908 and became professor of American History in 1910, a position which he filled with conspicuous success until his retirement in 1944, when the title of professor emeritus was conferred on him by the Board of Trustees.

Bretz's remarkable success as a teacher was due to several factors: mastery of his subject, an unusual ability to illuminate contemporary political and social questions by relating them, by way of comparison or contrast, to the earlier history and development of the United States, and an enviable gift of clear and lively exposition. The lasting regard and admiration felt for him by his students was shown year after year, when they flocked around him at the annual meetings of the American Historical Association or when, on their occasional return to Ithaca, they invariably sought him out. The published contributions to his subject were few, but of high quality; and for more than thirty years he was a frequent and valued reviewer in the *American Historical Review* and the *Mississippi Valley Historical Review*.

Bretz also devoted much time and thought to problems of university administration. After the Administrative Board in charge of Freshmen and Sophomores had been superseded in 1915-16 by the Committee of Advice to Underclassmen, he was for a number of years its energetic and highly efficient chairman. Later, he was at different times a member of the Educational Policy Committee, Secretary of the University Faculty, member of the University Policy Committee, and Faculty representative on the Board of Trustees. His wide administrative experience and judicial temper received further recognition, when he became a member, and indeed secretary, of the Trustee-Faculty Committee appointed to choose a successor to President Farrand. For many years he was one of the most impressive and respected speakers in the University Faculty and the Faculty of the College of Arts and Sciences. His contributions to debate were memorable no less for their breadth of view and fairness to the opinions

of his opponents than for their admirable and logical presentation; and he was ever a champion of liberal ideas and a staunch upholder of academic freedom.

He viewed the duties of citizenship in a democratic state with as much earnestness as the proper exercise of his profession. Thus he served on various civic committees, he was a member of the Democratic State Committee for eight years, and he ran for Congress in 1930 and again in 1932. His outstanding services to his party were recognized when he became chairman, first, of the City Democratic Committee, and then of the County Democratic Committee. Still later, his lifelong interest in Labor problems found expression when he took a prominent part in the formation of the Labor Legislative Conference. His election to be its president in December, 1947 was a fitting tribute to his leadership, but less than six months later ill-health forced him to resign the office.

Bretz was a distinguished figure—tall, erect, and dignified. He had a singular youthfulness of spirit and a rare courtesy and graciousness characterized him. His colleagues and a wide circle of friends will not soon forget that striking and kindly presence and that well-modulated voice speaking so persuasively, and will long cherish the memory of one whose intellectual gifts, sterling character, and human sympathy made him for more than forty years a prominent and greatly esteemed member of both the University and the community.

R. E. Cushman, M. S. Kendrick, M. L. W. Laistner

Margaret Louise Brew

July 6, 1905 — November 21, 1959

The death of Margaret Brew less than two years after she had joined the Faculty of Cornell University as Professor and head of the Department of Textiles and nothing, interrupted a number of promising developments that she was helping to initiate. Despite her short association with the College and the Department, her training and experience as a teacher, research worker and administrator had enabled her to make substantial contributions during this time.

Professor Brew was born in Chicago, Illinois, and she was closely associated with the University of Chicago from her early training at the University High School through work for the Ph.D. degree, which she received in 1945. She had been awarded the Ph.B. degree *cum laude* from that University in 1926 and the M.S. degree in 1935.

After receiving the Bachelor's degree, she first taught home economics in the high schools of Winnetka, Illinois, and then in the Milwaukee University School, Milwaukee, Wisconsin. From there she went to Oregon State College as an instructor in home economics.

She was made head of the textiles and clothing section of the School of Home Economics at the University of Minnesota in 1935 and remained in that position for ten years, completing work on the Ph.D. degree during that period. In 1945 she went to Washington, D. C, as a research administrator in home economics with the Department of Agriculture. She continued in this work until she came to Cornell University in February, 1958. While she was with the Department of Agriculture in Washington, she directed several studies of family expenditures and consumption and was responsible for a number of publications in these fields in journals and as bulletins. She was particularly interested in clothing consumption.

Her contributions in the field of textiles and clothing stemmed from the unusual combination of an appreciation of design with scientific training in economics particularly as applied to these two industries. She had a far-reaching acquaintance and working relationship with investigators in problems related to textiles and clothing. She brought many of these persons, with such diverse interests as anthropology, welfare work, child psychology, quartermaster service, and statistics, to the department seminars to contribute from their specialty to the broad understanding of the field of textiles and clothing.

She was a member of a number of professional societies, such as the American Statistical Association and the American Economics Association. She was particularly active in the affairs of the American Home Economics Association. She was chairman of the Family Economics-Home Management Section of the Association when she came to Cornell University; she had been a member of the Program Planning Committee for the 50th Anniversary of the Association in 1959 and was a member of the Program Planning Committee for the 1960 meeting.

A city dweller most of her life, she delighted in the outdoors. She was an ardent and active member of the Audubon Society. Her search for birds, flowers, and trees typical of this region lead her to a greater acquaintance with the territory surrounding Ithaca than many obtain in a lifetime.

Because of her variety of interests, professional and recreational, she left a host of friends who had shared in these activities.

Margaret Humphrey, Mabel Rollins, Mary Ryan

Alice Mary Briant

February 22, 1899 — March 14, 1988

The Ithaca and Cornell community lost an exceptional and unique member when Alice Mary “Molly” Briant died in the Ithaca Reconstruction Home on March 14, 1988 after an extended illness.

Born in Helsby, Cheshire, England, she was educated in private schools, receiving the general school certificate from Queen’s School in Chester. In 1925 she emigrated to Montreal, Canada, following an older brother. Between 1926 and 1938, she supported herself as a secretary. During the latter part of these years, she studied with a major in chemistry and received a B.S. degree in agriculture in 1938 from MacDonald College, McGill University. She began graduate studies at Cornell in 1938 and received both a Master’s and Ph.D. from Cornell.

From 1944 to 1962 when she retired, she served as a member of the faculty of the College of Human Ecology in the Department of Food and Nutrition. During that time she was a member of the graduate committee of more than 30 graduate students who were attracted to her because of her knowledge and ability in research methodology.

Her research interests were directed at studies of the effects of different flours, starches and cooking conditions on a wide range of products. She developed principles for cooking with New York State soft wheat flour, and did research on the quality and vitamin retention in cooked fresh and frozen vegetables. She considered statistical analysis of research data to be of prime importance in any research effort and encouraged and assisted many graduate students in the department as they worked on thesis projects. She was an early advocate of the use of sensory methods of analysis of food quality and worked towards standards for sensory evaluations as a member of the American Society for Testing and Materials Sensory Standards Committee. She actively participated in other professional organizations including the American Association of Cereal Chemists, the Institute of Food Technology, and the American Home Economics Association.

Her teaching activities involved teaching summer sessions at Cornell and other universities including Northern Illinois, Utah State, Washington State, and British Columbia, Canada. For several years after retirement, she continued to teach in summer sessions.

Among her talents, an outstanding quality was her ability to understand humans of all ages. She related well to graduate students, reached them on an intellectual level, encouraged them to think for themselves and helped them to set their sights high. Students considered Molly or “Miss B”, as they called her, an ideal major professor.

She permitted, even expected, a large amount of independence, but was available and willing to provide advice and assistance when appropriate. Her research assistants learned from her daily, though much of her teaching was indirect. Her zest for continued learning was contagious.

Miss B's sense of humor helped her and her students over the rough spots. She was interested in her students as persons and contributed to the development of their self-confidence. Although she was not effusive in her praise, she had her own ways of showing her approval. Today her former students agree that her influence was tremendous and long lasting.

Molly Briant had a consuming passion for nature in all its manifestations. She was proficient in identifying birds in the area and students remember visiting her at her home on Warren Road where birds were accustomed to eating from her hand. She was also cognizant of plant life and led many student expeditions to choice wild strawberry patches and to study early spring flowers. In retirement, these passions continued and took her on bird and plant tours in Africa, Australia, Central America and many countries in Europe.

Other pursuits of Molly's included woodworking, metal work, weaving and embroidery. Her standard of craftsmanship was of a very high level and many of her friends received examples which they treasure.

One aspect of Molly's life which few of her friends were aware of was the extent of her generosity to individuals and causes she deemed worthy of her help. She lived frugally but quietly, and unselfishly shared her assets with others.

Mary A Morrison, Kathleen Rhodes, Gertrude Armbruster

Neil Mather Brice

February 27, 1934 — January 31, 1974

Cornell suffered a tragic loss when Neil Mather Brice was killed in a plane crash in Pago Pago, Samoa, on January 31, 1974, at the age of 39. Brice was a professor of electrical engineering, and at the time of his death he was returning from Australia, where he had been on sabbatic leave at the University of Sydney. During the leave he had traveled and lectured in England, India, Japan, Hong Kong, and New Zealand, and he was on his way to Hawaii and back to the United States when the crash occurred.

He received his B.Sc. and M.Sc. degrees from Queensland University in his native Australia, and the Ph.D. from Stanford University in 1965. He then taught at Carleton University in Ottawa, Canada, for two years before coming to Cornell. During 1970-71 he served as a program director for solar-terrestrial research for the National Science Foundation. He was recently elected a fellow of the Institute of Electrical and Electronics Engineers and was awarded an honorary D.Sc. degree by Queensland University. His early research involved participation in both Australian and Stanford University expeditions to Antarctica, and there is now a mountain named Mt. Brice in Antarctica. He was a member of the American Geophysical Union, the International Scientific Radio Union, and the American Association for the Advancement of Science, and was on numerous advisory panels.

Professor Brice was an energetic and prolific scientist with an impressive record of publications. In his extensive work on various magnetospheric topics he demonstrated a keen ability to sort through a variety of data, recognize what was important, and construct a unifying model of the various phenomena and their interrelationships. He did fundamental work on whistler propagation, the physics of whistler emission, and electron precipitation from the magnetosphere. He was a major contributor to the early work leading to the recognition of the importance of the magnetospheric substorm, and he continued to contribute in many of the important areas of magnetospheric and ionospheric research. He was one of the first to recognize the importance of Jupiter's magnetosphere, and many of his ideas concerning Jupiter have been borne out by recent spacecraft measurements; in particular, the suggestion put forward by Brice and one of his former students that there may be "doughnuts" of gas associated with the large satellites of the major planets was apparently verified just a few days before his death.

Neil Brice was more than a talented scientist. His energy and enthusiasm affected all aspects of his life. He always had a dozen projects under way and was bursting to tell everyone he met about them. One minute he would be describing a new idea about the magnetosphere or some data from Arecibo, and the next he would be talking

about the barn he was building for his antique buggy collection or some new wrinkle in the income tax laws he had discovered. In whatever he did, whether it was teaching his children “Strine,” the dialect of Australia, jousting in academic politics, or trying to unravel a scientific puzzle, Neil put his considerable energy and talents to good use. He is survived by his wife, Marilyn, and their three children, Henry, Amy, and Betsy. Neil’s imagination and enthusiasm will be sorely missed by those who knew him well. His view of life is perhaps captured by an Oscar Wilde quotation on a poster taped to his office door: ‘Consistency is the last refuge of the unimaginative.’ He needed days with more than twenty-four hours and lived his short life to the full.

Gordon Cummings, Martin Harwit, Donald Farley

Herbert W. Briggs

May 14, 1900 — January 6, 1990

Herbert W. Briggs would not want this memorial statement to be written. We submit it reluctantly. We do it for the selfish joy of our own recollection, a joy that will be shared by others who had the good fortune to know him.

Briggs (an abbreviation he always employed professionally and sometimes personally) would command us to “get on with it.” So we will, at least with the formal record.

Briggs was born in Wilmington, Delaware, in 1900. He received his A.B. degree from West Virginia University in 1921, and his Ph.D. degree from Johns Hopkins in 1925. After teaching first at Johns Hopkins and Oberlin, he came to Cornell in 1929, and taught international law and international politics until his retirement in 1969. In addition to international relations courses focusing on the Atlantic Community, he regularly taught the Far Eastern Policy of the United States and U.S.-Latin American Relations courses.

He was appointed professor of international law in 1947, and in 1958 was named the Goldwin Smith Professor of International Law in the Department of Government and the Cornell Law School. From 1946 to 1952 he served as chairman of the Department of Government, and along with the late Robert Cushman, should be regarded as one of the founders of the department.

His lectures outside of Ithaca included a year as Fulbright Professor at the University of Copenhagen Law Faculty, and addresses to the Turkish Institute of International Law, the University of Aarhus, the University of Oslo, the Hague Academy of International Law, and the U.S. Naval War College.

Stephen M. Schwebel, a judge of the International Court of Justice recently noted in the *American Journal of International Law*:

“Briggs was perhaps best known for his casebook, *The Law of Nations: Cases. Documents and Notes*, first published in 1938. A work of exceptional pith and insight, it was one of the major teaching tools of international legal education in the United States for many years and a work that was highly regarded abroad. He was the author of *The Doctrine of Continuous Voyage* (1926), The International Law Commission (1965), two sets of lectures at the Hague Academy, and some 85 articles in legal and other Journals, above all the *American Journal of International Law*...

“Professor Briggs was a member of the Board of Editors of the *Journal* from 1939 until his death. He served with distinction as Editor in Chief (1955-1962) and as president of the American Society of International Law (1959-1960). A major figure in the Society and on the *Journal* for more than 50 years, Briggs brought to these and other activities an intellectual and personal vivacity that won universal regard and affection. His appearance and aptitude were unchanged over the decades; his red face, white hair and blue eyes may be said to have been the only nationalistic characteristics he displayed.

“Briggs ably served from 1962 to 1966 as a member of the UN International Law Commission, whose procedures and product he had been studying in depth at the time of his election. The codification of international law was a longstanding interest, to which he had contributed in the Harvard Research in International Law, the Harvard Draft Convention on International Responsibility of States for Injuries to Aliens, and the work of the Institut de Droit International. He served as counsel for Honduras, Spain and Libya in four cases before the International Court of Justice (and contributed to the analysis of the Court’s jurisdiction and jurisprudence in his writings). He also served as counsel to Chile and Canada in international arbitral proceedings. Briggs was a member of the United States delegation to the Vienna Conference on the Law of Treaties in 1969.

“A mark of the professional esteem in which Briggs was held was his appointment in 1975 by the Governments of the United Kingdom and France as one of five members of a court of arbitration on the delimitation of a portion of the continental shelf in the English Channel.”

That’s the record.

But Herbert was so much more than Briggs’s distinguished scholarly and professional record. He was a vital man whose personal characteristics were transparently contradictory. He was gruff; he was patient; he was empirical; he was sensitive; he was a workaholic; he liked real alcohol; his tastes were Spartan; he was a bon vivant; he was a great raconteur of funny stories; he was a serious and committed scholar; he was detached; he was ebulliently involved.

To recall one’s association with Herbert Briggs—particularly for those who were his junior colleagues—is to evoke a Shakespearean lament:

He was a man, take him for all in all,
I shall not look upon his like again.

George McT. Kahin, Arch Dotson

Thomas Roland Briggs

September 2, 1887 — August 9, 1952

Thomas Roland Briggs, Professor of Physical Chemistry, died in Ithaca Memorial Hospital, on August 9, 1952, following a long illness. He was born in Huddersfield, England, on September 2, 1887, and came to the United States with his parents in January, 1888. He became a naturalized American citizen in 1918. He received his early education in the public schools near New York and after graduating from Flushing High School, he entered Cornell, where he received his Bachelor of Arts degree in 1909 and the doctorate in chemistry in 1913.

After serving two years as instructor in chemistry at Worcester Polytechnic Institute, he returned to Cornell in 1915 as Assistant Professor of Physical Chemistry, and was made Professor of Physical Chemistry in 1925.

Professor Briggs was known among his many students as a very stimulating and forceful teacher. Gifted with imagination, dignity of manner and a keen sense of audience feeling, Professor Briggs' lectures were models of good organization, precision and clarity. Many graduate students in the fields of chemistry, biology and soil science for more than a quarter of a century have cited him as an inspiring influence during their years of training at Cornell. One of them said of him recently, "He made science dynamic, and research an exciting adventure. He was a teacher."

His advent into the field of physical chemistry coincided with the rapid development of the field of colloidal chemistry. His work on electroendosmose and his summation of knowledge in the field was an important contribution to the field of plant physiology and soils technology, as well as to chemistry. His research work in the field of phase equilibria and emulsification was extensive. His contributions in these various fields were of immediate value in the development of industrial processes. He recognized the practical application of his research work and served effectively as consultant to various corporations.

Professor Briggs was an ardent fisherman and loved to take a fishing trip with friends or his sons to some local stream or to some distant lake or stream in Canada or his summer camp in New Hampshire. As a hobby, he became very interested in the history of American railroads and maintained an extensive library on the development of the various systems.

He was a member of Phi Kappa Tau and Alpha Chi Sigma fraternities and of the American Chemical Society and the American Association for the Advancement of Science.

He is survived by his wife, Mrs. Francis Ingalls Briggs, and his four children, Lynton and Adelaide, of Ithaca; George, of Cambridge, Massachusetts ; and Gifford, of New York City, all of whom graduated from Cornell.

In the death of Professor Briggs, Cornell has lost a devoted alumnus and teacher, whose passing has brought a deep feeling of personal sorrow to his former students, his colleagues in chemistry and to other friends on the campus.

Lewis Knudson, A. W. Laubengayer, M. L. Nichols

George Prentice Bristol

Professor of Greek

1856 — May 16, 1927

Upon the death of George Prentice Bristol, Professor of Greek, Emeritus, the members of the University Faculty mourn a beloved colleague. His worth as a man, his long career as scholar and executive, his fortitude, in secluding and hopeless illness, all enhance our sense of personal loss.

As a teacher he was noteworthy for lively knowledge of the Greek language and civilization, for thoroughness and frankness in the classroom, but not less for human sympathy. His interest in his students was not obscured by interest in their studies.

As an executive, Registrar, Director of the Summer Session, Chairman of the Committee on the Relations of the University to Secondary Schools, President of the New York State Teachers Retirement Board, and in many minor posts, he was courteous, punctual, and untiring. His attention to business, his judgment of measures and men, his devotion not merely to his chosen subject but to the University as a whole, all these made him a man deserving well of our academic commonwealth. His memory is sweet.

Source: Faculty Records, p. 1507 Adopted by the Trustees and Faculty of Cornell Univ., June, Nineteen Hundred And Twenty-Seven

RETIREMENT STATEMENT

The Committee (Professors H. L. Jones, chairman, and R. M. Ogden) appointed to draft resolutions upon the retirement of Professor Bristol submitted the following report, which was adopted by rising vote:

“At the end of the present academic year George Prentiss Bristol, Professor of Greek in Cornell University, retires from active service. In recognition of his long and useful career as teacher and executive, and of his worth as man and scholar, we the members of the University Faculty desire to place on record this testimonial of appreciation.

Already an experienced teacher, he joined the Faculty of this University in the year 1888, and ten years later was promoted to a full professorship. As a teacher he is noted, not only for his ripe and ready knowledge of the Greek language and civilization, and for the thoroughness and directness of his instruction, but also for his sympathetic and inspiring personality.

The authorities of the University, early seeing in him executive ability of a high order, chose him for additional responsibilities in which he has served the institution with rare skill and efficiency. The growth of the Summer Session of which he was long the Director, (1906-1918), and the high standards which he maintained, constitute a distinct and permanent tribute to his vision and sound judgment. Later on, in addition to his duties as Professor of Greek and as Director of the Summer Session, he was appointed Director of the School of Education (1910-1916), Chairman of the Bureau of Recommendations, Chairman of the Committee on Relations to Secondary Schools, while he has also served as chairman of many other important committees. By reason of his many-sided contacts with Faculty and students, and with teachers and school authorities, he has established most happy relations, not only between members of the University community itself, but also between the University and the secondary schools from which our students are drawn.

But despite the heavy load of administrative duties, he has ever remained a true Hellenist, distinguished philologist and devoted teacher, and in these capacities has won the respect and admiration of all. He has edited an excellent text-book, entitled *Selected Orations of Lysias*, and has published, in collaboration with our lamented colleague, Charles Edwin Bennett, a most useful work on the Teaching of Greek and Latin in Secondary Schools; and since 1891 has been one of the editors of the Cornell Studies in Classical Philology.

His helpfulness, his courtesy, his frankness, his punctuality, his close attention to business, his keen insight into measures and men, his breadth of view, and his loyalty to the University as a whole, will long be remembered by students and teachers alike. And now, upon his withdrawal from active service in the University, we, his colleagues, tender him our assurances of affection, and express the hope that he may continue to dwell in these college precincts, to brighten them with his familiar face and figure.”

W. Lambert Brittain

August 10, 1922 — April 22, 1987

We have lost a friend; a citizen; a quiet, questioning intelligence; an extraordinary teacher; a modest man whose quest was individual development—his own and ours.

It was Brit's wish that his illness not be known. He wanted his relationships with others to be centered in living rather than on dying. So his death came as a shock to many colleagues and friends, even to some who had met with him in the final months of his life. Our silence and not knowing was a gift he prized.

He wrote his own obituary, leaving only the date to be filled in—so we read it with unusual care, recognizing that in it he has told of what he valued in his life. He said:

Cornell University professor W. Lambert Brittain, sixty-four, of Ithaca, died on Wednesday, April 22, 1987, at Tompkins Community Hospital after a long illness. He was born in Boston, a son of George and Sarah Stephenson Brittain.

He was a professor of human development and family studies in the College of Human Ecology at Cornell and was locally well known for supervising the Saturday art classes for children, which were offered at Cornell each year. Many of the activities from these classes formed the basis for new directions in the study of creativity and art for children.

Professor Brittain received a bachelor's degree from Syracuse University and a master's degree and a doctorate from Pennsylvania State University. He served with the U.S. Army in the Pacific during World War II, reaching the rank of first sergeant in the infantry.

He was active in community affairs and served as president of the Forest Home Improvement Association on two different occasions, as well as on committees for local school and civic groups.

In addition to his father, he is survived by his wife, Harriet Brittain of Ithaca; two daughters, Constance Bouchard of Wooster, Ohio, and Ann Brittain of Miami; three sons, David Brittain of Syracuse, Bruce Brittain of Ithaca, and Douglas Brittain of Detroit; two granddaughters; and two brothers, Oliver Brittain of Walpole, Maine, and Harvey Brittain of Boothbay Harbor, Maine.

There will be no memorial service and no calling hours. The family requests a period of privacy.

As a scholar, Brit studied creative processes in human development, directed theses, and wrote articles and books; as a teacher, he built situations in which persons could discover their own strengths and styles and stood ready to encourage successful discovery; as a citizen of the university and of its neighboring community of Forest Home, he was a persistent, dependable voice of reason, whether the question was one of tenure or of neighborhood traffic.

And his relationships have been marked by continuity as well as by quality: he was part of the Cornell faculty for thirty-five years, investing in its programs, careful for their excellence; he was available to students, supporting their efforts; and he lived with his family throughout those years in one house of his own design.

He was a gentle man and a gentleman. He knew who he was and what he cared about, and he arranged his life accordingly. Not surprisingly, then, he chose how he would use his remaining time: he visited his 103-year-old father in Maine with his family; he continued to work with his neighbors in Forest Home toward a civilized community; he met with his students; and he completed the eighth edition of the book that joins the vision of Viktor Lowenfeld with his own.

The book, *Creative and Mental Growth*, stands with the Saturday morning class as a remarkable legacy: the one descriptive, the other demonstrative, of Brit's respect for children, his enthusiasm for creative and intellectual activity, and his dedication to individual development.

In the preface he wrote:

It is only through children's interactions with adults that positive values are established and reactions to the environment are encouraged. It is this interaction that is crucial in learning; this is particularly true in the area of art expression. It is not the development of transitory skills that is important, but rather the development of a sensitive, creative, involved, and aware child.

Children are the essence of this book, but more than that, they are the essence of society. How children are cared for, nourished both physically and psychologically, gives an indication of the value society puts upon itself and its future.

We are grateful for this sensitive, creative, involved, and aware man.

Nancy M. Dodge, Henry N. Ricciuti, Helen T. M. Bayer

Harry Albert Britton

October 26, 1881 — February 17, 1959

Dr. Harry A. Britton, Attending Physician, Emeritus, at the Cornell University Infirmary and Clinic, died in Ithaca on February 17, 1959, after a long illness. Born in Reading, Pennsylvania, October 26, 1881, Dr. Britton received his early education in Reading and, in 1913, was graduated in medicine from the Medico-Chirurgical College in Philadelphia. He completed his internship at the Philadelphia General Hospital in 1914 and remained on the staff of that institution for the next two years as resident physician. He then became resident physician at the City Hospital in Minneapolis, Minnesota, until 1919 when he returned to Reading to engage in private practice and serve as school physician. In September, 1921, he came to Ithaca and became a member of the medical staff of the student health service at Cornell, a position which he held until retirement in 1950. Thereafter he curtailed his professional activities until ill health forced complete retirement in 1954.

In 1925, Dr. Britton was appointed team physician for the Cornell University Athletic Association, beginning a service which was to continue for the next twenty-three years. In this capacity, he treated the injuries and illnesses of hundreds of young Cornell athletes who, when returning to Cornell for alumni events in later years, never failed to visit their old friend and benefactor. Wrestling was his favorite sport. He became an expert in treating the ear injuries so frequently incurred in this sport in a manner designed to prevent "cauliflower ears." His original article on the subject, published in 1927, is still quoted whenever the management of external ear injuries is discussed, and a second article, published in 1953, summarized his experience with over a thousand cases. He is particularly remembered by the large number of wrestlers to whom he gave unstintingly of his time and effort. In June, 1954, the Cornell wrestling team held a dinner in his honor and presented him with an award in recognition of thirty-three years of service in the interests of Cornell wrestling.

His principal interest, aside from his professional duties, was in the Boy Scout movement and from 1924 to 1936 he served as Scoutmaster of Troop 1 and, during the summer camping period, as Medical Director at Camp Barton. He was a member of the local Red Cross chapter for many years and gave freely of his services as a first aid adviser and instructor during World War II.

Dr. Britton was a modest, quiet, kindly man who thoroughly enjoyed association with young people and had a genuine interest in their health, personal problems, and later progress in life. He will always be affectionately remembered by his many friends and associates.

E. C. Showacre, Alexis Rachun, E. J. Miller, Jr.

Urie Bronfenbrenner

April 29, 1917 — September 25, 2005

Urie Bronfenbrenner, the Jacob Gould Sherman Professor of Human Development and of Psychology, died in Ithaca at the age of 88, after more than 50 years on the Cornell faculty. He was a world-renowned scholar whose lectures filled Bailey Hall to overflowing and inspired generations of students. His graduate students are now on the faculties of colleges and universities around the country and abroad. He was so generous with his nurturing that many influential scholars who never studied directly with him also considered him their mentor.

Born in Moscow in 1917, Urie came to the United States at age six. As the child of immigrant parents, he became the interpreter of the new culture for his parents and always retained an immigrant's dual perspective, living in one culture but rooted in another. In the polyglot Pittsburgh neighborhood where he first lived, he learned how to play fair in baseball, a lesson he came to see as fundamental to being American. This experience led him to view the peer group as a complement to the family in the socialization of children, a view that motivated some of his earliest research and led him to reject the assumption implicit in much research and policy that the family has a separate and isolated effect on children.

He grew up near Letchworth Village, New York, a residential institution for people then known as "feeble minded," where his father served as clinical pathologist and research director. His mother nurtured his love of music and literature, and Russian literature, which always influenced his thinking about people in society and gave voice to his love of nature. He learned about ecology in the natural world from his father, a physician who also had a degree in zoology. In long walks around the grounds of the institution, his father would ask why the same plant looked so different in two different locations and then point to such factors as moisture, shade, wind, and soil type to illustrate the complex interdependencies between an organism and its physical environment. Young Urie had daily contact with residents of the village who had been labeled "feeble minded" but who nonetheless made valued contributions to their small community. He noticed that many became markedly more competent when given both the opportunity to contribute and the support they needed to do so. These early experiences helped to shape his subsequent professional interests.

Urie received his A.B. degree from Cornell in 1938 with a double major in Psychology and in Music. He then earned an M.A. degree from Harvard and his Ph.D. degree in Developmental Psychology from Michigan in 1942.

Following his graduation, Urie married Liese Price in Ann Arbor and immediately enlisted in the U.S. Army, where he served as a psychologist in the Air Corps, the Office of Strategic Services, and, following completion of officer training, in the Army Medical Corps. After demobilization, he served briefly as assistant chief clinical psychologist for research in the newly created V.A. Clinical Psychology Training Program in Washington, D.C. Following this stint in what was to become an important agency for the training of future psychologists, Urie joined the faculty at the University of Michigan for two years as Assistant Professor in Psychology. He left this post to join the Cornell faculty, with appointments in the Departments of Child Development and Family Studies and of Psychology. He was asked to become chairman of Psychology but found himself more attracted to what was then the College of Home Economics because his colleagues there were immersed in questions about children and families that he found compelling, and in running a nursery school and extension programs that he wished to join. In 1969, he played a leading role in the programmatic changes leading to the formation of the College of Human Ecology.

Urie and Liese settled in Forest Home, close to the woods and gorges their growing family came to love, and where they remained for more than 50 years. They had six children and nine grandchildren.

From the very beginning of his scholarly work, Urie contributed to three mutually reinforcing projects: 1) developing theory and research designs at the frontiers of developmental science; 2) laying out the implications and applications of developmental research for policy and practice; and 3) communicating—through articles, lectures and discussions—the findings of developmental research to students, the general public, and to policy makers, both in the private and the public sectors. In hundreds of research articles and four landmark volumes—*Two Worlds of Childhood: U.S. and U.S.S.R.* (with John Condry, Jr., 1970), *The Ecology of Human Development* (1979), *The State of Americans* (1996), and *Making Human Beings Human* (2005)—he laid out his ideas and elucidated both the extant empirical support as well as the lacunae that awaited exploration.

The Ecology of Human Development was hailed as groundbreaking, establishing Bronfenbrenner's place at the forefront of his field and transforming the way many social and behavioral scientists approached the study of human beings and their environments. His starting point was the observation that historically the study of early development had been conducted "out of context," that is, in the laboratory rather than in the environments within which children grow and develop, what he called "the study of the strange behavior of children in strange situations with strange adults for the briefest period of time." He maintained that development needs to be understood in its ecological context, as

“the progressive, mutual accommodation between an active, growing human being and the changing properties of the immediate settings in which the developing person lives, as this process is affected by the relations between those settings, and by the larger contexts in which those settings are embedded.”

His theoretical model led to new directions in basic research and to applications in the design of programs and policies affecting the well being of children and families, including helping to shape Head Start. The ecological approach to human development shattered barriers among the social sciences, built bridges among the disciplines, and linked research to policy and practice. Later in his career, Urie extended this theory, adding “bio” to “ecological” in recognition of his long-held view that biological resources were also important to understanding human development. But for him, biological potential was no more than potential. Whether it was brought to fruition depended on the presence of enduring, reciprocal, highly interactive processes between a developing organism and other individuals or objects in the environment, a view that anticipated our current understanding of gene-environment interaction.

Urie’s widely published contributions won him numerous honors and awards both at home and abroad. He held many honorary doctoral degrees. In 1996, Division 7 of the American Psychological Association established a Lifetime Award for the Contribution to Developmental Psychology in the Service of Science and Society; they named it The Bronfenbrenner Award and made him its first recipient. Two years earlier, he had been awarded the prestigious James McKeen Cattell Award for Lifetime Contribution by the American Psychological Society. Cornell’s Bronfenbrenner Life Course Center, a place for multidisciplinary research on human development, is a living memorial to Urie.

After the intellectual contributions are noted, major honors listed, and his profound influence on students acknowledged, there remains for those who knew Urie a persistent memory of the sheer joy he exuded: at being with or simply speaking of his family, listening to music, showing off Liese’s art, telling a story, singing, hiking, or having a good argument. His was a great soul. We are diminished by his passing.

Earl Brooks

March 7, 1914 — May 30, 1994

Earl Brooks, aged eighty, died unexpectedly of a heart attack on May 30, 1994 at his home in Ithaca.

Earl Brooks joined Cornell University in 1947 after World War II service in the U.S. Navy. His initial teaching was in the New York State School of Industrial and Labor Relations as a Professor of Personnel Management, but in 1955, he accepted an invitation to join the Graduate School of Business and Public Administration (the original name of the current Samuel Curtis Johnson Graduate School of Management). Earl also headed up the School's Executive Education Program for a decade and was a major contributor to that program for over thirty years. In recent years, Earl taught in the School of Hotel Administration and in executive programs.

While Earl's courses were in the area of human resource management (personnel management and negotiations), they were characterized by Earl's sense of humor and insights into people. There was frequent laughter followed by interesting insights and conclusions. Many of the School's most successful alumni, when asked what courses in their M.B.A. program they found most useful, would answer "Earl Brooks' courses". As one graduate wrote to Dean Tarr in 1984: "Earl Brooks was and continues to be a very special person to many of us who graduated from the School. He influenced us in a profound, but common sense way that found immediate application in the real world."

Once asked by a student his opinion of a sycophant, Earl quoted a CEO he knew, "I don't want just 'yes' men around me in the office. Hell, when I say 'no', I want them to say 'no' too."

Earl did considerable consulting that involved a large amount of travel. He was very proud of the fact that he never missed a class and would go to extraordinary lengths to make it back to Ithaca in time.

Earl was the first recipient of the General Electric Crotonville Bell Ringer Award in recognition of over 28 years of distinguished service in their Management Development Institute; and was very proud of being the fourth Distinguished Alumnus Award recipient from Bowling Green State University in 1963.

Earl loved athletics of all types. In his early days, he played baseball and was an outstanding pitcher. We suspect that he would effectively make his point both with the hitters and with the umpires. He was also a fine golfer.

Earl's personality and motivations were strongly shaped by his upbringing on a farm in Ohio during the great depression of the thirties and by his U.S. Navy experiences in World War II. He had a deep pride in his teaching

and expected his students to be in class and to be prepared. Those who did not make the effort paid a severe price. He did not accept lack of effort and he had a wide range of facial expressions indicating displeasure. Students stayed awake in Earl's classes, laughed, and learned. Few professors worked harder to educate or had greater concern for their students.

Earl never seriously considered retirement. Teaching was fun for him, and he would have done it without monetary compensation (but he intelligently kept this a secret from the deans). The community of teachers was fortunate in having Earl in their group, and future students are going to miss a rewarding learning experience with Earl gone.

Earl Brooks served Cornell University effectively for 47 years. His dedication to his students met the highest standard.

Thomas R. Dyckman, Alan K. McAdams, L. Joseph Thomas, Harold Bierman, Jr.

George Brooks

July 12, 1908 — January 27, 2000

George Brooks was a member of the faculty of the School of Industrial and Labor Relations for almost forty years. After earning a B.A. degree from Yale University in 1930 and an M.A. degree in Economics from Brown University in 1932, George began his career with Franklin Roosevelt's New Deal administration. He worked with the National Mediation Board, the National Labor Relations Board and, during World War II, with the War Production Board. He left government service in 1945 to become Director of Research and Education for the International Brotherhood of Pulp, Sulphite, and Paper Mill Workers, a position he held until joining the ILR School faculty in 1961.

Former ILR School Dean, Robert Doherty, who joined the faculty at the same time, remembered:

George was a fine teacher, sometimes profane but always well organized, knowledgeable and considerate of views other than his own. He was also one of the few on the faculty who could give an insider's view on how unions were structured, on the sometimes strained relationship between local and national organizations, on collective bargaining strategy and internal union politics.

David Lipsky, another former ILR School Dean (George outlasted five Deans), recalled:

George Brooks was a wonderful raconteur and one of the legendary figures in the history of the ILR School. His views were often controversial and considered unorthodox by many of his colleagues, but his students appreciated his stance as an occasional maverick—they loved his lack of orthodoxy. His courses were enormously popular with them and well remembered by alumni.

Among other courses, George developed and taught a course in Labor Union Administration as well as courses in Collective Bargaining and Labor History. He also taught in the School's Extension Division. He was dedicated to teaching and, despite consistently enthusiastic student responses, never stopped working to improve his courses. Over the years, many of his former students maintained close personal relationships with him. He warmly welcomed these continuing contacts because, as he told one former student, "a good deal of the teaching one does seems like dropping pebbles into bottomless holes. One does not even hear the splash."

Professor Brooks enjoyed telling how during the days of active student dissent on campus, he rejected the popular view that class attendance should be left to the students' discretion. As he related the story, rather than assume that "the brilliance of my lectures would guarantee attendance," he took the "totally unpopular view" that attendance would be required. He would recall with delight how this was met with "screams of rage and pain from most of

the students.” He would also emphasize, however, that some students were pleased that he cared whether they attended or not. No one cared more about his students than Professor Brooks.

George was also committed to using the School’s Extension Division’s programs around the state in a way that would make field work experience available to the School’s undergraduate and graduate students. He believed the resources of Extension should be used much more extensively than they were for the benefits of students in the degree program. He called it bringing the students to the outside world and the outside world to the students. George, who worked in close collaboration with ILR Extension Associate Sarah Gamm, developed courses, unique at the time, that integrated teaching, research, and field work at workplaces, bargaining tables, and inside labor, employer and government organizations. He wanted students to be involved in original research rather than learning only from secondary sources.

Much of his work in Extension emphasized training the trainers, that is preparing union members (and supervisors as well) to train their fellows in handling shop floor problems. This was a reflection of George’s skepticism about too heavy a reliance upon outside experts in collective bargaining, arbitrators included.

Union democracy was the dominant theme in George’s research and teaching. Throughout his career, he was an outspoken advocate for union democracy and a champion of the voice of the rank and file in union affairs. Forty years ago, he wrote prophetically that it was the local union and local leadership that provided the true source of vitality in the United States’ labor movement. He believed that unions would thrive as long as union leaders were sensitive to the membership’s desires. He was convinced that employee freedom of choice was essential to union democracy and, as he once wrote, “freedom of choice requires that union leaders not be relieved of the ordinary pressures, which are brought to bear in a democratic organization.”

George deplored what he considered the systematic withdrawal of the right of employee and membership free choice caused, among other things, by the centralization of authority in upper levels of union government, compulsory unionism, and an arrangement between unions and employers in which management obtained “mature,” “stable” and “predictable” industrial relations at the workplace in return for an “accommodating” relationship with their unions. George’s experience in government and the labor movement taught him that the presence of worker free choice is the foundation upon which true stability in industrial relations can be built.

Professor Brooks’ research was widely published in distinguished journals such as the *Industrial and Labor Relations Review*, the *Cornell Law Review*, the *Review of Law and Social Change*, and the *Monthly Labor Review*.

Exemplary as George's academic achievements were, those who knew him best will remember him for his wit, his charm, his friendliness, his generosity, and his citizenship. Professor Gross will never forget delightful weekly brown bag lunches with George and Professor Vernon Jensen and a strong, kind and gentle man who spent hours on his tractor driving Professor Gross' young children around "Mr. Brooks' woods."

Two sons, Edward M. Brooks, of Washington, D.C., and David J. Brooks, of Vienna, Virginia; one daughter, Phoebe Dexter, of Hillsdale, Michigan; eight grandchildren; and seven great grandchildren survive Professor Brooks.

Robert Doherty, Ronald Donovan, James Gross

Leslie Nathan Broughton

October 3, 1877 — March 3, 1952

Like every indefatigable scholar, Leslie Nathan Broughton found many things to engage his attention. Because of an interest in teaching, he prepared two useful textbooks; as a friend of scholarly publication, he helped edit the *Cornell Studies in English* for many years; and as an authority on the romantic poets, he reviewed several important books. But these were incidental to his work on four major projects.

About 1900, students of literature discovered how much they could learn about the major poets by studying their use of words. Appreciating the value of word-lists for this purpose, Professor Broughton joined with five other editors in compiling a concordance of the poems of Keats (published 1917), and later undertook, with Benjamin F. Stelter, a similar service for Robert Browning. Although he intended his preface to the latter work merely as generous acknowledgment of assistance from some hundred volunteers and agencies, he unintentionally revealed his own abilities as a director of such complex enterprises.

Then he turned to two other huge tasks. Annually for twenty years he collected, transcribed, and arranged some three thousand items for the invaluable *Bibliography of the Modern Humanities Research Association*. And he joined with Professor Clark S. Northup in preparing a bibliography (soon to appear) of writings relating to Browning.

At an early time he developed an enthusiasm for the character and writings of William Wordsworth. His dissertation on the Theocritan influence and later his teaching, kept him close to the subject. When a donor presented to the University a large collection of Wordsworth's books, letters, and similar materials, Professor Broughton was placed in charge of it and gave valuable guidance and direction in regard to technical processing and management. During his service as curator, he saw the items increase from 1700 to over 3000—a few standard, others rare, and many unique. He also published catalogues and volumes of letters of which almost any modern discussion of the poet must take account. In the Library, his dry pleasantries and knowledge of bibliographical matters made him friends and admirers among the staff.

Professor Broughton's students found in him a teacher who believed that they could acquire a better education by working out their own conclusions than by accepting without thought conclusions that he could easily have supplied ; hence, he often listened with kindness and patience to discussions that he must have found elementary, and refrained from offering corrections that must have seemed to him obvious. His colleagues learned that he took special pleasure in helping others with their work, even at the expense of time and labor to himself. If some one

delivered a paper, he made a point of attending the meeting and saying an appreciative word; indeed, he visited the campus upon such an errand less than a month before his death.

But perhaps the quality that especially impressed those who had much to do with him was his devotion to his subject. What in other persons might have seemed a preference or an accomplishment became with him something for which to live. To him (at least, so his students could easily believe) the personalities of Wordsworth and Coleridge had remained as vital and compelling as though the poets still were alive. In his presentation of them, the men and their writings blended into a harmonious picture, which one needed only to attend to if he would increase his enjoyment and understanding of hundreds of matters. Since the days of Browning societies and Kipling clubs, no authors have attracted at Cornell such devoted and wide-spread attention—an attention that culminated in 1950 in a series of exercises of national interest. The modest and industrious man who lent so much aid to bringing this situation about will not easily be replaced.

W. H. French, B. S. Monroe, G. F. Shepherd, Jr.

Ludlow D. Brown

April 13, 1909 — December 21, 2001

Professor Emeritus Ludlow D. Brown of Riverside, Rhode Island, passed away on December 21, 2001. He had received both the Bachelor of Architecture degree (1931) and the Master of Architecture degree (1934) from Cornell University. He had been a member of Cornell University's Alpha Tau Omega.

Professor Brown was appointed to the Cornell Faculty in March 1946 as an Associate Professor in the Department of Architecture, and rose to the rank of Professor in July 1951. Upon his retirement in July 1971, he was named Professor Emeritus of Architecture.

Office of the Dean of the University Faculty

Stuart M. Brown, Jr.

March 14, 1916 — March 18, 1996

Stuart M. Brown was born in Concord, North Carolina, on March 14, 1916, the son of Stuart M. Brown and Maud (Reynolds) Brown. He grew up in Camp Hill, Pennsylvania and Indianapolis, before moving to Ithaca with his family in the early 1930s. By far the largest part of his life was spent in Ithaca, and during most of it he was associated with Cornell. He graduated from Ithaca High School in 1933, and from Cornell's College of Agriculture, where he majored in biology, in 1937. After a brief term as Instructor of zoology at Massachusetts State College in Amherst (now the University of Massachusetts), he returned to Cornell to do graduate work in philosophy, and was awarded the Ph.D. degree in 1942, with a dissertation titled "Schleiermacher's Philosophy of Religion." He was briefly an Instructor in philosophy at Cornell before entering the United States Army in 1943. He served in the U.S. Army Signal Corps from 1943-46, some of that time in eastern Europe, and attained the rank of Master Sergeant. He returned to Cornell in 1946 as an Assistant Professor, was promoted to Associate Professor in 1949 and to Professor in 1956. From 1953-63, he was Chairman of the Department of Philosophy. He served two terms as Managing Editor of *The Philosophical Review*. In 1964, he became Dean of the College of Arts and Sciences, a position he held until 1969. He was Vice President for Academic Affairs from 1968-70. In 1970, he left Cornell to become Vice President for Academic Affairs at the University of Hawaii. When he returned to Cornell in 1974 as Professor of Philosophy, he became a member of the Science, Technology, and Society Program, and from 1974-76, was Executive Director of the Humanities, Science and Technology Unit of the program. Here his philosophical interests and his biological interests came together. He was actively involved in the development of the new Biology and Society major, and he introduced a new course in medical ethics, which he taught for many years. He retired and became Professor Emeritus in 1981.

Brown's philosophical work was primarily in the area of moral philosophy. He published a number of articles in *The Philosophical Review* and other philosophical journals, dealing with the work of such philosophers as Kant and Hobbes, and with such topics as inalienable rights and civil disobedience. In his later years, his concern was mainly with topics in applied ethics—his last philosophical publications include a paper entitled "The Social Control of Genetic Engineering."

In 1947-48, Brown was a Rockefeller Post-War Fellow in philosophy, and in 1957 he was awarded a Guggenheim Fellowship. He was a member of the American Philosophical Association, the American Society for Political and Legal Philosophy, and the Academy of Political Science.

The period in which Brown was Chairman of the Philosophy Department was one in which the Department was changing and growing, and in which its members included some very forceful personalities; that a very harmonious atmosphere nevertheless prevailed within the Department was due at least in part to Brown's skillful stewardship. Those who were junior members of the Department during that period remember him as warm, kind, and extremely helpful. He had very strong opinions on pedagogical matters, but was always ready to listen to dissenting opinions and to give in with good grace when he found himself in the minority.

Brown married Catherine D. Hemphill ("Kitty") on June 21, 1941, and they remained together for the remainder of his life—nearly fifty-five years. Among the many interests they shared was the raising and showing of giant schnauzers. (Brown's publications include articles in the *American Kennel Gazette*) Among his other interests were travel, swimming and skin-diving (he spent one sabbatic leave in the Caribbean), raising orchids, and listening to music, particularly opera.

Brown is survived by his wife; a sister, Margaret Brown Coryell of Sebastian, Florida; and his children, James Hemphill Brown of Corrales, New Mexico; Deborah Brown New of Canastota, New York; and Margaret Brown Cassidy of Putney, Vermont. A son, Peter, died in 1981.

Norman Kretzmann, Nicholas Sturgeon, Sydney Shoemaker

William L. Brown, Jr.

June 1, 1922 — March 30, 1997

In the early 1930s, when the summer weekend weather was clear, Bill and Beulah Brown liked to load their two sons into the car and drive from their Philadelphia home to the Jersey shore for a day at the beach. They made one stop along the way, however, so that their older boy, Bill Jr., could disembark at a familiar crossroads in the middle of the Jersey Pine Barrens. In accord with family custom, he would be picked up at the same location at the end of the day. In the meantime, equipped with collecting gear and a lunch packed by his mother, the young naturalist roamed the stark and beautiful solitude of the Barrens, observing and collecting ants and other insects. Bill Brown's first scientific paper, published in 1943, described a new ant species discovered during one of those boyhood treks, *Monomorium viride*. In years yet to come, he would likewise roam the forests and savannahs of six continents, reporting on what he learned in 273 scientific publications.

Bill Brown received a B.S. degree in Zoology and Entomology from Penn State in 1947 and a Ph.D. degree in Biology from Harvard in 1950. He interrupted his undergraduate studies from 1943-46 in order to serve with the USAAF 36th Malaria Survey Unit and in an air-ground rescue unit, primarily in western China, but with some malaria work in India. From 1950-52, Bill conducted research in Australia as a Harvard Parker Traveling Fellow and as the first Fulbright Research Scholar to Australia. From 1952-60, Bill served as an Assistant and Associate Curator of Entomology at the Museum of Comparative Zoology at Harvard, and in 1960, he assumed a professorship in the Department of Entomology at Cornell University, attaining emeritus status in 1991. In 1973, Bill received a Guggenheim fellowship. He maintained strong ties with Harvard as an Associate Curator of Entomology until the time of his death. At Cornell, Bill taught courses in evolution, insect systematics, insect physiology, systematic theory, and paleobiology. He mentored 21 graduate students.

Bill was the antithesis of the stereotypical ivory-tower stuffed-shirt academic. He arose from working-class origins and shot to the top of his field through sheer force of intellect and knowledge. A staunch but irreverent political liberal, he liked to poke fun at pomposity and self-importance whenever he saw the opportunity, and it has been said that he knew the word for "beer" in over fifty languages and dialects. Thankfully, some of the personal side of Bill's life in science has been recorded in the recent book, *The Earth Dwellers: Adventures in the Land of Ants*, by Erich Hoyt (1996).

Of Bill's 273 publications, 223 are about ants. Bill recorded discoveries in many aspects of ant biology, but his primary interest was ant systematics and his primary goal the clear and stable delineation of ant species and higher taxa. Since there are an estimated 15,000 species of ants, this represents a massive task. Bill made contributions to the systematics of most ant groups, but the two groups that received his greatest attention were the tribe Dacetini (subfamily Myrmicinae) and the subfamily Ponerinae. The Dacetini, a tribe of mostly minute, exquisitely sculptured ants, are speciose and worldwide in distribution, but because of their size they had been collected rarely and thus were very poorly known. Portions of Bill's dacetine revision appeared in 1948, during his first year as a graduate student. In all, he published 69 papers on dacetine ants over the course of four decades; 36 of those papers, published during a period spanning 20 years, constitute a revision of *Strumigenys*, the most speciose dacetine genus.

Bill's other primary focus was the ant subfamily Ponerinae, a heterogeneous group containing both "primitive" and highly derived ants. Bill's ponerine studies were reported in diverse publications, but were concentrated especially in a series entitled, "Contributions toward a reclassification of the Formicidae," which, in Bill's (unpublished) words, "was begun about 1951 in a hopeful but tentative way, and was aimed at revising to genus level the entire family. The 'Contributions to...' hedged the prospect of a task so huge and unmanageable that it might well never be completed as originally conceived, at least by this investigator." In all, there were seven publications in this series that spanned the years 1951-78 (Parts I-V, Parts VIA and VIB), that made important and lasting changes in our understanding of this fascinating group of ants. For the fifteen years prior to his death, Bill worked daily on Part VIIA, which was to treat the difficult genera *Diacamma* and *Pachycondyla*, and he had prepared extensive notes for VIIB and VIIC. Even in unpublished form, this work has had strong influence among ant biologists: many of the taxonomic implications are incorporated into the ponerine classification of Bolton's (1994) *Identification Guide to the Ant Genera of the World*, and "test versions" of Bill's keys have been circulating for two decades.

As is well known, Bill was an accomplished general naturalist, and was, as Ed Wilson has recently observed, arguably the most well-traveled field biologist in history. Based on years of careful observation, Bill possessed an intimate knowledge of the patterns of distribution of plants and animals. This knowledge formed the basis for his important contributions to evolutionary theory, and may be contrasted to the majority of the literature, which is typically based on abstract models or isolated studies of particular "model organisms." The vastly influential paper (co-authored with E.O. Wilson in 1956), "Character displacement," was honored in 1986 as a Science Citation Classic, i.e., as one of the most frequently cited scientific papers of all time. Bill's general theory of speciation was

described in two papers, “Centrifugal speciation” (Brown, 1957) and “Speciation: The center and the periphery” (Brown, 1958). His theory of the mechanisms that drive speciation and adaptive radiation was set forth in “General adaptation and evolution” (1959). Perhaps the premier example of the power of natural history-based reasoning is Bill’s 1960 paper, “Ants, Acacias, and browsing mammals,” a tour de force in which he assembles all of the evidence in support of the idea that plants benefit from ant-plant symbioses. This idea, which seems common-sensical today, was opposed for decades following the vigorous refutations of W.M. Wheeler and others in the first half of this century. Within a few years of the publication of Bill’s paper, Dan Janzen and subsequently a host of other ecologists, had proven experimentally what Brown had demonstrated by deduction.

Ant systematics has had some truly great scientists, in particular Gustav Mayr and Carlo Emery, but it may be argued that Bill’s constellation outshines them all. This is so for a number of reasons. First, Bill carried the evolutionary “Modern Synthesis” into ant systematics by emphasizing Mayrian population-level thinking in the critical process of delineating ant species. Inevitable by-products of this emphasis were Wilson and Brown’s (1953) and Brown and Wilson’s (1954) vigorous attacks on the taxonomic subspecies, which had a tremendous effect on zoological systematics in general. Second, Bill repeatedly emphasized that taxonomic revisions should be carried out on a world basis, rightly asserting that species and higher taxa can only be properly recognized and understood when their total diversity is surveyed. Third, Bill introduced the use of repeatable, quantitative measurements into ant systematics. Fourth, Bill maintained that his greatest contribution to science was the specimens that he had collected. These specimens, from remote locations all over the world, constitute an immensely important and in many cases unique source of biological information that will serve future generations in ways we have yet to imagine.

Bill is survived by his beloved wife, Doris, of Ithaca, New York; and by his son, Creighton Brown, of New York City. The tragic deaths of two daughters, Dorothy and Alison, preceded Bill’s. Bill’s five grandchildren include Creighton and wife Jennifer’s children, Simon, Ezra, and Willa; and Dorothy and husband Richard Anderson’s two children, Katherine and Stephen. In a fitting tribute to Bill’s memory, Doris has established an endowment for training Latin American students in tropical ecology. Tax-deductible gifts may be sent to: O.T.S. William L. Brown Fellowship, P.O. Box 90630, Durham, NC 27708-0630.

When the time came to place Bill’s body in the ground, his wife, Doris, and son, Creighton, wisely chose to dress him in his worn and weathered collecting clothes. When we think of Bill now, we think of the solitary boy in the Pine Barrens, shaded from the hot noonday sun under a pine tree, eating his lunch and watching *Monomorium*

viride workers come and go from their nest entrance. The wonder he experienced then, and the wonder he experienced subsequently in the wild places of the world, are generously shared with us in 273 publications and countless ant specimens that, together with the trajectories of the many lives he touched, constitute the unique and lasting legacy of Bill Brown.

Ted R. Schultz, Richard B. Root, Thomas Eisner

Arthur Wesley Browne

November 24, 1877 — December 15, 1945

Arthur Wesley Browne, Emeritus Professor of Inorganic Chemistry, died in Ithaca on December 15, 1945 after a somewhat prolonged period of ill health. He had retired in June of that year, having been continuously at Cornell since 1901, either as graduate student or member of the faculty.

Dr. Browne was born in Brooklyn, New York, on November 24, 1877. He attended Wesleyan University, receiving the degree of Bachelor of Science in 1900 and the degree of Master of Science in 1901. He came to Cornell University for further graduate work and was awarded the degree of Doctor of Philosophy in chemistry in 1903. In his forty-two years of service as a member of the staff of the Department of Chemistry, he held the following appointments: Instructor of Chemistry, 1903; Assistant Professor of Chemistry, 1906; Professor of Inorganic and Analytical Chemistry, 1910; Professor of Inorganic Chemistry, 1922. In 1925 he served as the Acting Head of the Department of Chemistry and for many years he was in charge of the chemistry courses offered in the Summer Session. He initiated an employment service for graduates in chemistry and maintained extensive connections with academic and industrial circles. He was visiting professor of chemistry at the University of Chicago during the Summer Quarter of 1931, lecturing on the hydronitrogens and their derivatives. In 1933 Wesleyan honored him with the degree of Doctor of Science.

Professor Browne early gained a reputation among his students for his enthusiastic and stimulating lectures on introductory chemistry in which he combined a forceful and colorful spoken presentation with a skillful use of the blackboard and ingenious and striking experimental demonstrations. He was particularly successful in gaining and holding the attention of large lecture groups and was much in demand for popular science lectures throughout the state. Many science students were first attracted to the field by his interesting talks.

As a graduate student at Cornell under the direction of Professor L. M. Dennis, he became interested in the compounds of nitrogen and hydrogen and subsequently, as a member of the faculty, he made this field his primary research interest. In nearly 100 scientific papers published in American and European journals he made substantial contributions to the understanding of this area of inorganic chemistry. As an expert on the hydronitrogen compounds, he was called during World War I to act as consultant for Army Ordnance on the use of the azides of the heavy metals as detonators. His phase rule studies of ammonia systems constituted one of the first systematic applications of phase rule theory and contributed much of fundamental importance. He worked on the oxidation

of hydrazine by mono and di-deelectronators, nitridation reactions, solvation and solvolysis in liquid ammonia systems, and perchlorides and chlorinates. He discovered azido-dithiocarbonic acid and made a thorough study of its properties and derivatives. An expert glass blower, he was particularly ingenious in the design of complicated apparatus and techniques which served admirably for investigation of very unstable systems where the hazard of explosion was frequently great. He was possessed of a lively imagination and did not hesitate to suggest and develop unorthodox ideas and methods which proved to be fruitful. A long list of successful and productive chemists who received their research training in his laboratory attests the soundness of his guidance.

Dr. Browne was a member of Phi Beta Kappa, Sigma Xi, Phi Kappa Phi, Tau Beta Pi, Alpha Delta Phi, Omega Epsilon Phi, Gamma Alpha, Alpha Chi Sigma, Aljebar, the American Chemical Society and the Savage Club.

Professor Browne was a man of broad interests. He was an enthusiastic and proficient figure skater and enjoyed long walks over the country side. He was gifted with a splendid bass singing voice of remarkable range and was active in quartet and chorus groups until his retirement. For many years he served on the music committee of the University and vigorously supported and took part in the musical activities of the community. He was particularly interested in student activities and was in great demand as a speaker at student gatherings where his ready wit, large fund of anecdotes, and superb command of the spoken word were much appreciated.

Arthur Wesley Browne will be remembered as a brilliant lecturer, a gifted scientist, and a kindly friend.

C. L. Durham, A. W. Laubengayer, L. A. Maynard

Stanley J. Brownell

November 13, 1893 — January 16, 1979

Stanley J. Brownell, professor of animal husbandry emeritus at Cornell University, died January 16, 1979, at his home in Sun City Center, Florida. Born in Michigan, he graduated from Michigan State College with a Bachelor of Science degree in 1916 and a Master of Agriculture degree in 1922. He was appointed assistant professor at Pennsylvania State College in 1923 in charge of the dairy cattle breeding extension program. He developed bull association organizations that served as a pattern for similar organizations throughout the nation. While at Pennsylvania, he was granted a Master of Science degree in 1929.

Professor Brownell came to Cornell in the fall of 1929 as an assistant professor of animal husbandry in charge of the dairy cattle breeding program. He became project leader of animal husbandry extension in 1934, a position he held until retirement in 1959. He was advanced to full professor in 1935.

During the early 1930s, Professor Brownell served as field secretary for the New York Holstein Association. Under his leadership, the association doubled in membership, had its greatest growth in affiliated local groups, and survived the Depression.

Soon after coming to Cornell, he created the two-day dairy cattle breeding schools and began demonstrating to farmers the possibilities of artificial breeding programs and principles of scientific breeding. The first artificial breeding cooperative in New York and the nation was organized under Brownell's direction and became operative in the fall of 1938. The development of this and other artificial breeding cooperatives is considered a crucial step in New York's advance in genetic improvement and in the development of artificial insemination in the United States. As more of these county and regional cooperatives came into being, he conceived the idea that a consolidation of these smaller cooperatives into a statewide organization would bring about a more rapid genetic improvement in dairy cattle in dairymen's herds. From this concept was born the New York Artificial Breeder's Cooperative, which later was merged with similar cooperatives in the Northeast to become Eastern Artificial Insemination Cooperative, Incorporated, which is located in Ithaca, New York, and serves New England and New York.

During Professor Brownell's tenure at Cornell, the animal husbandry extension faculty increased from five to sixteen specialists working with dairy, beef, sheep, swine, meats, and 4-H youth. Under his leadership, extension programs that attracted world-wide attention were state and county organizations for dairy herd improvement and artificial insemination, electronic processing of dairy records serving the entire Northeast, herd health, swine,

lamb, wool marketing pools, beef cattle projects, and 4-H youth programs. The College of Agriculture and Life Sciences at Cornell has recently been rated number one in the nation based on a survey of four thousand faculty members in other land-grant universities. Part of this success can safely be attributed to the philosophy, vision, and dedication of Professor Brownell in the development of a faculty and extension programs in animal husbandry.

In 1946 Professor Brownell was appointed chief of livestock and meats for the Office of Military Government in Germany, representing the United States on the four powers' committee for dairy, livestock, and meats. At the request of the German government in 1950, he returned to Germany to direct the establishment of centralized artificial breeding throughout the British Zone. He was honored for his contributions by the Bavarian government in 1946 and by the Bremen and Lower Saxony governments in 1950.

The Lambda Chapter of Epsilon Sigma Phi, the national extension fraternity, honored Brownell in 1949 for "the highest achievement in an extension project for advancing the work of the Cornell Extension Service".

In 1952 the American Dairy Science Association selected him to receive the DeLaval Award for outstanding accomplishments in dairy extension. He was the second individual to receive this honor.

In 1953 he was awarded the United States Department of Agriculture Superior Merit Award for "effective leadership in the field of animal and dairy husbandry and meritorious service to the welfare of the dairy industry resulting in better standards of living among farm families".

In 1955 Professor Brownell was granted a leave of absence from Cornell to assist the government of Greece in the development of a livestock research program in artificial insemination, a dairy herd improvement program, and demonstrations of proper milk sanitation and quality improvement.

Professor Brownell will long be remembered by those who knew him for his extension philosophy of helping others help themselves, for his vision, dedication, development of viable extension programs, and strong leadership in all phases of animal husbandry extension. It can truthfully be stated that Stanley J. Brownell had a tremendous impact on the dairy and livestock industry in New York, the United States, and the world.

He is survived by his widow, Mrs. Anna Fager Brownell, whose address is Post Office Box 5505, Sun City Center, Florida 33570, and a son, David R. Brownell, who resides in Washington, D.C.

Samuel T. Slack, Robert W. Spalding, Harry R. Ainslie

Robert Lee Bruce

April 14, 1925 — June 18, 1990

Professor Robert Lee Bruce, a faculty member at Cornell since September 1961, died June 18, 1990 after a short illness. Over his three decades at Cornell he provided leadership to more than one hundred graduate students, serving as chairperson of more than 70 graduate study committees. His academic leadership in the area of adult and extension education, evaluation and program development formed the basis for his teaching career. The word mentor best describes him. He was more than an excellent teacher; he was a tutor, an advisor, one who unlocked the ability to learn in students from cultures all around the world. His knowledge of cultures and history was extensive and enhanced by visiting professorships at the University of Reading, England (1967-68, 1989), at the University of Saskatchewan, Canada (1975), at University Pertanian Malaysia (1982-83), and at the University of British Columbia at Vancouver (1983).

As a university citizen he was a faculty fellow for Ecology House and served on numerous university committees. His service to his department (Education, College of Agriculture and Life Sciences) was described by colleagues as that of a valued team member whose judgement, sagacity, and wisdom were sought after. His “just plain horse-sense,” his ability to face crises and take charge when necessary drew people to him as a trusted colleague. He served as graduate field representative for the department from 1984-86 and as coordinator of the Adult, Extension, and Continuing Education Program.

That down-to-earth quality, a rare and wonderful find in academic circles, came from his farm boyhood in Nebraska where he was born April 14, 1925. After service in World War II as an infantry sergeant in the European Theater of Operations, he received his B.S. degree from the University of Nebraska. He was a county extension agent in Nebraska before receiving his M.S. degree from Cornell in 1951. For the next nine years he was at the University of Maryland, first as publications editor and later as assistant state leader for agricultural extension. He received his Ph.D. degree from Cornell in 1960.

Professor Bruce served on the board of trustees of Tompkins Cortland Community College for ten years. He strongly believed in the community college concept—the need to translate the finding of scholars to the workers of our society. The president of the College, Dr. Edwardo Marti stated: “His stewardship transcended budget difficulties, personal viewpoints, or political feelings. His sharply focused mind was a welcome presence....”

Professor Brace's community service also included five years as a member of the Tompkins County Board of Representatives, as a member of the Tompkins County Board of Mental Health, and as an elder of the First Presbyterian Church of Ithaca.

Professor Bruce and his wife, Charlotte, opened their home to students on a regular basis. Their genuine interest in others, their sense of humor, love of food and its growing and preparation provided an informal setting for good companionship and stimulating conversation. His talents also included photography and Chinese brush painting.

Professor Bruce's love of language and literature provided him strength during his illness. He selected this Tennyson quotation for the memorial services held following his death.

“Our little systems have their days;
They have their day and ceased to be;
They are but broken lights of thee,
And thou, O Lord, art more than they.”

In addition to his wife, Professor Bruce is also survived by his son, Thomas. A daughter, Ann Lynn, died in 1970.

Joseph P. Bail, Richard E. Ripple, Jane W. McGonigal

Jacob Herbert Bruckner

May 14, 1905 — February 26, 1970

J. Herbert Bruckner was born in Anaconda, Montana. From an early age he was interested in poultry. He owned and managed a poultry farm from twelve years of age until 1923, when he was graduated from Anaconda High School. He obtained the B.S. degree from Purdue University with a major in poultry husbandry, and the Ph.D. from Cornell University with a major in poultry breeding and minors in genetics and marketing. Throughout his forty years at Cornell University, Herb Bruckner did much to change the production of poultry from a “husbandry” to a science.

He married Frances McKibben in 1930. They had four sons, Bruce, Allan, Dean and Keith. He spoke often of his family and was proud of their achievements. He particularly enjoyed his eleven grandchildren.

Herb Bruckner loved Cornell University and had the highest devotion to its ideals and aims. Few are better versed in the history of Cornell than he was, and no one has been a greater supporter of the Cornell tradition of freedom and responsibility.

As head of the Department of Poultry Science for twenty-five years, Herbert Bruckner recognized that to serve the needs of both agriculture and Cornell it was necessary to staff his department with scientists capable of conducting the basic research needed to find the answers to problems of the poultry industry and, at the same time, with capabilities to teach and lead undergraduate and graduate students in these basic areas of research. Herb Bruckner saw his job as one of service to those in his department. He took a personal interest in the progress, accomplishments and tragedies of each faculty member and each student in his department. He did everything possible to provide his staff with the facilities and finances necessary to carry on the research and teaching that they wished to do. He shouldered numerous onerous tasks and responsibilities which could have been delegated to others.

He continued to follow the progress of each student who left Cornell. He published a newsletter periodically, which was sent to over two hundred alumni of the department.

He liked books, particularly old books about poultry. He did much to make the Rice Library at Cornell the best collection of poultry books in the world.

He was a much loved department head. In 1965, when he left the headship, the faculty of the department unanimously voted to ask the Board of Trustees to name the new poultry laboratory building the Bruckner Laboratory of Poultry Biology. The trustees agreed to bestow this rare honor on an active faculty member in 1966. Bruck's reaction upon reading the letter from the Board of Trustees typified his humble modesty. He read the letter, became rather embarrassed, and muttered something about how other members of his staff deserved the honor far more than he. This was characteristic. He was not one to seek honors. Naturally he was proud to be recognized and it touched him more than he would ever admit.

Herb was straightforward and unpretentious. He was comfortable to be with, whether you were a student meeting the head of the department for the first time, a poultry farmer, or a colleague, you could be comfortable with Herb. You could enjoy talking with him and could appreciate his sense of humor.

Herb Bruckner was an able departmental administrator. But his concern for the University extended beyond his own department. He was a member of the General Committee of the Graduate School, and he was on the selection committees for the dean of the College of Agriculture and the dean of the Graduate School; he played a crucial role on the Corson Committee that recommended the establishment of the Division of Biological Sciences. His most recent assignment was as a member of the Committee on Faculty Governance.

Herb tackled each assignment with enthusiasm, sincerity, and above all with wise objectivity. Thus one of his greatest contributions to Cornell lay in his constant challenging of the status quo, and his exhortation to reexamine academic programs. It was Herb Bruckner in the late 1950s who prodded the faculty and the administration of the College of Agriculture into a review of its entire academic program. This undertaking resulted in a recognition of the need for frequent reappraisals which has continued for over a decade.

Many of us will always cherish our informal discussions with Herb Bruckner. They never dealt with trivia but quickly centered on how this University could be improved and strengthened. He was a champion of change and he recognized that the young would have to provide much of the thrust for change; therefore, he also was a champion of the young. Herb Bruckner was not just a teacher, not just a colleague, not just an administrator—he was a good friend to all who knew him.

F. B. Hutt, M. C. Nesheim, M. L. Scott

Dorsey William Bruner

December 25, 1906 — September 1, 1996

Professor Emeritus of Veterinary Microbiology, Dorsey William Bruner, was a lifetime resolute and undaunted optimist, absolutely certain that he would live to age 90! But following an illness of several months, the Lachesian thread was cut short by just four months.

Born in Windber and raised in Paxtonville, Pennsylvania, in the heart of the “Dutch country”, he was as fluent in the Germanic dialect as he was in English. He attended grammar school in Paxtonville and, in 1925, was graduated from high school in nearby Middleburg.

In 1929, he completed the requirements for a B.S. degree from Albright College, and taught mathematics and biology in the Middleburg High School in 1929 and 1930.

He became fascinated by the science of bacteriology and was particularly intrigued by the scholarly reputation of William Arthur Hagan of Cornell University. Hagan was especially knowledgeable about the elusive, filament-forming acid-fast bacteria, especially *Mycobacterium tuberculosis* and *Mycobacterium paratuberculosis*. Consequently, in 1931, Dorsey was admitted to the Graduate School of Cornell University as a Ph.D. degree candidate, studying under the guidance of Dr. Hagan. The title of his thesis was “The Influence of Nutritive Conditions on Acid-fastness of Bacteria”. Acid-fastness of mycobacteria, due to high lipid concentration in the cytoplasm of mature organisms, is one of its most elusive characteristics. Dorsey Bruner found that the acid-fast determining requisite is nascent carbon. Carbon deprivation will obviate acid-fastness. Most interesting was his determination that mycobacteria, which retain acid-fastness when cultured on carbon-deficient media, are able to utilize the carbon in CO₂ of air, thus compensating for carbon deficiency in the culture medium!

Dr. William A. Hagan, who served on the faculty of the College of Veterinary Medicine since 1917, was named Dean of the College in 1932, the year after Dorsey Bruner began his graduate studies. He became so impressed by Dorsey’s personal and academic talents and scholarly attributes that he offered him an instructorship in bacteriology, and urged him to matriculate simultaneously as a candidate for the DVM degree. Consequently, Dorsey completed the requirements for the Ph.D. degree in 1933, and the Doctor of Veterinary Medicine (D.V.M.) degree in 1937.

In 1937, Dorsey W. Bruner, B.S., Ph.D., D.V.M., was appointed as a veterinary bacteriologist in the Department of Animal Pathology, Kentucky Agricultural Experiment Station, University of Kentucky in Lexington. It was there that Dorsey became a co-worker with Dr. Philip R. Edwards, a world-recognized microbiologist who had special expertise in the enteric (intestinal) disease-producing *Enterobacteriaceae*: notably those of the genera *Salmonella*, *Escherichia*, and *Shigella*; bacteria notable for causing life-threatening dysentery. His collaboration with Philip R. Edwards (and later with William H. Ewing) stimulated his abiding interest in the antigenic analysis of *Salmonella* species, of which more than 2000 serotypes have been isolated and classified.

Particularly impressive is that the 2000+ varieties of serologic types are in the genus *Salmonella*, a genus named for Daniel Elmer Salmon, the first student of James Law to qualify for a veterinary doctorate degree from Cornell University. The antigenic analysis of these serotypes is so complicated that they have been assigned complex identification codes, all appearing to be imposingly esoteric! Analysis is carried out by observing agglutination of pure cultures in specific rabbit antisera prepared against O (somatic) antigens, or flocculation of cultures in specific antisera prepared against H (flagellar) antigens. Dorsey Bruner, one of a few great world authorities on antigenic analysis of *Salmonella* species, who carried out many of the pioneering studies in this system, is considered to be one of the scholarly giants in *Salmonella* epidemiology. Serological type identification undergirds the modus operandi of epidemiologists who follow epidemics, predict flow patterns, and develop strategies against devastating infectious diseases, such as intestinal infections of animals or people housed under crowded, and often unsanitary, conditions.

For accurate diagnosis of serotypes (serologic variants or varieties within *Salmonella* species) it is essential that reagents are prepared with scrupulous precision. Antigens must be purified, classified and monitored, and antisera produced against them in rabbits also must be prepared and tested fastidiously. The work involved is highly sophisticated and demanding. It is in this arena of science, antigenic analysis, (genetic mapping for epidemiological purposes), that Dorsey Bruner devoted much of his professional life. In addition to his scientific achievements in serological analysis of *Salmonella* antigens, Dorsey described a baffling blood dyscrasia in newborn foals, which he named *neonatal isoerythrolysis*, a genetic disease resembling Rh isoerythrolysis (erythroblastosis fetalis, or Pfannenstiel's syndrome) in human neonates.

From 1942-46, Dorsey served as a bacteriologist in the Fifteenth General Medical Laboratory of the Fifth American Army, stationed in Naples, Italy. He attained the rank of Major, and in addition to earning 5 battle stars (4 for Italian campaigns and one in France), he was awarded a Bronze Star medal for heroic or meritorious service in

combat. Also, he was awarded the American Campaign Service Medal, and the European-African-Middle East Service Medal.

According to Alvin F. Sellers, V.M.D., M.S., Ph.D., Professor Emeritus of Physiology, College of Veterinary Medicine at Cornell, who served in the First Medical Laboratory (which was a field laboratory temporarily attached to the Fifteenth Medical Laboratory upon arrival from service in North Africa), Dorsey served alongside William Howell Ewing, a preeminent bacteriologist with special expertise in antigenic analysis of disease-producing genera of enteric microorganisms. Ewing, in collaboration with P.R. Edwards, devised a biochemical system for antigenic analysis and classification of enteric bacterial organisms, a refinement of the prestigious world-renowned Kauffmann-White serological system.

In the Fifteenth General Medical Laboratory of the Fifth Army during World War II, the rapid and accurate diagnosis of bacteria responsible for gastroenteritis among military personnel was extremely important and urgent. Dysentery caused by Salmonella and Shigella bacteria was a major problem in the military theater. Dr. Sellers stated that Dorsey Bruner was the key bacteriologist for antigenic analysis (diagnosis) of Salmonella species, and Bill Ewing was the key microbiologist for antigenic analysis of Shigella species.

Dorsey Bruner returned to the University of Kentucky in 1946, upon his discharge from the army. He transferred as a retired officer to the Veterinary Corps, U.S. Army Reserves, and attained the rank of Lieutenant Colonel.

On August 25, 1940, Dorsey married Beatrice D.E. Christman. She was the daughter of an Ithaca optometrist. "Bea" had been a student of Dorsey's at Cornell and was 6 years younger than Bea. Their marriage extended over a period of 49 years, until Bea's death in 1991. They had no children but were very fond of their nieces and nephews. Further, throughout his teaching career, all sophomore veterinary students were invited in small groups to the Bruner home for dinner.

Dorsey Bruner's life style was that of a legendary traditionalist. Every Thursday night he would prepare dinner, often employing Pennsylvania-Dutch recipes. And frequently on Saturday night, he and his wife, Bea, would dine at local restaurants. She would choose the restaurant on one Saturday; Dorsey the next. They played bridge often, but never on an evening where a major sports event was scheduled on the Cornell Campus (or on television)! Dorsey and Bea were enthusiastic gardeners and both enjoyed hiking and international travelling.

In 1949, Dorsey W. Bruner, B.S., Ph.D., D.V.M., was recruited by his mentor, William A. Hagan, to fill a vacant position at Cornell University for teaching bacteriology in the veterinary curriculum. He served as Professor of

Bacteriology in the Department of Pathology and Bacteriology from 1949-65, teaching veterinary students and graduate students and continuing his research and publishing on antigenic analysis of Salmonella species.

In 1965, Dorsey was named chairman of a newly formed Department of Microbiology (which also embraced the Veterinary Virus Research Institute). This department was split off from the Department of Pathology primarily because of the growth and expansion of microbiology and immunology. Dorsey continued to serve as chairman until his retirement on June 30, 1972. He was especially appreciated for his astute qualities as an administrator of an excellent but diverse department, and admired for his patience, no-nonsense determination, and sense of urgency. In the sweep of time, D.W. Bruner taught bacteriology at Cornell from 1931-37, and then again from 1949-72, for a total of 29 years of dedicated service.

Dorsey Bruner served as co-author of the second through the fourth editions, and then principal author for the fifth and sixth editions of *Hagan's Infectious Diseases of Domestic Animals*, a classic textbook for students and practitioners of veterinary medicine. To honor his participation in six editions of this magnificent textbook, the seventh and eighth editions have included his name in the revised title, *Hagan and Bruner's Microbiology and Infectious Diseases of Domestic Animals*. Also, he authored or co-authored over 140 scientific papers that were published in highly reputable peer-reviewed journals.

The Cornell Veterinarian, a professional journal issued quarterly, was published continuously for 82 years; between 1911 and January 1994. Although called "The Cornell Veterinarian", its Board of Directors published the journal independently of Cornell University, despite the fact that most of the directors were Cornell faculty members. Dorsey Bruner was editor for 20 years, from 1951 to June 1972.

Dorsey was an avid enthusiast for all competitive sports. He played baseball during his public school and collegiate student years. And while serving on the faculty of the Veterinary College during his graduate student days, he played on a faculty baseball team with W.A. Hagan, Peter Olafson, Alexander Zeissig, and other Cornell academic giants.

The prestigious, Twelfth International Veterinary Congress Prize, awarded by the American Veterinary Medical Association (AVMA), was established in 1936. It is awarded annually to a member of the AVMA upon selection of the AVMA Executive Board, in recognition of outstanding service by one who has contributed to international understanding of veterinary medicine. Nominated by Professor of Microbiology and Chairman of the Department of Microbiology, James H. Gillespie (Dorsey Bruner's successor) in 1972, and endorsed in writing by every member

of the department, Dorsey W. Bruner was commended to the executive board, and by acclamation was awarded the prize in 1972.

Dorsey received a citation for outstanding work in science from Albright College in 1949. He is listed in *Who's Who in America*, *American Men of Science*, and *Who's Who in Science*.

Dorsey served as Chairman of the Bacteriology and Mycology Study Section, National Institutes of Health, between 1962-66, and as a member of the Training Grant Committee in the same organization, 1968-72. He was a Charter Diplomate of the American College of Veterinary Microbiologists, a Diplomate of the American Board of Microbiologists, a member of the American Society of Microbiologists, and of the Society for Experimental Biology and Medicine. Further, he held memberships in the American Association for the Advancement of Science, the American Veterinary Medical Association, the New York State Veterinary Medical Society, and also the Societies of Pi Gamma Mu, Sigma Xi, Phi Zeta, and Phi Kappa Phi.

Dorsey retired on June 30, 1972 and was named Professor Emeritus of Microbiology by the Trustees of Cornell University. His independent, orderly, visionary, and well-disciplined life style, and his tenacious, critical attention to detail, especially in the laboratory, have left preeminent imprints, particularly in his graduate students and colleagues who probe the mysteries of the silent, invisible world of the microbes, which, according to Dr. Paul De Kruif "occupies that hazy borderland between life and lifelessness".

Roger J. Avery, S. Gordon Campbell, James H. Gillespie, George C. Poppensiek

Earl Louis Brunett

December 12, 1898 — May 14, 1943

After an illness of more than a year, Dr. E. L. Brunett, Associate Professor of Poultry Diseases in the New York State Veterinary College, died at his home on the afternoon of Friday, May 14, 1943. Until a few days before his death he performed his duties at the office and laboratory with the same good cheer that had always characterized him despite the fact that illness enforced a considerable slowing down of his normal tempo of living and working. He is survived by his wife, the former Loretta K. Hirsch, his father, and two brothers.

Dr. Brunett was born on December 12, 1898, at Utica, New York. He first came to Cornell in the fall of 1918 and for a few months was enrolled in the Student Army Training Corps. He supported himself while an undergraduate by serving as student assistant in the Department of Pathology and Bacteriology. He joined the staff of the College upon receiving the degree Doctor of Veterinary Medicine in 1923. Completion of graduate study earned him the Master of Science from Cornell in 1927. He was promoted to the rank of Assistant Professor in 1927 and became an Associate Professor in 1940. In the summer of 1930 he was the official delegate of the College at the International Veterinary Congress held in London.

Dr. Brunett was one of the first veterinarians in the State to devote himself entirely to the study of diseases of poultry. When, in 1925, he was chosen by the late Dean Moore to head the poultry disease laboratory, a tremendous task in adult education lay ahead. Poultrymen had to be taught methods of disease prevention and control, and veterinarians had to be apprised of their obligations to a small but rapidly growing industry. That progress has since been made is due in no small part to the skill, enthusiasm, good nature, and sense of humor of Dr. Brunett. He quickly established himself as one of the leading poultry pathologists in the country. When fowl plague, an extremely devastating virus disease, made its appearance in the United States in 1924, Dr. Brunett was the first to make the diagnosis and set the machinery in motion for its eradication. He played an important part in establishing a program of pullorum disease control in New York when that disease was taking a tremendous toll of chicks. He initiated an effective fowl-pox control program by the immunization of birds with vaccine which was produced in his laboratory. His wide experience with that disease was recognized when he was invited to write the section on fowl-pox for a recently published book to which thirty-three well known investigators contributed. His application of the system of raising poultry, known as "confinement rearing," was responsible for the survival of many poultry enterprises which were on the verge of failure because of the existence of parasitic disease in the flocks.

Dr. Brunett was popular with the poultrymen who admired him not only for his professional skill but also as a man. The veterinary profession never had a more staunch supporter. His efforts to interest and train students and practitioners in avian diseases were persistent and successful. Charlatanism and quackery both in and out of the profession received short shrift from him and his views were expressed in unequivocal terms. This characteristic may have antagonized some people who misunderstood his sincerity and singleness of purpose.

Dr. Brunett's other activities and affiliations were many and varied. He served as business manager for the *Cornell Veterinarian* for six years. He was a member of the American Veterinary Medical Association, New York State Veterinary Medical Society, Southern Tier Veterinary Medical Association, Poultry Science Association, Laboratory Workers in Pullorum Disease Control, Society of American Bacteriologists, Phi Zeta, Sigma Xi, Phi Kappa Phi, and Omega Tau Sigma.

In his limited life span, Dr. Brunett has left a lasting influence on the poultry industry and his passing will be keenly felt. The death of "Beno," as he was affectionately known to his colleagues and friends, has removed an unselfish, ebullient personality from the scene of which he was an irreplaceable part.

Max Edwin Brunk

September 12, 1914 — April 8, 1999

Max E. Brunk, Professor Emeritus of Marketing, died at his retirement home at Kendal at Ithaca, New York at age 84. He was born in Roswell, New Mexico but spent much of his youth in the State of Florida. He attended Clemson College (1934-35) and then transferred to the University of Florida where he received his B.S. degree in 1938 from the College of Agriculture. He worked for a year as a statistician for the Federal Land Bank of Columbia, South Carolina before entering Graduate School at Cornell University where he received his M.S. degree, majoring in Agricultural Economics, in February 1941.

Brunk returned to the University of Florida in 1941, as an Assistant Agricultural Economist to work in their agricultural research and extension programs. He was promoted to Associate Agricultural Economist in 1944, and published five experiment station bulletins, emphasizing methods of improving efficiency in the use of labor and materials in the production of marketing of crops. In 1945, he returned to Cornell University, where he completed his Doctorate in Agricultural Economics in 1947.

He was immediately appointed Associate Professor of Marketing with tenure at Cornell after completing his degree, recognizing his faculty experience and the quality of his research at the University of Florida. He was promoted to Professor in 1951 and continued as a productive and provocative member of the Cornell Faculty until his retirement in 1982, after 35 years of service in teaching, research, and extension.

One stream of Brunk's early research centered on work simplification in harvesting and marketing perishable crops. In Florida, he worked with a team to reduce labor in the harvest and marketing of celery, combining many of the necessary procedures in the field, and bypassing the packing shed, a forerunner of the mechanized harvest procedures we take for granted today. He established a time and motion laboratory looking for ways to save both time and materials in marketing perishables, from roses to fresh market apples. This work received almost immediate application by producers and handlers and national acclaim by industry leaders. He received the first of many national awards, the Charles W. Hauck Award, for his contributions to produce packaging between 1950-53.

Simultaneously Brunk was pioneering research on the use of experimental methods in merchandising perishable products in supermarkets with his colleague in Biometrics, Professor Walter Federer. He saw the possibilities of using polyethylene bags to prepackage fresh fruits and vegetables and the cost savings this would allow throughout the whole marketing process. His students tested these ideas with increasingly complex Latin Square designs in

stores to observe what consumers did, not what they said they would like. The experimental designs were novel and the success of these early merchandising studies were striking. In the stores where they were run, it was sometimes difficult to keep the managers from interfering with the experiments in their haste to adopt the new merchandising methods, which were working so effectively in selling produce. Industry response was prompt and widespread. Brunk received the National Apple Institute Award in 1954 for his outstanding service to the apple industry. He was likewise cited in 1954 by the Foundation for Floriculture for the most significant research in floriculture in that year.

These early successes in merchandising perishables led to an expanded research program and a substantial flow of speeches through the country to producer groups, handlers, packers, and the supermarket industry. He and his students worked on marketing problems and merchandising opportunities with fruit, vegetables, milk, meat, and a range of horticultural products. Periodically he served as a consultant to the United States Department of Agriculture, the Society of American Florists, the National Apple Institute, the American Meat Institute, the National Broiler Council and the Netherlands Bulb Institute.

Max was a wonderful graduate teacher. He had a fertile mind, with lots of ideas, and suggestions for thesis topics, but his students soon learned they had to develop and build their own research designs. He believed in the Cornell tradition of “freedom and responsibility” and let students learn from their own mistakes, then providing encouragement, suggestions and support at crucial points along the way. Writing a thesis with Brunk was a memorable experience for the 52 Master’s students and 35 Ph.D. students for whom he served as chairman in 35 years; most of whom improved their skills in written expressions as well as learning much more about applied economics, statistics, and experimental design along the way.

Brunk is co-author with Dr. L.B. Darrah of the widely used textbook, *Marketing Agricultural Products*. He is also co-author of a technical manual, *Time and Skill Requirements*, which summarized his early work on time and motion study. Much of his research was co-authored with his students in experiment station bulletins, journal articles, departmental reports, and trade publications. His speeches were often reproduced because of popular demand from producers and professionals working with perishable products. A small book, *Brunk at AMI*, was issued by the American Meat Institute containing ten speeches presented at their national conferences.

One gets a sense of his impact outside the university from the honors and awards he received throughout his productive career. His national and international honors included those provided by the National Apple

Institute, the Foundation for Floriculture, the American Farm Bureau, the Livestock Merchandising Institute, the International Apple Institute, the Netherlands Bulb Institute, the National Broiler Council, the Agricultural Institute of Canada, the American Meat Institute, and the New York State Agricultural Society. People came to national meetings to hear what Brunk had to say and greatly appreciated his ideas and wise counsel.

Max left indelible impressions on students, faculty colleagues, and the producers and industry people with whom he worked. He was full of ideas, had creative suggestions, and was a born optimist. He was a hard-driving individual with a wonderful sense of humor. He enjoyed playing practical jokes and expected to receive his share in return. Life in Warren Hall was always lively when Max was in the building. He had a “cabin” in the hills near Berkshire where he wrote and relaxed. For many years, he hosted an annual departmental picnic there in late August or September to welcome new graduate students to the department and to provide a send-off for the new academic year. As many as 200 would attend the chicken barbecue, swimming in the pond, playing softball and volleyball in the fields, and relaxing with a bonfire in the evening. It provided a sense of community for faculty, students and staff that all of us enjoyed and appreciated. The Brunk family cared and shared generously with their colleagues.

Max also conducted his non-professional life with great intensity. He was an avid gardener and kept the grounds around his home landscaped and manicured. His vegetable garden was usually weed-free and the Brunks were generous in sharing their raspberries, asparagus, melons and squash. Not surprisingly, roses were near and dear to him and he grew all the different types: miniatures, floribundas, teas, and grandifloras. If there was a new variety, Max was likely to be testing it in his garden and then sharing the blooms with friends and neighbors.

One of Max’s enduring hobbies was cutting and polishing gemstones. He obtained a professional set of equipment and over time, a wide set of materials on which to work. On his first speaking trip to Australia, he brought home basic minerals from their opal mines. From these wonderful materials, he fashioned rings and pendants which became some of his wife’s favorite jewelry, and which provided memorable gifts to family and friends.

Max and Letta were also collectors of ornamental glass. Any visitor to their home enjoyed the tasteful displays of period pieces from the time of Tiffany and the art glass of the late nineteenth and early twentieth centuries. Their home was regularly open to their students and colleagues. They were enthusiastic and generous hosts; conversation was always lively; guests were quickly put at ease. When a “night blooming cereus,” that the Brunks had carefully tended in their bedroom, finally decided to display its huge bloom, there was a spontaneous party to watch the long-awaited event. Such was the open and generous way in which the Brunks shared their life and hobbies.

Fortuitously, in the summer before Brunk's death, a group of Max's former Ph.D. students from the late 1960s and early 1970s, gathered at the Cornell Plantations for a small picnic to honor the Brunks. They came from England, Ireland, Washington, Texas, Pennsylvania, and New York to see each other and enjoy the company of their old mentor and the campus they had come to love. It was a lovely afternoon on the Comstock Knoll, a memorable day everyone enjoyed. Love, honor and respect along with lots of laughter were the orders of the day.

Max is survived by his wife, Letta Olga Reck; two daughters, Norma Marie Sullivan, of Shawnee, Kansas and Kathryn Sue Brennan, of Berkshire, New York; five grandchildren; and four great grandchildren. Mrs. Brunk continues to live at their home in Kendal at Ithaca.

Gene German, Robert Story, Bernard Stanton

Alexander Brunschwig

September 11, 1901 — August 7, 1969

Doctor Alexander Brunschwig was born in El Paso, Texas, on September 11, 1901. After attaining his Bachelor of Science and Master of Science degrees at the University of Chicago, he entered Rush Medical College where his superb intellect and gigantic capacity for work resulted in his immediate recognition as an outstanding student. During his student days at Rush, he helped Maximow and Bloom write their well-known histology text. He often reminisced about having spent some of the happiest and most fulfilling days of his life at medical school.

He learned every facet of his chosen profession. Sharing his knowledge with the doctors of the world, he taught, lectured, operated and, in the end, established a new chapter in American surgery.

He contributed more than four hundred articles to American and foreign journals. He was the author of four textbooks and he contributed chapters to two score more. His monumental work on *The Surgery of Pancreatic Tumors*, published in 1942, was inspired by the untimely death from pancreatic cancer of his own much admired father.

He was the first to do a one-stage radical pancreatoduodenectomy and the operation for which he is world renowned, the Brunschwig pelvic exenteration, is part of the armamentarium of almost every surgical service in the world.

Medical history will best judge Doctor Brunschwig's contributions when time has allowed their significance to be evaluated and it will judge him well for the stimulation he provided, for the controversy that he stirred, and the contributions that he made. Indirectly by challenges, he stimulated the radiation therapists to reevaluate their own work and to improve their techniques; the physiologists were presented with a whole new set of problems to solve that required a dedicated effort on their part. In essence, Doctor Brunschwig got gynecology moving again in the therapy of cancer.

He became a leader in medicine at a very young age. His chiefship was not the crown to be worn in the twilight of life but rather it was the legacy of a man whose future was longer than his past. He was Memorial Hospital's glory in a special way, for he somehow managed to personify what is magnificent in the hospital, and what is most appealing, with courage, doggedness, loyalty and strength. He made everyone proud of the hospital and proud of themselves.

His family and home life always occupied the dearest spot in his heart. It grieved him that the immense responsibilities of his position made demands on his time that deprived him of precious moments that he would like to have spent with his family. He often spoke with affection of his children, Louise Suzanne and Roxanne Josephine, known to her family as Josette. Their marriages, happiness and successes pleased him and he looked upon his two sons-in-law, Paul and Bruno, as the sons he never had. His heart leapt up when he saw his grandchildren, Louise, Nicholi and Mark, careening through life as if there was no tomorrow and his joy lit up the hearts of all the family during these never-to-be-forgotten moments. During these times he was not the world's greatest surgeon but rather the world's proudest grandfather. After Louise Suzanne and Josette left home to start their families, Doctor Brunschwig and his wife, Leah, for whom he had an abiding love, were drawn more closely together. Warmly and deeply he loved his wife Leah who served him so well. One could not see him for a minute with his wife and children and not realize the bond of friendship, understanding and love that existed among them.

Doctor Brunschwig had a deep religious sense. He was a mystic and mystics have faith above reason. He shared this gift with his family and guided them to an understanding and respect of religion.

With it all, he had time to be a student of the arts, literature, music, sculpture and the humanities. He was one of the most cultured and scholarly men of our times. Each generation has its stars that shine in every field of human endeavor and, in medicine, we the students of Doctor Brunschwig believe he was one of our blazing stars of this era. The medical profession and his fellowman, for whom he had such compassion, are better for his having shared part of his life with us.

For such a long time during the glory years of Memorial Hospital, Doctor Brunschwig was so much a part of the hospital that he became known as Mister Memorial and like a beautiful song in the end Memorial Hospital was part of him.

His friends, colleagues and fellowmen regret and mourn his death on August 7, 1969.

Hugh R. K. Barber, M.D.

Nelson Howard Bryant

September 19, 1917 — December 22, 1994

Nelson Howard Bryant was born in Greene, New York, on September 19, 1917. After obtaining the E.E. degree from Cornell in June 1939, Nelson joined the Westinghouse Lamp Division in Bloomfield, New Jersey, where he developed systems that led to patents on methods of carbonizing thoriated tungsten filaments and devised ferro-resonant circuits for starting fluorescent lamps. In 1944, he became a U.S. Naval Reserve Electronics Officer, attended radar schools at Bowdoin College and Massachusetts Institute of Technology, and supervised the installation and repair of radar and loran equipment at the Brooklyn Navy Yard and other bases until September 1946, when he returned to Cornell as a graduate student and Instructor in the School of Electrical Engineering. He received the M.E.E. degree in June 1949, was appointed an Assistant Professor in July of that year, became an Associate Professor in 1953, and attained full professorial rank in 1973. Nelson retired as Professor Emeritus in 1985, but he continued as a part-time Instructor designing laboratory experiments and demonstrations for use in the teaching laboratories until the spring term of 1994. During his overall 48-year academic career, Nelson mastered many of the complex electrical engineering technologies that evolved over the years and formed them into a vital part of his classroom activities.

Consistent with his early interest in the design of electronic circuits and systems—an interest that he maintained throughout his professional career—Nelson’s graduate research was concerned with the design, development, construction, and testing of a novel controlled-mercury-arc-rectifier tube that had potential for use as a high-power amplifier. Since the operating principle was based on the characteristics of the mercury-vapor plasma within the tube, Nelson was a very early investigator at Cornell in the field of plasma studies that is now an important area of research in the EE School. As a graduate student, and for several years after his appointment as an Assistant Professor, Nelson taught in the electrical engineering “service courses,” also known as “Electrical Engineering for Non-Electrical Engineers,” where he was responsible for the electronic segments of those courses. This work resulted in a collaboration with Professor William H. Erickson and the publication in 1952 of the first edition of their popular text, *Electrical Engineering, Theory and Practice*. A second edition was published in 1959, followed by a paperback edition in 1975.

During his academic career Nelson initiated and taught many courses and directed graduate study in electronic-circuit design, digital-electronic circuits, and control systems. In the early 1970s, students in the EE School were

expressing great concern about the absence of electronic-design courses in the EE curriculum. Nelson corrected this deficiency by developing two new lecture/laboratory courses in electronic-circuit design that became known for their scholarly rigor and relevance to engineering practice. These two courses were among the most popular in the EE curriculum for many years, formed the basis for the eventual complete overhaul of the EE undergraduate laboratories, and represent one of Nelson's major contributions to the School. In addition to his concern with undergraduate education in the classroom, he was a perennial undergraduate class adviser and a member of the Division of Basic Studies Academic Standards Committee. He was elected to serve three separate terms on the respected EE Faculty Committee and also served on many university committees. Nelson was a mainstay in the Master of Engineering Program, directed a multitude of M.Eng. (Elec.) design projects, and served on the Master of Engineering Committee in the College of Engineering, where he was a key contributor to the development of the Program and its required M.Eng. design project. As a favorite professor among his students, he was runner-up in the 1973 Tau Beta Pi Engineering Honor Society "Excellence In Teaching Award" was one of the top ten contenders for the same award in 1976, and received the IEEE School of Electrical Engineering "Excellence in Teaching Award" in 1978 and again in 1982.

Nelson took his first sabbatical leave in 1955-56 at Stanford University where he studied radio-wave scattering phenomena from a turbulent atmosphere. Upon his return to the campus he became interested in the design and development of electronic instrumentation for the measurement of biological phenomena, thereby becoming one of the first Cornell faculty members to work in the field of bioengineering. In 1962-63 Nelson took another sabbatical at the University of Pennsylvania Johnson Foundation for Medical Research. Through 1967 he continued to work in bioengineering and directed a number of master's theses and senior projects with special emphases on blood-chemistry instrumentation applied to automated differentiation of white-corpuscle types and the control of oxygen content in the blood. In later years, as a consultant to Powers Manufacturing Company in Elmira, New York, his knowledge of solid-state microprocessors and electronic-control methods enabled him to transform previously limited purely mechanical techniques into a modern system for automatic quality control in the manufacture of bottles. The variety of problems he encountered in this work significantly influenced the design of the laboratory classwork for his students in the EE School.

Nelson was a member of the American Institute of Electrical Engineers and served as Chairman of the Ithaca Section in 1956-57. When that organization became the Institute of Electrical and Electronic Engineers (IEEE) he continued his membership and was named a Life Member of IEEE in 1983. He was elected to the engineering honor

societies Tau Beta Pi and Eta Kappa Nu and was a member of the American Association for the Advancement of Science and the American Association of University Professors.

Nelson measured his accomplishments by the long-term success of his students, particularly those whom he inspired to pursue careers in bioengineering. He was uniquely able to recognize creative and unusual students and encouraged them to acquire the kind of deep fundamental understanding that contributes to a sense of accomplishment—even a sense of competence and power. Nelson became the mentor of several of these students and formed long-term friendships with them. He was technically thorough, imaginative, possessed an analytical mind, and had a remarkable ability to visualize the physical behavior of electronic circuits. His mastery of first principles made him a valued resource to colleagues and students. Highly regarded by everyone who knew him, Nelson was warmly admired for his personal attributes of complete integrity, honesty, patience, and good-humored generosity of time and effort.

In addition to his academic interests, Nelson was a naturalist, particularly of plant life and birds, and an enthusiastic gardener. Hiking was a favorite pastime, and he often went on camping trips in the Rocky Mountains and the Adirondacks with friends and colleagues. He was an accomplished musician, and he played the trumpet with the Cornell University Orchestra and the Ithaca Concert Band for many years. As an early-jazz aficionado, he derived considerable pleasure from introducing present-day “rock-and-rollers” to the delights of Dixieland and noting their immediate reaction and declaration that “this is the right stuff” In addition, EE School members who used to bowl in the old Franklin Hall League recall that Nelson achieved the top all-time average in that energetic group.

Nelson and Tommie Thomson were married on June 19, 1943 in New York City. The majority of their 51 years together was spent in Ithaca. Nelson is survived by his wife, who lives in Ithaca; a son, Bruce and his wife Linda, and two grandchildren of Elkins Park, Pennsylvania; a daughter, Jane of Boulder, Colorado; a brother, Robert of New Smyrna Beach, Florida; a brother, Stanley of Clover, South Carolina; a brother, Lincoln of Greene, New York; a sister, Madeleine Lewis of Ithaca, New York; and a sister, Ruth Rubright of Wernersville, Pennsylvania.

Nelson Bryant will be long remembered as a dedicated teacher and adviser, an outstanding engineer, a highly respected colleague, and a true friend.

William H. Erickson, H.C. Torng, Norman M. Vrana, Simpson Linke

Harry Oliver Buckman

July 4, 1883 — December 7, 1964

Harry Buckman was born on a farm at West Liberty, Iowa, where he very early gained the farmers' viewpoint which helped make him effective in later work on soil surveys, soil and crop management surveys, in preparing the resulting publications, and in the classroom. His formal education began in a one-room country school and terminated with postdoctoral studies in geology and climatology at Harvard University. Mr. Buckman earned a Bachelor of Science degree at Iowa State University (Ames) in 1906, and a Master of Science degree at the same institution in 1908. The Ph.D. in Soil Science was awarded him by Cornell University in 1912. At that time he was appointed a Cornell Assistant Professor of Soil Technology. He was awarded a full professorship five years later.

Dr. Buckman was an avid reader of English and American literature, history, geology, and theology. He could be depended upon to contribute something worthwhile to conversations on many topics. His knowledge of geology made him a most delightful traveling companion for he could improve most anyone's understanding of land forms in almost any area of New York State.

Professor Buckman's first part-time professional employment was as assistant chemist in the Iowa Experiment Station in 1906 and 1907. His first full-time appointment was as assistant agronomist in the Montana Agricultural Experiment Station in 1908. In 1910, because of his interest in students and in pedagogical mechanics, he was chosen to serve as teaching assistant in the elementary course in soil science at Cornell. Beginning in 1912 he was given full responsibility for that course which was to become the major activity of his professional career.

He taught with outstanding success a total of over 10,000 students in five separate courses. Ever the perfectionist, he devoted evenings when others were relaxing, to further refining the technical and communicational details of his classroom presentations. Noteworthy features of his remarkable lectures were the unique lead-off one or two-minute review of the highlights of his previous lecture leading into the current one; his use of chalk which reminded one of a penmanship copybook; his practiced blackboard sketches; his clear, concise, and yet uncompromising explanations of technical subject matter; his very helpful blackboard outlines; and his liberal use of slides with a difficult carbon-arc projector in a period before such use became widespread.

How well he succeeded in the classroom is evidenced by the fact that, although this was the beginning course in soil science for undergraduates, some semesters there were as many as a dozen graduate students enrolled to observe this master teacher. Staff members from all parts of the campus sought the privilege of editing his lectures.

Surely no one can estimate how much he contributed by example and inspiration to the improvement of college teaching all over the world.

Dr. Buckman's unselfish concern for students did not stop at the classroom door. He was a most effective student adviser. Since Professor and Mrs. Buckman had no children, it seemed to follow that he took a paternal interest in his advisees who brought to him not only academic, but all kinds of problems. He was ever in demand as a speaker at student functions. Especially well deserved was the student Professor of Merit award conferred upon him in 1948-49.

Most outstanding of his writings were textbooks, the first of which was *Soils, Their Properties and Management* published in 1915. He was coauthor with Lyon and Fippin. In 1922 a new book, *The Nature and Properties of Soils*, was written by Lyon and Buckman. A second edition appeared in 1929 and a third in 1937. Most of the latter and all of the 1943 revision were written by Dr. Buckman. The fifth edition in 1952 brought into the authorship Dr. N. C. Brady, who also wrote all of the 1960 edition. This book is read by agriculturalists all over the world and widely used for instruction in universities throughout the United States and Canada. It has been translated into Spanish, Chinese, and Japanese.

Professor Buckman was affiliated with various professional and honorary organizations, among which are the American Society of Agronomy, the American Association for the Advancement of Science, the International Soil Science Society, Sigma Xi, Phi Kappa Phi, Alpha Zeta, and Gamma Alpha.

As a faculty member, Dr. Buckman cheerfully shouldered the duties of numerous committees, always contributing with characteristic thoroughness and sound judgment. During those periods when he was called upon to serve as acting head of the Department of Agronomy, he proved to be a good administrator. Especially popular was his willingness to "hear each staff member to the end" with understanding and patience.

Probably unequaled was his record of never missing a lecture, recitation, or laboratory session during his entire thirty-nine years of teaching. How much sheer courage and sense of duty this required was probably understood only by his loyal and devoted wife, Rita Shannon Buckman. It seems ironic that within four months after the date of his retirement in 1949, Professor Emeritus Buckman came under the close care of his physician, so to remain during all of the last fifteen years of his life.

Nyle C. Brady, Richard Bradfield, Herbert B. Hartwig

Joseph B. Bugliari

June 7, 1932 — October 20, 2002

When Joe Bugliari retired after five years as Dean of the Faculty in June 1988, he received a number of well-deserved tributes from faculty and university administrators for his substantive and important service to the university. Provost Bob Barker commented:

“The very fact that he started the practice of speaking regularly to the trustees is a measure of Joe’s effectiveness in representing faculty interests and concerns. In general, he’s been infinitely patient, and very effective, in his role as principal consultant to the administration on faculty matters.”

Joe had made a tremendous difference in the life of the university community as teacher, advisor, listener, and confidant of those in need of wise counsel. His integrity was legion and we were all blessed by his more than 30 years service to the campus community.

Joe grew up in Plainfield, New Jersey and graduated from the Pingry School in Elizabeth, New Jersey. He graduated “With Honors” from Hamilton College in 1953, majoring in History and Education, and played with distinction on their golf team. He served for two years in the U.S. Army and finished as a Sergeant and as a member of the Signal Corps golf team. He received his L.L.B. degree “With Distinction” from the Cornell Law School in 1959. He was a member of the Board of Editors and then Managing Editor of the *Cornell Law Quarterly*. The members of his senior class chose him as one of two to be designated Fraser Scholars and elected him to the Order of the Coif.

With his distinguished record in law school behind him, he started work in New York City for a major law firm, Royal, Koegel & Rogers. His practice focused on corporate law, trusts and estates, and litigation. After two valuable years of experience there, he moved to Elmira, New York to serve as a Confidential Law Assistant to Associate Justice Walter B. Reynolds of the Appellate Division of the New York Supreme Court. From this location in 1961, he agreed to teach, on a part-time basis, a course in Business Law for students in the Graduate School of Business and Public Administration at Cornell University. His course received excellent reviews for content and presentation.

In 1967, the College of Agriculture and the Graduate School of Business and Public Administration worked out an arrangement by which they jointly employed Bugliari as an Associate Professor without tenure. This allowed him to teach full-time at Cornell, thereby meeting the needs of both undergraduates and MBA students for courses in business and communication law. Bugliari continued to work on a limited, part-time basis for Justice Reynolds.

This arrangement provided both Joe and his students with a window on the nature of the cases being argued in the court, and the processes by which laws were interpreted and further defined by these cases.

Joe was a wonderful teacher. His enthusiasm for the law and his interest in the well being of students was readily apparent. He agreed to advise undergraduate students interested in agricultural business and was housed for the rest of his university career in Warren Hall. He created a new course in Communication Law at the request of faculty in Communications. He taught two courses in Business Law and one in Estate Planning. In the spring of 1971, the students in the College of Agriculture elected him as their Professor of Merit, an honor accorded to only one professor annually, a reflection of the impact he quickly made in the undergraduate community. For over 20 years, he served as a member of the Board of Directors for the Cornell Daily Sun.

In the spring of 1969, Bugliari was a relatively new face on the Cornell faculty. He continued to teach his classes that spring throughout that period of campus unrest. He was a voice of calm within both Warren and Malott Halls. In the relative quiet that prevailed at the start of the fall semester in 1969, President Dale Corson announced that Joseph B. Bugliari would serve as the university's first Judicial Administrator. This new office was located in Olin Hall and charged with enforcing the University's Regulations for the Maintenance of Public Order adopted by the Board of Trustees in July 1969. In addition, this office was designated by the University Faculty to serve as the administrator of the Student Code. From the beginning, the independence of the Office of the Judicial Administrator from any other administrative body was established to assure autonomy in its actions.

One of the most noteworthy accomplishments of the newly established Office of Judicial Administrator was the lack of news or public debate that arose from actions taken by this office. It is a tribute to Bugliari and his deputy Judicial Administrator, Harry Kisker, that the office was quickly established and functioned smoothly. It provided counsel to those needing help, investigative service to gain credible information when necessary, and absolute integrity in keeping confidences. The wisdom of creating the Office of Judicial Administrator, taken in 1969 by President Corson and the Board, is reflected in the continuance of this office and its quiet, but important role in the university community more than 30 years later. The strong leadership of Bugliari in its early years established the pattern and respect for its administrators that remains its hallmark today.

Bugliari was made Associate Professor with tenure in 1970 and full Professor in July 1973. All through the period he served as Judicial Administrator, he continued to teach his classes in Business Law and work with faculty colleagues in teaching Estate Planning and Tax Management directly to practitioners at regional locations across the state, as his contribution to Cooperative Extension. In 1976, he received the SUNY Chancellor's Award for

Excellence in Teaching. In July 1977, he served as Director of Legal Services for the university for two years. In 1982, the New York Bar Association established a new committee of their Substantive Law Division on Agricultural Law with Bugliari as its first chairman. In 1983, he was elected Dean of the Faculty for a three-year term and then reelected for another two years in 1986. Throughout all the years of his service to the university, Joe continued to teach his classes and advise students. None of his many assignments kept him out of the classroom for long.

Golf was an important part of Joe Bugliari's life. He excelled as a competitor from his high school days forward and represented his college, the Signal Corps, and the Elmira and Ithaca Country Clubs on teams with great success. He was fun to play with and a fine teacher on the course as well. He was happy to join his faculty colleagues for the fellowship, not the competition. He always competed against the course but relished his matches with equally skilled players. He had a handicap of 2 at the Elmira Country Club and was inducted into the Elmira Sports Hall of Fame in 1985 for his achievements on and off the golf course. One of the highlights in Joe's golf career was nearly qualifying to play at the U.S. Open. Unfortunately, he was defeated in a qualifier at the Oak Hill Country Club on the fourth, sudden-death playoff hole. He was still playing golf at the Ithaca Country Club into the twenty-first century prior to his death.

Joe retired from Cornell in 1992. He and his wife moved to North Carolina for a period, but returned to Ithaca for their last years. His wife, Jeanne, predeceased him in May 2002. Their son and daughter-in-law, Jeff and Donna Turco Bugliari and their children, Bridget and Nicholas of Dryden, New York, and their daughter and son-in-law, Linda and Dana Philbrook and their daughters, Alison and Lauren of Hopkinton, Massachusetts, survive them. Joe's brother and sister-in-law, Miller and Elizabeth Bugliari of New Jersey, and their children also survive him. Joe's students will always remember him as a fine teacher who taught them a great respect for the law and our system of justice. He set an example during his years on the faculty for fairness, objectivity in judgments, and integrity. His colleagues and his students remember him with fondness and benefited greatly from his years on the Cornell campus.

Olan D. Forker, Dale A. Grossman, Bernard F. Stanton

Christopher Bull

October 14, 1921 — March 17, 2002

Christopher Bull, Professor of Clinical Medicine, died in Ithaca in the retirement community at Longview, where he had resided for the past several years following the death of his beloved wife, Kittie.

Chris was born and grew up in Ithaca, where his father was a practicing physician for many years. He attended Ithaca High School and went on to attend Cornell University in the class of 1944. After three years on the Ithaca campus, he entered the Medical College in New York and was graduated with his M.D. degree in 1947. He then took a year's internship at the Genesee Hospital in Rochester, following which he pursued residencies in psychiatry at the Pilgrim State Hospital on Long Island and at the University of Kansas Medical Center.

At this point in 1952, Chris entered the Medical Corps of the U.S. Army to complete his obligated service and served as a Staff Psychiatrist at the Osaka Army Hospital for one year. He was then assigned as Division Psychiatrist for the 45th Infantry Division in Korea, during which he was awarded the Bronze Star Medal. He then returned to take another year's training at the West Haven VA Hospital, affiliated with Yale Medical School.

For the next ten years, Chris held positions in teaching and research hospitals successively in Hawaii and Illinois. From 1964-66, he was a full time salaried Staff Psychiatrist at the Butler Hospital in Providence, Rhode Island. During this period, he published several research studies, principally related to biochemical correlates of behavior in schizophrenic patients.

Dr. Bull then joined the psychiatric staff of the University Health Services at Gannett Health Center, where he remained as Principal Psychiatrist until his retirement in 1986. As one colleague stated:

"Dr. Bull was a very gentle, kind-hearted man who was widely appreciated for his deep caring for Cornell students. ...this obvious caring and active interest made a powerful positive impression on students who initially arrived at the Clinic feeling frightened, sad, anxious, or alone."

Dr. Bull had a multitude of interests. One of particular pertinence was his collection of tropical fish, for which he maintained, at his own expense, an extensive and variegated aquarium that seemed to fill his waiting room. Although he no doubt enjoyed the display, its real purpose was to entrance the student patients and perhaps to provide a soothing setting for the distraught ones. It was characteristic that he left the aquatic display to the clinic when he retired, yet continued to return on a regular basis to maintain it.

Chris' interest in painting developed after his retirement to Longview. Many of his oils are displayed in the halls there, depicting scenes from his extensive travels to the Indies and to Tasmania.

Chris Bull was a thoughtful, accomplished, gentle man who was professionally and personally at the top of his class.

Joann Basgall, George Miller, Allyn Ley

Helen Dudley Bull

October 3, 1886 — January 14, 1978

Helen Dudley Bull is remembered in both the local and the academic community as a gifted pediatrician, teacher, writer, counselor, and friend. Her gentle serenity, quiet sense of humor, readiness to be helpful, and insight into both adult and childhood needs endeared her to many. She was a member of the Department of Family Life in the New York State College of Home Economics from July 1, 1926, until June 30, 1949, except for a brief period after the birth of her sixth child in 1928.

Dr. Helen, as her friends called her, was a member of a gifted family of five girls and two boys. An older sister studied bookbinding in the United States and France. Examples of her work are on exhibit in the J. Pierpont Morgan Library in New York City. Another sister became a deaconess in the Episcopal church, working in the Virginia mountains. One of her brothers became an architect, settling in Argentina.

Dr. Helen herself was sure by the time she graduated from Packer Collegiate Institute that she wanted to study medicine. From 1907 to 1911 she attended Cornell University Medical College, being elected to the top honorary society, Alpha Omega Alpha, in her junior year and graduating first in her class. She interned at Worcester Memorial Hospital in Worcester, Massachusetts.

In 1914 she was married to Harry Clifford Bull, M.D., also a graduate of Cornell University Medical School. They established themselves in Ithaca as general practitioners with special interest in pediatrics. Many will remember Dr. Harry not only as a fine doctor but also as a gifted musician and composer.

During World War I he served with the Red Cross in Europe while Dr. Helen carried on their combined practice in Ithaca and cared for the first two of their six children.

Dr. Helen Bull was appointed acting professor of child hygiene in the College of Home Economics on July 1, 1926, to take over the work of Dr. Helen Zillmer, who had been on loan to the college for a year from the New York State Department of Health. She was elected professor of child hygiene September 24, 1931. She became pediatrician for the nursery school and for the babies who lived in the Home Management Apartments.

In 1938 Professor Lemo Rockwood initiated a course in marriage that was attended by men and women from a number of colleges on the campus. Dr. Bull taught the section of the course dealing with sex, reproduction, and childbirth. Mrs. Rockwood said of her participation in the course, "Her approach was that of the clinical teacher,

but her language was non- technical. She was relaxed and comfortable with her subject matter. The students respected her as a medical authority and appreciated her success as a wife and mother.”

Dr. Russell Smart, a colleague in the Department of Child Development and Family Relationships, wrote of her, “She saw health as a positive aspect of living, but she also recognized that families had to cope with more than medical and physical components. She also served as consultant with the students in the college, and acted as liaison with University Health Services.”

Dr. Mollie Smart, also a member of the department, wrote, “I have fond memories of Dr. Helen. First, she was a dear friend. Our whole family loved to go to the Bulls’ house and to their cottage on the lake. When the children went with us, Dr. Helen always did something to make it special. She would give each a tiny toy, or show them the new kittens, or tell them a story.

“As pediatrician in the nursery school Dr. Helen counseled us on our children’s health, both physical and mental. Not only did she have helpful ideas about how to cope with problems of growing up, but she made me feel confident and comfortable about myself as a parent.

“Dr. Helen and I were coauthors of *Living with Baby*, a Cornell Homemakers’ Bulletin, in 1947. We had many interesting and happy times talking about what was to go into the bulletin, she teaching me.

“Rus and I went to see Dr. Helen a few years ago in Keeseville, where she lived after her retirement from Cornell. She was about to give up her house and live in retirement apartments in Saratoga. We were amazed and pleased at how little she had changed in more than twenty years. She was just as full of life and love as she had been during those happy years in Ithaca.”

A Cornell extension bulletin that also came from Dr. Helen’s pen, *The Adolescent: Physical Development*, was reprinted in 1950. She conducted a number of research studies, among them “The Incidence and Treatment of Pin Worms in Nursery School Children.” With Professor Ethel Waring and George H. Mauhan, she conducted research on the “Effect of Ultra-violet Irradiation on a Group of Preschool Children,” published in June 1937.

Dr. Helen was a member of the American Medical Association and of the Tompkins County Medical Association. She served for many years on the Ithaca School Board.

She and her husband retired in 1950 to live in Keeseville, New York, Dr. Harry’s birthplace. Here she was active in the American Association of University Women and the North Country Women’s Club. Best of all, there was time

to share with her husband their many interests and friendships and to enjoy visits to and from many of their fifteen grandchildren. After his death on June 9, 1958, she lived for several years in Saratoga Springs at the retirement center. Her last year was spent at the Pine Rest Nursing Home in Paramus, New Jersey, near two of her daughters.

All of her six children attended Cornell. One, Dr. Christopher Bull, is currently professor of clinical medicine at Cornell and a psychiatrist at the Gannett Medical Clinic. Another son, Gifford, formerly flight engineer and test pilot for Calspan, is professor of aerospace and aerophysics at Mississippi State University. A daughter, Alice, follows her father's love of music. Living in Anchorage, Alaska, she teaches music and composes children's ballets, songs, and chamber music.

Dr. Helen died at the age of ninety-one in her sleep. Her daughter Helen wrote, "Up to her death she was clear of mind and in good spirits." It was a fitting close to her serene life.

Mary Ford, Lemo D. Rockwood, Esther H. Stocks

Elizabeth Loring Keyes Burckmyer

December 8, 1900 — January 30, 1985

Elizabeth Loring Keyes Burckmyer was born in San Diego, California, and spent her childhood on a small ranch in Claremont, California. After graduation from Pomona College in 1922 with a Bachelor of Arts degree, she secured an assistantship at Cornell. She received the Master of Science degree in 1924. From 1924 to 1925 she taught biology at West Virginia Wesleyan College. She was a member of Sigma Xi, Sigma Kappa, and Sigma Delta Epsilon. In 1925 she married Lawrence A. Burckmyer, who was an instructor in electrical engineering at Cornell, and took up permanent residence in Ithaca.

She felt it was her early training as a biologist and her interest and skill in making drawings from the microscope that led to her development as a scientific illustrator. While raising her family of two boys, she did illustrations for many types of publications; among them were fish drawings for the United States Geological Survey, Rural School Leaflets, textbooks, and most of the plant drawings for E. Laurence Palmer's *Fieldbook of Natural History*. Among her finest early works were the watercolor paintings for Liberty Hyde Bailey's *Garden of the Bellflowers*. She furthered her art training under the tutelage of Professor Kenneth Washburn.

In 1946 Elizabeth Burckmyer joined the Cornell staff as an instructor and assistant to Professor Clara Garrett, who taught the drawing courses offered by the Department of Floriculture and Ornamental Horticulture in the New York State College of Agriculture. At the time of Professor Garrett's retirement in 1949 she was promoted to assistant professor, and in 1954 she became an associate professor of freehand drawing. From 1949 until her retirement in 1962 she had responsibility for the planning and teaching of the drawing courses. Professor Burckmyer continued to do illustrations for publications, among which were the drawings for Mary Geisler Phillips's book, *Makers of Honey*.

On her sabbatical leave in 1956 she traveled through Europe to sketch and paint. She came back with a portfolio of watercolors and drawings from France, Spain, Italy, Sicily, Lebanon, and Jordan. Of particular interest to her were the architecture and colorful costumes of busy marketplaces.

Although she came from a California ranch as an accomplished horse-woman and delighted Ithaca friends by instructing them in the art of western-style riding, it was Cayuga Lake and boating that were to become a source of enjoyment during the Ithaca years. The June 1929 issue of *Motorboating* carried as its lead article her account of a

thousand-mile trip she and her husband made in a twenty-one-foot open launch from Ithaca across Lake Ontario to Ottawa and back by way of the St. Lawrence River, Lake Champlain, and the New York State barge canals.

After both she and her husband, Professor Emeritus Lawrence A. Burckmyer, Jr., retired in 1962, they moved aboard a large motor sailboat with the idea of cruising for a while before settling down. It was to be their home for the next twenty years, as they followed the seasons along the inland waterway, moving north to Massachusetts in summer and south to Florida as winter came on. Professor Burckmyer kept a lively interest in sketching life along the waterways, filling sketchbooks and letters to friends with ink sketches of people, boats, harbors, and wildlife.

Those who had the privilege of knowing and working with Betty Burckmyer will remember her vitality and warmth and her excellence and dedication as a teacher. She always made time to be available to students and demonstrated a caring for their work. Her love of art, her strong feeling for its craft, and the need to acquire skills was communicated to all her students and other members of the various art study groups in which she participated, not only through her ability to teach, but also by the example of her finely crafted artwork.

Even though the years after retirement were spent mostly away from Ithaca, she maintained her contact with Ithacans and activities at Cornell.

She is survived by her husband and two sons, Lawrence L. Burckmyer and Peter Burckmyer, and four grandchildren.

Raymond T. Fox, Robert G. Mower, Robert J. Lambert, Jr.

Lawrence A. Burckmyer, Jr.

September 7, 1901 — April 7, 1988

Lawrence A. Burckmyer, Jr. (hereinafter referred to as “Burck”) was born in North Augusta, South Carolina. After prep-school work at Virginia Military Academy (where he was first in his class) he entered Clemson College, a short distance up the road from where he was born. Upon graduation with a Bachelor of Science degree in 1922 (again first in his class) he was highly recommended for an instructorship in the School of Electrical Engineering at Cornell and was offered an appointment, which he accepted for the fall term 1922. He became an assistant professor in 1929, an associate professor in 1942, and a professor in 1943. He retired early and became professor emeritus in July 1962.

During his teaching career Burck had only two sabbatic leaves. In 1947-48, he was with the Western Electric Company in New Jersey; in 1954-55 he was in the Du Pont Teachers Training Program in Wilmington, Delaware. Before early retirement he asked for a one-year leave of absence without salary even though he was eligible for a sabbatic. This was a measure of the man’s integrity because he felt that he might not come back to Cornell after the leave and that it would be wrong to ask for a sabbatic under such circumstances.

Burck’s numerous administrative responsibilities during his career included membership on a three-man committee appointed to administer the affairs of the School when it was without a director (1944-45). Also, he was in charge of the electrical engineering curriculum for the Steam and Diesel Programs of the Naval Training Program during World War II. This responsibility included the task of seeking out and hiring a teaching staff consisting of practicing engineers, active and retired, as well as developing the course material and a new laboratory. He was also in charge of an area responsible for electrical circuits and measurements laboratory, and machinery courses in the School.

While a member of the three-man committee in 1944-45 he was chosen as chairman of the Building Planning Committee for a new building to replace the facilities in Franklin Hall, Rand Hall, and the Old Heating Plant (converted to an electrical laboratory for the Naval Training Program). This proved to be a monumental task that took ten years to complete.

Burck started by making a complete survey of the space requirements known for the present and contemplated for the future. It was an outstanding job largely due to his efforts. Then came the first of many architectural designs that would satisfy these requirements. Many were discarded because their cost exceeded what the administration

felt they had available from a prospective donor. Eventually, all conditions were compromised and the move to the new building, Phillips Hall (given by Ellis L. Phillips '95), was completed in January 1955.

In addition to his efforts guiding the planning committee, Burck's tangible contributions to the new building were the design of the electrical laboratory benches used in all laboratories and the design of the electrical supply system for the laboratories and classrooms. With this system it is possible to connect any electrical supply anywhere in the building to any other place in the building, an extraordinary achievement. An audio system with similar capabilities was included in his design.

In both his measurement and machinery courses, Burck demanded not only precision in the laboratory but also precision in speech, along with clear thinking. While Burck's insistence on clarity, accuracy, and responsibility in their work seemed harsh to many students, it was really a great kindness. He considered it his duty to prepare the students for the expectations they were sure to face in the field of engineering. His thoughtful, professional approach and his courteous demeanor was a good example to them all.

The statement is made in a Centennial article concerning these courses:

"Scores of Electrical Engineering Alumni remember these courses as being very demanding and even painful. After entering their professional careers, however, many of these same alumni reported their appreciation of the value of these rigorous exercises."

For the laboratory course Burck wrote the text material for *Engineering Principles in Electrical Experiments* which was printed in photo offset form. His writing showed another Burckmyer characteristic — conciseness. Students and colleagues soon realized that Burck wrote one sentence where others would write two or three.

While active, Burck belonged to only one professional society, the American Institute of Electrical Engineers, and was chairman of its subcommittee on Temperature Measurement and the Rotating Machinery Committee. He felt that he should participate only where he could make a reasonable contribution.

Burck was a member of the honorary societies, Eta Kappa Nu, Tau Beta Pi, and Sigma Xi.

Throughout his life Burck's recreation was his boats which he enjoyed with his family. In his younger years it was a thirty-foot single-masted motor sailer, the *Kestrel*, which he kept in immaculate condition (as he did his automobiles). In the summer months the family spent many hours on the *Kestrel* on Cayuga Lake and beyond. A picture of *Kestrel* under full sail appeared on Ithaca/Cayuga Lake publicity brochures for many years. An interview with Burck, and details of the innovations he made on *Kestrel* were featured in a major article in *Yachting Magazine*. This is a reflection of the thought and excellence he brought to everything he dealt with. At the time of

his retirement he acquired a cabin cruiser, the *North Star*, a larger boat with ocean going capability, on which he intended to live. He settled on the Marina at Marineland in Florida as the proper place to berth the boat. He and his wife, Elizabeth (retired as an associate professor emerita in ornamental horticulture at Cornell), continued to enjoy this form of living, with occasional trips out into the Atlantic Ocean and the Gulf until they decided in 1984 it was time to go ashore. What eased the transition for Burck considerably was the fact that a suitable person appeared who offered to care for the boat and use it as Burck would.

They acquired a house in Palm Coast, Florida, not far from Marineland and were beginning to enjoy their new kind of living when Betty died suddenly in early 1985. Subsequently Burck went into a nursing home where he died.

Burck is survived by two sons, Lawrence L. of Peabody, Massachusetts and Peter A. of Somers, New York, both Cornell graduates; and four grandchildren.

True McLean, Robert E. Osborn, William H. Erickson

Charles Kellogg Burdick

February 7, 1883 — June 22, 1940

Charles Burdick's connection with Cornell University spanned more than fifty years. It began in 1887 when his father, Francis Marion Burdick, a professor in the original faculty of the Law School, brought his family to live on the Cornell campus. In 1891 the family moved to New York City and the elder Burdick began his long career at the Columbia Law School. Charles Burdick entered Princeton in 1900. There he studied jurisprudence under Woodrow Wilson, edited the *Daily Princetonian*, and was graduated in 1904. At the Columbia Law School his first year's standing won him, at the beginning of his second year, the honor of election to the board of editors of the *Columbia Law Review*. He received the LL.B. degree in 1908, after a delay of a year which he spent in the North Woods while recovering from an illness. He then began practice in New York City with the firm of the present Mr. Justice Stone of the United States Supreme Court. Thence he went into the teaching of law. Tulane University at New Orleans and the University of Missouri knew him briefly, and in 1914, at the age of 31, he came to Cornell as a professor of law. His success as a teacher and as a man and brother among students and colleagues was immediate. He became a standby of the School and so continued. In 1926 he succeeded George G. Bogert as dean; he resigned the deanship in 1936 but retained his professorship to the end.

Burdick's activities were manifold, not only as a teacher, as a writer, and as an administrator, but also as a participant in important affairs outside the scope of his regular duties. His classroom presence was courteous, his method urbane, and his tolerance so generous that it may occasionally have led him to suffer fools. His thorough culture and his wide knowledge of the law made his instruction outstanding. To his teaching, as to his writing, he brought an illuminated and well stored mind and a knack of clear thinking. Out of these qualities came lucid exposition of material, set forth in English that no hearer or reader had to labor to comprehend. In his teaching and in his writing he ranged widely. He edited new editions of his father's books on subjects which he himself did not regularly teach. He prepared works of his own on Public Service Companies and on Constitutional Law. His book on the latter topic has become a classic; West Point alone has absorbed some hundreds of copies a year; at the time of his death he was doing a new edition.

He taught through the Law School curriculum, but in the end he concentrated upon American Public Law and International Law. In recognition of his authority in the latter subject he was asked to serve as special counsel to President Roosevelt in a South American boundary dispute if it should be, as eventually it was not, referred to the

President. Burdick was, till his death, a consultant on the restatement of international law undertaken by the body called Harvard Research in International Law. While the late George W. Wickersham was its chairman, Burdick was Reporter for the subject of Extradition and his work has since been used by several countries in disputes involving that topic.

Burdick wrote and worked ardently in behalf of international peace. He was a profound believer in the League of Nations, and the state of the world just before his death re-aroused his compassion for humanity, for his outlook on life was characterized by a sympathy for the under dog. That compassionate disposition conditioned his legal thinking on domestic constitutional questions as well as on international problems. He was at heart a humanitarian.

When he became dean of the Law School he found the legal world in a ferment over standards of preliminary education for admission to law schools and of training for admission to the bar. The content of the law curriculum was also under discussion. Burdick's qualities soon disclosed themselves. He marshaled arguments which convinced all doubters that the Cornell Law School should be put on a level with the half-dozen or so in the country which then required a college degree for entrance. He enriched the curriculum. His Faculty increased from seven to twelve men. In his time also came Myron Taylor's gift for a law school building, and Burdick turned from law-books to blueprints and became an amateur architect. The great sunlit Reading Room and the acoustic perfection of the Moot Court Room are his monuments. To the deanship Burdick brought his urbane good sense, his serene temper. As a faculty chief he tolerated every opinion of every colleague. His was no one-man show. Harmonious teamwork among an independently thinking faculty continued year in and year out. Incidentally these same qualities, which so endeared him to his immediate colleagues, operated to the same result in the wider fields of university administration to which he was called from time to time. Sane and steady, tenacious but open-minded, he never slighted a problem, and the results of his thinking had a compelling reasonableness. In his relations with the students Dean Burdick occupied himself with their personal troubles as well as their scholastic difficulties. With affairs of the heart that went awry, family matters at home, or police entanglements in Ithaca, in physical and psychical ill health, students came to Burdick and he helped them with his time, his advice, and often with his money. Frequently he sensed their unhappiness and gave them unsought assistance.

Burdick's life, however, was far from being enclosed by the walls of our university. He taught, in their summer sessions, at other institutions—Chicago, Columbia, Stanford. He traveled abroad, and in other lands met the men of his profession, particularly the international lawyers. He knew Geneva well, and the League of Nations asked him to direct the Greek evacuation of Asia Minor, a task that he was unable to undertake. All Souls' College at

Oxford made him an associate member, a rare honor for an American, and gave him a seat at the high table. During the World War he was a director of one of the American Red Cross services. In the American Bar Association he made efforts to guide modern legislation into more effective form. His interest in social economics brought him in 1931, from the hand of Governor Roosevelt, an appointment to the New York State Commission to Investigate the Administration of Justice. Governor Lehman in 1934 made him a member of the State Judicial Council assigned to abridge legal procedure. Later in that year the same executive made him chairman of the New York State Law Revision Commission, whose task has been the elimination of outworn or outmoded state law, and he was still chairman at his death. He was a member of the American Bar Association's committee seeking the same ends in the national field and among the states. In 1936 he served as special counsel to Governor Lehman in an investigation of the charges brought against District Attorney Geoghan of Kings County by those who demanded Geoghan's removal. Burdick's public service in this last matter was arduous.

Charles Burdick thus had a full and well rounded life. Everywhere his intellectual gifts won him respect and his warm heart won him affection. Besides distinction of mind he had rare distinction of personality and of bearing. No shouter from the housetops, he was gentle in manner and quiet in voice; but his outward aspect gave little hint of his firm will and tenacious spirit. He was never overbearing to others, but others in their turn were not allowed to override him. He could not be made to abate from his ideals, and in any matter of principle he revealed the adamant core that lay within him. Those who knew him realize that a great light has gone out and agree that his most fitting epitaph is the phrase: "He was a scholar and a gentleman."

James Dabney Burfoot, Jr.

October 18, 1896 — February 27, 1966

Professor Burfoot was born in Richmond, Virginia, the son of James Dabney, Sr., and Minnie Elbridge Burfoot, of English ancestry. He attended the public schools in Richmond and graduated from Petersburg High School in 1914. Although he had won several scholarships he decided to work; and for several years he was employed in a bank until enlisting in the Navy in 1918. After the war he went to William and Mary to study accountancy but soon found that his forte was science. In 1922 he received a scholarship at the University of Virginia. There, after taking one course in geology, he was given an assistantship by Thomas L. Watson, a well-known economic geologist. A year later he received the B.S. degree, followed by the M.S. in 1925. In the fall of that year he came to Cornell for more graduate work with Professor Heinrich Ries in economic geology and Professor A. C. Gill in mineralogy and petrography. In 1926 he served as Assistant Professor at Washington and Lee, and in 1927 was back at Cornell as instructor, receiving his Ph.D. in 1929. He was Assistant Professor from 1935 to 1946, Associate Professor from 1946 to 1952, and Professor of Geology from 1952 to his retirement as Professor Emeritus in 1964.

Dan Burfoot was primarily a teacher, and to his courses in elementary geology, economic geology, clay mineralogy, optical mineralogy, sedimentary petrography, and metamorphic geology, he gave unstintingly of his time. In the laboratory he was a perfectionist, and students were expected not only to learn but also to think; they groaned at the work but eventually recognized the thorough grounding they were given.

Professor Burfoot was always interested in students and their problems, not only in his department but in the University at large. Many a graduate owes his degree to Dan's sound counsel. In 1946 he became Assistant to the Dean and Chairman of the Advisory Board for Undergraduates, College of Arts and Sciences, while still teaching part-time in the Department of Geology. In 1952 he was appointed Assistant Dean of the College where he devoted himself to the counseling of upperclass students until his retirement. He was Secretary of the University Faculty, 1950-53.

In the summers from 1924 to 1939 he worked in the field for the Virginia Geological Survey, at first as a field assistant, then as assistant geologist and as geologist, investigating the talc, soapstone, and slate resources of the state. He also taught in the Cornell Summer Sessions in 1930, 1932-34, and 1940-43. Upon the retirement of Professor Ries as head of the Department of Geology in 1937 he was executive secretary of the Department for two years. During the war years he worked with the ASTP program.

At William and Mary, Dan Burfoot was elected to Theta Delta Chi and the Flat Hat Club. For many years he helped and advised the Cornell chapter of his fraternity. He was elected to Phi Beta Kappa at the end of his first year at the University of Virginia, later to Phi Kappa Phi and Sigma Xi. He was a fellow of the Mineralogical Society of America and member of the Society of Economic Geologists.

On January 19, 1924, (Robert E. Lee's birthday) he married Marion Elizabeth Wiant of Charlottesville, Virginia, who survives him and who for many years was the secretary of the Department of Geology. Both Dan and Marion will long be gratefully remembered by generations of graduates of the Department they served so long and faithfully.

With the passing of Dan Burfoot, Cornell lost not only a devoted teacher, friend, and counselor of students but a genuine example of that vanishing type, a gentleman.

G. Ferris Cronkhite, Douglas C. Darling, John W. Wells

Alice M. Burgoin

August 29, 1902 — December 8, 1971

Alice M. Burgoin, professor of institution management, emeritus, was born in Silver City, Iowa. She received her B.S. degree from Nebraska Wesleyan University and her M.S. degree from Iowa State College. She pursued additional study in the United States and in England. Prior to her appointment in the Department of Institution Management, New York State College of Home Economics (now the College of Human Ecology), at Cornell University, she held positions in secondary schools and colleges in Iowa and Wisconsin.

Professor Burgoin came to Cornell in 1932 as an instructor and subsequently held appointments as assistant and associate professor. Following a leave of absence she was reappointed in 1951 as associate professor. From 1953 to 1955 she served as acting head of the Department and was promoted to full professor in 1962. She retired in 1964 as professor emeritus, having served on the faculty for a period of twenty-eight years.

Miss Burgoin's major responsibility during her tenure at Cornell was teaching undergraduate students in the College of Home Economics and in the School of Hotel Administration, and graduate students majoring in institution management. Together with the late Professor Katharine W. Harris, Miss Burgoin was responsible in 1933 for opening, and subsequently for directing, the Martha Van Rensselaer cafeteria, which for many years served as a student laboratory. Her area of specialization was quantity food preparation and service, and she contributed to publications in this field. In response to the needs of the National School Lunch program, she developed a graduate course in school lunch management and directed graduate studies in the area. Her vision in recognizing the need for training in this field, her pioneering efforts, and her competence led to her appointment on the New York State Board of Regents Advisory Committee on School Lunch.

Professor Burgoin was an adviser to the Executive Board of the New York State School Food Service Association and a member of the advisory committee for the Food Service Administration program at the New York State Agricultural and Technical College at Morrisville. She was also chairman of the college section of the American School Food Service Association.

Professor Burgoin gave unselfishly to many related groups, professional associations, and committees. In addition to her membership in the American School Food Service Association, she held membership in the American Home Economics Association, the National Restaurant Association, the New York State School Food Service Association, and the Cayuga Dietetic Association. She was a faculty member on the Cornell Board of Directors for

the Interfraternity Cooperative Association, and in this capacity she advised fraternities regarding the selection and purchasing of foods. She also served on several College and University committees.

Professor Burgoin was highly recognized as an outstanding teacher as well as an academic administrator. While she expected high standards of students, they held her in high esteem — she was affectionately known as “General Burgoin” by her students in Hotel Administration. She kept in touch with many of her former students, several of whose professional careers have been recognized nationally and internationally.

Miss Burgoin enjoyed a wide circle of friends, which included university and other professional colleagues, students, employees, and many persons beyond the university community. She instinctively sensed the needs of others and generously and cheerfully responded to these needs. In her retirement she was an active member of the Tompkins County Hospital Auxiliary. She participated in the Head Start program at St. Paul’s United Methodist Church and served on many church committees. Her many interests included gardening, entertaining, and travel. In her travels she frequently contacted former students.

Professor Burgoin came from a closely knit family. She maintained strong ties with her brother and three sisters in the United States and with her relatives in England.

Miss Burgoin was carrying on her usual schedule of activities and was making plans for the future, including travel, at the time of her illness. Her many friends and acquaintances were greatly shocked by her sudden death and they extend their deepest sympathy to her family.

Catherine J. Personius, Kathryn O. Visnyei, Mary Bloetjes

James David Burke

October 3, 1907 — January 23, 2004

James David (Jim) Burke, Professor Emeritus of Animal Science, died January 23, 2004 in Port Orange, Florida at the age of 96.

Jim was born in Beech Creek, Pennsylvania in 1907 and his experience growing up on a farm led him to his career in Animal Science at Cornell. After high school, he received a teaching certificate from Lock Haven Teachers College in 1927 and taught elementary country school for two years before entering Pennsylvania State College where he earned a Bachelor's degree in 1932. He worked in the dairy industry until 1936 when he joined Cornell as an Extension Assistant in Animal Husbandry at the salary of \$1,800 per annum. He was appointed an Assistant Professor in 1946, Associate Professor in 1948 and Professor of Animal Husbandry in 1957. Jim completed his Master's degree from Cornell in 1946.

While he was noted as a Dairy Extension Management Specialist, some of his early extension efforts included proper hitching of multiple horse teams and how to cut pork the easy way (with photos by Elmer S. Phillips).

Jim was instrumental in the organization of the New York Dairy Herd Improvement Cooperative and the establishment of central laboratories for milk testing and recording. He was especially effective in the early days of the computerization of dairy records and the incorporation of management factors—especially of feeding recommendations for individual cows in the dairy record reports returned to the dairymen enrolled in the testing program. His understanding of farm procedures and in what form information could be used was unique. This was enhanced by the respect and admiration the dairy farmers had for Jim, which contributed to his success as an Extension Professor in Animal Science. At one time over 6,000 New York dairy farmers were enrolled in his program.

Jim received many awards including the Epsilon Sigma Phi Award in 1964 and an Appreciation Award from the New York Dairy Herd Improvement Cooperative in 1967 as well as the DeLaval Award for Dairy Extension from the American Dairy Science Association. He held all the offices in the Extension Section of the American Dairy Science Association. Jim was also a member of the American Society of Animal Science, Phi Kappa Phi, Gamma Sigma Delta and Epsilon Sigma Phi. He maintained his subscriptions to both the *Journal of Dairy Science* and applied dairy magazines throughout his life and was always anxious to discuss new findings and their application to the dairy industry.

Jim was continually active in the Department of Animal Science after retirement including frequent attendance at seminars and social gatherings when he was in Ithaca. Most recently he participated in the Department Centennial Program in November 2003. He retired and became an Emeritus Professor in 1971. After his retirement, he spent most of his winters in Florida.

He married Velma Dillen in 1932 and they had eight children. She predeceased him after 55 years of marriage. Jim then married Helen Meek and they had 15 wonderful years before his death. In addition to Helen, he is survived by his children: Barbara Brown, Michael Burke, Nancy Drane, Betty Chupp, Sharon Wright, Timothy Burke, Tom Burke and stepdaughter, Sandra Meek True. His daughter, Susan Howser, predeceased him. He also has 24 grandchildren, 30 great-grandchildren and 5 great-great-grandchildren; all of whom gave him great pride and joy.

Dale E. Bauman, Robert W. Everett, Douglas E. Hogue

Walter Hagemeyer Burkholder

February 1, 1891 — January 31, 1983

Walter H. Burkholder was known affectionately to his many friends as “Burkie.” He was born in Crawfordsville, Indiana, where he obtained his A.B. degree in botany and English from Wabash College in 1913. He then joined the Department of Plant Pathology [at Cornell] as a fellow to begin his doctoral program. This association with Cornell University continued forty-six years, until his retirement and appointment as professor emeritus on July 1, 1959. Burkie received his Ph.D. degree in 1917; held an appointment as investigator until 1921, when he was designated assistant professor; and was appointed professor in 1927.

Burkie began his scientific career investigating fungi that cause disease in plants. In particular he was concerned with diseases of beans. For his outstanding research he received a Meritorious Service Award from the Bean Improvement Cooperative, a national organization dedicated to improvement of bean crops. He became a world authority on bacteria that cause disease in plants. For many years Burkie was editor of the section on phytopathogenic bacteria in Bergey’s *Manual of Determinative Bacteriology*, a definitive reference work for bacteriologists. Over the years he assembled a large collection of plant pathogenic bacteria, which he made available to scientists all over the world. For many years he taught a section of the advanced graduate course on bacterial diseases of plants. His numerous research contributions ranged from fundamental studies on the physiology and taxonomy of these organisms to development of resistant bean varieties by which to control them and reduce losses sustained by bean growers. He was a member of Sigma Xi, the Society of American Bacteriologists, the Ecological Society of America, and the New York Academy of Sciences. He was a life member of the American Phytopathological Society and a fellow of the American Association for the Advancement of Science.

Burkie was an avid reader of poetry and fiction and especially enjoyed light opera. He was a connoisseur of fine food and liquor, whose subtle delights he happily introduced to others. Burkie was also an outstanding person who exemplified the words *gentleman*, *scholar*, and *scientist*. He was a friend of students, whom he counseled and regularly entertained; of growers, whom he respected and was admired by in turn; and of people throughout the University community. He had such warmth of personality and good humor, such diverse interests and experiences, that people sought his company and simply enjoyed him greatly.

William F. Rochow, Leon J. Tyler, Roy L. Miller

Temple Burling

March 22, 1896 — February 16, 1975

Temple Burling was a member of the faculty of the School of Industrial and Labor Relations from 1948 until his retirement in 1964. During the first two years he served half-time in the mental health program of Gannett Clinic, later continuing to practice psychotherapy there for one afternoon a week. Dr. Burling was a pioneer in the field of industrial psychiatry. With R. H. Macy and Company (1937-40), he was the first psychiatrist to serve full time on the staff of a business or industrial firm. During this same period he was publishing the first articles outlining how the psychiatrist could ease the emotional tensions people encounter in work situations. At Cornell he succeeded Alexander H. Leighton as the director of the ILR Industrial Psychiatry Program. This program provided young psychiatrists with internships in industry, under the guidance of the director and in consultation with other faculty members.

The Give and Take in Hospitals, which he coauthored with Edith Lentz and Robert Wilson, was the first book that applied the research methods and theories of the behavioral sciences to the field of hospital administration. His bulletin “You Can’t Hire a Hand” has proved to be the most popular extension bulletin ever published by the school.

Temple Burling was a devoted teacher, especially effective in small-group situations, where, as he puffed on his pipe and reflected with interest and real enjoyment upon what students were saying, he stimulated them to weave more effectively together the emotional and cognitive aspects of living. His seminar on “Dynamics of Personality” which for a number of years he offered each semester, one semester for graduate students and the other for undergraduates, became a treasured experience for students, who learned thereby how better to understand themselves and others.

The same warmth and human understanding marked his work as a psychiatrist. He really liked and respected his patients, and his human concern helped them to work their way through emotional crises. He made a deep impression on former students and patients, many of them returning to Ithaca years after leaving Cornell to visit him and his wife, Katy, who helped to build this strong personal relationship between Temple Burling and all those with whom he worked in teaching or in the clinic.

In committee meetings Temple Burling never took anything for granted. He could be counted on to see problems from a new angle, thus often helping to move discussions that had reached an impasse.

Dr. Burling was a man of innumerable hobbies, which he pursued throughout his career and with special intensity after retirement. Perhaps this wide range of hobbies helped him to understand a wide range of people. His hobbies ranged from leather work and weaving to gardening and training bonsai, a project of special pride in his later years. He was an active member of the Men's Garden Club.

Temple Burling was born in Chicago on March 22, 1896. He received his bachelor's degree from the University of Chicago and his M.D. in 1923 from Rush Medical College, part of the University of Chicago. He interned in psychiatry at the Sheppard and Enoch Pratt Hospital in Towson, Maryland.

After a year in private practice in Minneapolis, he served for two years as field epidemiologist of the Minnesota Board of Health. He then served as psychiatrist with the Institute for Juvenile Research in Chicago and later with the public schools of Winnetka, Illinois, before his three-year period with R. H. Macy and Company. After holding this position in industrial psychiatry, he became field director of the Providence Child Guidance Clinic and then field director of the Division of Rehabilitation of the National Committee for Mental Hygiene, also in Providence, Rhode Island.

Dr. Burling is survived by his wife, Mrs. Katherine Burling of Trumansburg; a daughter, Helen Ottaway of Johnson City; two sons, Robbins Burling of Ann Arbor, Michigan, and James Burling of Oswego; seven grandchildren; a sister, Helen Kronwall of Tucson, Arizona; and a cousin, Edward Burling of Washington, D.C.

Douglas Darling, Alpheus W. Smith, William F. Whyte

Leroy Pearl Burnham

May 11, 1880 — June 17, 1952

Leroy Pearl Burnham, Professor of Architecture, Emeritus, died in Ithaca on June 17, 1952. He had been ill but a short time. Professor Burnham was born at Waltham, Massachusetts, May 11, 1880, the son of Charles and Sarah Avery Burnham. After his early education in the public schools of Waltham, he entered Harvard University from which he was graduated as Bachelor of Science in 1902 and as Master of Science in Architecture in 1903. Having been awarded both the Harvard and the Roche Traveling Fellowships he spent the next four years in Europe, traveling extensively, chiefly in England, France and Italy, and in study at the Ecole des Beaux Arts in Paris and at the American Academy in Rome. Soon after his return to the United States he became associated with the firm of McKim, Meade and White in New York City. Here, during several years with what was perhaps the leading architectural firm of the country, he acquired a broad and thorough training in the practical aspects of his profession, and the prominent part assigned to him by his employers in the design and construction of the Metropolitan Museum of Art indicates that he had profited substantially by this training.

He came to Cornell in the fall of 1914 as Assistant Professor of Architecture and was appointed Professor in 1923, a position in which he served with effectiveness and distinction until his retirement in June, 1947. Professor Burnham brought to his teaching of architectural design not only a mature philosophy but also the convincing artistry of the highly skilled craftsman. His personal qualities of sincerity, integrity and artistic sensibility, tempered by a kindly manner and genial tolerance, together with the breadth and thoroughness of his education and experience, were clearly reflected in his teaching. Many of his former students, now leaders in their profession, bear witness to the effectiveness of his insistence on sound analysis, rational development and clear presentation of the problem at hand.

In addition to his teaching and after his retirement he found time to participate occasionally in practice, several local residences and the Tompkins County World War I Memorial being products of this avocation. Also over a period of many years, he gave generously of his time and talent in designing and supervising the decorations of Barton or Bailey Halls for the commencement exercises.

Among the organizations with which Professor Burnham was actively affiliated were the American Institute of Architects, the Council of Registered Architects of New York State, the American Academy in Rome Associates, the Harvard Club of New York, and St. Johns Episcopal Church.

H. E. Baxter, G. I. Dale, J. A. Hartell

Arthur Houghton Burr

May 27, 1908 — November 5, 1993

Over sixty years of dedicated service to mechanical engineering, mechanical engineering education, and mechanical engineering educators came to an end on November 5, 1993 with the death, due to congestive heart failure, of Arthur Houghton Burr, Hiram Sibley Professor Emeritus, in Austin, Texas. Art was born in Worcester, Massachusetts, where he attended schools through graduation from Worcester Polytechnic Institution in 1929, earning the degree of B.S. in Mechanical Engineering, with Distinction.

Art then accepted a position as Research Engineer at the Research Laboratories of the Westinghouse Electric Company, East Pittsburgh, Pennsylvania. His work there was primarily related to investigating the mechanisms of gear-tooth failure. His experimental study of surface pitting was particularly important in that he was the first person to obtain pitting under laboratory conditions. He began graduate study in a joint program between the Westinghouse Mechanical Design School and the University of Pittsburgh, from which he received the degree of M.S. in Mechanical Engineering in 1931. He then began the somewhat daunting task of looking, in the depth of the depression, for a teaching position at an engineering college. In 1933, he found a position as Instructor in Mechanical Engineering at the Rice Institute (now William Marsh Rice University) in Houston, Texas. This was the beginning of Art and Phyllis Burrs' love affair with the Southwest, and it was also an excellent opportunity for a beginning teacher in mechanical engineering. The school was small and Art taught practically every course in the field. He also gained valuable practical experience working part-time during the winter and full-time during the summers with local companies, such as the Emsco Derrick and Equipment Company and the Houston Lighting and Power Company. In the late 1930s, Art began part-time study towards the Ph.D. degree in Engineering Mechanics at the University of Michigan and started looking around for another teaching position, as the depression was still on in Texas. In 1941, he accepted a position as Assistant Professor at the University of Missouri, Columbia, where he taught courses in machine design, metallurgy, advanced strength of materials, and mechanical vibrations. In 1944, he was promoted to Associate Professor and took a leave of absence to join the war effort at the Aerial Measurements Laboratory at Northwestern University where, in June 1945, he was promoted to Executive Officer (Chief Engineer and Assistant Director).

The year 1947 was a time for momentous decisions for almost everyone. In Art's case, it was the perfect time for redirecting his career, since he had received his Ph.D. degree from Michigan and the Aerial Measurements

Laboratory was winding down. His move was to accept an offer from Cornell University to become Professor and Head of the Department of Machine Design in the Sibley School of Mechanical Engineering—a move that was most fortuitous for Cornell and those of us who came to Cornell to study and/or teach.

In 1947, there were still eight semi-autonomous departments in Mechanical Engineering, the result of the College of Engineering being formed in 1921 by the consolidation of the Colleges of Civil and Mechanical Engineering. The school was faced with accommodating a horde of highly-motivated veterans returning to complete their educations for the existing four-year bachelor's degree while simultaneously admitting a freshman class entering a new, not completely defined, five-year program. The department had lost four senior professors due to retirement and departing for other positions. Upon his arrival in September 1947, Art found the remaining staff, three professors and two instructors, was being augmented by the hiring of an associate professor and four instructors. The professor came from a “high-tech” industry (aircraft engines) and the instructors were veterans with one or more degrees and considerable practical experience. Instructors were hired, generally, as full-time teachers with the opportunity for doing graduate work. There were no teaching assistants. Since the four departmental required courses were upper-class courses, Art had some time for hiring the necessary additional staff.

The rapidity with which the collection of individuals with widely different interests, backgrounds, and capabilities was transformed into a cohesive educational department can only be attributed to Art's managerial style—which in essence was to be supportive in every way possible while providing the maximum practical freedom for independent thinking and action. Engineering at Cornell was a textbook example of democracy in action. Instructors were members of the faculty in all matters related to undergraduate programs and extra-curricular activities. For a number of years there were no large lecture sections and often there would be more instructors than professors teaching the multiple-section required courses. In several instances, instructors were responsible for single-section courses, and in one multiple-section course, an instructor was in charge of the course scheduling and putting together the common prelims. The main consequences of this mode of operation, encouraged by Art, were the many discussions—often heated—at lunch and at department meetings and the almost continuous, slow change in course content and emphasis.

Before 1948, there were few elective courses and almost no graduate courses, in machine design at any American school. Art had become convinced that there was a need and a place for a “real” graduate program in machine design; one of his immediate goals was to set up such a program. By 1949, the existing elective course, “Advanced Machine Design”, had been augmented by five courses covering topics from creative design through kinematics

and vibrations to laboratory work in machinery development. These courses were built upon the unique areas of knowledge brought in by instructors as well as professors. The courses related to vibrations and machinery development were among the very first courses to utilize the “war-effort developed, state-of-the-art” instrumentation in college laboratory studies of machine elements and machines.

Historically, research in the department had been sporadic, at best; another of Art’s goals was to get the department involved on a continuous basis. Pure luck led to a quantum jump in research when in the fall of 1947 the National Advisory Committee for Aeronautics (NACA, now NASA) approached a number of universities with the idea of sponsoring experimental and theoretical research on high-speed journal bearings, an area of great importance in relation to the recently developed aircraft gas turbine engine. Art immediately saw that Cornell was the ideal place, because the professor just hired from the aircraft engine industry, George B. DuBois, was the ideal person to head up such a project. The selection committee wasted little time in awarding the contract to Cornell. In a few years the Department of Machine Design was recognized as one of the world’s leading centers for lubrication research. Practically everyone in the department, including Art Burr, was actively involved at some point in the eleven-year life of the project. Theoretical lubrication research continues to this day.

The turnover in staff, the returning older veterans, the influx of highly selected high-school graduates, and a legal age of eighteen for drinking alcoholic beverages combined to make Cornell a very socially active place with almost weekly meetings of student organizations and faculty groups, but they were all eclipsed by the Department’s social activities—which had to meet the standards of Phyllis and Art Burr! In effect, the Burrs adopted the entire department, including families. The fall, winter, and spring outdoor activities were wonderful opportunities for families to get to know each other and the annual Christmas party (for adults) at the Burr home was the event of the year. Phyllis and Art were the consummate party givers and party goers!

Art was highly professionally oriented. He was a registered professional engineer in Illinois and he was active, locally and nationally, in the American Society of Mechanical Engineers (ASME) and the American Society for Engineering Education (ASEE). His deep sense of responsibility carried over to the mechanical engineers working in the region around Ithaca; he was a mainstay in the operation of the Southern Tier Section of ASME throughout his years in Ithaca. Art (and the School and the College) considered participation in activities of professional societies to be significant contributions to the educational program and he strongly encouraged participation by his staff.

Art was a consultant for a number of operations, notably the Cornell Aeronautical Laboratory, the Edlund Machine Company and the Boeing Airplane Company; but his major concern, along with being department head, was the education of students for careers in the broad field of machine design—or mechanical design as it was being renamed. He loved all aspects of teaching mechanical design—from collecting broken, deformed, or worn-out parts to show students, to organizing plant visits, to writing extensive volumes of classroom notes for use as up-to-the-minute textbooks for the required courses, “Design of Machine Elements” and “Design of Machines”. The notes were published, in effect, by the department. Art was the sole author of Mechanical Design Parts I and II, which first came out in 1952, and co-author with Professor DuBois of Parts III and IV, which first came out in 1955. The McGraw-Hill Book Company approached Burr and DuBois and a contract was signed. The book was never published for the simple reason that Art, a perfectionist, never reached the point where he could conclude that this was the best he could do and turn the manuscript in for publication. Although this was unfortunate for mechanical engineering education in general, for Cornell public relations, and for the financial well-being of the authors, it was beneficial for Cornell students in that they, in effect, had a new edition to use every year or so.

In 1953, Art was appointed the Hiram Sibley Professor of Mechanical Engineering.

The Burr family spent the academic year 1953-54 on sabbatical leave in Brazil where Art was a Visiting Professor at the Instituto Tecnológico de Aeronáutica, Sao Jose dos Campos, Sao Paulo. Their love affair with the Southwest had really gone south!

The appearance of Sputnik (and the resulting flood of U.S. government money for research), the development of the digital computer, and changes in the deanship of the college resulted in many educational and structural changes in engineering at Cornell. By 1965, when the undergraduate program was changed back to a four-year program, the number of departments in the Sibley School had decreased to three and the Department of Machine Design had become the Department of Machine Design and Manufacturing Processes. Several structural changes occurred in 1967 when administrative appointments were changed to term appointments from “lifetime” appointments, the Department of Industrial Engineering and Operations Research became the School of Industrial Engineering and Operations Research, and the remaining two departments—Machine Design and Manufacturing Processes and Thermal Engineering—became more autonomous than before. Professor Burr relinquished being Head of the Department and in 1969 the Department was renamed Mechanical Systems and Design. In 1972, the departments disappeared completely when the Schools of Aerospace and Mechanical Engineering combined to become the Sibley School of Mechanical and Aerospace Engineering.

Upon his return from Brazil, Art had foreseen many of the approaching changes and he began to concentrate his efforts on the upper-class/graduate level courses, “Advanced Mechanical Analysis” and “Mechanical Vibrations”. He had already concluded that at least at the graduate level, a course in mechanical design should be organized in terms of the principles of mechanics involved rather than in terms of named machine elements. The first edition of his new notes, *Advanced Mechanical Analysis*, was privately published in 1967 and the third edition in 1972.

Art spent the summer of 1966 as a Visiting Professor at the Pontificia Universidade de Catolica, Rio de Janeiro, Brazil. In August 1968, the Burrs began a long-delayed sabbatical leave that became an extended trip around the world with sightseeing intermixed with visits with past students and active teaching and consulting at several major universities; His appointments during this period were: (a) from August 1968 to December 1969, as Ford Foundation Visiting Professor at the Universidad de los Andes, Bogata, Colombia; (b) from January to April 1970, as Visiting Professor at the Indian Institute of Science, Bangalore, and (c) from April to June 1970, as Professor and Consultant at the Indian Institute of Technology, Bombay, and the P.S.G. College of Technology, Coimbatore, India.

With retirement approaching, Art and Phyllis began looking for the ideal situation in the ideal place—considering they wanted to be “South of the Border” and Art wanted to keep active professionally, with his major effort being directed towards preparing an expanded version of *Advanced Mechanical Analysis* for publication by a major publishing company. The newly established Universidad de los Americas at Puebla, Mexico appeared to offer everything the Burrs had hoped. Upon arrival, Art was appointed head of the department as well as Professor of Mechanical Engineering and thus was faced with all of the start-up problems of a new school. This was a time of student unrest in Mexico, too, and the University was essentially an armed camp. Art, and Phyllis, decided this was not really “Eden” and in 1976 he resigned from the University and they moved to Guadalajara, Mexico.

In 1981, his book, *Mechanical Design and Analysis*, was published by Elsevier. Although quite respectable, the response was not up to what Art had hoped for; the idea and the book were ahead of the times. However, the University of Texas, Austin was more forward looking and Art was contacted by a professor—who had received his Ph.D. at Cornell, with his dissertation in the area of lubrication—to see if he would be interested in an appointment as an adjunct professor. Art was delighted! This would be his first opportunity to teach using his new “hardcover” book, there would be no more trips back to the States for access to the quality of technical library needed for his work on the second edition of his book and for access to quality medical care, he would have an office and daily professional and social contact with friends of many years, and there would be no more hassles with the Mexican

bureaucracy. The Burrs moved to Austin in 1983 and Art served as an Adjunct Professor from 1984 to 1992. Always looking ahead, Art decided that a co-author would be a good idea for the second edition of *Mechanical Design and Analysis* and his choice was Professor John B. Cheatham, William Marsh Rice University. The new edition was scheduled for publication by Prentice-Hall in the spring of 1995.

Art was a Life Fellow of ASME, a Life Member of ASEE and a member of the honor societies Sigma Xi, Tau Beta Pi, Pi Tau Sigma, and Phi Kappa Phi.

He is survived by his wife Phyllis (Carter) Burr of Austin, Texas; three children; six grandchildren; and a sister. His son, Arthur H., Jr., is a biology professor at Simon Fraser University, Vancouver, British Columbia, Canada; daughter, Merrill (Burr) Hille, is a biology professor at the University of Washington, Seattle; and son, T. Shepard, is a certified public accountant in Orlando, Florida.

Art Burr will be remembered for his stellar performances as mechanical engineer, department head, teacher, author and colleague, but those who worked most closely with him will always think of him first as a true best friend.

John F. Booker, Robert L. Wehe, Richard M. Phelan

George Lincoln Burr

January 30, 1857 — June 27, 1938

George Lincoln was born in Oramel, New York, January 30, 1857. Preparing for college at Cortland Academy in Homer, New York, he entered Cornell University in 1877, graduated in 1881, and was then appointed instructor in History and personal secretary to President Andrew D. White. The years from 1884 to 1888 he spent chiefly in Europe, studying in German, Swiss, and French universities, and collecting books and manuscripts for President White's library. He became assistant professor of History in 1889, professor of History in 1892, professor of Mediaeval History in 1902, and John Stambaugh Professor of History in 1919. From 1890 until his death he was librarian of the President White Library, and from 1924 to 1927 faculty member of the Board of Trustees of Cornell University. In 1896 he served as historical expert on the American commission to determine the boundary of Venezuela. He was associate editor of the *American Historical Review* from 1905 to 1916, and president of the American Historical Association in 1916. In 1904 he received the degree of LL.D. from the University of Wisconsin, and in 1905 the degree of Litt.D. from Western Reserve University. He retired from active teaching in 1922, and died in Ithaca June 27, 1938, at the age of eighty-one years.

As a scholar Professor Burr early acquired an international reputation. His grasp of the general field of history was exceptional, his mastery of historical literature and of historical geography was such as few historians possess, and his knowledge of the special fields of Mediaeval history, the Protestant Reformation, and the history of witchcraft and religious persecution was unrivalled. Much of his time and energy as a scholar was devoted to labors that did not result in publication. As secretary to President White, he contributed so much to the preparation of *The Warfare of Science and Theology* that his name would have been on the title page if he had been willing. He was chiefly responsible for making the President White Library one of the richest collections in the world in the fields of the French Revolution, church history, and the history of witchcraft and persecution; and his marginal notes in the books of that library add substantially to its value for scholars. His published works, all of high distinction, include many articles in periodicals and the collections of learned societies. In addition, he edited *Narratives of the Witchcraft Cases, 1648-1706*; and just before his death he finished reading proof for a work on which he had been engaged for more than twenty years—the completion of an unfinished manuscript on the history of witchcraft left in his care by the late Henry C. Lea.

Professor Burr was a great teacher as well as a great scholar. He once said that a man could teach history or he could teach *through* history. He himself could and did do both. He discouraged his students from taking notes of his lectures; the essential facts he preferred them to get from books; in the class-room he would have them listen to him and try to understand what he was saying. Often enough, no doubt, they failed to understand him fully; but, as William James said of the undergraduates who listened to the lectures of Josiah Royce, they must have had a feeling that something big was going on. Like the rest of us, he was not always at his best. Graduate students who listened to his undergraduate lectures said that he sometimes became so absorbed in erudite comment on the mysteries of bibliography that the hour ended before the lecture began. But not infrequently, getting happily started on some subject of human import and forgetting the formidably bibliographed outlines and the piled-up books which he always brought to class, he would speak as one inspired. Many of us know it well—the moving eloquence with which he would on occasion expound or defend before this faculty the causes that were dear to his heart.

George Burr—how imperishably the name is written into the history of this university and the life of this community! What enduring memories are for many of us associated with this vivid and arresting, this always human and altogether lovable personality! The short, compact, powerful figure of the man, ceaselessly active, tireless as a dynamo, at any hour of the day to be seen slipping in or out of the library, hurrying across the campus, hurrying down the hill, and, with unabated and triumphant vitality, hurrying up again. The richly stored and alert mind, keen as a Damascus blade, slaying the spurious and the inept with the deftest wit, pouring forth a wealth of relevant and curious lore for the illumination of matters great or small, and, on rare occasions, exploding into detonating wrath when goaded past endurance by the senselessly stupid, the malicious, or the cruel act. The indefatigable scholar and bibliophile, browsing and brooding in the stacks, with the still concentration of the mystic poring over some rare manuscript, or with loving touch caressing the frayed covers of ancient books. And not least the fellow man, ever friendly and ever gracious, meeting with equal courtesy and consideration the humble and the exalted, and ever ready with unfailing generosity to lend himself to the promotion of any worthy cause or the relief of any human need. No man ever better exemplified the rule of plain living and high thinking. No man was ever more tolerant of other's frailties, or less tolerant of his own. Valiant and intrepid crusader in the cause of human freedom and enlightenment! If there be any intangible possession that distinguishes this university it is the tradition of freedom united with responsibility—freedom to do what one chooses, responsibility for what it is that one chooses to do. On this memorial occasion it is altogether fitting for us to recall that no one ever did more than George Lincoln Burr to endow Cornell University with this priceless possession.

Arthur Brotherton Burrell

February 20, 1902 — May 5, 1987

Arthur Brotherton Burrell died at his home near Peru, New York on May 5, 1987 at the age of eighty-five. He was born in Cleveland, Ohio, February 20, 1902, the son of George W. and Evelyn A. Burrell. The family moved to east Cleveland where he attended public schools and graduated from Shaw High School in 1920. During the next four years he studied at Ohio State University, Columbus, and received a Bachelor of Science degree in horticulture with the class of 1924. At various times during summers in his undergraduate days at O.S.U. he worked in Ohio orchards and nurseries where he learned much about growing woody perennial fruits and the problems involved in growing apples.

In February 1925 he entered the Graduate School of Cornell University, where he majored in the field of plant pathology with minors in pomology and plant physiology. Dr. H. Earl Thomas, then a professor in the department and specialist on diseases of deciduous fruits, supervised Burrell's graduate studies.

Burrell completed requirements for a Ph.D. in plant pathology at Cornell in June 1931 with a doctoral dissertation entitled, "The Cork and Rosette Diseases of Apple in the Champlain Valley of New York". Shortly afterward in 1931, he was appointed assistant professor in the Department of Plant Pathology and professor in 1938. He retired in 1959 so that he could give full attention to and continue experimental work long in progress in his orchards in the Champlain Valley.

The story of his successful venture in apple growing in the Champlain Valley is briefly given here because it shows what a well-trained individual with courage, desire and determination can accomplish when faced with problems involved in growing apples, especially one known serious problem that awaited investigation.

In 1926 officials of the Champlain Valley Fruit Growers Association offered Cornell funds (fellowship) to support work on a long known apple problem known as "Cork" or Steven's disease which interfered with growth of apple trees and rendered the fruit worthless. Arthur Burrell, because of his experience and desire to investigate the problem, was chosen. In 1927, encouraged by Professor H.H. Whetzel of the Department of Plant Pathology, he rented a run-down orchard near Peru, New York for a period of five years where he was free to carry on necessary experimental work without interference. Working from April to mid-October each year he obtained results which proved to neighboring apple growers that their disease and insect problems could be brought under control. Burrell's tremendously important discovery was that the lack of available boron, at least in some Champlain

Valley soils, resulted in the development of the destructive Cork-Rosette diseases of apples. In addition to the discovery of the importance of boron, his studies concerned the importance of balanced nutrition, available soil moisture, beekeeping and pollination, concentrated spraying of trees for insect and foliage disease control and orchard management in general showing that all were important for success in growing apples. As a result of his research, some of it in collaboration with other researchers in the College of Agriculture and the State Agricultural Experiment Station at Geneva, apple yields in the Peru area were doubled in five years. Burrell's orchards served as a laboratory over the years for demonstrating new scientific findings. These findings were largely responsible for the growth of the apple industry in the Champlain Valley. His discovery of effects of boron deficiencies also led to applications of boron to apple orchards in many parts of the world.

Professor Burrell was highly thought of by his peers. He was a member of the honorary societies of Sigma Xi, Phi Kappa Phi, Phi Delta Gamma, and Sigma Rho. He was a fellow of the American Association for the Advancement of Science.

He was well known for promoting agriculture in New York State for half a century as an investigator, scientist, educator, grower of apples and promoter of innovations in fruit farming. In 1960 he received a citation from the New York State Horticultural Society and in 1973 from the New York State Agricultural Society for his outstanding contributions to the apple producing industry.

He was a member of the American Pomological Society, the American Society of Horticultural Science, an honorary life member of the Quebec (Canada) Horticultural Society and active in the Audubon Society. He was a member and past president of the New York State Horticultural Society and the Northeastern Division of the American Phytopathological Society.

Professor Burrell was a member for several years of the New York State Conference Board of Farm Organizations; a four-year member of the Advisory Council of the New York State College of Agriculture and Geneva Experiment Station; chairman for ten years of a Committee on National Legislation, Clinton County Farm Bureau; member of Governor Rockefeller's Advisory Council on Migrant Labor; member of the Advisory Council on Continuing Education, Plattsburgh State University College; and a member of the Champlain Valley Physicians Hospital Medical Center Corporation.

Burrell was an invited speaker at meetings over the years of the Horticultural Societies of the New England states, New York, New Jersey, Pennsylvania, Virginia and Michigan.

For twenty years, Arthur and his wife, Virginia, took annually, as many as 300 students in the elementary grades of the Peru, New York Central School, on educational tours of the Burrell orchards and controlled atmosphere facilities during harvest. In June 1987 the elementary grades of the school held a memorial ceremony for Arthur Burrell and planted two apple trees on the school campus and placed a granite marker reading: "In Memory of Dr. A.B. Burrell". Also the Clinton County Historical Society in setting up a mobile exhibit for the Bicentennial Year Celebration selected ten people who have made major contributions to the development of the Champlain Valley area, and Dr. Arthur Burrell is one of those ten.

Professor Burrell is survived by his wife of fifty-six years, Virginia (Whiting) Burrell; a son George; a daughter Marjorie; a brother; a sister; two grandchildren, and two nephews.

Leon J. Tyler

Earle Nelson Burrows

March 24, 1883 — May 6, 1951

Earle Nelson Burrows, Associate Professor of Structural Engineering, died unexpectedly at his home in Ithaca, N. Y. on May 6, 1951, after forty years of uninterrupted service in the School of Civil Engineering at Cornell University.

He was born on March 24, 188 at Deposit, N. Y., the son of Nelson D. and Adeline M. Burrows. After graduating from the Deposit High School, he entered Cornell University and was graduated with a civil engineer degree in 1907, and in 1914 he obtained the M.C.E. degree from his Alma Mater.

From 1907 to 1908, Professor Burrows was employed by the Owego Bridge Company; then followed two years' association as a structural engineer with the American Bridge Company at Chicago. In 1911, he returned to Cornell as an instructor in the then College of Civil Engineering; was made an assistant professor in 1915, and an associate professor in 1941.

In addition to his teaching, he was engaged as a consultant on many structural engineering projects and served for a number of years as a consultant bridge engineer for the Board of Public Works of the City of Ithaca, and in that capacity designed several of the smaller bridges across Cascadilla and Fall Creeks in Ithaca. During the summer of 1917, he was employed as a bridge designer for the State of New York at Albany.

As a teacher, Professor Burrows was most friendly with the students, for whose individual needs and difficulties he had great understanding and patience. He had a wide acquaintance with the civil engineering alumni. His courses in structural engineering were popular; while he demanded certain standards, yet he was patient and took great pains to demonstrate the practical application along with the theory. The students always felt free to consult with him at his office. His classes looked forward with pleasure to field inspection trips with him to existing structures, and the annual visit of the structural class to the American Bridge Company's plant at Elmira was arranged by him with much care so that the student could gain practical knowledge of steel fabrication.

Professor Burrows was an ardent fisherman and nothing pleased him more than to accompany a few of his friends on a fishing trip to some nearby stream or lake, or as he often did, take an extended journey to fish a stream in the Adirondacks or a lake in Canada. He was also interested in golf and enjoyed heartily his associations at the Ithaca Country Club, of which club he was at one time a trustee. He was a member of the Seal and Serpent Fraternity, the Pyramid Society, and the national honorary civil engineering society of Chi Epsilon.

He is survived by his wife, Mrs. Julia Vail Burrows, and a son Earle Lawrence Burrows of Pittsburgh, Pa., who was graduated from Cornell as a civil engineer in 1934. Professor Burrow's first wife, Mae Whitaker Burrows, died in 1946.

Professor Burrows' passing will be deeply regretted by a host of former students and alumni, who remember him not only as a former teacher but as a sincere friend. The School of Civil Engineering has lost a most valuable and experienced teacher and the faculty a friendly and loyal colleague.

B. S. Monroe, John Perry, George Winter

Malcolm Sandell Burton

March 26, 1918 — December 22, 1997

Malcolm Sandell Burton was born in Boston, Massachusetts, son of Reverend Charles Jewell and Ethel Sandell Burton. He graduated in 1940 from Worcester Polytechnic Institute in Mechanical Engineering, and in 1943 from Massachusetts Institute of Technology in Metallurgy with B.S. and M.S. degrees respectively. After a short stay at M.I.T., Malcolm Burton joined Cornell as an Assistant Professor in the School of Chemical and Metallurgical Engineering in 1946. He retired from Cornell in 1983 where he spent nearly his entire professional career.

In the early time, Malcolm Burton worked closely with Professor George V. Smith in the development of the Metallurgical Engineering Program, which was a part of the School of Chemical and Metallurgical Engineering. Professor Smith was in charge of the Metallurgical Program. They did research on iron and its alloys. Malcolm Burton's specialty was in metallurgical processing including casting, welding, and other joining processes, which was also the subject where he did his teaching. His teaching effort resulted in a textbook, *Applied Metallurgy for Engineers*, published by McGraw-Hill in 1956.

In the late 1950s, the Metallurgical Program began to expand as a result of a large governmental grant to develop Materials Science at Cornell. Funding was also available from the donation of Mr. Francis Norwood Bard (Cornell, 1904) to build a new and separate building for Metallurgical Engineering. Malcolm Burton played an important role in the planning and building of the new building, named Bard Hall. The build-up of Materials Science at Cornell resulted in the reorganization of academic programs. The Metallurgical Program merged into a new Department in Engineering Physics and Materials Science in 1964 from which another new Department in Materials Science and Engineering was created in 1965. During the transition period, Malcolm Burton was active in administrative matters first as the Assistant Director of the Department of Engineering Physics and Materials Science and later as the Acting Director of the new Department of Materials Science and Engineering. It was an exciting time in Materials Science at Cornell. New ideas and programs were created both in research and in teaching. Malcolm Burton's quiet and calm personality was effective amid all the excitement.

In the years following, Malcolm Burton shifted his interests to administrative activities. He joined the office of the Dean of Engineering as an Associate Dean in charge of undergraduate affairs. At that time, the first two years of an engineering undergraduate was a common curriculum administered by the College of Engineering. In his

position, Malcolm Burton was able to help a number of engineering undergraduates in their beginning years at Cornell.

Upon his retirement, he moved to California where he designed and built a new home.

Malcolm Burton will be remembered as a dedicated teacher and able administrator who served Cornell well.

Arthur Ruoff, Pete Scala, Che-Yu Li

Edwin Arthur Burt

October 11, 1892 — September 6, 1989

Ned Burt was born in Groton, Massachusetts, the son and grandson of Baptist ministers. He remembered his mother as a gentle and devout woman who taught him that the best form of religious faith is indispensable to the successful living of a life. His father he remembered in part as a zealot who early in his adult career determined, in order to demonstrate his faith in divine providence, to forswear dependence on a salaried income and allow God to provide for the material needs of his family as He saw fit. In the service of this ideal, Ned's father went to South China at the age of 45, to spend the rest of his life as a missionary for evangelical Christianity. One result of these decisions was that Ned spent several of his teenage years in China. Another that he acknowledged is that his own philosophical thought, although always deeply sympathetic to religious perspectives on the world, was marked from the beginning by a reaction against what he saw as the narrowness of his father's outlook.

Returning from China, Ned went from Mount Hermon School to Yale, where he majored in philosophy, and then to Columbia, where he earned his Ph.D. degree, and then to Union Theological Seminary, where he was awarded the S.T.M. degree. He first established his academic reputation with *The Metaphysical Foundations of Modern Physical Science*, published in 1924; the revised second edition, from 1932, is still in print and is still highly regarded. The book is a learned and fascinating account of the scientific revolution of the sixteenth and seventeenth centuries, with a critical survey of the thought of a number of seventeenth-century thinkers on the question of how human consciousness, purpose and religious aspirations fit (or do not fit) into the world that that revolution progressively revealed. It owes its eminence partly to the author's perspective on this question, as pressing in 1990 as it was in 1690 or in 1924, and partly to its convincing demonstration that one cannot read intelligently those seventeenth-century thinkers (such as Descartes, Hobbes and Locke) classified in retrospect as major philosophers, without also reading the works of their contemporaries (such as Galileo, Gilbert, Boyle and Newton), now regarded primarily as scientists. This latter moral is one with which most contemporary historians of philosophy would emphatically agree.

Ned taught for two years at Columbia and nine at Chicago before joining Cornell's Sage School of Philosophy in 1932. He was asked on arrival to take on a course on the history and comparison of religions, a new field for him. He willingly complied, and soon made both the course and the field his own. The course, which had 12 students when he first taught it, regularly drew 300 by the time of his retirement in 1960. His writings during this time

included *Types of Religious Philosophy* (1939; rev. 1951) and *Man Seeks the Divine: a Study in the History and Comparison of Religions* (1957), as well as his edition of *The Teachings of the Compassionate Buddha* (1955). Work in this area changed his own life. He felt that as the teacher of such a course he owed it to his students to take them as best he could inside the perspective of each of the faiths studied; and the result of this exercise, he found, was to broaden his own outlook, both by highlighting the basic convictions that the major religions share and by encouraging a sympathetic appreciation of what was distinctive about each. It was in this spirit that he joined the Religious Society of Friends (Quakers), and then, while in India in 1947, also took the vows of a Buddhist layman. His point, he explained, was to emphasize that his spiritual nourishment came from the East as well as the West. When he returned to India in 1953, he and his wife lived in a Hindu religious retreat. In 1966, just two westerners were invited to join in retracing the Buddha's footsteps in honor of the 2500th anniversary of his enlightenment; Ned Burttt was one of them.

Ned also accumulated numerous academic honors during his career. In 1941 he was named Susan Linn Sage Professor of Philosophy. He was elected vice president of the Eastern (and largest) Division of the American Philosophical Association in 1952, and president in 1964. He also served as president of the American Theological Society. He was awarded an L.H.D. by the University of Chicago and the Nicholas Murray Butler Silver Medal by Columbia University; and he was welcomed as a visiting professor at Harvard, Stanford and the University of Hawaii.

Ned was married twice, first to Mildred Camp in 1916, and then to Dr. Marjorie Murray in 1951. He and his first wife had four daughters, of whom two, Virginia and Winifred, survive. But, because of the passage of time if for no other reason, it is the second marriage that is remembered best by most of the friends who survive him in Ithaca. Marjorie Murray Burttt had a distinguished career of her own. After graduating from Columbia Medical School with only the second class that included women, she worked for years as a pediatrician. Increasing interest in the emotional problems of children drew her toward psychoanalytic thought. Encouraged by her acquaintance with Anna Freud, she underwent analysis herself, trained as an analyst, and after her marriage to Ned practiced in Ithaca for 30 years (with adult patients as well as children), until well past her 90th birthday. Ned shared her interest, having undergone psychoanalysis himself in the 1940s. He found that it not only helped to resolve his personal conflicts but gave him new insight into the unconscious influences on his philosophical thought, thereby freeing him to pursue new directions. In her later years Marjorie regularly hosted an informal gathering of local

psychiatrists in their home on Willard Way. Ned often sat in on the discussions, and was respected for his own thoughtful contributions from his philosophical perspective.

This was far from being the only gathering to which Ned and Marjorie opened their home. Wednesday evenings were for Friends, and for any others who wished to gather for meditation and discussion. Most afternoons students and others could come for tea and, depending on the season, enjoy either croquet or the comfort of a warm fire. (Well into his 90s, Ned insisted on bringing the firewood up from the basement himself.) At the Burtts's any students found a home away from home. All remember the warm presence of both of the Burtts and their remarkable ability to see good in people, even while maintaining a realistic awareness of the less attractive sides of human nature. Ned was rarely content to confine these meetings to small talk, and was eager to discuss with anyone the most important topics on which they held views; he drew people into such discussions easily, partly through his quiet humor, partly through his obvious interest in, and openness to, any opinions seriously held, whether or not they agreed with his own.

Ned's writing did not end with his retirement and appointment as Sage Professor Emeritus, but its direction changed. He saw himself now as less of a scholar and more of a seeker, and so gave away most of his professional library. He continued his busy correspondence with friends and acquaintances around the world: he had spoken with Gandhi in the year before the latter's death, and maintained a life-long friendship with Archibald McLeish, a Yale classmate, among others. He described *In Search of Philosophic Understanding* (1965) as "a foil against which readers can test their own evolving philosophy," and addressed his reader personally: "I put into your hands a book which has been in the making a long time; and I hope you may find it a worthy companion in your search for philosophic understanding." He completed another book, *The Human Journey*, when he was 90, basing it on the Stephanos Nirmalendu Ghosh Lectures he gave at the University of Calcutta. It was two years later that he published his final book, *Light, Love and Life*.

His own attitude toward life, and the warm affection of many friends, seemed to make the afflictions of old age more bearable to Ned than they are to many. He refused to let his loss of hearing bar him from discussion, and so often carried a child's "Magic Slate" on which others could write their questions and comments to him. Nor did he allow his increasing frailty to keep him from making at least one trip across the country, entirely by himself, while he was in his 90s. Marjorie's death in 1982 was a severe loss, but he mourned her partly by drawing strength from his friends, inviting any who wished to do so to join him for meditation in his home at eight every morning, the hour at which he found he missed her most. He continued until his final year to spend part of every day working

in his study. He died at home, in the company of friends and of his two daughters, just over a month short of his 97th birthday.

In the Foreword to his final book, Ned Burttt lamented discovering, in his 80s, that he had still not learned how to live. Most of his friends, while accepting his implication that learning must continue while life does, found that assessment too modest.

Stuart M. Brown, Jr., Nicholas L. Sturgeon

Donald John Bushey

September 9, 1896 — July 10, 1966

Donald John Bushey, Professor of Ornamental Horticulture, Emeritus, died July 10, 1966, in Tompkins County Hospital after a brief illness. He was sixty-nine years of age.

Professor Bushey was born in Rib Lake, Wisconsin. He received a Bachelor's degree in Botany from Beloit College, Beloit, Wisconsin, a Master's degree in landscape design from the University of Michigan, and a Doctor's degree in horticulture from Ohio State University.

Before coming to Cornell, he worked with the League of Kansas Municipalities in landscape planning for public and private grounds in cities and towns of Kansas. He was also associated with the Morton Arboretum in Lisle, Illinois, and superintended landscape work on several country estates around Cleveland, Ohio.

Professor Bushey joined the Cornell faculty in 1928 as Assistant Professor of Extension in Ornamental Horticulture. His appointment came at a time of state-wide interest in beautification of schools, grange halls, churches, and other public buildings, as well as private homes both rural and urban. Through his extension lectures and demonstrations, he helped thousands of people improve their home environments.

During the 1940's an increasing audience was reached through publication of several brief, well-illustrated bulletins on aspects of garden living such as recreation, pools, and outdoor fireplaces. During the 1950's Professor Bushey developed appropriate script for motion pictures and for slide lectures to meet an ever increasing audience. He prepared and used appropriately designed models of homes, plants, and gardens, precisely duplicating the three-dimensional effect for any specific landscape plan.

The models were used in television and other media to demonstrate specific landscape effects in young and mature stages of plant growth.

In 1956, Bushey was author of the book, *A Guide to Home Landscaping*. In the preface he states his sincere hope that "it will be a guide to you as a homeowner or prospective homeowner from the initial stages of planning through the final planting of your property for use and attractiveness," and that "your results will provide years of satisfaction and give you a new interest in gardening, a most healthful, happy, and outdoor recreation." Written during the early years of contemporary homes, the book is still a fundamental guide in the extension service tradition.

Professor Bushey retired in 1958 after thirty years of active service. He continued his association with landscape design as a professional in private practice. His interest in horticultural events continued with his attendance at horticultural meetings at Cornell and elsewhere.

Professor Bushey was affiliated with Epsilon Sigma Phi, Pi Alpha Xi, the American Society for Horticultural Science, the International Shade Tree Conference, the New York State Arborists Association, and the American Society of Landscape Architecture.

A. S. Lieberman, E. F. Schaufler

Frank Pores Bussell

September 3, 1878 — May 27, 1956

Frank Pores Bussell, professor emeritus, who had served Cornell as professor of plant breeding for 22 years, died on May 27, 1956 at San Gabriel, California. Professor Bussell was born on September 3, 1878 at Abilene, Kansas but soon moved with his parents to a farm in Illinois. He was graduated from Colgate University in 1901. For two years he taught classics in the high school at Geneva, New York and then came to Cornell University for a year of graduate study in philosophy while holding a Sage scholarship. After his year's graduate work he taught history and the classics in Minnesota and California. He did additional graduate work in the meantime at the University of Chicago and at the University of Illinois. From 1908 to February 1915, he managed the home farm in north central Illinois. As the result of his farm experience Professor Bussell acquired a keen awareness of the need for an adequate supply of pure seed of improved varieties of farm crops. To further his training for public service in this field, he returned to Cornell in the spring of 1915. He chose plant breeding, plant physiology, and soils as the subjects for his doctorate which he received in 1919. Having served as an instructor in plant breeding during his graduate study, he was appointed assistant professor in 1919 in charge of the extension work for the department. He was further advanced to the rank of professor in 1924, which position he held until retirement. On September 1, 1946, he was appointed professor of plant breeding, emeritus.

Professor Bussell with his thorough knowledge of farm problems, a sympathetic viewpoint and fundamental training in the sciences was able to undertake his extension teaching with unusual success. He used the demonstration method as an effective means of teaching throughout his period of service. He was among the pioneers in believing farmers should have an important part in their programs of better seeds. To this end he among others helped to organize the seed growers and distributors into a cooperative known as "New York Seed Improvement Cooperative Association, Inc.". This has now become the "New York Certified Seed Growers Cooperative". This organization has been effective in promoting the extensive use of improved crop varieties by insuring adequate supplies of pure seed.

Farmers from the humblest to the most prosperous were considered of equal importance and deserving of Dr. Bussell's best efforts. The confidence that the Iroquois Indians on their seven reservations in the state had in Dr. Bussell was exemplified by the fact that he was the first man ever entrusted with the improvement of their sacred

maize. In addition to his extension teaching, he taught the winter short courses in plant breeding for many years. On occasions he also gave regular courses in plant breeding during the college year.

Professor Bussell was an active member of the American Association for the Advancement of Science; American Society of Agronomy; Genetics Society of America; New York Seed Improvement Cooperative Association. He was also a member of Sigma Xi, Gamma Alpha, Alpha Zeta and Delta Kappa Epsilon.

In addition to his work among farmers and students he always found time to serve his community through membership in civic and fraternal organizations. He liked people and made many friends with those in all walks of life. He was a loyal and dependable friend with an ever ready word of cheer and hope and a helping hand for those in need. He was an active member of the Baptist Church where he served as a trustee, teacher, and lay minister. He joined and was a life member of the Hamilton Lodge F and A M, and belonged to the several upper bodies and served as Commander of the St. Augustine Commandry, Knights Templar.

He married Grace Eaton in 1912 who passed away in 1947, and after her death married Ruby Tobias in 1952. He is survived by two daughters, Mrs. Olivia Bussell Kikendall, Jr. and Mrs. Ruth Bussell McLay.

A. A. Johnson, H. M. Munger, R. G. Wiggans

Julian Edward Butterworth

October 2, 1884 — April 3, 1961

Julian E. Butterworth, Professor Emeritus of Rural Education, was born in Dow City, Iowa, the son of Charles Edward and Ida May Butterworth. He received the A.B., A.M., and Ph.D. degrees from the University of Iowa. His distinguished professional career began as a teacher of English in Iowa from 1907 to 1911) followed in succession by college and university appointments as Processor of Psychology at Duluth State Normal School; Professor of Secondary Education and Dean of the College of Education at the University of Wyoming; Professor of Rural Education at Cornell University from 1919 to 1952, director of the Graduate School of Education, 1931-1944, and Professor Emeritus since 1952.

Early in his professional career Julian Butterworth contributed significantly to the studies of the famous Committee of Twenty-One, of which he was a Member, in the development of programs for the improvement of rural education in New York State. He also helped to advance the scope and quality of education in rural areas through his research as chief consultant in the comprehensive study of the intermediate school district for the New York State Department of Education. His studies were supported by financial grants from the legislature and they resulted in the adoption of permissive legislation for the merger and enlargement of school districts for the purpose of providing special educational services, which small school districts could not afford to provide. As an interim step, this law provided for the establishment of Boards of Cooperative Educational Services. Many such boards have been established with resulting increases and improvements in the character and quality of educational services provided for thousands of boys and girls in rural and suburban areas of New York State.

Julian Butterworth also served as a consultant in state surveys in Virginia and New Jersey, and as director of the New Haven, Connecticut, School Survey in 1947. Following his retirement in 1952, he served as consultant to the United States Office of Education.

Many professional organizations benefited from his research and active support, including the New York State Council on Rural Education, the National Commission on School District Reorganization, and the National Commission on the Intermediate School District. He was a founder of the Cornell Parent-Teacher Institute, an organization that has served the New York State Congress of Parents and Teachers for thirty-five years. The thirty-fifth program of this organization included special recognition of the services and leadership of Dr. Butterworth.

The American Association of School Administrators presented its distinguished service award to him in 1958, in the following words:

To Julian E. Butterworth

America has been blessed with many leaders who helped build our great system of public schools. Possibly no one has contributed so much to the development of the sound structure and efficient administration of the rural and small town areas as has Julian Butterworth. For his foresight in anticipating kaleidoscopic social and economic change and for his assiduous guidance to thousands of students of school administration headed for sparsely populated areas, we take pride in bestowing upon him this award of excellence and distinction.

AMERICAN ASSOCIATION OF SCHOOL ADMINISTRATORS

Julian Butterworth was a member of the National Society of College Teachers of Education, the National Society for the Study of Education, Phi Beta Kappa, and Phi Delta Kappa. He was the author of several professional books, the last of which was entitled *The Modern Rural School*. That book is a standard reference text in its field.

Following his retirement, he and Mrs. Butterworth established the Julian E. and Veta S. Butterworth Award Endowment, from which awards are made to outstanding Cornell graduates in school administration.

Julian Butterworth was an extraordinary and inspiring teacher. He expected much of his students, and they responded appreciatively to his leadership. He knew where they could use their individual talents best and helped them to reach their objectives. Today they occupy administrative and leadership positions in school systems, in state departments of education, in colleges and universities, in state and national associations of teachers, and in foreign service.

He had great faith in the common sense and good judgment of rural people and in the democratic processes. Though a modest man, he also was realistic and uncompromising. One evidence of the sincerity of this faith and these traits was the development at Cornell of an effective University-Public School plan of cooperation in providing student-teaching experiences in the preparation of teachers and other school personnel. In the process of this development, he was instrumental in attracting to Cornell both eminent faculty and able students from many parts of the United States.

Julian Butterworth is survived by his wife, the former Veta Laura Scott, whom he married in 1909; by his son, Dr. Julian Scott Butterworth; and by two grandchildren.

William A. Smith, Donald J. McCarty, Claude L. Kulp

George Samuel Butts

June 29, 1899 — January 25, 1975

George S. (Tim) Butts was an individual of whom it can truly be said that both Cornell University and the Ithaca community are better because of his having been with us. His many talents and interests enriched both town and gown in significant ways up to the time of his death. Retirement from the New York State College of Agriculture on July 31, 1959, after thirty-four years of service to Cornell, only enabled him to devote more time to community projects.

Born on a farm near Sodus, New York, Professor Butts joined the Department of Extension Teaching and Information (now Communication Arts) in 1925 after his graduation from the College of Agriculture. His first assignment was taking charge of the farm study courses—a program enrolling over sixty thousand persons in the years that followed—and then he accepted the responsibility for the distribution of all visual materials. His responsibilities later increased to include the distribution of experiment station and extension bulletins, editorial material issued by the college, and penalty mail covers used by cooperative extension personnel throughout New York State. He also directed the film library, edited service letters for farmers and homemakers, prepared tape recordings, and took an active part in improving radio and television presentations. His administrative talents were further recognized when he was invited to serve as acting head of his department in 1956-57.

His versatility and creativity found expression in the planning and construction of animated parts for the college's exhibits at the New York State Fair from the early 1930s until 1951. His creative talents at the drawing board were translated into reality in his garage shop, where Eggbert, the talking egg, and Sam, the vocal vegetable man—now of historical state fair fame—were assembled.

During his years at Cornell he was an active member of the American Association of Agricultural College Editors, Epsilon Sigma Phi (honorary extension service fraternity), and Alpha Gamma Rho fraternity. An accomplished violinist, he was a member of the University orchestra and other musical groups as a student and continued to enjoy playing in the orchestra for the twenty years following his graduation.

After his retirement he was one of the prime movers in organizing and setting up the drive for nonpublic funds to help the College of Agriculture and Life Sciences. In the future untold numbers of students and staff will benefit from his efforts.

In the community he was a member of the Ithaca Rotary Club. Here he spearheaded the collection and distribution of food and money for the needy of Ithaca and also served as chairman of the annual Christmas Bureau Appeal.

Another of his community interests was the Tompkins County Public Library. He helped organize and administer the annual book sale, a program so successful that it has served as a pattern nationwide. Over the years he also contributed countless days working in his quiet and self-effacing way for the Tompkins County United Fund.

His leadership and organizational abilities and talents were further recognized when he was selected to serve as president of the Savage Club of Ithaca for several years. His musical talent was utilized in the club's annual Cornell reunion show. Countless alumni will long remember Tim and his cohort Allan Treman stopping the show with their performances on their "one string" instruments. Equally at home with a hammer and saw, his craftsmanship and woodworking abilities were the prime force in constructing the facilities for the new home of the club at the Village Green.

He will be long remembered for his many contributions to both Cornell University and the Ithaca community. His quiet and kindly humor, his sincere interest in his fellow man, and his willingness to help in many ways will be missed by all. He was a person about whom it can be truly said, "He had no enemies, only friends."

He is survived by his wife, Mrs. Orilla Wright Butts, four sisters, and several nieces and nephews.

Russell D. Martin, William B. Ward, Chester H. Freeman

Orrilla Wright Butts

June 25, 1904 — March 21, 1987

Orrilla Wright Butts was one of those rare individuals whose personality radiated warmth and friendliness. She had a delightful sense of humor and a quick wit that often broke the strain of a tense moment. Those qualities, plus her sincere faith in people and in their ability to help themselves, inspired confidence and encouraged families to participate in cooperative extension programs. Homemakers and colleagues alike valued her vision, leadership, and ability to develop educational programs that met the needs of families—and particularly of women—of the depression and war-torn years. She was known to her friends and colleagues as Ril.

Ril came to the College of Home Economics in 1935 as an assistant professor in cooperative extension and assistant state leader of home demonstration agents to provide leadership for the home economics program in New York State. Later she was promoted to professor in extension, coordinator of extension in the College of Home Economics, and state leader of home demonstration agents.

Ril worked to strengthen the local leadership system in New York State, where college faculty taught groups of leaders who in turn taught others in the community. She encouraged local women to serve on county program advisory committees. She obtained much satisfaction in observing the personal development of people who assumed leadership roles.

Ril was one of Cornell's effective ambassadors to those from foreign countries seeking guidance in the establishment of an extension program. She was in much demand to talk to representatives from war-torn countries to discuss the involvement of the local people in developing educational programs to strengthen home and community living. In 1949, in recognition of her interest, Ril was selected as a visiting consultant in home economics for the United States army of occupation assigned to the food, agriculture, and forestry division of the British army of occupation in Germany. One of her many responsibilities was working with committees to plan for the establishment of two new home economics institutes (colleges of home economics) with Marshall Plan aid.

Ril's ability to work successfully with people played an important role in creating understanding of the legislative decision to separate the Home Bureau from home economics extension work. Her vision for educational programs based on resources of the College of Home Economics and for audience outreach was key in directing the extension effort. Ril also had the ability to gain support of faculty and administrators at state, county, and university levels to

focus programs for people in all socioeconomic groups. This effort is now the basis for the current home economics extension program.

Ril's special assignments while employed at the college included many community and statewide commitments. She served on the WGY radio and television planning committee during the station's pioneer effort to secure homemakers' participation. She was also an adviser to the New York State Council of Rural Women and the New York State Federation of Home Bureaus. She was a member of the University Committee on Adult Education, the Intra-College Committee on Extension Studies, and the New York State College of Home Economics Scholarship Committee. In addition, she wrote articles for publications, including *Forecast* and *Better Farms*.

In 1954 Ril represented the college at the ninth annual Conference on Citizenship, in Washington, D.C. The following year she received the Merit Award from the Cornell chapter of Epsilon Sigma Phi, a national honorary extension fraternity. At that time she was cited for her ability as a teacher, an organizer, and an administrator and for her forthrightness in meeting problems.

In 1957 secretary of agriculture Ezra Benson presented Ril with the Superior Service Award "for devoted and unselfish leadership, for faith in people and respect for their ability, for skill in the multitudes of human relationships that characterize the extension service."

Her alma mater, Rochester Institute of Technology, recognized her statewide leadership role by awarding her the Margaret Gillam award on October 14, 1972. The citation was "for outstanding professional contributions to the field of home economics through the extension service."

During her retirement she and her husband traveled widely, including spending a year abroad. Ril was an avid reader and a fan of the *New York Times* crossword puzzle. Ril enjoyed playing bridge and the people with whom she played. She served on the board of the Friends of the Tompkins County Library and on the board of the Service League. Ril was the widow of Professor George S. Butts, who predeceased her on June 25, 1975.

Ril was born in Perry, New York, the daughter of Allen James and Minnie Goodridge Wright. She earned a teaching certificate in 1924 from the Mechanics Institute in Rochester (Rochester Institute of Technology) and her Bachelor of Science degree in home economics in 1926 from the University of Rochester. She did postgraduate work at Cornell and Columbia universities.

Ril was a true friend and colleague and is greatly missed.

Carolyn O. Boegly, Hazel E. Reed, Ethel W. Samson

Gwendolyn J. Bymers

June 19, 1915 — April 13, 2001

Gwen J. Bymers, Professor and Chair Emerita of Consumer Economics, died on April 13, 2001 at age 85, after a second bout with cancer. As a member of the Faculty from 1956-77, Gwen left her mark on both the college and the department for her leadership role in two transitions: that of the College from Home Economics to Human Ecology and that of the Department from Household Economics and Management to Consumer Economics and Policy. A second major contribution was her ability to inspire, encourage, and guide her students on their career paths.

Gwen Bymers' character and approach to life were shaped by two transcendent experiences: (1) growing up on a prairie farm in the Dakotas and (2) the postwar GI Bill.

Gwen graduated from high school in 1932 at the very bottom of the Great Depression. She attended Normal School and taught country school for two years before moving to the Big City—Chicago. There she studied briefly at the American Academy of Art, before becoming a Custom Dressmaker.

When World War II intervened, Gwen joined the WAC (Women's Army Corp), serving first as weather observer in New Hampshire, and then in Paris, where her horizons were truly expanded.

The World War II GI Bill that underwrote university education for former GIs served Gwen extremely well. She entered the University of North Dakota, majoring in Economics and Business Administration in 1946. She received her B.S. degree in 1948. She continued her education with Graduate Studies in Economics at UCLA where she earned a Ph.D. degree in Economics in 1958 under the direction of George Hildebrand, later an ILR faculty member. In the interstices of her Ph.D. Program, Gwen was a Lecturer in Family Economics at UCLA for three years, and served for two years as Economist at the Bureau of Labor Statistics.

Gwen came, by train, to Cornell in 1956 to become Assistant Professor in the Department of Household Economics and Management, the first economist to grace its roll. Gwen fitted herself into her department and into Home Economics. But she was always an agent for change where it seemed appropriate. In the late 1960s, the college initiated a review of both structure and program. Gwen was a valued member of the Review Committee, and during discussions of reorganization, showed her dedication to the interests of the whole college and the preparation for the new concerns at the end of the 20th Century. Henry Ricciuti, Chair of the committee charged with the reorganization of the college in the late 1960s, comments:

“This Committee dealt with a number of ticklish problems: whether there should be changes in the departmental structure of the college, possible deletion of some departments, shifts of faculty from one department to the other, a subject matter reorganization among departments. In all this, Gwen Bymers’ dedication to the interest of the college—not her department—was highly visible. She was open, forceful, but diplomatic. An extremely valuable participant.”

In 1969, Gwen became the Chair of the newly formed Department of Consumer Economics and Public Policy. Under her leadership, the department attracted an increasing number of young, discipline-based faculty who brought new viewpoints to the issues, yet were held together by the commitment to the well being of consumers and households. Gwen demanded and obtained dedication from the new recruits. She had a strong sense of good performance, for herself *and* for others.

Gwen’s leadership was recognized during her entire tenure at Cornell. Besides a seven-year stint as Chair, Gwen served on the University Council and the university-wide Faculty Council of Representatives.

As an excellent teacher, Gwen inspired her students, not to become followers, but to develop their own career paths whether in academic positions or in business. (In 1999, the American Council on Consumer Interests conferred its Super Mentor award on Gwen, 22 years after her formal retirement.) Karen Stein, a 1974 Master’s student from CEPP and Chair of the Consumer Studies Department at the University of Delaware, said:

“It was Gwen Bymers who convinced me through her actions, her leadership positions, and her personal history that one should never be hesitant about accepting challenges and reaching beyond the expected. She showed me by example what it means to exhibit leadership...I found my own voice because of Gwen Bymers!”

In 1957, Gwen Bymers, in partnership with Professors Kathryn Walker and Mary Wood, purchased “The Cottage,” a summer retreat 3 miles from Ithaca up the West Side of Lake Cayuga. The hospitality of *Walk-By-Wood* was legendary. There is scarcely a colleague, staff member, graduate or undergraduate student from 1957-90 whom did not experience the hospitality of “The Cottage,” whether in the form of a meal, picnic, boat ride, a drink, etc. In 1990, the three professors donated “The Cottage” to the college, directing that the proceeds should be used to support graduate students in Consumer Economics and Housing.

Gwen was a member of the appropriate professional organizations: the American Economics Association, the American Council on Consumer Interests, the American Home Economics Association, and the Society for Consumer Affairs Professionals in Business. She was a Consultant to J.C. Penney, Corning Glass Works, Life Insurance Institute, and BLS. And she put in overseas stints as a Visiting Fellow, University of Ghana in 1973-74; and as a Lecturer at the Salzburg Seminar.

In 1974, the University of North Dakota conferred on her its Sioux Award for distinguished service in her field. In 1977, the year of her retirement, Gwen was chosen to deliver the Colston Warne Lecture at the Annual Conference of the American Council on Consumer Affairs.

Gwen was a vigorous participant in the Ithaca community. She was an active member of the First Unitarian Church. She served as a Director of the Citizens Savings Bank and on the Boards of the Ladies Union Benevolent Society, McGraw House, and the Kitchen Cupboard and also was active in the Friends of the Tompkins County Public Library.

Gwen Byrners has left a rich legacy in the department, the college, and the profession.

W. Keith Bryant, E. Scott Maynes, Jean R. Robinson

Helen J. Cady

February 26, 1911 — October 17, 2001

Professor Emerita Helen J. Cady died October 17, 2001 in McPherson, Kansas, after a retirement of twenty-nine years from the Department of Design and Environmental Analysis, College of Human Ecology, Cornell University. Helen was born on her parents' farm near Lawrence, Kansas on February 26, 1911, and completed her secondary education in Excelsior Springs, Missouri.

Professor Cady was a life-long student as is evident in her educational pursuits and interests, receiving the Associate in Science degree from Kansas City Junior College; the Certificate of Completion for Interior Architecture and Interior Design, Kansas City Art Institute; a B.F.A. degree in Design, University of Kansas; and an M.F.A. degree in Fine Arts Education from Teachers College, Columbia University. Her love for and interest in design and the crafts led her to a variety of teaching and work experiences. Early positions included technical illustrator for an advertising agency in Chicago, and a professional interior designer in Kansas City. During World War II, she held positions as a master templater, Douglas Aircraft Incorporated in Santa Monica, California, and as a technical artist and draftsman with the Donners-Joyce Co., Chicago, Illinois.

Professor Cady's teaching career began in 1940 when she held the position of Instructor at Iowa State College, Ames, Iowa, followed by her appointment as Head of Interior Architecture and Design, the Memphis Academy of Arts, Memphis, Tennessee. In 1946, she was appointed Assistant Professor of Housing and Design (Design and Environmental Analysis), a position she held until her retirement in 1972.

At Cornell, she taught courses in interior design with an emphasis in residential lighting, history of furniture, and color. She is the author of an article on "How to Enjoy Color and Use it Effectively".

She taught weaving as a disciplined craft and as a free, "expressive art". To enhance her teaching expertise and to enrich her personal growth, Miss Cady was an active member of the New York State Craftsmen, the American Craftsmen Education Council, and the World Craft Council. She was also an active member of the American Society of Interior Designers and encouraged the interior design students to participate in the activities of the student chapter.

Helen was a member of Delta Phi Delta, national honorary art fraternity, Kappa Delta Pi, and Pi Lambda Theta. She was also affiliated with the American Association of University Professors, the Academy of Lighting Arts, and the French Azilum, Inc.

Professor Cady was a willing member on numerous college and university committees such as a subject matter consultant for the Cornell-Ghana project; a member on the Secondary School Educational Policies Committee; a member of the planning committee of the Adult Institute for Community Leaders; a consultant for local and state craft groups; and a vocational consultant for the Housing and Design Department.

Helen loved to travel, and in 1951, she was awarded a four-month travel and study to France, Italy, England, and Sweden. During a sabbatical leave in 1958-59, she traveled to Holland, Belgium, Germany, Finland, Sweden, Norway, and Denmark, which enabled her to attend design exhibitions, to meet practicing artists and designers in their studios, and to visit schools in session. In 1969, she received a travel study award from the National Society of Interior Designers for a summer session of the National Trust in England. These travels and studies, both formal and informal, gave greater meaning and depth to her teaching the history and design of furniture, architecture, and interior textiles.

Professor Cady had an unusual talent and capacity to work with individual students and to encourage them to discover themselves through special interests outside the regular classroom curriculum. Her efforts were effective, meaningful, and sincere. Her many accomplishments over her extensive and productive teaching career will be cherished by her students and colleagues.

Allen R. Bushnell, Clark E. Garner

John Carlton Cain

October 14, 1911 — June 16, 1998

If there ever was a true “rags to riches” story in the world of academe, John Carlton Cain was a prime example.

Born in Blakely, Georgia on October 14, 1911, John Cain was the son of poor, struggling sharecropper parents. Over the years, and because of the background and teachings of his mother and father, he gained respect and almost a love relationship with things growing in the soil. He also found out that having an education would allow him to become a better person and serve his fellow man in ways that he could only dream about as a child.

Eventually, he entered the University of Florida and was awarded a Bachelor of Science degree in Agriculture from that institution in 1935. Even before entering college, he had associated himself with the agricultural experiment station system of the United States, having worked as a Field Assistant at the Florida Sub-tropical Experiment Station from 1930-31 and then from 1931-35 at the Florida Agricultural Experiment Station as a Laboratory Technician.

After graduating from the University of Florida, he continued his stay at the Florida Experiment Station until 1940, first as a Research Assistant, then as an Assistant Horticulturist his last three years. His primary work was with citrus crops.

In 1940, he felt it important that he advance his educational standing and entered Cornell University to study in the field of Pomology. He also worked as an Instructor in Research in the Department of Pomology while obtaining his degree.

World War II interrupted his education temporarily. He entered the United States Army in 1942 and served as a commanding officer until his discharge in 1945. He had an outstanding military career and was awarded the Bronze Star for his achievements.

After the war, John Cain returned to Cornell University where he was awarded a Ph.D. degree in 1946. That same year, he was appointed an Associate Professor of Pomology at the New York State Agricultural Experiment Station in Geneva. In 1951, he was appointed to the position of Professor of Pomology.

This outstanding scientist came to the Geneva Experiment Station with a superb background. He had advanced training in the fields of pomology, plant physiology, plant biochemistry, and soils chemistry. While in Florida, he

gained considerable experience and knowledge of cold storage problems of citrus and other sub-tropical fruits. He also had conducted, before coming to Geneva, six years of research on the nutrition of deciduous fruits.

From the time he came to Geneva until his retirement in 1973, he expanded the horizons of his fellow colleagues and the fruit industry, not only in New York but also in other parts of the world, with his outstanding contributions in the field of plant nutrition. Other scientists universally recognized his studies demonstrating nutrient uptake and interactions in fruit plants. Later in his career, and working with agricultural engineers from the Ithaca campus of Cornell University, he turned his attention to the mechanical pruning and harvesting of trees and the design of orchards and trees. Many of the things that John Cain recommended during his career concerning nutrition, spacing, and planting of tree-fruit orchards have stood the test of time and are still being used today by leading fruit growers.

John Cain was always looking for something new to do, or some different tack to take with a particular project. In his private life, he developed a great affinity as an amateur astronomer. This interest in astronomy perhaps led him to one of his most fascinating cooperative projects with the astronauts in the Apollo Space Program. With the cooperation of some friends close to the astronauts involved in the program at the time, John got the astronauts on both Apollo Flights 10 and 13 to smuggle apple seeds in a fountain pen aboard those spacecrafts. The seeds were from the variety, Flower of Kent, grown at the Geneva Station. This variety was particularly suitable for a “zero-gravity” flight because this apple was the same variety that reputedly hit Newton on the head when he discovered the laws of gravity. Following the flights, John Cain and his colleagues at the Station grew seedlings from these seeds. For a number of years, there were three trees growing on the campus of the Station that represented these two flights. One of the astronauts involved in the project, James Lovell, sent Dr. Cain a letter of thanks for helping with this project.

Dr. Cain’s work was not confined to New York State. In 1954-55, he served as a horticultural advisor to the Catholic University in Santiago, Chile. Then, in 1964, he acted as a consultant at the Inter-American Institute for Agricultural Science in Turrialba, Costa Rica. In 1972, he was elected a Fellow of the American Society for Horticultural Science, the most prestigious award of that outstanding organization of scientists. Only a handful of individuals out of a membership that exceeds 3,500 are elected each year as Fellows. From 1972-73, he served as President of the Northeast Section of the American Society for Horticultural Science. He also was an Associate Editor for the Society for five years.

During his career at Geneva, he authored 73 scientific papers in the fields of fruit nutrition, mechanical harvesting and pruning, and orchard design. He was awarded the title of Emeritus Professor upon his retirement in 1973.

He and his wife, Marie, were married for 63 years, and the couple had two sons, James McRae and John Jr. Dr. Cain was 86 years of age when he died.

R.E. (Pat) Krauss, Charlotte Pratt, Roger D. Way

George Chapman Caldwell

August 14, 1834 — September 7, 1907

“The Faculty of Cornell University inscribes the following tribute to the memory and worth of the late George Chapman Caldwell, Professor of Agricultural Chemistry in the institution from its inauguration in 1868 up to his retirement as emeritus in 1902, of analytical chemistry since 1875 and of general chemistry since 1891.

Educated in Harvard and Göttingen, after a teaching experience in Antioch College, O., and the Agricultural College of Pa., he was the first professor appointed to the faculty of Cornell, where he presided for 34 years over the Chemical Department, while it grew from a small class-room and laboratory until it taxed the capacity of two large buildings with a teaching staff of 21 — one of the leading centers of chemical education and achievement in the world.

In the chemical profession he early took high rank, his book on agricultural chemical analysis, the first work on that subject in English, was at once accepted as an authority and aroused an active interest in the important field which had been so brilliantly exploited by Liebig in Germany. His text books on analytical chemistry received a corresponding wide appreciation and adoption.

It was characteristic of Professor Caldwell that he kept himself in closest touch with all advances in a rapidly developing “and almost illimitable subject, and unfolded this to his students in class room and laboratory, inculcating and enforcing such precision of method and thoroughness as would make all work of a full and permanent value. The many students, trained under him, and who now occupy prominent positions in teaching, in government service, in agricultural experiment stations and in collegiate and industrial positions, and their uniform success, bear forcible testimony to the efficiency and value of Professor Caldwell’s teaching.

His varied and comprehensive acquaintance with all divisions of the field of chemistry and the critical acumen with which he had worked out each subject received deserved recognition when, in 1892, he was elected to the presidency of the American Chemical Society. This great capacity for accurate and excellent work was early recognized by the Faculty, in which he served as Secretary from 1872 to 1886. The intimate acquaintance thus secured with all departments of the University work rendered him a trusted and valued adviser in all matters of university policy.

Not of an assertive nature Dr. Caldwell stood out as a great man on the basis of strenuous work, thoroughness in every detail, accuracy in every result, and a sound judgment in seeking and arriving at the truth.

His social life harmonized with his professional. His was the quiet, abiding friendship, the valued advice, the sterling example, the safe guidance. His students owed their prospects in life no less to this worthy influence than to the great excellence of his instruction, and everywhere they unite in thankfulness that they were brought under the influence of such a man. His name is to us a memory of the early builders of the University, a man deeply imbued with the scientific spirit, one who inspired his students to their best efforts in spite of the personally unostentatious disposition, a sincere lover of truth, and a worker who never wearied in well-doing.

James Law, B. G. Wilder, L. M. Dennis

James Campbell

February 18, 1919 — March 8, 1962

Born in Gillestown, Ireland, James Campbell came to the United States at the age of four, lived for a few years in Pittsburgh, and then attended elementary and high schools in Salem, Ohio. In 1940 he was graduated from Wittenberg College, where he had majored in mathematics. For the first two years after graduation he was a junior high school teacher; then he served for four years in the Army Air Force.

Coming as a graduate student to Cornell in 1946, he continued here for the remaining sixteen years of his life. He received the M.S. degree in 1947, with a major in educational administration, and the Ph.D. degree two years later, with a major in student personnel and minors in educational psychology and human relations.

His relationship with the School of Industrial and Labor Relations started in 1948, when he became a research associate. In the following year, upon completion of his graduate work, he was appointed Assistant Professor; in 1953 he was promoted to Associate Professor, and on July 1, 1961, to Professor.

Although he did some extension and resident teaching, Professor Campbell's work was primarily in student personnel. While still a graduate student, he was a part-time vocational counselor. For a time he directed the Division of Unclassified Students, but most of his professional years he devoted to the Office of Resident Instruction in the School of Industrial and Labor Relations. He was acting director of the Office of Resident Instruction in 1956 and in 1961, and he was named director January 1, 1962.

Professor Campbell rendered important service to the University by serving on many committees, including five years on the Committee on Student Activities, four years on the Committee on Student Conduct, four years on the Administrative Committee of the Division of Unclassified Students, and five years on the Committee on Calendar.

After only a few days' illness following a coronary thrombosis, Professor Campbell died March 8, 1962.

Professor Campbell enjoyed the universal respect of his colleagues for the high order of his personal, moral, and religious qualities. He exemplified, to an eminent degree, the Renaissance ideal of the fusion of knowledge and being—to be the good that one *knows*—the ideal that John Milton expressed in his statement that the true poet “ought himself to be a true poem.” One felt in the presence of James Campbell that one faced a whole person, a man for whom there was no separation of fact from value, existence from ideal, the outer man from the inner man. He was one of the few men of whom, without hesitation, one could say— one *wants* to say—that he was pure in

heart. While God did not give him abundance of years to live, however, by upholding him in the integrity of his heart, God gave him an unusual measure of grace.

To those of us who are teachers, James Campbell was a daily reminder of the fact that the essence of our work is not to teach subjects but persons. For whenever one met with him—in his office, at committee or faculty meetings, at a coffee break, in the corridor—one came to feel one's own inadequacy, for while we knew our books and subjects, he knew the students, knew them as persons as well as students—their names, their problems, their sorrows and joys, their defeats and victories, their frustrations and goals. Human beings who were mainly abstractions to their teachers were to him human beings—persons with whom he stood in an I-Thou relationship, the essence of which was a courtesy in which there was no taint of craft, a love in which there was no diminution of independence and dignity.

Donald P. Dietrich, Duncan M. MacIntyre, Milton R. Konvitz

Joseph Kearns Campbell

October 30, 1927 — August 4, 1997

Joseph Kearns Campbell, Professor Emeritus of Agricultural and Biological Engineering, passed away peacefully at his home in Fredricksburg Texas on August 4, 1997. Professor Campbell is survived by his wife, Sigrid (Beicht); daughter, Sabine Hyland; son, Oliver; brother, John D. Campbell; and sisters, Ann Campbell and Susan Campbell Shell.

Joe was born and raised in Belleville, Pennsylvania. In 1945, he volunteered for the U.S. Navy and served three and one half years as a Radarman. In 1953, he earned a Bachelor of Science degree in Agricultural Engineering at Pennsylvania State College and then worked for eight years as a Design Engineer at New Holland Machine Company in New Holland, Pennsylvania. During the next four years, he worked at Allegheny Ballistics Laboratory in Maryland as part of the team that developed the Polaris missile launch system. In 1967, he completed a Master of Science degree in Agricultural Engineering at Cornell and joined the faculty as an Extension Engineer. Joe retired from Cornell in 1992 and he and Sigrid moved to Fredricksburg, Texas shortly thereafter.

Joe had a very successful career at Cornell University and was active in teaching, research and extension, serving as Department Extension Leader from 1983-89. His outgoing personality, formal training and practical “hands-on” engineering experience in industry made him a natural extension educator and a great university teacher. Joe’s leadership in extension was clearly evident as he inspired all those around him to expand their efforts in transferring information and technology into the farmer’s hands. To this end, he produced upwards of 150 articles and papers of practical content aimed toward production agriculture and technology transfer. A number of these publications received Blue Ribbon awards, a national recognition by the American Society of Agricultural Engineers. Joe was a registered Professional Engineer and held four U.S. Patents at the time of his retirement.

Joe was a recognized authority on tillage and implements appropriate for use by the smallholder farmer in the international community. To this end, he developed a popular undergraduate course, Agricultural Mechanization--an International Perspective, which he taught from 1981-86. Students learned about the simple tools and machines used in developing countries and drew upon the examples he had encountered in his many real world experiences. His course was a blend of engineering, production agriculture, and social and political science. This made his course unique in an engineering department, for he taught mechanization using examples of engineering principles which had in many cases evolved and been tested in agrarian cultures for hundreds of years. The fact that many of

the technical features of the “third world” tools formed key elements in modern machines made his course equally relevant to both international and domestic students.

Joe expanded his international agriculture expertise by spending sabbatical leaves at the International Rice Research Institute (IRRI) in the Philippines, and at the International Potato Center (CIP), in Lima, Peru. During his sabbatical at IRRI, he served as head of the Agricultural Engineering Department and wrote the textbook *Dibble Sticks, Donkeys, and Diesels*, which is a practical guide for appropriate technology transfer and sustainable agricultural mechanization. While at CIP, he focused on simple machines for cultivation and processing of potatoes. In addition to this formal international involvement, Joe worked as an engineering consultant with a number of international agencies on projects in Indonesia and Africa.

After Joe retired, he and Sigrid moved to Fredricksburg, Texas, a small town that has retained much of its German heritage. Joe and Sigrid busied themselves there with settling into their new home, writing the Campbell and Beicht family history, enjoying their new grandchildren and hosting a number of visitors from around the world. Joe continued to pursue his many hobbies, one of which was a long time association with a Model A Ford pickup. During this same time, Joe continued his battle with cancer.

What we remember most and appreciate most about Joe was his constant positive attitude. He was a role model to all that knew him and he was a person who led by example. Joe was always looking on the positive side of things and he was a constant source of new ideas and concepts. He always encouraged his students in the classroom and on the farm to “try it out”, to implement new technology and improved methods in a positive way in order to make work more efficient and labor less tedious. His office was often a beehive of activity featuring international visitors, graduate students, extension specialists and his Cornell peers discussing technology, research, or the latest extension information. Everyone appreciated his willingness to help solve problems, his creativity in making technology useful, and his ability and patience in explaining it all in printed and spoken words. He was an eternal optimist who sought to improve peoples’ lives by generously sharing his many talents. He was a mentor and a friend and we miss him deeply.

James A. Bartsch, Roger F. Sandsted, Michael B. Timmons

Ralph Norton Campbell

March 7, 1910 — July 25, 1971

Ralph Norton Campbell died unexpectedly in Phoenix, Arizona, less than a month after he retired from the Cornell faculty and but a few days after he was elected professor of industrial and labor relations, emeritus, by the Board of Trustees. He was 61 years old.

Born in Minotola, New Jersey, Ralph attended Rutgers University, where he became editor of the college newspaper and was elected to Phi Beta Kappa. Upon graduation from Rutgers in 1931 with the Bachelor of Arts degree, he worked a year as reporter for the New Brunswick *Daily Home News* and *Sunday Times*. He returned to Rutgers for the academic year 1932-33 as a graduate student in history, after which he began a seven-year stint on the staff of the university as, variously, assistant director, public and alumni relations; associate alumni secretary; and director of personnel and placement.

During World War II he rose from first lieutenant to colonel. He was chief of the Officers' Division of the Adjutant General's Section, Headquarters Eastern Defense Command and First Army (1940-43); chief of Personnel Division, Headquarters First Army (1943-45); and Adjutant General, Advanced Echelon, Headquarters First Army (1945). He served in both the European and Pacific theaters of action and was awarded the French Croix de Guerre, the Bronze Star, and the Army Commendation Ribbon.

The field of labor relations in 1948 was the focus of often intense, and not altogether rational, debate. Cornell's School of Industrial and Labor Relations in its fourth year was still suspect in some quarters within the state, and the extension activities of the School, because of their greater visibility, were especially subject to hostile criticism. It was in this climate that Ralph Campbell, who had received the M.B.A. degree with distinction the year before from the Harvard Graduate School of Business Administration, joined the Cornell faculty and became director of extension in the ILR School. The full range of Ralph's considerable talents as an administrator and mediator were employed in developing a program which, by the time he relinquished his post in 1956, had assumed the basic form that it has today.

As the administrator of what became a large and growing educational enterprise, Ralph Campbell exhibited a style natural to him, one of gentle determination. He encouraged, he prodded, and at times he was obstinate. But throughout it all, he was kind, gentle, and supportive in his relations with others.

In 1956 Ralph gave up the duties of extension director (he was to return for another tour from 1960 to 1963) in order to devote more time to teaching and research in management organization and development and in the social role of American business. In the classroom his methods were Socratic as he sought to expose error by persistent questioning and challenging of his students. During this period he coauthored with Elizabeth Knowlton the monograph *Business Leadership in Air Transportation*, which grew out of his experience in organizing and directing an innovative training program for the management leadership of American Airlines. In 1956 he became a member of the faculty of the School of Education at Cornell and served actively with that School until 1966. Ralph did not completely fore- swear administration, however. He became the director of University Summer Sessions in 1956 and retained the post for the next two years. Also from 1958 to 1960 he was head of the ILR School's Department of Human Resources and Administration.

Ralph Campbell's interests in and contributions to the field of adult education were manifold. In addition to his achievements through the ILR Extension Division, he was a prime mover in the establishment of the National Institute of Labor Education and as its president functioned as a creative force in labor education. In the National University Extension Association he served as chairman of the Industrial and Labor Relations Committee. Closer to home, he was a cofounder and the first executive director of the Ithaca Festival of Classics.

The breadth of his interests and abilities is further reflected in some of Ralph's other activities. He was impartial chairman of the New York State Advisory Council on Minimum Farm Wages and an active labor arbitrator as a member of the national panels of the American Arbitration Association and the Federal Mediation and Conciliation Service. Shortly before his death, Ralph completed a study for the Episcopal Diocese of Central New York on organization, structure, and decision making within the church.

He is survived by his wife, Marian McCauley Campbell; a son Peter; a daughter Patricia; two stepdaughters, Patricia McCauley and Nancy McCauley; a stepson, Philip McCauley; and two brothers, Clarence and Edward.

Alice H. Cook, Felician F. Foltman, Ronald Donovan

Samuel Gordon Campbell

December 10, 1933 — September 29, 1997

Dr. Samuel Gordon Campbell died on September 29, 1997 at age 63 years. He was born on the west coast of Scotland in Oban and was raised in the small town of Crieff where he learned and developed a liking for the rural life — especially animal agriculture, and particularly sheep husbandry. He chose veterinary medicine as his career and graduated from the School of Veterinary Medicine at Glasgow University at the young age of 22; after an internship at Glasgow University, he earned a Master of Science degree in Microbiology at the Guelph campus of the University of Toronto, Canada. He was then required to serve in the military in Britain and was posted as an officer of the Royal Army Veterinary Corps to a dog-training unit stationed in Malaya. Gordon then decided to pursue an academic career and came to Cornell University in 1961, obtaining his Ph.D. degree in Microbiology in 1964. Except for three years as a member of the faculty at the University of Melbourne, Australia, the rest of his career was spent at Cornell University, where he became an Assistant Professor in 1967 and achieved the rank of full Professor in 1978. He also held the post of Associate Dean for Academic Affairs at the College of Veterinary Medicine for five years; following this appointment, he became Director of International Programs. Thus, his contributions to Cornell University span over 30 years and incorporate a breadth of responsibilities including administration, research and teaching, for which he was given a distinguished teaching award in 1994 by the Agriculture Honor Society, Gamma Sigma Delta. This was not surprising since Gordon's lectures were spellbinding affairs richly decorated with amusing but relevant anecdotes. His research expertise encompassed the disciplines of bacteriology and immunology and he was always most interested in the practical application of his science. In fact, he engaged in a fair bit of sheep extension work in his own time and on top of his formal responsibilities. Gordon became involved in international affairs in part due to his experience in Malaya, and in part because small-ruminant husbandry represents a particularly important part of agriculture in developing countries. Always a supporter of the less privileged, he worked for many international aid organizations including the World Bank, the U.S. Agency for International Development and the Food and Agricultural Organization of the United Nations.

This catalogue of achievements does not define the personality of the man. Gordon's Scottish heritage (of which he was very proud) and his determination to retain and embellish his Scottish dialect (and harp and bagpipe skills) were combined with other Scottish traits such as being forthright in communication and requiring honesty and integrity from those with whom he interacted. As a member of the Cornell community, the needs of students were

foremost on Gordon's personal agenda, as was the need to have representation of the faculty in the major decisions concerning governance of the university. Gordon served with distinction (often as chair) on many college and university committees. At meetings of the faculty of the college, his Scottish brogue was heard loud and clear as it rang around these halls with forcefulness and passion, and his subtle sense of humor. Gordon's great wit and personal charisma also made him an excellent raconteur, and he was much in demand as an after dinner speaker.

He loved his profession and practiced it beyond Cornell, living on a farm in Dryden called "Hickory Ridge" with his wife, Elizabeth (Beth) and their sons, Rory, Kyle (Cornell 1990; Veterinary class of 2000), and Scott. He raised sheep, cattle and Border Collies, and bred and trained Collie sheep dogs. He was chairman of the Tompkins County SPCA and therefore practiced his profession to the ultimate level. Gordon and Beth Campbell were active in community affairs, and he was the founding president of the Rotary Club of Dryden. He enjoyed working with young people and on the day of his death had played soccer with some of the young men of the community. Thus, the Cornell and the Tompkins County communities have lost a person of great intellect, energy, enthusiasm and moral strength. However, he leaves a recorded legacy in the published minutes of the meetings of the faculty for future generations to emulate. In addition, the students, staff and faculty of the Department of Microbiology and Immunology, have planted a red oak tree in Gordon's memory at the entrance to the Veterinary Medical Center.

Hollis Erb, David Robertshaw, Roger Avery

Thomas Harrison Canfield, Sr.

January 19, 1916 — April 8, 1993

Thomas Harrison Canfield was born on January 19, 1916 in Butte, Montana, and received his Bachelor of Architecture degree from Ohio State University in 1939. During World War II (1942-46), he served with the Navy Strategic Bombing Survey in the Pacific Theatre, interpreting aerial reconnaissance photos for promising strategic targets in Japan, for which he was awarded the Army Commendation Medal.

In 1947, he joined the faculty of the College of Architecture where he taught Architectural Design and, for a number of years, Building Material and Construction. As a design critic, he was devoted to his students and constantly challenged them to do better. Nothing was ever good enough and he was a stickler for detail and for respecting the program. Two constant admonitions were: “Draw it, don’t talk about it!” and “Don’t worry about being original—be good!” One of his techniques for encouraging good work was to regularly schedule “crits” in his office, instead of just cruising in the studio, so that one had to bring all of one’s work for a substantive preliminary review. This lent a greater sense of urgency and responsibility to the process, as all who waited their turn out in the corridor will clearly remember.

Also, his studio was never his personal “atelier” and he never promoted a single point of view, but always encouraged students to pursue their own strengths and interests and to be the best at whatever they ultimately did, whether it be architecture, or technology or art, etc. On one occasion, he told a student, “I know you can be an architect, but can you be an artist?” The answer proved to be a resounding yes! Another time, he told a student who was considering a year in Europe, “If all you achieve is to learn something about French wines, consider your time well-spent.”

For many students, and new colleagues, he was also a mentor and friend. He often hired students for temporary drafting help on some of his personal projects or for work on his on-going renovations on his house on Eddy Street. Many distinguished alumni of the period regard him as the best and most influential teacher in their careers; one who played a pivotal role in shaping their attitudes.

Not only was he an active and dedicated teacher of architecture, he was also an active practitioner. Soon after he joined the faculty, he went into partnership with F.M. Wells, the head of architectural design, and together they designed a number of contemporary homes in the Ithaca area.

In the early 1960s, he headed up the design team of Tallman & Tallman, Architects, designing the new Ithaca College campus on south hill. This was a major challenge which he relished, single-handedly doing virtually all of the preliminary schematics. Colleagues from those days describe him as the consummate draftsman and designer who was so fast and so accurate and thorough that, as soon as the preliminaries were approved”, they could immediately proceed to the contract drawing stage. During those years he was virtually on a non-stop series of “Esquisses”, evenings and weekends working in his studio at home, cranking out endless preliminaries on yellow trace for building after building. He practiced what he preached. In 1970, Ithaca College awarded him an honorary Doctorate of Fine Arts. And, on a visit to the new campus, Governor Rockefeller remarked that it was the handsomest campus in the state.

But his interests and activities ranged even more broadly. In 1958-59, he joined Associate Dean Henry Detweiler, professor of architectural history, and others as the field architect for the Harvard-Cornell Archeological Expedition of Sardis, Turkey where they discovered and excavated the ruins of the ancient city of Croesus. And, in the mid-1960s, he and several other College faculty members worked together with several alumni to help them establish the first school of Architecture at the University of Puerto Rico in San Juan. One of the leaders of their effort, Jesus E. Amaral (B. Arch. '51), a former student, was appointed the first dean of the new program. During the 1968-69 academic year, Canfield spent his sabbatic leave teaching there as a visiting professor. He was also involved in local planning projects with the firm of Kelly, Parsons, Canfield and Stein, and from 1961-63 he served as a member of the Ithaca Planning Board.

Upon his retirement in 1976, Canfield moved out to the countryside in the Buttermilk Falls area, for a well-deserved rest from the hectic pace of his active years.

He will be remembered fondly by many Architecture, Art, and Planning alumni and former colleagues for the high quality of his teaching, his rigorous standards, his devotion to his students, his dedication to creative work, and his warm personality. He is survived by his wife, Dorothy Fogel Canfield of Ithaca, a son, a daughter, and a sister.

Charles W. Pearman, John Reys, Alexander Kira

Helen Canon

August 15, 1888 — July 9, 1954

The death of Helen Canon, Emeritus Professor of Economics of the Household and Household Management, brought a heavy sense of loss, not only to members of her own department, but to the entire College of Home Economics. Yet this sense of loss was accompanied by deep pride in the rich contribution Miss Canon had made over the years to the breadth and soundness of the growing field of home economics, and more particularly to the area of her greatest interest, the art and science of management and economics in their relation to family living.

For thirty-seven years Helen Canon was connected with home economics at Cornell University, through its early years when it was a Department of Home Economics in the College of Agriculture; later when it became a School, and finally in 1925 a College of Home Economics. Miss Canon's interest in the application of economics and management to homes developed from close association with Martha Van Rensselaer who was a pioneer in this field. Miss Canon came to share with Miss Van Rensselaer a tremendous respect for the size and scope of the work of the homemaker and for its economic importance. Both saw the limitations placed on women because inadequate consideration and study had been given to the work they must perform. As Miss Canon's interest grew, there appeared the clear need for rigorous and long-time study in the fields that touched on this interest. Gladly she undertook such study and willingly she gave the time to it.

Her appreciation of the need for objective knowledge of the varied ways families were managing their household work and finances was evident in a survey she made in 1928 of the financial management of nearly two hundred farm families whose business enterprises had been studied by the Department of Agricultural Economics in the College of Agriculture. She recognized that only through accumulation of factual material about family management was it possible to develop sound and acceptable principles of management and techniques for performance. The material gathered through research in the way families lived and managed, continually impressed her with the soundness of the individual and independent thinking of families. She used research findings not to establish rules, but to show increased possibilities for management.

Miss Canon defined the major functions of the field in these words, "... to explore and clarify the process of management in democratic family living and to develop techniques that will be helpful to families in their managing. Managing in a home not only takes its cue from the individual family's values and desires, but scales these to the resources and limitations of the family and to the present and prospective conditions in the outside

world. ... To draw from the field of economics such facts and generalizations from facts as can be of use to families in their managing, to help families appreciate the two-way connection between their economic activities and those of the larger society and to represent the interests of families to outside economic agencies from close association with family practices and values ...”

In 1930 Miss Canon secured the Ph.D. degree from Cornell University and in that same year she was appointed Professor of Home Economics and Head of the Department of Economics of the Household and Household Management. In the following twenty-two years of her leadership, research studies continued not only in homes throughout the State but in the College laboratories, enriching the subject matter of the field and enlarging the curriculum both at the College and in the Extension program. Staff members were selected and trained, largely from the growing number of graduate students who were attracted by the soundness and originality of the program she was developing.

Students with whom Miss Canon worked will always remember the vitality and inspiration of her teaching, the force of her words, her far vision, the clarity of her thinking. They acquired her conviction of the need for women to gain an understanding of the economic structure of society in order to make their full contribution as homemakers and as members of the community and the larger society. Through her, students learned devotion to a field of work. Her colleagues appreciated and relied on her power to penetrate to the heart of a matter. In any group in which she worked her calm thinking and clear presentation helped to bring order to a tangled issue.

To all she was endeared by the warmth of her personality, her genial hospitality, her ability to give quick and complete response to the problem of another. All those who knew her remember her love of the out-of-doors, her appreciation of beauty in homely experiences and above all her gift of living fully and with joy.

Beulah Blackmore, M. A. Rollins, Jean Warren

Helen Gertrude Canoyer

June 20, 1903 — February 25, 1984

Helen G. Canoyer, retired dean of the College of Home Economics (now the College of Human Ecology) and emeritus professor of household economics and management, was distinguished in academic and government circles as an administrator, educator, adviser, and trailblazer for women. During her Cornell deanship Canoyer instigated the evaluation of the College of Home Economics that eventually led to its reorganization as the College of Human Ecology. She also spearheaded the drive to build the new wing of Martha Van Rensselaer Hall, which was dedicated in 1968, shortly before her retirement, and began an annual institute for community leaders that was held for many years.

Born in Melrose, Minnesota, Dean Canoyer attended secondary schools throughout the Midwest. She received her B.S., M.A., and Ph.D. degrees from the School of Business Administration at the University of Minnesota, then served on the faculty there for more than twenty years as an assistant, associate, and full professor of economics and marketing. Dr. Canoyer was one of the first women to be awarded a doctoral degree in economics with specialization in consumer economics and marketing.

During World War II Dean Canoyer left her academic post to serve as an economic analyst in the food section of the War Production Board. She then held an appointment as an economist in the distribution division of the Bureau of Foreign and Domestic Commerce, Department of Commerce, and in 1945-46 was the assistant chief, Division of Research and Statistics, Office of Alien Property Custodian.

In 1954 Dr. Canoyer, on becoming dean of the College of Home Economics, was also appointed the first woman faculty member of Cornell's (then) Graduate School of Business and Public Administration; she taught a course in the school's marketing program.

Dean Canoyer was dedicated to the development and maintenance of excellence in the three thrusts of the college: resident education, research, and extension. Her drive and energy resulted in strong growth in these three areas. Her interests were broad and eclectic and included education in home economics for both men and women. She enthusiastically encouraged young men to explore the field of home economics as a career.

One of her most compelling interests was in promoting the professional growth of women, as she saw society emphasizing more and more the dual role of women in homemaking and in work outside the home. She believed

that the basic changes that reshaped the living pattern in the home made it essential for more women to be equipped to make the complex adjustments resulting from this dual role.

This interest was intensified through her involvement in international programs of women's education. She was one of a group of United States educators who conducted workshops in East and West Africa on "Problems of Education of African Women Educators." The workshops were followed by a request from the government of Ghana for help from the faculty of the College of Home Economics. The resulting cooperative project, along with projects in Liberia and the Philippines, continued for several years and involved several faculty in the college.

Honored for her professional contributions, Dean Canoyer received the University of Minnesota's 1956 alumni achievement award "for her distinguished achievement record."

In 1962 President John F. Kennedy appointed Dr. Canoyer as chairperson of his Consumer Advisory Council. She oversaw the compilation of a council report that was later published. In 1963 she received a citation of appreciation from the American Home Economics Association for her service to the federal government and to peoples of other countries. The citation specifically referred to her chairpersonship of the Consumer Advisory Council, saying she had "steadfastly represented the interests of the consumer; established the value of home economics as a discipline fundamental to the welfare of the consumer; brought to other members of the association inspiration in professional service to the consumer; and cooperated with recognized leaders to determine and develop the means by which the consumer may be heard, may be protected, may speak, and may be informed." At that time she had just completed a term on the Commission on Federal Relations of the American Council on Education.

Other professional activities through the years included being a member of the editorial board of the *Journal of Marketing* (1941-47); chairperson of the Land Grant Home Economics Study Proposal Committee; director of the American Marketing Association; director of the National Association of Consumers; director of Consumers Union; director of Grand Union; member of the American Council on Education; officer of the New York State Minimum Wage Board for Retail Trade; and member of the Council of the New York State Department of Commerce and Agricultural Advisory Committee.

She co-authored, with Professor Vaile, two books: *Income and Consumption* and *The Economics of Income and Consumption*. She also contributed numerous articles on home economics, cooperatives, and the role of land-grant colleges to a variety of professional journals. She was an accomplished speaker and was in frequent demand by both national and international groups.

Throughout her tenure at Cornell she was a dynamic and incisive leader. Her energy, drive, and vision contributed significantly to the present high status of the college.

She retired from Cornell University in 1968 and went to the University of Massachusetts to serve as dean of home economics. She moved to San Francisco in the late seventies, where she resided until her death, in 1984.

Urie Bronfenbrenner, Kathleen Rhodes, Jean McLean

Raymond M. Cantwell

September 21, 1927 — November 11, 1980

On November 11, 1980, the School of Hotel Administration lost one of its most loyal and dedicated alumni, Ray Cantwell.

Ray was a unique person: a self-made businessman who never lost sight of his early career struggles, who therefore always had time, sympathy, and understanding for those starting their careers. As a colleague he was a delight; he challenged, he provoked thought, he offered sage advice, he empathized. As a friend he was fun, a smiling Irishman in the best sense of the phrase, someone who always had time for a laugh.

When Ray Cantwell traveled, he read all the signs, climbed all the famous hills, found every historical site, snapped every picture, quizzed the guides and local citizens for every detail, and, on his return, shared his discoveries in the fashion of the great early explorers. He invested his life with the same qualities of enthusiasm, curiosity, and zest.

His was not an easy childhood. His parents died before he was eight years old. Although Ray received kind help and care from the nuns and loving support from his older brothers, he had to be self-reliant from the beginning. The decisiveness and independence he developed in those early years were sources of strength throughout his life. That strength was sustaining and generous—never harsh, never strident, never demanding.

Perhaps because of his early experiences, Ray had a profound respect for the importance of commitment to significant institutions. For Ray, the most significant of these institutions were his church, his school, and his family.

Ray was an active member of St. Catherine of Siena. His faith and devotion were unbreakable and steadfast. In an era when such devotion is often viewed by many as outdated, Ray never relented. From the church he derived a real sense of stability and meaning, and to the church he returned his gratitude and appreciation. His efforts were unceasing.

Ray was very proud of his association with Cornell. After serving in the Marine Corps, he came to Cornell as an undergraduate in the School of Hotel Administration. For several years after he earned his Bachelor of Science degree, he worked successfully in industry. In 1973, at mid-career, he returned as a graduate student and began

his teaching career here. Until his death last October, he worked devotedly and joyfully with both his students and his colleagues at the school.

Ray's role in the school was unique. None of us has ventured to think of replacing him; he is not replaceable. All of us have been enlarged by our contact with him. Ray pretended nothing; he was absolutely straightforward in speech and deed. His colleagues and students came to depend on his unswerving loyalty and support. He was friendly, charming, honest, humorous, considerate, vigorous, intelligent, hard-driving, and hardworking. He was a man of convictions, who did not shrink from arguing strongly for what he believed; yet he never left the scene without resolving conflicts and reaffirming his friendship, even with those with whom he disagreed.

Those of us who grieve for our colleague, our teacher, and our friend can only begin to imagine the grief of his family. A man who had no parents for so many years, Ray deeply loved and appreciated his wife, Mary Jo, and his children, Mark, Mary, Matthew, and Catherine. Sensing that his time was short, he felt an urgency to finish his work and to share joy with his friends and family. Never did he indulge in self-pity or pessimism. Mary Jo Cantwell has generously shared this memory of Ray: just before he went into surgery, he kissed his wife and children, and as the attendant wheeled him down the corridor, he raised his arms in a last optimistic salute— thumbs up.

Some people's lives touch the world like a feather. You hardly know they ever existed, and upon their departure from this earth it is difficult to locate the marks they made. Ray Cantwell's life caused a crater, and his death left an enormous void in all who knew him. To have known Ray is to have known a genuine human being. To his legion of friends he left a legacy. Each of their lives is richer today because Ray Cantwell touched them. We shall all miss this man who showed so much love for everyone he knew.

John J. Clark, William H. Kaven, Donal A. Dermody

Harry Caplan

January 7, 1896 — November 29, 1980

The death of Harry Caplan brings to a close a career that is surely one of the most remarkable in the history of Cornell University. To record that Harry Caplan was a distinguished scholar and a superb teacher, important though it is, does not begin to describe the depth or the breadth of the impact that he had on his university. To generations of Cornell people—students, faculty, staff, alumni, and their families—Harry Caplan was a friend and counselor. No brief statement can present an adequate picture of his career. It can only recall some of the facts and circumstances, and leave the portrait to be filled in from the reader's own recollections. All who knew him will have their own rich and individual memories.

Harry Caplan was born in Hoag's Corners, Rensselaer County, New York, and attended the public schools of Albany, New York, graduating from high school in 1912; he was valedictorian and won the prize in Greek. He graduated from Cornell in 1916. Among his undergraduate achievements were election to Phi Beta Kappa in his junior year, the Barnes Shakespeare Prize, the Frances Sampson Fine Arts Prize, and awards in public speaking. His Master of Arts (1917) and Doctor of Philosophy (1921) were both Cornell degrees. He was graduate scholar in archaeology and comparative literature in 1916-17, fellow in Greek and Latin in 1917-18. His academic work was interrupted by service in the U.S. Army, 1918-19. His doctoral dissertation, written under the direction of Charles E. Bennett, was entitled "The History of the Jews in the Roman Province of Africa." Other Cornell teachers influential on him were H. C. Elmer and Lane Cooper.

His first faculty appointment was in the Cornell Department of Public Speaking, where he was an instructor from 1919 to 1923, a period when Cornell was dominant in the field of rhetoric and public address. In 1924 he moved from Public Speaking to the Department of Classics, in which he served until his retirement in 1967, as instructor, 1924-25, assistant professor, 1925-30, and professor, 1930-67. He was chairman of the department from 1929 to 1946, became Goldwin Smith Professor of the Classical Languages and Literature in 1941, and was appointed Goldwin Smith Professor Emeritus on his retirement in 1967. Though the dedication to Cornell that is implicit in this record was very real and very strong, Professor Caplan enjoyed also an extensive and prestigious connection with other universities, serving as a visiting professor in the summer session at Wisconsin (1925), Michigan (1932), Northwestern (1938), Stanford (1942 and 1948), Chicago (1945), and Columbia (1946). After retirement from Cornell, he held a series of visiting professorships: Mellon Professor at the University of Pittsburgh (1967-

68), Walker-Ames Professor at the University of Washington (1968), Ziskind Professor at Brandeis University (1968-69), and at Minnesota and Stanford in 1969. Much in demand as a speaker, he gave public lectures at more institutions and learned societies than can be listed in this account.

To the world of scholarship, Harry Caplan is known above all as one of this century's leading authorities on ancient and medieval rhetoric, and his publications in this field are marked by breadth of range and meticulous scholarship. His edition and translation, in the Loeb Classical Library, of the *Rhetorica ad Herennium* has been recognized as a model of editorial skill and judgment. The elegance of the translation and the combination of succinctness and informativeness in the introduction and notes make this volume a leading contribution to scholarly work on ancient rhetoric. The range and variety of his interests in rhetorical studies are suggested by the volume of his essays entitled *Of Eloquence*, edited by two scholars whose doctoral work he directed, Anne King and Helen North, and published in 1970 by Cornell University Press. Among his other publications are an edition and translation of Gianfrancesco Pico della Mirandola's *On the Imagination* (New Haven, 1930); a series of booklists of *artes praedicandi*, "treatises on preaching," most of them done in collaboration with H. H. King; several encyclopedia articles, such as "Rhetorica ad Herennium" in the *Oxford Classical Dictionary*, "Quintilian" in the *Encyclopedia Britannica*, and "Ars Praedicandi" in the *New Catholic Encyclopedia*; and numerous articles and reviews in learned journals.

His roster of professional honors and distinctions is long and illustrious. He was president of the American Philological Association in 1955, culminating many years of active participation as a director and officer of the association. In 1957 he was inducted as a fellow of the Mediaeval Academy of America. In 1962-63 he was a fellow of the Center for Advanced Studies, Wesleyan University, and in 1970 was awarded the honorary degree, D.Litt., by Wesleyan. He was an honorary fellow of the Cornell Society for the Humanities. The diversity of his interests is suggested by his membership in other learned societies, including the Modern Language Association, the Speech Association of America, and the Renaissance Society of America. He twice held Guggenheim Fellowships and twice was awarded research grants by the American Council of Learned Societies. A volume of studies in his honor, *The Classical Tradition*, edited by Luitpold Wallach and published in 1966 by Cornell University Press, contains thirty-eight studies by colleagues in Classics and other disciplines. On December 30, 1965, a special session at the convention of the Speech Association of America was held, with addresses in his honor.

To his Cornell students, colleagues, and friends there was a further dimension to Harry Caplan's life that transcends in importance his scholarly eminence, though it can in no way be separated from it. Harry Caplan was a great

teacher, one of the most admired in Cornell history. It was not only the wit and vivacity of his classroom manner, not only, even, the wonderful sense of engagement, of his personal interest in his students, a concern that all who have been his students recall and treasure; there was also a unique talent, springing from his combination of personal warmth and scholarly excellence, that made all his classes experiences in broad humanistic learning. Not that there were many digressions or that much time was taken for anecdotes; for, marvellous raconteur though he was in private conversation, his classes were on their subject, and he was a demanding teacher with a knack for getting the best out of students. It was more that his own broad interests and knowledge always illuminated whatever subject matter he was dealing with. His influence as a teacher extended beyond the classroom, and 121 Goldwin Smith Hall, Harry Caplan's office, was for generations of Cornell students, alumni, and colleagues a place to repair for advice, conversation, consultation, and reunion. It has been well described as "less an office than a way of life." It was, in fact, where Harry Caplan lived; a life-long bachelor of simple and regular habits, he lived in rooms that were only a place to sleep, and his office was the center of his daily life. He served on a multitude of faculty and university committees, and was an honorary member of two Cornell classes, 1924 and 1930. Of the many further honors and celebrations arising from his unique place in the life of Cornell, there is not space for full mention, but two demand notice: the Statler Hall banquet on the occasion of his retirement in 1967, attended by some one hundred and fifty friends from all over the country, the number limited by the available banquet space, and the Cornell Club of New York dinner in his honor on January 22, 1975.

On his retirement his office, 121 Goldwin Smith, was "retired" with him, to become the Classics Department office, and a roomy office was found for him in Rockefeller Hall, where he continued his scholarly and Cornell activities surrounded by his books and by the offices of the Arts College admission staff. There his influence on the Cornell scene continued unabated, as this picture of him as viewed by the admission staff suggests:

Perhaps what struck us most vividly about Harry Caplan during these years was the extraordinary number of friends who came to look for him. Cornellians of every age, from near or very far, stopped in the Admissions Office to look up their former professor, to chat with him about their careers and their families, or simply to be with him for a few moments of warmth and affection. Harry Caplan believed in Cornell traditions and in "legacies;" he took genuine pride in having played a major role in the education of many Cornellians, especially women, and enjoyed seeing again and again "these kids," as he sometimes called them, now with their children and often their grandchildren, sharing in their hope that these "kids" too would choose to continue with their studies at Cornell. Harry Caplan will be remembered for generations to come as the source and inspiration of that Cornell "legacy."

As might be expected in one of such strong human concerns, Harry Caplan was a man of deep family attachments, and kept in close and affectionate contact with his brothers and their families. It was while visiting at the home of his brother, Dr. Louis Caplan, in Seattle, Washington, that he became fatally ill, ending a career remarkable in the annals of his university and of his profession.

We hope that this sketch has succeeded in suggesting what is a very important fact about Harry Caplan's career: that, though many whose lives he touched deeply had only a slight contact with the fields of scholarship in which he was eminent, the two sides of his activity are really one; Caplan the scholar and Caplan the teacher and friend of Cornellians are inseparable parts of a remarkable person. His impact on the fields of learning in which he was engaged and on the generations of Cornellians whom he influenced depended alike on his personal warmth and concern and his devotion to humanistic study. Harry Caplan was an outstanding example of that combination of qualities that he admired in others and that constitute, to use a favorite phrase of his, *a vir humanus*.

Alvin H. Bernstein, Urbain J. DeWinter, Gordon M. Kirkwood

Anthony Caputi

December 22, 1924 — February 6, 2008

Tony Caputi, Professor of English and Comparative Literature in the College of Arts and Sciences, was a major scholar, a stellar teacher and mentor, a wonderful colleague, a loyal and trusted friend, a polished and talented actor, and a gifted administrator. Most importantly, he was a terrific human being.

A 1956 Cornell Ph.D. degree following a 1949 B.A. degree and a 1951 M.A. degree at the University of Buffalo, Tony stayed on at Cornell as an Instructor in 1956 but within a decade had climbed the ladder to full Professor. He published three important scholarly books—*John Marston, Satirist* (1961), a revision of his dissertation; *Buffo: The Genius of Vulgar Comedy* (1978); and *Pirandello and the Crisis of Modern Consciousness* (1988). For decades, students have learned from his splendidly edited Norton Critical Edition entitled, *Eight Modern Plays* (1966). Tony was also a writer of fiction; he published a critically acclaimed novel, *Storms and Son* (1985), as well as a fine earlier novel, *Loving Evie* (1974). Nothing speaks more to his academic distinction than the fellowships he held: the Guggenheim in 1964-65, a Senior Fulbright in the same year, and a National Endowment for the Humanities Fellowship in 1971-72.

During two sabbaticals, Tony and Adrienne resided in Rome and Paris, setting a pattern for extended travel abroad upon his retirement in 1991. He loved to practice his Italian and French during his travels. Essential equipment for these adventures included a pasta strainer, durably stashed in his suitcase for preparing his favorite food-type, and a list of worldwide outlets for theater-tickets inscribed in his address-book for access to his favorite cultural pursuit.

Tony served as English Department Chair in the mid 1970s. Competent and fair-minded, he would artfully disguise feelings towards the very few colleagues he felt were being difficult or selfish, but he would always try to see the point of view of others.

In 1984, Tony joined the Comparative Literature Department as its Chair, a position he held for six years. Tony had, for many years before then, offered a widely successful course in Italian, English, Spanish, and French drama from the Renaissance to the Enlightenment, cross-listed in English, Theater Arts, and Comparative Literature. During his administration of Comparative Literature, Tony negotiated delicate transactions between and among recent joint members and their home departments; he brokered new appointments of one full junior member and

one full senior member; and he stabilized an increase of fellowship and teaching assistantship opportunities for graduate students. The department's shape has borne his imprint since then.

As his Comparative Literature colleague Walter Cohen remarked in his eulogy at Tony's memorial in May 2008:

"This or that faculty member, myself included, would complain, and Tony, always unflappable, would respond calmly, never get upset, and keep things going. The effect of all this, over time, has been, well, dramatic, though again in an ironic sense. Comparative Literature has long since been marked by a remarkably high degree of collegiality, by a consistent success in reaching consensus on most decisions, and, more important still, by an ability to disagree civilly and even in friendly fashion when consensus proves impossible, to reach a decision by majority vote, and then cheerfully to move on."

A loving father, he is survived from his first marriage to Marjein by his three daughters: Pauline, Carol, and Mary; his son, David, predeceased him.

Tony had a surprisingly old-fashioned elegance and formality in his demeanor and speech. When Tony expounded on a play, a novel, or a movie, and wanted to clarify a point he had just made, he generally used the phrase "that is to say," a turn of expression that was, in fact, never out of place in the longer flow of his remarks.

Tony had a very fine and developed intellect, which he expressed with an extraordinary deftness, lucidity, and precision of speech. Tony wore the mantle of his learning easily and had vast array of interests from acting in plays, attending films, and fiction writing to horse racing, squash, tennis, and baseball, but he was also a learned man and deeply committed teacher and scholar.

An exceptional athlete, Tony took pride in being physically fit. On the squash court he was an enthusiastic, ebullient and optimistic teacher; on the tennis court an appreciative, curious, and enthusiastic student. And that combination informed so much of his zest and joy in the university and the world beyond.

Tony never forgot where he came from or that he was an urban Italian from Buffalo teaching in a department, which, especially in his early years, he felt, had the whiff of Ivy League pretensions. He was proud of his ethnicity.

All of us remember Tony's zest for living, his wit, and his flair. And we also remember his incredible capacity for understanding other people, empathizing with them, and making them feel appreciated. He was fun to be with because he was articulate, intellectually curious, loved conversation, and embraced life as if it were a play in which he performed, an elegant meal or a beautiful woman. For him, the entire world was a stage; and polymath that he was, he played many parts.

Tony loved Ithaca—notwithstanding his impatience with Ithaca winters—and the surrounding area, and took great pride in the creation of the Gee Hill house and grounds he lived in with Adrienne in rural Virgil. He built his country home overlooking his land with a beautiful mountain view; here his evening meal, often with friends, to whom he would enthusiastically discuss his rural life, was still an important daily occasion.

Not surprisingly for a man who defined the concept of friendship in his very being, Tony had a very wide circle of friends, and was deeply loved by many in the Cornell community. He was an open, authentic, and enthusiastic friend who always made people feel that he was very glad to be with them.

A passionate and energetic man with many enthusiasms—theater and movies, France and Italy, food and wine, to name a few—he brought his passion and energy as well to his friendships. His conversation with friends was always animated and often even physical. When he spoke about something he cared about (and he cared about nearly everything), he would reach out to grab you by the arm or the shoulder, as though his words had to flow from his entire being, and so that no separation would exist between you and him. If you were walking with him, his arm would go around you as he talked.

Didn't we all relish our time with him? In our mind's eye, we can see Tony's wonderful smile with which he would greet a friend while shaking one hand and giving his shoulder a warm squeeze with the other. In his book on Pirandello, Tony wrote of how Pirandello, despite his rather dark view of the world, understood the possibility of creating a rich life for oneself. Tony did Pirandello one better by creating a rich life not only for himself, but also for his family, friends, and for so many others privileged to know him.

Daniel R. Schwarz, Chairperson; Stuart Blumin; William J. Kennedy

Herbert J. Carlin

May 1, 1917 – February 9, 2009

Herbert J. Carlin, the J. Preston Levis Professor of Engineering Emeritus, died on February 9th, 2009, in Walnut Creek, California. He was 91 years old. He is survived by his wife of 35 years Mariann, two sons from an earlier marriage to Esther Beth: Seth Carlin, Professor of Music at Washington University, St. Louis, and Elliot Carlin, attorney in New York City; two daughters-in-law Maryse and Marianne, his wife Mariann's two daughters: Andrea Szentirmai of Kansas City, Missouri, and Susan Oliker and her husband Scott of Danville, California, and four grandchildren: Daniel, Tova and Annie Carlin, and Jacob Oliker.

Carlin was born in New York City and grew up in the Bronx. He received a B.S. degree and an M.S. degree in Electrical Engineering from Columbia University, and a Ph.D. degree from The Polytechnic Institute of Brooklyn where he subsequently became chairman of the Department of Electrophysics.

An eminent authority in the fields of wideband circuit design and network theory, Carlin was invited to the Cornell faculty in 1966 to serve as Director of the School of Electrical Engineering. The period from 1966-75 during which Herbert held that position, widely referred to as “the Carlin years,” was a time of unprecedented growth and progress in the School of Electrical Engineering. The faculty expanded by more than 50 percent, as did the number of undergraduate majors. Similarly, the Master of Engineering program almost doubled in size and the MS/PhD program flourished, characterized by growth both in the research budget and in the international breadth of its graduate students and professors.

Professor Carlin was sought after worldwide as a lecturer and researcher. He spent a year as a Senior Research Fellow at the Physics Laboratory of the École Normale Supérieure in Paris in 1964-65, and another as a Visiting Scientist at the National Center for Telecommunication Research in Issy-les-Moulineaux in 1979-80. He was a Visiting Professor at M.I.T. in Cambridge, Massachusetts 1972-73, at Tianjin University in China the summer of 1983, and at both University College Dublin and the Swiss Federal Institute of Technology in Lausanne in 1991. He also delivered invited lectures in Italy, Great Britain, Hungary, Turkey and Japan. Carlin served as Chairman of the IEEE Professional Group on Circuit Theory and received the IEEE Centennial Medal in 1984. He published numerous articles and was senior author of the books *Network Theory* (Prentice Hall, 1964, with Anthony Giordano) and *Wideband Circuit Design* (CRC Press, 1997, with Pier Paolo Civalleri).

Soon after arriving in Ithaca in 1966, Herbert made friends with a number of remarkable faculty members from various departments across several disciplines. They would meet at the then Rathskeller Faculty Club for lunch to discuss a variety of subjects. He was a member of a distinguished group of Cornell faculty who helped the University through its great political crisis in April 1969. He later made a recording that narrated in detail the events of those troubled days in a manner that was meticulously fair to all parties involved. One of us recalls Herbert's advice, offered during the lengthy deliberations that April, of the need for, in his word, "sitzfleisch."

Herbert Carlin's great love of music permeated his entire life. He regularly listened to an eclectic selection of classical music, and was also passionate about jazz and blues, the best musicals and popular songs. He played the flute and for many years participated in a weekly chamber music group. He always had a grand piano in his house on which he played in the evenings or enjoyed his pianist son Seth and other musician friends. For many years he was on the Faculty Committee on Music, influencing which international orchestral and solo artists should be invited to the Bailey Hall Concert Series. Many of his closest friends were members of the Music Department; he was also a faithful member of the Barnes Hall audience.

Carlin remained forever a New Yorker through and through, reading the *New York Times* daily and *The New Yorker* often cover to cover. Yet, he was also a Francophile, spending two sabbatical leaves in Paris. He enjoyed every aspect of that city with all its offerings, including good food and wine. Herbert was proud of the fine red wines he would offer his guests to accompany his wife Mariann's wonderful French/Hungarian cooking. Italy was likewise high on the list of his favorite places; he spent many memorable holidays and professional visits there. He often remarked that his stay as a Visiting Professor at Tianjin University in China was one of the highpoints of his life.

Herbert was extremely well read, mostly non-fiction on a broad variety of subjects (history, science, music, literary criticism), yet loved great fiction as well. In his late eighties, he was rereading James Joyce's *Ulysses*. In 1967, he wrote a collection of book reviews in the "Readers Report" as part of the Olin Library Bookmark Series; his writing style was lucid and easily approachable.

Herbert Carlin was appropriately described at his 70th birthday celebration as a "quintessential intellectual." There was, moreover, an active athletic facet to his life – playing tennis with his sons and friends, rooting rabidly for Giants and later Mets baseball, fencing while a student at Columbia, and piloting a small sailboat he kept for many years at the Ithaca Yacht Club. One of Herbert's favorite pastimes was slide photography; he had a beautiful collection featuring both his various trips and the Cornell campus in every season.

Carlin was passionately involved in politics, possessing a prodigious memory of seemingly everything he had ever heard or read. Coupled with his fervent and pronounced likes and dislikes, this enabled him to enrich conversations on a vast number of subjects. Somehow he also always found time for his students, his colleagues, his friends, his family, and his beloved wife, Mariann.

Herbert Carlin loved America and he loved Cornell.

Toby Berger, Chairperson; Malcolm Bilson, Terrence L. Fine, C. Richard Johnson, Jr.

Mildred Carney

November 12, 1882 — November 21, 1966

Mildred Carney, born in Carney, Maryland, began her professional career of teaching in 1909 in the public schools of Maryland. At Teachers College, Columbia University, in New York City she received the B.S. degree in 1925 and M.S. degree in 1926. She came to the New York State College of Home Economics, Cornell University, in July 1926 as Extension Assistant Professor and retired July 1950 as Associate Professor, Emeritus.

As a specialist in the Cooperative Extension Service, Mildred Carney was particularly successful because she accepted the women she taught with all their abilities and their limitations. She set high standards of achievement which these women could attain intellectually, aesthetically, and economically in their home environment. She was unusually gifted in instilling in them a confidence in their own abilities and in making clear to them the responsibility for sharing with others what they had learned.

As a representative of the College and of the University, she demonstrated to the women of the state a recognizable concern for their welfare and a direct response to their desire for personal development. Her own forthrightness and integrity, her rejection of ostentation, and her practical approach to adult education made her a respected friend, teacher, and adviser to thousands of women.

In the much less affluent era of the 1930's, Mildred Carney's success as a teacher was highly respected by administrators, co-workers, and students because of her ability to help people make use of what they had, conserve it to the utmost, and enjoy the whole process. Still later she was persuasive in her teaching because she believed that all homemakers could participate in the war by conserving resources, working to protect the health and morale of the family, and making a concerted effort to contribute to the total national effort. She was called to Washington during World War II to work on textiles and clothing projects on a national level. Her publications of extension bulletins during the 1930's and 1940's were a result of working with specialists in the country to give needed information to her students and co-workers.

A scholar at heart, she spent periods of time at the University of Minnesota and the University of Chicago taking additional study in the areas of psychology, anthropology, economics, mental hygiene, and English, French, and Russian literature. She was an avid reader and had an insatiable thirst for knowledge. She never traveled on her extension trips without books under her arm. She treasured her books, shared them generously, but guarded them assiduously. Woe to the careless friend who forgot to return one.

As an extensive traveler in this country and abroad she sought to know and understand the people of the countries she visited, their way of life, and their art works. In her own country and abroad she cherished the works of artists and artisans whatever their art or trade. Her teaching at all times reflected her search for knowledge and the wisdom she gained in understanding a wide world of people.

After her retirement Mildred Carney was an active and enthusiastic worker with the Senior Citizens organization of Ithaca. Her preparation for meetings with this group was as well-organized and thorough as had been her preparations for extension meetings with women in the state of New York. She was as well a most enthusiastic babysitter for a young Ithaca family. The young family moved to Baltimore, Miss Carney's home. She, too, moved home to Baltimore and continued her devotion to this family of seven. The parents of these five young children have written of Mildred Carney's influence. "She has given our children such a thirst for knowledge, a hunger for learning, and a great love of books. She read to each and every one of them from their infancy on. But the most important thing she gave to them was her love, which they returned a hundred fold. She gave unstintedly of her time, listened to all their problems, and was their confidante. I feel that her immortality will be right here in our lives, and in all of those people who were fortunate enough for their paths to have crossed hers. Mildred has had a profound influence on our family. I hope that whoever reads her books next will derive as much wisdom from them as she did."

Mildred Carney will be remembered by her many friends of all ages for her serenity, her witticisms and wisdom, but most of all for her sharing with others her knowledge, experience, and wisdom.

Orrilla Butts, Doris T. Wood, Margaret Humphrey

Dwight Clark Carpenter

June 6, 1890 — January 14, 1953

Dr. Dwight Clark Carpenter, Professor of Chemistry in the Division of Food Science and Technology at the Experiment Station in Geneva, passed away at the Clifton Springs Sanitarium on January 14, 1953, following a long illness. He had been a member of the staff of the Experiment Station for 30 years and was the recipient of many honors. He obtained his early training in Michigan State College and his doctor's degree from the University of Michigan in 1921.

Dr. Carpenter's chief field of research was in protein chemistry. His numerous contributions to the scientific literature concerned such topics as optical rotation and molecular weights of proteins, protein aldehyde plastics, and casein chemistry. In recent years he was making studies of the nitrogen compounds in tomatoes.

Dr. Carpenter was an ardent fisherman and he and his wife made many sojourns in the Canadian wilds. He combined his enjoyment of travelling with his professional interests and studied in Upsala, Sweden in 1927; and in Vienna, Austria in 1928; as an International Education Board Fellow. In 1935 and 1936, he was a visiting professor at the California Institute of Technology; and in the fall of 1949, he spent a six-months sabbatic leave in South America where he lectured at several universities.

Dr. Carpenter served as a consultant to the U. S. Department of Agriculture, the U. S. Navy, and the War Manpower Commission. During World War II he advised the War Department on the problems of chemical decontamination.

D. B. Hand, G. J. Hucker, Richard Wellington

Jesse Thomas Carpenter

December 11, 1899 — September 15, 1986

Jesse came to the New York State School of Industrial and Labor Relations at Cornell in the fall of 1947. Thus he joined that faculty in the years of its infancy, and he stayed until his retirement in 1966. As a bachelor when he came to Ithaca, he lived on the campus at 1 East Avenue, in the house where a number of venerable faculty members lived, until he married Dr. Martha E. (Patty) Stahr, assistant professor of astronomy, in August 1951. They had two children, Martha Alice and Sarah Margaret.

Jesse was born in Durham County, North Carolina, and attended Duke University, where he majored in history and economics, earning his A.B. degree in 1920. He spent two years as a high school principal and the following two years as an instructor of economics at Duke University. He earned an A.M. in government at the University of Iowa in 1925 and followed that with a Ph.D. in political science at Harvard University in 1930. It is to be noted, however, that from 1927 to 1942 he was an associate professor of political science at New York University, where at various times he taught public administration, constitutional law, municipal administration, and international law. While at NYU, he published *The South as a Conscious Minority* (NYU Press, 1930), which won the Mrs. Simon Baruch Prize in 1931.

Jesse's wartime service was first as a senior personnel research analyst in the Industrial Personnel Division of the U.S. Army. From 1943 to 1946 he served in military government, working with the U.S. Navy. Following his wartime service he was employed as a labor economist with the Bureau of Labor Statistics in the Department of Labor in Washington, D.C., where he was in charge of the management section in the Union and Management Division of the bureau. While there, he produced a manuscript, "Employer Associations and Collective Bargaining," which was released by the Division of Industrial Relations in 1947.

It was that study that led directly to his appointment at Cornell to the faculty of the School of Industrial and Labor Relations and also to his first activity there. It resulted in publication by Cornell University Press, in 1950, of *Employer Associations and Collective Bargaining in New York City*. It was a very interesting and revealing book dealing with the multiplicity and variety of arrangements for collective bargaining in the City, particularly among small businesses and their respective unions. It revealed, something of a surprise to many, that negotiations were primarily done on an association basis as a way of equalizing power; that is, employers organized, too, in order to meet with their unions. Jesse described the development, composition, powers, internal organization, methods

of operation, and responsibilities of these employer associations. He showed the patterns of employer alignments for bargaining purposes and compared those patterns with structures prevailing among union organizations. He disclosed that multiple-employer bargaining lessened competition for workers by creating marketwide standards of employment and produced uniform interpretations of the master agreements. He analyzed grievance machinery and showed how multiple-employer contracts were enforced to produce peaceful settlement of local disputes, and he pointed up the opportunities for self-government that such arrangements supplied.

Jesse was also a teacher who, throughout his stint at the school, taught a very well organized course for non-ILR students, the predominant group being engineering students. The course was carefully developed and thorough in content and method in presenting industrial and labor relations. The directors of the various schools of engineering always spoke highly of that course.

Jesse and Patty spent a sabbatical year, 1954-55, in Australia on a Fulbright grant. His primary purpose was to study the Australian system of compulsory arbitration, hailed by some as an alternative to collective bargaining as we know it in the United States. His letters attest to his powers of insightful observation and are full of humor about life “down under” as he saw it.

Jesse was a person with diverse interests. He was a very competent contract bridge player and a dedicated gardener. He was a person whose basic goodness and integrity stood forth always. He was a man who stood by his principles.

During the time Jesse was completing work on his book on employer associations in New York City, Dr. Paul Abelson had been invited by the school to give a series of lectures, “The Evolution of Collective Bargaining and Agreement Administration in the Needle Trades.” This visit led directly to the acquisition of Abelson’s voluminous files, accumulated over the forty years he had served as adviser, negotiator, mediator, arbitrator, impartial chairman, or umpire in more than a score of different industries in the needle trades, and in several other industries as well. Without a doubt the Abelson papers are one of the most significant collections on the origins and development of collective bargaining in New York City, and Jesse took on the task of organizing and codifying the material, cooperating with Dr. Abelson personally during the latter’s remaining few years. Jesse at first had it in mind to write the biography of Dr. Abelson, who liked Jesse very much and was impressed with his sense of humor, industry, thoroughness, objectivity, and meticulousness. But as the work of organizing, codifying, and analyzing the papers went on, the project grew in size and complexity. Besides the gigantic archival task that Jesse undertook, the work he did led, even beyond his retirement, to the very meritorious and definitive book, *Competition and Collective Bargaining in the Needle Trades, 1910-1967* (published in Cornell Studies in Industrial and Labor Relations, 1972).

There are precious few books on collective bargaining that are better researched or more meticulously, fairly, and objectively written than this one. It is a great monument to Jesse's dedication to his work and the thoroughness with which he did it.

Donald E. Cullen, Maurice F. Neufeld, Vernon H. Jensen

Kendall Sewell Carpenter

August 11, 1916 — June 13, 1967

The loss of Kendall Sewell Carpenter, who died at the Tompkins County Hospital June 13, 1967, following a short illness, saddened the Cornell community at the close of the academic year. Carpenter was Professor of Business Management in the New York State College of Agriculture.

Professor Carpenter was born in Groton, Vermont, and educated in the local schools. He attended the University of Vermont where he earned the B.S. degree in June, 1938. Following graduation, he taught vocational agriculture at Barton, Vermont, until 1942 when he enlisted in the United States Coast Guard. He returned from service in 1945 with the rank of lieutenant and taught vocational agriculture for two years in Chester, Vermont. He then served as instructor in and supervisor of the institutional on-the-farm training program for veterans in Brattleboro, Vermont, until 1950.

Carpenter enrolled in the Graduate School at Cornell University in 1950 and earned the M.S. degree in 1951 and the Ph.D. degree in 1953. Thereafter, he served approximately a year as a poultry and egg-marketing specialist with the United States Department of Agriculture. He was appointed Assistant Professor of Business Management in 1954, Associate Professor in 1957, and Professor in 1964. Professor Carpenter taught courses in Accounting and Farmers' Cooperatives. In addition, he conducted an extensive program of research and extension work in business management and marketing and served as secretary of the New York State Council of Farmer Cooperatives since 1955.

In 1965, seniors of the New York State College of Agriculture honored Carpenter with the Professor of Merit Award in recognition of his outstanding teaching. He was also recognized by the Future Farmers of America for his work with youth in the field of farmers' cooperatives. He also held the Honorary Empire State Farmer degree, the highest degree given in New York State by that organization. His civic duties included membership on the executive committee and board of the Tompkins County United Fund, neighborhood commissioner for the Boy Scouts of America, president of the official board of the Newfield Methodist Church, and service as chairman of the supervisory committee for the Cornell Credit Union. He was the author of several bulletins and articles concerned with egg and livestock marketing.

Carpenter was a member of the American Farm Economics Association and the honorary societies of Phi Beta Kappa and Alpha Zeta.

He is survived by his wife, the former Louise Ordway of Burlington, Vermont, and one son, Richard.

With Professor Carpenter's passing, the staff and students of the New York State College of Agriculture at Cornell University and the farmers' cooperatives of the state lost a valuable teacher, research worker, and adviser. The students in the College of Agriculture have lost not only the competence and wit of his lectures but also the wise counsel he gave to so many as faculty adviser during their years of undergraduate study. Graduate students for whom he served as committee chairman or as a committee member will long value his friendly, willing guidance and encouragement. His many friends share the loss of a competent colleague—a loss that occurred at the peak of an outstanding career.

W. G. Earle, J. P. Bail, L. B. Darrah

Rolla Clinton Carpenter

Professor of Mechanical Engineering

June 16, 1852 — January 19, 1919

The members of the Board of Trustees and the Faculty of Cornell University wish to express themselves for record upon the death of Professor Rolla Clinton Carpenter.

Professor Carpenter came to Cornell in 1890 to take charge of the Mechanical Laboratory of Sibley College and continued to direct this work until his retirement in June 1917. During this time the laboratory grew from very small beginnings to its present size, with its large material equipment and its efficient courses of instruction. In all this development Professor Carpenter showed wisdom and sound judgment in the selection of his teachers, in the building up of material equipment and in the planning and conducting of the courses of instruction.

Outside the University his counsel was widely sought by the government, in large engineering undertakings, and in patent legislation. Thus his influence has been far-reaching both in engineering education and practice.

He was active as member and committeeman in several of the national engineering societies, and was honored by election to their highest offices.

In all personal relations Professor Carpenter was always kindly and helpful; he was a pleasant companion and a loyal friend.

This loss falls heavily upon all who worked with him or who had the privilege of his friendship, but especially upon his family to whom it is desired here to express profound sympathy.

Cornell University 1890—1917; Professor Emeritus 1917—1919

Joseph A. Carreiro

March 12, 1920 — October 15, 1978

Joseph Carreiro began his career at Cornell as an instructor in the Department of Housing and Design from 1950 to 1954. After eleven years at the Philadelphia College of Art, where he served as professor and dean of faculty, he returned to Cornell to become head of the Department of Housing and Design from 1965 to 1968 and then chairman of the Department of Design and Environmental Analysis from 1968 to 1975.

Professor Carreiro graduated from the design department at the Massachusetts School of Art in 1947. In 1947-48 he attended Cranbrook Academy of Art. In 1950 he was awarded a Bachelor of Science degree from the Massachusetts School of Art. While attending the Massachusetts School of Art he received four scholarships, including the Ann Bliss Award, the highest award offered. During 1951-53 he attended the Harvard Graduate School of Education.

Professor Carreiro was one of the truly inspirational design educators. He had the ability to identify major design problems, to coordinate multidisciplinary problem solving and research, to separate central from peripheral problems, to inspire and promote creative solutions. He believed and preached that design could and must play a major role in humanizing the environment.

He had a major impact on design education nationally and internationally. He belonged to a variety of organizations to improve the quality of design education. He was founder of the Industrial Design Education Association and served as its first president in 1955. During 1957-59 he was educational secretary for the American Society of Industrial Designers.

In 1961 he was invited by the Ministry of Trade and Information and the Industrial Arts Institute of Japan to conduct an advanced design workshop for fifty graduate industrial designers selected by national examination. In 1962 he was invited to serve as educational consultant for the establishment of the first school of industrial design in Brazil. During 1963-64, he served on the Fulbright Committee for the Institute of International Education, helping to select the recipients for Fulbright awards in design. He served the American Association of Housing Education as its educational secretary in 1967 and its vice president in 1968. In 1973 he was awarded a grant from the Industrial Designers Society of America and the National Endowment for the Arts to conduct a nationwide survey of design schools. In 1975 he was selected as one of four design educators responsible for the creation and construction of a major exhibition depicting the current status of design education in the United States. Professor Carreiro accompanied the exhibit when it traveled to the U.S.S.R., adding lectures and seminar presentations to its

visual display. In 1978 he became a member of the board of governors of the Interior Design Educators Council.

Professor Carreiro's special talent with regard to design education stemmed from his continued involvement in the industrial design profession. His professional activities in industrial design were many and varied. From 1954 to 1965 he was president of Carreiro Design Associates and Carreiro Industrial Designers. In 1957 he was a consultant to the Asko plant of Finland, the largest furniture factory in Scandinavia. He met with the most prominent Finnish designers and established a design program for a line of contemporary furniture for export to the United States. In 1958 he was the administrative director for the selection and procurement of products for the "How America Lives" exhibit at the Brussels World's Fair. In 1959 he conducted a field survey trip for the United States Department of Commerce in preparation for major United States exhibitions for Turkey and Morocco. In 1960 he supervised the installation of the ensuing International Trade Fair exhibition in Izmir, Turkey. In 1959 he conducted three months of educational field research on the impact of educational television on school architecture for the Educational Facilities Laboratory for the Ford Foundation. During 1961-62, he was appointed a member of the advisory board to the RCA Advanced Design Center. In this capacity, he helped project new product planning for a twenty-year period for the Home Instruments Division of RCA. In 1970 he was a consultant to the Bethlehem Steel Corporation on its proposal involvement with industrialized building systems. In 1972 he was a consultant to the LTV Industries in Dallas, Texas, on the design of modular flight service stations for 350 United States airports. At his death he was president of Carreiro Design, Incorporated in Ithaca, New York.

During the late 1960s Professor Carreiro established national leadership in the field of industrial housing. During 1967-68, he was the principal investigator in a state-of-the-art study on the potential of industrialized housing in reducing construction cost. The findings were published in a report: *The New Building Block: A Report on the Factory-Produced Dwelling Module*. During 1968-69, he was the principal investigator in a study of an industrialized housing system based on regional potential and constraints. The findings were published in a report: *Building Blocks: Design Potentials and Constraints*. Between 1972 and 1974, he was a member of the board of directors of the National Corporation of Housing Partnerships. This private organization, created by the Congress, seeks to encourage maximum provision by private enterprise of housing for low- and moderate-income families. His contribution to the housing field will play an important role in the years to come.

Professor Carreiro is survived by his wife, Dorothy, seven children, and by a host of friends at Cornell and across the nation who were profoundly touched by him as a person as well as a colleague.

Kermit C. Parsons, Susan M. Watkins, Allen Bushnell

Howard Wilmot Carter

November 18, 1908 — September 2, 2007

Howard Wilmot Carter, a pioneer in the establishment of the Cornell University Dairy Records Processing Laboratory and a leader in the tabulating and distribution of genetic evaluations of dairy bulls, died September 2, 2007 in Delray Beach, Florida.

Wilmot was born November 18, 1908 in LaRaysville, Pennsylvania, the son of a dairy farmer. He graduated from high school in Montrose, Pennsylvania and matriculated to Pennsylvania State University (B.S., 1932). He earned an M.S. degree from the University of Connecticut in 1934. He married Helen Westcott in 1935 and moved to Kentucky as a County Agent. From 1943-46, Wilmot taught animal husbandry as an Associate Professor at Berea College, Berea, Kentucky.

Wilmot joined Cornell University in 1946 as an Instructor. He was promoted to Assistant Professor in 1949, Associate Professor in 1951 and Professor in 1961. Wilmot earned his Ph.D. degree from Pennsylvania State University in 1951. He and his wife experienced sabbatical leaves in Argentina in 1958 and in the United States in 1964, studying dairy records processing and dairy cattle breeding programs.

Professor Carter was instrumental in establishing (1947) and operating the Dairy Records Processing Laboratory. This laboratory was one of the first in the world to electronically tabulate production records on dairy cows for Dairy Herd Improvement, a farmer cooperative established and nurtured by Cornell Cooperative Extension. The laboratory serviced over 450,000 cows in 10,000 herds in New York and the northeastern United States. Carter and his colleague, C.R. Henderson, tabulated sire summaries that evaluated genetic merit of dairy sires three times a year and distributed copies to cooperating dairy farmers. In addition, the archived data from the Dairy Records Processing Laboratory proved to be a valuable resource for the research programs of Carter and his colleagues and students at Cornell as well as at other northeastern universities.

Wilmot Carter was a valued Extension specialist with expertise in data processing and dairy cattle genetics. Wilmot crisscrossed New York and New England holding farmer meetings on dairy records and dairy cattle breeding. He was the farmer's resource for advice on genetic programs and won their acceptance for the concept of sampling young sires, a truly revolutionary idea in the 1950s. In addition, he was a consultant to the United Nations Food and Agricultural Organization and helped establish dairy processing laboratories in Argentina and

Costa Rica. Professor Carter also helped the University of Guelph, Guelph, Ontario, Canada, establish a dairy records processing center.

Carter established a strong working relationship with New York Artificial Breeders Cooperative (NYABC). NYABC served as a valuable extension and multiplier tool for the dissemination of new ideas as well as a research laboratory for new ideas and student training. The Cornell-NYABC relationship was the strongest university-industry relationship in New York and resulted in numerous advances, including the young sire program, and linear model genetic evaluation systems, used throughout the world today.

Carter's work exemplified the ideal of the Land Grant concept of coordinated extension and research efforts. He was rewarded for his excellence and hard work with the 1961 Award of Merit by the New York Chapter of Epsilon Sigma Phi and the 1969 DeLaval Award in Dairy Extension by the American Dairy Science Association. He was a member of the American Dairy Science Association, American Society of Animal Science and American Genetics Association.

An avid fisherman, even well into his 10th decade, Wilmot enjoyed annual fishing expeditions in Canada with family members from 1972 until 2007.

Helen, his wife of 64 years, predeceased Professor Carter in August 1999. Three sons survive him, James E. (Lois) of Elmira, New York, Wilmot R. (Bill) (Sherry) of Arizona and Richard L. (Kathy) of Arizona, eight grandchildren and eight great grandchildren.

Robert W. Everett, Chairperson, J. Murray Elliot, Douglas E. Hogue

Walter Buckingham Carver

January 11, 1879 — July 4, 1961

Walter Buckingham Carver, Professor Emeritus of Mathematics, died July 4, 1961, in Ithaca, New York, at the age of 82.

Professor Carver was born January 11, 1879, in Town Hill, Pennsylvania. A graduate in 1899 of Dickinson College, which later awarded him an honorary D.Sc. degree, he received the Ph.D. from Johns Hopkins University in 1904. He came to Cornell in 1906 and continued, officially and unofficially, to be active in mathematics at Cornell for fifty-five years. He was chairman of the Department of Mathematics from 1938 to 1940. He became Professor Emeritus in 1948, but nevertheless continued his contributions to Cornell mathematics by occasional teaching and student counseling during fall and spring terms and by conducting special mathematics programs during summer sessions. He taught mathematics in the Shell Merit Fellowship Program for Teachers in the summers of 1957 to 1960 with vigor and enthusiasm, and he was cheerfully looking forward to repetition in 1961 when illness forced his actual retirement.

Professor Carver published several research papers and booklets in geometry, but he found his greatest satisfaction and usefulness in working with and for students and teachers of undergraduate mathematics. He broke all records for continuous active service in the Mathematical Association of America and for its official journal, the *American Mathematical Monthly*. In addition to holding many other responsible positions, he served as editor-in-chief of the *Monthly* from 1932 to 1936, and as president of the Association in 1939 and 1940. His contributions of problems and solutions of problems to the *Monthly* cover a span of 58 years, longer than that of any other contributor. His last article in the *Monthly* appeared just a week before his death, making a total span of sixty years for his contributions to this journal.

In all of his scientific work, Walter Carver required clarity and precision and complete honesty. His successes as a teacher and as an editor were well known to publishers of mathematical textbooks. Very few people ever knew the extent to which publishers were swayed by his masterful appraisals of hundreds of manuscripts that were submitted for publication. The mathematics of 1960 is better than the mathematics of 1906, and Walter Carver earned much more than one professor's fair share of the credit.

Ralph P. Agnew, M. Lovell Hulse, J. Barkley Rosser

Alison P. Casarett

April 17, 1930 — June 1, 2002

Alison Casarett was a woman of strong convictions, unusual stamina, and great personal courage. Through the ordeals of the past several years, since her cancer was diagnosed, she refused to give up. She continued to live her life to the fullest through the sheer force of her determination and spirit. In her final week, someone suggested that she consider moving into the Hospicare Program. She retorted, “I get to decide that myself and I’m not ready.” And even on her last day, she would not give in to the cancer, and instead spent time at the Farmer’s Market, shopping and visiting as she had done so often over the years. One would expect nothing less of someone with two Episcopal bishops in her lineage.

Alison’s determination and courage were defining characteristics of her life, and they asserted themselves early on. She was born on April 17, 1930 in Richmond Hill, New York, the daughter of Edith and John Croes Provoost, and grew up in Sea Cliff, New York. She chose a career in science at a time when very few women considered a career at all, much less a career in a scientific field. She earned her B.S. degree in Mathematics at St. Lawrence University in 1951, followed by M.S. and Ph.D. degrees in Radiation Biology at the University of Rochester.

She joined Cornell in 1963 as an Assistant Professor of Radiation Biology and was promoted to Associate Professor with tenure in 1969, before advancing to full Professor in 1979. She was a productive researcher, with many journal articles and textbooks on radiation biology to her credit, and a teaching schedule that included courses on the biological effects of radiation, radiological physics, and applied radiation biology for veterinary students.

Early in her Cornell career, Alison demonstrated another talent not usually recognized in women of her era—a gift for administration. Upon her arrival at Cornell, she served as Associate Director of the academic-year Institute in Radiation Biology, sponsored by the National Science Foundation and the Atomic Energy Commission. A few years later, she became the program’s director.

Then in 1973, in a career move that again required a great deal of courage, Alison began a two-decade association with the Cornell Graduate School—first as Associate Dean, and then, beginning in 1979, as Dean for fourteen years. This made her not just the first woman to become Dean of Cornell’s Graduate School, but one of the pioneering women leaders of the University. She was Dean for a record-breaking three consecutive terms. Her length of service as Dean of the Graduate School surpassed that of any of her predecessors, and her immediate successor

doubts that it will be equaled in the future. During part of her time in the Graduate School, from 1978-84, she also served as Vice Provost, a post in which she gained a university-wide perspective.

During Alison's deanship, graduate applications to Cornell doubled, enrollment reached record highs that are only now being once again approached, and many graduate programs advanced to be among the nation's best. Yet Alison's achievements at the Graduate School are perhaps most notable on a human scale. A faculty member who served with Alison on a graduate fellowship committee credited her with designing a selection process marked by simplicity, efficiency, and warm camaraderie—a significant departure from the temper of many university committees on which he had served.

Though Alison sometimes tried to be gruff and crusty with graduate students, she was a lousy actor and in the end fooled nobody. She couldn't help revealing her zealous concern for their individual and collective welfare. She worked very hard to make their lives as stress-free as possible so that they could focus on their research and scholarship. She was instrumental in creating a graduate center in the Big Red Barn to give "her" students a social center to call their own. She championed a Graduate and Professional Student Assembly (GPSA) to represent her students in university governance, and the GPSA continues as a reality at Cornell today. Countless former graduate students, especially in the humanities and some of the basic social sciences, remain grateful to Alison for her role in creating multi-year, twelve-month support packages that enabled them to make sustained progress toward their degrees. In establishing this practice, Alison put Cornell a decade ahead of nearly all other top graduate schools in the country.

But as involved as Alison was in the operations of the Graduate School day by day, it was international liaisons that were her special strength. When one of us—Bob Cooke—was invited by Dale Corson to serve as the University Marshal (i.e. the presiding officer at Commencement), he initially declined, saying that he lacked the courage to read the names of the Ph.D. candidates from around the world. After Alison was convinced to handle that duty, he agreed to take on the remaining assignment. "My admiration continues for Alison's courage and ability to pronounce all those complicated names." Here, as in other respects, she has had no true successor: after various less-than-satisfactory efforts, the task has now been turned over to the students themselves.

Undoubtedly Alison's comfort zone with languages and world travel played an important role in her subsequent successes in expanding Cornell's international presence. Another of us—Frank Rhodes—recalls a trip to China in 1980, just shortly after that country was opened to the Western world, in which he, Alison, and several others

from Cornell were involved. The trip was so grueling that many of the participants were barely on speaking terms by its conclusion.

“Two memories from that trip remain etched in my mind even after more than 20 years—the insufferable dust, which completely took away my voice, and how at the Beijing Zoo, Alison turned out to be more of an attraction than the giant pandas we had come to see, for it was extremely rare to see a fair-haired Westerner in China then.”

Thanks to Alison’s superb follow-through, many of the partnerships explored during that trip came to fruition over time, as Alison patiently, imaginatively, and successfully built exchanges involving graduate students and faculty members in Asia and also in Africa. So great was Alison’s success in building international linkages that in 1993, as she approached retirement and prepared to step down as Dean of the Graduate School, she was asked to take on a new assignment—to explore the idea of establishing an international consortium of universities that, like Cornell, were interested in taking practical steps to share students, faculty members, and electronic communication. She was appointed Special Assistant to the President in 1993 until her retirement in 1995, when she was named Professor Emerita, Physiology; and Special Assistant to the President and former Dean of the Graduate School, Emerita. Her efforts during her final two pre-retirement years set the stage for making Cornell more global in scope.

After retirement from Cornell, Alison served on the Boards of the New York State Electric and Gas Corporation and of Hospicare of Tompkins County, was president of the Hospicare Foundation, helped lead the Cornell Association of Professors Emeriti, and was an active member of the Ithaca Garden Club and the Ithaca Swim Club, where one of us fondly remembers swimming laps next to her and then tapping her for professional advice. She was an avid traveler and explorer long after her institution-building work for Cornell had come to a close and even in the later stages of her illness, visiting 37 countries across five continents in all.

Others will have their own recollections of Alison. She was a valued friend, who, in what was to be her last act of next-door-neighborly kindness just before her death, brought a pastry to one of us. She cared meticulously for Annie, her cocker spaniel. She was the loving mother of Elissa and Jenel, whose accomplishments were always a source of pride and joy for her. Alison was all those things, and much, much more. She is survived by Elissa and her son-in-law, Tim Rice; by Jenel and her son-in-law, Ed Polido; and by her four granddaughters: Elizabeth, Katherine, Jessica, and Lea.

Sophocles wrote, “One must wait until the evening to see how splendid the day was.” Alison Casarett’s day was splendid indeed. For almost four decades, she offered exemplary service and strong leadership to Cornell and our

community. Her hallmarks were vision, excellence, courage, and grace. In the breadth of her achievements, in the scope of her concern, in the wisdom of her experience, she strengthened this university and our community as she enriched and ennobled our lives.

We mourn the passing of Alison Casarett. We miss her presence in our midst. But we also celebrate, as we reflect together on the remarkable ways in which Alison transformed our university, enlivened our community, and touched each of our lives. Although she is gone from us now, in our hearts and our minds she lives. For over a life so fully, generously, and courageously lived, death can have no dominion.

J. Robert Cooke, Francis Kallfelz, Frank H.T. Rhodes, Walter Cohen

Martin P. Catherwood

January 28, 1904 —November 23, 1978

Few members of Cornell's faculty have served the University, New York State, and the Ithaca community with such devotion and distinction as Martin P. Catherwood. To these employments he brought energy, probing Intelligence, administrative skills, and close knowledge of industry, labor, and government.

His education and teaching experience prepared him admirably for the tasks he later undertook. After earning a master's degree in agriculture in 1927 at the University of Illinois where he had received his bachelor's degree the year before, he came to Cornell for his doctoral degree. His doctoral dissertation, completed in 1930, dealt with an activity of great importance to New York State's economy: *A Statistical Study of Milk Production for the New York Market*. Appointed assistant professor of business management in the College of Agriculture in 1930, he was promoted to the rank of full professor in 1936. Three years later, he became the first professor of public administration in the Department of Agricultural Economics at Cornell. The studies of local government that he published during these years were conceived and carried out in the best tradition of applied research.

In 1938 Governor Herbert H. Lehman appointed Catherwood to the chairmanship of the New York State Planning Board. In this post, which he occupied until 1941, he acquired wide knowledge of the state's formal and informal administrative and legislative process through his wide acquaintance with legislators and government officials in Albany. His investigations of local government had already opened many doors to him throughout the state, but now even more doors were opened.

As a result of the close working relationship that had developed between the State Planning Board and the Joint Legislative Committee on Industrial and Labor Conditions headed by Irving M. Ives, the majority leader of the Assembly, the legislature created the Division of Commerce as of May 1, 1941. Governor Herbert H. Lehman appointed Catherwood as the first commissioner of commerce and Governor Thomas E. Dewey continued him in that office. In this important and pioneering post, Catherwood set the foundations and structure for the division that it has retained ever since. As commissioner, Catherwood expanded his already large knowledge of the state. He served on the Advisory Committee on Technical Industrial Development and the Governor's Reconversion Service Agency. He was also a member of the Postwar Public Works Planning Commission, the Veterans Advisory Commission, the Commission on Building and Development, and the Apprenticeship Council. He served, too, on the Interstate Commission on the Delaware River Basin and on the board of directors of the World Trade

Corporation. As commissioner of commerce he became an ex officio member of Cornell's Board of Trustees and began his long years of service on the board.

Edmund Ezra Day selected Catherwood to succeed Irving M. Ives as dean of the New York State School of Industrial and Labor Relations in 1947. Catherwood had been involved in the events that led to the creation of the school by the state legislature. The concept of the school had originated in the Joint Legislative Committee on Industrial and Labor Relations through the brilliant initiative of Ives and William B. Groat, the committee's counsel and Ives' intellectual alter ego. Although the temporary board of trustees had defined the school's purposes in its exemplary report and had also suggested the means to achieve them, it fell to Catherwood to devise the institutional arrangements for establishing sound standards for undergraduate and graduate teaching, research, and extension. During his tenure as dean from 1947 to 1958, he helped to shape the departmental structure of the school, engaged able scholars, encouraged research through generous grants of time and funds to the faculty, and established the three extension centers outside of Ithaca. Because of his experience in the College of Agriculture, he stressed the important relationship that extension bore to both resident instruction and research. He was also aware of other benefits that would accrue to the school by providing adult classes for labor, management, and the public. With his usual insight and vigor, he responded to the growing interest of the country in international affairs. He encouraged the faculty to undertake teaching and research assignments abroad and in Ithaca with regard to the international and comparative aspects of industrial and labor relations.

While dean, Catherwood chaired the board of inquiry that investigated the dock strike in New York City in 1951. He was a member of two national emergency boards under the Railway Labor Act and of a minimum wage board for Puerto Rico. The state's Senate Committee on the Affairs of New York City appointed him as its consultant in 1957 concerning labor-management relations in public transit.

In 1958 Governor Nelson Rockefeller named Catherwood to the important post of industrial commissioner of New York State. The New York Times headed its profile of the new commissioner, "Rural Expert on Cities." As head of the Department of Labor, he sought to coordinate and streamline its manifold activities. He established himself and the central administrative offices in Albany and used the New York City offices as regional headquarters. He remained industrial commissioner until his retirement in 1971 when he became professor of industrial and labor relations emeritus.

In 1970, on the occasion of the celebration of the school's twenty-fifth anniversary, its library, the largest and most comprehensive in the field, was named in Catherwood's honor. As industrial commissioner he had become, once

again, an ex officio member of Cornell's Board of Trustees. He was named trustee emeritus in 1971. During his long service of almost three decades on the board, he was active on the Building and Grounds Committee, the Ad Hoc Committee on State Relations, and the Committee on Special Educational Programs (COSEP). He became one of the earliest and most active members of the University's Tower Club. He served as a member of the administrative board of the Cornell University Council from 1957 until the time of his death. Between 1971 and 1976 he was a member of the advisory councils of the College of Agriculture and Life Sciences and of the College of Veterinary Medicine. He also lent his talents to the Tompkins County Memorial Hospital Corporation's board of trustees and served as its president for two years. He participated as well in the activities of the Tompkins County United Fund and headed its leadership gifts division. He was a member of the board of directors of the First National Bank and Trust Company of Ithaca for thirty years.

Basic to Catherwoods remarkable achievements were his sterling traits of character. He was forthright, candid, to-the-point, plain-spoken, and just. He possessed rare integrity. He knew where he stood and accorded that blessing to all those who knew him.

Donald E. Cullen, Vernon H. Jensen, Maurice F. Neufeld

Jack S. Catlin

September 21, 1944 — December 7, 1976

Jack Catlin was born in Eldorado, Kansas, but grew up in Florida. He received his bachelor's degree from the University of Chicago and his Ph.D. in experimental psychology from the University of Pennsylvania in 1971. He was a psycholinguist.

Recently his work dealt with the relation of formal models of language analysis to psychological processes of language comprehension. He argued that the semantic representation of a sentence must include procedures for evaluating its truth conditions. The neurological basis of language processing was a secondary concern of Professor Catlin.

He contributed papers to *Psychological Review*, *Journal of Psycholinguistic Research*, *Brain and Language*, and *Neuropsychologia* on these and other topics. He participated in a symposium in honor of the late Eric Lenneberg, presenting a paper on the psychological status of generative grammar and the innateness of universal principles of language.

As a professor, Jack took his teaching responsibility seriously. The courses that he taught ranged from experimental psychology and psycholinguistics on the one hand to the history of psychology on the other. His students were impressed with his dedication as a teacher, his ability to synthesize disparate points of view in class discussion, and his clarity in presenting and explaining complex issues. To his graduate students Jack was more than a teacher, he was a mentor and a friend.

As a colleague, Jack was a constructive hell-raiser. He always had the best interests of the department at heart and continually reminded us that department and University decisions could not be separated from a system of values. In person, in letters to the Daily Sun and in departmental memos, Jack reminded, goaded, challenged, and provoked, and did so out of caring and a sense of loyalty to his colleagues and students. He was appreciated most for his soft-spoken determination, his enthusiasm, his wit, and his caring for people.

He was thirty-two when he died.

Robert E. Kraut, Susan Kemper, Ronald D. Mack

Ralph Charles Henry Catterall

— August 2, 1914

The Professor of History, Professor Burr, on behalf of the Committee appointed by the President (Burr, chairman, Hammond, Lunt) to prepare resolutions on the death of Professor Catterall, reported the following, which were adopted by rising vote:

“ At the beginning of August, just as the tidings of impending war startled us from across the sea, there came to us from the West the dismaying news of the death, during the sojourn with a friend, of our colleague, Professor Ralph Charles Henry Catterall. Since 1902 he had held at Cornell the chair of Modern European and of English History, and from his arrival to take up his work, he stood among us for a decade the very impersonation of manly force and manly character. When two years ago, at the very prime of his years and his ambition, there fell upon him and us the crushing knowledge that his health was broken and his life henceforth precarious, the shock was common to us all. But he was by temper a fighter, and how indomitable has been since then his fight for life and how proud and firm his persistence in his work, has been our marvel. It has deepened the high esteem which from the first had been our tribute to his sane scholarship, his sturdy manhood, his uncommon powers of thought and speech. No more virile, no more masculine, soul has ever had a place among us. None perhaps has had a wider influence, not only over the student body but throughout the alumni. Brief, when measured by years, as was his career among us, and cut short in the glory of its prime, we can never forget that stalwart figure, those rugged features, that keen and often mocking humor, that sound and sterling sense, that freedom from all pettiness, that outspoken impatience of sham, that loyalty to friends and to convictions, which were to us the essence of the man and shall remain his message.”

George Walter Cavanaugh

February 4, 1870 — July 2, 1938

The retirement of George Walter Cavanaugh at the end of the last academic year, and his death on July 2, 1938, brought to a close an uninterrupted service of forty-seven years.

He was born in Watertown, New York, February 4, 1870. After graduation from the Watertown High School he taught school for one year at Rutland, New York. He graduated from Cornell University in 1896 with the degree of bachelor of science. In 1891, while still a junior in the University, he was appointed assistant chemist in the Cornell Agricultural Experiment Station. He held this position until 1903, when he was appointed assistant professor of Agricultural Chemistry. In 1909 he was made professor of Agricultural Chemistry, the position which he held until his retirement.

The development of the College of Agriculture to its present position was made possible to a large degree by those members of the staff who, in earlier days, carried science to the practical farmer. In this field Professor Cavanaugh played a large role. His engaging personality, his faculty of making clear the application of scientific facts to agriculture, and his interesting presentation, made him at all times a welcome lecturer at farmers' institutes.

Through his intimate association with the farmers of the State Professor Cavanaugh early realized the necessity of utilizing surplus agricultural products. The economical production of powdered milk was an important development resulting from his investigations.

From the beginning of the University, agricultural chemistry was recognized as fundamental to instruction in agriculture and later became an essential part of the Experiment Station. On the retirement of Professor Caldwell in 1903 Professor Cavanaugh succeeded him in the field of agricultural chemistry. Professor Cavanaugh was essentially a teacher. His subject matter was presented in an interesting and convincing manner. He was gracious and generous, and took a keen personal interest in his students. He will be remembered by a host of former students with affection and respect.

As a citizen, Professor Cavanaugh was a man of broad interests. He possessed a kindly disposition and a keen wit, was sympathetic and tolerant, and always ready to serve his fellow men. His influence on the life of the community in which he lived will not soon be forgotten.

Russell L. Cecil

October 13, 1881 — June 1, 1965

Dr. Russell L. Cecil, who was associated with the Cornell Medical College for nearly fifty years died June 1, 1965, at the age of 83. Dr. Cecil was Professor of Clinical Medicine in Cornell from 1933 to 1950 when he retired as Emeritus Clinical Professor and Consulting Physician in The New York Hospital.

One of the College's most distinguished faculty members, Dr. Cecil gained world-wide recognition for his creation of Cecil's *Textbook of Medicine*. On the occasion of his funeral¹, a successor in the editorship of his book, Dr. Walsh McDermott, delivered a eulogy, which with some modification is reproduced here.

I speak, as a sad and solemn tribute to a true friend of us all—not to say how much he was like other men, but to say in how very many ways he was different.

The influence for good or bad that each of us exerts in life, is usually enclosed by a fairly small circle and within it, we give pieces of ourselves to those around us.

Big pieces to those close to us in a personal sense, and smaller pieces of whatever size is needed, to those with whom we work.

And if we push that circle out too far, we run grave risk that all the pieces end up so minute that they are valueless to anyone.

But such was not the case with Russell Cecil.

Without skimping on the pieces for his family and his intimate associates, he nonetheless succeeded in giving real pieces to so very many more. "So very many more" were both those he knew and the literally hundreds of thousands he benefited, whom he never saw.

What his intimate associates felt of his influence shines through in the warm and always different anecdotes they constantly recite about him. Anecdotes of those days after World War I when he was the central figure of that small group of young doctors, all destined for great distinction, who lived together in a bachelor menage on sixty-second street.

But this wonderful capacity of one human being to support and to delight another, which Russ Cecil owned in such large measure, was not something only of his youth; he kept it at a high pitch his whole life.

And he had it even in those small affairs of daily life which most of us treat as almost mechanical transactions.

Whenever he would call me on the telephone, he would call out my given name, with that explosive rising inflection of his, and make me feel, in the fraction of a second, that a whole new world of exciting adventures was just about to open up before me.

The message itself might be of the most mundane sort, but it was that way he had, of throwing that first lifeline to the other human being, that would glow after in one's heart.

¹ In the Madison Presbyterian Church, June 4

And with this extraordinary ability to throw the lifeline to the other person went an equally extraordinary perceptivity of other persons. In the professional sphere, in my whole experience, Russ Cecil was absolutely without equal in his ability to judge the worth of other men. He saw his fellow physicians with very clear eyes. Yet without altering the picture as he saw it, he would always surround his Judgments with a frame of compassion and a certain amused tolerance of human frailty.

Indeed, the faintly comical antics of most human beings, including himself, were a source of constant delight to him, and he loved to describe them with that salty humor we knew so well.

This urbane and witty man we knew as a cosmopolitan, was the product of the post-bellum South, yet he always refused to be a traditionalist.

He was a modern man when he graduated from Princeton more than sixty years ago, and he stayed modern all the way.

But every now and then he would reveal “the persistence of the past,” in some of the old-fashioned values he cherished.

In book publishing, whenever a new edition of a work is brought out, it is necessary to destroy—quite literally to chop up—the remaining copies of the old one.

Whenever Russ would think of this happening to his book, he would be filled all over again with a sense of outrage.

Not outrage because it was his book but outrage that any book could be subjected to such vandalism. For deep within him was that old attitude derived from our frontier days, that a book—any book—as a product of man’s intellectual creativity was something very precious and not a thing to be destroyed by any man or group of men.

And it was in that same spirit of respect for creativity that he made himself a Greek classicist, a poet, and an artist.

In his scientific and professional life had been limited to his accomplishments in the laboratory and at the bedside, he would have had a most distinguished career, but, as we all know, it turned out to be something far more than that.

For, forty years ago he had an original idea that without question made him the best known American physician in the world—and known for something of the intellect.

He reasoned that if the expertise of our country’s finest physicians could be properly fused into one book, an instrument would be created that could be put into the hands of physicians everywhere to help them in their task.

He made a success of this idea—a success far greater than he had dreamed.

Today his book, and the later ones like it, have been institutionalized and hence no longer represent that personalized form of creativity that was his.

But forty years ago it was an act of personal creativity, to identify who could do things best, to get them to do it, and to fuse the pieces into the whole.

And his uncanny ability to note the strengths in others, stood him in very good stead in this work.

This act of creativity had an immense effect in helping to turn medical students into better physicians, and they are deeply grateful, as can be seen by the whole flood of letters to Mrs. Cecil from physicians young and old on the announcement of his death.

But his creativity had an even wider impact, for all over the world in innumerable single crucial incidents, what he did enabled some physicians to be guided to the correct action for the benefit of a sick patient.

Thus forty years ago, Russell Cecil forged one of the most important of our instruments whereby we could follow that sacred principle of our Judaeo-Christian culture—that the creativity of all men should be used for the individual—for the good of the one man who needs it. . . .

These are some of the ways in which Russ Cecil was different and in their many facets, they tell us the meaning of the man.

He gave the delight of loving to those he knew, and he helped to give the chance to continue to live to the many he never knew.

We mourn his death today; we feel a great loss.

But even today in the midst of our sadness and our loss, we also know that having had our own lives influenced by Russell Cecil is an immense and an enduring gain.

As one of his old friends put it in a message to Mrs. Cecil: “What a triumphant life!”

Walsh McDermott

Robert Charles Cetas

February 23, 1922 — June 14, 1979

Robert Charles Cetas, professor of plant pathology, passed away June 14, 1979, in Riverhead, New York, after being associated with Cornell University for thirty-two years as graduate student, assistant, associate, and full professor, and professor emeritus.

He was born February 23, 1922, in Harbor Springs, Michigan. Following three years service in the army (1942-46) he returned to his undergraduate studies at Michigan State University where he graduated with a Bachelor of Science degree in agriculture in 1947. He then matriculated at Cornell University as a doctoral candidate in the field of plant pathology and, during 1947-52, was responsible for potato pathology work on Long Island. He was awarded the Doctor of Philosophy in 1952 for his work on the potato "A" virus. On July 1, 1952, Dr. Cetas was appointed assistant professor of plant pathology and began work at the Long Island Vegetable Research Station near Riverhead. He succeeded Dr. Howe Cunningham, who had held that post for many years. Bob was promoted to associate professor in 1956 and professor in 1971, a position he held until his early retirement on June 11, 1979. On that date he was granted professor emeritus status by the Cornell University Board of Trustees.

Although research was his major assignment at the station, he frequently became involved in extension activities such as identifying potato and vegetable diseases, speaking at meetings, and writing for county publications. He was a constant cooperator in field trials with Cornell (Ithaca-based) specialists. His readiness to help with disease problems was always appreciated by farmers, county agents, agribusinessmen, and colleagues. During his long association with Cornell, Bob conducted experiments on the control of late blight, scab, *Rhizoctonia*, *Verticillium* wilt, leaf roll, black leg, black spot, nematode root rot, and ring rot of potatoes. He also worked on black rot, black leg, wirestem, and downy mildew of cabbage and cauliflower, damping-off of spinach, blotch of onions, and several other vegetable diseases. He was a leader of a long-term project involving the screening and evaluating of new potato fungicides. This included studying efficacy, phytotoxicity, dosage, and spray schedules of these fungicides. Potato seedpiece treatments received much of his attention in recent years. His research has resulted in potato fungicide and nematicide registrations of critical value to Long Island farmers. He authored or coauthored over 140 papers during his career.

Dr. Cetas was an active participant in many scientific and professional organizations. He served on a number of committees of the American Phytopathological Society (APS) and the Potato Association of America. He was

a frequent contributor of scientific papers to the publications of these organizations and was a member of the editorial board of the APS publication *Fungicide and Nematicide Tests*, At the time of his death he was preparing a paper for presentation at the IXth Congress of Plant Protection in Washington, D.C. These research results could lead to a breakthrough in controlling late blight, one of the most devastating diseases of potatoes. He also made significant contributions to the Council for Agricultural Science and Technology as a member of a special task force studying the uses of energy in agriculture. He participated with other pathologists in gathering statistics and data for use by the United States Environmental Protection Agency in their appraisal of a fungicide in worldwide use.

Dr. Cetas had been a member of Sigma Xi since 1952. He was a long-time member of the American Association for the Advancement of Science and the American Institute of Biological Sciences. He was also affiliated with the Society of Nematologists, International Society of Plant Pathologists, Pesticide Association of New York State, and the American Society for Testing and Materials. He was elected a member of the New York Academy of Sciences in 1972.

Dr. Cetas' most significant contributions have been of most value to the farmers and agribusinessmen of Long Island. The results of his research are being used in disease-control practices of the vegetable and potato growers in that area and throughout New York State. His knowledge of food production was very broad and thus his opinions and advice were sought after by many farmers with whom he may have had contact. Among his peers in the science of plant pathology he was highly respected. Testimony to the esteem in which he was held was tendered on the occasion of his retirement. Plaques were presented by the Alumni Association of the College of Agriculture and Life Sciences, the Long Island Farm Bureau, the Long Island Agricultural Marketing Association, the Cooperative Extension Association of Suffolk County, and the Pesticide Association of New York State.

He was a very devoted and loving husband and father. He dedicated his life to his family, his church, and his profession. Soon after he and his wife moved to Riverhead, they started a bible study class in their home. From this beginning came the Calvary Baptist Church of Riverhead. Over the years Bob served his church as Sunday school teacher, deacon, trustee, and chairman of the building committee. He is survived by his wife, Henrietta; son, Charles, of East Lansing, Michigan; and daughter, Cheryl, of Montgomery, Alabama.

William F. Mai, Maurie Semel, Arden F. Sherf

George Ray Chamberlain

Assistant Professor of Freehand Drawing

— July 15, 1929

In the death of Professor George R. Chamberlain Cornell University has met a decided loss.

The fine influence that he had on his many pupils will always be remembered by them with deep gratitude.

His colleagues appreciated his utter devotion to his work, the steadfastness of his character, the kindness of his heart, and his ever ready cooperation.

Robert Franklin Chamberlain

May 19, 1884 — July 15, 1967

Bob Chamberlain, as he was affectionately known throughout the College of Engineering and by his many friends and associates, was born in Newark Valley, New York, the son of Theodore F. and M. Eloise Slosson Chamberlain. On August 19, 1914, he married M. Mabelle Sandwick. They are survived by three children: John Theodore, Robert Sandwick, and Phyllis Jane (Mrs. Philip A. Kilbourne).

His early education was in the Newark Valley schools, and he prepared for college at Phillips Exeter Academy. With the class of 1908, he graduated from Cornell University in mechanical engineering, and, although he had had summer experience in industry, he continued in the academic area by appointment as instructor in electrical engineering at Purdue University. In 1910 Bob Chamberlain returned to Cornell with appointment to the engineering faculty. Successively then, from instructor to Assistant Professor (1920), Professor (1926), and Assistant Dean of Engineering (1946), to Professor Emeritus in 1952—interrupted only with sabbatical leaves to industry and editorial interests – his career evolved at Cornell.

Professor Chamberlain's technical interests were primarily in electrical machinery and in the problems of motor control both in the industrial area and in the then developing field of electric railways. In 1914, the first electric power plant in Newark Valley was built from his design and specifications, and in later years he was consultant to the cities of Ithaca and Elmira when they operated their own independent power systems for local power, light, and “traction” (street cars).

In 1921, when the College of Engineering reorganized its technical fields into several schools, Professor Chamberlain accepted the responsibility in the School of Electrical Engineering for managing personnel matters and for the advising and placement of students. Clearly his success and interest in this area marked a turning point in his career. Moving now to the College, he organized the Engineering Placement Office and, upon appointment as Assistant Dean, became also Director of Student Personnel for the College, including in his office much of the work on student admissions, scholarship awards, and placement.

During World War II, Professor Chamberlain, with Professor Walter Cornell, organized a large area of New York State for engineering defense training. They also administered in the area the wartime activity known as E.S.M.W.T. (Engineering Science and Management War Training) which involved many members of the faculty both on and off campus.

As a member of A.I.E.E., Eta Kappa Nu, and Tau Beta Pi, Professor Chamberlain gave strong and loyal support to his technical and honorary societies. For the national technical conference of A.I.E.E. at Ithaca in the summer of 1935, he was responsible for the organization, planning, and executive work involving most of the Engineering College faculty.

A lifelong member of the Masonic order, he joined the Blue Lodge in Newark Valley and after moving to Ithaca became a member of Ithaca Eagle Chapter 58, Royal Arch Masons, and of the Saint Augustine Commandery 38, Knights Templar.

In recreational pursuits as well as professionally, Bob Chamberlain found strength in the quiet mode; he was an ardent disciple of Isaac Walton and enjoyed nature to the fullest, although his observer interest in the more active sports from baseball to crew was always evident in season.

In his quiet way, Robert Chamberlain was a keen analyst of current affairs and adept in the constructive influence of both town and campus thought and action. Many students and younger teachers can look back to a timely word to them or in their behalf, often unsolicited, that lighted the more productive or wiser way to successful goals. This extraordinary gift of the timely word, together with a keen sense of personal integrity and nonstrident persuasion, characterized a colleague, adviser, and friend who exemplified for his University, profession, and community an uncommon standard of service.

True McLean, Howard G. Smith, Everett M. Strong

Emile Monnin Chamot

March 4, 1868 — July 27, 1950

Emile Monnin Chamot was born in Buffalo, and attended the public schools of that city. He received the degree of Bachelor of Science in 1891 and the doctorate in chemistry in 1897, both from Cornell University. The following year was spent in Europe, studying at the Universities of Nancy and Delft.

During his period of service at Cornell Chamot gave instruction in various branches of chemistry specializing in toxicology and sanitary chemistry, and later also in chemical microscopy. He was largely responsible for introducing the latter field to American chemists, by many lectures before scientific and technical societies, and by his pioneer book “Elementary Chemical Microscopy”, published in 1915 and succeeded in 1928 by the “Handbook of Chemical Microscopy”.

During World War I he carried on extensive studies of small arms ammunition for the Ordnance Department, and was a consultant on explosives during World War II.

In 1924-25 Chamot was appointed an exchange professor in chemical microscopy, visiting a score or more of French Universities, a representative of seven American Universities. In 1937 he was awarded the Longstreth Medal of the Franklin Institute, “for meritorious work in chemical microscopy”. Chamot’s interest in sanitary chemistry was the basis of invaluable service in testing Ithaca’s water supplies during the typhoid epidemic of 1904, and of a long association with the development and control of the purification systems for the city and the university. In 1906 he acted as consultant in a similar epidemic in Scranton.

A large share of the planning and supervision of the construction of the Baker Laboratory of Chemistry was his responsibility—evidence of the engineering bent that was so useful in his technical consulting work.

A lover of nature from his childhood, a student of the biological sciences as well as of chemistry, eminently practical and realistic in the application of his diverse knowledge, Chamot was ever generous with advice and experimental assistance to faculty and students in the Department of Chemistry.

He particularly enjoyed his collaboration in border-line problems with colleagues in biology, geology, archeology, physics and engineering, and continued active in research after his retirement in 1938. He is survived by his wife, Cora Genung Chamot.

T. R. Briggs, C. W. Mason, W. M. Sawdon

Lewis Duane Chapman

September 3, 1940 — July 29, 2007

Duane Chapman, Professor of Resource Economics in the Department of Applied Economics and Management, died unexpectedly after a short illness in July 2007 at age 66. He joined the Cornell faculty in 1972 after spending three years as a Research Scientist at the Oak Ridge National Laboratory. Duane received a Ph.D. degree in Agricultural Economics in 1969 from the University of California at Berkeley where his choice of a topic for research was indicative of his future career. While most of his fellow students worked on conventional problems in agricultural production and marketing, Duane studied the economic viability of using nuclear power to desalinate water. This research led to his first appointment at Oak Ridge.

At Cornell, Duane's research focused on energy and the environment, including nuclear energy, electricity market restructuring, world oil prices and international security, renewable energy policy, and climate change and energy use. He also worked on forestry policy and economic development and environmental quality. His research topics were sometimes well outside the mainstream of current academic fashions, and his conclusions were often at odds with the views of powerful economic interests. Nevertheless, his conclusions almost always proved to be correct, and in most cases, his policy recommendations were adopted after years of delay. When researchers at Cornell first identified the environmental damage caused by acid rain in the 1970s, Duane showed that it was both technically and economically feasible to install scrubbers to reduce sulfur emissions from coal plants, like Cayuga Station, but these emission reductions were not mandated for power plants in Federal legislation until 2000, over 20 years later.

Duane's research at Oak Ridge demonstrated that nuclear desalination was not economically viable. This conclusion was in conflict with the leadership of the Atomic Energy Commission, and this disagreement was partly responsible for Duane's move to Cornell. His early research at Cornell showed that Federal plans to expand nuclear power as a step towards energy independence, in response to the oil embargo in 1973, were based on unrealistically high forecasts of the demand for electricity. His well-researched opposition to the licensing of new nuclear power plants was an important reason why only two such plants were built in New York State instead of the seven that had been planned. As a result, New York State was able to limit the substantial financial costs of overbuilding experienced in other states like Washington.

This work provided a preview of Duane's academic career. He was only interested in issues with substantial economic consequences, and on occasion, his results angered people who stood to lose large amounts of money.

Moreover, he was committed to communicating his insights beyond academic forums. He wrote opinion editorials for the *Ithaca Journal* and presented his research to numerous groups of citizens. In the 1980s, Duane visited the Mescalero Indian Nation in New Mexico where he spoke about the pros and cons of storing nuclear waste on their reservation. The result was a contentious referendum in which a proposal to store the waste on the reservation was first turned down and then reversed. In the interim, Mescalero Nation leaders sent letters to Cornell's President, Frank Rhodes, deploring Duane's "interference" in sovereign matters and calling for his dismissal. Such reactions to Duane's research were not unusual, but his conclusion, that nuclear waste should be stored on site, will likely prove to be correct.

The conclusions from Duane's research were based on empirical reality rather than on a blind belief in "invisible hands" and the other arguments used by mainstream economists. For example, when the electric utility industry argued that the installation of scrubbers on coal plants would cause major disruptions in supply, Duane brought a plant manager from Kentucky to testify before the Federal Power Commission that his coal plant worked perfectly well with a scrubber. More recently, Duane was skeptical about the claims that deregulating the electric utility industry would benefit the public. He demonstrated that suppliers could use perfectly legal means of collusion to manipulate prices. These results did not make him popular with the advocates of deregulation.

Duane traveled to many different countries on professional projects for the World Bank and US AID to study energy and environmental problems. These projects included assessing levels of pollution in Siberia and Central Europe following the collapse of the Soviet Union, and more recently, evaluating energy policy in Iran. He was also interested in the economic and political changes occurring in Southern Africa. This interest probably stems from his active involvement in the civil rights movement during his undergraduate days at Michigan State University in the 1960s. In 1991, Duane spent a sabbatical leave at the Universities of Zimbabwe and Natal as a Fulbright Fellow studying the development of the mining industry in Southern Africa.

His recent work on world oil prices and international security received attention in academic, military, and policy circles. He was invited by the U.S. Army War College, the U.S. Air Force Academy, and the National Security Administration to present his research on oil. Duane's forecasts of future oil consumption and oil prices were quite different from the popular view of most analysts who believed that oil consumption would peak in the near future, but once again, Duane's results will probably be a more accurate guide for future energy policy.

Duane was the author of two books (*Environmental Economics: Theory, Application, and Policy*, Addison, Wesley, 2000 and *Energy Resources and Energy Corporations*, Cornell University Press, 1983), more than 50 journal articles,

16 book chapters, and well over 100 published essays, monographs, and hearing testimony. In 2007, he received the Editor's Choice Award from the Western Economic Association International for a paper that was published in *Contemporary Economic Policy* in October 2006.

A popular advisor of graduate students, many of his publications were co-authored with his students. He supervised 16 Ph.D. dissertations and more than 25 Master's theses. His students were struck by his belief in their academic abilities, and he often played the role of morale booster and friend. He transmitted his penchant for writing about policy issues by pushing his students to think about the bigger policy context, no matter how detailed or technical the discussion. Even before a student would start writing a paper, Duane would want to know how it would advance an ongoing policy debate. Not surprisingly, he attracted non-traditional graduate students to applied economics, including former Peace Corp volunteers, a forest ranger, a military security officer, and students who initially questioned the applicability of economic analysis in realistic but complex settings. Many of these former students have established successful careers, and their work represents the most enduring component of Duane's legacy.

Although a rather quiet, diffident man, Duane was an active member of the Newfield (NY) Democratic Party and the Newfield Lions Club, and he was Vice President of Honest Insight. An avid outdoorsman, he camped in Montana, the outback of Australia and the high Sierra in California. He chose to live the last two decades of his life on 165 acres of wooded lands in Newfield. He incorporated the principles of solar passive architecture in the design of his house and heated it with a wood burning furnace and fireplace. Sitting on his porch, he could regularly hear coyotes and even encounter an occasional black bear. He was proud of the hiking trails and private campsite on his property, which he maintained with the help of a few friends. Winter camping was his passion, and it was not unusual for him to camp outdoors in subzero temperatures. He often invited graduate students for barbeques and hikes on his property, weather notwithstanding.

In June 2007, Duane was diagnosed with a rare form of non-Hodgkins lymphoma. After nearly a month of excellent care at the Strong Memorial Hospital in Rochester, he returned home on July 28 but passed away in his sleep that night. A celebration of his life was held on September 15, 2007, at the Anabel Taylor Chapel on the Cornell campus. It was attended by nearly 200 people, including former graduate students who traveled to Ithaca from across the United States and Canada. Following the Memorial Service, a small group of friends and former students hiked down to the campsite on the Chapman property in Newfield where they spent a few hours around a campfire exchanging stories about Duane and the "good old days."

Duane was predeceased by his parents, Louis and Alice Fullerton Chapman, and by his two brothers, Bruce and Allan. The surviving members of his family are his two daughters, Erin and Amy Chapman, and their mother, Mary Chapman; many cousins and nieces; his loving partner, Alice Brody and her daughter, Melissa; and many former students, colleagues and friends who were all part of Duane's extended family. Cornell has lost a researcher who searched diligently for the truth and was willing to stand his ground and defend the public's interests whenever his results were in conflict with the interests of the powerful.

Timothy D. Mount, Chairperson; Neha Khanna, William G. Tomek

Paul Jones Chapman

September 9, 1900 — October 6, 1993

Professor Paul Jones (Chappie) Chapman had a distinguished and productive career in research, extension and administration at Cornell's New York State Agricultural Experiment Station at Geneva and briefly on an extension assignment in Ithaca. He made a number of important contributions to the science of entomology that had very practical benefits for the fruit growers in New York, other states and around the world. He was widely recognized for his keen intellect, good judgment and far-sighted approach to future needs in crop protection from the ravages of arthropod pests.

He was born in Cazadero, California, the operating base for his father's lumber business. He was the sixth of seven children. In 1910, the family moved to Santa Rosa to provide proper education for the children. His father developed an interest in orcharding and owned several prune orchards. Chappie was more interested in this than lumbering, although he worked summers as a lumberjack to earn money for college. He was interested in bird and animal life and read all the books he could find on the subject. Horticulture became his career interest. He followed his two older brothers to Stanford University, but transferred to Oregon State University after one year to pursue his education in horticulture and related sciences. He received his B.S. degree in 1922.

Chappie then came to New York and was employed as a Special Field Assistant assigned to Genessee and Wyoming Counties, Departments of Entomology and Plant Pathology, Cornell University, from April through September, 1923. More about this activity later. He accepted an assistantship with Extension Professor Cy Crosby, and enrolled in the Graduate School with a major in Entomology. He chose a taxonomic problem on the Psocoptera Order because he could fit it into his assistantship extension responsibilities. In 1927, he studied six weeks at the Museum of Comparative Zoology, Harvard University. After receiving his Ph.D. degree in 1928, he went to the Virginia Truck Crop Experiment Station as an Entomologist in April 1928. He returned to Cornell at the New York State Agricultural Experiment Station in June 1930, to manage the new "Moths and Insect" project established by the State legislature with a \$50,000 appropriation. He was hired as Chief in Research (the equivalent of full professor) in the Division of Entomology at the age of 29. Chappie served as Head of the Department for 17 years from 1948 until 1965, and retired in 1968. From then until shortly before his death, he was active in research and in writing the history of the New York State Agricultural Experiment Station.

Even though his official extension duties were brief, he had an outstanding record. As an inexperienced special field assistant working with apple growers, he recommended the then not accepted spraying of apple trees in prebloom and late bloom with fungicides for control of apple scab. Chapman advised his growers to make two applications, just before and in late bloom, because of a heavy rain that year. His growers had clean fruit at harvest whereas others were badly damaged by apple scab. These outstanding results led to offers of graduate assistantships in plant pathology and entomology as well as an industry position. As a graduate assistant with the late Professor Crosby, he became involved in the controversy of the merits of spraying versus dusting for control of orchard insects and diseases. He believed that spraying was superior over all, which eventually was proven to be true.

Professor Chapman had a very distinguished career in research. He was author or co-author of 180 papers and a book. His research began as a graduate student with a classic study on the taxonomy of the insect order Psocoptera, a study which is still the reference standard. His two years in Virginia resulted in four publications on the biology and control of vegetable insect pests. Upon his return to New York, he undertook studies on three major pests of apple and developed a research program for fruit pest control in the Hudson Valley. He was an outstanding researcher in the field with his carefully planned experiments that have provided essential knowledge about the basic biology of fruit pests and their interactions with their hosts. He developed innovative control measures for pest control, such as determining that one-month storage of apples at 32-35°F kills all stages of apple maggots, thus making apples eligible for export to England and other markets where this insect is not present.

He collaborated with chemists at the New York State Agricultural Experiment Station in defining the mode of action of and characterizing those qualities in petroleum oils that contribute to their toxicity to insects and mites and to plant phytotoxicity. In this one area of research, he published over thirty papers and has set the specifications for plant spray oils now widely used on deciduous and citrus fruits for insect and mite control in New York and throughout the world.

After assuming headship of the Department of Entomology in 1948, Professor Chapman still continued active research, working in collaboration with the late Professors S.E. Lienk and horticulturist, Otis Curtis. They designed field experiments to determine the impact of mite foliage feeding on apple tree growth and yields. These studies demonstrated that heavy mite populations early in the season slowed tree growth and drastically reduced bloom and yield the following year. The Chapman-Lienk collaboration continued with a National Science Foundation grant to explore what happens to an introduced plant species (apple) entomologically. The study was limited to the Lepidopterous family Tortricidae.

The final report is a book, *Tortricid Fauna of Apple in New York*, published in 1971. It includes a wealth of information on cultivated and wild apples along with the biology and color plates of larval and adult stages of 54 tortricid species. After retiring, he and Lienk initiated studies on the flight periods of Macrolepidoptera. In 1991, at the age of 91, he published a 152 page Station bulletin summarizing the records of the flight periods of 676 species occurring in Western New York. He made Professor Lienk, his long-time collaborator and friend who died in 1988, the senior author.

As significant as Professor Chapman's research findings have been, his contributions as teacher of young faculty and his leadership of the Department of Entomology into a modern diversified unit are equally if not more important. He encouraged basic biological studies as essential to sound integrated pest management (even though he did not use that term). Because of his success with chemists in collaborative research on spray oils, he recognized the potentials for such collaboration. He was a pioneer in integrating other disciplines into the entomology profession, establishing toxicology, biological control and biochemistry positions in the department. The last one was to study the then new field of insect pheromones. By example and encouragement, he set the highest goals for the department's basic and applied research programs. He set very high standards in selecting new professorial staff. Besides great promise as scientists, he looked for balanced well-rounded persons. Of the ten faculty positions appointed during his tenure, six went on to chair departments of entomology. One of these also became a director, one a dean and one was elected a member of the National Academy of Sciences. A seventh professor moved directly into a directorship. He was very proud of his faculty and their accomplishments.

From retirement until a few months before his death, he came to his office and laboratory regularly where he continued work on the flight periods of moths and writing the history of the Station. He was always available to anyone for advice and counsel. The Department of Entomology was very important to Chappie, especially after his wife died in 1988. It became his primary interest and he was concerned for its future. In 1992, the Paul J. Chapman Graduate Student Fellowship in Entomology was established with a very generous gift from Chappie to Cornell University. This will ensure that "his" department can continue to inspire young entomologists to follow the principles and insights he had instilled in his colleagues.

Professor Chapman was an Honorary member of the Entomological Society of America where he served a term as President of the Eastern Branch and a term on the National Governing Board. The Eastern Branch honored him three times. In 1940 and 1942, he received the gold medal awarded for the best paper presented at the Eastern Branch meeting and in 1965 he was awarded the Certificate of Merit, only the third time this certificate had been

presented. He was a member of the American Association for the Advancement of Science (Fellow), American Institute of Biological Sciences and a member of Sigma Xi, Phi Kappa Phi, Gamma Alpha and Scabbard and Blade.

Professor Chapman was active in community affairs. He served as board member and president of the Geneva Civic Music Association; board member, president and Paul Harris Fellow of the Geneva Rotary Club; board member and first vice president of the Geneva General Hospital; and board member of the Geneva Free Library.

Chappie was an articulate, persuasive, reserved, polite, courtly gentleman. He was highly respected by staff at all levels for his keen intellect, wisdom and common sense. He had an instinct for doing the right thing and was a person people naturally turned to for counsel and advice.

He was predeceased by his wife in 1988. They had no children. Several members of his family still live in California.

Edward H. Glass, Haruo Tashiro, Wendell Roelofs

Cora Binzel Chase

1880 — February 18, 1965

Cora Binzel Chase, Professor Emeritus of Home Economics Education and Rural Education, died February 18, 1965, in Milwaukee. She was born in Beaver Dam, Wisconsin, the youngest of a large, closely knit family, the members of which were extremely devoted to each other throughout their lives.

Professor Cora Binzel Chase held the Bachelor of Science and the Master of Arts degrees from Teachers College, Columbia University. Her first teaching experience was in the public schools at La Crosse, Wisconsin, where in due time she assumed the position of Supervisor of Home Economics. From La Crosse she went to the University of Wisconsin for advanced study, on the completion of which she became a member of the faculty in the Department of Home Economics at that university with responsibilities in both resident and extension teaching. Later, she directed the program of home economics teacher-education at Wisconsin. She was one of the pioneers in directed teaching experience for prospective teachers.

In 1920, Professor Cora Binzel Chase was appointed to the faculty of the Department of Rural Education in the College of Agriculture at Cornell University, with the major responsibility of developing the program in home economics teacher-education. In 1942 she was elected to membership on the faculty of the College of Home Economics. In the early years of her service at Cornell, she worked with both undergraduate and graduate students. As the program developed, however, and as other members were added to the home economics education faculty, she chose to devote herself primarily to the undergraduate program. During her years at Cornell, the program in home economics education grew consistently in both quality and scope. The preservice program for teachers, which ranked high among such programs in the United States, was not only an expression of her belief in directed teaching experience for prospective teachers; it was also a tribute to her ability to develop and utilize the facilities within which such experiences could take place effectively.

Professor Cora Binzel Chase expressed her keen interest in education and her relief in education for home and family living through her participation on committees not only within the University but also those at state and national levels. She was active in professional organizations and made valuable contributions to the New York State Education Department and to the Home Economics Bureau in the United States Office of Education. She was a member of Phi Kappa Phi, Pi Lambda Theta and Omicron Nu honor societies. Within the period between 1920, when she first came to Cornell, and her retirement in 1945, she devoted twenty-two years to teaching here,

one year to the direction of the Education Department at McCreery's Department Store in New York City, and two years to study. During her period of teaching service, she spent her sabbatic leaves in study and travel, visiting secondary schools, colleges, and universities in various parts of the United States.

Among the many contributions which Professor Cora Binzel Chase made, perhaps the richest were her personal relationships with both colleagues and students. The philosophy of loyalty and devotion which characterized her family life was an underlying factor in the establishment of close bonds between herself and others. That she was an artist in developing and maintaining fine relations with others was evidenced not only by her large circle of friends among the student body, alumni, and faculty, but also in her professional contacts with educators throughout the United States. She was held in high esteem by all who had the privilege of working with her.

After Professor Cora Binzel retired in 1945, she was married to Joseph Cummings Chase, an internationally known portrait painter and head of the Art Department at Hunter College. For ten years they lived at the Arts Club in Grammercy Park, New York City, and were active in much of the cultural life in the city. For the last ten years they had made their home in Milwaukee. Mrs. Chase played hostess to many notable persons as her husband painted their portraits. She is survived by several nieces and nephews.

Margaret Hutchins, Clyde B. Moore, Irene Patterson

Clarence Orion Cheney

July 10, 1887 — November 4, 1947

Dr. Clarence Orion Cheney entered the field of Psychiatry upon graduation from the College of Physicians and Surgeons, Columbia University, in 1911. He was Assistant Physician and Pathologist at the Manhattan State Hospital from 1911 to 1917. Dr. Cheney's work during this period resulted in valuable histopathological investigations in dementia praecox and in focal infections. His interest in pathology persisted during his life. The training in pathology formed his scientific medical attitude which never permitted him to accept theories and claims which were not related to established facts.

The following twenty years were spent in clinical and administrative psychiatry in various New York State Hospitals. From 1931 to 1936 he was Director of the New York State Psychiatric Institute and Hospital, and from 1933 to 1936 he was Professor of Psychiatry at Columbia University. When Dr. Cheney assumed the position of Medical Director of the Westchester Division of the New York Hospital, he was appointed Clinical Professor of Psychiatry at Cornell University Medical College.

Until his death, Dr. Cheney participated actively in the undergraduate teaching. His lectures on legal aspects of psychiatry formed an important part of the teaching program. His interest in psychiatric treatment was manifested in several publications and, in recent years, dealt especially in the methods of insulin and convulsive therapy. This progressive attitude in treatment expressed itself in his teaching of medical students and his psychiatric colleagues. His influence was felt widely, and was recognized by his election as president of the American Psychiatric Association.

During the ten years of his leadership at the New York Hospital, Westchester Division, Dr. Cheney found ample opportunity to demonstrate his unusual abilities as hospital administrator. A gradual building program led to extensive renovation. In the construction of a building for excited and highly disturbed patients, Dr. Cheney realized many thoughts with regard to their treatment which he had developed during his years as a hospital psychiatrist. He oriented the hospital to an active treatment program which resulted in a constantly increasing number of admissions of acutely ill patients who are benefitted most by treatment. As a member of the Medical Board of the New York Hospital, he had an opportunity to help in forming the policies of this teaching center.

Dr. Cheney's interest in graduate and postgraduate education had become obvious during his years of service in the various state hospitals, and became especially fruitful when he was Director at the Psychiatric Institute and at

the Westchester Division of the New York Hospital. His "Outlines for Psychiatric Examinations" have influenced psychiatrists greatly, and are used in many hospitals and medical schools.

In all his manifold activities during a highly successful life, Dr. Cheney has been open to new thoughts and tolerant of the viewpoint of others. His frankness and kindness have made him respected by his colleagues and admired by his grateful patients and their relatives.

Askar Diethelm

Nephi Albert Christensen

January 19, 1903 — April 12, 1996

Nephi Albert Christensen died on the morning of April 12, 1996, in his home in Albuquerque, New Mexico at the age of 93. His wife, Leda Lyman Christensen, predeceased him. He is survived by his youngest sister, Eva C. and her husband, John VanOrman; as well as his four children: Albert L. Christensen; Robert W. Christensen and his wife, Carrie; Marilyn C. and her husband, Dr. Jerome W. Bettman, Jr.; and Julianna McGregor; and nine grandchildren.

Born January 19, 1903, in Provo, Utah, Nephi was the second eldest child of seven born to Ellen Susanna Jorgensen and Chresten Carl Christensen. After receiving a Bachelor of Science degree from Brigham Young University, he taught high school in Cedar City, Utah in 1925-26. In 1928, he received a Bachelor of Science degree in Civil Engineering from the University of Wisconsin and then from 1928-33, he was Professor of Exact Science at Ricks College, Rexburg, Idaho. He was a member of the Hydraulic Research Laboratory of the Soil Conservation Service of the U.S. Department of Agriculture while completing Master of Science and Doctoral degrees from the California Institute of Technology in 1934 and 1939.

He became Dean of Engineering at Colorado State University in 1938, while simultaneously serving as Director of the Engineering Division of the Colorado Experiment Station for the next decade. He took leave from Colorado State during World War II to serve as chief engineer for the Ballistic Research Laboratory where he was promoted to Chief of Research for the Rocket Research Division in the Ordnance Research and Development Center, Aberdeen, Maryland.

In 1948, Dr. Christensen joined the Cornell faculty as Director of the School of Civil Engineering. Chris's tenure as Director of the School of Civil Engineering has to be viewed in the context of his times. In 1937, "Cornell was reported to be the worst housed and equipped among twenty-five top (engineering) schools in the country" and "virtually no research was done except that which the then new Director of Civil Engineering, Solomon Cady Hollister, started in the Hydraulic Laboratory." In the same year, Hollister became Dean of the College of Engineering and immediately undertook its revitalization. But Hollister's plans had only begun to bear fruit when World War II put them on hold. When Chris arrived in 1948, he found a faculty within civil engineering composed of experienced hands, tired from wartime teaching, and new hires with energy and ideas - but there was little that could be called research.

The picture was not completely bleak. Cornell was on the threshold of regaining a prominent role in engineering education by introducing a five-year undergraduate program and reviving long-delayed plans for new engineering buildings. In addition, the attitudes and funding required for the expansion of graduate study and research gained prominence. In civil engineering, Chris took advantage of these opportunities. Nationally, he was active in engineering educational planning circles. Locally, he oversaw the planning and the 1959 move from Lincoln Hall—tradition-rich but outmoded building—to Hollister Hall on the new Engineering quadrangle. A primary example of the progress in civil engineering was the transition in hydraulics from a largely empirical approach to one in which Cornell's historical status as a leader of the field was restored through the theoretical and experimental contributions of a new, younger faculty group.

The road to revival was not a smooth one, but when Chris retired, he could leave with pride and a sense of accomplishment in a school that was once again one of the undisputed leaders in civil engineering education and research. He remained director until 1966, and retired from Cornell in 1968 when he was named Professor Emeritus. He then led the Near East Foundation team assisting the Iranian Government in establishing an agricultural college at Rezaiyeh in northwestern Iran.

He was a member of Tau Beta Pi, Sigma Xi, Chi Epsilon, Sigma Tau, the American Geophysical Union, a National Director of the American Society of Civil Engineers, and the American Society for Engineering Education. For ASEE, he co-authored *Ethical Problems for Engineers* in 1965 with Philip Alger and Sterling Olmsted - an early reference and guide for engineering students and professionals. He was a trustee for the Village of Cayuga Heights in 1956 and a member of the New York State Flood Control Commission from 1954-60. He helped develop a comprehensive sewerage plan for Monroe County, New York in the late 1960s. He served as a consultant to the Brookhaven National Laboratory, the Argonne National Laboratory, and other national agencies.

Chris was a “hands-on” engineer who thoroughly enjoyed building things, including his own home five miles east of campus in Ellis Hollow and the Mormon Church in Ithaca. After returning from Iran in 1972, he became deeply involved in numerous building projects with his family and friends, including homes for several of his family, and also undertook the exacting pastime of building some 75 violins.

Nephi Christensen was a gentle, unassuming, honest, and honorable man who was kind to everyone. His sense of fairness and his dealings with people were exemplary. His philosophy of life continues to serve as a model for faculty members who become involved in administrative leadership positions in a university setting.

D.R. Corson, W. McGuire, R.N. White, W.R. Lynn

Vance A. Christian

December 19, 1928 — November 5, 1984

On November 5, 1984, the School of Hotel Administration lost one of its most famous, respected, and dedicated teachers and alumni, Vance Christian.

“Teaching is my greatest joy,” Vance often remarked. “I like to see and be instrumental in developing success. What brings tears to my eyes is recalling some young man or woman sitting across my desk from me who has no idea of his or her potential, convincing the student that he or she has it, and then seeing that person years later as a leader in the hospitality industry.” By the time of his death, Vance had become, in the words of several colleagues, “the closest thing we had to a legend” at the Hotel School.

Born in New York City, Vance moved as a child to rural West Virginia, where his father was a country doctor choosing to serve those who were not fortunate enough to receive adequate medical attention. Vance’s father was his mentor—kind, gentle, patient, but with an underlying independence and iron resolve. Vance adopted his virtues and combined them with his strong opinions and theatrical manner of making his point.

Vance arrived in Ithaca in 1959 through a bit of good luck for him and for Cornell. After earning a chemistry degree at West Virginia State College, he had enlisted in the army and managed an army service club. Upon his discharge he had planned to enroll in the Harvard Business School, when a waiter working for him suggested Cornell. “I don’t want to go to hotel school and be a cook,” Vance recalled telling the waiter. When he reviewed the catalog and became aware of the school’s commitment to management, he changed his mind. He earned a second bachelor’s degree and a master’s degree at Cornell. He then joined the faculty as a lecturer in 1961 and was appointed an assistant professor in 1965, at that time one of only a few black faculty members at Cornell.

Over the years, Vance developed an international reputation as a concerned, caring, and demanding professional, who lived by the philosophy absorbed from his father—concern for people, hard work, independence, and leadership. On campus he developed and taught numerous food and beverage management courses, spicing each lecture and demonstration with strong opinions and a personalized phrase such as “in doing so” or “on the reverse side” followed by an all-knowing smile and a chuckle. His most popular course, “Introduction to Wine and Spirits,” attracted hundreds of Cornell students each semester. For his efforts and leadership in promoting beverage management in the curriculum, he was named the Villa Banfi Professor of Wine Education in 1978.

Students and former students making their way up the echelons of the industry sought out Vance for his sage advice. He became the mentor to a wide range of students, both domestic and international, and to many young faculty members. He took time to listen, to be concerned, and to become involved. The loan fund, which he established in his father's name, quietly assisted deserving students.

Within the industry Vance was well known and highly respected. By example he promoted hospitality-management education as a legitimate and demanding discipline. A black in an industry whose management ranks were almost entirely white, he said his color was not a problem. "I do not teach black management. I teach management. If people want to improve their business or make their personnel more efficient, they don't care who does it."

Vance carried the highest standards of hospitality education with him wherever he traveled throughout the world—Europe, the Far East, Africa, South America, and India. He personified Cornell to those he taught and encountered in distant places and to those government and industry leaders he advised. An established and reputable consultant and management adviser, he also contributed significantly to industry education and research as president of the Society of Wine Educators, as a member of the board of directors of the Culinary Institute of America, and as an active member of the Society for the Advancement of Food Research; the Council on Hotel, Restaurant, and Institutional Education; the Institute of Food Technologists; and the Hotel Sales Management Association.

A bachelor most of his life, Vance's family was the students he taught and the faculty he befriended. Late in his life he married Nena, his steadfast companion through his long and slow illness. Vance never gave up. With deep, moving courage and hope, he talked and planned of coming back. He rose from his bed to lecture to his class and to travel for one last visit to Singapore to give his farewell seminar to the industry he loved.

Vance's passing leaves a void that cannot be filled. He touched our lives in deep and moving ways. A personal giant: tough, but soft underneath; demanding, but understanding; opinionated, but willing to reconsider his position. From humble beginnings to a humble end, Vance was laid to rest in a small country churchyard in rural Virginia beside his mentor, his dad.

Stephen Mutkoski, Normand Peckenpaugh, James Eyster

Charles D. Chupp

June 2, 1886 — November 9, 1967

After fifty-five years of association with Cornell University as a graduate student, teacher, extension pathologist and Professor Emeritus, Dr. Charles Chupp died following a chronic illness on November 9, 1967, in Ithaca, New York. He had retired from active service in the Department of Plant Pathology on June 30, 1954.

Dr. Chupp was born June 2, 1886, in Millersburgh, Indiana, son of Levi and Rebecca Chupp. Following graduation from Wabash College in 1912 with a B.S. in botany he entered the Graduate School at Cornell University that fall. While studying, he served as assistant and later as instructor in plant pathology. He was granted the Ph.D. from Cornell in 1916. For the year following, he was Acting Professor of Botany at Wabash College. In 1918 he returned to Cornell as Assistant Extension Professor in Plant Pathology handling extension duties mostly dealing with vegetables. He was appointed an Assistant Professor in 1919 and Professor in 1927. He continued to serve in vegetable extension pathology work until his retirement June 30, 1954.

Known as the premier diagnostician of plant disease problems, Dr. Chupp was internationally recognized for his studies on vegetable diseases and his knowledge of all plant production problems. He traveled throughout New York State widely in the days of the Model T Ford, railroads, and mud roads and was known and respected by three generations of vegetable growers throughout the state and by the graduates in plant pathology and vegetable Crops at Cornell. Dr. Chupp had outstanding abilities as a teacher. He was at his best with small informal groups. He was equally adept with professional colleagues, students, county extension staff, and farmers. With each group he had contagious enthusiasm for his subjects, and he used terminology and techniques appropriate for the particular audience.

His recommendations to farmers resulted in the adoption of sound practices that have been of inestimable value to vegetable growers by increasing their yields and reducing disease losses. He was one of the first to recognize the importance of the use of disease-free seed and of protecting the plants during their early period of growth as well as the use of resistant varieties. Tomato plant growers followed his methods of seedling production after the industry was seriously threatened by disease. He was also active in planning and initiating vegetable seed certification and was responsible for exacting field inspections during its early stages. As a measure of appreciation of his work, the New York State Vegetable Growers Association, at its annual meeting in 1951, honored him with a citation and presented him with a purse.

At a ceremony held in Washington, May 18, 1954, the United States Department of Agriculture bestowed on Professor Chupp its Superior Service Award in recognition of the value of his services to agriculture in the United States.

Professor Chupp became interested, as a hobby, in the classification and relationship of the fungi belonging to the genus *Cercospora* on observing many diseases of vegetables and other plants incited by species of this genus. He spent some thirty years of his spare time in studying this group from specimens in the field and dried specimens in herbaria that he visited in this country and in Europe. The results of his studies were published privately in 1954 in his monograph on the fungus genus *Cercospora*. It was a contribution of great value to research in the identification and relationships of this group of fungi, an aid alike to plant pathologists, mycologists, and other botanists throughout the world.

In addition to his numerous articles and bulletins on vegetable diseases, his *Manual of Vegetable Garden Diseases* was published by Macmillan and Company in 1925, and *Vegetable Diseases and Their Control*, written with Dr. A. F. Sherf, was published by Ronald Press in 1960. This latter publication has become a standard reference work in the libraries of extension specialists, county agents, and college teachers throughout this country and abroad.

Dr. Chupp was a life member of the American Phytopathological Society serving as councillor in 1937 and 1938, vice president in 1939, and president in 1940. He was designated Fellow by the Society in 1965. He was also a member of the American Mycological Society, The American Association for the Advancement of Science, Epsilon Sigma Phi, and Sigma Xi. In 1964 he was presented the Award of Merit by the Northeastern Division of the American Phytopathological Society. He was a member of the Forest Home Chapel and a fifty-year member of the Edinburg Lodge, F. & A. Masons, Edinburg, Indiana.

He is survived by his wife, the former Nora Mae Scrugham, sons Karl, Howard, Frank and John, thirteen grandchildren and four great-grandchildren.

With his passing, Cornell has lost a spirited, loyal supporter of its traditions and a man who added much to its prestige.

William F. Mai, Robert D. Sweet, Arden F. Sherf

Irving Porter Church

Professor of Applied Mechanics and Hydraulics

— May 8, 1931

In the death of Professor Irving Porter Church, Cornell University has lost one of her most distinguished graduates and most valued teachers. His whole career was spent in the service of his Alma Mater.

Graduated in 1873, a member of the instructing staff since 1876, he gave to Cornell the benefit of his exceptional training as a mathematician and of his rare qualities as a teacher. When he retired in 1916 he had taught here forty years, first as assistant and associate professor of Civil Engineering and later as professor of Applied Mechanics and Hydraulics.

He enriched the literature of his profession by works of lasting merit in which his keen analytical mind, his matchless gifts of exposition are strikingly illustrated. His pupils have attained eminence in every field of engineering.

The alumni of the College of Civil Engineering expressed their appreciation of his services shortly after his retirement when they presented to the University a portrait of their teacher and the Irving P. Church Fund to purchase books for the library of the College.

Another high honor came to him in 1919 when he was awarded the Benjamin G. Lammé gold medal “for accomplishment in technical teaching and actual advancement of the art of technical training.” This medal, given by the Society for the Promotion of Engineering Education, was a tribute of the whole profession to the man who had been called “the father of mechanics” on account of his epoch-making book *The Mechanics of Engineering*.

The essential doctrine of this book as well as of his teachings was that all good design must be based on the principles of mechanics.

His students were unanimous in praising his qualities as a teacher; clarity of presentation, rigor of demonstration, unlimited patience, unfailing courtesy were outstanding characteristics. They remember with especial gratitude that he spared neither his time nor his labor in helping them individually to understand difficult questions and to solve what seemed to them insoluble problems.

Their respect for the teacher was equaled only by their admiration and affection for the man whose quiet manner and self-effacing modesty won the hearts of all who knew him.

Science was only one aspect of his versatile personality. Nothing in the realm of literature and art was indifferent to him. He read good books. He displayed a peculiar and persistent interest in modern languages. Although he made only one short trip abroad he spoke well and understood both French and German. He loved and practiced the arts. Painting was one of the favorite diversions of his later years, and his home was filled with his copies of great masterpieces.

He was very fond of music. He played the violin. Until the very last he found solace in listening to melodies that had always enchanted him.

This unassuming and retiring man whose life was so full of work and who seemed absorbed in his many avocations found time to interest himself in the activities of the city. No good cause, no work of community interest or of social service appealed to him in vain. He gave generously and cheerfully. His acts of kindness to humble folk, his interest in deserving students, his love of children are remembered by all who knew him.

His last illness had kept him confined to his home for two years, without depriving him of the companionship of his family and his friends. Those who called on him found him always resigned, serene, and smiling. To the end he was deeply interested in everything that concerned the University. He ever remained the gentle, friendly, and human soul that his colleagues and pupils will ever mourn and remember.

Peter Walter Claassen

March 17, 1886 — August 16, 1937

Peter Walter Claassen was born at Hillsboro, Kansas, March 17, 1886. He began his collegiate work at McPherson College but transferred to the University of Kansas, from which institution he was graduated with the degree of Bachelor of Arts in 1913. Although his major work as an undergraduate was in chemistry, on graduation he accepted a position as Assistant State Entomologist of Kansas and remained at the University of Kansas, continuing graduate work in his newly chosen field. He was granted a master's degree in 1915. He came to Cornell University in the autumn of 1915 as assistant in general biology and took graduate work in entomology, receiving his doctor's degree in 1918. For one year he returned to the University of Kansas as assistant professor of entomology, but after receiving his doctor's degree he retained his connection with Cornell University for the remainder of his life. During the academic year 1924-25 while on leave from the University, he taught at Tsing Hua College, Peking, China, where he reorganized the work of that institution in the biological sciences. In the scientific societies of his field, he played an active part.

The subject of his doctor's thesis was an ecological study of the insect inhabitants of the cattail, in the course of which work he uncovered many interesting and important facts about the numerous insect species which invade this plant. Later he undertook special studies in the Plecoptera or stone flies, his papers on this order of insects including a monograph of the nymphal stages. Shortly before his death he completed a manuscript for a catalogue of the stone flies of the world. Although chiefly interested in the taxonomic aspects of these problems he never lost sight of the possible economic applications of entomology. This is shown in his work on the grasshoppers of Kansas and his studies upon the animal life in streams polluted by milk and factory wastes.

This cold array of facts about his vocational and avocational activities fails to indicate the nature of the life and work of Professor Claassen. Not only was he a skilled observer in scientific fields, but he was outstanding as a teacher. His strength in teaching, whether formally in classes or elsewhere, rested chiefly on his happy disposition, his jovial informality, and his friendly attitude to all persons at all times. He was known affectionately to his friends and associates by his nickname and the attribute which led to this, which might easily have been mistaken by those who knew him less well as a lack of dignity, in no degree reduced the affectionate appreciation of his merit as a student and teacher. Few men have surpassed or equaled him as a friend of all his associates of whatsoever rank, and because he showed himself a friend, others were friendly toward him. In social affairs among his associates

and students he was a natural leader. That leadership was as natural to him as breath itself, and he showed unusual skill in using it to the advancement of his research and teaching.

The sudden death of Professor Claassen in Ithaca, New York, on August 16, 1937, followed closely on a trip which he took to the Pacific Coast while on sabbatic leave, on which he visited many old friends and made many new ones. On this trip, as usual, he assiduously collected insects of his chosen Order and took every possible occasion better to prepare himself for his later work by consultations with those in similar work in numerous institutions across the country. He seemingly looked forward to many more years of service for Cornell University, but these hopes were blasted. By his death Cornell University loses a loyal supporter, an ardent worker, and a friendly spirit. His many friends among students, faculty and fellow citizens mourn his death but are happier and better because of their association with him. He leaves a wife and two children who are inspired by the memory of his life.

The Faculty of Cornell University records its appreciation of the many years of service of their former associate and the sense of loss which members of the faculty feel in his death. The Faculty extends to members of the immediate family of Professor Claassen this expression of its sympathy in their loss.

Resources: Faculty Records, p. 2004 Resolutions of the Trustees and Faculty of Cornell University, November, Nineteen Hundred And Thirty-Seven

Charles Edward Cladel

August 27, 1906 — March 7, 1985

Charles Edward Cladel was born in New York City, the son of Edward and Louise Eberhart Cladel. He prepared for college in the New York City school system, graduating from the Evander Childs High School. He attended Columbia College for one year and then applied for admission to the Hotel Management Program at Cornell, at that time a division of the New York State School of Home Economics. He matriculated in fall 1925 and successfully completed his Bachelor of Science degree in February 1929.

He then entered the hotel industry as an accountant and worked for the firms Horwath & Horwath, Haskins & Sells, Howard Dayton Hotels Corporation, and the American Hotel Corporation. In 1933 he was invited by the late dean Howard B. Meek to join the faculty as an accounting instructor. He accepted this position and also began work on his Master of Science degree, which he completed in 1936. During this period he also prepared for the New York State certified public accountant examination and was certified in 1938.

Charles Cladel taught at Cornell for nearly forty years. He was promoted to assistant professor in 1940, to associate professor in 1945, and to full professor in 1953 and was granted the title of professor emeritus upon his retirement in 1972.

Drawing on his extensive previous work experience, Professor Cladel developed and taught specialized courses in hotel accounting, food and beverage control, and hotel front-office posting machines. In addition, he offered general courses in basic accounting, intermediate accounting, and auditing.

During World War II Professor Cladel made a significant contribution to the war effort by teaching all five of the school's accounting courses to a substantial number of army and navy personnel who were attending the special officer training program. This often entailed working in excess of seventy hours a week.

To keep in touch with the industry, Professor Cladel spent a number of summers working with Horwath & Horwath as a senior accountant. He also collaborated with the late Professor James Barrett in the design and installation of the first accounting system to be used at the Statler Inn and Club on the Cornell campus.

He married Mabel Elizabeth MacGregor in December 1935 in Johnson City, New York. They had two children: a son, Charles (1939), and a daughter, Nancy (1942). Eventually they were also blessed with four grandchildren.

During his undergraduate years he was a member of the Cornell Crew, Pi Kappa Phi fraternity, and the honorary societies of Phi Kappa Phi and Ye Hosts.

Professor Cladel was a member of the Kiwanis Club, a Mason, and a member of the New York State Society of Certified Public Accountants. He was a member of St. Paul's Methodist Church and a former president of the Ithaca Chapter of the Cornell Society of Hotelmen.

Always possessed of community spirit, he worked on a volunteer basis for a number of local organizations as treasurer and accountant. Those who were fortunate to know him will remember Charlie Cladel as a contributor to society and his fellow man and as a true gentleman in every sense of the word.

After an extensive illness, during which he was lovingly cared for by his wife and family, he quietly went on his way, at home, in March 1985.

Richard A. Compton, Richard G. Moore, David C. Dunn

James H. Clancy

May 1, 1912 — March 3, 1993

James H. Clancy was born in 1912 in Oakland, California. He obtained his B.A. degree in theatre studies at San Jose State College in 1935 and continued at San Jose as an instructor of dramatic literature and history of the theatre. In 1940, he joined the United States Air Force, attaining the rank of Captain, then pursued advanced study at Stanford, obtaining a Ph.D. degree in 1947. He returned to San Jose to teach and serve as director of the University Theatre. Two years later he married Stella Pinoris.

During the next thirty years Jim Clancy established himself as one of the leaders in the American educational theatre, excelling separately and concurrently as administrator, teacher, and director. He contributed significantly to the national professional organization, the American Theatre Association, served (1957-59) as editor of its journal, the *Educational Theatre Journal*, and headed four of the country's most distinguished programs in theatre education.

He left San Jose in 1957 to become professor of dramatic literature and director of the University Theatre at the State University of Iowa. There he founded an experimental theatre which became one of the most important in the country. Within a few years, in fact, his achievement at San Jose and Iowa made him one of the ten American directors awarded grants-in-aid by the Ford Foundation in 1960 to study European theatre direction. Then in 1961 he returned to Stanford as professor of dramatic literature, director of the University Theatre, and director of Graduate Studies, and the following year he was appointed professor of drama at Dartmouth College and director of Dartmouth's Hopkins Center.

In 1967, Jim came from Dartmouth to Cornell to serve as department chair and director of the University Theatre. His major concern at this juncture was to guide the reorientation of the department, which had recently changed from a Department of Speech and Drama to one of Theatre Arts. Central to Jim's reorganization was the establishment of a professional training program in acting and directing and the organization of M.F.A. degrees in these areas to complement the program's already established M.A. and Ph.D. degrees. The establishment of these programs and the advanced students they attracted enabled the Cornell University Theatre to aim at more ambitious and more polished productions than had previously been undertaken, an important gain both for the department and the entire community. Within a short time, the "Clancy era" was firmly underway, and the evidence in interest and enthusiasm among undergraduates, graduate students, and community theatre buffs was

matched only by the steady intensity of activity at the Straight and Lincoln Hall theatres. Jim not only directed frequently (he once said that any director worth his salt directed at least three shows a year), he and his wife frequently joined their students as actors.

The improvement in the quality of theatrical productions under Jim's leadership served, among other things, to make more evident than ever the inadequacy of the University Theatre's aging facilities in the sub-basement of Willard Straight Hall. The eventual construction of the new University Theatre in Collegetown may be seen in significant measure as a response to the heightened awareness of the need for the support of quality theatre that Jim encouraged at Cornell.

Among his further contributions to such theatre, he was instrumental in 1970 in the formation of the Ithaca Summer Repertory, which developed into a joint venture supported also by Ithaca College and the Center for the Arts at Ithaca. The current highly successful Hangar Theatre is the direct descendant of this organization.

During his ten years at Cornell, Jim was widely admired and loved by students and colleagues alike for his infectious passion for and knowledge of theatre, his wit, his Irish charm, and his inspiring uncompromisingly high standards for the art of the theatre. His classes were lively and stimulating, and the productions he directed were always fresh and exciting, and frequently powerful and visually stunning. Upon his retirement he returned to California, and subsequently moved to southern Arizona, where he continued for some years to accept invitations to teach and direct. He is survived by his wife, two sons, a daughter, and grandchildren.

Anthony Caputi, Bert O. States, Marvin Carlson

Benjamin E. Clark

October 3, 1914 — May 26, 1983

Benjamin E. Clark, professor emeritus of seed investigations, was born and raised on a truck farm in Southampton, New York. An early interest in plants led to his matriculation in the College of Agriculture at Cornell, where he received a Bachelor of Science degree in 1940. He accepted a position as farm foreman in the Department of Seed Investigations at the New York State Agricultural Experiment Station at Geneva, starting July 1, 1940, but after seventeen months he resigned to enter the U.S. Army. He had three years of active duty in World War II, including combat service in Luxembourg, Belgium, Holland, and Germany.

After his discharge in November 1945, Ben returned to Cornell, where he studied under Dr. H. C. Thompson, receiving a Master of Science degree in vegetable crops in 1946. He then went to Michigan State College (now University) where he was Dr. Sylvan Wittwer's first Doctor of Philosophy student, receiving his degree in horticulture-plant physiology in 1948. In September of that year Ben returned to the Experiment Station at Geneva as assistant professor of seed investigations. He was promoted to associate professor in 1952 and to professor in 1956, retiring June 30, 1980.

In 1952 Ben was appointed head of the Department of Seed Investigations, a position he held until October 1968, when he was appointed assistant director of the Experiment Station and assistant director of research for the College of Agriculture and Life Sciences. He remained in this position until February 1977, when he requested to return to field and laboratory research. During his tenure as assistant director of the Experiment Station he was responsible for preparation of programs, architectural planning reviews, and oversight of construction of several new buildings.

Ben established a reputation as an efficient and progressive researcher and administrator in correlating seed testing and seed law enforcement. He was soft-spoken and reserved—a very effective listener—and he had the ability to come up with concise and effective summaries and/or solutions to problems under discussion. Under his leadership new equipment and national personnel were added to the station's seed testing and seed research programs, and new programs were established in seed physiology and seed microbiology. He advised a number of students who were working for advanced degrees in seed technology at Cornell.

During his career Ben authored or coauthored more than one hundred scientific papers that significantly advanced our knowledge in seed science and technology. He conducted extensive investigations on development

of a supplemental cold test to determine the ability of seeds to germinate under unfavorable field conditions. This enabled seedsmen, growers, and processors to better predict field performance.

Ben promoted the use of high-quality seed, encouraging cooperation among the New York Seed Improvement Cooperative, Inc., Cornell Cooperative Extension, the Atlantic Seedsmen Association, and the Northeast Seed Control Officials. He worked closely as well with the New York State Department of Agriculture and Markets in implementation of the New York State seed laws. He was chairman of the New York Seed Law Revision Committee from 1953 to 1955 and, as such, wrote most of the present law. For many years he coauthored a seed inspection report that listed the quality and labeling of seeds sold within New York State the preceding year.

Ben was an active member of the Association of Official Seed Analysts. At various times he served as editor of its *Proceedings*; as chairman of the Editorial Committee; as vice president, president, and chairman of the Research Committee; and as chairman of several subcommittees and was a member of the legislative and constitution committees. He was presented the association's Award of Merit in 1968. He was a past board member of the Council of Agricultural Science and Technology. At the time of his death he was serving as secretary-treasurer of the New York State Seed Association, of which he was an honorary member. He belonged to numerous professional societies, including the American Society of Agronomy, the American Society for Horticultural Science, and Sigma Xi.

Ben's influence was felt far beyond the scientific community. He spent thousands of hours working with the Boy Scouts of America and with his church. In scouting he received the Silver Beaver Award, the highest honor given to scouters. He was a member of the executive board of the Finger Lakes Council, served as a member of the council's Membership Committee, and served as chairman of the Advancement Committee. He also had been active in many other phases of scouting throughout his lifetime in Geneva.

Ben was a member of the Board of Deacons, a member of the Session, and an elder at the First Presbyterian Church. He was president of the Board of Trustees before the church adopted the unicameral system. He had served as chairman of the Interpretation and Stewardship Committee and also as chairman of the Christian Education Committee. A number of years ago he had been active on the church's building committee.

He was also a member of the Finger Lakes Torch Club, an international discussion group.

Survivors include his wife, Sarah Wolstenholme Clark; a son, Christopher, associate professor of plant pathology at Louisiana State University; a daughter, Mrs. Constance Clark Smith, who lives in Randolph, New York; and four grandchildren.

Donald W. Barton, Gary E. Harman, Morrill T. Vittum

Daniel Grover Clark

August 20, 1900 — April 13, 1962

Professor Daniel Grover Clark of the Department of Botany passed away on April 13, 1962, at the age of 61. Professor Clark was born in Ithaca on August 20, 1900, and obtained all of his education in Ithaca, first in the public schools, subsequently at Cornell University. He received the B.S. in 1929 and the Ph.D. in 1936.

Professor Clark's association with the Department of Botany began during his high school days, when he was employed in the stockroom. He continued in this position during his undergraduate studies. Following graduation he became a scientific assistant. With the receipt of his Ph.D. he was made an Acting Assistant Professor, Assistant Professor, Associate Professor, and then full Professor in 1948.

Professor Clark's teaching duties were confined to plant physiology, where he saw at an early date the necessity of utilizing the tools of biochemistry in physiological research. In his presentation of the advanced plant physiology laboratories and the introductory course in physiology he perfected a Socratic approach that forced many a beleaguered student to think hard for the first time. His first concern was that students recognized the need to explore all avenues to the solution of a problem. As a result of his labors the self-reliance and imagination of a host of Cornell undergraduates were tremendously stimulated.

Professor Clark's own research centered on problems of photosynthesis, enzyme activity, hormones and vitamins, biological nitrogen fixation, and hybrid vigor. Outgrowths of some of this work were a splendid movie film on the opening and closing of stomates. Although it is one of the early attempts to utilize photomicrographic techniques in the making of moving pictures for teaching purposes, it is still in constant use. The work on nitrogen fixation with the late Professor Lewis Knudson involved furnishing approximately 20,000 cultures of legume bacteria a year to farmers in New York State. The cultures were used to inoculate leguminous plants and contributed significantly to the use of alfalfa in the state because of the role played by these bacteria in the successful growth of alfalfa.

A major share of Professor Clark's time was devoted to advising graduate students who minored in plant physiology. At the time of his death over 70 were registered with him and more than 350 came under his tutelage at various times. With all of these students his questions and suggestions stimulated their thinking and guided their approach to a myriad of problems. His humanity marked him as a man whom students not only respected

but loved. There is no way to evaluate the total effect of this immense contribution. His name, however, will live long in the memories of these students.

Dr. Clark collaborated with the late Professor Otis F. Curtis to write *Introduction to Plant Physiology*, which was published in 1950. This text was translated into Polish and was published in Warsaw in 1958. The thoroughness of the Curtis and Clark approach to all problems is amply demonstrated in this book.

Professor Clark was a member of the Botanical Society of America, American Society of Plant Physiologists, Sigma Xi, and Phi Kappa Phi. He was active in the First Presbyterian Church of Ithaca where he served as an Elder, He was a member of the Ithaca Rotary Club and was also active for many years in Community Chest affairs. He served on numerous University committees but was most concerned with the activities of Cornell United Religious Work, which he served many years as a member of the board.

The death of Professor Clark deprived his colleagues of a true friend and counselor, his graduate students of a skilled and devoted adviser, and his undergraduates of a gifted and inspiring teacher. Truly he succeeded in combining scientific intellectual skills with an unusual capacity to affect the lives of the people with whom he worked.

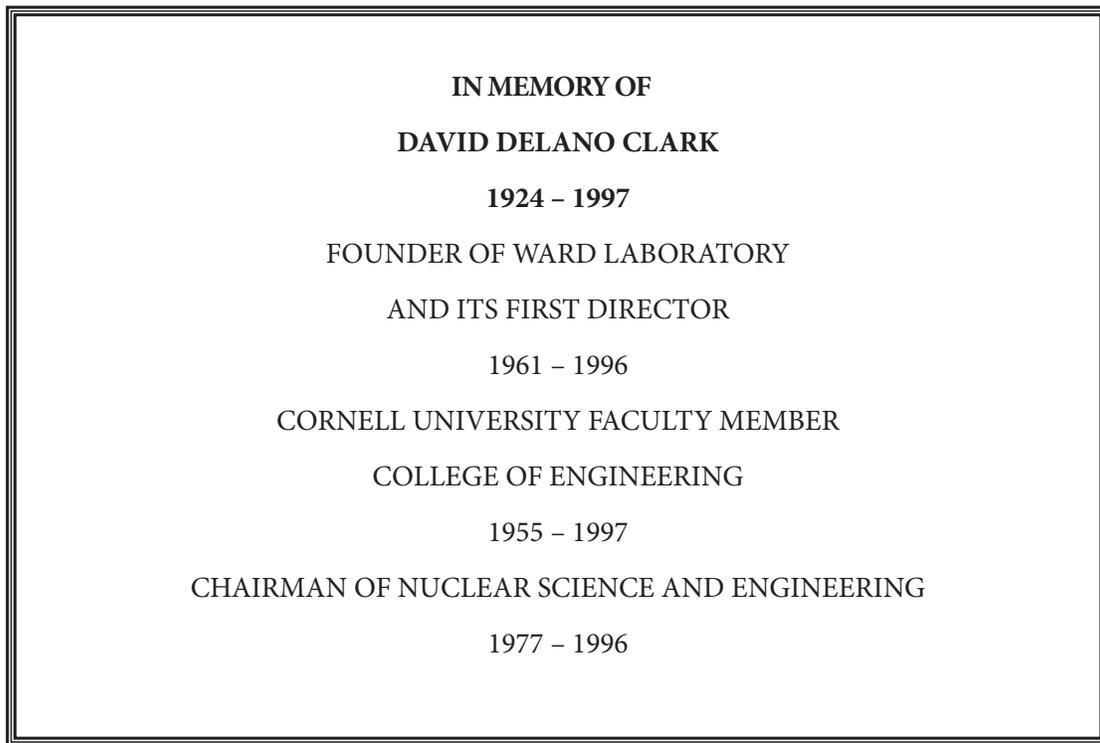

Dr. Clark is survived by his wife, Frederika Ahrness Clark; one daughter, Mrs. Mary E. Crawford of Manhasset, New York; and two grandchildren.

G. W. Dimock, R. M. Smock, H. P. Banks

David D. Clark

February 10, 1924 — December 22, 1997

David Delano Clark, Professor of Nuclear Science and Engineering, died at age 73 on December 22, 1997, at the Ward Laboratory of Nuclear Engineering. The memorial plaque in the lobby succinctly records his remarkable career at Cornell.

David was born in Austin, Texas. His undergraduate education at the University of Texas was interrupted by service in the U.S. Army Air Force in World War II. After the war, he enrolled at the University of California at Berkeley where he earned the B.S. degree in 1948 and the Ph.D. degree in 1953 under the supervision of Nobel Laureate, Owen Chamberlain. David was a post doctoral research associate at Brookhaven National Laboratory before joining the faculty of Cornell University in 1955.

David's most prominent contribution to Cornell is that he planned and oversaw the design and construction of the Ward Laboratory of Nuclear Engineering, and served as the laboratory director for 35 years. The Ward Laboratory houses the University's pulsing TRIGA Mark II nuclear research reactor. The formal program in Nuclear Science and Engineering at Cornell grew out of the Department of Engineering Physics in 1977, and David was its chairman for twenty years, 1977-96. The Ward Laboratory has contributed to the research of scores of faculty members and

students at Cornell since its completion, and thanks to David's leadership in the five years prior to his death, is playing a role in an increasingly broad range of research around the campus.

David was a Euratom fellow at Ispra, Italy in 1962; a Guggenheim fellow at the Niels Bohr Institute in Copenhagen in 1968-69; a Visiting Professor at the Technical University, Munich in 1976; a Visiting Scientist at Brookhaven National Laboratory in 1982; and a Guest Scientist at the Center for Analytic Chemistry of the National Institute of Standards and Technology, Maryland in 1990.

In 1996, David was elected a Fellow of the American Nuclear Society in recognition of

“the conception, design, and development of a succession of novel experimental facilities and instruments for the performance of unique research in nuclear science and engineering, including estimation of reactor physics parameters under isothermal conditions, determination of short-lived isomer decay schemes, measurement of delayed neutron energy spectra, and utilization of cold neutrons.”

He was also a member of the American Physical Society, Phi Beta Kappa, and Sigma Xi.

David was an outstanding teacher and helped develop graduate and undergraduate courses in nuclear science and in nuclear laboratory techniques. In 1964, he was a member of the College of Engineering committee that changed the five-year Bachelor of Engineering curricula to four-year Bachelor of Science curricula followed by fifth-year professional Master of Engineering degrees. Shortly before his death, David led the development of a multidisciplinary course, Art, Architecture, and Analysis, that was taken by a broad group of students from physics, classics, archeology, art, and engineering. The course showed scientists and non-scientists alike how nuclear techniques are applied. This course is a model of modern interdisciplinary science education.

In 1993, he led a successful petition by eleven universities to reverse the Nuclear Regulatory Commission decision to charge annual license fees (\$62,000 per year) for educational non-power reactors. This led to his realization of the importance of Cornell's research reactor to the rest of the university, and to the establishment in 1996 of the Ward Center for Nuclear Sciences, which took over the Ward Laboratory from the College of Engineering. David saw this as the correct direction for service-oriented laboratories in large, diverse universities.

David's research was extremely broad. He developed a fast rabbit system synchronized with the TRIGA reactor pulse to study nuclear isomers with half-lives from 25-milliseconds to several seconds; he conceived and developed the inner-shell vacancies; he developed a cold neutron source to be used with a totally reflecting neutron guide for

doing prompt gamma-ray analysis; and he invented a portable cold neutron irradiator for doing prompt gamma-ray analysis without the use of a reactor.

Using the pulsing capability of the Cornell TRIGA reactor, David and his students discovered or studied a number of nuclear isomers. He discovered the 24.6-second ground state of Ag-110, the 0.29-second isomer of Xe-134, and the 10.6-millisecond isomer of Sm-153. He measured properties of eleven other isomers: In-114m, In-116m, Xe-125m, Xe-127m, Ba-136m, Gd-155m, Dy-157m, Ta-182m, Ir-194m, Pa-235m, and U-236m.

In addition to all else, David was a great colleague. As director of Ward Laboratory and the Nuclear Science and Engineering Program, he listened to what others had to say about important issues. He also served as a quality control officer, reminding us what our responsibilities to students in nuclear science and engineering are. He always carried his teaching load even with his administrative duties. Finally, David tried to enable the rest of us in the program to accomplish our own research and teaching goals, no matter how different they were from his own. A commemorative plaque honoring this wonderful teacher, creative researcher, and great friend, is currently on display at the Ward Center for Nuclear Studies and will be moved to the Applied and Engineering Physics Lounge in Clark Hall.

David is survived by his wife of 48 years, Gladys Clark; two daughters; a son; and seven grandchildren.

David Hammer, Val Kostoun, Bing Cady

Roy Edwards Clark

June 11, 1889 — August 9, 1970

Professor Roy Edwards Clark was born in Norwood, New York. He attended Norwood High School and was awarded a New York State Scholarship at Cornell University in 1907. He worked for one year at the Norwood Paper Company where he had worked while in high school and then entered Cornell in the fall of 1908. Midway through his college program he took a leave of absence for one year to earn money to finance the completion of his college education. He received the degree of Mechanical Engineer from Cornell in 1913.

Professor Clark was appointed an instructor in the Department of Heat-Power Engineering at Cornell in the fall of 1913 and thus began a long teaching career at Cornell. He was appointed assistant professor of heat-power engineering in 1919 and associate professor of heat-power engineering in 1944. Professor Clark was awarded the title of emeritus professor of thermal engineering July 1, 1957.

A veteran of World War I, Roy Clark was an engineer in the Army Ordnance Department from September, 1918, to January, 1919. He was a charter member of the American Legion, Ithaca Post 221.

Professor Clark's interest in engineering was in the field of heat-power and particularly steam power plants. He spent his sabbatic leave during the spring term of 1927 at the General Electric Company's steam turbine division at Schenectady, New York, where he investigated performance factors of steam turbines. During several summers, he worked for the General Electric Company, the Westinghouse Electric Company, and several smaller companies where he was engaged in testing steam turbines, steam condensers, and steam boilers. Professor Clark held a professional engineer's license in the state of New York.

His main academic interest and consequently his primary academic activity was teaching. To this end, he devoted his full energy, and courses in his specialties were among those frequently chosen by mechanical engineering students. He was well liked and remembered by his students, and for years following his retirement there were always requests for information from returning alumni as to the whereabouts of "Entropy Clark." Professor Clark was always ready and willing to serve the Department of Heat-Power Engineering to the fullest extent of his ability. He was highly regarded by his colleagues.

Professor Clark gave generously of his spare time to outside interests. He was active in Boy Scout work for twenty-seven years and was business manager at Camp Barton for ten summers. He held the awards of Scouter's Key and

Scoutmaster's Key. He was also active in the American Red Cross, in which organization he taught first aid over a period of twenty-five years. He was a member of the Ithaca Stamp Club, the Kiwanis Club, and the Barber Shop Quartet.

Professor Clark was a Mason for over fifty-nine years and he was a member of the Balbec Grotto and the Acacia fraternity. He was a member of the Society for the Promotion of Engineering Education and of Atmos. He was an active member in the First Methodist Church of Ithaca.

Upon his retirement in 1957, Professor Clark and his wife, the former Ina Williams of Ithaca, moved to Florida and made their home in Fort Meyers.

George R. Hanselman Dennis G. Shepherd Howard N. Fairchild

Gilmore David Clarke

July 12, 1892 — August 6, 1982

When Gilmore D. Clarke, professor emeritus, died in August 1982 on a cruise ship off the coast of Denmark, he had not been active at Cornell for more than thirty years. The results of educational programs he inaugurated and attitudes he fostered as professor of city and regional planning and as dean of the College of Architecture, however, are still clearly evident.

Clarke graduated from Cornell in 1913. Then in 1930 the University sought his help and he became a member, while in practice as a landscape architect, of the Architectural Advisory Council. This council had been newly formed to advise the president and the trustees in matters concerning the physical development of an expanding campus. The council, which Clarke chaired from 1939 to 1950, studied and made recommendations about many problems small and large. In 1948, for instance, it prepared a plan for the development of the campus, rearranging road patterns and suggesting possible locations for new buildings. The plan proposed that the College of Engineering be housed in new buildings at the south end of the campus, as it now is, a scheme that had been under discussion for some time.

In 1935 Clarke began to serve Cornell in another way, when he became professor of city and regional planning and then, in 1939, dean of the College of Architecture. There were no professors of planning at that time; in fact, planning was a newly designated field of study, and there were few professors of it anywhere. Under Clarke's guidance, with the help of funds from the Carnegie Foundation, the unique program in city and regional planning, which now has fifteen faculty members, was developed.

It is significant that when, as a landscape architect and civil engineer with a large practice, Clarke accepted the responsibility of a professorship, he came prepared. The notes he used in giving the original course in the history of city planning are still in existence.

Many other things about Gilmore Clarke's career as professor and dean are notable. The new field of study necessitated additional faculty, and because of the retirement of several important teachers in architecture and art new appointments in those fields had to be made—and the job was done well. The faculty in all areas was strengthened, and the foundations were laid for the change made in 1976, when the College of Architecture became the College of Architecture, Art, and Planning.

In certain ways, however, Clarke was not a usual dean. For one thing, he had accepted the post with the understanding that he would continue as a principal in his practice in New York and be in residence in Ithaca only three days a week. In fact, he never did become a completely academic person. Sometimes he would operate as if he were running his firm in the city. On one such occasion he fired on the spot, for cause, a tenured professor. When President Day heard this, he protested that it just could not be done; it was contrary to academic procedure. Clarke pointed out that the man in question knew nothing of academic procedure; he was only an architect.

Clarke entered Cornell in 1909, enrolling as a student of landscape architecture. Many years later he explained in conversation that the choice of landscape architecture was made while he waited to register. The pleasant fellow in line in front of him had decided upon that field as his major, and since it sounded interesting, Clarke went along. The choice proved perfect. By 1930, when he joined the Architectural Advisory Council, he had become an important figure in his profession, although his career had been interrupted in 1917 by World War I, during which he served with the Sixth Engineers, attaining the rank of captain. After the war he returned to practice and became superintendent of construction for the Bronx River Parkway in Westchester County, New York. A few years later, when the Westchester Park Commission was formed, he became chief landscape architect in charge of design and construction for the remarkable system of parks and parkways the commission was building. These parkways, the first roads designed especially for automobile traffic, developed features we are all now familiar with—limited access with separate roadways, curvilinear as they follow the contour of the land, for traffic in each direction. The designer became a prominent man.

Until his retirement from practice in 1972 Clarke was president of the firm of Clarke and Rapuano, which he and the late Michael Rapuano, a 1927 Cornell graduate, had formed in 1937. This New York City firm developed a large practice, executing commissions in many areas: college campuses, housing developments, and parks and parkways. Clarke was involved with this practice all the years he was spending three days a week in Ithaca. During World War II, however, the firm became involved with military installations for the government, and the volume of work became so large that in 1950 Clarke was obliged to resign as dean. At his request he was continued as a member of the faculty with the title of professor of landscape architecture, and in 1963 the University Faculty voted to grant him the title of professor emeritus.

There is much to be told about Gilmore Clarke as an impressive figure, tall and handsome; as a kindly and sympathetic listener to students and young professors; and as a protagonist, a man active in support of causes in which he believed. While chairman of the National Commission of Fine Arts in Washington between 1937

and 1950, for instance, he fought endlessly to protect the Mall from threatened encroachments and carried on a dispute, reported widely in the press, with President Harry Truman over the balcony Truman added to the White House. Another such angry dispute involved Clarke with Cornell in the 1950s, when he disagreed with the decision to tear down Boardman Hall and build the present Olin Library in its location. However, time healed the wounds, and in 1965 Clarke returned to the campus to attend a reception given in his honor on the thirtieth anniversary of his establishment of the program in city and regional planning.

A list of the important positions Gilmore Clarke held, of important projects with which he was associated, and of the honors he received is very long indeed and may be found in many places. It seems suitable to note here, however, that he served terms as trustee of the American Museum of Natural History and the American Academy at Rome and on the Advisory Commission of the Graduate School of Design at Harvard University and that he was awarded the Doctor of Humane Letters by Yale University in 1940.

One more facet of this remarkably busy and effectual man must be mentioned—he wrote sonnets. One of these, included in a selection Published as *A Septet of Sonnets*, seems to sound a note on which a tribute to his memory might end.

On reaching seventy and five I've met
The winter of a long and busy life;
Apologies there be, for life is strife
And disappointments, sorrows and regret.
Success, I'm sure, is measured by the friends
We've made, not in our mere accomplishment,
For friends remain unto the end unspent;
Our works, done and undone, all have their ends.
Let me remembered be by friends I've made,
Unnumbered through the long eventful years
I've trod this earth, resisting countless fears
While following the tenets of my trade.
To be recalled by friends, have their respect,
For me is what I hope for, yea, expect.

Kermit C. Parsons, John A. Hartell

Robert Theodore Clausen

December 26, 1911 — December 31, 1981

Robert T. Clausen, professor emeritus of biology, was born in New York City, the son of Adam and Mary Blum Clausen. His early childhood was spent in that city and subsequently in Passaic, New Jersey, where he graduated from high school in 1929. His interest in natural history developed during his boyhood, and at various times during his early career he was concerned with birds, insects, reptiles, and amphibians as well as with plants, and he published on each of the animal groups.

Professor Clausen entered Cornell University in the fall of 1929, beginning an association that lasted until his death. He received his Bachelor of Arts degree in 1933, having completed a dual major in vertebrate zoology and botany. His graduate work was carried on in botany and plant taxonomy under the direction of Professor Karl M. Wiegand. He received the Master of Arts degree in 1934, his thesis dealing with the fern genus *Botrychium* in northeastern North America, and the Doctor of Philosophy degree in 1937, with a monograph on the family *Ophioglossaceae*. He became a member of the American Fern Society in his student years and served a three-year term as its president after receiving his doctorate.

On completion of his degree program, Professor Clausen continued his association with the L. H. Bailey Hortorium, where he had been employed as a graduate student, first as an instructor (1937-39), then as assistant professor of botany (1939-41). The latter title continued when he joined the Department of Botany in 1941. There he gained the rank of associate professor in 1944 and professor in 1949. In 1954 he also became curator of the Wiegand Herbarium. He served in this dual capacity until his retirement in 1977, when he was awarded emeritus status.

Professor Clausen was a superb though demanding teacher. Plant anatomy, which he taught for thirty-six years, is not a subject easily taught. He knew how to reach students. His lectures were logically and clearly presented but required close attention. In his unique way he was a marvelous storyteller, and he used that talent to bring his lectures to life. He was a man of incredible energy, and on weekday afternoons he would lead the class to such well-known natural history sites as McLean Bogs or South Hill Swamp. On weekends the forays were longer. He was ever present in the teaching laboratory and equally accessible to students outside for serious discussion. His influence on undergraduates passing through his courses was great, and many went on to pursue professional careers in botany. In recognition of his commitment to teaching, he received the Chancellor's Award for excellence in teaching from the State University of New York in 1974.

Professor Clausen's research interests covered a range of plant groups. In the late 1930s he pursued taxonomic studies in the ferns, published on several genera of aquatic plants, and began to develop an interest in the *Crassulaceae*. After joining the Department of Botany, Professor Clausen continued these interests, augmenting them with research in selected genera of *Leguminosae* and in *Cyperaceae* and the genus *Gentiana*. Many years were spent in a more general floristic manner, surveying parts of the glaciated Allegheny Plateau in New York and Pennsylvania. He was the acknowledged expert on the flora of the Cayuga Lake region of New York and held an honorary membership in the Torrey Botanical Club.

For over three decades, however, the major thrust of Professor Clausen's research centered on *Sedum* of the *Crassulaceae*, a large and difficult genus of over six hundred species. Meticulous and detailed studies of wild populations in the United States and Mexico and experimental studies on plants grown in the greenhouse and garden provided the basis of his approach. These studies, augmented by more-traditional herbarium studies, led to the publication of two major botanical works: *Sedum of the Trans-Mexican Volcanic Belt: An Exposition in Taxonomic Methods* (1959), and *Sedum of North America North of the Mexican Plateau* (1975). Until the time of his death he was actively preparing a third book, to be titled *Sedum of the Mexican Cordilleran Plateau*. His two published books about *Sedum* were not only monographs of significance, based on an intimate knowledge of the species studied but also statements concerning his taxonomic philosophy and methods.

Professor Clausen believed strongly in fieldwork, experimental approaches, and statistical analyses in taxonomy, and this belief influenced both his teaching and his own research. Fieldwork carried him from the Labrador Peninsula and British Columbia in the north to Mexico, Guatemala, and El Salvador in the south. Incidents other than those botanical abounded in his travels, and his stories, dryly but yet hilariously told, often punctuated his seminars and conversations. Because of its great richness in *Sedum*, Mexico held special interest for him, and had not illness prevented it, he would have spent the better part of 1981 in that country. As it was, during the last year of his life he contented himself with writing and with a continuation of his studies on garden and greenhouse plants. These activities were interspersed with periods of hospitalization for treatment of cancer, a disease that Professor Clausen endured for over half his professional career.

Published works constitute only one element of Professor Clausen's writings. As a boy he acquired the habit of keeping a diary, making daily entries. This habit continued throughout his life. His diary comprises thirty-two volumes, covering the period from 1923 until near his death. The journal, together with his field notes and letters

of significance, will be deposited in the Department of Manuscripts and Archives in the Olin Library of Cornell University.

Professor Clausen is survived by his wife, Edna Rublee Clausen, also a botanist, whom he married on January 31, 1942, and four children: Eric Neil, Joanna Margaret, Thomas Paul, and Heidi Elizabeth.

Stephen Farrell Cleary

September 10, 1896 — October 16, 1960

The sudden passing of Professor Stephen F. Cleary removed from the Cornell campus a most lovable figure who had served as a teacher at Cornell for over forty-one years and as head of the Department of Engineering Drawing in the School of Mechanical Engineering since 1951.

Born in 1896 on a farm at Ballston Spa, New York, Professor Cleary received his preliminary education in the Ballston Spa schools and then attended the General Electric Drafting School at Schenectady, New York, graduating in 1916. He joined the General Electric Corporation as a designer, enlisted in the United States Navy (aviation) for the period 1917-1919, and then was employed by the General Aviation Corporation for a short time.

In the fall of 1919 he entered the Sibley School of Mechanical Engineering in the unusual dual role of student and instructor, receiving the M.E. degree in 1925, the M.M.E. degree in 1929. His later promotions were: Assistant Professor, 1936; Associate Professor, 1940; and Professor, 1946. His honors included Phi Kappa Phi, and he was a member of the American Society for Engineering Education, American Association of University Professors, Cornell Society of Engineers, Pi Tau Sigma, Tau Kappa Epsilon social fraternity, Statler Club, Ithaca Yacht Club, and the American Legion.

Professor Cleary was a student of educational philosophy and constantly introduced new concepts in the fields of descriptive geometry and engineering drawing as evidenced by his writings and teachings in these fields. Included in his works are *Descriptive Geometry for Engineers* and a series of three volumes, *Basic Mechanical Drafting*, as well as earlier works in collaboration with Professor C. E. Townsend, his predecessor as head of the Department of Engineering Drawing. In addition, Professor Cleary published many papers on engineering education.

Those of us who knew him intimately recall his devotion to teaching the younger instructors and aiding the freshman students. He was a true and loyal friend and a man of many interests and hobbies, including fishing, hunting, and conservation. His interest in students was exemplified by the fact that he was a class adviser over the years, served as personnel adviser for the students in job placement, and was for many years the faculty adviser to many student organizations including his social fraternity Tau Kappa Epsilon, Atmos, and Kappa Beta Phi.

In addition to his teaching and writing career, Professor Cleary was active in his professional field as a Licensed Professional Engineer, New York State, and served as consultant for many industries including the General Electric Corporation.

On September 8, 1928, Professor Cleary married Beverly Owen, who died in 1945. He is survived by his daughter, Beverly Ann (Mrs. N. Mandato).

“Red” Cleary, as he was affectionately known to his colleagues, students, and many friends in the local community, will be remembered by all as a companion who enjoyed life and people. He was a fine teacher with a great sense of humor, a genial personality, and a sincere interest in students and in the many assistants who taught in his department.

William C. Cleveland

Professor of Civil Engineering

— *January 16, 1873*

“After voting that the usual order of business be suspended, the following preamble and resolution were approved and passed.

“Whereas the death of Professor William C. Cleveland has removed from us one of our number, who from the first opening of the University has labored faithfully for its interests and built up his Department to a condition of great efficiency, and

“Whereas, we desire to record our testimony to this fidelity in the discharge of his duty, and to his ability and purity of character.

“Resolved, that in him the University has lost a most able professor and excellent instructor, and that we his colleagues have lost a friend of great intellectual attainments, pure and amiable character, and noble aspirations; and that we tender to his family the assurances of our warmest sympathy in their sorrow, and of our belief that the influence of our departed friend will live long after him, in those who came under his care.

“The secretary was requested to send a copy of this resolution to the wife of the deceased.

“Voted that after passing upon the petitions from students, the Faculty adjourn in respect for the memory of our deceased colleague.”

Source: Fac. Rec. p.33-volume B

“Voted that Prof. Wait be requested to accompany Mrs. Cleveland and the remains of her husband to Mt. Auburn on behalf of the Faculty.”

Marlin G. Cline

December 31, 1909 — January 9, 2009

Marlin G. Cline, Professor of Soil Genesis and Classification, spent a productive 35-year career at Cornell during which he pursued his love for soil science in general and soil classification in particular. He died on January 9, 2009 at the age of 99 in Ithaca, New York. He is survived by his wife, Agnes and son, Richard.

Marlin Cline was born December 31, 1909 and raised on a small pioneer dairy farm in Bertha, Minnesota. He spent six years operating the farm after high school before obtaining a B.S. degree from North Dakota Agricultural College in 1935. He was then employed for several years with the North Dakota Agricultural Experiment Station and the United States Department of Agriculture carrying out soil surveys in North Dakota, Hawaii and Tennessee. Marlin studied for a Ph.D. degree at Cornell under the guidance of Professor Richard Bradfield, graduating in 1942. He was then hired by Cornell for teaching and research in soil classification and geography, but was granted leave during World War II for strategic intelligence involving soil conditions affecting military movements in Asia. Showing a wry sense of humor, he later also recounted how he became involved in growing dandelions as a bio-oil crop and how difficult this was compared to the ease with which they always seemed to grow as a weed.

Following the war, Marlin became deeply involved in methods of soil classification and was widely recognized as an authority in this area. He and Guy Smith, a U.S.D.A. scientist, were largely responsible for the development of the current U.S. Soil Taxonomy system. Many brown bag lunch hours with colleagues included tales about the scientific controversies, debates and personalities involved as this system evolved. Concurrently with his U.S.-based work, Marlin travelled extensively in the tropics, beginning in 1949 with participation in a U.S. team to inventory soil resources and agriculture in the British East African territories, continuing in 1955-56 as leader of a Cornell team assisting in the rebuilding of the College of Agriculture at the University of the Philippines, Los Baños after its destruction by the Japanese in WWII, return visits to Africa in the 1960s with Cornell teams looking at animal health and to Brazil as the agricultural potential of the savannah region near the newly founded capital, Brasilia, was being explored. In the 1950s, he also represented the U.S. at a Paris conference on agricultural development in sub-Saharan Africa and served on the President's panel on World Food Supplies. In 1958, during the cold war, he was a member of a State Department mission to appraise resources and research on soil and water in the Soviet Union. These international travels and activities influenced him greatly. He became a promoter for international agriculture at Cornell and instigated a tropical soils program when he served as chair of the Department of Agronomy from 1963-70.

Marlin was a person with a great awareness for both detail and broad vision and applied his knowledge from local to global scales. His 1960s bulletin on the survey of Cornell University Lands was used by many graduate students and faculty. His work in Brazil contributed to the development of what has become one of the world's major agricultural regions. He was also the lead faculty person involved in the design and construction of the Bradfield-Emerson Hall building complex. He was succinct in expression, both verbal and written, and always to the point. At age 96, in a small meeting at his house with soil survey personnel, he said, "soil scientists can't wait to see what is on the other side of the hill". Marlin imparted this enthusiasm together with his wisdom and philosophy of science to those whom he mentored throughout his professional life, including students, faculty and professionals in the Natural Resource Conservation Service (formerly Soil Conservation Service). His contributions to soil science were recognized by honorary doctorate degrees from North Dakota State University and Trinity College, Dublin, Ireland; by election as a Fellow of the American Society of Agronomy, the Soil Science Society of America, the American Association for the Advancement of Science, and the New York Farmers Award.

Marlin had a strong sense of history, undoubtedly developed from the pioneer spirit of his family and his own early farming experiences. Following retirement, he chronicled the history of the Department of Agronomy from 1868-80. This document provides enormous insight into that department and also to the factors that influenced the development of agricultural science at Cornell and in the United States. Together with his family, he contributed to a current Smithsonian museum exhibit, *"Dig It! The Secrets of Soil"*, which in many ways exemplifies his life's work.

John M. Duxbury, Chairperson; Gary W. Fick, Harold van Es

Clement Biddle Penrose Cobb

September 16, 1900 — March 11, 1955

The Department of Pediatrics of Cornell University Medical College and a host of personal friends, including patients and their parents, share with his family a great sense of loss in the untimely death on March 11, 1955 of Doctor Clement B. P. Cobb.

Doctor Cobb was born in 1900 in New York City, and received his M.D. from Harvard Medical School in 1926. Following an internship at Presbyterian Hospital, he became a resident at Babies Hospital in 1929. From 1933 until the time of his death, Doctor Cobb was Assistant Attending Pediatrician at The New York Hospital, and also a member of the faculty of Cornell University Medical College, first as instructor and then, from 1944, as Assistant Professor of Clinical Pediatrics. He also served at various times as an attending pediatrician at the New York Foundling Hospital, St. Vincent's Hospital and Knickerbocker Hospital.

Doctor Cobb was certified by the American Board of Pediatrics in 1937, and was a member of the American Academy of Pediatrics, the American Medical Association and the Harvey Society. He was the author of several publications in the field of pediatrics.

He was beloved by his patients and their parents, who had great confidence in him and to whom he gave much of his time as an advisor and friend.

Doctor Cobb was a very sociable person. Possessed of a charming manner, he had the dignity, the poise and the graciousness that becomes a man of good breeding. He was loyal to his friends and enjoyed their company. He would go out of his way to have others share the company of interesting people with him, especially at such places as the Century Club, of which he was a member, and at the Medical Strollers, of which he was past president and a zealous member. He was always tolerant of the foibles and shortcomings of others, holding no grievances and having few prejudices.

His interests were varied. He enjoyed music, and in his younger days played the cello. He had a great enthusiasm for the outdoors. Duck hunting, trout fishing and surf casting were his favorite sports. He was a member of the Audubon Society, and bird watching in which he was interested for many years, was perhaps his keenest hobby. In fact, it was on a weekend of bird watching at Newburyport, Massachusetts that Doctor Cobb's fatal illness began.

His tall figure, his cheerful kindly manner, his wit and repartee, and his friendliness will be missed by patients and friends alike.

At The New York Hospital and Cornell University Medical College, his colleagues will remember, gratefully, his long and faithful service.

S. Z. Levine

John Robert Cobb

February 28, 1903 — March 24, 1967

An orthopedic surgeon in New York for more than thirty years, formerly Director of the Scoliosis Clinic of the Hospital for Special Surgery, and a Clinical Associate Professor of Surgery in Cornell Medical College, Dr. Cobb died on March 24 after an illness of several years. Born in New York, he received the A.B. degree from Brown University in 1925 with a major in English literature. In his last year in college he decided to make a career in medicine, and lacking the required study in the premedical sciences, he spent a year in postgraduate study at Harvard to make up this deficit.

Dr. Cobb had a great interest in mechanics which was probably the determining factor in his decision to specialize in orthopedic surgery. After two years of surgical and orthopedic internship at New Haven Hospital, he received an appointment as a Fellow in orthopedic surgery at the Hospital for the Ruptured and Crippled in New York, whose name was changed to Hospital for Special Surgery. This institution became the center of his later professional life.

He was given responsibility for the care of patients with scoliosis, or curvature of the spine. He organized the Scoliosis Clinic at the hospital and, during ensuing years, registered and studied a total of 4000 patients who came to the hospital with this disability. He classified the curvatures whose cause could be found and pointed out the grave, disabling characteristics of curvatures associated with neurofibromatosis. He found that many of the curves picked up in the growing years, and particularly in girls, did not increase beyond acceptable limits and that only about 10 percent required corrective surgery and treatment in plaster casts. He was a careful and meticulous surgeon, and he watched over his patients like a father with his children. He proved that the risk of operative treatment was extremely small.

Although he became a specialist in scoliosis, he did not limit his work to this field but had well-rounded experience in other divisions of orthopedic surgery. He was appointed Orthopedic Surgeon to the Sea View Hospital in Staten Island where he demonstrated his rich experience in the care of patients with tuberculosis of the bones and joints, especially of the spine. He was appointed Professor of Orthopedic Surgery at the New York Polyclinic Medical School and Hospital, and Assistant Visiting Orthopedist at the Willard Parker Hospital. He also served as a consultant on the staff of St. Charles Hospital in Port Jefferson, Long Island, the Eastern New York Orthopedic Hospital-School in Schenectady, and the Veterans Administration Hospital in Castle Point.

He was a Fellow of the New York Academy of Medicine, and member of the American Academy of Orthopedic Surgeons, American Medical Association, American Geriatrics Society, American Medical Writers Association, and the Association of American Medical Colleges. He was a diplomate of the American Board of Orthopedic Surgery, a member of the American Orthopedic Association, and president of the Alumni of the Hospital for the Ruptured and Crippled.

He had a long American heritage and belonged to the Massachusetts Society of Mayflower Descendants.

He is survived by his widow, Mrs. Louise W. Tower Cobb; two sons, Robert T. and Allen T.; a daughter, Mrs. Joan Boyce; and several grandchildren.

Philip D. Wilson, M.D.

LaMont C. Cole

July 15, 1916 — June 3, 1978

LaMont C. Cole came to Cornell from Indiana in 1948 and within four years rose from assistant to full professor. In 1964 he was chairman of the Department of Zoology. In that year the Division of Biological Sciences was created, and he was influential in forming its Section of Ecology and Systematics, which he chaired for its first three years.

At the same time, LaMont's national and international reputation was expanding, and he played a fundamental role in the activities of the Ecological Society of America, serving a series of editorial functions for its *Journal of Ecology*, over twelve years between 1946 and 1963 and serving as vice President (1964) and president (1967-68). He was also on the executive committee of the Board of Governors of the American Institute of Biological Sciences and was vice president in 1968 and president in 1969.

LaMont Cole's greatest influence was through his contributions in a wide-ranging research career. His first publication, at the age of nineteen, was a report on the herpetology of the Navajo country, the first product of his four-year stint as chief herpetologist on the Rainbow Bridge and Monument Valley expeditions of the U.S. National Park Service and the American Exploration Society.

His master's thesis (1939) at the University of Utah, on the effects of radiant energy on reptiles, was the beginning of his interest in the ecological effects of radiant energy and temperature variation. It led in a natural way to his later involvement with the study of environmental insults and their effect on natural populations.

LaMont's early work included a classic thesis (under Thomas Park) on the cryptozoa of a woodland in Kendall County, Illinois. In this work was rooted his later interest in population and community theory and in the statistics of population distributions over space. LaMont's conclusion that it would be a mistake to refer to the cryptozoans as a supraorganismic community, as Harshbarger had argued in 1911 for the soil fauna in general, was an early and important ingredient in later changes in the community concept.

LaMont's unique talents, however, were his tremendous ability to blend analytic thought and biological fact and his knack for interesting others in these problems. His earliest theoretical study was his 1946 paper, "A Theory for Analyzing Contagiously Distributed Populations," which grew out of his thesis work and was followed by an important 1949 paper, "The Measurement of Interspecific Association." From these purely statistical studies of

static populations, themes that were not abandoned in his later work, it was natural for his interests to develop along dynamic lines related to population cycles, life history phenomena, and competitive exclusion. His fundamental paper, "Some Features of Random Population Cycles," showed that population cycles, for which "mysterious causes" had and have been concocted, could be explained equally well as essentially random fluctuations.

His paper on the population consequences of life history phenomena, published in 1954, remains the classic of LaMont's repertoire and the classic of the life history literature. This study of the trade-offs between various life history characteristics demonstrated that LaMont Cole, as few others, could fit logical elegance to biological necessity. His Cold Spring Harbor paper, "Sketches of General and Comparative Demography," is further evidence of his ability to get to the heart of demographic problems and to phrase them in sharp new formulations and, with profound understanding of a diverse literature ranging from mathematics to natural history, eloquently blend his own particular insights and innovations to those of others. Each of these lines of inquiry represented a major area of investigation for LaMont, and each resulted in a major series of publications.

In his later years he paid particular attention to the social aspects of ecology. In 1963 he published on pesticides and nature's equilibrium, in 1968 on radioactivity and power plants on Cayuga Lake, in 1969 on thermal pollution, and over the years on a tremendous number of environmental problems. His concern for nature's balance that perhaps dominated his thoughts for at least the last fifteen years led him to membership on the Committee on Pesticides of the U.S. Department of Health, Education, and Welfare and the New York State Environmental Board and to other related activities.

LaMont's independence of thought was a heritage from his father, a distinguished anthropologist who had the courage to join with Clarence Darrow, H. H. Newman, and Shailer Mathews in planning the scientific defense of John Scopes. La Mont Cole's career was dedicated to fighting against the dangers of scientific ignorance and corporate self-interests. He had a tremendous impact on the ecological community and upon all who came into contact with him.

LaMont Cole became professor emeritus in January 1978 and was honored at a symposium in May that attracted distinguished scientists from across the country.

He is survived by his wife, Ann Schuster Cole; two sons, John LaMont Cole of Columbus, Ohio, and George Frederic Cole of Ithaca; and a granddaughter, Carolyn Louise Cole of Columbus, Ohio.

Simon A. Levin, William N. McFarland, Richard D. O'Brien

Randall Knight Cole

September 21, 1912 — January 26, 2006

Dr. R.K. Cole was better known as Randy to his faculty colleagues, friends and almost the entire poultry industry. He was a world-renowned poultry scientist who made major contributions to avian genetics and avian disease research. He was a consummate instructor and a valued collaborator and adviser to his colleagues at Cornell and throughout the poultry world.

Professor Cole was born in Putnam, Connecticut on September 21, 1912. During his adolescence, his family moved to Massachusetts where he furthered his earlier interest in poultry by working on a local poultry farm and joining the local 4-H Club. This led eventually to his decision to major in Poultry Husbandry at the Massachusetts Agricultural College at Amherst. After graduation, he was appointed as a Research Assistant in the avian pathology laboratory at the University of Connecticut. Here his lifelong interest in poultry diseases was stimulated by Dr. Erwin Jungherr. In 1935, he was recruited to Cornell by Professor F.B. Hutt. Here he served as an Instructor while earning his M.S. and Ph.D. degrees in Animal Genetics. He was appointed in 1939 as an Assistant Professor and eventually in 1950, as Professor of Animal Breeding and Poultry Husbandry. He retired in 1973 and became Emeritus Professor of Genetics. Professor Cole continued to maintain an office in the Department of Poultry and Avian Sciences until 1996 when he was transferred to the Department of Avian Diseases, later part of the Department of Microbiology and Immunology in the College of Veterinary Medicine. During his retirement, he continued to write and interact with the faculty and other poultry research and genetic colleagues. In fact, he continued to work until mid-2005 when forced to finally really retire because of failing physical health. During World War II, he served in the Army, reaching the rank of Lieutenant Colonel.

Professor Cole's major contributions to science were associated with the role of genetics in disease resistance and susceptibility. His guide and collaborator in this field was Professor F.B. Hutt. Together they developed genetic lines of chickens susceptible and resistant to leucosis. In turn, these chicken lines made possible the experimental transmission of avian leucosis and proof of its viral etiology. Later Professor Cole showed that it was possible by selective breeding to develop further susceptible and genetic stock starting from a single poultry population. These stocks, together with some of the earlier selected genetic lines, were used widely by avian disease research groups here at Cornell and elsewhere. As a result, the nature of Marek's disease and avian leucosis was recognized, and studies led toward their diagnosis and prevention by vaccination or other procedures.

Another long-term area of interest for Dr. Cole was the study of embryonic lethals and other genetic anomalies. From one of his early papers in 1939 on an autosomal lethal in the fowl until his last published paper (2000), an autosomal dwarfism in the domestic fowl, he maintained his interest in this branch of genetics. Probably the most significant result of these studies was the development of the obese strain of chickens by pedigreed mating from three chickens that were observed with this abnormality in one of the Cornell breeding flocks. This was described as hereditary hypothyroidism and later recognized to be similar to Hashimoto disease, a human autoimmune thyroiditis. These birds became a valuable animal model for the study of spontaneous autoimmune thyroiditis as well as autoimmune disorders in general.

Dr. Cole was not only a basic scientist; he was interested in the practical application of his studies. This was demonstrated in a lengthy review article in 1973 in which methods of breeding for maximum production of eggs are given, along with supporting evidence of the efficacy of those methods. Further, acting as a consultant to Shaver Poultry Breeding Farms, he played a major role in producing one of the most successful commercial laying chickens by instituting pedigree breeding and selection programs based on his previous research experience.

Professor Cole had other activities during his Cornell career. He was responsible for post-mortem examination of mortality from the University poultry flocks and many of the birds from various research projects carried out in his department. He was thus able to maintain his early interest in avian pathology and also made observations leading to many publications of genetic and pathologic interest.

Finally, Professor Cole taught courses in genetics of the fowl and avian anatomy and participated in teaching of the introductory course in poultry diseases.

Three children, two sons and a daughter, Mary C. Smith, who is an Associate Professor at the Cornell Veterinary College, survive him.

Richard Austic, Rodney Dietert, Julius Fabricant

W. Storrs Cole

July 16, 1902 — June 14, 1989

Professor W[illiam] Storrs Cole, a long-time student and professor at Cornell, died in Arizona on June 14, 1989, a month short of his 87th birthday. Storrs liked to tell people that he was raised on an Albany “poor farm,” a county home, and technically he was correct; but what he didn’t say was that his father was the chief administrator there. Storrs first came to Cornell in the early 1920s to study entomology in the College of Agriculture (where there was no tuition for New York residents); he received his bachelor’s degree in 1925. As an undergraduate, he took several geology courses. The summer after graduation, he started working with the Federal Bureau of Entomology on Japanese-beetle control; he described the experience as wandering the streets and backyards of Yonkers, New York, counting Japanese beetles and dodging goats. After about a month, he sat on a railroad track one hot afternoon staring across the Hudson at the Palisades, thinking there must be something in science that doesn’t move, fly, or chase you. These thoughts led him back to Cornell to pursue graduate work in geology, after an intervening year spent working on a farm.

One day in the spring of 1927, Professor G.D. Harris gave Storrs a small bottle of what looked like large grains of sand and told him that these were *foraminifera*, the coming thing in paleontology. Storrs was assigned to go to the library, dig out the report of the *Challenger* expedition (a famous oceanographic expedition in the late 1800s), and use this to identify as many of the samples as he could. That small bottle of samples started him on a life-long involvement with micropaleontology and the larger *foraminifera*. Only a month or so later, Professor Harris advised Storrs to get a train ticket for New York City at once: the Pan-American Petroleum and Transport Company was looking for a micropaleontologist to work in their Mexican operation, the Huasteca Petroleum Company of Tampico.

As Storrs recalled it, the job interview was conducted by two men, one of whom did most of the talking. After an hour or so he told Storrs he could have the job at \$250 a month plus transportation and a month’s vacation. This very generous offer left Storrs speechless, and during the ensuing silence, as he was getting his wits together, the quiet member of the pair said, “Offer him \$300 a month.” Storrs quickly accepted.

His Mexican activity was brought to a sudden halt about a year later by a serious attack of malaria. Storrs almost died, but after a six-week recovery and his month’s vacation, he was back at Cornell in late 1928 to finish work on his doctorate. He had completed all the course work before he left, and only had to write the thesis, which he based

on *foraminifera* he had collected in Mexico. Storrs remembered setting the type for his title page and printing it on Professor Harris' press on the third floor of McGraw Hall.

Having accepted an assistantship at Cornell, Storrs found himself working both for Professor Harris in paleontology and Professor von Engel in geomorphology. Aside from the one undergraduate course in glacial geology, he had no background in geomorphology, and yet he was now teaching all the laboratory sections for Professor von Engel. The work with Professor von Engel resulted in a well-known paper on Coy Glen (*Journal of Geology*, 1930, v. 38, pp. 423-36). At the same time, he was working on fossils from Florida and Maryland that resulted in several papers—one coauthored with Joseph A. Cushman, one of the pioneers of *foraminifera* study. These *foraminifera* papers, plus the Coy Glen work, were accepted by the department as his thesis and Storrs received his Ph.D. in 1930.

In 1931 Storrs became an instructor at Ohio State University. His primary responsibility was to teach geomorphology, but he also kept his work with *foraminifera*, making thin sections at home in the evening, literally in the kitchen sink. Eventually he became a full professor and acting head of the department. In 1946 he left to accept a position at Cornell, where he was the departmental chairman for 15 years.

In the late 1940s and through the 1950s, Storrs was associated with the U.S. Geological Survey, working on aspects of the Bikini Atoll Atomic Bomb Project. He was also a member of a team that was studying Guam, Saipan, Eniwetok, and Fiji during the 1950s. Part of these studies involved examining cores from holes that were drilled completely through the coral cap of Bikini and Eniwetok to the underlying basalt. Later, in 1966, he participated in the MOHOLE project on Midway Island; his task was to identify the *foraminifera* in the well samples as they were brought up.

Storrs retired in 1968 after twenty-two years on the faculty. He received much recognition for his professional achievements and leadership; he was a fellow and former vice-president of the Geological Society of America, and served as president of both the Paleontological Society and of the Cushman Foundation for Foraminiferal Research. In 1983, Storrs received the Cushman Foundation Award in recognition of his work. He published 100 papers during his active professional life.

In 1980 after the loss of his beloved wife Gladys, Storrs established the Gladys W. Cole Memorial Research Award of the Geological Society of America, to be used to support geomorphologic field work in the southwestern United States and adjacent Mexico. In their later years, Storrs and Gladys Cole spent most of their free time in the Arizona desert, where she painted while he collected *Kachina* dolls and studied Hopi Indian life.

Note: Much of the description of Stores' early years has been extracted from the recently published "Cornell Geology Through the Years" (Cornell Engineering Histories, v. 2, 1989) by William R. Brice.

John W. Wells, Shatter S. Philbrick, Arthur L. Bloom

George Louis Coleman

December 27, 1872 — March 21, 1946

George Louis Coleman, Assistant Professor of Music, Emeritus, died on March 21, 1946 at his home in Johnson City, Tennessee. For a half century he had been a central figure in the musical life of the Cornell campus and community.

Mr. Coleman was born in Titusville, Pennsylvania on December 17, 1872. During his youth he learned to play several instruments, and was a member of the orchestra and band which his father conducted. On coming to Cornell as a freshman in the fall of 1891, he became active in the campus musical groups and was able to finance his education by playing in theatre and dance orchestras. He received the B. S. degree in Architecture in 1895, thereafter devoting part of his time to the designing and building of houses. Music regained his chief interest, however, and in 1901 he became director of the Banjo and Mandolin Clubs. Two years later, he became director of the University Orchestra. His first official appointment by the Board of Trustees occurred in 1919 on his return from two years of service with the A.E. F.; at that time he was made Leader of the Cadet Band and Instructor of Music. He continued these varied activities until the spring of 1941, when he was given the unique recognition of being elected Assistant Professor of Music, Emeritus.

Throughout this long period of continuous work, Mr. Coleman brought about a striking evolution in the organizations for which he was responsible. The old Banjo and Mandolin Clubs became a salon orchestra with an extensive and varied repertoire. The University Orchestra attained complete symphonic instrumentation, and presented, in the annual Farm and Home Week, Hinckley foundation and other concerts, a large amount of the finest type of symphonic literature. The scope of the band work was enlarged greatly, the "Ten-Square" band being brought to a state of high development and being supplemented by an equally large cadet band of less experienced players.

Such expansion in the scope of activities and such development of standards normally involves external stimuli such as academic credits or scholarships or the availability of a group of professional music students. It is significant that Mr. Coleman worked without things of this sort, that he based his entire program on the power which music-making can have on the individual.

Mr. Coleman gave constant and close attention to the integrating of the work and of the personnel of the instrumental ensembles. His chief concern always was the welfare and the development of the individual student.

He gave endless hours to coaching them singly and in small groups. He interested himself actively in the solution of their personal problems. To literally hundreds of them he was the trusted guide, the constant advisor, the intimate and beloved friend. And with literally hundreds of them he maintained a close relationship long after they had left the campus.

The nature of Mr. Coleman's duties brought him into close working contact with an unusually large number of people in the University community—the Department of Music, the Department of Military Science and Tactics, the Athletic Association, the Musical Clubs Council. With his colleagues in these and other groups he always cooperated whole-heartedly. He radiated a simple kindness which appealed to all with whom he came in contact. He combined gentleness and modesty with determined and energetic industry. No task was too small for careful attention, and no task was too large, too complex, for successful solution.

On his retirement Mr. Coleman went to Florida to live. But the war emergency soon called him back to duty, and from 1942 on, he directed the instrumental groups at Eastern Tennessee State College and in the Boone's Creek Schools, and also directed the music in the Methodist Church in Johnson City. His sudden death came as he and his countless friends would have wished, when he was still giving himself for the enrichment of the lives of others.

W. A. Hurwitz, P. R. Pope, P. J. Weaver

Jacob Roland Collins

March 28, 1891 — September 16, 1948

Jacob Roland Collins, professor of physics, died September 16, 1948, after having suffered poor health for several years.

Professor Collins was born in Byesville, Ohio, March 28, 1891. He graduated from Byesville High School and entered Ohio University at Athens, Ohio, from which he was graduated in 1912. He was appointed graduate student assistant in physics at Purdue University in 1912 and was granted the Master's Degree by Purdue in 1914. He continued at Purdue as an instructor of physics and studied during Summer Sessions at the University of Chicago, until his appointment as instructor of physics at Cornell in 1918. He received the Ph.D. Degree from Cornell in 1921, was appointed assistant professor of physics in 1921 and professor of physics in 1938.

He was married to Emma Keturah Ford in 1915 and to them was born a son, Richard, Cornell '41, who was lost on a bombing raid over Germany during World War II.

Professor Collins was of a modest and retiring nature. He arrived independently at his stand on the problems of the department, community, and nation ever without compromise with justice. He was a brilliant student and set high standards for any class of which he was a member. He had complete disdain for mediocrity in whatever field it appeared although always a warm, friendly heart for all students irrespective of their specific day-to-day performance. Few men have the broad knowledge of the whole field of physics that Professor Collins possessed. It has been said frequently that he was the only member of the Physics Staff able to teach, and teach well, each of the many courses offered in the physics curriculum. He was a scholar in the true sense of the word.

He was foremost in the development of a physics laboratory course for advanced students which is unique in American Universities. Many Cornellians, both in industry and teaching, acknowledge their indebtedness to the thorough training they had received in this course under his direction. He was at his best in advanced courses in which his lectures were always thoroughly prepared and presented with a clearness that attracted students to him later for discussions of their research problems.

It was in the field of infrared spectroscopy that he did most of his research and published many papers. He was a co-author of a text on high temperature measurements.

Professor Collins was a Fellow of the American Physical Society and the American Association for the Advancement of Science. He was a member of Phi Kappa Phi and Sigma Xi and of many other scientific societies. For many years he served as the physics editor of the Americana Encyclopedia.

As a colleague he was loved and respected. He was always ready and willing to help one in difficulty and many of his colleagues profited by his consideration of their problems. Those who have worked with him will miss his wise counsel, scholarly inspiration, and deep friendship. Truly, the University has suffered a severe loss in his death.

G. B. Grantham, L. G. Parratt, R. Y. Thatcher

Reginald C. Collison

May 3, 1884 — June 25, 1983

Reginald “Rex” Collison’s life span was ninety-nine years.

Reginald C. Collison was born in Prospect, Ohio, on May 3, 1884, and died in Geyserville, California, on June 25, 1983. He received his B.S. degree in agriculture from Ohio State University in 1908 and his M.S. degree in 1909. He had a year of graduate study in chemistry and plant physiology at Columbia University in 1917. He was appointed an assistant in agricultural chemistry at Ohio State in 1907, instructor in 1908, and assistant in animal nutrition at the Ohio Experiment Station in 1909.

Professor Reginald Collison’s entire career in New York was in research in soils, with emphasis on their selection and management for fruit crops. That research was centered at the New York State Agricultural Experiment Station at Geneva, New York. After his appointment in 1912 as an assistant chemist, he was project leader with the title of chief in research, first, in the Division of Agronomy, until it was discontinued in 1929; then in the Division of Horticulture; and last, in the Division of Pomology. From 1943 until his retirement, in August 1945, he was a professor of pomology.

His New York career in agronomic and pomological research from 1912 to 1945 had many projects, including such unusual ones as development of high-nicotine tobacco for insecticides and the preparation of artificial manure from straw. But his three major projects involved (1) lysimeter research from 1914 to 1942; (2) experiments on fertilization and the nutrition of New York’s major tree fruits, small fruits, and grapevines; and (3) soil management of fruit plantings with emphasis on control of runoff and erosion by tillage, cover crops, sods, and mulches.

Professor Collison’s research was enriched by his awareness of advances he could apply to his projects. Examples are his use of Russian lysimeters beneath apple trees, his use of randomized blocks and the analysis of variance in his 1927 experiments on tree fertilization, and the 1929 use of direct tree injection in the study of tree nutrition problems.

Professor Collison’s research was a major part of the foundation for the decisions on soil management and fertilization of New York’s plantings of tree fruits and small fruits, such as strawberries and blueberries. He traveled throughout the United States studying and observing soil management practices and research in the various states.

Professor Collison was a member of Alpha Zeta, Sigma Xi, Acacia, the American Society of Agronomy, the Soil Science Society of America, and the American Society for Horticultural Science. He was a member of the Regional Advisory Committee, Soil Conservation Service, U.S. Department of Agriculture, and technical project leader, Soil Conservation Service, U.S. Department of Agriculture.

He married Mary E. Gates of Geneva. They had two daughters. Mrs. Collison died on August 11, 1970. Professor Collison is survived by one daughter, eight grandchildren, and nine great-grandchildren.

For many years the Collisons were leaders in the Bahai community of Geneva. It emphasized the spiritual unity of mankind. When Professor Collison retired from the station, he and Mrs. Collison moved to Geyserville, California, where he began a training in lay missionary work. In his three decades of missionary endeavors they traveled extensively, primarily in Africa, finally returning to their home in Geyserville.

Cyril L. Comar

March 28, 1914 — June 11, 1979

Prior to a planned appearance before a Congressional panel on health effects of low-level radiation, Cyril L. Comar, at the age of 65, died of a heart attack in Palo Alto, California. Cyril retired from Cornell in 1975 as professor emeritus and joined the Electric Power Research Institute in Palo Alto as director of the Environmental Assessment Department. He is survived by his supportive and loving wife, Mildred Cashin Comar; their three children, Anne Patricia, Thomas Allan, and Louise Elaine; and one grandchild.

Born in Dudley, England, Cyril became a United States citizen in 1941. After completing a Bachelor of Science degree at Berkeley in 1936 and a doctoral degree at Purdue University in 1941, he held positions at Michigan State University and the University of Florida. He became director of the University of Tennessee-Atomic Energy Commission Agriculture Research Program at Oak Ridge in 1948, developing a highly regarded research program on the application of radioisotope tracers in biological research and on the effects of radiation (both internal and external) on animals. He then became chief of biomedical research at the Oak Ridge Institute of Nuclear Studies (1954). While in this position, he published the book entitled *Radioisotopes in Biology and Agriculture, Principles and Practice*, which was to become an important reference for workers in the field for more than two decades. During this and later periods, important contributions to knowledge of mineral metabolism were made, particularly on the physiological aspects of calcium and phosphorus, and the relative transfer of calcium and strontium through the biosphere. He and Dr. Felix Bronner edited a five-volume series entitled *Mineral Metabolism, An Advanced Treatise*, which contains authoritative reports by world experts.

In 1957 Cyril came to Cornell as professor and director of the Laboratory of Radiation Biology in the Department of Physiology of the New York State Veterinary College. In 1960 the Department of Physical Biology was created in the Veterinary College with Cyril as chairman. The focus of the department was to further the application of physical and mathematical approaches to biology. From this effort a research and teaching program evolved that won national recognition and attracted many scholars from abroad. Cyril organized the International Training Courses on Radioisotopes in Agricultural Research sponsored by the United States Atomic Energy Commission and by the Food and Agriculture Organization and the International Atomic Energy Agency. This program trained many scientists throughout the world in radioisotope methodology and gave them an appreciation of the peaceful uses of atomic energy and the potential problems unique to the nuclear age. Cyril was also instrumental in the development and organization of research programs in the nuclear field in Yugoslavia and other foreign countries.

He was very much concerned with the potential hazards of radiation and as part of this concern prepared a booklet entitled *Fallout* for the United States Atomic Energy Commission (1963). He was chairman of the Advisory Committee on the Biological Effects of Ionizing Radiation of the National Academy of Science-National Research Council. Six years of work by the committee culminated in the report entitled *The Effects on Populations of Exposure to Low Levels of Ionizing Radiation* (1972). He served on many other significant national and international advisory groups in the radiation, energy, and environmental fields.

With characteristic foresight, Cyril turned his enthusiasm and intellect to the general problem of energy, a problem that is currently of great concern to the American public. While still chairing the Department of Physical Biology, he initiated and directed for several years the Cornell Energy Project. He left Cornell to assume his post with the Electric Power Research Institute where he worked until his untimely death.

Cyril was a member of numerous learned and professional societies including the American Institute of Nutrition, the American Society of Biological Chemists, the American Chemical Society, Phi Kappa Phi, and Sigma Xi, and was an honorary member of the American Veterinary Medical Association. He published over two hundred original articles in the scientific literature. In 1957 the city of Paris awarded Cyril its medal of honor for his organizational contribution to the UNESCO Conference on Radioisotopes in Scientific Research. In 1968 the American Institute of Nutrition honored him with the Borden Award for his studies in mineral metabolism.

A scientist with a keen intellect who enjoyed solving problems of all kinds, Cyril was indeed an independent thinker and scholar. From him, one was assured a considered and reasonable point of view, underpinned by as many available facts as possible. A strength was his analytical ability; his counsel, always available, was sought by many persons. His was not an angry voice on controversial issues, but he expressed his views in a strong, convincing manner and these were based on his analytical and balanced thinking. He was a man who was fully involved in life's activities and concerns, be it accompanying his wife on bird-watching expeditions or serving on an international committee. There was a spirit of enthusiasm and zest that was characteristic of him, a spirit that was infectious and influential on others. Consistent with his full approach to life were Cyril's final moments, spent in vigorous handball competition, a sport he avidly and skillfully played.

Daniel N. Tapper, Robert H. Wasserman, Edgar L. Gasteiger

Anna Botsford Comstock

Professor of Nature Study

— *August 24, 1930*

Anna Botsford Comstock, born on a farm in western New York, spent her childhood years among the fields and woods of a beautiful countryside. Here she learned the haunts and habits of the native wild life, came to love and foster domestic animals of the farm, and grew in sympathetic understanding of the problems of farm life. She was always intensely interested in men and women, and particularly in the welfare and education of children.

Entering Cornell University almost at its beginning she began the long period of devoted service that closed with a lecture to her summer class in Nature Literature only nine days before her death. She early began the study of the art of wood engraving in order to illustrate the entomological textbooks of her husband, John Henry Comstock, and achieved marked distinction as an artist, especially in her work representing the delicate texture of the bodies and wings of butterflies. She had a large share in the early extension movement in nature study and agriculture and undertook the leadership of the work in nature study in the University at its beginning. Among her varied and rich interests nature study became the chief field of her activity as writer, lecturer, editor, and teacher of teachers.

Mrs. Comstock became endeared to a wide circle of friends beyond the possibilities of merely professional contacts through the hospitality of the home which for half a century was a rendezvous for her students and those of her husband. Here she received and entertained with that gracious sympathy and understanding that made every guest a real participant in the life of a lovely home.

In an eminent degree Mrs. Comstock possessed the quality of warm and helpful friendship. Her long life in this community attached her to a remarkably wide circle of friends, all of whom became admirers. Her personality enriched her work as well as her relationships. Her interests were greatly varied and she touched life at many diverse points with the skill of the artist, the warmth of rich enthusiasms, and the emotions of the poet. To all her associates in Cornell University her memory will remain a blessed experience, and to generations of students she will continue to be an inspiring example. We are all conscious that a great soul has passed.

As a mark of profound respect, we, her colleagues of the University Faculty wish to place in permanent form upon their minutes this tribute to a life of service to the State, the Nation, and the University.

Retired: June 1922

John Henry Comstock

Professor of Entomology

— *March 20, 1931*

In the death of Professor John Henry Comstock on March 20, 1931, Cornell University has lost the scholar who perhaps more than any other embodied the aims of her founder and the spirit of her earliest years. Fatherless from his infancy and reared mainly by strangers, he spent his youth largely as a sailor on the Great Lakes with but winters for schooling, and his higher education had to be won without financial aid from others. Thus he built up the self-reliance, the tireless energy, the concentration, and efficiency so characteristic of his whole career; and thus there came to him, as to few men, power of observation, skill of touch, boundless persistence, and a rare union of quickness, even impatience, with sympathetic insight and considerate helpfulness.

Already while a sailor he had found spare time for the study of plants and of insects, and he came to the young University a ripe student in these fields. Here, under the encouragement of Dr. Wilder, then in charge of biology at Cornell, he developed so swiftly that he was but half through his undergraduate years when at the request of his fellow students he was set at giving a course on insects. This was but the beginning of a professional career which later assumed world-wide significance. His work as an investigator began to express itself in published papers as early as 1871, and his ability and enthusiasm in research grew with the years. This is indicated by his papers on the *Coccidae* (1880, 1883), his essays on *The Descent of the Lepidoptera* (1892), and on *Evolution and Taxonomy* (1893), and by his papers in collaboration with J. G. Needham on the wings of insects (1899). Subsequent papers embodying the results of researches on spiders appeared regularly during his later years. These culminated in the publication of "The Spider Book" (1912.) Following his retirement in 1914 he devoted the remaining years to the rounding out of his life's work. The results of his long years of research on the wings of insects were finally brought together in the form of a book, "The Wings of Insects" (1918), probably his chief contribution of pure research. His last years were devoted to the writing of his final work, "An Introduction to Entomology." Happily this was completed before his last illness.

Professor Comstock never engaged in controversy nor did he criticize the work of others. He did his own work as well as he knew how, and with faith in it he let all adverse criticism pass in silence. On the other hand, no one was franker to acknowledge a mistake than he, for accuracy was almost a fetish with him. Moreover he never appropriated the work of others.

Professor Comstock was one of the earliest teachers of entomology in the United States; and his ideals and standards have exerted a profound influence on the teaching of entomology in this country. His early struggles in self-education undoubtedly begot in him the habit of clear, precise, logical arrangement in his own mind of the problem in which he was interested. As a result, his lectures were models of simplicity, clearness, and conciseness. This logical quality of mind, together with his infectious enthusiasm and his personal interest in his students, made him a great teacher, and this characteristic, together with his experience as a teacher, lay at the root of his success as a writer of text-books. His greatest service to the University and to the world may but be expressed in this brief sentence: He was a trainer and inspirer of men.

Ruth B. Comstock

November 17, 1903 — January 11, 1978

Mrs. Ruth B. Comstock, professor emeritus and extension specialist in interior design, was a member of the faculty of the Department of Housing and Design of the New York State College of Home Economics (now the College of Human Ecology) for twenty-eight years. Prior to her university appointment she served for five years as a county home demonstration agent in Yates County and as an agent-at-large for four years.

Professor Comstock was born in Springwater, New York, and attended the State Teachers College in Geneseo. She received her Bachelor of Science degree from the New York State College of Home Economics and completed her graduate work in 1942 at Cornell University and at the Teachers College, Columbia University. To enrich her professional background, she took additional graduate work at the New School for Social Research in New York City and at New York University.

In her extension teaching Mrs. Comstock was sensitive to the needs and capabilities of homemakers. Through her expertise in the area of interior design and her unusual gifts as a teacher, she helped homemakers use their skills to create attractive, comfortable, and efficient homes. Her teaching was especially important during the Depression and wartime years when money and material resources were limited. The participatory teaching methods she used gave homemakers pride and satisfaction in their achievements.

Perfection in her own work was evident in all of Mrs. Comstock's teaching and writing. She was the author of numerous Cornell extension bulletins and leaflets that were distinguished by her knowledge and by the clarity of her writing.

Among her writings on home furnishings, the chair seating series is well known. The bulletin "Cane Seats for Chairs" has been the best seller in extension bulletins during the past few years. Even after retirement and prior to her death she constantly revised and kept the bulletins current.

In 1952 Epsilon Sigma Phi awarded Mrs. Comstock a certificate for excellence in written material. In 1956 her bulletin "How to Make Curtains and Draperies" received an award from the American Association of Agricultural College Editors.

She served as chief of the Cornell chapter of Epsilon Sigma Phi. She was a former national chairman of the home furnishings extension specialists and was a member of the American Home Economics Association.

For many years Mrs. Comstock was a member of the Women's Advisory Committee of the New York State Fair. She was also superintendent of the State Cooperative Extension home economics exhibits at the state fair. In 1962 she served as chairman of the state fair's Women's Day program.

Upon her retirement in November, 1964, Mrs. Comstock assumed a three-year teaching assignment at the Ranch House College in Salisbury, Rhodesia. After her return to her home in Penn Yan, New York, she was Active in volunteer teaching; in the meals-on-wheels project of the Methodist Church; and in other community activities. She was also a member of the hospital board of the Soldiers and Sailors Hospital. She traveled widely, Vlsiting Japan, Taiwan, Thailand, Hawaii, Spain, Morocco, Mexico, and Canada.

Mrs. Comstock was devoted to her family, loyal and helpful to her many friends and colleagues.

She was the widow of the late Herbert G. Comstock and the mother of Alan B. Comstock of Penn Yan, New York, and of Mrs. Stuart (Ann) Crandall of Greensboro, North Carolina.

Ruby M. Loper, Hazel E. Reed, Clark E. Garner

John C. Condry

December 6, 1938 — June 27, 1993

John Condry was one of those rare individuals whose professional life and private self were in harmony.

When we remember John, we remember his wonderful verve and enthusiasm for his profession. He loved teaching; he loved research; he loved to talk with colleagues about his latest idea. He generated enthusiasm in our responses because he was so obviously caught up himself with the intellectual challenge. And John's own enthusiasm for his work was mirrored in his research on intrinsic motivation—the impetus to work at something not because of external rewards but because it is the work itself that one finds compelling.

When we remember John, we also remember that, above all, John was a man of integrity. He maintained his honesty and his principles even when it was not expedient to do so. John was trusted even by people who disagreed with him. He acted on his belief that the academic profession was worth the best that is in us. And John's personal integrity was reflected in his major research, during the past two decades, on the truth and falsity (or at least distortion of the truth) presented by television and on the effects of television on children.

John founded the Center for Research on the Effects of Television and was its co-director. The Center created an archive that consisted of a representative sample of television programs and advertisements that spanned more than a decade. The archive is the only sample of its kind and became the raw material for John's research on the effects of government policy on television programming, the kinds of values and stereotypes conveyed by television, and the effects of television on children. For example, John and his collaborator, Cindy Scheibe, found that the people who are the most susceptible to what they see on television are those who have the most limited real-world knowledge with which to moderate or counteract what is presented on television—a population that includes but is not limited to children. Furthermore, children are especially susceptible to television presentations because, in addition to their limited knowledge, they also are less able to distinguish the fantasy that is often presented on television from reality. The archive continues to serve as a data base for researchers across the country.

John's research on the effects of television made him an acknowledged expert in this area and he was often called on to testify before Congressional committees and federal and state agencies. But it was another mark of his integrity that some of us did not realize how famous he had become: John never engaged in self-promotion; he did not dismiss his old friends even when his—or their—fortunes changed.

And when we remember John's capacity for friendship, we remember that his friendship was always refreshingly free of gender stereotypes—a characteristic that contributed tremendously to the way he related to colleagues. Moreover, John's own personal view of gender, in turn, informed his research on the social construction of gender. Some of this research was done collaboratively with John's wife, Sandra. Their classic work examined the perceptions of the behavior and motivations of children whose gender could not be determined from their physical appearance or from the way they sounded. John's and Sandra's research found that perceptions of children vary dramatically depending on whether the perceiver has been told that the children are female or male. The importance of this research was recognized by an award from the Association for Women in Psychology.

John grew up in West Virginia and graduated from West Virginia University with an A.B. degree in 1961 and an M.A. degree in 1962. He took his Ph.D. degree in social psychology in 1966 from the University of California at Los Angeles. John's entire teaching career was spent at Cornell with sabbaticals at the University of Kansas and at Stanford University. John received the Amoco award for excellence in teaching in 1991. In addition to being co-director of the Television Center, John was Associate Editor of the journal, *Motivation and Emotion* and was a member of the editorial board of the *Journal of Applied Developmental Psychology*. John also served as editorial consultant for the *Journal of Personality and Social Psychology*, *Child Development*, *Developmental Psychology*, *Sex Roles*, and the *Journal of Communication*. John's most recent book was *The Psychology of Television*, published by Lawrence Erlbaum Associates, Hillsdale, New Jersey, in 1989. John's last publication was an invited paper published in the winter 1993 issue of *Daedalus* and was entitled, "Television, A Thief of Time."

Throughout his life, John's main source of pride and strength was his family: his wife, Sandra McConnell Condry and their children, Ian, Kirsten and Jennifer. They were friends as well as family. They were his anchor.

Our grief at John's death is proportional to what he gave us in life.

Barbara Koslowski, George Suci, Jerome Ziegler

Howard E. Conklin

January 23, 1917 — November 2, 2006

Dr. Howard E. Conklin, Professor Emeritus of Agricultural Economics, resident of Longview, Bella Vista Drive, Ithaca, New York, died November 2, 2006 at Oak Hill Manor. Howard was a national leader in the field of land economics and took leadership throughout his academic career in seeking ways to keep productive agricultural lands available for use in farming in this increasingly urbanizing state and region of the country.

Howard grew up on a small dairy farm in the hill country of Allegany County, the eldest son of Monroe and Mabel Conklin of Ischua, New York. He often spoke of his heritage from life on a “hard scrabble” farm where producing enough feed for the cows and horses was usually as difficult as feeding the family. He understood rural poverty first-hand and spent his life trying to help citizens of the State and the Northeastern United States understand the value of the natural resources where they lived and the highest and best uses to which these lands could be put. Education was given high priority by his parents and they found ways to get him and his brother and sister to high school in the days before centralized, school systems and buses had come to rural Allegany County. Howard graduated from Cuba High School as its valedictorian when only 16, in 1933, at the bottom of the great depression.

Conklin entered the New York State College of Agriculture at Cornell University in fall 1933, working his way through college like most of his contemporaries. These years opened the world of scholarship and agricultural science to him. He was most grateful for these years of social and personal development associated with membership in the fraternity of Alpha Zeta. He was an outstanding student academically, elected to Phi Kappa Phi, and graduated in 1937. He then accepted a graduate assistantship in agricultural economics at the University of California, Berkeley, where he completed his M.S. degree in 1939. Howard worked for two years in California as an employee of the U.S. Department of Agriculture. In 1941, he returned to Cornell to enroll for a Ph.D. degree majoring in land economics.

He enlisted in the U.S. Army Signal Corps in 1942 and became an instructor in radio and long-line communication. His orders to go to the Pacific Front in 1945 were cancelled before he left the country. Mustered out of the Army in July 1946, he returned to Cornell and completed his Ph.D. degree in 1948. He was immediately appointed an Assistant Professor of Land Economics at Cornell; became an Associate Professor with tenure in 1951; and Professor in 1959. After many years of productive service to the College and University, he retired in 1982 and joined the ranks of Professors of Agricultural Economics, Emeritus.

Conklin added his own legacy of accomplishment in land economics to that of G.F. Warren, and F.F. Hill, who had pioneered work on public policy in land use in New York in the 1920s and 1930s. Conklin led the efforts in completing the land classification work started in the 1930s and then renewed efforts in working with the Governor's Office in Albany, first developed with Governors Alfred E. Smith and Franklin D. Roosevelt. Conklin's abiding interest was to support efforts by local landowners to maintain a strong voice at the local level (town or county) in decision-making about land use. He worked to document changes in land use through time, the movement of non-farmers into rural areas as landowners, and the economic viability of agricultural lands as technology changed.

Conklin's contributions to the debate over State land use policy in the post-World War II years were profound. His intellectual leadership turned long-standing land evaluation techniques to more contemporary concerns about population dispersion and urban encroachment in farming communities. The capstone of that effort was the production of a map showing grades of economic viability for farming areas across New York State. This map, and the economic intuition embedded in it, suggested territory where farming could succeed if protected from undue urban influence; this map was destined to guide policy thinking by adorning the walls of offices and conference rooms across New York State for years to come.

Working with successful farmers, rural landowners and public officials, Conklin spearheaded the creation of the Rural Resources Commission and the development of new institutional arrangements to encourage the continuation of farming. This included refining the concept of Agricultural Districts as a multifaceted approach to farmland protection. Enabling legislation was passed and signed into law in New York State in 1971. To form such a district, local residents, usually farmers, request it from county government. Hearings are held, areas proposed to be included, and boundaries established. Within these designated areas, commercial agriculture is designated as primary and landowners have the opportunity to realize a lower tax bill by applying for agricultural rather than full market value assessment. Over two-thirds of the farms in New York State, and about one quarter of New York State's land area has been included in designated agricultural districts.

The concept of agricultural districts in New York State received national attention in the 1970s and has been adapted to meet the needs for legislation to sustain commercial agriculture in other states, particularly in the Northeastern United States where suburban growth and urbanization has created great pressure on commercial farming. In 1979, Conklin received the American Agricultural Economics Association's inaugural award for "Distinguished Policy Contribution."

While Conklin saw the benefits of land use planning by citizens and local governments, he was also concerned about the application of State-level police power in controlling land use without appropriate citizen interaction and appeals. He was pleased that the Department's land use maps were used by State agencies in Governor Rockefeller's ambitious State Development Plans of the 1960s. Agricultural districts legislation was in part a response to what he saw as the potential dangers in granting too much power at the State level in land use decisions. His concerns were voiced effectively by county and town governments and local citizenry. He worked successfully with local groups in influencing the location of right-of-ways to preserve prime agricultural lands in locating the Interstate 88 highway between Binghamton and Albany. His concerns were always related to what he believed was in the best long-term use of these natural resources. Today, a key part of his legacy is a standing statewide commitment to minimize the impact of infrastructure development on commercial agriculture and farming communities.

One of Conklin's strengths was in working with graduate students on agricultural land use issues both within New York State and elsewhere in the world. He provided sophistication in sampling techniques using aerial photos to identify major farming areas and land use patterns in New York State. His initial state-wide maps coded in red, green and yellow, like a stop light, sent understandable signals to anyone interested in commercial agriculture. When satellite imagery later became available, the same kinds of current information became attainable to those with access to the necessary translation equipment. His students were among the pioneers in this process. Conklin was invited to work in a number of countries in Latin America on land use issues, often at the invitation of former students. His understanding of political decision-making was broadened by this experience to the benefit of both students and colleagues.

Howard Conklin will be remembered because of his enduring concerns for the welfare of those who make their living from the land and for the wise use of their resources. He left behind his willingness to listen carefully to those with limited resources and helped them to get a hearing. His students came away with a practical understanding of the art and science of political economy. His bibliography is large, replete with journal articles, research bulletins and publications; he left behind a worthy legacy.

He and Mary Chittick were married in 1940 and had three children: Lawrence, Glenn and Nancy (Brittain), all of whom survive him as well as five grandchildren, a brother, Gordon, and sister, Cecile Mapes.

Bernard F. Stanton, Chair; Nelson L. Bills, George J. Conneman

Harold J. Conn

May 29, 1886 — November 10, 1975

Dr. Harold J. Conn, eighty-nine, of 458 Castle Street, Geneva, New York, a former chief in research in bacteriology at the New York State Agricultural Experiment Station, Geneva, died November 10, 1975 after a long illness.

Dr. Conn was a pioneer in the field of bacteriology, having a special interest in soil bacteriology. He came to the station in 1911 as an associate bacteriologist, was promoted to chief in research in 1920, a position he held until his retirement. He was appointed professor of bacteriology in October 1945 and professor emeritus on May 1, 1948. He also served as chairman of the Commission on Standardization of Biological Stains.

This distinguished scientist was born in Middletown, Connecticut, May 29, 1886. He received two doctorate degrees, one in 1908 from Wesleyan University and the second in 1911 from Cornell University. Before coming to the Geneva station, he was an assistant in the Department of Experimental Agronomy on the Ithaca campus of Cornell University.

He was a member of Phi Beta Kappa, Sigma Xi, the American Society of Agronomy, a fellow in the American Association for the Advancement of Science, and chairman of the Committee on Technique in the Society of American Bacteriologists.

Dr. Conn was the author of more than two hundred articles in the field of bacteriology, many of them dealing with establishing specific staining techniques that are still used as the basis for procedures used today. Many other articles were based on his work with bacteria in the soil.

Surviving are a daughter, Mrs. Vincent (Jean) Cochrane of Portland, Connecticut; and a son, Herbert J. Conn of Custer, South Dakota.

Carl S. Pederson, Roscoe E. Krauss

Lewis Atterbury Conner

January 17, 1867 — December 4, 1950

On December 4, 1950, at the New York Hospital death came to one of the most distinguished of American physicians. A member of the *Association of American Physicians* since 1908 his 84 years had been rich in accomplishment and his life and acts had merited the affection and esteem of the many students and colleagues whom he had taught and influenced.

Dr. Lewis Atterbury Conner was born in New Albany, Indiana, a son of Charles Horace Conner and the former Katherine Boudinot Atterbury. At the age of 21 he received the degree of Bachelor of Philosophy from the Sheffield Scientific School of Yale University. Three years later he was graduated from the College of Physicians and Surgeons of Columbia University and was awarded a position as House Officer at the New York Hospital, thus commencing an association which was to extend over more than half a century.

His exceptional ability was almost immediately recognized and from the time he completed his internship he was sought for positions of responsibility and prominence. In 1898 he was selected as a member of the original faculty of Cornell University Medical College. Two years later, at the early age of 34, he was appointed Professor of Clinical Medicine, a position which he occupied until 1916, when he succeeded Dr. W. Gilman Thompson as Professor of Medicine.

Over the course of years Dr. Conner's interests and influence embraced many activities. He served as a private in the Spanish-American War and as a Brigadier General in the Army Medical Reserve Corps during the First World War.

He was a friend and advisor of John Masterson Burke and was responsible perhaps more than any other for the concept and development of the Burke Convalescent Home. For many years he served on its Board of Directors and after his retirement from practice acted as its Medical Director.

He was one of the Founders of the American Heart Association and served as its president in 1924 and 1925. He was the first editor of the American Heart Journal and to his leadership, wisdom and unselfish devotion during the years from 1925 to 1937 may be attributed its early growth and rapidly expanding influence. It stands today as a monument to his imagination, industry and ability.

Dr. Conner's pre-eminence as a teacher can be attested by all graduates of Cornell and by many others who came into even casual contact with his remarkable example and method. Educated at a time when the unaided senses still represented the only resource in the clinical study and recognition of many diseases, Dr. Conner developed a mastery of physical diagnosis which has seldom been equalled. With this invaluable asset he combined qualities of scholarship and perception which enabled him to appreciate and evaluate newer scientific knowledge and to share the enthusiasm and aspirations of his younger colleagues. His learning, his clinical judgment, and above all his integrity, made him the idol of the students and particularly of those chosen young men who were permitted to work with him as interns or residents in the wards of the New York Hospital. To them and to those who have succeeded them, his acumen and skill have become an unforgettable legend.

Dr. Conner never expected praise or gratitude, but it is pleasant to think that he was frequently honored and that many tributes were offered to him. As head of the Department of Medicine at Cornell University Medical College and Attending Physician and Chief of Service at The New York Hospital, he was guest of honor at the dinner given at the Waldorf-Astoria Hotel on April 21, 1932, to celebrate the union of the two institutions.

In the last year of his life he received the Gold Heart of the American Heart Association as one of its four living founders. On another occasion while attending a dinner in honor of a former associate he received a prolonged, spontaneous and heartening ovation.

The Medical Board records his death with sorrow, realizing that in his death its members and all who work for The New York Hospital have lost one of its greatest and staunchest friends.

David P. Barr

Bartholomew J. Conta

March 29, 1914 — November 1, 1993

Bart Conta had a long association with Cornell beginning with his M.S. degree in Experimental Engineering, awarded in 1937, and ending with his position of Emeritus Professor, which he became in 1979. In between he rose from an Instructor (1937) to a full Professor (1951) while for various periods having appointments at other universities and in industry.

Bart Conta was a loved teacher. He specialized in the thermal and fluid sciences but also taught courses in the history of technology and its social implications. He was in many ways the ideal undergraduate professor; engaging and clear with a kind voice and gentle manner. In the more formal courses he rarely used notes, unusual in science and engineering. After lectures and at office hours (which seemed to an outsider to be more like office days), there were usually lines of good-humored students. One of us, when walking across the quadrangle one day just around Bart's retirement, asked a passing student what courses she was going to take next semester. After naming a few she said "and I am going to take Bart's Thermodynamics since I hear he will retire soon". Thermodynamics is usually considered the bane of students, not the course one would normally talk about with high expectations because of its association with a particular professor. A partial list of technical courses taught by Bart is as follows: Physical Metallurgy, Strength of Materials, Thermodynamics, Fluid Mechanics, Heat Transfer, Gas Turbines, Internal Combustion Engines, Fuels and Combustion, Steam Power Generation, Refrigeration and the Thermodynamics of Fluid Flow. During World War II, the U.S. Navy sent shipboard engineering officers to Cornell to learn about diesel and steam power. As a young Professor of Heat-Power Engineering, Bart Conta performed a vital wartime service as a teacher in that program from 1941-44.

During the 1960s and 1970s, Bart was a beacon for the more radical engineering students who opposed the Vietnam War and were interested in alternative forms of technology. He became involved with social and environmental issues and their relation to engineering. His courses reflected the times and although they were not compulsory they were well attended. Some of their titles were: The Thermodynamics of Energy Husbandry, Biology and Society, Social Implications of Technology, and Technological, Society, and the Human Condition. His goal was to give students a historical perspective on technology and its societal consequences. He also taught a very popular course on solar energy. His interest in appropriate technology extended to becoming an active participant in the planning of Eco Village near Ithaca. He influenced many students, showing them that engineering could be different to that done by the large anonymous design teams associated with big industry and the military.

Bart was also active on University committees and boards. These included the University Faculty Council, Committee on Academic Freedom and Tenure, Committee on Academic Status of the Faculty, Committee on Academic Integrity. He was active on the Board of Directors of the Statler Club and president from 1966-67. He also was on the Board of Directors of the Center for Religion, Ethics and Social Policy (CRESP) and a member of its executive committee. He was a member of the American Society for Mechanical Engineers, American Society for Engineering Education, American Association of University Professors, American Association for the Advancement of Science and the Society for the History of Technology.

Apart from his years at Cornell, Bart spent periods with the Texaco Corporation (Research Engineer, 1940-41), Syracuse University (Professor, 1947-51), Dupont (1952-58) Universidad del Valle Cali, Columbia (Ford Foundation Visiting Professor, 1964-65), Berkeley (NSF Science Foundation Fellow, 1970) and the British Museum in London (1973). He married Ruth Fletcher in 1937 and they had three children in their long and happy relationship. After Ruth died in 1987, he married Claire Tallman in 1989. It was a joy to see this happy couple walking around the streets, and in the cafes of Ithaca; they showed a sprightliness that is too often lacking in people 50 years their junior. He is sadly missed.

Tob deBoer, Frank K. Moore, Zellman Warhaft

H.D. (“Don”) Conway

December 3, 1917 — May 31, 2007

H.D. Conway, or “Don” as he was universally known, was remarkably productive for a phenomenally long span. He began his working life in 1934 as an “indentured engineering apprentice” at a British shipyard, being paid just 50 cents per week for laboring 7:00 a.m. to 8:30 p.m., Monday thru Friday plus Saturday mornings. His last appointment—a labor of love tutoring undergraduates—occurred 70 years later at Cornell with only slightly better pay. In between, Don was on the Engineering College faculty from 1947 until his official retirement in 1988; he remained active in the department for 15 years more—teaching, advising and mentoring.

Don was born in Chatham, England, 30 miles southeast of London, as World War I ended. His father, of Irish parents living in Scotland, was an enlisted man in the Royal Marine Light Infantry and his mother, an English homemaker. After secondary education, Don joined the sprawling Chatham dockyard and, five years later, he had become an electrical fitter, laying cables on dry-docked ships. During the early years of World War II, with still no academic training but considerable engineering experience, he was a stress analyst supporting the design of the Royal Air Force’s Sterling bomber. To Don’s surprise, the government acceded to his request to attend the University of London, then displaced to Cambridge by Germany’s blitz bombing of Britain’s capital. By 1942, he had earned a Bachelor’s degree in Mechanical Engineering with first-class honors. Don then joined the National Physical Laboratory to continue war-motivated studies of the stresses in jet engines and gun barrels, and he simultaneously went forward with his education. While serving on an overnight fire watch for German bomb damage, he met his future wife Dorothy, a clerical assistant. The University of London granted him a Ph.D. degree in Structural Mechanics at the war’s end, followed by a D.Sc. degree in 1949 for his published work. He was appointed as a “University demonstrator” in engineering at Cambridge University, which awarded Don an M.A. degree in 1946. Based on his research publications, he received a Sc.D. degree from Cambridge University in 1971.

Don Conway joined the Department of Engineering Mechanics within the Sibley School of Mechanical Engineering as an Associate Professor in 1947. When hired by Cornell, he was a rising European star in classical elasticity and structural mechanics, and thus represented a new breed of faculty within the College of Engineering. Before World War II, U.S. engineering education was centered on “engineering practice”—with professors at that time mostly devoted to teaching, professional case studies and consulting. Don and others, such as J.N. Goodier who preceded him to Cornell, were instead expected to carry out scholarly research along with their teaching responsibilities. Over the years, this trend continued and Don’s department transitioned into an independent

Engineering Mechanics and Materials Department, and then in the mid-sixties to today's Theoretical and Applied Mechanics (T&AM).

Don returned to England on his inaugural sabbatical leaves, both at Imperial College, in 1953-54 as a Guggenheim Fellow and in 1961-62 as an NSF Senior Postdoctoral Fellow. In the academic year 1958-59, Ohio State (like many other universities) tried to lure him with the Julius Stone Professorship. These three leaves were his only extended stays out of Ithaca. He moved in 2004 to Florida to consult with his youngest son, Peter. Geoff Conway and wife, Sally, live in North Reading, Massachusetts, with two sons. Don had raised the two boys, both engineering graduates, after Dorothy's passing in 1976.

Don performed stress analysis for companies such as General Electric, Battelle Memorial Institute, North American Aviation and Union Carbide. His strongest consulting association, with IBM-Endicott, began in 1961 and endured more than twenty years. Even as a technical consultant, Don was the consummate teacher, educating engineers about available historical solutions, new problem-solving approaches and the true meaning of complex analytical results.

Throughout his decades on the faculty, Don taught undergraduate courses in strength of materials and graduate courses in classical elasticity that were primarily taken by civil and mechanical engineers. Working from notes penciled on ruled, yellow paper, and preparing a beautifully organized blackboard, Don educated students about stress and strain, St. Venant's torsion and the bi-harmonic equation. He gave clear lectures, occasionally illuminating them with slides of renowned mechanics, plus some funny anecdotes and corny jokes. Don added humorous tales of real-world engineering and provided practical advice about technical topics but life too. The students loved Don and their affection was fully reciprocated. Once, when a co-teacher got upset with undergraduate antics, Don said, "They're God's children, and good lads, too, you know."

As a Professor, Don was recognized as deeply involved with his graduate and undergraduate students, and very generous with his time. He often ranked among the top ten percent of the college's educators, and in 1987—just before his first (i.e., official) retirement—he became the first T&AM Professor to receive the Engineering College's highest teaching honor, the Tau Beta Pi prize. Don supervised nearly 50 Ph.D. and M.S. students, many of whom became leaders in academia and industry around the globe.

Professor Conway published more than 200 research papers, his second appearing in the prestigious *Philosophical Magazine* in 1946, and his last pair being published 55 years later. The latter were written with C-Y (Herbert) Hui,

a faculty colleague in T&AM who became a good friend, although they were separated by 35-plus years in age. At the start of his academic career, Don wrote the technical treatise *Aircraft Strength of Materials* (Chapman and Hall, 1947) and then the textbook *Mechanics of Materials* (Prentice Hall, 1952).

To honor Don's active involvement with students, Professor Andy Ruina organized and furnished the H.D. Conway study room (102 Thurston), a former lab now filled with tables and blackboards for teaching assistants and faculty to aid students on problem-solving in mechanics and mathematics. At the dedication ceremony in 1999, Don talked about

"The students that I like are those who aren't unduly gifted, but study hard. They're the ones who use this study room. Others who get 100s all the time, you don't see...it does my heart good to watch kids struggling and making it against great odds."

Don enjoyed his many hours spent there with students, helping them with homework problems, surely, but also listening to their dreams, difficulties and disappointments.

Even though a distinguished and productive researcher himself, Don felt that many at Cornell were overly impressed with their own research—attributing far too much importance to it. How many of us really carry out research that has a lasting impact—that actually changes the world, he'd ask? For the vast majority, it is our teaching that is our most meaningful activity—since it touches so many young people during their formative years. Sometimes, if you met Don after a student had just departed, he'd state, "Now that's the best thing about our job, isn't it?" Over the years, he likely taught 15,000 Cornellians.

Don's quiet demeanor, frequent smile and interest in fellow humans had a much-appreciated and calming influence on the department during the tumultuous late sixties and seventies. Don considered himself to be Irish, more emotional than if he had been English, and he was proud of that heritage. Don had a mischievous sense of humor. For example, for many years, his office was located on the heavily traveled first floor hallway of Thurston Hall. After tolerating countless interruptions, he eventually put a sign on his office door that read:

*"The department office is upstairs. I do **not** have a stapler; I do **not** know who has a stapler. The men's room is that way (=>); the ladies' room is this way (=>)."*

During Don's middle years in town, he collected antique Ithaca Calendar Clocks, many of which decorated his office. Don shared this passion, and another for investing, with Pete Zaharis, a local merchant. They attended auctions and meetings of historical societies in Rochester and Syracuse in quest of their clocks. Pete says that Don was so sharp, so informed:

“a tough shopper, who loved to make a buck by turning things over...he was so secretive about the sources of his bargains, he was like an MI5 spy.”

This hobby took him on car trips across his beloved Finger Lakes.

During his last decade in Ithaca, Don continued to come to campus every weekday. His daily leisurely tour included coffee, chats with his colleagues, several stories to recall and a half-hour with *The New York Times* (stocks, primarily) before sitting down to help students.

When Don retired in 1988, having reached the then-mandatory retirement age, the T&AM chair wrote the Dean:

“In his 41years at Cornell, Don has been an exemplary faculty member: he’s been an excellent teacher and advisor and, throughout his career, he’s continued as a strong researcher...Although extraordinarily productive, Don has been the easiest and most gentle faculty member in the department. He always has a kind word for staff, students and faculty, as long as they’re willing to listen to an old English saying, a joke or a line of poetry.”

At Don’s death, that letter remained fully accurate, but his service to Cornell’s students had reached 57 years.

Professor Conway was a true gentleman, a gentle man, and a scholar, with a unique combination of intelligence, charm and kindness, and not an arrogant bone in his body—a “jolly good chap,” he might have said.

Joseph A. Burns, Chair; Edmund T. Cranch, Timothy J. Healey, Francis C. Moon, Andy Ruina

Herbert Conway

June 25, 1904 — August 25, 1969

Doctor Herbert Conway, clinical professor of surgery at Cornell University Medical College and director of the Plastic Surgery Department at the New York Hospital-Cornell Medical Center, died soon after his arrival at the New Rochelle Hospital early on the morning of August 25, 1969.

One of the world's leading and best known plastic surgeons, Doctor Conway organized a training program in plastic surgery at the New York Hospital-Cornell Medical Center in 1936 and served as its director to the time of his death. He was also consulting plastic surgeon to the Veterans Administration Hospital, Bronx, New York; White Plains Hospital, White Plains, New York; Bellevue and Memorial Hospitals and the Hospital for Special Surgery in New York City.

Doctor Conway was born in Fort Wayne, Indiana in 1904. He received his undergraduate training at Miami University in Oxford, Ohio and his Bachelor of Science and Doctor of Medicine degrees from the University of Cincinnati in 1929. He also received a Master of Science in Surgery degree from the University of Cincinnati in 1932.

His early training in surgery was at the Cincinnati General Hospital. In 1932 he came to the newly constructed New York Hospital-Cornell Medical Center with Doctor George Heuer, the newly appointed chief of surgery. After completing his training in surgery with Doctor Heuer, he joined the staff of the New York Hospital and established a Section of Plastic Surgery in the Department of Surgery.

During the years from 1942 to 1945 he served as a lieutenant colonel in the United States Army Medical Corps in the South Pacific Theater. He became the plastic surgical consultant for the entire Southwestern Pacific area and was awarded the Bronze Star Medal. Upon his return to civilian life he resumed what was to become one of the most prolific careers in plastic surgery.

He was chairman of the American Board of Plastic Surgery, editor of the *Transplantation Journal* and associate editor of the *American Journal of Plastic and Reconstructive Surgery*. His writings include more than two hundred and fifty articles in the surgical literature and three books, *Tumors of the Skin*, *Surgery of Tumors of the Skin* and *Plastic Surgery One Hundred Years Ago*. His postgraduate training system has trained over ninety-five surgeons for important posts in this country and abroad.

A founder member of the Society of Head and Neck Surgeons, Doctor Conway was a member of numerous surgical organizations in this country and abroad, including the American Surgical Association, the British Association of Plastic Surgeons, and the American Society for Surgery of the Hand, the Plastic Surgery Section for the Pan-American Medical Association, and the American Academy of Compensation Medicine. He was president of the New York Regional Plastic Surgery Society.

On June 15, 1969, he received the honorary degree of Doctor of Science from the University of Cincinnati. The recipient of many honors, Doctor Conway was an honorary member of the Chilean Plastic Surgery Association, the faculty of the University of Chile, the Academy of Surgery of Peru, the Argentine Surgical Association, and many other organizations. He was also a government lecturer in plastic surgery under the auspices of the U.S. State Department in India, Pakistan, Saudi Arabia and Lebanon from December, 1962, through February, 1963.

Doctor Conway is survived by his wife, Frances Gallagher Conway of New York and Palm Beach; a son, Richard W. of Bel Air, California; and two daughters, Karen and Catharine Lanning of this city.

Dicran Goulian, Jr., M.D.

Walter Lichtenthaeler Conwell

August 14, 1884 — October 7, 1967

Walter L. Conwell, Professor of Civil Engineering, Emeritus, died in Tompkins County Hospital on October 7, 1967, after a brief illness. He was eighty-three years of age.

Professor Conwell was born in Reading, Pennsylvania, the son of W. Lord and Sarah Frances Lichtenthaeler Conwell. Although the family lived in Nashville, Tennessee, during his early school years, he returned to this part of Pennsylvania later in his youth; and throughout his life he maintained an interest in the colorful folklore and customs of the Pennsylvania Dutch country.

He entered Cornell in 1905 at the age of twenty-one, having interrupted high school to work in industries such as the Reading Iron Works and the Reading Railroad. During this period in industry, he became acquainted with Cornell engineers—perhaps from afar, as he viewed the exalted position of the engineer in relation to his own job in the company. In any case, this contact, along with family encouragement, urged him toward the faraway goal of Cornell. In preparation, he traveled to Ithaca in 1903 and entered Ithaca High School as a special student for completion of his high school requirements.

After his college freshman year he left for two years to earn funds for the continuation of a college career. This time he turned west. With a year of Cornell engineering behind him he was able to obtain employment with a surveying crew of the Southern Pacific Railroad, working in the rugged Sierra Nevada mountain terrain of California. During the winter he returned to the fountains to try his hand at prospecting. It seems likely that the self-reliance which was so characteristic of him was formed and nurtured in these early years of hard work.

Walter Conwell returned to Cornell and received the degree, Civil Engineer, in 1911. He was immediately appointed an instructor in civil engineering and continued as a member of the faculty until his retirement in 1953.

At the time he was a student, one of the most active areas in the College was the Department of Railroad Engineering—in fact, it had been a significant part of civil engineering at Cornell from the earliest days. Although Walter Conwell was trained in this tradition and had worked on a number of railroad projects before and during his college years, he was one of the first to foresee the need for a new approach to highway engineering, in terms of route location, of materials, and of construction methods. As a young instructor he established the first courses in highway engineering at a time when the automobile was still limited mainly to local transportation. Soon

thereafter a highway materials laboratory was constructed, largely by the direct labor of Walter Conwell and his students.

For many years he spent his summers traveling to highway projects in all parts of the country in order to study design and construction in the field. His courses were constantly enriched with a steady input from his field studies. Throughout his teaching career he was a strong advocate of close association between engineering education and the practicing profession.

In 1916, at the age of thirty-two, he began drilling with the Faculty Military Company, and in 1917, with the entry of the United States into World War I, he took a leave of absence from Cornell for war service. He served with distinction as an artillery officer in France, achieving the rank of major. Following the armistice, he was assigned to duty as superintendent of buildings and grounds for the American Expeditionary Forces University in France.

A letter of commendation from the President of that University says, in part “. . . you have had a position involving many responsibilities and filled with many duties which to a person of less even temper would be received in the way of an annoyance.” This could be said also of his long service to Cornell, which he resumed in 1919 and continued without interruption until his retirement in 1953.

Although he concentrated on teaching in the years following his return, his administrative abilities were called upon at various times by both the University and the College. He served on a number of regular and special committees, often as chairman. For many years he was a member of the old Athletic Council and helped to shape the long-range athletic policies of the University during the changing era of the 1930's. He also served on the Board of Directors of the old Cornell Cooperative Society (the present Campus Store) from 1927 to 1947.

In 1930, Dexter Kimball, Dean of the College of Engineering, appointed him chairman of the administrative committee for the School of Civil Engineering which administered the work of the School during a four-year period when the directorship was vacant.

With the beginning of the war emergency in 1940, Professor Conwell helped to organize and administer the special training programs established by Cornell. Subsequently he was appointed director of the Engineering, Science, and Management War Training Program operated by Cornell University for the United States Office of Education in various industrial areas in the state. His relations with that Office, with the large teaching staff assigned to the Program, and with the industries served, brought great credit to the University in a difficult period. It was said by

the Washington Office that the organization and operation of the Cornell Program served as a model for others established across the nation.

During the war years, S. C. Hollister, Dean of the College of Engineering, had planned for the continuation of the development of the College of Engineering interrupted by the war—development of program, of facilities, and of staff. It was clear that the College would require administrative assistance for both planning and operation; therefore, on February 1, 1945, Walter Conwell was appointed Assistant Dean of the College of Engineering.

In this position he undertook various responsibilities in the increasingly complex administrative functions of the College, and his sound judgment contributed substantially to the operation of the College in this transitional period. His principal role was in the area of budgetary planning and control, and it was here that he won a reputation for efficient and impartial handling of the affairs of the College and its divisions. He demanded good business practice and judgment of his associates, but he was equally generous with advice and assistance. His work was consistently motivated by an attitude of support for the progressive development of the College.

In later years, Walter Conwell was often described as “a gentleman of the old school,” and for his friends this was a simple description composed of both affection and respect. In his manner, his dress, his integrity, his generosity, his sincerity, he was indeed a gentleman. He was good friend and neighbor, too. With no family responsibilities of his own, he undertook the role of Samaritan for many of the elderly retired faculty whom he knew and who were less mobile than he.

His affection for Cornell and Ithaca was deep and genuine. He was fond of recalling that in his years at Cornell he had known or met many of the great persons associated with the University from its earliest days to the present—including Andrew Dickson White.

For almost fifty years, Walter L. Conwell served as teacher, administrator, counselor—and sometimes as critic—but always with complete devotion and loyalty to the College, to Cornell, and to his country. His years covered wars and depressions, good times and bad, during which great changes took place in education as in the world. He neither resisted change, nor did he submit to change for the sake of change, but tried to perform his job as he saw it in response to the needs of the times and the aspirations for the future. He served well.

Donald English, Solomon C. Hollister, John F. McManus

Alice H. Cook

November 28, 1903 — February 7, 1998

Professor Emerita Alice Hanson Cook died on February 7, 1998, just nine months short of her ninety-fifth birthday. Throughout her long and productive life, she dedicated herself to improving the lives of working women and men everywhere she went, not only at Cornell and across the United States, but around the world as well.

In her autobiography, *A Lifetime of Labor* (New York: The Feminist Press at the City University of New York, 1998), Alice refers to her “patchwork career”: student, social worker, YWCA Secretary, labor educator, post WWII advisor in Germany on reconstituting German labor unions, wife, mother, single parent of two boys and temporary parent to numerous others, professor, university ombudsman, world acclaimed researcher, and to the very end, an activist. What a remarkable example she set for living life to its fullest!

Labor education was Alice’s first vocation, and dedication to the enlightenment of working adults continued to engage her energy and attention throughout her life. Upon graduation from Northwestern University where she had been a student activist, Alice wondered where she could find work, which would implement her social ideals. She found that spot in the YWCA Industrial Department, which provided education and support to blue collar women. A talented educator even in her twenties, she volunteered to teach in other pioneering workers’ education movements of the time: Commonwealth College in Arkansas, Bryn Mawr Summer School in Pennsylvania, the Summer School for Workers in North Carolina. She applied her skills as an organizer and teacher while serving as Education Director for the Textile Workers Union and as Assistant to the President of the Amalgamated Clothing Workers Union Joint Board in Philadelphia.

Professor Cook had pursued graduate studies in Germany prior to the rise of Hitler, with special emphasis on the trade union movement there. Post-war, the U.S. Army turned to Alice for the task of reestablishing democratic unions in Germany through programs of adult education. Drawing on her prior knowledge of trade unions both in Germany and the U.S., and her fluency in the German language, Alice performed her assignment with distinction. Moreover, she developed contacts that became lifelong friends and sources of data for her later career as a scholar engaged in research and publication.

In 1952, Alice was recruited by ILR Extension to direct a foundation-funded project: Integrating of Unions and Community. The project brought Alice to Ithaca, where she remained for the rest of her life. M.P. Catherwood,

then the Dean of the ILR School, recognized her brilliance, and persuaded her to teach Labor History and Union Administration courses in the resident degree program.

Moving into a new career as a college professor, Alice contributed both to teaching and research, publishing such path breaking works as *Union Democracy: Practice and Ideal, Labor's Role in Community Affairs*; and after winning a Fulbright for a year's study in Japan, *An Introduction to Japanese Trade Unions*, plus dozens of articles. Her research was almost always ahead of its time, and often cited.

As a teacher, Alice was both devoted and demanding. Her lectures were a pleasure to listen to, and easy to take notes from; each sentence was complete, it nested where it belonged in a paragraph, which in turn supported a section of her presentation. Not surprisingly, she graded student papers on both form and substance.

Alice Cook's service to Cornell and other parts of the local community was legendary. On campus, she was co-founder of the Women's Studies Program and the Advisory Committee on the Status of Women. And she opened the once all-male Faculty Club lunch hour to women. Appointed by University President Dale Corson as Cornell's first Ombudsman, she received complaints from anybody in the community, and she helped resolve them with patience and diplomacy. The procedures for that office are essentially the same now, as they were when Alice instituted them in 1970.

Nearly every women's group in the Ithaca area also benefited from Alice's wise counsel and generous support. Among them were the Ithaca branch of the American Association of University Women, the Professional Skills Roster, Displaced Homemakers, the Tompkins County Chapter of the National Organization for Women (NOW), and Planned Parenthood of Tompkins County.

Alice Cook retired from Cornell in 1973, but retirement, for her, merely meant going on to other pursuits. Her first undertaking was a study for the Ford Foundation of working women around the world, a global enlargement of the courses she had often taught for ILR Extension during her tenure. An explosion of publications followed that study, and included, *The Working Mother*, among others. In this period, she filed three *amicus curae* briefs, two in Japan on gender and age discrimination, and one in Canada on gender discrimination, as well as writing or co-authoring numerous articles.

In 1975, Alice and her collaborator received a German Marshall Fund grant to study women and trade unions around the world. Once again, she donned her seven-league boots, and the two-volume report which followed this

exhaustive research, *Women and Trade Unions in Eleven Industrialized Countries*, made its appearance, along with *Working Women in Japan: Discrimination, Resistance and Reform*, and *The Most Difficult Revolution: Women and Trade Unions*, treasures all for anyone interested in comparative labor relations.

In 1983, which coincided with Alice's own 80th year, ILR celebrated her birthday by hosting an international conference on "Women Workers in Fifteen Countries" featuring speakers from the countries in which Alice had conducted her research. And in the years following, Alice Cook dedicated herself and her still remarkable energies to the study of comparable worth, and wrote two casebooks on the subject. Her research played an important role in public policy formulation and was the subject of a number of ILR Extension Conferences in which she was the lead speaker. Following the pattern of her youth, she continued to participate in summer schools for women workers as a teacher and speaker. And she found a winter home at the University of Hawaii's Industrial Relations Center, where, working at her computer, she turned out numerous articles, and finally many chapters in her autobiography.

Over the years, Alice Cook inspired and mentored thousands of students, trade unionists, and colleagues with her active mind, her interest in everything human, and her good and graceful spirit. She leaves a rich legacy for the next century.

Lois Gray, Francine Herman, Jennie Farley

W. Donald Cooke

May 15, 1918 — September 20, 2007

Cornell Professor Emeritus W. Donald Cooke, 89, died peacefully at home on September 20, 2007. Don, as all knew him, had a remarkable Cornell career that covered the full academic gamut of teaching, research and administration.

Don was born in Philadelphia, Pennsylvania, on May 15, 1918. He joined Cornell in 1951 and advanced quickly through the ranks. When he came to Cornell, he led the effort to modernize analytical chemistry with spectroscopic, electrochemical, and chromatographic techniques. His productive 15 years of research yielded more than 35 publications, but during this time, he became Associate Dean of Arts and Sciences. He then was Dean of the Graduate School for a decade, and finally spent 15 years as Vice President for Research and Advanced Studies. He was an active member of the Cornell University Senate, Acting Provost, Acting Chairman of the Chemistry Department, and Director of the Occupational Health and Safety Program during its formative years. During all this, he continued an active teaching role, even past his retirement in 1987. Outside of Cornell, Don served on boards at several institutes and universities.

Don's early childhood was reasonably comfortable, but it fell apart with the 1929-1939 Depression. At one point, his extended family of eight lived day-to-day off the waitress tips of his sister, the only one with a job. Although Don has described himself as a lackadaisical student, St. Joseph's College saw enough promise to offer him deferred tuition and a job to pay for his study materials. After he graduated in 1940, he stayed on a year to work off his tuition and then spent a year at the Hanshaw Chemical Company as an analytical chemist. He joined the U.S. Army Air Force as a Private and was sent to MIT for a year to study Meteorology. After serving three years in the European Theater, he was discharged with the rank of Major. He served at General Eisenhower's headquarters and helped with tactical weather forecasts including the Normandy D-Day invasion.

Don was a highly skilled poker player and on the return trip home he made enough money to afford a diamond ring and get married to his childhood sweetheart, June. His love of poker continued throughout his career and he played several games a month that continued until a few weeks before his death. Don founded the Cayuga Poker Society, and beginning in 1992, he published a monthly newsletter that in addition to poker announcements included unusual stories about everything from sports to politics. He was fascinated by stories about probabilities.

After his marriage in 1946, he entered graduate school at the University of Pennsylvania, where he received his M.S. degree in 1948 and his Ph.D. degree in 1949. He then studied at Princeton University with Professor N.H. Furman for one year as a National Research Council Postdoctoral Fellow and another year as a Eugene Higgins Fellow. Up until WWII, almost all of Analytical Chemistry used “gravimetric” and “volumetric” techniques, weighing a precipitate or titrating solution. Furman was a pioneer in the new instrumentation revolution, such as with “potentiometric” titrations, but Don took a far broader view at Cornell. His research exploited the analytical potential of new methods then used almost entirely in industry such as nuclear magnetic resonance, infrared, atomic absorption, and flame spectroscopy, and polarography and gas chromatography. This revolution was so complete by the mid-60s that several other major Chemistry Departments closed their Analytical Chemistry sections.

A QuickTime video, “Conversation with W. Donald Cooke,” in which Don reflects on his youth and later experiences can be viewed at <http://ecommons.library.cornell.edu/handle/1813/3770>.

Don’s extraordinary life experiences only hint at his character. He is remembered for his integrity, his genuine humility, and his ability to understand and respect the viewpoints of others from all walks of life. Not surprisingly, Don had a special gift with people. During the turbulent student unrest in the 1960s and 1970s, he negotiated with student leaders, and despite being on opposite sides, he afforded them the same respect and, indeed, remained in contact with several of them in later years.

After the death of Don’s beloved wife, June, to whom he was married for 60 years, his health faded rapidly. His brother, Edward; two daughters, Catherine and Ann; four sons, W.D. Cooke, Jr., Peter, Christopher and Timothy; and nine grandchildren survive him.

All who knew Don will miss him.

Fred McLafferty, Chairperson; Ben Widom, Charles Wilcox

Barbara Hope Cooper

September 1, 1953 — August 7, 1999

Barbara Hope Cooper, a leader in surface science and the first woman to be appointed a Professor of Physics at Cornell University, died of lung cancer on August 7, 1999 in Ithaca, New York.

Born in Lancaster, Pennsylvania on September 1, 1953, Barbara graduated from Cornell in 1976 with a B.A. degree in Physics and went on to earn a Ph.D. degree in Physics from Caltech in 1982. She remained at Caltech as a Postdoctoral Fellow until 1983, when Cornell's Physics Department recruited her to be an Assistant Professor. She became a full Professor in 1985.

Barbara is best known for innovative experimental studies of the scattering and trapping of low-energy ions at metallic surfaces. She began as a novice in this research field in 1983, with an empty laboratory and relatively little support, but within a few short years she had created one of the leading laboratories. She and her students designed and built a versatile ion scattering apparatus that could operate at ion energies from 10 to 1000 eV. With this apparatus, detailed information about the scattering potentials, energy transfer processes, scattering mechanisms, and the role of surface adsorbates was obtained from measurements and simulation of the energy and angular distribution of alkali and oxygen ions scattered from copper (100) and (110) surfaces.

She obtained particularly important results from scattering processes in which electron transfer occurred when the ion was near the surface. In addition to carrying out the experiments, she launched a parallel program in large-scale trajectory simulation using accurate potentials and systematically incorporating many-body effects. This initiative gradually led to a new understanding of the role of correlation effects in charge transfer processes and to a far deeper appreciation of these inherently complex dynamical phenomena.

More recently, Barbara extended her research program to investigate the manner in which low-energy ion bombardment affects the erosion and growth of metal surfaces and in thin film deposition. She used an *in situ* scanning tunneling microscope to gain atomic-resolution images coupled to real time and *in situ* synchrotron x-ray scattering to gain low-angle diffraction data for the surface structure during ion bombardment. She was able to observe pattern formation during sputtering of a gold surface and then to probe the competition between roughening and smoothing mechanisms during sputtering and annealing.

Throughout her career, Barbara had a keen eye for potential technological opportunities resulting from her research. However, always closest to her heart was a deep devotion to fundamental science. She was a superb research supervisor and successfully guided a dozen students through their Doctorates at Cornell.

Her impact went far beyond her own research group. In recent years, her scientific leadership talent for organizing large, diverse groups was increasingly vital to two of Cornell's multidisciplinary research centers, the Cornell Center for Materials Research (CCMR) and the Cornell High-Energy Synchrotron Source (CHESS). She was also a key leader in an initiative now under way to build a new facility at Cornell's CHESS that will provide a unique, dedicated x-ray facility for materials research.

Barbara's talents were widely recognized in the national and international physics communities. She received a Presidential Young Investigator Award from the National Science Foundation (1985-89), and faculty development awards from IBM and AT&T. She received the American Physical Society's Maria Goeppert-Mayer Award in 1992.

A truly dedicated teacher, she worked to develop more hands-on investigation of fundamental scientific concepts in several introductory physics courses at Cornell. Her eight-year-old daughter, Katie, inspired her to take a special interest in educational outreach programs introducing elementary school students to the wonders of science.

Barbara will be enduringly remembered for her dedication to science, her quiet and effective leadership skills, and her insight and courage to invent and develop new experimental methods. Her untimely death continues to affect all of us who had the great privilege of knowing her.

Douglas Fitchen, Wilson Ho, Neil Ashcroft

L. Leola Cooper

January 11, 1903 — April 23, 1989

L. Leola Cooper, retired professor of household economics and management died April 23, 1989 in Sun City, Arizona. Leola Cooper was born in Watonga, Oklahoma, to J.S. and Ladema Cooper. She grew up in central Oklahoma and was graduated from the Norman, Oklahoma, High School in 1921. She attended the University of Oklahoma, receiving the B.S. degree in home economics in 1924.

Between 1925-28 she taught home economics in high school and began graduate study at the University of Chicago for the masters degree, which she received in 1931. In 1928 she began teaching at the Milwaukee Vocational School, where she remained until she resigned in 1946 to accept a position as assistant professor with the New York State College of Home Economics in the Cooperative Extension Program in the Department of Household Economics and Management at Cornell. Leola was a home-management specialist; her primary interests were in the work centers of the home—the kitchens, the storage areas—the locales of household production frequently neglected by builders and architects.

This was a most timely appointment. The post World War II housing boom for both new and remodeled homes had created a growing demand for help with planning kitchens and/or other work centers in the home. The research on the Cornell Kitchen was well underway and faculty members were involved in time and motion studies of household work. Leola “took the findings to the field.” She was a good teacher, very popular with the county extension home economists because she was particularly skillful at translating the technical language and findings of research into practical suggestions. She did most of her teaching in the counties, leading work shops, running kitchen conferences, and consulting with Extension staff and others on the local scene. Her practical common sense approach to problems at hand, her sense of humor, as well as her wealth of knowledge of the field made her a very popular teacher.

Early in her professional career, Leola Cooper adopted the pattern of studying with the experts. In addition to her University of Chicago M.A. degree, she attended summer sessions and/or did sabbatic study at Columbia University, the University of California at Berkeley, Purdue and Ohio State.

During the fifteen years she was at Cornell she wrote several popularly received extension bulletins and leaflets dealing with household storage and related problems. Several of these were reprinted many times. She developed a

set of slides and other creative teaching tools that were used in teaching kitchen planning long before the general shift to visual aids.

Leola had a sense of color and design that came through in her teaching, her home and her wardrobe. Her enthusiasm for line and color was still evident in the last months of her life. She was fortunate in being able to live among her own things at Camelot Gardens until almost the very end. Those of us who worked with her or did graduate study in household economics and management at Cornell during Leola's tenure have warm memories of her friendliness, generosity and hospitality, especially her "Kentucky Custards" at holiday time. Several Ph.D. candidates were recipients of her thoughtfulness and skill as they received Cornell doctoral hoods which she had made especially for them when they finished their graduate studies.

Responding to the need to care for her aging father, Leola Cooper took early retirement in 1962. Although he passed away before she could finalize her move back to Kentucky, she located on the property of a cousin, living there for nine years and renewing acquaintances with a host of kin folks.

During this time she traveled extensively, often visiting former Cornell University graduate students in far off lands. A colleague remarked on how congenial she was as a traveling companion. In 1971 a chance visit of the pair to Sun City, Arizona resulted in a move to the Southwest where they each purchased a home in the Sun City development. There Leola lived near other Cornell retirees, one of whom had lost her sight. The latter reported to friends here that "Leola Cooper became my eyes."

Leola Cooper was a member of the American Home Economics Association and of Epsilon Sigma Phi, the extension honorary. She is survived by one niece, Wanda Young of Salina, Kansas, several cousins and other relatives plus many friends. A brother, Crawford Cooper, preceded her in death in 1975. She was buried in the family plot in Keval, Kentucky with a grave side memorial service held in late April.

Mildred Dunn, Kathryn Walker, Gwen J. Bymers

Lane Cooper

December 14, 1875 — November 27, 1959

Lane Cooper was born in New Brunswick, New Jersey. His father, Jacob Cooper, was Professor of Greek and later of Philosophy at Rutgers College (now Rutgers University), and one of the most impressive academic figures of his day. The son, after graduating with the A.B. from Rutgers in 1896, studied medicine for a year at the College of Physicians and Surgeons of Columbia University, but he found the subject uncongenial and transferred to the Yale Graduate School for the study of English literature under Albert Stanburrough Cook, taking the M.A. degree in 1898. After teaching for a year at the College of St. James, a preparatory school near Hagerstown, Maryland, he went to Germany, where he studied in Berlin under Alois Brandl and in Leipzig under R. P. Wülker, and took the Ph.D. degree in English philology at Leipzig in 1901. During the next academic year, he studied at the College de France in Paris, following in particular the lectures of Gaston Paris. In later life, he felt that he owed most to the teaching of his father and of Cook; from his German experience he especially retained a sense of gratitude to the geographer Friedrich Ratzel, who had been among his teachers in Leipzig.

Returning to the United States in the spring of 1902, he accepted an instructorship in English at Cornell University under James Morgan Hart. Hart encouraged the younger members of his staff to create courses of their own, and Cooper early arranged a course in Wordsworth that led to his studies of this poet and eventually to the making of the *Concordance to Wordsworth's works* (1911) which won the universal acclaim of scholars. Within a few years he built a whole program of courses and made himself into a sort of one-man institute within the Department of English. Assistant Professor in 1906, he became Professor in 1915 and in 1927 was placed in charge of a department of his own which he called "The Comparative Study of Literature," though he gained his title as Professor of the English Language and Literature and continued chiefly to train graduate students for the teaching of English. He was John Wendell Anderson Professor of English from 1941 to 1943, when he became Professor Emeritus. He taught in the summer sessions of the University of Illinois (1914), Stanford (1918), and the University of California (1919).

In 1921 he received the honorary degree of Litt.D. from Rutgers, and in 1943 the honorary degree of L.H.D. from Wesleyan University (Conn.).

Lane Cooper was above all a great teacher, one of the greatest of his generation in America. Unmarried, he made his students the center of his life, lavishing upon them the resources of a strong personality. A man of imposing

presence and sedate carriage, he made an immediate impression by his fine and glancing eyes, beneath a domed forehead and, in later years, silvered auburn hair, and by a resonant voice that penetrated with an edge of tension. Tension, not to say uneasiness, permeated the atmosphere of his classroom, yet did not dominate it; the student felt free to express his own thoughts, discussion was lively, and in a process that often really was mental collaboration, new horizons opened to the mind—sometimes, as happens, new to the teacher himself. There were limitations, the significant structure stood on unquestioned axioms, and woe to the student who seemed unsure of the goodness of God or of Aristotle. He was adept at bringing students of rather indifferent equipment to a high sense of the value of literature and learning and of a disciplined mind. But chiefly he was on the lookout for superior students, whom he urged forward with missionary zeal to undertake higher studies. Already in 1915, he told President Burton of Smith College, who had offered him a professorship, that he had more graduate students at Cornell than Professor Cook had at Yale.

Holding that the effective teacher must also be a continuously productive scholar, he kept up a stream of publications throughout his career. His concordances—of Wordsworth, Boethius, the poems of Milton—are indispensable tools of scholarship. A scholar may profitably consult his *Aristotelian Theory of Comedy*. Yet his greatest strength lay elsewhere than in the realm of pure historical research. Of his twenty-seven books, some of them gatherings from nearly 200 articles and reviews, a significant portion are related to the courses he taught. Even when compilations, these are infused with original ideas. Such is his *Methods and Aims in the Study of Literature*, which Andrew Dickson White read with enthusiasm. Among the first to see that when American students were failing to gain a knowledge of Latin and Greek, they might yet learn something of classical culture through courses in translation, he devised such a course and produced for it his widely used translation of Aristotle's *Poetics*, and later, translations of Aristotle's *Rhetoric* and of a number of the dialogues of Plato. But nothing preoccupied him more than literary form and style, and he himself possessed a style remarkable for purity of idiom and the stamp of personality. A youthful ambition to be a writer was most clearly realized in his essays and addresses on educational, moral, and literary subjects, represented, for example, in *Two Views of Education* and *Evolution and Repentance*. Especially in matters of education, he was known everywhere as the spokesman of an inspired conservatism in a period of novelty and experiment.

For more than half a century he was a familiar figure on the campus, in the town of Ithaca, and in the country around. No committeeman, he exerted much influence informally, for example, in academic appointments. He was an early and devoted member of the Research Club. He took an active part in the affairs of Phi Beta Kappa and

of his fraternity Delta Phi. A track athlete in his college days, he retained an interest in this sport and delighted to extreme old age in acting as inspector at intercollegiate contests. Above all, he was a man of deep though nonsectarian piety; he regularly attended services in Sage Chapel and enjoyed the society of clergymen.

Affable and kindly, but not familiar, he contrived to be at once companionable and solitary. He loved good conversation, humorous anecdotes, and verbal jokes, and he had a pungent wit; yet he was perhaps too ready to take offense and spoil all with a sharp rejoinder. Apart from his close friendship with Professor J. Q. Adams, his relations with the Department of English were not easy while he was in it. Mistrustful of the University administration in his early days, he determined, he said, to make himself independent; and by prudent care over a long life he gathered a very considerable estate, which as the "Lane Cooper Fund" will give scholarship aid to students of the humanities in various institutions. Students were always his chief concern. Generations of them will remember his nightly appearance at the University Library, clearing his throat and exchanging a word with those he knew; afterwards he might be seen with a small group over coffee in Barnes Hall or Willard Straight, whittling matches into toothpicks and leading a more or less scholarly conversation. After his retirement, he devoted much of his attention to his farms in the Town of Lansing, where he soon found friends, and where he spent many hours driving his car around a countryside that in days gone by had echoed to his gun and that of his friend Adams in the hunting season.

There was a magnetism in his personality. He invested everything he did with an aura of importance; he radiated interest and enhanced the value of life. No one would deny that the words spoken of his father Jacob Cooper by the late President Demarest of Rutgers apply equally to the son: "He was no usual person; whoever knew him would never forget him."

James Hutton, Harry Caplan, J. L. Zwingle

William Cooper

April 23, 1909 — May 19, 1970

It is with deep regret that the New York Hospital reports the death of Dr. William Cooper on May 19, 1970.

Doctor Cooper was born in New York City on April 23, 1909. He was graduated from New York University and received his M.D. degree from Long Island College of Medicine in 1933. He received his orthopaedic training under Dr. Arthur Steindler at the University of Iowa, and was subsequently certified by the American Board of Orthopaedic Surgery in 1941.

He served as a major in the U.S. Army Medical Corps, both in this country and overseas, from 1942 to 1946.

After the war he practiced orthopaedic surgery in New York City, in connection with The Hospital for Special Surgery, and The New York Hospital and Cornell Medical College, where he held the title of clinical professor of surgery (orthopaedics).

He was an excellent teacher and had a special interest in the various problems of patients with cerebral palsy or birth defects. He was largely responsible for the development of special schools and classes for cerebral palsy patients and was for many years the medical director of the Cerebral Palsy Center in Roosevelt, Long Island.

He wrote extensively on cerebral palsy and frequently gave instructional courses or prepared exhibits for National Orthopaedic Society meetings. He was considered one of the leading authorities in the country on this subject, and he was a member of the World Commission for Cerebral Palsy.

He was a member of all of the major medical societies connected with orthopaedic surgery, traumatology, and cerebral palsy, and in New York City he was very active as a consultant to the Bureau of Handicapped Children, The National Foundation, and other rehabilitation services. He was on the medical control board of H.I.P. and an honorary police surgeon for many years.

As a hobby, he collected old orthopaedic records and instruments, and was an enthusiastic supporter of the Rare Book Room at the New York Academy of Medicine.

He was a congenial, cooperative, and enthusiastic member of the staff of this Medical Center and his death leaves a void that will be almost impossible to fill.

The members of the Medical Board of The New York Hospital wish to express their great appreciation of his fine work, and extend their sympathy to his wife, Therese, and his two children, Rebecca and James.

T. Campbell Thompson, M.D.

Joshua Alban Cope

December 31, 1887 — August 26, 1950

Joshua Alban Cope, Professor of Forestry, and one of the nation's leading extension foresters, died Saturday, August 26, 1950. Professor Cope had been a member of the Cornell University Faculty for twenty-six years. His death occurred at "Spruce Top", his Christmas tree farm and summer camp on Blackman's Hill in the Town of Caroline. He was 62 years old. Professor Cope was born on December 31, 1887 at Hatsboro, Pa. Most of boyhood was spent on an island off the Massachusetts coast where he received his early education. After preparing for college at the Westtown School, he entered Haverford College in 1908 and from that institution was graduated with the Bachelor of Science degree in 1912. The same year he entered the Yale School of Forestry and in 1914 was graduated with the degree Master of Forestry.

After completing his forestry training he entered the United States Forest Service and spent two years working with that organization in Montana. In 1916 he returned to the Westtown School, and for two years taught there. In 1918 he entered the service of the Department of Forestry of the State of Maryland as Assistant State Forester, and continued with that organization until the fall of 1924. While at Maryland his primary duties dealt with the organization of a system of forest fire protection, as well as extension and research work on the management of locally important timber types. He gave special attention to the management of loblolly pine, and was the author of a widely used bulletin on this subject. In September 1924, he came to Cornell as an Assistant Professor of Forestry to take charge of the extension work in this field. Since that date he has been continuously with the College of Agriculture carrying on actively and vigorously his work as project leader in forestry extension. He was advanced to a full professorship in 1937.

Professor Cope's knowledge of and interest in forestry were broad, though he was especially interested in all fields of silviculture, wood preservation and maple sirup production. Noteworthy was his work in organizing with the late C. R. Pettis, formerly Superintendent of Lands and Forests of the State Conservation Department, the 4-H reforestation project which over the years has been instrumental in widening interest in forestry in the state. He was within this project responsible for organizing the annual 4-H forestry tour to the Adirondack Mountains, an activity which still continues. In 1947 he pioneered in starting at Spruce Top a 4-H forestry camp, the forerunner of the 4-H Conservation Camp that has for each of the past three years been held at the Arnot Forest. He was a leading authority in the Northeast in the field of maple sirup production and as a result of his studies and extension

work, the production of maple products in this state was increased greatly over the years. During his many years in the extension field he worked with hundreds of farmers in improving woodlands, starting new reforestation projects and in marketing woodland products.

Professor Cope was serious in all his professional responsibilities, taking an active part in local and regional meetings and in participating in matters dealing with state forestry policy. His publications were numerous. Not only did he prepare nine bulletins on various phases of forestry which were published by the College, but he contributed many articles to the Journal of Forestry, American Forests, and numerous farm journals.

Professor Cope was active in Boy Scouting and worked with the scouts in many of their projects. Prior to coming to Ithaca he had been a Scout Master at Baltimore for six years. He was a member of the local Troop 19 Committee from 1928 until 1933 and chairman from 1933 to 1941; also a Deputy Boy Scout Commissioner from 1926 to 1934 and Field Commissioner from 1932 to 1936. He was always prominent in the work of the Society of Friends.

During Professor Cope's residence at Cornell he was granted three sabbatical leaves. The first of these in 1932 was spent in the forests of Scandinavia and Central Europe. The second in 1942 was devoted to a study of the problems of farm forestry in eastern United States under the auspices of the Charles Lathrop Pack Forestry Foundation. As a result of this study he published his well known bulletin "Farm Forestry in Eastern United States" a study of methods used by public and private agencies to interest farmers in the proper management of their woodlands. This excellent publication has had wide distribution and use. His third sabbatical was in 1949. During this period he spent six months in Finland under the auspices of the American Friends Service Committee, working with the foresters of Finland. During the later part of his trip he lectured at Helsinki University. From that institution he was awarded a Certificate of Merit for service to Finnish Forestry, being the first American to receive such an award.

While at Haverford he was elected to Phi Beta Kappa. He was a member of the Society of American Foresters and numerous other professional organizations. Also he was a member of the honorary extension fraternity Epsilon Sigma Pi.

Surviving are his wife Mrs. Edith Cary Cope, two sons, Harold C. Cope of Richmond, Ind. and James B. Cope of Centerville, Ind., and a daughter Mrs. Mary Elizabeth Cope Probasco of Cambridge, Ind.

His special avocational interest was in the growing of Christmas trees on his property in the Caroline Hills. This project he carried on with signal success and his Christmas tree farm was a center for visits from many authorities

and groups of Christmas tree farmers from the Northeast. There was nothing that he enjoyed more than spending his spare time with his trees at Spruce Top. Professor Cope was an extraordinarily able and aggressive forester. Hard working, sincere and enthusiastic, he imparted his knowledge and enthusiasm for forestry to large numbers of farmers throughout the state as well as to great numbers of boys and girls.

C. H. Guise, R. R. Hoff, C. B. Raymond

Morris A. Copeland

August 6, 1895 — May 4, 1989

Morris A. Copeland died on May 4, 1989, in Sarasota, Florida, where he had retired following a long and varied career in government and academia. He was born in Rochester, New York, in 1895; attended Amherst College (A.B., 1917); and received his Ph.D. degree from the University of Chicago (1921). Amherst honored him with its Doctor of Humane Letters degree in 1957. His close attachment to his alma mater was reflected also in the generous endowment he provided for its Copeland Colloquia Program, which supports cross-disciplinary studies.

Morris began his teaching career at Cornell in 1921, serving successively as instructor, assistant professor, and professor, an appointment he held until 1930. During 1927-29, he was on leave, teaching at the Brookings School of Economics and Government and working at the Board of Governors of the Federal Reserve System in Washington. It was during this period that he began an association with the National Bureau of Economic Research that continued until 1959 and resulted in two published works, the latter his path-breaking *A Study in Moneyflows in the United States* (1951).

In 1930, Morris accepted a professorship at the University of Michigan, which he held until 1936. In 1933, he began what proved to be a six-year term as executive secretary of the Central Statistical Board; between 1939 and 1944 he served, successively, as Director of Research at the Bureau of the Budget and Chief of the Munitions Bureau of the War Production Board. For the next five years, he worked on his moneyflows research, now with substantial funding from the Federal Reserve Board. He returned to Cornell in 1949; in 1957—the year he also served as president of the American Economic Association—he was appointed to the Robert Julius Thorne Chair, which he held until his retirement in 1965.

Morris' retirement was short-lived. He accepted posts as visiting professor at the University of Missouri for 1966-67 and at the State University of New York (Albany) for the two following academic years.

Morris' crowning achievement was undoubtedly his work on moneyflows, for which—working largely alone, in his small, book-filled office on the second floor of Goldwin Smith—he completed the manuscript, containing both the conceptual framework and the initial empirical estimates. Together with Simon Kuznets' national income accounts and Wassily Leontief's input-output analysis, it constitutes one essential component of the triad of accounting frameworks by which we comprehend macroeconomic magnitudes and processes. The national income and product accounts cover only transactions involving final goods and services; input-output analysis

adds the intermediate transactions carried out within the production (business) sector. Copeland's flow of funds encompasses both, and adds the purely financial flows—i.e., the transactions involving exchanges of financial instruments. The U.S. Federal Reserve System and countries all over the world assemble these data on a current basis, and use them in their economic forecasting.

That work was, however, only the most important manifestation of Morris Copeland's constant insistence that if economics was ever to validate its claim to be a science, it would have to frame its theoretical propositions in forms capable of empirical verification, and devote at least equal energy to that empirical testing. This, in turn, explained his life-long efforts to develop the relevant statistics, not just in his work on moneyflows but also, among other contexts, in his six years with the Central Statistical Board.

In these views, he was firmly in the institutional tradition, with which he consistently identified himself. He shared with the institutionalists also the conviction that "economic laws" are valid only in specific, historical institutional contexts, which are themselves subject to constant evolution. Not surprisingly, therefore, he published not only in economic journals but also in professional journals of psychology, philosophy, statistics, political science and accounting.

Not surprising, also, these convictions entailed a skepticism of the tendency of main-stream economists to find support in "natural economic laws" and "invisible hands" for a laissez-faire political philosophy. He summed up these broader concerns in his American Economic Association Presidential Address, "Institutionalism and Welfare Economics," where he emphasized "the significant divergences between what is profitable and what is in the public interest" (AER, 1958, p. 12), and championed governmental interventions to bring the two into closer harmony. He strongly supported collective bargaining to compensate for the fact that "the wage system imposes upon its employees the obligation of subservience," (p. 14) despite his recognition that "collective bargaining may leave the interests of an important group of third parties, viz., the consumers, quite inadequately protected" (p. 16). In his view, "when a conflict of interest develops between our free enterprise system and the objective of developing and strengthening our bill of personal rights and liberties, it is the free enterprise system that must yield" (p. 16).

For all his skepticism, however, Morris Copeland also recognized the enormous advantages of *Our Free Enterprise Economy*—the title of the little book he published in 1964. He begins his Presidential Address with an apt summation of his views.

We in the West are proud—and justly proud—of our free enterprise economic system. Nonetheless...

Morris' professional work tells only part of the story. He made a deep impression on generations of students and colleagues. His graduate students, particularly, remember vividly, with both affection and enormous respect, his dogged use of the Socratic method; his persistent challenge of generalizations based on pure deduction; his “prodding examination of the basis on which you thought you knew something to be true”; his rare combination of a thorough grasp of the traditional theory with his own insistent empirical and institutional orientation. One writes:

*I went through Chamberlin's **Theory of Monopolistic Competition** with Chamberlin himself, at Harvard, then with Morris, at Cornell: you wouldn't know it was the same book! The one, a direct exposition, the other enormously illuminating, stimulating and original—but it took me a semester and a half to catch on.*

He slowly worked his way through the great works with questions, questions, questions...And what questions!

They remember also his eminent approachability, his personal and social courtliness while he subjected them to intense intellectual challenge.

Morris Copeland was opinionated, disputatious, some might even say cantankerous. He was also a giant.

Fred Kahn, George Staller, Tom Davis

Frank E. Cormia

April 25, 1905 — August 26, 1968

Dr. Frank E. Cormia, clinical professor of medicine (dermatology) at Cornell University Medical College, died August 26, 1968, at Memorial Hospital, New York. Dr. Cormia was also an attending physician at The New York Hospital where he had been a staff member since 1946.

Dr. Cormia, the son of Frank and Winona Cormia, was born on April 25, 1905, in Milton, Vermont. He grew up in Vermont and happily never recovered from the “indegoddampence” which this upbringing is believed to engender. He received both his B.A. and M.D. from the University of Vermont, the first degree in 1926 and the second in 1930. After he became a full professor at Cornell University Medical College, he would break into uproarious laughter when he revealed that he had been told at Vermont that he was not a good enough student to become a physician, but he would have a chance to try.

From 1931 to 1934 he trained in dermatology at the University of Pennsylvania under Dr. John Stokes. He attributed to Stokes much of his conviction that there is no excuse for sloth or sloppiness in dermatology. From 1935 to 1941 he was assistant, then associate in medicine (dermatology) at the Royal Victoria Hospital, and instructor, later associate professor of medicine (dermatology) at McGill University Medical School. He made many friends in Canada and continued to attend the meetings of the Canadian Dermatological Society where he gave an after dinner speech on dermatological writing that was later published as a paper in *Cutis*.

Service in World War II from 1942 to 1945 with the United States Army Medical Service took him to England where he again made many lasting friendships.

In 1946 Dr. Cormia came to the Cornell University Medical College and worked with Dr. George Lewis. He was instructor in 1946, assistant professor in 1947, associate professor in 1956, and in 1965 became clinical professor of medicine (dermatology). He held corresponding staff appointments at The New York Hospital. He was always an enthusiastic and critical teacher, quick and direct in his comments. In his own words, he did not suggest that a student or resident might be in error; he simply “corrected him.”

Frank Cormia would have enjoyed being a full-time faculty member, but such positions were not then common in dermatology. For a man who made his living in private practice, his research and publication were especially commendable. His first paper in the *Archives of Dermatology* in 1933 was entitled Urinary protease; allergic

dermatoses and eczema–hay fever complex.” Thereafter, he published at least one paper every year except 1943 and 1966. Three or four papers a year was the general pattern, with a total of between eighty-five and ninety. His last paper, as yet unpublished, describes the skin changes associated with the onset of his own malignant disease and their regression as the primary lesion was treated. His interests were broad and changing. Many of his earlier papers were on syphilis and reactions to arsenicals. Then came a series on penicillin reactions. He wrote several papers on the psychosomatic aspects of dermatology, and in his teaching delighted to show students how an attack of urticaria could be induced in some patients by raising psychologically loaded questions. He studied pruritus for several years, using histamine and then proteolytic enzymes. He had a long-standing interest in alopecia and made several contributions in this area. His last big interest was prophetic of his own prostate cancer—the skin manifestations of internal cancer, and immunological aspects of host resistance to malignancy.

Many of the dermatological societies honored Frank with positions of responsibility. He was secretary and president of the Dermatology Section of the New York Academy of Medicine, president of the New York Dermatological Society, and a member of the Board of Directors of the Academy of Dermatology. He was a member of the American Dermatologic Association, Atlantic Dermatological Society, Canadian Branch of British Dermatological Association, Canadian Dermatological Society, Society for Investigative Dermatology, the New York County Medical Society, and the American Medical Association.

What we all will miss most, however, is the enthusiastic man with his enormous zest for life. In his early sixties he was skiing, climbing mountains, and backing down places to hear good jazz. He faced life with exuberance and continued fascination. Who can forget the way his face would suddenly grow height and pixieish as a prelude to an Olympian eruption of loud laughter that would go booming through the room and down the corridors?

He was a man without an act, a facade; the real man was right there with simple, total honesty and absolute integrity. Frank was always very positive; when he was right he was very right, and when wrong, he was the first to admit it and see the humor of it

During his final illness his virtues did not leave him. He could say that he hoped to fool the experts but didn’t suppose he would,” then break into an impish and radiant smile. On his last day, when he realized that he had asked for something that he had already received, he groaned, “Take me out and shoot me,” as if even then he had no patience for any brain that wasn’t working hard and doing its best. The loud laughter was gone, but even in his last few days he had a radiant smile for his friends.

We have lost a warm-hearted and colorful friend; an enemy to the phony; a hard worker for excellence in dermatology. We extend our sympathies to his relatives and hope they appreciate how much we feel dermatology has lost.

Farrington Daniels, Jr., M.D.

Ezra Cornell

Founder of The University And President of The Board of Trustees From Its Founding in 1863 Until His Death

— *December 9, 1874*

On the occasion of the death of Ezra Cornell the Faculty wishes to place upon record this expression of its feelings with regard to the Founder of the University.

Under quiet, undemonstrative manners and entire freedom from obtrusiveness he possessed a will of unusual strength and a character of great earnestness, unselfishness and purity. With little education besides that which he derived from observation and intercourse with men, he accomplished with sagacity, breadth, and boldness a great amount of varied and useful work. Usefulness, indeed, and the power of doing good to society seemed to be the criterion by which he directed his efforts. In the improvement of the agriculture of the State through successful experiments in farming, and by the introduction of better breeds of cattle, and the manufacture of improved farming implements; in his development of telegraphic communication over the country; in his extensive railroad enterprises to build up the place of his residence; in the formation of the Cornell Library and the gift of ample resources for its support, and above all in the establishment of this University do we see him from his beginnings in poverty and hard work, through wealth and more difficult labors always identified with the progress of society.

This institution proves his deep interest especially in the working classes, and his conviction that their elevation and happiness as well as the prosperity of the community are based on intellectual improvement. His sympathies with the poor nerved his efforts to educate manual labor, and lie at the foundation of one of the greatest gifts for purposes of education ever made by any man in his life time. Under the severest trials of heart and brain and nerve, he was supported by the determination to help the world.

We know that he has succeeded, we recognize the nobility of his aspirations and the wisdom of his plans, and trust that his good influence may never cease. We cannot but believe that though his physical life has ended, and his form has departed from among us, his love of his kind, his unselfishness and devotion to the general good will long live in blessings through centuries to come.

Walter Rodney Cornell

July 19, 1882 — May 27, 1950

Walter Rodney Cornell died at his home on Saturday, May 27, 1950, after forty-one years as a member of the Faculty of Cornell University. He had taught his last classes for the term and was to be retired June 30.

Born July 19, 1882, in Vineland, New Jersey, Professor Cornell attended Rutgers College, receiving the B. Sc. degree in 1907. He then went to Michigan State College where he was appointed to an instructorship in Civil Engineering. He joined the staff at Cornell in 1909 as an instructor in mechanics under the famous Professor I. P. Church in the College of Civil Engineering. He received his degree in Civil Engineering in 1915.

When a separate department of mechanics was created in Sibley College of Engineering in 1910, Professor Cornell was made an instructor there. He was promoted to the rank of assistant professor in 1920, and became Professor in 1926. Upon the resignation of Professor F. G. Switzer in 1940, Professor Cornell became the senior professor in the department, a position he held until his death. For the past thirteen years he had been secretary of the Executive Committee of the Engineering Division of the Graduate Faculty. Much of his time was devoted to the improvement of the standards of graduate work through his position on this committee. Only recently, as secretary of the group, he prepared a report recommending standardization of degree requirements.

Professor Cornell was very active in the religious life of Ithaca. He was a member of the First Methodist Church which he served in various capacities over a period of thirty years. He was a member of the Board of Trustees, editor of the Church Helper, Lay Leader, Communion Steward, Recording Secretary of the Quarterly Conference, and served on many important committees. At the time of his death the church committees for the ensuing year had been announced and Professor Cornell's name appeared on so many committees that his friends marveled at his industry. He was the Methodist representative on the Board of Directors of the Cornell United Religious Work and was treasurer of the Board.

Perhaps his greatest interest in the work of the church centered upon the activities of the young people. For over twenty-five years he was the leader of the Friday Night Class, a group of students of Cornell University and Ithaca College which met each Friday night during the school year. This class had been organized by his father-in-law, Mr. J. Will Tree. At times the membership of this group reached 150. Professor and Mrs. Cornell opened their home to this group. Generations of former students returning to Ithaca have called to pay their respects to Professor and Mrs. Cornell for the inspiration and hospitality offered by this gracious couple.

Although Professor Cornell was unusually active as a faculty member and in his church, it was in the role of teacher and student advisor that he probably has left the greatest imprint. In his position of senior professor, with a strong background of Cornell tradition, he gave unstintingly of his time and energy to help all who sought him out for counsel. Successive department heads looked to him for guidance and leaned upon his advice. He provided that fine line of continuity and inspiration which contributed so much to the development of his School to its present position in the field. Fortunately for those who continue his work, his inspiration is not mortal.

G. E. Grantham, D. F. Gunder G. J. Tarboux

John Farnsworth Cornman

January 22, 1913 — January 6, 1998

John Farnsworth Cornman, Professor Emeritus of Ornamental Horticulture at Cornell University, died Tuesday, January 6, 1998, at the age of 84 in Ithaca, New York. He retired in 1973 after a 37-year affiliation with the College of Agriculture and Life Sciences. His spouse, Frances Davis, died on June 6, 1998. John and Frances are survived by their sons and daughters-in-law: David and Nancy Cornman of Pittsford, New York; Peter and Geraldine Cornman of Bonita Springs, Florida; and Stephen and Deborah Cornman of St. Augustine, Florida; two grandchildren; and two great-grandchildren.

John was born January 22, 1913, in Shelby, Ohio, and attended elementary school in Ohio and New York. John and Frances both grew up in Valois, New York on the shores of Seneca Lake. *The Watkins Review and Express*, reporting John's death, noted that he had been raised "in the big white house on the corner of Route 414 and Lake Street in Valois." Residents still refer to it as "the Cornman house". John designed a garden on the property for his parents during his college years. John and Frances both graduated from Watkins Glen High School and from Cornell University. John received his Ph.D. degree from Cornell in 1947. His doctoral thesis was considered a major contribution to the taxonomy of the genus *Juniperus*.

Before and during his college days, he worked as a landscape foreman, an estate head gardener, a horticulturist with the United States Golf Association Green Section, and an instructor at Cornell University.

He served with the United States Naval Air Training Command, United States Bureau of Aeronautics, as an Agronomist. He returned to Cornell in January 1946 as an Instructor in Ornamental Horticulture, and was promoted to Assistant Professor in April 1947, Associate Professor in July 1950, and Professor in July 1957. In the early years of his career, his major effort was directed toward teaching, research and extension in woody ornamentals and other plant materials. During the latter part, his responsibilities were in turfgrass management and, there were times in between when he covered all of these areas, which spoke well of his dedication to the university. Characteristically, John did it all without fanfare!

Perhaps Professor Cornman's principal interest was in turfgrass management and he was instrumental in developing this newly emerging field at Cornell. Teaching, research, and extension activities in turfgrass management were started under his direction in 1940. Initially shared with instruction in woody plant materials, these efforts became a full-time responsibility in 1961. Some of his many contributions included: assisting in the formation of

the New York State Turfgrass Association; the planning and development of twenty-six annual Cornell Turfgrass Conferences; the preparation, publication and the editing of the monthly *New York State Turfgrass Bulletin*; undergraduate and graduate instruction in the principles of turfgrass management; the establishment of turfgrass research and extension demonstration plots at Cornell and in Nassau County, Long Island; and the preparation of the annual *Cornell Recommendations for Turfgrass Pest Control and Cultural Management*; as well as numerous other articles and extension publications on turfgrass culture and maintenance.

Cornell Extension Bulletin 922, *Home Lawns*, authored by Professor Cornman, was for many years requested in greater numbers than any other Cornell extension publication. *Picture Clues for Turfgrass Problems*, also a Cornell extension publication, was one of the first field guides for diagnosing turfgrass problems. His special research interests were the selective control of turfgrass weeds, especially crabgrass and *Veronica filiformis*, thatch control in turfgrass, and new cultivar evaluation for New York State conditions. These continuing activities have provided the turfgrass professional and the consumer alike with pertinent and reliable information that has contributed significantly to improved culture and maintenance of turfgrass in New York State.

Professor Cornman was a familiar figure to extension field staff and audiences through the years as he traveled the meeting circuit and in other ways served as a resource person in home lawn, golf course and athletic field management, and in commercial sodgrass production. His quick wit and intolerance of the unnecessary was greatly appreciated by all.

Teaching of undergraduates and graduate students and of extension audiences was John's forte. He was a well-recognized authority in both plant materials and turfgrass science and had solid experience working in these fields. He brought his knowledge and experience to bear in his instruction in a most effective way. His lectures were beautifully illustrated with slides as well as with specimen materials, and were generously spiced with his bright and colorful humor.

He was a master of wit and understatement whether in the lecture room or the coffee room. His colleagues eagerly anticipated his succinct assessments of the most recent faculty meeting, committee session or local or national news development. John was convinced that meetings were the work of the devil!! His astuteness and insight enabled him to cut through to the heart of matters, to analyze the situation and to come to his conclusion on the necessary course of action long before others had finished debating the issue. He often left meetings early with a witty quip to the effect that "we beat this issue to death an hour ago!"

John took to the field with his courses. His excursions to the Rochester, New York and Washington, D.C. parks, gardens and even cemeteries, to introduce students to the rare as well as common plants and to show them an especially ancient or special specimen were great adventures as well as effective learning opportunities. His wit and humor again made these especially enjoyable events.

A major interest of John's was the development of the Cornell Plantations, the arboretum, botanical garden and natural preserves of the university. As a plant materials specialist, John saw the development of the university's living plant collections as essential for his as well as for other plant science courses and outreach programs. He served as Director of Cornell Plantations from 1947-52 at a time when the unit was a loosely organized patchwork of university lands and limited plant collections assigned for administration to the Department of Floriculture and Ornamental Horticulture. John had a permanent staff of one, Raymond Patno, his superintendent of operations. John and Ray, working with a few temporary staff, made considerable progress in forging Plantations into a more organized and functional unit. John served as Director in addition to his otherwise full-time responsibilities.

John Cornman was a member of the American Society of Agronomy, Weed Science Society of America, International Turfgrass Society, and the honorary societies Phi Kappa Phi and Sigma Xi. He was honored in 1979 by the New York State Turfgrass Association with the Citation of Merit for "dedication and for his 33 years of service to Cornell University and the turfgrass industry in New York State."

Professor John Cornman is remembered by alumni for his fierce independence, his stinging yet refreshing wit, and his concern for the quality of undergraduate instruction. Turfgrass professionals still remember and admire John for his no-nonsense, to-the-point approach to turfgrass technology. His insistence that all recommendations be based on sound science and research brought him great industry respect. John was proud of Cornell and frequently spoke of "the Hill" when discussing the university.

John Cornman will be remembered as a pioneer turfgrass scientist and teacher, a faculty member who truly appreciated and served well his students, and a friend whose wit and wisdom helped us all keep our perspective.

George L. Good, A. Martin Petrovic, Carl F. Gortzig

Hiram Corson

— *June 15, 1911*

(Retired: 1902)

The Trustees of Cornell University desire to record their appreciation of the services of the late Professor Hiram Corson, to the University and their regard for his personal character and influence.

When Professor Corson came to the University in 1870, only two years had elapsed since its opening. Although provision had been made from the beginning for the teaching of the ancient and modern languages and English literature, the public regarded the new institution largely as a scientific and technical school. It was of the utmost benefit to the University that so early in its career a scholar of the established literary reputation of Hiram Corson should have given to it his loyal and unselfish services, — services that extended through a period of activity of thirty-three years, and of eight years of scholarly retirement. During this time Professor Corson displayed an extraordinary range of intellectual ability, teaching the philological elements of the Anglo-Saxon and English languages, the formal side of rhetoric, the history of the literature and the literature itself.

Gifted with a voice of wonderful sweetness and power, and with a dramatic instinct of the highest order, he was one of the greatest public readers ever heard in this country. Through this marvelous power of vocal expression he made literature interpret itself and convey its message to the heart and mind.

The influence of his unique personality was equally deep with that of his teaching. In an age whose material interests were increasing with alarming rapidity he stood as a representative of a higher order of things, — things unseen and immaterial, the spiritual elements in the nature of man. It was his mission to interpret these elements in literature and to awaken a response in his hearers.

Source: Resolutions passed by the Board of Trustees of Cornell University, June 21, 1911. (From Minutes of Board of Trustees, p. 342)

Pol N. Coryllos

November 2, 1880 — July 26, 1938

On July 26, 1938, a cerebral hemorrhage closed the career of Pol N. Coryllos, since 1923 a professor of Clinical Surgery in the Cornell University Medical College.

Dr. Coryllos was born in Patras, Greece, on November 2, 1880. His college and medical education was obtained at Athens, where he received a medical degree in 1900. In the same year he went to Paris, became a French citizen, obtained a bachelor's, a master's and a doctor of Philosophy degree from the Sorbonne, and a second degree of M.D. from the University of Paris in 1914. During this time he served as an instructor in Anatomy from 1902-1910, an instructor in Pathology from 1909-1911, and an assistant in Gynecology under Dr. Jean Louis Faure from 1910-1912.

In 1912, during the Balkan war, he went to Greece as a volunteer. He was commissioned captain in the medical service of the Greek army, and was appointed director of an ambulance unit of 75 beds. He organized this ambulance unit as a mobile hospital, thus bringing surgery to the wounded, which was contrary to the principle of that time of transporting the wounded to the surgeon. This hospital was the precursor of the underground advance posts that were used during the World War. He was thus able to treat abdominal, thoracic, and head wounds within a comparatively short time after injury. His experiences were published in a number of articles and in book form in Paris in 1914 under the title *Preventive Trepanation in Bullet Wounds of the Skull*. For this he was awarded the gold medal of the Academy of Paris.

At the end of the Balkan War he resumed his hospital position in Paris. In 1914 he was a lieutenant in the French army, serving from August 1914 to December 1916 at Dieppe, Bar-le-duc, and Verdun. In December 1916 he was sent by the French Government as a member of a special mission to Russia to organize the surgical service at the Russo-Rumanian front. He was given the medical direction of the section of Padureni and organized the combined Russian and Rumanian hospitals at the front. In March 1918 he was recalled to France, was promoted to the rank of major, and served at Chateau-Thierry until the Armistice. Immediately after the Armistice, at the request of the Greek Government he was sent to Greece on a special mission to organize the surgical service in the Greek army. He was appointed a professor of surgery in the medical college of the University of Athens and surgeon-general of the army. During this time he devoted himself principally to the study of wounds of the chest, for which he had organized a special surgical center. As evidence of the appreciation of his services during these

years he could wear, although he never did, seven decorations from the country of his nativity, one from Serbia, one from Montenegro, three from Rumania, four from Russia, and three from France, a total of nineteen.

The question naturally arises, why did Dr. Coryllos, occupying such high positions in his native country, leave Greece and come to America. It was the same reason which has directed so many to our shores since the very beginning—politics. Dr. Coryllos was by birth, training, and personal conviction a believer in the principles of democracy, and so became a friend and supporter of Venizelos, the leader of the antiroyalist or republican party of Greece. In 1922 this party suffered an eclipse and Dr. Coryllos had to follow his leader into exile, not a permanent exile, for he was repeatedly besought by his countrymen to return and was decorated by the Greek Government as late as 1936.

Such was the remarkable career of a remarkable man. In a way it was a handicap, for unless one knew the intensity of his training, the breadth of his experience, his linguistic accomplishments, and his unparalleled memory for literature and clinical cases, it was impossible to believe that one mind could encompass so much, and this of course led to mental question and reservation concerning him. His incomplete mastery of spoken English made it difficult to follow him, thereby increasing the listener's difficulty in evaluating the man. But to those who knew him well enough to gain an insight into his vast and varied experience, who knew the background and ideals of the man, he stood revealed as an example of the highest type of Old World gentleman. If hard work is the essence of genius, then Dr. Coryllos was a genius, for there could not be a more energetic and indefatigable worker. Interested in all phases of medicine, he was especially enthusiastic in his chosen field of Thoracic Surgery, an interest which, as we have noted, began in Athens. During his connection with Cornell he did a great amount of research in this field. Time alone can be the ultimate judge of the value of any such work. It can be said now, at any rate, that his work stimulated many others to an interest in the problem. His work was honestly, thoroughly, painstakingly performed.

We can share with his native country a sincere regret that one of the best sons of the land which has produced so many men of note for so many centuries should be taken at the comparatively early age of 57. We can extend to his widow and daughter our profound sympathy. This much only can we do. We can never replace him.

Walter Wendell Cotner

February 27, 1896 — June 10, 1970

Walter Wendell Cotner, professor emeritus of electrical engineering, was born in Lima, Ohio, on February 27, 1896, the son of Jacob B. and Carrie H. Cotner. Upon obtaining his B.S. in E. E. degree at Ohio Northern in 1925, he came to Cornell as an instructor in electrical engineering, and continued his formal study, receiving the E. E. degree in 1928, and the M.E.E. degree in 1932. Remaining at Cornell, he became assistant professor in 1939, advanced to professor and, upon his retirement in 1964, to professor emeritus.

Throughout his career, even before coming to Cornell, teaching was his dominant interest. He gave of his time and talent with full devotion to the student's needs both for instruction and for counsel. He served as adviser to the student branch of the American Institute of Electrical Engineers (now the Institute of Electrical and Electronics Engineers) and to several classes of undergraduate students in the field of electrical engineering.

With a professional competence extending well beyond the "academic," Professor Cotner maintained a life-long interest in the broader aspects of engineering, and was active in the engineering profession beyond the limits of the campus. His summers and sabbatic leaves were devoted to varied research, design, and consulting experiences in industry. These experiences were rewarded by patents issued to him, and by the enhancement of his teaching effectiveness, both in the laboratory and in the classroom.

His academic role at Cornell included responsibility for teaching junior-year circuit theory, electrical machinery, basic electronics, and industrial electronics. During World War II, in addition to his on-campus duties, he taught extramural courses in electronics to industrial groups in Ithaca, Elmira, Binghamton, and Sidney. During a sabbatic leave, his work for the Westinghouse Electric and Manufacturing Corporation on electronic motor controls resulted in two patents. His summer activities included employment as a senior field engineer for the New York State Power Authority and involved rehabilitation of two 80-mile-long, 110-kilovolt transmission lines. He made studies of transmission circuits for the New York Telephone Company.

He served as secretary, and as chairman of the Ithaca Section of the American Institute of Electrical Engineers, and as commander of the local flotilla of the U. S. Coast Guard Auxiliary. His affiliations included the Ithaca Power Squadron, Acacia Fraternity, Phi Mu Delta Fraternity, and the Masonic Blue Lodge, Chapter, and Council.

Prior to his service in the Signal Corps of the United States Army in 1918-19, Professor Cotner was a teacher and principal in the Allen County, Ohio, public school system. This teaching experience, combined with his subsequent studies at Ohio Northern and at Cornell, led him to establish a firm philosophy that held undergraduate teaching and advising to be of highest importance. His research and industrial activities were carefully chosen to advance his effectiveness on campus.

The possessor of a ready wit, Curly, as he was affectionately called by his colleagues, was always prepared with an amusing story or a wry comment on the foibles of contemporary civilization. Proud to be an American, he kept himself well informed on civic matters and participated actively in them. Aldermen, mayors, state and federal officials were among the recipients of his many suggestions and comments.

A keen interest in the progressing state of the art in manufacturing prompted Professor Cotner to obtain and restore to their original condition many examples of the manufacturer's best products down through the years. His collection of radio receivers dating back some fifty years, all in their original cabinets, perfectly restored and in perfect operating condition, is but one example of his interest in man's material advancement.

He was married August 17, 1935, to Coral E. Jack, who survives him, together with a son, Calvin B. Cotner, and a daughter, Jacqueline M. Cotner. He is survived also by five younger brothers, Wilbur C. Cotner of Van Wert, Ohio; Herbert Cotner of Wapakoneta, Ohio; James M. Cotner of Lima, Ohio; Milo Cotner of Birmingham, Michigan; and Bernard W. Cotner of Lima, Ohio; and a sister, Mrs. Cecil Ramga of Canton, Ohio.

Robert E. Osborn, Howard G. Smith, Everett M. Strong

Casper Lehman Cottrell

May 13, 1895 — February 26, 1968

Casper Lehman Cottrell, Professor of Electrical Engineering, Emeritus, was born in Annville, Pennsylvania, on May 13, 1895.

His formal education resulted in the award of an A.B. degree from George Washington University in 1920 and his Ph.D. from Cornell in 1928. Subsequent formal studies were pursued under postdoctoral fellowships at Columbia University and the University of Pennsylvania.

Professor Cottrell's practical experience began before the receipt of his baccalaureate degree. Between 1915 and 1918 he was a laboratory assistant in the photometry and radio fields at the National Bureau of Standards, and between 1918 and 1920 he was in the radio laboratory of the United States Signal Corps. Additional experience was gained in the physics laboratory of the Westinghouse Electric Company, in color research for the Munsell Color Company, and in biophysics research for Cornell.

Beginning as an instructor in physics at Cornell in 1920, Professor Cottrell decided to devote his professional life to the educational field where he remained until his retirement in 1963. After a year as an Assistant Professor of Physics at the University of Maryland, he accepted a similar appointment at Kenyon College in 1928, where he remained until 1934 when a health problem took him to Arizona for the next two years. Returning East, Professor Cottrell accepted an appointment for a year as Professor of Physics at Center College before coming back to Cornell in 1937 to conduct biophysics research.

In 1941 he was attracted to the College of Engineering, first in the Department of Mechanics, then, the following year, in the School of Electrical Engineering where he was promoted to Associate Professor in 1946 and to Professor in 1952, until retirement as Professor Emeritus in 1963.

Although Professor Cottrell's consulting and research were primarily related to the biological effects of light, his list of publications includes the intriguing titles of "Fertility Study of Eggs by Radio Conductivity," and "Bioelectric Potentials in Hens' Eggs." His researches in the fields of optics, color, and vision have been widely hailed as major contributions to progress in illuminating engineering and his work in this field was recognized on a number of occasions by the Illuminating Engineering Society. During his sabbatic leave in 1950-51, under a research grant

from the Illuminating Engineering Research Institute, he developed the now famous Cottrell Visibility Meter for measuring contrast-brightness threshold.

Honorary and professional associations to which he belonged include: Illuminating Engineering Society (Fellow); American Association for the Advancement of Science (Fellow); American Association of Physics Teachers; Sigma Xi; American Society for Engineering Education; Gamma Alpha; Sigma Phi Epsilon; Institute of Electrical and Electronic Engineers; Optical Society of America; Eta Kappa Nu; Tau Beta Pi. He was secretary treasurer of the central New York section of the Illuminating Engineering Society in 1950-51 and its chairman in 1951-52.

Although well known for his consulting and research, Professor Cottrell is best remembered by his former colleagues and students as a dedicated teacher and adviser. In both functions he was willing to spend many hours with students who found their course material too difficult to grasp or who found themselves in need of serious counsel on matters both academic and nonacademic. He could see through falseness, however, and was quick to point out the error in the student's approach, whether it be in an academic or nonacademic matter. He was an active participant in social affairs that involved students or alumni, and his presence at these affairs was earnestly sought.

He is survived by his widow, the former Pernetta Erneste Goodman; two daughters, Mrs. Pernetta Marie Deemer and Mrs. Anne Louise Cuff; a son Thomas Henry Ernest Cottrell; eight grandchildren; and a half-brother, Earl Young of Reading, Pennsylvania.

Paul D. Ankrum, Everett M. Strong, William H. Erickson

John Courtney

March 20, 1880 — January 27, 1957

The death of John Courtney on January 27, 1957 brought to a close a long career of service to Cornell University. Professor Courtney had retired from teaching in June of 1952 but had carried on actively with his important work as Secretary-Treasurer of the Cornell Society of Hotelmen.

Professor Courtney was born in Illinois on March 20, 1880. He joined the Army as soon as he could persuade the recruiting sergeant that he was of age. He had risen to the rank of captain in the artillery at the close of the first world war when he returned to civilian life. He joined, in September 1922, the very first group of students of the newly organized Department of Hotel Administration, and by virtue of transferred credits was graduated with the first class in June of 1925.

After tours of duty in accounting for the firm of Horwath and Horwath and at such hotels as the first Waldorf-Astoria and the Lincoln, he was called back to Cornell to assist in the development of the specialized accounting program of the Department of Hotel Administration. During his career the offerings of the Department expanded from a single course to a list at his retirement in 1952 of nineteen courses, enough to warrant the official approval of the program as satisfying the academic requirements for the Certificate in Public Accounting by the New York State Education Department. Others participated in this expansion, but much of the work of organization was that of John Courtney.

As a classroom teacher Professor Courtney was unexcelled. A clear thinker, his expositions were models of lucidity. An amiable person, he was patience itself with the struggling student, but he was doggedly persistent in holding the potentially indolent to his task.

In research in hotel accounting Professor Courtney was a pioneer. His early studies of hotel operating ratios became models for later researchers. Among his contributions were *Normal Hotel Operation*, *Basic Accounting Principles*, *The Flexible Budget*, and *The Small Hotel Problem*.

Fully as important to the Department (later the School) of Hotel Administration as his teaching and research, was Professor Courtney's service as Secretary-Treasurer of the Cornell Society of Hotelmen. As a member of the first class Courtney was one of the organizers of that society. As life-long Secretary-Treasurer he was its continuing

mentor. To him must go a very considerable share of credit for developing the organization into one of the strongest of school alumni groups at Cornell or elsewhere.

Fundamentally a friendly person, Professor Courtney was active in all aspects of community life, a Rotarian, a thirty-third degree Mason.

His civic friends, his fellow alumni, his faculty colleagues join Mrs. Courtney and their daughter, Mrs. Genevieve Courtney Bushey, in regret at the passing of a beloved colleague.

Robert A. Beck, H. B. Meek, Frank Randolph

J Milton Cowan

February 22, 1907 — December 20, 1993

J Milton Cowan died in Holyoke, Massachusetts from complications following emergency hip-replacement surgery.

He was born in Salt Lake City, Utah. At his birth, his parents, hesitating between the first names James and John, decided to give him neither but to leave the choice for him to make later. In due time he rejected both alternatives; instead, when asked to give his full name, he would regularly cite it as “J, no period, Milton Cowan,” In the years that followed he acquired also a whole string of nicknames, different ones among different circles of friends. To the three of us preparing this memorial he was “Milt” and we shall call him that here.

Milt’s initial education was in his native city’s public schools. Then he proceeded to the University of Utah, where he distinguished himself both as a scholar and as a track-and-field athlete. The former pointed toward his career, but the latter also presaged later activities: he became, in the 1960s, one of the pioneers in scuba diving, and was still going on dives in his eighties. And on July 6, 1992, at age 85, he participated in a competitive 3.1-mile walk, jogging the last mile, and was named Athlete of the Week by radio station WHCU.

Milt’s college career was interrupted so that he could fulfil the duty required of all young Mormon men, to serve a period as a missionary. For this he spent 30 months in Germany in 1928-30, in the process achieving a solid command of German. He was also able to attend some lectures at the University of Leipzig.

Back in Utah, he earned a B.A. degree in 1931 and an M.A. degree in 1932. After a year (1932-33) in the University of California graduate school, he moved to the University of Iowa, where he spent the next decade. It was there that he met, courted, and in 1934 married Theodora (“Ted”) Mary Ronayne, originally of Austin, Texas. His work at the University, as student and as teacher, was in three departments, Psychology, Speech, and German. It was in the first of these that he obtained, in 1935, his Ph.D. degree; the focus of his research was on experimental phonetics, with a thesis on “Pitch, intensity, and rhythmic movements in American dramatic speech.” In 1938, he was elected to Sigma XI. Starting some time before that, and until 1942, he was teaching, eventually in the Department of German; unfortunately, the available record of his appointments and promotions is not entirely clear.

In 1937, Milt joined the Linguistic Society of America. In 1941, he became its secretary-treasurer, a post he held through 1950; in 1966, he was the Society’s president. In 1941, he was chairman of the experimental phonetics section of the Modern Language Association; in 1941-42, a member of the Advisory Board to the journal, *American Speech*; and for many years a fellow of the Acoustical Society of America.

In April of 1942, Milt left Iowa to join the staff of the American Council of Learned Societies (ACLS), at that time still in Washington, DC, whence he came to Cornell in 1946 as Professor of Linguistics and Director of the newly established Division of Modern Languages. After his retirement in 1972, he remained in Ithaca, establishing and running a publishing firm, Spoken Language Services.

Milt's coming to Cornell was a direct consequence of his work at the ACLS. Since the mid-1930s, that organization's secretary, F. Mortimer Graves, had recognized that the United States was in sore need of persons with competence in "strategic languages," including many not taught at any college in the country. Even before war broke out in 1939, the ACLS had begun to sponsor a series of pilot courses in some of these languages in its Intensive Language Program. These courses were built on a triad of fundamental principles: (1) the primacy of speech over writing, which means the learner must hear, imitate, and understand native (or near-native) speakers of the target language; (2) intensive concentration—as many hours per day as possible; and (3) guidance by someone trained in linguistic analysis, in order to focus on the real differences between the learner's native language and that being acquired and to avoid the multitudinous time-wasting traps that arise from popular misconceptions about the nature of language. The partly independent work begun somewhat later at "165 Broadway/' as it was familiarly referred to (officially the Language Section, Education Branch, Information and Education Division, Army Service Forces, located in New York City at that address) under Milt's close friend and colleague Henry L. ("Haxie") Smith Jr., was based on the same premisses.

Milt's role in the ACLS was as peripatetic overseer of this enterprise, initially small but very shortly expanded by the military authorities into the large-scale Army Specialized Training Program, involving thousands of soldier-students and many universities. Wherever all three of the principles were followed, these courses were eminently successful.

One of the successful operations was at Cornell, where, in 1944-45, there were Army Specialized Training Program groups in Russian and Italian. Their supervisor was the then Dean of Arts and Sciences, Cornell's Willem ("Dick") De Kiewiet, who had earlier been a colleague of Milt's at Iowa. Impressed by the success of the Army's program, De Kiewiet took advantage of several impending faculty retirements and other campus changes to persuade the Arts College to institute a radical revision of foreign-language teaching, involving an adaptation of the principles of the Intensive Language Program to civilian conditions. Milt came as Director of the newly established Division, and was joined by a number of young linguists experienced in the languages to be taught.

The story of Milt's career at Cornell is the story of the Division of Modern Languages, because upon his retirement the remaining members of the Division took the initiative in changing its official status and its name: with the approval of the College it became, in 1972, the Department of Modern Languages and Linguistics. The details of that story belong elsewhere, but it must be recorded here that under Milt's leadership there took place at Cornell some of the most efficient and effective foreign-language learning ever seen as part of a regular college curriculum (that is, as over against special intensive programs that leave little or no time for anything else). The bulk of this activity was, to be sure, in the handful of Western European languages traditional in American universities. But almost as much effort went to Russian and Chinese, and a good deal even farther afield: in fact, at one time or another instruction was offered in a total of thirty-four different languages.

This effectiveness and diversity led also to many productive collaborations with other organizations. On campus, these were especially with the Literature departments, Far Eastern Studies, and Anthropology. Off campus, there were joint programs with, once again, the ACLS (including the preparation of a series of introductory courses in English for speakers of other languages); with the Language Training Section of the Foreign Service Institute of the Department of State, to which Haxie Smith had moved after the War; and with Standard Oil of Venezuela, Aramco (Arabian-American Oil Company), various National Defense Education Act Institutes, the Ford Foundation, and the Rockefeller Foundation. Various members of the Division, including Milt himself, were from time to time seconded to diverse parts of the world in connection with these cooperative enterprises; in his nonadministrative role in this, Milt became an Arabic expert.

Moreover, in its alter ego as the Field of Linguistics in the Graduate School, Milt's faculty awarded, during his twenty-six years as Director, a total of eighty-eight doctorates, whose recipients now hold positions all over the world.

Milt's role throughout his career—at Cornell and elsewhere—has been aptly characterized as that of an enabler. He was, to be sure, a scholar in his own right, but he published very little. He was also a teacher, and carried a share of the division's teaching load in German and in linguistics. But his great strength lay in having faith in the practical relevance of linguistics, in seeing what needed to be done, in finding people who were eager and able to do it, and in smoothing the way for them. As an administrator he occasionally took it on himself to make an unpopular decision—but usually, in the long run, it turned out to be the right one. He took great pride and joy in the achievements of those about him (including the undersigned), and in response to that we were devoted to his leadership and worked very hard to be worthy of his approval.

After Milt's retirement the newly named Department of Modern Languages and Linguistics carried on for a number of years in much the same spirit. But those years saw a sea-change in the field of linguistics. Milt and his original coworkers had believed firmly not only in the relevance of linguistics for second-language learning but also the reverse—that the practical enterprises of teaching and learning languages can afford valuable insights into the nature of language. The New Wave in linguistics saw no such connection, which meant that there came to be little reason for the two activities to be housed in a single department. These developments saddened Milt considerably: despite his essentially upbeat character, he felt, at times, that a lifetime of effort had been largely wasted.

Yet his own career after retirement from Cornell remained one of service to those in his field. Although Spoken Language Services (his publishing house) supported the preparation of some fine new beginning language courses and issued some important reference works, its main mission was to continue to make available the excellent foreign-language textbooks prepared during the war years under the sponsorship of the ACLS and “165 Broadway”—teaching materials whose quality has rarely been surpassed.

Milt's effectiveness as an enabling administrator was made possible by his remarkably warm and loyal nature. Any friend he made was a friend for life. In 1993, only months before his own death, he flew to California to be present at the memorial service for the just deceased writer Wallace Stegner, whom he had known since school days in Salt Lake City seventy years earlier. And in those same final months he was remarking to some of us that he should get back to Germany to see friends he had made there in the late 1920s; the few who survived were getting pretty old and feeble.

The network of friendships that Milt built around himself over the years was a blessing for the friends. It was also his own safety net, the framework of warm human relationships that more than anything else gave meaning to his life. That became particularly important after the death, in the fall of 1986, of his wife Ted. Happily, the net includes family survivors: son, J (no period!) Ronayne of Urbana, Illinois; son, Bruce Milton of Northampton Massachusetts; daughter, Julia Cowan Spurr of Los Altos, California; and grandchildren, Mitra and Mark of Urbana, Alexander and Julia of Northampton.

R.S. Hall Jr., C.F. Hockett, R.L. Leed

John Craig

— *August 10, 1912*

“The University Faculty of Cornell University desire to give expression to their deep sorrow at the loss of their colleague, Professor John Craig, and their appreciation of his personal qualities and of his work as a teacher and investigator.

“Professor Craig came to us first as a graduate student and received the degree of Master of Science in Agriculture in 1898. In the year 1900 he was called back to this University to take charge of the extension teaching in agriculture; and in 1903 he was made Professor of Horticulture, which position he held till his death on August 10th, 1912.

“Professor Craig was a man of great earnestness and unusual personal charm. He met the world with a cheerful face even when enduring intense physical pain. The fortitude and perseverance with which he carried on his work almost to the end of his life in spite of great suffering were an inspiration to all who witnessed it.

“In his going from among us we feel that the University Faculty has lost an efficient and loyal member; and that each of us has lost a friend.

“We extend to his family, whose grief we share, our heartfelt sympathy in their bereavement.”

W. D. Bancroft, D. S. Kimball, J. H. Comstock, Chairman

Carl Crandall

July 22, 1890 — April 25, 1968

Carl's death marked the first time in one hundred years that at least one member of the Crandall family was not either a student or a member of the faculty at Cornell. His uncle, Charles Lee Crandall, entered with the first freshman class in 1868 and, following his graduation in 1872, taught in the School of Civil Engineering until he retired in 1915. His father (C.E. 78) and his two brothers also graduated from Cornell, as did various members of the younger Crandall generation.

Born in Ithaca, Carl started surveying while still in Ithaca High School and pursued this work both as a vocation and avocation all his life. "Better than golf," he often said. There was no one who knew more about local property lines or made more surveys than he. Among other things he made about one-fourth of the University's topographic surveys, laid out eleven parks in the Finger Lakes State Parks system, and was the New York State representative for the United States Coast and Geodetic Survey.

He received his C.E. degree from Cornell in 1912 and then did graduate work in hydraulics for three-quarters of a year. While an undergraduate he took part in many extracurricular activities. He won his varsity "C" in cross country and track, and continued an interest in athletics all his life. He was a familiar figure as an official at track meets, timing events with stop watch in "and, and as a spectator at most other sports events. Always interested in getting things done, he served on numerous student committees, was editor-in-chief of the *Cornell Civil Engineer*, and was assistant chief engineer of the school's summer surveying camp for juniors on Cayuga Lake.

Except for two years during World War I when he was a second lieutenant, pilot, and flight instructor in the old Army Air Service, he served on the civil engineering faculty, in all ranks from instructor to professor, until he retired as Professor Emeritus in 1958. While his principal field was engineering construction and administration, his versatility was such that he taught more than eighteen courses at one time or another. When Director W. L. Malcolm died in 1948, Carl guided the affairs of the school as acting director for many months until Director Christensen arrived. Among his numerous committee assignments was one which called for the study of the academic and administrative functions of the College of Engineering, and another that dealt with military service. And, for six years as secretary of the School of Civil Engineering, and eleven years as secretary of the faculty of the College of Engineering, he not only kept concise accurate records but also, through tactful comments and suggestions made at strategic times, guided these faculties and their committees in the development of well-

worded consistent bodies of legislation. It was characteristic of him that he took only three sabbaticals in his forty-five years of teaching and none in his first twenty-two years.

Off campus, Carl was even more active as a licensed professional engineer, businessman, and civic leader. His extensive engineering practice took him to many parts of New York and other states and ranged in scope from surveys and appraisals to the planning and design of structures, utility systems, roads, parks, communities, and other engineering concerns, and to work as a consulting engineer and as an expert witness in well over 300 court cases. Locally, for example, he designed and supervised the foundations for such buildings as the DeWitt Junior High School, Treman King Company store, First National Bank buildings, Rothschild's department store; and the structural frames and foundations for the County Court House and Jail, the Seneca Building, Cayuga Apartments, the addition to Uris Library, and a host of smaller structures. He also handled improvements to the Tompkins County Airport and the sewage collection and disposal system of the village of Cayuga Heights.

One of his great interests was the development of parks and recreation areas. This started in 1920 when he was made chief engineer of the Enfield Falls State Reservation Commission, an event which led to a long association with the Finger Lakes State Parks Commission as engineer, secretary-treasurer, and finally executive officer from the time it was formed in 1924 until he retired from it in 1961. In this work he had the principal hand in conceiving the scope of the programs and in acquiring lands and developing and operating the eleven constituent parks. His expertise in this area extended to work on many important committees of the State Council of Parks, of which he was a member, and to service as a consultant for many years to the Genesee and Allegany State Parks and to shorter consultations elsewhere in New York and in other states. It also covered a tour of duty as procurement officer for the National Parks Service.

As a businessman he contributed to civic affairs in such positions as treasurer and president of the Ithaca Savings and Loan Association, vice president and director of the Ithaca Chamber of Commerce, director of the Robinson Airlines, forerunner of the present Mohawk Airlines, and president of the East Lawn Cemetery Association. This interest in community affairs was manifested in many other ways as well. He was acting city engineer of Ithaca for a time and served the village of Cayuga Heights during most of its history, as engineer, zoning officer, and even police commissioner. Through his technical, legal, and administrative expertise and wise counsel he did much to provide an orderly continuity in the growth of the village. He was also a member of the Cornell Plantations committee from its founding; chairman of the local Selective Service Board in World War II, chairman of the Tompkins County Relief Bureau, and director of local WPA projects during the great depression.

Among other societies, Carl was a member of Zodiac, Sigma Xi, Chi Epsilon, American Society of Civil Engineers, New York State Society of Professional Engineers, Cornell Society of Engineers, American Association of University Professors, American Institute of Park Executives, American Legion, and the Cornell Club of Ithaca.

At his death, town and gown joined in voicing the sentiments expressed by the faculty and alumni of the School of Civil Engineering at a reunion breakfast on his retirement from teaching in 1958:

A man of many talents, you blended into our classrooms and council chambers the benefits of your wide experiences as a practicing engineer, businessman, and civic leader, and by your example you showed us how versatile and efficient an engineer can be. Your unusual ability to plan your time and effort and direct the work of others enabled you over the years to do the work of several men, never seeming hurried or slighting a task.

S. C. Hollister, William McGuire, J. C. Gebhard

Charles Lee Crandall

— August 25, 1917

The Professor of Engineering, Professor Jacoby, presented the following resolutions, which were adopted by rising vote:

The sudden death of Professor Emeritus Charles Lee Crandall on August 25, 1917, came as a shock to all of his colleagues as well as to his friends among alumni and townspeople. His colleagues had cherished the hope that he would remain with them for a decade or more. Since his retirement from active university service in June, 1915, he was continuously engaged in a variety of pursuits. He revised several of his books, continued active work on the Committee on Iron and Steel Structures of the American Railway Engineering Association and served as a member of the Board of Public Works of the City of Ithaca, since January, 1915.

The Faculty expresses its deep sense of personal loss and extends its warmest sympathy to the bereaved family.

Resolutions relating to his character and service were adopted by the University Faculty at the time of his retirement.. It may be appropriate, however, to add a hearty endorsement of the following editorial note published in Engineering News-Record, September 27, under the title “ Professor Crandall—A Successful Teacher “:

“ The lot of the professor of engineering is not always a happy one. Compensation is low, recognition is often belated. The main reward must come from a sense of duty well performed and the affection of a long line of students. Success of the more material sort came to Professor Crandall of Cornell University,—but the crowning professional success, the affectionate regard of forty engineering classes, was his in exceptional measure. Kindliness and sympathy were the lodestones by which he attracted the young men, and forever kept them as friends; but to these traits he added a sureness of technical knowledge that made him in after years a professional mentor as well. His work and the place he holds in the memory of his boys should be an inspiration to every teacher. He showed how great a success can be made in the teaching profession.”

Committee: S. G. George, E. E. Haskell, Henry S. Jacoby, Chairman

Source: Records, p. 918, October 10, 1917

(continued)

RETIREMENT STATEMENT

The Professor of Applied Mechanics, Professor Church, on behalf of the committee (Professors Church, chairman, Burr, A. W. Smith) appointed by the President to prepare resolutions on the retirement of Professor C. L. Crandall from active service, presented the following resolutions, which were adopted by rising vote:

“At the close of the present academic year, after more than forty- one years of continuous service on the teaching staff of Cornell University, our colleague, Professor Charles Lee Crandall, retires from his active duties. The University Faculty desires to record its regret at this severance of his old relations with us, and its appreciation of his work and his influence.

A member of the first four-year class graduating from Cornell, he was appointed in 1874 an Instructor in Civil Engineering, in 1875 an Assistant Professor; and thus he was from the outset one of the earnest workers of those pioneer days of our University. During that early period his work as a teacher had to cover several of the technical subjects of the civil engineering curriculum; but, as years went by and the increasing resources of the University made possible a larger number of teachers, Professor Crandall was enabled to concentrate his energies on the subjects of his choice. He became Associate Professor of Civil Engineering in 1891, and in 1895 was appointed Professor of Railway Engineering and Geodesy.

During the college year 1892-93, Professor Fuertes, Director of the College of Civil Engineering, being absent in Europe, Professor Crandall was the Acting Director of the college ; and he again served in that capacity after the death of Professor Fuertes, from 1903 till the appointment of the present Dean, Professor Haskell, in 1906. In these two critical periods of the history of the College, Professor Crandall’s services in directing its affairs were invaluable.

But these heavy duties by no means sum up Professor Crandall’s activities, Besides being the author of important text-books in the fields of his work as a teacher, he has done valuable experimental and literary work for two of our national engineering societies of which he is an honored member, and he has never wholly abandoned the practice of engineering, by which he has not only kept in touch with the practical field of his profession, but has opened the door to many services, both civic and technical, to the people of the city of Ithaca. A special debt of gratitude is due him from the alumni of the College of Civil Engineering for his constant and effective service in securing them professional positions through a correspondence bureau which during many years he has conducted for this purpose. But what is probably Professor Crandall’s greatest usefulness is the result of his high, unselfish character. His whole life has been given to the devoted service of his associates and of his students.

Graduates of the College of Civil Engineering have no memories of Cornell that do not include a feeling of affection and thankfulness to Professor Crandall. Of kindly disposition and practical sound sense, sympathetic in his intercourse with students, quiet and modest in manner, but with strong convictions as to truth and justice in any matter brought before him, and always ready to sacrifice personal interests in following the dictates of duty, Professor Crandall has won the warm esteem of all who have come within the circle of his influence during these two score years of service at Cornell. The University Faculty extends to him the assurance of its highest gratitude, with the earnest hope that the future holds in store for him many years of activity and happiness.”

William Truman Crandall

May 11, 1886 — November 3, 1959

William Truman Crandall, Professor Emeritus of Animal Husbandry, died November 3, 1959, following a serious illness. He was born in Lexington, Kentucky, May 11, 1886. His father, a faculty member of the University of Kentucky, was a nationally famous geologist and church worker. Thus ended two generations of outstanding educational contributions.

Truman, as he was known to his associates and friends, was an outstanding teacher. He used this particular talent to encourage dairy farmers to change their practices in order to improve their economic status and way of life. He served Cornell for thirty-two years.

Professor Crandall had a deep appreciation of the importance of the dairy cow to New York Agriculture. He looked upon her as a marvelous machine especially adapted to convert the products of the field into the best of human foods, milk. Therefore it was logical that his chief objective was teaching dairymen how to feed and care for their cows to obtain production at their fullest economic capacity. To this end, he developed two-day dairy cattle production and feeding schools, which were attended by thousands of dairymen.

Professor Crandall was also in charge of the dairy production records programs. He recognized that these records were a tremendous source of field data, which he used as teaching and demonstrational materials. He developed methods of analyzing herd production results which now are an integral part of the National Cooperative Dairy Herd Improvement program.

He was co-author of the Extension Bulletin, "Feeding the Dairy Cow Efficiently," a bulletin that has become the dairyman's textbook on feeding and is now in the eleventh printing with a circulation of 125,000 copies. He was also the author of "A Study Guide for Dairy Farming," written for the U.S. Armed Forces Institute in 1945. He was author or co-author of many other publications on dairy feeding and record keeping.

He attended Alfred Academy, received B.S. degrees from Milton College in Wisconsin and from the University of Wisconsin, and an M.S. degree from the University of Illinois.

In 1909-1910 he headed the animal husbandry department of Alfred State School of Agriculture and was an associate in dairy husbandry at the University of Illinois, 1911-1916. In 1920-1922 he was extension assistant professor of dairy husbandry at Kansas State Agricultural College. During these years he was a member of local,

college, and university orchestras. He was a talented violinist and skilled in other string and wind orchestral instruments.

He came to Cornell as Extension Assistant Professor in 1922 and served in that capacity until 1935 when he became Extension Professor and was Professor from 1945 until retiring in 1954. He was a member of Epsilon Sigma Phi, national honorary extension fraternity, and of the American Dairy Science Association.

Surviving are his wife, Mrs. Emma Anderson Crandall, Ithaca; one son, Truman A. Crandall, Manchester, Connecticut; two daughters, Mrs. W. Eugene Dennis, Ithaca, and Mrs. Frederick Garrett, Miami, Florida; a sister, Miss Alberta Crandall, Milton, Wisconsin; and nine grandchildren.

Professor Crandall not only was an outstanding extension teacher himself but also had the rare ability to guide and inspire his co-workers along similar lines. His associates valued Truman's good judgment, his friendly suggestions, and his willingness to assist in every way in carrying on dairy extension programs. His influence will be felt for years to come not only by his fellow workers but, in a broader sense, in the state and nation.

S. J. Brownell, Raymond Albrechtsen, J. D. Burke

Thomas Frederick Crane

Professor of Romance Languages and Literatures

1844 — Dec. 9, 1927

Dean Crane is gone. No other held among us so unique a place. Not only at eighty-three was he the last survivor of the notable group of teachers who nearly sixty years ago formed the original Faculty of Cornell, but as had none of his colleagues he had personally known the Founder and his advisers and shared their plans. A student of law in the office of Ezra Cornell's closest friend and legal adviser, he had been at hand for help in the new institution's emergencies. Thus there fell to him large part in its first entrance examinations; and when its professor of German was delayed in Europe he found himself drafted into his place. But his tastes and ambitions were always those of the scholar, and except for the period spent abroad in the completion of his studies he never turned from the career thus thrust upon him.

The chair of which he dreamed, devoted wholly to Spanish, was indeed never his, but as Professor of Spanish and Italian, as head of the department of the Romance Languages, as Dean of the College of Arts and Sciences (1896-1902), as Dean of the University Faculty (1902-1909) he passed through all ranks of academic preferment, and twice (1899-1900 and 1912-13) he for a year as President of the University. But his activity was never exhausted by class room or administrative office. Gifted with a pen of singular grace and charm, he was a frequent and welcomed writer for both the learned and the general magazines, and volume after volume he gave to the press. From the first his interest was less in language than in literature and in the living sources from which literature flows. Even before, in 1885, he published his first book, his *Italian Popular Tales* had given to the world the study which pointed out the importance for the beginnings of modern literature of the *exempla*, or illustrative stories used by the medieval preachers; and when in 1890 he followed this with his edition of those of the great crusading orator Jacques de Vitry, his reputation as a folklorist was established on both sides of the sea. Already his work had lost all touch of the dilettante. His narrow income was strained for the building up of his remarkable private library, and his slip catalogue of folk-tales became a resource for scholars the world around. In later volumes he exploited the mine thus opened; but these by no means checked the breadth of his reading or set a limit for his exuberant pen. This still found tireless vent in essay and review, edition and textbook, even now and then in a venture into fiction and it is matter for lasting gratitude that his latest volume (1925) could include, from his own hand, a bibliography of his rich output.

But this career of bookworm and writer meant never for him neglect of social gifts. Of society he was always a lover as well as a student, and from his early manhood he shone both in conversation and as an after-dinner speaker. Yet few who knew him, sensitive and of delicate health, in his earlier years as a teacher, could have guessed how as Dean he was to become the very centre of student life, accessible and beloved, interested in every student activity and a speaker at all student gatherings. The university, too, now found him its happiest mouthpiece for all public occasions, its most attractive deputy for errands abroad. His addresses on memorial occasions will remain to it an especial treasure. Nor is its debt to him small for material gifts. Again and again he enriched the university library with precious collections and his last act among us was to bestow on it the note-books and memoranda of his lifetime's study

Nor were his interests ever narrowly academic. Though not a native of Ithaca, much of his childhood was spent here, here he fitted himself for college, and his love for the town and its people was deep and sincere. To church and school, to charities and hospital, he gave almost too generously of his means and of himself; and to the wider claims of country and mankind his ear was never deaf. Beneath all this wealth of service, this exuberance of self-expression, there lay, too, a character deep and earnest. The lightness of his touch was never permitted to belie his reverent convictions or his high sense of what became the gentleman. We shall miss the scholar and the courtly wit; but our deepest sorrow is to lose the man.

Retired: June 1909 (Fac. Rec. p. 464)

Robert Henry Crawford

October 10, 1924 — February 6, 1998

Dr. Robert H. Crawford died in Phoenix, Arizona at age 73. He was an Associate Professor in the Department of Communication Arts, now Communication, in the College of Agriculture and Life Sciences from 1967-81.

Educated at the University of California at Berkeley (B.A., 1951), and at Syracuse University (M.A., 1953; Ph.D., 1967), Dr. Crawford was engaged in publication, consulting, and distribution of publications in missionary Christian church organizations in Indonesia and the Philippines. This experience and background proved invaluable as he guided and advised overseas graduate students in their careers during his time at Cornell. He was faculty advisor to a majority of the foreign and minority students in the department during his tenure. He coordinated graduate studies in communication, including recruitment, admissions, financial aid, graduation requirements and liaison with the graduate school with an exemplary attention and concern for the best interests of the students and the department.

Other responsibilities in the department included extensive teaching of graduate and undergraduate students. Courses included communication in developing nations, news and science writing, communication history and mass media. In addition to teaching and advising, from 1971-74, Dr. Crawford developed and directed the Communication Specialists for Population Affairs (COSPA) program, designed to provide graduate training for use in family planning, population education and related efforts. His students from this program have gone on to useful careers worldwide, and current research projects in the department reflect these early beginnings in an important field.

As the Master of Professional Studies degree was developed in the college in the 1970s, he served the college on the committee and task force charged with setting standards and making recommendations for a new, practical approach to graduate study for those already active in professional fields. At the university level, he served as a member of the Faculty Council of Representatives, and on the Rural Development Committee of the Center for International Studies.

Dr. Crawford's international consulting assignments ranged widely, and included those with the World Health Organization, the Population Information Field Services Program and the East-West Communication Institute.

When he left Cornell in 1981 and moved to California, he became an independent communication consultant, working with students who needed assistance in completing their graduate studies. He is survived by his wife, Alice; daughter, Donna March; sons, Paul, James and Steven; and 14 grandchildren. He will be remembered as a person of strong convictions and missionary zeal in his dedication to help others.

Chester H. Freeman, Jane E. Hardy, Russell D. Martin

James Edwin Creighton

Sage Professor of Logic and Metaphysics

1861 — Oct. 8, 1924

James Edwin Creighton was a member of the teaching staff of Cornell University for thirty-five years, and at the time of his death was the senior active member of the University Faculty. During his long career as teacher, writer, and editor he stamped his personality indelibly on all of his work.

As Dean of the Graduate School he was chiefly responsible for the creation and formulation of its standards and procedure; as Editor of *The Philosophical Review* during a period of over thirty years he read, adjudged, and published a large part of the philosophical articles written in America and through this labor he exerted an influence far beyond the country's boundaries; as a teacher he interpreted with unrivalled clarity and expository skill the great systems of speculative thought and created among his students, as few men have done, a body of disciples, many of whom have become writers and teachers,—his living epistles; as a member of our faculties and in the general life of the University he was an extraordinarily impressive and influential figure.

Preeminently he was a man of faith. Tenacious of principles, persistent and persuasive in controversy, he was a protagonist in every important issue that concerned the ends and ideals of university education and government. He was a stalwart and outspoken advocate of the professorial point of view, an ardent believer in the efficacy of open discussion, a lover of the fire of intellectual battle, and impatient of easy and unconsidered acquiescence. His was a rugged and virile mind. He had strong convictions and there was a contagion in his earnestness and sincerity. In his death the University is impoverished by the loss of one of its most distinguished scholars.

Cyrus Richard Crosby

Professor of Entomology

January 9, 1879 — January 11, 1937

In the sudden death of Cyrus Richard Crosby on January 11, 1937, Cornell University lost an efficient and faithful member, his associates in the Department of Entomology a helpful and inspiring colleague, his neighbors a genial and entertaining friend. Professor Crosby was born January 9, 1879 at Penn Yan, New York. After graduating from Cornell University in 1905 with the degree of Bachelor of Arts he served as assistant entomologist at the University of Missouri. Returning to Cornell in 1906 he held successively the positions of entomological investigator in the Experiment Station, assistant professor, and finally since 1913, that of extension professor. He was a member of the Association of Economic Entomologists, of the Entomological Society of France, a Fellow of the Entomological Society of America and a Fellow of the American Association for the Advancement of Science.

Professor Crosby has written extensively on subjects related to his field. He completed a work on fruit insects which had been begun by Professor Mark Vernon Slingerland, and with Dr. Mortimer Demarest Leonard he collaborated on a widely used text on vegetable insects. He also wrote, either alone or in collaboration with others a number of experiment station circulars and bulletins. Although his time was chiefly given over to his activities as extension entomologist, he nevertheless found time – evenings, holidays, and vacations – to devote to his hobby of studying spiders, a group in which his interest was first aroused by Professor John Henry Comstock, and in which he became a leading authority. On his collecting trips the usual discomforts in the field did not deter him from often spending hours in the chill winds on a mountain top or in a mosquito-infested swamp, sifting for spiders. His work is marked by meticulous care.

Though physically rather deliberate, he exhibited an astounding intellectual alertness, a tireless industry, and an unbounded enthusiasm which was an inspiration to the young men with whom he was associated. The catholicity of his tastes was shown by his interest in philosophy, religion, anthropology, geology, and other subjects outside the field of his profession.

He was known as a man of positive character with firm convictions and strong likes and dislikes. Not so well known is the fact that his sympathies were easily aroused, and then his purse, time, and thought were freely given.

Professor Crosby will be long remembered by the members of the University community. The Faculty extends to his family its sincere sympathy in their bereavement.

Willard F. Crosier

October 26, 1904 — October 24, 1996

Dr. Willard F. Crosier, a world leader in seed pathology and a Professor Emeritus at Cornell University's New York State Agricultural Experiment Station in Geneva, New York, died following a long illness.

Willard was born in Juanita, Nebraska. He was awarded an A.B. degree from the University of Kansas in 1927 and a Ph.D. degree from Cornell University in 1932. His Ph.D. research on late blight of potato was considered a major advance in the study of this disease. His active career at Cornell spanned 43 years before his retirement as Professor Emeritus in 1970. He authored or co-authored about 250 scientific articles in the fields of chemistry, entomology, mycology, plant pathology and seed technology. He was especially well known for his research into the detection and control of seed borne diseases. He served in numerous capacities in the field of seed technology, including chairing the Research Committee of the Association of Official Seed Analysts and editor of the Proceedings of that Association. He helped to organize the International Seed Pathology Congress in 1958 that was held in Cambridge, England. In addition, Willard served continuously as chair or co-chair of the Committee of Detection of Seedborne Diseases of the International Seed Testing Association from 1937 until his retirement in 1970. He enjoyed several sabbatical leaves in the important seed production areas in Idaho and Virginia and a three-month leave during which he attended the Tenth Congress of the International Seed Testing Association in Ireland and visited the best known seed testing stations in Europe.

During the 1940s, Willard was a member of Company K, the New York State Guard and served as its last commanding officer in 1947-48. He was Director of Civilian Protection in the town of Waterloo and trustee of Waterloo School District number 5. He was a member of the Board of Education of the Waterloo Central School District from 1973-77.

Following his retirement, he was employed as a caseworker with the Department of Social Services in Seneca County, as a substitute teacher, and a Fayette town assessor. Crosier was very active in promoting the cause of senior citizens in Seneca County and in the State of New York. He was elected to the state Senior Citizens Action Council where he served on the Constitution and Bylaws committees. He served in Seneca County as president of the Senior Citizens Action Council, was chairman of the board of the Seneca County Senior Center, member of the Seneca County Nutrition Advisory Council Board, and treasurer of the Seneca County Senior Center. For his efforts on behalf of seniors, Willard was named Seneca County Senior Citizen of the year in 1981.

His wife of 67 years, the former Lucille Maude Guilfus, three children, seven grandchildren, and seven great-grandchildren survived him. He also was survived by a sister, two nieces and two nephews.

Throughout his long life, Willard never outgrew his love of the earth and the beauty of and bounty brought forth from planting seeds.

Nathan Peck, Morrill Vittum, Gary Harman

Natalie Crowe

June 29, 1911 — April 25, 2000

Born June 29, 1911 at Newport, Rhode Island, Natalie D. Crowe graduated from the University of Rhode Island in 1932 with a Bachelor of Science degree, and graduated from Cornell University in 1934 with a Master of Science degree. Professor Crowe joined the College of Human Ecology staff as an Assistant Professor and a Cornell Cooperative Extension Leader–Home Economics on March 1, 1967, after having served previously as an Extension Educator in Suffolk, Chenango, Erie, and Cortland Counties. As an Extension Leader/Program Coordinator, she contributed significantly to statewide programs by providing leadership for new program development, implementation and evaluation. She retired as an Associate Professor and was named Professor Emeritus in 1977.

As Chairman of a Human Resources Program Unit in Cooperative Extension, she provided insightful leadership in identifying critical human needs. Her influence at the college, with other state agencies, and in stimulating effective county level programs resulted in significantly increased college and community efforts to improve the support systems that serve children and their families in the State. She received United States Department of Agriculture Special Needs funding to initiate a Family Day Care program in the Hempstead area of Nassau County as well as funding from the Carnegie Corporation of New York to make it a statewide initiative.

Professor Crowe served on numerous college committees and as Secretary to the College Faculty from 1968-70. She worked with Cooperative Extension educators in 18 Western New York counties who drew on the resources of the College of Human Ecology for outreach programming with adults and youth. For nine years, she chaired a faculty committee organizing a major public information/relation tool for the college: an annual N.Y.S. Fair exhibit highlighting a major emphasis of the college. Some 25,000 to 30,000 people visited these exhibits yearly including key decision-makers from local and state governments and Cornell University alumni. Professor Crowe edited, *On the Extension Line*, a major monthly house organ from campus staff to Cooperative Extension educators in the state. Her systematic, analytic eye for the pertinent and the relevant was evident in the quality and usefulness of the publication.

In 1974, Professor Crowe was recognized for her leadership in human resources programming when she was awarded a certificate of high achievement by Epsilon Sigma Phi, an honorary society of extension workers. She was a member of the New York State and National Associations of Extension Home Economists, the Business and Professional Women of Cortland County, American Association of University Women, Phi Kappa Phi, and

Pi Lambda Theta. In addition, she was a lifetime member of the Parent Teachers Association, a member of the National Council on Family Relations, and a member of the Day Care and Child Development Council of America.

Natalie Crowe, age 88, died April 25, 2000 at her residence on Union Street, Dryden, New York. Survivors include her children, Margaret C. (Richard) Taylor '63, of Sandy Hook, Connecticut; William C.F. (Jan) Crowe, of Overland Park, Kansas; and Barbara C. Babin, of Denver, Colorado; and seven grandchildren. Two daughters predeceased her: Mary Judith Crowe and Linda Crowe Kelly.

Ethel W. Samson, Bettie Lee Yerka, Lucinda A. Noble

Gordon Joseph Cummings

April 30, 1919 — April 5, 2005

Gordon Joseph Cummings was born in King Ferry, Cayuga County, New York, on April 30, 1919, the son of Peter and Ida Cummings. During Gordon's formative years, when life in the 1930s of the Great Depression was so difficult and opportunities were limited, Peter Cummings alternated jobs between farming and work in Ithaca; in these alternations, young Gordon attended schools in both locations. These early years in a small upstate community laid the groundwork for a theme that would run through Gordon's entire life, namely, a love for rural life and the small communities in the state.

The Cummings were Irish and Roman Catholic, and as such exposed to the underside of upstate New York in the 1920s and 1930s. Gordon told of the Ku Klux Klan dumping nails in the road in front of their farm. However, typical of Gordon, he told this straightforwardly, without bitterness, even with a twinkle in his eye.

Gordon graduated from King Ferry High School and immediately enrolled at Cornell University. His university education was interrupted by World War II, during which he was stationed in Okinawa and Japan. He was in Nagasaki, Japan just five days after the atomic bomb destroyed that city. As an agent of the Counter Intelligence Corps, he had close contact with the Japanese people and came to appreciate many aspects of the Japanese and other Southeast Asian cultures. After the war, he returned to Cornell to complete a Bachelor of Science degree in 1948, a Master of Science degree in 1950, and a Doctor of Philosophy degree in 1954. Immediately after completing his Ph.D. degree, he joined the Department of Rural Sociology in the College of Agriculture as an Assistant Professor with a predominant responsibility in Extension.

The core subject of the more than 50 reports, articles, and papers he would write, dealt with "Leadership in Rural Life," "How to Identify Policies and Organization to Improve Community Life," and, near the end of his career, "The Evaluation and Improvement of Health Care in Rural Areas." One of the many projects in which he participated and of which he was most proud was "Operation Advance." This work on public policy and public decision-making was joined by Professors Clifford R. Harrington and Edward A. Lutz, and together they prepared discussion guides on topics such as "Community Growth and Development," "Education and the Future," "Resources – Land, Water and People," "The Changing Environment for Living, Work and Play," and "Managing Community Growth." Related to these topics, among the courses he taught were those titled "Small Towns," "Sociology of Leadership," and "Organization of Rural Health Care."

His projects were largely implemented through the auspices of the Cornell Cooperative Extension Service. He also served as Department Extension Leader for many years and, along with Professor Robert Polson, on the New York State Citizens Council Field Service Committee. In 1975, he spent his sabbatic leave with the New York State Health Department in Albany, helping to organize Comprehensive Health Planning and community mammogram centers for breast cancer screening. He also served as Chair of the Planning Committee of the Governor's Health Advisory Council.

Professionally, he was a member of the Rural Sociological Society, the Adult Education Association, and the Community Development Society.

His passion for the local community extended into his retirement years. He became Historian for the town of Genoa, and the village of King Ferry in Cayuga County, and was the first President of the Board of Directors of the Genoa Historical Association. Gordon was President of the Community Development Federation and on the Board of Directors of Blue Cross of Central New York. He was always looking for projects both in his professional and private life. He used to tell his children the story of two frogs swimming in a bucket of buttermilk, wondering if they could stay afloat. One turned to the other and said, "Please don't be discouraged brother, one more kick and this stuff will turn to butter." So it was with his projects: never be discouraged.

After a long marriage he was predeceased by his wife, Jane Powers Cummings, and is survived by son Thomas (Beverly Ludke) of Pittsford, New York; son Gregory of Washington, D.C.; son Daniel (Danielle) of Syracuse, New York; daughter Molly (David Rose) of Rochester, New York; and four grandchildren. At his funeral Mass in King Ferry, they observed that the heart of his life concerned his family; their accounts of "Life with Pop," were filled with love and affection, and, most of all, with respect. They also recognized that Gordon Cummings loved Cornell as an institution in its variety of activities, and especially its Cooperative Extension program in playing out its role as part of a Land-Grant University, as well as the various communities of people with whom he worked so closely.

Paul R. Eberts, Frank W. Young, Eugene C. Erickson

John F. Cummings

September 3, 1936 — November 3, 1996

John F. Cummings, James Law Professor of Anatomy, played a major role in the College of Veterinary Medicine during his twenty-nine years as a faculty member. In addition to having primary responsibility for teaching histology and organology, an essential body of knowledge for all veterinary students, John mounted a significant research program in and made major contributions to the area of animal models of human neurologic disease. He was responsible for the early and sustained development of ultrastructural technology in the college. He also contributed greatly to the life of the college, at one time or another serving on most of the standing committees of the college and being the Secretary of the College for the last two years of his life.

John was born in Newark, New Jersey, where he lived until age fifteen, at which time he moved to Syracuse, New York. His high school years were spent at Seton Hall Preparatory School in Newark and at Christian Brothers Academy in Syracuse where, according to John, he received the rigorous training in study methods and critical thinking that became cornerstones for his professional life.

In the fall of 1954, John matriculated at Cornell University, where he earned a B.S. degree from the College of Agriculture in 1958, and then D.V.M., M.S., and Ph.D. degrees from the College of Veterinary Medicine in 1962, 1963, and 1965, respectively. In 1965, he was commissioned as a First Lieutenant in the Veterinary Corps of the U.S. Army and was assigned to the Department of Neurophysiology, Walter Reed Army Institute of Research in Washington, D.C. The Army granted him an honorary discharge with the rank of Captain in 1967.

John was appointed as Assistant Professor of Anatomy in the College of Veterinary Medicine in 1967 and given primary responsibility for the teaching of histology, organology, and ultrastructure to first year veterinary students. He was promoted to Associate Professor of Anatomy in 1971 and to Professor of Anatomy in 1977.

John's greatest contribution to the College of Veterinary Medicine was as a teacher. Although his primary efforts were directed toward the teaching of microscopic anatomy to first year students, he was a regular contributor to other courses in the curriculum. Scientists around the world looked to John as a valuable source of information on light microscopic and ultrastructural anatomy of domestic animals.

As a teacher of veterinary students, John's standards for excellence were high. He demanded superior performance but strived to help his students achieve it. He always was available to assist the students at any time of the day

or night. As much as students lamented his rigorous examinations, they truly respected his goals and efforts; moreover, they knew that they were well-prepared for their professional activities. John's constant "one liner" style of humor and his ability to correlate structure with function and with clinically relevant problems kept the undivided attention of his students.

Throughout his professional career, the goal of John's research was to identify neurological disorders in domestic animals that were models for similar human disorders. He recognized and described a variety of these models that ranged from acute to chronic peripheral neuropathies, to storage diseases due to inherited enzyme deficiencies, to numerous examples of central nervous system axonopathies, to delayed organophosphate intoxication, to muscle disorders, and to motor neuron disease.

There were two diseases in which his studies contributed the most to the understanding of comparable human disease. Early in his career, John described the clinical and pathological basis for polyradiculoneuritis of dogs (Coonhound paralysis) that was a model for the Landry-Guillain-Barre disease, the most common cause of total paralysis in people. Since 1990, John Cummings led the efforts in the recognition, description, and research of an acquired motor neuron disease in the horse that is a model for the sporadic form of motor neuron disease in people which is known as amyotrophic lateral sclerosis (ALS) or Lou Gehrig's disease. He made great strides in understanding the cause of this equine disease which had a direct impact on the understanding of the human disorder, and he was actively engaged in these efforts when his untimely death occurred.

John's extensive compilation of publications gave him an international reputation as an outstanding contributor to the knowledge of domestic animal peripheral nerve and motor neuronal disorders. John shared his knowledge enthusiastically and his peers considered him an ideal colleague for collaboration in their scholarly efforts.

John Cummings was one of the most popular and beloved professors at the Veterinary College. He was renown for his brilliant intellect, his wonderful sense of humor, his modesty, and his unrelenting willingness to help others. In 1994, he was honored by being elected Secretary of the Faculty, a position he held until his death. His mastery of the English language and keen sense of humor were greatly appreciated and guaranteed that each monthly edition of the faculty minutes was read by virtually every faculty member.

In 1995, in recognition of the esteem with which he was held by his colleagues for his distinguished career in comparative neurology and neuropathology, John was awarded the endowed title of James Law Professor of Anatomy. He was a member of Phi Zeta, Sigma Xi, Pi Kappa Phi, and Gamma Sigma Delta honor societies. The

Cornell University Veterinary College faculty and alumni further honored his memory by dedicating the 1997 Annual Conference as a celebration to his life. This was the first time in the hundred-year history of the college that the Annual Conference was dedicated to an individual.

In addition to the college and the university, John was also devoted to his family, his church, and his community. He spent many hours at Lynah Rink, Cass Park, the Lansing town ball fields, and other athletic venues as his children developed their prowess in hockey, baseball, softball, and other sports. On weekends and summer evenings, he was often in the yard with them, teaching the finer points of several sports. He was involved as well in their scholastic development and expected as much from them as he did from his students. The fruits of his labors shine in the success that each of his children has enjoyed.

John was convinced of the importance of athletics in child development and served for many years as a member and as the chair of the Town of Lansing Athletic Commission. During his tenure, the facilities available for athletic programs in the town were expanded significantly. A strong supporter of Cornell athletics, John frequently could be found at intercollegiate football and basketball games. He also served on the Committee on University-ROTC Relationships. He was a communicant of St. Catherine of Siena Parish, where he served as an usher and in many other capacities for more than twenty years.

John is survived by his wife, Mary Ellen Zolper Cummings; his children, Michael, Daniel, Tara Cummings Zigarelli, Patrick, and Mary Anne; and by six grandchildren.

Alexander deLahunta, Thomas J. Divers, Francis A. Kallfelz

Gustavus Watts Cunningham

November 14, 1881 — April 1, 1968

Gustavus Watts Cunningham was born of a Southern family and spent his early years in South Carolina. His undergraduate study was done at Furman University where he received his A.B. degree in 1902. For three years he served as Professor of English and Philosophy at Howard College in Birmingham. In 1905 he came to Cornell as scholar, and later fellow, in the Sage School of Philosophy. He received his Ph.D. in 1908 with a dissertation on "Thought and Reality in Hegel's System." He was a member of the societies of Phi Beta Kappa and Phi Kappa Phi.

From 1908 to 1917 he served as a teacher of philosophy at Middlebury College. While there he published his Cornell dissertation and also *A Study in the Philosophy of Bergson*. In 1917 he was called to the University of Texas as Associate Professor of Philosophy, soon being advanced to full rank. Two books appeared during his years at Texas. One entitled *Five Lectures on the Problem of Mind* was published in 1925. The other was published a year earlier under the title *The Problems of Philosophy*. This book, a systematic survey of those problems as they engaged thinkers in the field at that time, became a popular text in introductory courses; it was revised and enlarged in 1935.

He began his long and influential professorship at Cornell in 1927, serving as Chairman of the Sage School of Philosophy and Susan Linn Sage Professor of Philosophy. When he came, Cornell was a stronghold of neo-Hegelian idealism, and his own philosophical sympathies lay in the same direction. However, he was never a follower of any philosophical school, and his idealism became increasingly critical, as was evident in his book on *The Idealist Argument in Recent British and American Philosophy*, published in 1933. It was in harmony with his broad orientation that representatives of various philosophical viewpoints were brought to Cornell during the period of his leadership, so that the Sage School became known as actively fostering a wide spectrum of philosophical positions. Through a large part of this period he was an editor of the *Philosophical Review*, and several of his many articles were published in its pages. His interest in University affairs was vigorous and his participation in debates at meetings of the University faculty was lively. From 1944 to 1948 he served as Dean of the Cornell Graduate School where his scholarly concern and wise judgment were constantly evident. He retired from University duties in 1949.

Professor Cunningham gave the Howison Lecture at the University of California in 1933 under the title "Perspective and Context in the Meaning Situation." He contributed chapters toward the *Essays in Honor of James E. Creighton*

(edited by G. H. Sabine), *Contemporary American Philosophy* (edited by G. P. Adams and W. P. Montague), and *Contemporary Idealism in America* (edited by C. L. Barrett). He was president of the Eastern Division of the American Philosophical Association in 1936-37, giving his presidential address on the theme "Meaning, Reference, and Significance." His alma mater Furman University honored him with a D.Litt. degree in 1916, and an LL.D. in 1935.

Many former undergraduate students in the Sage School will remember his illuminating lectures in the history of philosophy, which he continued to teach during his deanship, and candidates for advanced degrees will especially remember the seminar on Hegel which he gave for many years. To his colleagues he was a man of strong conviction, especially on the important role of philosophy in higher education, and also a man of genial friendliness in his personal relations. The picture of his courtly figure rhythmically swinging his cane as he walked to and from the campus, will long remain with those who knew him.

On retirement in 1949, he settled in the old family plantation near Laurens, South Carolina, where he lived for the nearly two decades that ended with his death. He had won a distinctive place in American philosophy and in the growth of the Sage School at Cornell. His wife, the former Mattie Hipp, who had been his close companion for more than fifty years, passed away in 1966. They had no children. His will provided for the establishment of two fellowships in philosophy at Cornell to be awarded annually on the recommendation of the Graduate School. One is named after his wife and the other after himself.

Max Black, Stuart M. Brown, Jr., Edwin A. Burt

Howe Symond Cunningham

November 2, 1884 — August 27, 1962

Howe Symond Cunningham spent his childhood in farming communities in Pennsylvania, Massachusetts, and Nova Scotia, and he received a portion of his early schooling in each locality. As a young man he sailed with the Canadian Merchant Marine and with the Canadian fishing fleet. The lessons that he learned from the sea were an inspiration to him and to those with whom he shared them. Later in life, the sea provided him with much enjoyment and relaxation and with a place where he could commune with God and meditate upon his research and extension activities. To him, the sea was a source of strength and courage, and he captured its beauty and power in many beautiful photographs. It was fitting, indeed, that sudden death came to him on August 27, 1962, while he and his wife were bluefishing in Long Island Sound near their summer cottage near Riverhead, New York. Many of his friends and colleagues expressed this thought by saying, "It was wonderful that he died while enjoying his great love, the sea."

Although "Doc," as he was known to his many friends, loved the sea, he was devoted to his chosen discipline, phytopathology. He realized that man must earn his living by "the sweat of his brow," and, to make man's life a little easier and more enjoyable, he devoted his life to learning the truths of phytopathology and sharing these truths with his fellow men. His abilities were recognized by Nova Scotia Agricultural College, which awarded him the associate diploma in 1912, and the Nova Scotia Department of Agriculture appointed him as its first district representative. While serving in this capacity, he attended McGill University and was awarded the B.S. degree in agriculture in 1917. In 1918 he was appointed Professor of Agriculture at Nova Scotia Agricultural College. After completing his work for the M.S. degree in agriculture at McGill University in 1924, he filled the position of Professor of Botany at Nova Scotia Agricultural College. In 1927, he became an assistant in plant pathology and mycology at Cornell University and received a Ph.D. degree in 1928.

From Cornell University, he went to Bermuda where he was the plant pathologist for the Bermuda Department of Agriculture for three years. He returned to New York in 1931 and served as Assistant Professor of Plant Pathology and associate in research at the New York State Agricultural Experiment Station, Geneva, while stationed at the Long Island Vegetable Research Farm in Riverhead. On April 1, 1946, his position was transferred to the Department of Plant Pathology, Cornell University. He continued research and extension activities at the Long Island Vegetable Research Farm as an Associate Professor until he retired on July 1, 1952. Following retirement,

he continued to serve the Long Island farmers in the capacity of consultant with the Long Island Produce and Fertilizer Company, Inc., Riverhead, New York, until the afternoon of his fatal heart attack.

His research activities covered the major disease problems of vegetables, including potatoes, on Long Island. He developed a spray program for the control of downy mildew of lima beans and helped lay the foundation for the development of downy mildew-resistant varieties. His appreciation of disease resistance led him into an extensive search for a source of resistance to black rot of crucifers. The decay of potato seed pieces caused large losses to the growers until he and Dr. Otto A. Reinking determined the causal agent and developed a seed treatment for its control. His studies helped establish the nature and importance of various nematode problems on potatoes. A better understanding of the effect of certain growth hormones on wound periderm formation in potato tubers was the result of one of his histological investigations. His researches into the histological relations of various pathogens to their suspects were classic examples of his exacting approach to fundamental research. He realized that methods of disease control were of little value until growers understood how to use them properly, and he spent much time teaching growers how to take advantage of research results. The results of his studies were published in New York State Agricultural Experiment Station bulletins and in various technical journals.

Dr. Cunningham married Margret Caldwell in Kentville, Nova Scotia, on September 16, 1921. She was graduated from Arcadia Ladies Seminary, Wolfwell, Nova Scotia, in 1905. She was a devoted helpmate and encouraged her husband to obtain his Ph.D. degree, although it meant considerable self-sacrifice. They had no children, and she is his sole survivor.

Membership in scientific organizations included the American Phytopathological Society, the American Potato Association, and the American Association for the Advancement of Science. He was a member of the Masonic Lodge, and his activities in Rotary led to the presidency of the Riverhead Chapter in 1934 and 1935. The Congregational Church in the rural community in which he resided benefited greatly from his faithful and dedicated service as a choir member and as a member of various boards and committees. "Doc" and his wife were active in several community clubs, and they were noted for their humorous skits, which they willingly presented on many occasions. Photography was his major hobby, which afforded enjoyment to him and entertainment to others. He also gave valuable assistance to his colleagues in the preparation of illustrations for technical publications. Many young camera enthusiasts have become expert photographers as the result of the encouragement they received from him in camera clubs. He was an expert in handicraft, and he designed and constructed many of the pieces of equipment that were needed for his research activities and for his personal use. The latter included various types

of boats. Because Dr. Cunningham was always willing to give fully of himself, many sought his sound advice, and he will be remembered by all who knew him as “one of the finest men we have ever known.”

Charles D. Chupp, Allan G. Newhall, Robert C. Cetas

Lowell Clem Cunningham

August 3, 1903 — February 20, 1983

Professor Emeritus Lowell C. Cunningham died at the Broadmead Retirement Home, Cockeysville, Maryland, February 20, 1983. The Cunninghams had moved from Ithaca to Broadmead in 1980, after fifty years of active and productive association with Cornell University and the Ithaca community.

Lowell C. Cunningham was reared on a livestock and grain farm in Vermilion County, Illinois. He received the Bachelor of Science degree in agriculture in 1926 and the Master of Science degree with a major concentration in animal husbandry in 1927 from the University of Illinois. His professional career started in LaSalle County, Illinois, where he was an assistant agricultural agent from 1927 to 1930.

In 1930 L. C. Cunningham entered the Graduate School at Cornell University as a graduate assistant in the Department of Agricultural Economics. In 1932 he was appointed an extension instructor and embarked upon an economic study of New York dairy farming, which proved to be the basis for his distinguished career as a dairy economist. He received his doctorate from Cornell in February 1934.

In July 1934 Dr. Cunningham was appointed assistant professor of farm management with primary responsibilities in extension teaching. This was the beginning of a thirty-five-year career as a Cornell professor concentrating on the economic problems of the dairy industry. His work in the early years focused on applied research and extension work with dairy farmers. In the later years he also supervised graduate students and taught an advanced course in farm management. He retired June 30, 1969, and was made an emeritus professor.

The major thrust of Professor Cunningham's work was determining the factors that affect the successful management and operation of dairy farms and the effective use of associated agricultural resources. His research was based on the collection of data from individual dairy farmers in order to determine the factors affecting costs and returns in producing milk. His economic studies were used extensively in developing milk-pricing systems in New York and elsewhere, and he was often called to present testimony and economic information at public hearings. The findings from his research also provided the basis for developing an index of the costs of dairy farming that continues to be used as an important economic indicator.

His early experience as an extension agent gave Professor Cunningham an excellent understanding of cooperative extension and provided the basis for working closely with extension agents throughout his career. He developed

a strong commitment to the importance of coordinating research and extension efforts. Agents were involved in the early stages of planning his applied research studies. He had an equally strong commitment to getting research results to agents, teachers, and farmers promptly. Plans for extending the results were incorporated in his research project statements.

Professor Cunningham was alert to the need of extension agents, teachers of agriculture, and agribusinessmen to obtain current economic data and to improve their understanding of economic issues. He worked closely with these groups to provide teaching materials and in-service education. He was recognized for these efforts in 1968, when the Association of Teachers of Agriculture made him an honorary life member, "in appreciation of the service, cooperation, and assistance rendered to the association." His annual dairy outlook statements were widely used and much appreciated by both agricultural professionals and farmers.

With his highly integrated research and extension program, Professor Cunningham was requested to serve on many state and regional committees. He served on milk-pricing committees for the New York milkshed, was a longtime member of the College Feed Survey Committee of the commercial feed industry, served on the Northeast Regional Farm Management Research Committee, and was active on the College Interdepartmental Dairy Industry Committee for many years. On committees he was especially adept in challenging both old and new ideas, thus adding much to the soundness of decisions made.

Preparing clear, concise economic articles and publications was one of Dr. Cunningham's outstanding talents. He coauthored a book, published numerous research and extension bulletins, and authored more than one hundred articles in professional journals and trade magazines. He was an effective communicator on radio and television. His best known bulletin was *Commercial Dairy Farming in New York*, for which he received a national blue award from the American Association of Agricultural College Editors.

Tours to farms and business firms were used as part of the teaching methods both in Professor Cunningham's extension programs and in his classes. He placed great emphasis on the management experiences of the farmers and the direct interchange with them and students. His tours were carefully planned and organized, included appropriate reference data, and provided for farmer and student interaction; and events were held to a precise schedule. These tours were enjoyed and appreciated by all who participated.

Retirement did not bring an end to Dr. Cunningham's career. He held a Fulbright lectureship in Trinidad for one year, accepted several short-term assignments abroad, and hosted visitors and conducted tours for the

International Agriculture Program in the College of Agriculture and Life Sciences until 1980, when he left the Cornell community.

Lou Cunningham was a person with great drive, energy, and enthusiasm; high standards of performance; and a dedication to serving mankind. He was committed to the seeking out of all relevant facts and then presenting and defending them in the best way he knew how. His impact on the dairy industry and the agriculture of New York State and the nation will be felt for a long time.

In addition to his productivity as a professor of farm management, Lou Cunningham found time for nonprofessorial activities. His family, home, and garden ranked high among his priorities. He swam regularly as a health measure, was an avid bridge player, enjoyed athletic events, and was active in church and community affairs. His nearly fourscore years were full and productive, bringing enrichment to his family, friends, colleagues, and mankind.

He is survived by his wife, Marie Crouch Cunningham, who was a loyal helpmate and supporter in all his professional activities for nearly fifty years, and by their three sons, Jay, Robert, and Lynn, all graduates of Cornell.

George J. Conneman, Bernard F. Stanton, C. Arthur Bratton

Otis Freeman Curtis, Jr.

January 28, 1915 — July 18, 1988

Otis Freeman Curtis, Jr., emeritus professor of plant physiology, Department of Horticultural Sciences, had 73 years of association with Cornell at the time of his death. He was born in Ithaca, the son of Otis F. Curtis, Sr., professor of botany at Cornell, and spent his boyhood here. He received his B.A. degree from Oberlin College in 1936, but came back to Cornell for his Ph.D. degree, which he received in 1940. Otis took a job as junior plant physiologist and instructor at the University of California at Los Angeles from 1940-42. From 1942 to 1946 he was associate physiologist with the United States Department of Agriculture Guayule Project at Salinas, California. He then joined the Department of Pomology of the New York State Agricultural Experiment Station at Geneva, where he stayed until he retired in 1980.

Ote, as he was known, worked primarily in herbicides for fruit crops. He tested many new herbicides that were being developed at that time and also worked in techniques of applying herbicides. He was a regular speaker at the New York State Horticultural Society meetings and the County Fruit Schools on herbicides, and was well-known and appreciated by county agents and fruit growers. He served for many years on the Northeast Weed Control Committee and in the Northeast Weed Science Society. He was awarded a Certificate of Merit of that organization for a paper on "Weed Control in Peach Nurseries with Terbacil."

Otis had several cooperative projects with a number of entomologists and plant pathologists on the effect of various pesticides on the growth and yield of apple trees. In particular, he worked with Dr. Siegfried Lienk on the effect of various levels of mite infestations on the yield of apples. He also worked on techniques of crop forecasting in apples.

Otis was a member of numerous professional societies: American Society for Horticultural Science, International Society for Horticultural Science, Council for Agricultural Science and Technology, Weed Science Society of America, and Sigma Xi. He was interested in university governance, and was a member of the University Senate 1972-74, and the Faculty Council of Representatives 1974-77.

His other greatest interest was barbershop singing. He was very active in the Geneva Chapter SPEBSQSA for 38 years. He was area counselor, president of the local organization, and held several other offices in the group. He sang bass in several quartets. Otis was elected to the National Hall of Fame of the club in 1978.

Another great interest of Otis and Elizabeth, his wife, was the American Indian Program of the Save the Children Foundation. They visited reservations in the south and the southwest and worked in support of the Indian Tribes.

Otis is survived by his wife Elizabeth; his two children, Cynthia (Mrs. Timothy Volin) and Otis F. Curtis, III; his sister, Mrs. Frank Walkley; and four grandchildren.

Otis was a warm and friendly colleague who served the Department of Pomology well. He was always willing to discuss a problem, whether it had to do with herbicides or statistics. He loved the out-of-doors and knew many wild plants. He was a great help in identifying wildflowers.

Robert C. Lamb, Roger D. Way, Donald W. Barton

Otis Freeman Curtis

February 12, 1888 — July 4, 1949

Otis Freeman Curtis, Professor of Botany at Cornell University, died unexpectedly and suddenly on July 4, 1949, while on vacation at Chatham on Cape Cod, Massachusetts. He is survived by his wife, two sons, a daughter, six grandchildren and two sisters.

Dr. Curtis was born in Sendai, Japan, on February 12, 1888, where his father, a minister of the Congregational Church, was active in missionary work. He left Japan at the age of seven and received his education in various parts of the United States, finally entering Oberlin College in 1907 and receiving from Oberlin the A.B. degree in 1911. While at Oberlin he came under the influence of Susan Percival Nichols and Frederick O. Grover, Professors of Botany in that institution, who undoubtedly stimulated young Curtis to enter the field of botany. At Oberlin he held the Oberlin Alumni Magazine Scholarship and during the summers of 1911 and 1912 the Oberlin Botanical Fellowship at the Marine Biological Laboratory at Woods Hole, Massachusetts.

Dr. Curtis entered Cornell in 1912 with his major in what was then the Department of Plant Physiology and which in 1913 became a part of the newly created Department of Botany in the College of Agriculture at Cornell. He obtained the Ph.D. degree from Cornell in 1916. In 1913, while still a graduate student, Curtis became an Instructor in Plant Physiology. He continued in this position until July 1917 when he was made an assistant professor. He became Professor of Botany in 1922, a position which he held until his death. During the year 1926 Dr. Curtis was an exchange professor at the University of Leeds (England) and in the summers of 1930 and 1931 he was a nonresident Professor of Botany at Ohio State University.

At Cornell teaching occupied a large share of Dr. Curtis' time, nevertheless, through great diligence he published about thirty papers dealing chiefly with vegetative reproduction, translocation, temperature and water relations of plants. The name of Dr. Curtis is generally associated with the subject of translocation of solutes in plants. His monograph on the subject brought together in one volume a critical appraisal of the work of others, a summary of his own contributions, deductions concerning the tissues involved and the mechanism involved in translocation. This monograph redirected research in this important field. He pioneered also in emphasizing the relation of re-radiation and the relative non-importance of transpiration in controlling the temperature of plants.

For many years Dr. Curtis, as senior author, and Dr. Daniel G. Clark had been working on a textbook on Plant Physiology. Fortunately, shortly before the death of Dr. Curtis the manuscript was completed.

While contributions of Dr. Curtis to the advancement of knowledge in plant physiology were numerous and important, it is probable that his greater contributions were in teaching. Alternating for many years with Dr. Lewis Knudson in teaching an advanced course in plant physiology which ran throughout the year, he taught anywhere from thirty to sixty graduate students who majored in the plant sciences and soil technology. These men, now scattered throughout this country and in foreign lands where many hold responsible positions in the field of science, recall with pride their association with Dr. Curtis. Throughout his teaching he stressed the dynamic use of factual material in the solution of problems rather than memorizing facts. In his conferences with students he emphasized the importance of critical reading and of analyzing and evaluating the evidence for or against an hypothesis. He took special delight in arousing a group of students to an argumentative discussion of a particular problem. His ideal for teaching was epitomized in his presidential address to the American Society of Plant Physiologists in 1938 which bore the interesting and revealing title, "Education by Authority or for Authority?" As a result of his teaching methods, graduate students during and after their days at Cornell were often heard to say "He taught us to think".

In addition to his duties within the Department of Botany Dr. Curtis devoted many hours to important committees of the College of Agriculture and the University. Committee work to Dr. Curtis was a serious and important phase of university work and he devoted effort to whatever problem was under consideration. At the time of his death he was Chairman of the University Committee on the "Evaluation and Improvement of Instruction", a subject in which he was greatly interested. For many years he was a valuable member of the General Committee of the Graduate School and for the last five years served as secretary of the Graduate School. He took an especial interest in the Graduate School; perhaps because of the fact that in addition to three or four graduate students who majored with him each year there were from forty to sixty graduate students who were registered with him for a minor subject.

It is needless to add that the passing of Dr. Curtis has left a void in the Department of Botany, and his loss is felt by a host of devoted friends in the University. Rarely does one find a man with such high ideals and with such a desire to serve. In this sudden and unexpected passing of Dr. Curtis, Cornell University has lost one of its most earnest and devoted scholars and the field of botany one of its outstanding scientists. Internationally recognized as a leader in his field, his passing at the height of his power is especially regrettable.

C. W. Jones, Lewis Knudson, L. H. MacDaniels

Ralph Wright Curtis

December 8, 1878 — November 13, 1968

The death of Ralph W. Curtis in his ninetieth year brought to a close more than seventy years of devotion and dedication to Cornell University. For thirty-three of these years he was a professor at Cornell and devoted his energies to transmitting to two generations of students his enthusiasm and great understanding of the landscape merits of trees and shrubs. His kindliness and good humor endeared him to each of his students, and his teaching had effects far beyond the subject matter.

Ralph Curtis was born in Burlington, Wisconsin, son of Charles and Mira Vail Curtis and received his early education in Burlington. He first came to Cornell in 1897 and received his B.S. degree in agriculture in 1901 and the M.S. degree in 1905. He continued for a year as an assistant in nature study at Cornell and then left to work in the Boston Park Department under John A. Pettigrew. From this great park superintendent, Ralph Curtis gained his practical experience as well as his bride, Miss Allison Pettigrew, who survives him. In 1909 Professor Charles Sprague Sargent asked him to come to the Arnold Arboretum as assistant superintendent under Jackson Dawson. It was with this background of inspiration and practical experience that Ralph Curtis was called back to Cornell in 1913 by Liberty Hyde Bailey to become assistant professor of landscape art. He retired in 1945 with appointment as emeritus professor of ornamental horticulture.

During the years 1913 to 1945 Ralph Curtis was primarily a teacher and leader among his associates. He taught courses in lawnmaking, plant propagation, landscape design, and the production of trees and shrubs in nursery and park planting, as well as his outstanding courses in woody plants and their landscape value.

His writing included numerous bulletins and mimeographs as well as material for the public press. His voluminous classroom outlines and keys to woody plants were revised continuously; and, while he never published these extensive records, they have served many of his students in later years as the bases of numerous books and courses of study at other institutions. In his professional writing, as in the classroom, he was always concerned with his primary thesis of proper use of plants in creating simple, pleasing, and enduring landscapes. The standards thus set up are now accepted by all progressive plantmen.

Ralph W. Curtis joined Karl M. Wiegand (botany) Ralph Hosmer (forestry) and Eugene Montillon (landscape architecture) in 1928 on the first College of Agriculture study committee for setting up a Cornell Arboretum. This same group continued to serve as key leaders in the Arboretum development that was to become the Cornell

Plantations. Thus the Cornell Plantations stands as most tangible evidence of the interest, proficiency, and faith of Ralph Curtis and his associates.

As a citizen of the Ithaca community he frequently shared his knowledge by writing for the local press and by aiding garden clubs and other civic groups in improving the appearance of local roads, parks, and grounds.

It can most truly be said of Ralph Curtis that his contribution to horticulture lives on through his students, many of whom hold responsible positions in horticulture throughout the country. The significance of his thirty-three teaching years at Cornell lies as much in the regard by which he is held by his students as in his recognition as an authority on ornamental trees and shrubs. He was truly the beloved mentor in his chosen field. In his later years, the accomplishments of his students were the source of great pleasure to him. The strength of his teaching is shown in the number of sponsors of the Cornell Plantations who are former students of Ralph Curtis.

We concur with Albert Hazen Wright when he said that he knew of no finer human, in spirit and in practice, than Ralph Wright Curtis.

L. H. MacDaniels, A. M. S. Pridham, J. F. Cornman

Ella Mary Cushman

April 22, 1886 — February 21, 1967

Poverty was the condition of life for many farm families at the time Ella Cushman began her extension teaching in New York State in 1926, and this condition continued through the 1930's. Miss Cushman brought to her teaching the conviction that farm families could be helped to recognize, use, and develop the resources they had to make their everyday life more satisfying, and that such activity would contribute to the improvement of their total way of life. Her ideas are finding renewed interest today, although now the concern centers on low-income families in our large metropolitan areas.

Although Miss Cushman came to Cornell as an extension instructor in clothing, a latent interest in organization and management was developed by Martha Van Rensselaer and Dexter Kimball while Miss Cushman was a graduate student in 1927-28. As chairman of Miss Cushman's graduate committee, Miss Van Rensselaer encouraged the investigation of the organization of sewing centers as the subject of a Master's thesis. Miss Van Rensselaer had a long-time interest in work organization and had written the first issue of the Cornell Reading Course for Farmers' Wives, "Saving Steps," in 1901. Dean Kimball, as a member of Miss Cushman's committee, introduced her to scientific management in industry and to work-study methods which she used for her research. It was probably through her association with Dean Kimball that she met the Gilbreths.

During the spring of 1928, at the invitation of Dr. Lillian Gilbreth, Miss Cushman visited the Gilbreth Micromotion Laboratory in Montclair, New Jersey. She was eager to learn the method of analyzing micromotion films and to consider the possibilities of adapting this technique to the study of household tasks. This experience probably emphasized to Miss Cushman the importance of photographic records of work areas—a technique she used extensively in teaching. Her friendship with Mrs. Gilbreth continued through her lifetime as did her interest in the developments in industrial management. In 1952, Miss Cushman took part in a round-table discussion of "Management in the Home" at a program sponsored by the Washington Chapter of the Society for the Advancement of Management. She discussed principles of home management as illustrated through her experiences in many homes.

Ella Cushman was born in Akron, Ohio, in 1886. Because of family responsibilities, her college education was delayed, and it was not until 1915 that she graduated from Kent State Normal School. She obtained a B.S. degree

from Teachers College, Columbia University, in 1925. While Miss Cushman was studying for the M.S. degree, which she received from Cornell in 1928, she held the Mrs. Henry Morgenthau Fellowship.

Upon completion of her graduate study Miss Cushman was appointed extension instructor in economics of the household and household management. She was promoted to Extension Assistant Professor in 1935. During extension appointments Miss Cushman taught in the resident program for summer sessions in 1934-37 and also in the regular academic fall term of 1936-37. In 1938, Miss Cushman moved into resident teaching full time and was promoted to Associate Professor in 1941. She became a professor in 1950 and was named a Professor Emeritus, following her retirement in 1954.

In her many Cornell Extension bulletins and her book, *Management in Homes*, this teacher-author dealt with actual homes in which families lived. From the written words and the many photographs, homemakers and students gained insight into the ways in which differently situated families had achieved important goals in the face of varied obstacles.

Miss Cushman pioneered in such effective teaching methods as management conferences in homes and management tours of homes. Carloads of interested men and women joined the tours to see the improvements that families had made in their homes, to hear the family members describe the satisfactions they had gained from the intelligent use of their resources, and to return home with new ideas. Pictures of work areas in many of the thousands of homes in which she taught from 1928 to 1954 proved to have far-reaching value. They provided ideas to students, homemakers, and social workers in New York and other states, even foreign countries. Builders, carpenters, and manufacturers of household equipment put the new designs into mass production.

In Miss Cushman's applications from industrial management, she never lost sight of individual values and goals of families and students with whom she worked. She was vitally interested in good methods of teaching. She had the courage to try methods that she originated, first in extension teaching and later in resident classes.

The presence in the Cornell community of her brother, Robert E. Cushman, now Professor of Government, Emeritus, and his family gave to Miss Cushman both pleasure and stimulation.

Mabel Rollins, Kathryn Walker, Elizabeth Wiegand

Harold R. Cushman

December 21, 1920 — July 28, 2007

Harold R. Cushman was born in Ferrisburg, Vermont and grew up on a dairy farm during the Great Depression. He served in the U.S. Army during World War II, taught high school agriculture in Vermont, served as an agricultural education professor at the University of Vermont and Cornell University, and spent much of his professional life working in the South Pacific. Harold is survived by his wife, Natalia, who still lives in the home they shared in Ithaca, New York; two daughters, Janette and Nanette; two sons, Robert and William; 11 grandchildren; and four great-grandchildren. His eldest son, Richard, predeceased him.

Harold graduated from Vergennes High School, having been a student in the agricultural education program and serving as his local FFA Chapter President and as the Vermont FFA State Reporter. He worked his way through the University of Vermont with the help of scholarships, majoring in agriculture and graduating in 1941. He began teaching agriculture at Peacham Academy that fall and completed his first year of teaching before enlisting in the Army in August 1942.

Harold attended Officer Candidate School at Ft. Knox, Kentucky and was commissioned as a Second Lieutenant. He was stationed at Camp Polk, Louisiana until being transferred to England in November 1944. On Christmas Day 1945, the German Army began a major winter campaign in the Ardennes region of France that came to be known as the Battle of the Bulge. Lt. Cushman's unit had been scheduled to deploy some time after the beginning of 1945 but when Allied commanders realized the seriousness of the German offensive, he and his unit were immediately rushed overnight to France to help counter the attack. During the remainder of the war in Europe, he served as an armored Infantry troop leader and company commander in the 8th Armored Division of the U.S. Army. Lt. Cushman was wounded in close combat; his injuries resulted in medical evacuation and extended convalescence until the end of the war in Europe. By the end of the war, Cushman had been promoted to First Lieutenant and had been awarded the European Service Medal with Battle Star for the Rhineland Campaign, the Bronze Star medal, the Combat Infantry Badge, and the Purple Heart medal with Oak Leaf Cluster.

After the war, Mr. Cushman taught agriculture in Woodstock, Vermont for three years. After Woodstock, he was appointed to a half-time position as Assistant State Supervisor of Agricultural Education for Vermont and attended graduate school half time, completing a Master's degree at the University of Vermont in 1949. He attended Cornell University for his doctoral studies and earned his Ph.D. degree in Agricultural Education in 1951.

Dr. Cushman began a long career in higher education as an Assistant Professor of Agricultural Education at the University of Vermont in 1951. In 1955, he moved to Cornell University as a faculty member in the Department of Education serving as a member of the Agricultural Education team until his retirement in 1990. He taught courses in Agricultural Education, directed 39 graduate Master's theses and doctoral dissertations, developed curriculum, and worked to improve teaching methods.

Professor Cushman was best known for his international work. In the early 1960s, he was assigned as a Visiting Professor at the University of the Philippines College of Agriculture at Los Baños to help rebuild the undergraduate agriculture program with funding from the International Cooperation Administration (ICA). He followed his Los Baños ICA tour with post-doctoral study at the University of Hawaii, returning to Ithaca in 1962. He was promoted to Associate Professor in 1963 and to Professor in 1968. Professor Cushman returned to Los Baños for a second tour in 1968-70, during which he helped establish the College of Agriculture as a graduate educational and research center for agriculture in Southeast Asia. He returned to Ithaca briefly in 1970-71. He was appointed by the United Nations as a Rural Education Officer at the University of the South Pacific in Western Samoa in 1972 and simultaneously appointed as the first Professor of Agriculture at the University of the South Pacific. His work led directly to the establishment of the University's Agriculture Bachelor's degree program. That tour was followed by a return to Ithaca lasting from 1973-79. His next international posting was to Papua New Guinea in 1979-80 followed by an assignment to the South Pacific Region Agriculture Development (SPRAD) Program in Fiji from 1980-86, on a grant from the U.S. Agency for International Development with the University of Hawaii and Cornell University. As a part of the SPRAD program, Professor Cushman developed and implemented a teacher preparation program in Agricultural Education at the University of the South Pacific.

In all of Harold's international projects, he recruited local graduate students for Cornell to prepare them to staff the programs when the project funding was terminated. Between his international assignments, Harold was a teacher educator in agriculture advising undergraduates and graduate students, teaching, and conducting research. Jointly with the late Professor Fred F.K. Tom, he developed a program for evaluation of college teaching that was used at Cornell and other higher education institutions.

One of Harold's former colleagues said:

"It was my privilege to work with Harold Cushman from my joining the CALS Education faculty in 1967 to his retirement in 1990. We collaborated in research, co-taught courses, and co-authored research papers. Harold's advice and assistance was very important for me as a new faculty member. He was also a close personal friend including deer hunting in New York and Vermont. I will both miss and remember him."

A former student said:

“Harold Cushman was my faculty advisor at Cornell. As one of the early female agriculture teacher candidates, he gave me advice as if I wasn’t a female in a male dominated world. He was similar to my parents by telling me that I could do anything if I put my mind to it. Thirty years later I am still following his advice and counsel.”

In 2005, Harold published a book of memoirs entitled *The Other Side of the Mountain*, in which he recounted his experiences as a child in Vermont, his war years in the Army, his years as an agriculture teacher in Vermont, his university career at the University of Vermont and Cornell, and his life with family and friends. Some of Harold’s most interesting stories involved his experiences in the War, his days in Vermont and New York hunting deer and bear, and his experience in the South Pacific working in sometimes dangerous but always interesting settings. Reflecting back on his life with the kind of wisdom that comes only with age and experience, Harold concluded his book with what he called “a few rules for life:”

- Dare to dream big when setting your life’s goals.
- Get all the education you’ll need to achieve your goals. Don’t let anything stop you. Stay in school.
- Work hard when you have to. Otherwise, don’t strain yourself needlessly.
- Pursue your hobbies vigorously.
- Listen a lot – and carefully.
- Be a team player. You’ll need the stimulus of others to do your best.
- If you can’t say anything positive or pleasant, keep your mouth shut.
- Volunteer for tough jobs; they have more payoff. Take reasonable risks.
- Be persistent. Don’t give in to aches, pains, or loneliness. Hang tough. See it through. Life is not always a stroll in a rose garden!!
- Make love the central theme of your life and your relationship with others.

William G. Camp, Chairperson; Arthur L. Berkey, Daryle E Foster, Richard E. Ripple

Robert Eugene Cushman

March 27, 1889 — June 9, 1969

Robert Eugene Cushman, Goldwin Smith Professor of Government, Emeritus, and for many years head of the Department of Government, died in Washington, D. C., on June 9, 1969. He was born in Akron, Ohio, on March 27, 1889, and was the son of Sylvanus Dustin Cushman and his wife Estelle Caroline. Professor Cushman married Clarissa White Fairchild in 1916. They had two sons, Robert and John.

Professor Cushman had his formal education at Oberlin College and Columbia University. Columbia gave him the Ph.D. degree in 1917; Oberlin gave him an honorary Litt.D. degree in 1946. Study and writing and teaching, together with some involvement in academic administration, filled up his professional life from the time he began as an instructor in history and civics at Oberlin Academy in 1911 until he retired in 1957, after thirty-four years of service at Cornell. In 1958 he moved to Washington where he took over the position of editor-in-chief of the *Documentary History of the Ratification of the Constitution*. The location of his command post in the National Archives Building was proof that he was in full-time service.

While at Cornell, Professor Cushman took part in the work of the University faculty. The faculty elected him to serve as its representative on the University Board of Trustees for a period of five years. He was also a trustee of Wells College. His professional eminence caused him to be chosen a member of President Roosevelt's Committee on Administrative Management and to become a fellow of the American Academy of Arts and Science. In 1944 he served as president of the American Political Science Association.

The Political Science Quarterly published his first article in 1913. Year by year, from that time till his death, he contributed to the study of American government by books and articles and reviews. The range was wide. His *Leading Constitutional Decisions*, first published in 1925 and issued in a dozen or so later editions, shows the great central area of his work as an undergraduate teacher. In his study of *Independent Regulatory Commissions* he compared the administrative procedures of the United States with those of Great Britain and other European countries. He wrote about the case of the Nazi saboteurs. But his chief concern as a scholar and writer from 1940 was the problem of civil liberties. He himself wrote much on the subject—his presidential address to the Political Science Association in 1944 was on the topic “Civil Liberties after the War”—and, in addition, he launched the Cornell Studies in Civil Liberty with a grant from the Rockefeller Foundation. When some of Professor Cushman's

students and colleagues published a volume of essays in 1958 to show their affection and respect, they gave it the title *Aspects of Liberty*.

To many thousands of Cornell undergraduates Professor Cushman was the teacher of the elementary course in American government, and in him they saw the Cornell concept of undergraduate teaching at its best. The teacher was a scholar of eminence and a man of practical experience in the working of national government. He presented his subject simply, directly, vigorously; he answered questions, offered interpretations, and dealt with one and all, freshman or graduate student, in class and out, as though they shared with him in the business of learning. As a teacher-scholar he was one of a marvellous foursome of contemporaries who had offices side by side in Boardman Hall: Carl L. Becker, M. L. W. Laistner, Robert E. Cushman, and Carl Stephenson.

To his colleagues and other friends Professor Cushman was an open, warm companion; they went to him for practical advice, or to state a case about University policy, or to talk over the affairs of the day. He listened well, he spoke with simple force; his voice, with a hint of dryness in it, kept to the facts, to the logic, to the way of reason.

He was in many respects the perfect representative of the Cornell professor of the 1930s, 40s, and 50s. He was both teacher and scholar, he participated in the management of University affairs, he presided over the growth of a department which gave strength to the College of Arts and Sciences and to the University, He brought his students face to face with the governmental problems with which they were to contend, above all with the problem of civil liberty.

Herbert W. Briggs, John W. MacDonald, Frederick George Marcham

Edward Cussler

May 3, 1882 — February 2, 1949

Edward Cussler, Assistant Professor of Clinical Medicine, was born near Catskill, New York on May 3, 1882 and died in his 67th year at his home in New York City. After graduating from Columbia University where he received the degree of Doctor of Medicine in 1904, he served on the staff of the New York Hospital for a period of forty-four years. His service during that time was varied and comprehensive. Beginning as assistant house physician in 1905, he served in turn as house physician, 1906; physician to the Out Patient Department, 1907 to 1911 and associate attending physician from 1912 to 1922. He continued on the staff of the New York Hospital from 1932 to 1948 and was made Consulting Physician in 1948. In addition he was internist at the New York Hospital in Westchester from 1925 to 1948 and Consulting Physician from 1948 to 1949.

Dr. Cussler was interested in medical education from the beginning of his medical career. He taught at the College of Physicians and Surgeons from 1907 through 1916. He came to Cornell in 1932 as Assistant Professor of Clinical Medicine and continued in that capacity until his death.

From 1906 until his death Dr. Cussler was in active practice as an Internist in New York City. Here he made his reputation as an astute diagnostician and sound therapist. He was interested in his patient as an individual, and through his unusual power as a listener he lead the most reserved patient to unburden his problems to him freely. His skill imbued the patient with confidence so that he left the consulting room with relief of mind and belief in his future. Through his own fortitude and philosophy he gave comfort to even the incurably ill.

Dr. Cussler was universally beloved and admired as a devoted physician and loyal friend.

Connie M. Guion

Trevor Rhys Cuykendall

November 30, 1905 — June 4, 1985

Trevor Rhys Cuykendall came to Cornell from the University of Denver as a graduate student in physics in 1929 and retired as the Spencer T. Olin Professor of Engineering Emeritus in 1972. During the major part of his long tenure at Cornell, Trevor Cuykendall played a central role in developing and sustaining the excellence of the innovative curriculum of engineering physics in the College of Engineering.

Finishing his doctoral research in the field of high-energy X-ray physics, he showed an early interest in areas of engineering that were strongly based on physics, such as photoelastic modeling of structural shapes, on which he worked with Professor S. C. Hollister. However, it was in his work at the Naval Ordnance Laboratory, and then at the Los Alamos Scientific Laboratory, during the war years that he came to realize the need for a new type of engineering curriculum. During those years he worked very closely with hundreds of young engineers and physicists on widely varying projects that required background training in both engineering and physics. He quickly sensed that very few of his co-workers were properly trained for the demands set by the fast pace of the war-time effort. He realized that generally a combination of engineering and physics training would continue to be in demand long after the war. This realization was the basis of his deep commitment to the development of engineering physics and its undergraduate teaching and administration.

Returning to Cornell in 1946, Cuykendall found this same understanding among the other physicists who were returning to Cornell from their war work. With the effort given direction by Lloyd P. Smith, chairman of the Department of Physics, and the strong support of S. C. Hollister, then dean of the College of Engineering, a Department of Engineering Physics, with Lloyd Smith as director, was established in the College of Engineering. They saw this course of undergraduate study, an engineering curriculum combined tightly with physics and mathematics, as the necessary basis for the postwar education of future engineers, who would have to deal with an ever innovative, changing, and expanding technology.

Trevor Cuykendall and Henri Sack were co-opted as the primary faculty members in the establishment of the new department. In their complementary ways, and with a small group of faculty members from physics-, chemistry-, mathematics-, and science-oriented faculty in the College of Engineering, they developed a unique undergraduate program that set the highest standards of excellence, combining a strong core of courses in the physical sciences and mathematics with engineering courses. Trevor Cuykendall was director of the Department of Engineering

Physics from 1956 to 1962. Under his guidance the department grew, taking on new faculty members in areas of solid-state physics and nuclear engineering, strengthening the teaching in the undergraduate program, and establishing a strong graduate Field of Applied Physics. He taught several key courses and was particularly active in the development of the program in nuclear engineering and research in reactor physics. Through his efforts the TRIGA reactor was brought to Cornell as a teaching and research tool, which was housed in a building specially constructed for it, the Ward Laboratory.

Nationally he played a significant role in promoting the teaching of reactor physics and nuclear engineering as a consultant to the Atomic Energy Commission and as the chairman or member of a number of the commission's committees and panels on nuclear engineering education and training. From 1962 to 1966, when engineering physics and materials science were one department, he became the associate director in charge of the undergraduate curriculum and student advising. In 1967, when engineering physics and materials science and engineering were separated, he again became the director of engineering physics. He continued to guide the undergraduate program until his retirement in 1972. During this period of leadership he made engineering physics a strong, unique program that to this day continues to attract many of the best undergraduate students in the College of Engineering.

His outstanding success in pursuing his commitment, in guiding students and faculty members alike, was due in large part to his "unflappable" personality—to the knowledge whereof he spoke, to his unfailingly quiet, encouraging sympathy toward everyone. Unobtrusively persuasive and always helpful, he is and shall be forever cherished with affection by all who have been fortunate to have entered his sphere of influence.

We will also remember his joy in the beauties of nature, especially his native Rocky Mountains. His love of the varied American landscape was beautifully expressed in the paintings of Muriel Fetterly Cuykendall, Trevor's first wife, who died in 1968. Some of her paintings now add warmth and character to the engineering physics student lounge in Clark Hall. Muriel Cuykendall, a physician for many of the public schools of the district, is remembered with Trevor and their children, Mary and Robert, for the friendly hospitality they shared with their many friends and colleagues.

Trevor and his second wife, Helen, moved to Englewood, Florida, shortly after they both retired from Cornell. There she cared for him through his later years of declining health and long illness.

Paul L. Hartman, Lyman G. Parratt, Benjamin M. Siegel

Arthur C. Dahlberg

1896 — May 5, 1964

A long and distinguished career in dairy science and technology came to an end on the fifth day of May 1964, when Arthur C. Dahlberg, Professor Emeritus of Dairy Industry at Cornell University, died at his home in Florida. In a day of specialization when it is most difficult for a scientist to keep abreast of movements in a single phase of a discipline, Dr. Dahlberg remained a foremost authority not only on most of the phases of dairy manufacturing and the sanitary handling of milk, but also on dairy cattle breeding and dairy cattle production. To many, he was known for the development of processes for making cheeses, but he was as famous in the ice cream industry for his work on flavorings and body and texture of ice cream. His work, sponsored by the National Research Council to determine the sanitary and physical conditions of the milk supplies of our major cities, remains an outstanding contribution to sanitary science.

His studies on milking machines, carried out at the Geneva Experiment Station about thirty-five years ago, remain the basis for present proper milking methods.

Dr. Dahlberg was born on a dairy farm in Wisconsin four years before the turn of the century. From the University of Minnesota in 1915, he received the B.S. and M.S. degrees in agricultural chemistry. He then became an instructor in dairy manufacturing at the University of Wisconsin. A brief period of service for the U.S. Navy as an inspector of butter followed, whereupon he accepted a position as creamery extension specialist at North Dakota State University. In 1919 he was superintendent of a co-operative creamery in Fargo, North Dakota, leaving shortly thereafter for a research post at the New York State Agricultural Experiment Station, Geneva, New York. During this early period he completed the University of Illinois requirements for an advanced degree and was awarded the Ph.D. in 1929. He served at the Geneva Experiment Station from 1921 until 1943, at which time he became Professor of Dairy Science at Cornell University, a post that he held until his retirement in 1963.

Dr. Dahlberg was the author or co-author of 179 research publications and the holder of several patents. He gave many lectures and published many papers of both a scientific and a popular nature. The Borden Award for excellence in research in dairy manufacturing was given to him in 1944.

In 1937 he was an official delegate of the U.S. government to the International Dairy Congress in Berlin, Germany. He traveled on technical missions for the U.S. Department of Agriculture to Costa Rica, Honduras, Nicaragua, and Panama during World War II. He has served as an adviser on many committees of the U.S. Department of

Agriculture and of the U.S. Department of Health, Education, and Welfare. He was for many years an adviser to the board of directors of the Dairy Products Improvement Institute, a non-profit organization interested in improving milk and milk product quality. He was an officer of the New York State Jersey Cattle Club from 1923 to 1948.

He served as director, vice-president, and president of the American Dairy Science Association and was editor of the *Journal of Dairy Science* from 1928 to 1938. In 1958, he was elected an honorary member of that association, the highest recognition given by that society.

He was a member of Sigma Xi, Gamma Sigma Delta, and Phi Kappa Phi. His biography has appeared continuously in *Who's Who in America* from 1930 until his death. In 1960 he was elected a fellow in the American Public Health Association.

Dr. Dahlberg brought to the dairy industry a keen mind, an understanding of the chemical, physical, and bacteriological problems that beset the industry, and the initiative to attack the dairy industry's problems with vigor. Those who worked with him were appreciative of his intuitive understanding of a problem, his resource in getting a job done, and his lively sense of humor that was always evident to those who worked with him. He leaves us a large legacy of scientific work, and he will be missed greatly by those in his chosen field.

In his personal life Dr. Dahlberg showed civic responsibility of a high order. He was president of the Rotary Club of Geneva and was a member of the board of trustees of the Geneva General Hospital and of the North Presbyterian Church.

Professor and Mrs. Dahlberg, the former Lenora Damuth of Ft. Atkinson, Wisconsin, have two children—a daughter Leola with whom they were residing in Florida, and a son Dale, a technical dairy manufacturing consultant.

F. V. Kosikowski, C. S. Pederson, J. C. White

George Irving Dale

August 12, 1886 — June 19, 1960

George Irving Dale was born in Rome, New York, the son of James and Edith (Heeley) Dale. He attended the Schenectady High School and graduated from Cornell with the degree of A.B. in 1910. He was a member of Bandhu fraternity and of Phi Beta Kappa. He remained at Cornell as a graduate student, working especially with Professor Everett Ward Olmsted, and collaborating with his master in the composition and publication of a *French Grammar*. He took the Ph.D. degree with Spanish as his major subject in 1918. Previously, in 1915, he had gone to Washington University, St. Louis; there he rose to be Professor.

He returned to Cornell in 1925 as Professor of Romance Languages, becoming in 1946 Professor of Romance Literature. He retired in 1954, after 29 years on the Cornell Faculty.

He was an admirable linguist, competent in Russian as well as the Romance languages, and was a cogent writer. In addition to many articles for scholarly journals and compendia, and the *French Grammar* mentioned above, he published a critical edition of *Ver y no creer*, a seventeenth-century play attributed to Lope de Vega, a *Portuguese Reader* (the first in this country), and a *Spanish Grammar* (with Thomas G. Bergin). He was associate editor of *Hispania*, the journal of teachers of Spanish, and was prominent in the meetings of the Modern Language Association. His special interest was in the drama of the seventeenth century, the Spanish Golden Age.

He was one of the kindest, the sweetest-natured, of men. His character made him an exemplary teacher—not that he was easy with his students, but because he was eager to draw forth their interest in the subjects of his own enthusiasm. Many former students, now themselves teachers of Romance languages, owe their first stimulation in the subject to his example.

The old teachers pass, one by one, and their friends who knew their qualities and virtues pass too. But the old teachers remain alive in their students' methods, memories, and affections. The students will in turn pass on something of what they have learned from their masters. This is the special immortality vouchsafed to the good teacher.

George Dale is survived by his wife, the former Alvena Hartung, whom he married in 1914; by his daughter Marjorie, Cornell '40, now Mrs. John G. Hemingway of Lyons; and by five grandchildren.

Morris Bishop, Harry Caplan, Blanchard L. Rideout

Norman D. Daly

August 9, 1911 — April 2, 2008

One of Norman Daly's proudest achievements was having taught at Cornell for over 50 years, in a career which began in 1942. He was probably the most influential art teacher in the post-war years in a long and remarkable career. It was a time when the University truly valued a strong independent Art Department as his esteemed colleagues joined him: Joe Hanson, John Hartell, Kenneth Evett, and Victor Colby. Norman Daly often remarked that he had been privileged to teach at Cornell during its golden age which he defined as that period after the war when all the veterans were returning to school, filled with enthusiasm, intellectual curiosity and the need to accomplish.

What made Norman so successful and valued as a teacher was his ability to sustain throughout his career, both as artist and teacher, an ever youthful and innovative mind forever searching out new ways to communicate, spreading out beyond the realm of visual aesthetics to archeology, music, poetry, history, anthropology, etc, etc. This served to make him invaluable to ever changing generations of students who brought new needs to their learning as well as providing him with the tools for his greatest artistic accomplishment to make him a peerless teacher of teachers.

Norman was born in Pittsburgh in 1911, receiving his undergraduate degree from the University of Colorado and Master of Fine Arts degree from Ohio State University. Professor Daly took great pride in having been a featherweight boxer as an undergraduate as well as a bartender in Chicago where he had been told to keep a knife behind the bar. He did post graduate work in Paris as well as the Institute of Fine Arts of New York University. This diverse education gave him a great breadth of knowledge and erudition not often encountered.

After arriving at Cornell, he began an active exhibiting career, which included such galleries as Lurand-Ruel, Betty Parsons, Bertha Schaefer and the Rochester Memorial Museum as well as the State Archeology Museum in Bochum, Germany. Over his long career, he was represented in countless group exhibitions as well as achieving many awards and commissions. He is likewise represented in collections at Oberlin College, Walker Art Center, University of Washington, Seattle, Rochester Memorial Art Gallery, etc.

In 1972, Norman exhibited the largest project he had ever conceived and worked on at the Andrew Dickson White Museum. It was nothing less than the invention of an entire civilization, the Civilization of Llhuros, a project whose production had consumed him for well over a decade and whose roots went back to his beginnings

as an artist. It was his protean qualities that allowed him to achieve this conceit for he was a painter but also a sculptor and conceptual artist, a found object artist, a musician, historian, actor, playwright and an insightful observer of the human condition. The civilization is a satire on how we humans organize ourselves into groups, form religions, taboos and conduct our lives in accordance with strict unsparing rules of behavior. Norman Daly explored as many avenues of how we organize our lives as any single artist could be expected to do.

This brilliant exhibition when fully installed often entirely filled a museum. It was shown internationally to rave reviews in the national and international press breaking attendance records when exhibited in Berlin. In the ensuing years, Norman Daly never stopped working on his civilization. He created music, church liturgy, further artifacts and a play, which was produced at Cornell. He was involved with art until the very last years of his life, never losing his ardor and enthusiasm. As the years gathered, his loving son, Dr. David Daly, helped him in this and his many projects.

On a personal note, Professor Blum clearly remembers his Llhuros exhibit in the Rochester Memorial Museum when he dressed in a completely black ninja outfit replete with an immense gold medallion that he had made. He addressed an audience of over 300 museum goers posing as a Scandinavian archeologist who sought to debunk the entire exhibit as an obvious fraud. He soon convinced the audience of this. They left the hall with a new sense of their own erudition.

Professor Daly was truly a man for all seasons.

Moses Zevi Blum, Chairperson; Victor Kord, Eleanore Mikus

Louise Jane Daniel

October 28, 1912 — October 18, 2001

Louise Jane Daniel was born on October 28, 1912 in Philadelphia along with her twin sister, Marcia. She majored in Chemistry at the University of Pennsylvania, graduating in 1935. She received her M.S. degree in Biological Chemistry from Penn State in 1936, and her Ph.D. degree in Nutrition and Biochemistry from Cornell University in 1945. She taught Chemistry and Physics from 1936-42 at Penn Hall Junior College in Chambersburg, Pennsylvania. After finishing her Ph.D. degree, she worked as a Research Associate in the Cornell Poultry Department from 1945-48, and then joined the Cornell faculty as an Assistant Professor in the Department of Biochemistry and Nutrition in 1948. She was promoted to Associate Professor in 1951 and to full Professor of Biochemistry in 1958. She retired in 1973, as an Emeritus Professor. Louise's major hobbies were bird watching and gardening. Louise continued to live in Ithaca until 1985, when she moved to California where she lived with her sister. Louise died on October 18, 2001 in Carmel, California.

Despite the major difficulties facing women scientists in the first half of the Twentieth Century, Louise carried out pioneering research on the role of vitamins focusing on folic acid and vitamin B12, often collaborating with Dr. Louise Gray in the U.S. Plant Soil and Nutrition Laboratory. She trained twelve Ph.D. students, several of whom joined the Cornell faculty and published forty-one papers.

Louise's first love was teaching, at which she excelled. She taught Introductory Biochemistry in the College of Home Economics (Human Ecology) from 1948-58 and General Biochemistry in the College of Agriculture from 1958-73. In addition, she taught a biochemistry laboratory course from 1948-64, and wrote a laboratory textbook with Professor Leslie Neal in 1967. Finally, she taught an upper level course on the Biochemistry of Vitamins every other year from 1955-73. Despite her general biochemistry course being scheduled at 8:00 a.m., her lectures were always well attended. Each year she would consult with faculty specializing in different areas of biochemistry to make certain her course was up to date. In 1964, Louise took a sabbatical leave touring European universities to study their biochemistry courses and teaching methods.

Her retirement led to a major change in biochemistry teaching. It took six people to replace her as her course was split into an auto tutorial course, BioSci 330, and a lecture course, BioSci 331. Her longtime associate in teaching, Dr. Joan Griffiths, wrote:

“I knew Dr. D for several decades, first as one of her graduate students, as her teaching assistant, and as a friend. She was the best educator I have encountered anywhere, but she was more than that. She was the consummate professional. Dr. D never refused to serve on committees and was always available for her students. Her research was impeccable and she required the same precision from her graduate students. I feel as if an era has ended.”

Louise was honored for her teaching by being voted the Professor of Merit in 1970 by the graduating seniors in the College of Agriculture and Life Sciences. The Alpha Chapter of Sigma Delta Epsilon/Graduate Women in Science also honored her in 1988. Louise was such a warm and friendly person, and will be missed by all who knew her.

George Lust, Ross MacIntyre, David B. Wilson

Arthur Gordon Danks

December 10, 1906 — July 1, 1989

Born to a farm family at Allamuchy, New Jersey, Gordon Danks had an early introduction into the field of animal care. His father was a widely known breeder and judge of dairy cattle and sheep. It is therefore quite understandable why Gordon would select veterinary medicine as his lifetime pursuit. This choice was strengthened by his admiration of Dr. Neil Gordon Darby, the farm veterinarian.

His secondary training was obtained at Blair Academy, Blairstown, New Jersey, after which he acquired a B.S. degree at Pennsylvania State College in 1929. He interrupted his education during the year 1926-27 to lease and operate a 100-acre dairy farm in northern New Jersey. This confirmed his desire to obtain a veterinary degree.

He entered Cornell in 1929 and, because of his advance training, was able to finish his course work in three and one half years. During this time he served as student assistant in physiology and helped in two other departments from time to time. Since his classroom obligations were completed in midterm, he was permitted to assist in the Small Animal Clinic during the second semester of his final year. He was awarded the D.V.M. degree in June, 1933.

Upon graduation he spent a year in general practice at Allamuchy, New Jersey. In 1934 he obtained an appointment as instructor in the Department of Surgery and Medicine at Kansas State College, Manhattan, Kansas.

It was in Kansas that he met and married Bernice Sutherland. To this happy union in due time were added four children. They are Mrs. Gary Homer (Marguerite), Gordon Sutherland, Edward Robert and Paul Douglas.

Dr. Danks remained at Kansas State until July 1936 when he accepted an appointment as instructor in Large Animal Surgery at Cornell. From 1936 to 1948 he rose through the ranks to a full professorship. In addition to his clinical and teaching duties he became active in the affairs of the *Cornell Veterinarian*, a unique veterinary publication with world-wide circulation.

With the January issue of 1938, he became the assistant editor to Dr. D.H. Udall. When Dr. Udall resigned in 1939, Danks took over the editorship. At that time he was the youngest editor of a major veterinary publication in this country. He held this position until 1942 when the pressure of clinical teaching forced him to relinquish it. World War II was in progress, the curriculum had been accelerated, and Dr. Frost was on sabbatic leave. Danks was the only person of faculty rank in the department and his schedule was tight in order to meet all his commitments. In the autumn of 1942 he published a new revised edition of Williams's *Surgical and Obstetrical Operations*.

In 1948 he left Cornell to become the director of the Department of Surgery and Medicine at the University of Illinois at Urbana, Illinois. He was disappointed with his choice, and after a brief period moved to the University of Pennsylvania as professor of animal husbandry and manager of the New Bolton Farm at the School of Veterinary Medicine.

His return to Cornell in 1950 occurred shortly after the death of Dr. J.N. Frost. For the next twelve years he served as professor and head of the Department of Veterinary Surgery and director of the Large Animal Clinic. During that time he was forced to abandon his surgical activities because of a physical disability.

He was appointed the first director of College's Student Administration in 1962 and remained in that position until he retired in 1970. He was granted emeritus status that same year.

Gordon Danks's contributions to veterinary medicine covered a broad spectrum. His written offerings were sound and concise, and were primarily in the field of clinical veterinary surgery. He was a good teacher and instilled professional discipline in his students. His services were widely sought for programs of veterinary organizations throughout the country, and he received many attractive offers from other colleges including the deanship at one veterinary college. He served the American Veterinary Medical Association as a member of the Research Council and as a trustee on the Group Insurance Trust. The A.V.M.A. awarded him Gold Star membership. At the state level, he was president of the New York State Veterinary Medical Society in 1973 and elected a distinguished member in 1981. He was also voted "Veterinarian of the Year" by the State Society in 1964.

The Southern Tier Veterinary Medical Association elected him president in 1967, and in 1976 the New York State Agricultural Society awarded him a distinguished service citation.

His fraternal affiliations included Alpha Zeta, Gamma Sigma Delta, Phi Zeta, Phi Kappa Phi, Sigma Xi, and Alpha Psi. Gordon had a wide acquaintance with veterinarians across the country and visited with many of them during trips that he made after retirement. His was an encyclopedic knowledge concerning the veterinary graduates from Cornell, and many questions about our alumni were referred to him.

During his active years he often served as a consultant to the dean, especially during the construction of the east campus and during the establishment of the student administration service. For his distinguished alumni service he was presented the Daniel Elmer Salmon Award in 1986. In his declining years, his veterinary activities were severely curtailed. but in spite of the long illness his interest remained, as illustrated by his attendance at the alumni breakfast in June, 1989.

Francis H. Fox, John M. King, Ellis P. Leonard

Harold W. K. Dargeon

May 7, 1897 — October 29, 1970

The loss of Dr. Harold Dargeon, a highly respected and beloved pediatrician and authority in the field of cancer in children, is deeply felt by all. A native New Yorker, Dr. Dargeon was graduated from Fordham University in 1919 and from Albany Medical College in 1922. He completed his internship at the 4th Division Bellevue Hospital, became an assistant attending physician at Willard Parker Hospital, then an assistant attending pediatrician at St. Luke's Hospital and subsequently at New York Foundling Hospital.

Dr. Dargeon's interest in juvenile cancer began in 1933, and with the establishment of the first children's cancer ward in this country he was appointed to the attending staff of the Memorial Hospital for Cancer and Allied Diseases, where he later served as the chairman of the Department of Pediatrics. He also established the first training program in cancer for Pediatric residents.

In the early 1930s, with the cooperation of the American Academy of Pediatrics, Dr. Dargeon established the first pediatric tumor registry in this country. These records together with his own experiences constitute the basis for the descriptions of the clinical aspects of 1,418 malignant tumors and 1,800 benign tumors in children, described in his second book, *Tumors of Childhood*, published in 1960. In 1940 he edited *Cancer in Childhood*, the first book written in English dealing exclusively with juvenile neoplasms. In 1966 he published a monograph on reticuloendotheliosis and he has authored sixty-three scientific articles and books. Dr. Dargeon also participated in local, regional, national, and international meetings and prepared eleven exhibits on various aspects of children's tumors.

In 1950 Dr. Dargeon was elected to the Theta Chapter of the Alpha Omega Alpha. He was a member of the American Medical Association, a former member of the New York Chapter of the American Academy of Pediatrics, a fellow in the New Jersey Chapter of the American Academy of Pediatrics, a member of the New York Academy of Medicine, the James Ewing Society, the American Radium Society, the Irish and American Pediatric Society, and the New York Celtic Medical Society. Prior to his death he was chairman of the Committee on Neoplastic Diseases of the American Academy of Pediatrics, which was writing a manual on cancer for pediatricians; he was chairman emeritus of the Department of Pediatrics at Memorial Hospital for Cancer and Allied Diseases, clinical professor of pediatrics emeritus, Cornell University Medical College, and a consulting pediatrician in eight metropolitan hospitals.

Dr. Dargeon was the recipient of several awards including the Alumni Award of Albany Medical College, 1969, and the James Ewing Society Medal, 1963; he was the Henry Harrington Janeway Medalist and Lecturer of the American Radium Society, 1964, and the Otto A. Faust Lecturer at Albany Medical College, 1961. He was also appointed as a special consultant of the United States Public Health Service. Recognition of Dr. Dargeon's work came not only from professional groups but also from political leaders. In 1948, when he pointed out that cancer ranked third among causes of death in children, support grew for expansion of his children's ward at Memorial Hospital. The ward was expanded from eighteen to thirty-five beds in 1950, and Governor Thomas E. Dewey and Mayor Vincent Impellitter were on hand for the ceremony.

Dr. Dargeon served in both World War I and World War II, retiring a captain, Medical Corps, U.S. Naval Reserve. He participated in the Kwajalein, New Britain, Guam, Leyte, Morotai, and Lingayen Gulf invasions and was awarded six Bronze Stars.

To the people who knew him Harold Dargeon was a respected doctor and warm friend. But to the children with whom he worked he was the tall, kind man who was doing all that he possibly could to help them. In the History of the Department of Pediatrics at Memorial Hospital, which Dr. Dargeon prepared in 1967, he wrote, "The concept of the child as a person suffering from a grave illness rather than the primary approach of that of a disease being attached to an individual was the decisive factor in placing the children in Memorial Hospital under the direction of a pediatrician in 1933."

Dr. Dargeon is survived by his wife, the former Muriel Mosher, of Sea Girt, New Jersey, and a daughter Jill of New York City.

M. Lois Murphy, M.D.

Charles Douglas Darling

July 7, 1905 — August 23, 1986

Doug was born in Walkerton, Indiana, the second son of a Canadian-born Presbyterian minister, Charles David Darling, and an American mother, Gertrude Peebles Darling. As church ministers then and now frequently receive different parish assignments, Doug's early schooling was in many places. His longest childhood home was in Cleveland, Ohio, where he graduated from high school and entered Lafayette College, from which he graduated summa cum laude in 1929 and was honored by membership in Phi Beta Kappa. He entered the University of Pennsylvania Medical School that same year, received his medical degree in 1933, and immediately entered a two-year internship at the Presbyterian Hospital in Philadelphia.

Colleagues of Doug's in medical school and during internship days remember his great interest in music, especially his talents with the piano. His interest in music continued throughout life. One of his classmates remembers going with Doug to operas many times in Philadelphia. At Cornell Douglas and his wife regularly attended the concerts in Bailey Hall.

Following his internship he became school physician at the George School for two years. While there, Doug met Ruth Walton, the daughter of the director of the school, whom he later married in the summer of 1938. Doug became a member of the staff of the Princeton Student Health Service for the following two years, marking the beginning of Doug's interest in, and understanding of, young people. In the course of his medical education, in medical school and during his internship, Doug made the acquaintance of, and established the beginning of a lifelong friendship with, Dr. Joseph Hughes, director of the Pennsylvania Institute in Philadelphia, whose influence was to nurture Doug's interest in mental health and the emotional problems of young people. While still on the Princeton staff, Doug enrolled as a summer extern in psychiatry at the institute. So great was his interest in the mental health field that he accepted the invitation of Dr. Dean Smiley, head of the Department of Hygiene and Preventive Medicine at Cornell, to join (in 1938) the staff of that department as lecturer in mental health and adviser to students with emotional problems.

About the time Doug arrived at Cornell there appeared on campus concern that the university had no control over the medical care of ill students. After two years of investigation and debate among university officials, the trustees took action. In July 1940 the university assumed responsibility for clinical care of students and delegated that responsibility to a newly appointed clinical director, whose duty was to organize a medical staff to provide

both ambulatory and hospital care for ill students. As the service was short of clinicians and Doug had a solid background in medicine, he was requested to serve along with others as an attending physician for all hospitalized student patients, as well as act as counselor to student patients with emotional problems. That was a time when a residency program in medicine was begun at the direction of the board of trustees. Doug added to the program by sharing in the total educational program of those young physicians. Later, when the residency program was expanded by arrangement with the staff of Tompkins County Hospital, Doug's contributions to the educational program were of even greater significance.

Before the clinical department was fully developed, and because of the war, physicians in the newly formed department were assigned additional medical responsibilities by the Cornell administration: for the personnel of the Naval Officer Training Program, the Army Student Corps, the Air Force Officer Training Program, the Army Student Training Program, and other short-term military programs on campus. Those responsibilities were in addition to providing clinical care for some four thousand civilian students. The medical facilities and staff were fully occupied from 6:00 to 8:00 a.m. and from 4:00 to 6:00 p.m. with military sick call. The hours between 8:00 a.m. and 4:00 p.m. were the hours for ambulatory visits by civilian student patients. Douglas Darling, although eager to develop a mental health division, recognized the priorities of war time, and shared the clinical load with his medical colleagues. Needless to say, he had patients with serious emotional problems from both the military and civilian groups in addition to his sick-call patients.

After the war Dr. Darling was able to continue the development of the mental health division. With administrative support he recruited psychiatric social workers and clinical psychologists. He spread his expertise to the larger community by establishing a local Mental Health Society and by encouraging other colleges and universities to develop strong mental health divisions via the American College Health Association and through state and national psychiatric associations, of which he was a contributing member. He continued his general medical interests through membership in the Tompkins County Medical Society, the Medical Society of the State of New York, and the American Medical Association. He was in demand by public health officials to participate in programs in mental health.

During that time Doug kept his contact with Dr. Joseph Hughes at the Pennsylvania Institute. He seldom came back from a visit to Philadelphia without the urge to strengthen the mental health program at Cornell. Even before the war the problem of suicide attracted his attention. As the years went on, his interest in suicide became stronger. Together with one of his clinical psychologists, Leif Braaton, he pursued the subject in several scientific papers

and, with the cooperation of his medical colleagues at Cornell, devised a system to help identify students with suicidal tendencies. The implementation of that system put a burden on the mental health staff at Gannett Clinic, but it worked. The last years Doug was at Cornell, the student suicide rate was very low.

Doug's career in psychiatry did not end with his retirement from Cornell in 1969. He opened an office for private practice from 1969 to 1977. Although failing health restricted his activities, he continued to see some former patients and a few new ones at his home until 1983. When further failing health forced him into complete retirement, Doug continued his intellectual pursuits although seriously ill. In fact, he wrote and published a booklet of poems during that time, which he enjoyed distributing among his friends.

Friends and former patients alike will miss this genial, talented man. Those professionals who worked with him during his active years will remember him as the one who developed high standards for the treatment of emotionally disturbed students at Cornell.

Doug is survived by his wife, Ruth, who was affiliated with Cornell in several capacities—as a research assistant, as a member of the staff of the Office of the Dean of Men and Women (1959-77), as the coordinator of disabled students (1977-79), and as the acting dean of students (1979-80). Douglas Darling is also survived by his daughter, Barbara. His son, Charles Douglas Darling, Jr., died in a motor vehicle accident in 1958.

Ralph Alexander, Blanchard Rideout, Norman Moore

Lawrence Bryce Darrah

December 4, 1915 — May 25, 2004

Lawrence B. Darrah was an important contributor to the teaching and research programs of the College of Agriculture and Life Sciences and the Department of Agricultural Economics during his 30 years of service on the faculty, 1944-74. A native of West Virginia, he received his Bachelor's degree at the University of West Virginia in 1939. He completed an M.S. degree at the Pennsylvania State University in 1941 and then entered the doctoral program in agricultural economics at Cornell, receiving his Ph.D. degree in 1944 under the direction of Professors F.F. Hill and E.G. Misner. The title of his thesis was "Commercial Poultry Farming in New York State." During much of his early career, his work was intimately connected to the poultry industry. He was appointed an Instructor in April 1943 and his substantial talent as a teacher was quickly recognized. He became an Assistant Professor of Marketing in 1944, was given tenure in 1946, and made a Professor of Marketing in 1951.

Professor Darrah initially taught a course in marketing eggs and poultry products. His success as a teacher and communicator led to his receiving responsibility for the introductory course in agricultural marketing, which began to attract students from throughout the college and other colleges of the University. In 1955, he was chosen by the senior class of the college to receive their Professor of Merit Award given annually to one professor for the outstanding quality of his teaching. In 1971, the American Agricultural Economics Association honored him for the excellence of his teaching, the 7th such award granted by AAEA nationally.

Darrah's performances in lectures are legendary. Nearly every lecture was an exciting demonstration to illustrate a concept. One of the favorites each year was to bring a large box of chocolate-covered cherries to class. He would then hold an auction to see how much a student was willing to pay for the first chocolate covered-cherry. He then kept that student in front of the class ascertaining his willingness-to-pay for more cherries until Darrah was paying the student to consume one more candied cherry. Finally the student refused more at any price. The concepts of demand, time and place utility, and diminishing returns were all illustrated. His final lecture each semester included a series of awards to students based on his keen observations of their behavior during lectures and discussion sections throughout the term.

Darrah and his colleague and friend, Dr. Max Brunk, collaborated in writing a basic text, *Food Marketing*, in 1967, which they revised in 1971. It was the standard text for the course for a number of years. A succession of able teachers followed in Darrah's tradition using his text and classroom illustrations successfully. Student demand

for the course led to it being offered each semester. Darrah was also a top-notch student advisor, often working with 40 to 50 students annually on their academic programs and later helping them find employment in the food industry and business. He was one of the builders of the agricultural business program that in the 21st century has become an accredited undergraduate business degree program, located within the Department of Applied Economics and Management at Cornell.

In the 1950s, Darrah was one of the leaders in the Department in carrying out studies of new methods of handling and merchandising perishable products. Most of this work was developed with colleagues in the Departments of Poultry Science and Food Science. This was the period in which the self-service, supermarket industry grew rapidly throughout the country. Darrah worked effectively with Professor Robert Baker (Food Science and Poultry) in developing and then studying new methods of packaging and merchandising eggs and poultry products. The acceptability of new products was tested with Latin Square designs in supermarkets at selected locations throughout the Northeastern States. A number of the products, now found in supermarkets, such as frozen French toast, chicken hotdogs and frozen egg whites, had their origin in these studies. Many ideas were tested, even taking cracked eggs, breaking them and putting them in plastic containers (“naked eggs”). Retailers and manufacturers, as well as consumers, benefited from this early merchandising research.

Larry and his wife, Wanda, were effective ambassadors for the College and University. They had three tours of service at the College of Agriculture, Los Baños, of the University of the Philippines. The Darrahs first took a two-year assignment in 1957 to help the Filipino staff design and then teach a basic course in agricultural marketing. He worked with a young staff member, P.R. Sandoval, in writing a new textbook, using examples from the Philippines. It was titled, *Marketing of Farm Products in the Philippines*. They returned in 1962 to assist the Philippines Department of Agriculture and Natural Resources with its research program in agricultural marketing. In 1970, when Cornell was working with the College at Los Baños to develop its graduate program in agricultural economics, Darrah returned to help establish courses and research programs in marketing in cooperation with the staff at the International Rice Research Institute, also located in Los Baños. He continued in this assignment for four years.

Retiring from Cornell as a Professor Emeritus in 1974, Darrah stayed on in the Philippines until 1980 working for their Department of Agriculture & Natural Resources in developing their research programs and statistical reporting system. He received honorary Master’s degrees from both the Philippine Special Studies Division, Agriculture and from the National Food and Agricultural Council. The Philippine Council for Agricultural

Research and the Alumni Association of the College of Agriculture, University of the Philippines, also presented special awards. He was much appreciated by his former students, the faculty of the College, and the DANR.

Wanda Darrah was an important contributor, along with her husband, to the Philippine community. She helped reorganize the library of the College at Los Baños in the 1950s and volunteered there on each of their subsequent assignments in the Philippines. They returned to Ithaca for health reasons and Mrs. Darrah died in 1984. Larry married Fern (Rusty) Rhoades in 1985 and moved to the Leisure World retirement community in Mesa, Arizona where they enjoyed the mountains of Arizona in the summers and the warmth of the Salt River Valley near Phoenix in the winter.

The Darrahs had three children: Dr. Larry L. Darrah, now retired as a research geneticist for USDA-ARS and Professor Emeritus, University of Missouri; Ms. Alice A. Darrah St. John, living in Florida, and Dr. Brenda B. Darrah, a physician in Illinois. There are seven grandchildren and three great grandchildren.

Larry Darrah was a loyal Cornellian, and throughout his life cared a great deal about his former students and the health of the University where he had worked and taught. He enjoyed good stories and playing practical jokes on his colleagues. There was a twinkle in his eye that stayed with him to his last years. His students, colleagues, and long time friends fondly remember him.

George J. Conneman, William G. Tomek, Bernard F. Stanton

Paul H. Darsie

October 2, 1916 — May 29, 1999

Paul Harold Darsie, a physician on the staff of Cornell University in the Department of University Health Services, died on May 29, 1999, at the age of 82. He was born October 2, 1916 in Lexington, Kentucky, the youngest of seven children of a third-generation Protestant minister. Paul's early years were spent in Lexington and Cynthiana, Kentucky. He went on to obtain his Bachelor's degree in 1938 from Washington and Lee University, and his M.D. degree in 1942 from the University of Rochester.

In college, Paul achieved exemplary grades in a broad spectrum of academic studies, while actively participating in a sports program that included basketball, tennis and track. Furthermore, he not only earned all his college expenses, but was able, by the time he graduated *magna cum laude* and with a Phi Beta Kappa key, to repay his parents completely for all the funds that they had advanced him toward his education. (At a time, before the computer age, when few college students knew how to type, Paul's skills as a typist and even as a stenographer, won him many income-producing opportunities.)

Paul interned at the Strong Memorial Hospital in Rochester, New York, then completed residences in internal medicine at the University of California Hospital in San Francisco, and at Columbia-Presbyterian Hospital in New York.

He initiated his medical practice in Cooperstown, New York, where he was affiliated with the Mary Imogene Bassett Hospital. After two years, Paul moved to Ithaca to join the staff of the recently formed Student Health Service at Cornell University, where he served for 34 years until his retirement in 1980, with the rank of Professor of Clinical and Preventive Medicine, Emeritus.

Paul derived much pleasure and professional satisfaction from his medical practice at Cornell. He found that the ambiance of teaching and learning that surrounded him was stimulating and motivating. From his earliest days in medical school, he was convinced that a medical encounter was never complete unless the persons seeking advice or treatment learned something about their problems and the ways to correct them and to prevent their recurrence. Crowded university curricula have seldom allowed time for formal courses in health education, but Paul found that his one-to-one contacts with his student-patients were ideal times to impart useful information as well as treatment. He was always a good listener and explainer, and the students who have sought his advice or treatment over the years have appreciated his talents.

Paul enjoyed his life among the Finger Lakes. He made good use of all the advantages that his surroundings afforded him. He loved fishing, hunting and sailing, and practiced these activities with his father as well as with his sons. He took an active part in the planning, building and maintenance of his home. (He was as methodical in the care of his home as he was in his medical practice. For example, when he decided that his house should be repainted every four years, he proceeded to paint one of the four sides of the house each year, to complete a four-year cycle.) He was proud of his skills as a gardener, and often-brought fruit and flowers from his garden to the clinic to share with his colleagues.

Paul was a member of the First Presbyterian Church of Ithaca, where he has served as a deacon and elder. He has been a compassionate and caring visitor to shut-ins and the elderly. He also was a member of the City Club of Ithaca, and of the Liberty Hyde Bailey Men's Garden Club.

Paul is survived by a loving family: his wife of 52 years, Peggy; three sons; a daughter; eight grandchildren; and a sister.

Leroy K. Young, Allyn Ley

Herbert Joseph Davenport

Professor of Economics

— *June 16, 1931*

RETIREMENT STATEMENT

Professor Herbert J. Davenport came to Cornell in 1916 at the ripe age of fifty-five years. Already he had published two stout volumes, "Value and Distribution" (1908) and "Economics of Enterprise" (1913), the earlier giving a detailed, penetrating, and systematic criticism of his predecessors' contributions, the later embodying his own constructive theory. That they are among the outstanding contributions to American scholarship in a most difficult field, the field of systematic coherent abstract thought, and that they are marked by a rare combination of theoretic insight with hard common sense, no competent judge will deny.

Before Davenport came to this University he had had an indirect but significant relation to it. When the University of Chicago opened its doors, its department of economics was staffed with four men from Cornell, and ten years later when Davenport began his teaching of economics with an appointment at the university which held him there for six years, he found on its faculty two of the Cornell appointees, Laughlin and Veblen. To the former he dedicated his first and perhaps his most important book, saying that, much as Laughlin might differ from its conclusions, the book had been made possible "only through the freedom of thought and of teaching" which he had fostered. Davenport's debt to Veblen, widely as they also differed, was even more intimate and personal.

During the thirteen years which were passed at Cornell before he reached the age of retirement, Davenport continued to write numerous articles on economic theory, incisive in style and constructive in content, but none the less his main service was in the classroom, the work which he best loved and in which his mastery and success grew with the years. Formal lecturing he disdained; with his students he trod the more congenial Socratic path of a cooperative search for truth, for the principles which underlie, for example, the simplest act of purchase and sale. Along this path he guided them until they seemed with him to discover what before was unknown, and in the process to gain confidence and zest in the unwonted exercise of their own powers of analysis and thought. His classroom was the arena for a conflict of ideas, and the teacher's word of approval went not to the one who agreed with him but to the one who had wrestled well or even successfully against the elder thinker.

His power as a teacher was increased by his rugged, forceful personality, his kindly personal interest in all his students, his deep enthusiasm for his own theories, his conviction of their abiding importance and of society's need of them for its salvation.

Alice Davey

March 24, 1924 — January 27, 1997

Alice Davey received a Bachelor's degree from the University of Maryland in 1946, and taught junior and senior high school home economics in Maryland for three years. She came to Cornell as a graduate student in Household Economics and Management and was a teaching assistant for two years. She received a Master's degree in 1951. Subsequently, she taught and supervised home management houses at the University of Massachusetts from 1951-53 and at the University of Connecticut from 1953-58.

In 1958, Professor Davey was appointed Assistant Professor in the Department of Household Economics and Management at Cornell. She taught courses in family decision making and home management and supervised the residence for undergraduate students in Martha Van Rensselaer Hall. The residence course was required for high school teacher certification. She worked with the faculty in home economics education to develop appropriate placements for student teachers. In addition, she adapted her teaching to include experience in managing a low income household with food stamps and few resources. Thus, her students were prepared not only for teaching in high school courses, but also for working with modest income households in social welfare offices and in cooperative extension programs. Her handbook for home management residence courses was widely used. She has been recognized as a gifted teacher and advisor who held her students to the highest standard of intellectual integrity.

With her particular interest in teaching, Professor Davey became a consultant to the New York State Department of Education and worked with foreign visitors to help them understand home management in the United States. For several years, she served as graduate field representative for her department and developed orientation activities for new students. Her work with graduate students, particularly those assisting in the management house, provided life long friendships.

On campus, Professor Davey was active on the Board of Cornell United Religious Work, the Faculty Council of Representatives, and Omicron Nu. When the major in home economics education was terminated, Professor Davey served on the committee developing plans to combine preparation for teaching with the various majors in the college. To whatever committee assignment she accepted she gave her full attention and responsible leadership.

While teaching, Professor Davey continued her graduate education during summer school and during a leave of absence. She completed her doctoral work and received a Ph.D. degree from Michigan State University in

1971 under Professor Beatrice Paolucci in the areas of Family Ecology and Higher Education. On a subsequent sabbatical leave, Professor Davey worked on preparing the papers of Professor Paolucci for publication.

Professor Davey was a member of the American Association of University Women, Omicron Nu, Pi Lambda Delta, the American Home Economics Association, the New York State Association of Gerontological Educators, the National Education Association, and the National Council on Family Relations.

Professor Davey retired in 1987. She then gave up her Ithaca residence and lived in the home her grandparents had built in Ninevah, New York, where she had earlier spent her summers. For the last several years she had spent winters in Texas, and was there when she died. She is survived by her brother, Robert Davey, of Ninevah.

She loved to garden and shared flowers and vegetables with friends and neighbors. She was a quiet, private person but welcomed her circle of friends to conversation and tea in both Ithaca and Ninevah. She was open to discussion about how to reach students, current developments in family resource management and family decision making, new studies in Bible history and any new mysteries. She taught through her example of faith, gentleness and grace. She was an excellent listener and students brought concerns to her and in her open and accepting way she frequently helped students work through their own problems.

She was a friend to many and a very special friend to a few.

Francille Firebaugh, Jean Robinson, Rose Steidl

Adam Clarke Davis

November 21, 1889 — March 17, 1942

The sudden passing of Professor Adam Clarke Davis on March 17, 1942, in Ithaca, New York, removes from Cornell engineering and the profession at large one of its ablest and most lovable figures. Succeeding the late Dean Herman Diederichs, Professor Davis had been head of the Department of Experimental Engineering since 1936.

Born in 1889 in Goldsboro, North Carolina, Professor Davis received his preliminary education in the Goldsboro schools, he then attended Virginia Polytechnic Institute for two years, and this he followed by four years in the Sibley School of Mechanical Engineering at Cornell. Upon graduation from Cornell, Professor Davis became an instructor in Experimental Engineering and, except for a two-year period in industry, had been teaching at Cornell ever since. He became an assistant professor in 1919, and was named Professor of Experimental Engineering in 1925, becoming head of the department in 1936.

Professor Davis was twice associated with the training of members of the United States armed forces. During World War I, he was an instructor in the U. S. Army School of Military Aeronautics and, at the time of his death, was in charge of the World War II Diesel Engine Training of the Ensigns of the U. S. Naval Reserve. The success of both of these training courses was due to Professor Davis' choice of the curriculum and the teaching staff.

Professor Davis was widely known in industry, both as a teacher and consulting engineer, particularly in the fields of internal combustion engines and physical metallurgy, and was associated with Professor G. B. Upton in many investigations in these fields.

Professor Davis was a member of Kappa Sigma fraternity, Tau Beta Pi, Phi Kappa Phi, the Society for the Promotion of Engineering Education, The American Association for the Advancement of Science, the American Society for Metals, and the American Foundrymen's Association. In addition, he was a licensed professional engineer of the State of New York, and a member of the Cornell Club of New York, the Ithaca Country Club, and the Ithaca Yacht Club.

"Dave," as he was affectionately known to his friends, was an unusual judge of men. He had long cultivated this rare ability and as he grew older, he perfected the knack not only of fitting men into their proper places in an organization, but also of developing such men to their fullest capabilities. Competent as he was in the judgment of men, so likewise was he talented in the design and construction of machines. His particular gifts lay in correlating

the theoretical, practical, and economic aspects of a problem, and of translating the results of research and development into actual manufacturing processes. He had an uncanny ability to estimate the costs of machines and operations. This was most important both in the conduct of the Department of Experimental Engineering and in his own consulting work.

He was a sincere, loyal friend, modest and unselfish to a fault, and possessed a rare sense of justice, honor, and square-dealing that made him beloved by all who knew him.

“Dave’s” hobby was boats. His many friends knew that a trip to the boathouse to tinker with the engine or to polish the deck was his way of relaxing and keeping fit.

In work or in play he strove everlastingly for perfection. He loved to work with his hands—to remake the old and to create the new. This zeal for perfection and creation he carried into all of his many research and consulting projects. About him it might well be said:

*“How few men venture out beyond the last
Remaining mark upon the well-worn trail,
‘Tis he who has courage to go past
This sign, who cannot in his mission fail.
He will, at least, have left one mark behind
To guide some other, bold, exploring mind.”*

E. Gorton Davis

Professor of Landscape Architecture

May 7, 1880 — May 23, 1930

Professor E. Gorton Davis was born May 7, 1880 at Cincinnati, Ohio, where he spent his early years. He was graduated from Denison University in 1905 with the degree of Bachelor of Arts. Shortly after graduation he joined Townsend and Fleming, Landscape Architects, and remained with this firm until 1911 when he became a member of the Faculty of the Landscape Department, then in the College of Agriculture. He soon became head of this department and held this position until his sudden death at Ithaca, on May 23, 1930.

During his years at Cornell Professor Davis became outstanding in the educational field of his profession and greatly influenced the course which the teaching of Landscape Architecture throughout the country has followed. He also greatly influenced the development of the School of Landscape Architecture at Cornell and was a vital factor in its progress. As a teacher he inspired the confidence and held the interest of his students. His close contact with them as undergraduates was followed by an equally great interest in them as alumni.

Undoubtedly, his greatest interest was in the History of Landscape Architecture, of which he made a most scholarly study. His compilations and research in this field, particularly as related to the early American work, are a great achievement. They constitute, even in the unfinished state in which he left them, a valuable contribution to our knowledge. It is to be hoped that this work, which he formulated so effectively, may be carried forward.

In addition to his teaching he carried on a private practice; his work in this field bears ample witness to his practical ability as a Landscape Architect.

But the memory of Professor Davis that lives undimmed in the minds of his friends is a warm and human thing that no record of work done can render. His fiery enthusiasm, his gusto in the act of living, even his quick and generous anger, were the marks of such an ardent spirit as we see but seldom. It was this prodigal ardor of his that so caught and held his students that they would crowd his hospitable home, and would return thither year by year when they were undergraduates no longer. One likes to think that this ardor of spirit has worked upon them, and is through them preserved to the future.

Source: Faculty Records, p. 1646 Resolution of the Trustees and Faculty of Cornell University December, Nineteen Hundred and Thirty

Hollis Rexford Davis

October 18, 1915 — January 13, 1995

Hollis Rexford Davis, Associate Professor of Agricultural Engineering, retired on February 28, 1978, after over thirty-three and a half years of service to the Department of Agricultural Engineering at the New York State College of Agriculture and Life Sciences at Cornell University. In March of 1978, he was awarded the title of Professor Emeritus of Agricultural Engineering.

He graduated from South Otselic High School where he played baseball and basketball and participated in band and orchestra. He was active in 4-H and played in the Chenango County 4-H Band which made a trip to the Chicago World's Fair in 1933. At Cornell, he was a pitcher on the Freshman Baseball Team and played in the Cornell Marching Band. He received both his degrees from Cornell University, the B.S. in Agriculture in 1937, and the M.S. in Agricultural Engineering in 1948.

Hollis taught vocational agriculture at DeRuyter High School. In January 1942, he was appointed District Agricultural Engineer to work with the New York State Emergency Farm Machinery Repair Program, directed by the Department of Agricultural Engineering at Cornell University. Hollis served in the U.S. Marine Corps from October 1943 to March 1946 and returned to Cornell University as an Extension Agricultural Engineer in April 1946.

Hollis distinguished himself as an outstanding teacher in educating farmers, dealers, and equipment service personnel in proper selection, operation, and adjustment of agricultural machines and equipment. As the program emphasis changed, Hollis was called upon to broaden his Extension commitment to include structures and electrification, dairy and poultry building ventilation, and materials handling systems. His Cornell Extension Bulletin 849, "Adequate Farm Wiring Systems," became a widely used publication throughout the United States.

Mr. Davis was promoted to Assistant Professor, Department of Agricultural Engineering, College of Agriculture and Life Sciences, Cornell University, in 1956, and in 1962 was promoted to Associate Professor. He was an authority on poultry laying and pullet housing systems. Builders, equipment manufacturers, and poultry producers throughout the United States continually sought his advice. He worked with government agencies in developing plans and regulations in the design of egg grading and breaking facilities, processing plants, and slaughter plants for poultry operations.

Davis was also involved in the problems associated with the disposal of waste from the above facilities as well as for home sewage disposal systems. In the 1970s, he worked with growers and builders to design common refrigerated and controlled atmosphere storage facilities and ventilation systems for crop storage. He helped develop drying systems for potatoes and onions that made it possible for growers to salvage their crops during wet harvest seasons. He collaborated on the most practical and authoritative cabbage and onion storage bulletins that are available in the United States today.

He consulted in England, Italy, Greece, Iran, India, and with the World Bank. He was widely respected by growers, equipment manufacturers, contractors, government agencies, professional peers, and his friends for his expertise, friendliness, and desire to help people with problems. He served the agricultural industry of New York State in a dedicated, conscientious manner, always emphasizing practical solutions.

Early on, Hollis was an active sportsman indulging in hunting and fishing. Later he became an ardent golfer and continued to be one for the rest of his life.

Hollis was an active member of the American Legion and past Commander of the Owen Woodford Post 894, DeRuyter; past Master of Masonic Lodge 692, DeRuyter; member of the American Society of Agricultural Engineers; and member of the Ithaca Lions Club.

Hollis and his first wife, Harriet, had a happy life with their four sons. Harriet died in 1982.

Later Hollis married Margaret Sullivan Paetow. Hollis and "Peg," both ardent golfers, enjoyed life at their summer residence in Ithaca and their winter townhouse at Suntree in Melbourne, Florida.

Hollis is survived by his wife Margaret; his four sons: Richard of Merrit Island, Florida; Robert of Atlanta, Georgia; Allen of Philadelphia, Pennsylvania; and Steven of Reading, Pennsylvania; and his two stepdaughters: Elizabeth Cowger of Rochester, New York, and Anne Barnett of Jasper, Indiana.

Everett D. Markwardt, Richard W. Guest, E. Stanley Shepardson

Stanley Warburton Davis

March 19, 1920 — June 1, 2001

Professor Stanley Davis, Stan to all his many friends, was born in Elizabeth, New Jersey on March 19, 1920 and lived there for much of his early life. Stan was educated at Cornell, and received his A.B. degree in Psychology in 1947, and his doctorate in Applied Psychology in 1951.

During his academic career, Stan was employed by three institutions of higher learning. From 1951-56, he was an Operations Analyst in the Psychology Department at Johns Hopkins University in Baltimore. After a stint at General Electric Corporation from 1956-62, during which time he was a Manager of Corporate Psychology, Stan returned to higher education when, for five years, (1962-67) he was Dean of Students and a Lecturer in Psychology at Cornell. In 1967, Stan was recruited by Ithaca College and served as Vice President of Student Affairs and Professor of Psychology until 1972.

In 1972, Stan rejoined Cornell when he was appointed as full Professor to the faculty of the School of Hotel Administration where he served with distinction until his retirement in 1983.

In 1977, Stan, Professor William (Bill) Wasmuth (ILR), and Senior Lecturer Roy Alvarez '72, M.P.S. '82, began developing CHARMS, an international hospitality research project which dealt with strategies for reducing employee turnover.

It subsequently became an effective and popular human resources management training simulation.

Dr. Davis was appointed by Cornell as Professor Emeritus on July 1, 1983. Following his retirement in that year, he went to live in California and for several years thereafter maintained a consulting practice using the CHARMS program. He died on June 1, 2001.

His wife Lucile, of Vista California; and his former wife, Ruth Ann of Ithaca; and two sons, Richard W. and Robert P. Davis, survive him.

While at the Hotel School, Stan was the leading member of the Human Resources area, and was also the Graduate Field Representative for the college. During that period, Stan was the active voice and moving force behind the implementation of the academic program for the Master of Professional Studies in Hotel Administration. His ongoing guidance brought the new program to full accreditation.

Among his many honors, prizes and awards, he was most proud of his citation by the United Nations from which organization he received a service award for his civilian research efforts during the Korean War (1950-53). In later years, he was active in the local community as a member of the Tompkins County United Fund Board of Directors, and served for an extended period as a member of the Tompkins County Drug Steering Committee.

Stan was a member of the American Psychology Association, the American Educators Resource Association and the American Association for Higher Education.

He will be remembered by his colleagues for his wonderful sense of humor, his contagious laugh, his love of Cornell, his broadly inquisitive mind and his extremely cooperative nature. He will also be remembered by scores of students for his open door policy, his willingness to listen, and his wise advice. He was a truly loved and respected professor.

John J. Clark, William J. Wasmuth, Malcolm A. Noden

Jeffery Earl Dawson

July 18, 1920 — February 2, 1969

Jeffery Dawson died suddenly on a Sunday morning, ending a struggle with diabetes and its complications that began in boyhood.

He was born in Newberry, Florida, and educated in the public schools of the state and the University of Florida. After receiving the B.S.A. degree in 1942, he came to Cornell as a graduate student. He was awarded the Ph.D. degree in 1945 and in the following year joined the Department of Agronomy staff as assistant professor of soil technology. He became associate professor in 1949 and professor in 1955. His first sabbatic leave was spent as a Guggenheim Fellow at the Biochemical Institute of Uppsala, Sweden, in 1952-53, and the second in the laboratories of the Tennessee Valley Authority in 1961. For several years he served as a special consultant on organic soils to the United States Soil Conservation Service.

Through his work on the chemistry of organic soils he became a recognized authority on those soils and on soil organic matter. He was gifted with a bold, imaginative, and analytical mind, however, and there were few topics within the scope of his competence that he did not consider and speculate upon. At one time or another he worked on the chemistry of boron in soils and boron deficiency in plants, continuing this interest from his Ph.D. dissertation. He investigated the transformation of nitrogen and its equilibrium levels in soils, the effect of soil factors on the fungal diseases of banana, and the nature of organo-copper complexes in soils, in addition to problems of crop plant behavior in organic soils. In recent years his knowledge of organic structure in soil and command of analytical techniques led him to a cooperative series of fundamental studies of how pesticides decompose in soil or are metabolized in plants. He saw his profession as science applied to the world's need for food; in a quiet way he rejoiced in the mission as well as the science, and in his own part in these.

He approached even the most applied problem in terms of simplest theoretical considerations first, then through sifting existing data for consequences others had overlooked, and, finally, to analysis or experiment. On one occasion he was persuaded to examine the drying process in hay because farmers were being sold a useless chemical for this purpose; quite characteristically, his seminar report on the study began with the Second Law of Thermodynamics and proceeded to the energy requirements of drying and the unexpectedly large contribution of mold respiration.

Colleagues and graduate students came to him for advice on equipment and techniques, and even more frequently for the insights which discussion with him so often generated. His firm grasp of chemistry and soil science was

coupled with a fondness for concept above detail, and a shrewd appreciation of research strategies. No matter how unfamiliar, a problem that a colleague found interesting must be worthy of attention, and he was willing to give the full resources of his mind to its exploration.

He studied his disease dispassionately with the interest and objectivity he gave to analysis of any scientific problem; few physicians could have known as much about its biochemistry. He was conscious of the numbering of his days in a way that few men are, though of this he rarely spoke. Nevertheless, the feeling intensified a dedication to his own research and his generosity of outlook. An unintended acknowledgement of this came once in a comment on an unproductive and dissatisfied acquaintance; the man, he said, has never lived with Death looking over his shoulder.

Until increasing ill health began to limit participation, he was active in the affairs of his department and profession. He served in numerous departmental committees, as Field Representative to the Graduate School for several years, and as an effective member of the Cornell coordinating committee on computer use during the formative years that led to the present Computing Center. Among other societies, he was a member of the American Chemical Society, Soil Science Society of America, International Society of Soil Science, and a Fellow of the American Society of Agronomy and the American Association for the Advancement of Science. He was elected a Fellow of the American Institute of Chemists, although notice of this honor arrived too late for his attention before his death. He was twice chairman of the Division of Organic Soils in the Soil Science Society of America, chairman of the Soils Section at the Copper Symposium at Johns Hopkins University in 1950, and served on committees for the monographs and advances published by the American Society of Agronomy.

He carried into his personal life the same zest in understanding and a delight in good conversation, mingling ideas and observation, logical argument and humanity. Few topics were beyond his wide ranging interest and no company dull in his presence. In this his wife, Elizabeth Ritchey Dawson, was an able companion, and many colleagues and graduate students recall with pleasure an evening at the Dawson home.

He is survived by his wife; a son, Leonard J. Dawson; a daughter, Loretta Dawson; and also by his parents, Mr. and Mrs. Lonnie S. Dawson; a grand-mother, Mrs. E. C. Sapp; and a sister, Mrs. Mildred Bryant, all of Florida; and by nieces and nephews.

W. T. Federer, M. D. Glock, E. L. Stone

Edmund Ezra Day

December 7, 1883 — March 23, 1951

Edmund Ezra Day, destined to be the fifth President of Cornell University, was born in Manchester, New Hampshire, on December 7, 1883. His parents were Ezra Alonzo and Louise Moulton Nelson Day. He attended Dartmouth College, and there made a brilliant scholastic record. He was awarded a Rufus Choate scholarship, and thus acquired the nickname of "Rufus," which clung to him all his life. He was a member of Phi Beta Kappa and Theta Delta Chi. He received his B. S. from Dartmouth in 1905 and an M. A. in 1906. He then entered the Harvard Graduate School, and gained a Ph. D. in Economics in 1909.

He began his teaching career as Instructor in Economics at Dartmouth, from 1907 to 1910. He entered the Harvard Department of Economics in 1910, and rose rapidly to become Professor of Economics and Chairman of the Department. During the first World War he served as statistician for the U. S. Shipping Board and the War Industries Board.

In 1923 he left Harvard for the University of Michigan. There he was Professor of Economics, organizer and first Dean of the School of Business Administration, and Dean of the University.

His administrative ability and his understanding of economic and social problems attracted the attention of the great Foundations. In 1927-28 he was associated with the Laura Spelman Rockefeller Memorial; in 1929 he left Michigan to become director for the social sciences with the Rockefeller Foundation. He carried on concurrently the duties of director of general education with the General Education Board. His signal success in these responsible positions prompted his appointment to the presidency of Cornell in 1937.

In the following years he added to his onerous presidential duties many important tasks in educational and social realms. It is impossible here to list more than a few examples. He was president of the New York State Citizens Council, the Association of Land-Grant Colleges and Universities, the World Student Service Fund, the American Statistical Association; he was chairman of the American Council on Education, director of the National Bureau of Economic Research, director of the Federal Reserve Bank of New York, Councillor of the National Industrial Conference Board. He held fifteen honorary degrees. He was the author of "Index of Physical Production," "Statistical Analysis," "The Growth of Manufactures," (with W. Thomas), and "The Defense of Freedom".

In 1912 he married Emily Sophia Emerson, daughter of Dean Charles F. Emerson of Dartmouth College. He leaves two sons and two daughters. One son (Dr. Emerson Day) at present holds a professorship in the Cornell Medical College.

Dr. Day was suddenly stricken by a heart attack on the morning of March 23, 1951.

Dr. Day was President of Cornell University from 1937 until his resignation on July 1, 1949. He was then appointed Chancellor, with the larger interests of the University in his hands. Counseled to disburden himself of such responsibilities for reasons of health, he resigned the Chancellorship on January 31, 1950.

The twelve years of his presidency were a period of rapid growth of the University. The student enrollment and the Faculty lists nearly doubled. New schools and units were established, responsive to new educational and social concerns of the nation: the School of Chemical and Metallurgical Engineering, the School of Industrial and Labor Relations, the School of Business and Public Administration, the School of Nutrition, the School of Aeronautical Engineering, the School of Nursing. The Floyd Newman Laboratory of Nuclear Studies in Ithaca and the Cornell Aeronautical Laboratory in Buffalo were inaugurated.

The physical development of the University kept pace with the new demands. Important buildings were erected, among them Olin Hall, the Newman Laboratory, Savage Hall, Moore Hall, Clara Dickson Hall, and the Administration Building. Arrangements were made for other buildings, now rising on our campus. The Greater Cornell Fund was carried triumphantly to its goal, raising over \$12,500,000 for university needs.

To assess the value of Dr. Day's contributions to the University would require far more space than can be here afforded. This much is clear and certain: that during a period of war, of disorganization and reorganization, of rapid social and economic change, of inflation, insecurity, fear, his strong hand at the helm guided us through the storms to calmer waters. We cannot know how much of his own strength, his own life, he sacrificed to this terrifying task.

The writer of the notice on the death of President Livingston Farrand (in the Necrology of the Faculty, 1940) said: "No doubt every true leader communicates something of himself to his companions. The Cornell of Andrew D. White partook of his indomitable idealism; the Cornell of Jacob Gould Schurman shared his superb, almost resistless energy; the Cornell of Livingston Farrand became somehow more urbane, more kindly, more human." To these words we may now add that the Cornell of Edmund Ezra Day became more socially conscious, more cognizant of its duties to the state and the world, more aware of its function as an organ of the body politic. The

new schools established during Dr. Day's regime were mostly schools of social service. Within the older units of the University a corresponding influence was at work. Such Departments as Sociology and Psychology were reconstituted; the need for social justification was felt throughout the University.

Dr. Day liked to ask provocative and sometimes infuriating questions. He liked to affront a Professor of, for instance, English, with the demand: "What are you trying to do? What is the use of the study of literature?" The Professor of English usually found, after his first bewilderment or anger had died, that the necessity of defining his aims was very wholesome. Dr. Day of course knew his own answers before he asked the question.

His mood was often quizzical. He liked to shock, unsettle, disturb; he enjoyed playing dumb. He was convinced that the great menace to successful teaching is complacency, satisfaction with routine. Tirelessly experimental himself, he could easily be exasperated by the conservatism of the Faculties. And if, as was inevitably the case, Faculty members found themselves in disagreement with him, they had only to visit him to be most cordially received and most fairly heard. In such circumstances his visitors were usually astonished to find how minutely Dr. Day was acquainted with the least operations of his great, far-flung, multifarious University, and how he had given serious attention to the smallest of her problems.

He gained this knowledge by giving to Cornell the best part of his thought and his life. He had little time for recreation, all too little for the intellectual diversions he earnestly desired. His obligation to Cornell came always first, and this obligation never ended, never left him free.

He had planned, on his retirement, to take at last his rewards: the pleasure of friendship, the pleasure of reading, the mere simple pleasure of rest. He did not have time for his rewards. He had never had time. He had time only for his duty.

Morris Bishop, S. C. Hollister, L. A. Maynard

William Tucker Dean

August 31, 1915 — December 3, 1999

William Tucker Dean graced the faculty of the Cornell Law School from the time of his appointment as Associate Professor in 1953 until his retirement as Professor Emeritus in 1988. His academic pedigree included a Bachelor's degree from Harvard, a law degree from the University of Chicago and a M.B.A. degree from Harvard's Business School. Between his law and business degrees, he served in the Army for three years. Following a brief assignment as a private, he became an officer in the Army Transportation Corps, with overseas service in the Pacific Theater as a Lieutenant and Captain, principally with the 96th Infantry Division in the Philippines. Before coming to Cornell, he had taught at the law schools of the University of Kansas and Texas for a summer term.

At Cornell, Tucker's basic teaching interests revolved around trusts and estates, a field that encompassed estate and gift taxation, fiduciary administration and family law. He authored a number of law review articles in this field, together with many devoted to legal history. Meanwhile he served on a vast panorama of committees within the Law School as well as the broader university. During his tenure, the New York State Law Revision Commission was based at the Law School and he not only put in a stint as its Associate Director for Research, but also drafted various statutes calculated to rationalize work-a-day New York law.

Many a senior member of today's university faculty, not to mention innumerable alumni, will recall also that Tucker, between 1962 and 1990, served the outside community as the Village Justice in Cayuga Heights. Professor Dean as Judge Dean was dedicated to the proposition that a posted 30 miles-per-hour speed limit meant precisely that, a maximum speed of 30 miles-per-hour. Thus on the bench, he presented a formidable formal presence, and this mien carried over into his appearances behind the classroom lectern. And all the while, Tucker chose to walk at a brisk pace between his home and the Village and the Law School, the Village Hall, downtown, or wherever it was he was headed about the town, always carrying himself in a very erect military manner.

To have accepted these appearances as the last word was to miss the delight of knowing the very humanely decent, witty and fun-loving person that lay behind the veneer. His wit was quick and cut to the nub of the matter, as when he manhandled a cigarette machine into the office of a sober colleague who had just forsworn nicotine. And there are those who recall fondly the time that, during the interminable student protests about the Vietnam War, his Myron Taylor Hall teaching was disturbed by the loudspeaker noise from across the street. Tucker's was an old

soldier's answer to the problem: he applied a pair of wire cutters to the electric cord powering the apparatus. But again, one has to recall, these were pre-political correctness days, happy days as it were.

This same informal *joie-de-vie* characterized the hospitality ever present at the home occupied by Tucker and his wife Ann, and their four children. As fate would have it, Ann died in the year of Tucker's retirement. Then it was that he married Rosamond Arthur and moved to Long Island where, until illness overcame him, he was able to continue to enjoy domestic life while contemplating the world around him with wry acumen more often encountered in a poet than a lawyer.

Let it be recalled, finally, that whenever there arose a last minute need to find a teacher for some Law School course or other, it was William Tucker Dean who would step in and undertake the thankless job of spending hour upon hour to bone up on a subject he might never again teach. These must have been particularly onerous chores given his wide-ranging interests in the literature of contemporary law and politics. Duty to the larger community was an idea deeply rooted in his mind-set and he never failed to perform that duty as he perceived it.

W. David Curtiss, Gray Thoron, E.F. Roberts

Peter Joseph William Debye

March 24, 1884 — October 2, 1966

Peter J. W. Debye came to Cornell University in the fall of 1939 to present the Baker Lectures in Chemistry; he departed, to our great sorrow, in the fall of 1966, while still working on several exciting research problems, among the many which interested him during his active and rewarding scientific career. But a chronology of his sojourn in Ithaca is somewhat misleading. Through his reputation and influence as an explorer and expositor of physical phenomena, he may be said to have arrived in the early years of the second decade of this century, and he will remain as long as there is a single student of physics or chemistry on the Cornell campus.

To our nonscientific colleagues a listing of the numerous awards and honors which have been bestowed on Professor Debye by his scientific peers will convey some impression of the significance of his contributions. He was awarded the Nobel Prize in Chemistry in 1936. In addition, he received fourteen medals and citations, eighteen honorary degrees, and was elected to membership of twenty national academies.

After serving as departmental chairman at Gottingen, Leipzig, and other universities, he became Director of the Max Planck Institute in Berlin in 1934, and in the decade of the 1940's he was Chairman of the Department of Chemistry at Cornell. Between 1952 and 1966, he was a Professor Emeritus, but a very active one.

In science, as in art, there is style. Debye's theories, his ways of looking at physical phenomena and of expressing his understanding of them, were as uniquely Debye's as a painting is unmistakably an El Greco or a van Gogh. The essential element of his style was simplicity, which for Debye was not merely a technique; it was an earnest conviction. He knew that physical phenomena must have simple explanations; he took complexity to be lack of understanding. If a theory was not yet simple then it was not yet right—it was unfinished and imperfect. To achieve simplicity one must identify the essentials and isolate them from the irrelevancies. To recognize the essentials, to express them clearly and pictorially, and then to pursue their consequences with superb technical facility was Debye's style.

A scientist verifies that he has recognized and isolated the essentials by constructing a *model*—a hypothetical system which consists of abstractions of physical entities and of the laws which govern their behavior. If the consequences of the model correlate well with measurements made on the real physical system, then it provides an “explanation” of the phenomenon. A successful model has no redundant elements and in the minds of scientists becomes the embodiment of the very physical system it illustrates. It permits visualization of the phenomenon in its starkest

simplicity, unencumbered by irrelevancies. In the role of a master model-builder, Debye has left an indelible mark on physical science. One cannot now consider an aqueous solution of a strong electrolyte as anything other than a somewhat organized yet dynamic distribution of small, charged spheres in a uniform dielectric; the dynamics of a crystal are accountable in terms of an ensemble of coupled, harmonic oscillators, and at low temperatures the important crystal vibrations are those of a continuum; an amorphous structure scatters light as would plane traveling ultrasonic waves. These ideas and a host of others, each of breathtaking audacity because of its simplicity, burst upon science as sudden illuminations.

The illustrations and analogies which so enlivened Debye's lectures are unforgettable. Those who heard them can no longer think of density fluctuations without seeing the tiny stick he asked us to imagine thrown into the medium to measure spatial correlations, and we cannot think of a dipole without seeing a cigar. (In a photograph of Debye, which is now famous because of the cigar he is shown holding, a plus sign was dubbed in at one end and a minus sign at the other.) These two homely examples of Debye's models point up another aspect of his style in his approach to model-making. Models may be either physical or mathematical; Debye's were physical. Though he had mathematical abilities of the highest level (one of his earliest papers, published in 1905, contained the independent discovery of the method of steepest descents, and its application to the determination of the asymptotic behavior of Bessel functions), he had a deep distrust of overly mathematical theories, and dismissed as "mere mathematics" any explanation of a physical phenomenon that lacked a concrete, visualizable basis.

Debye reached scientific maturity at exactly the right time and place. Thoroughly grounded in (indeed, one of the great masters of) the classical disciplines of mechanics and electrodynamics, he also knew their basic limitations. When quantum mechanics was discovered, he was ready; in fact, he promoted its development and made some of its important early applications. Thus, through a receptivity that was genius in itself, and a lucky accident of time and place, Debye was to be one of the first to combine in a single intellect a knowledge of classical mechanics, electrodynamics, thermodynamics, statistical mechanics, and quantum mechanics. He had all the materials for his models, and he used them as would a great artist—each step simple, spare, and incisive. It was a unique experience to observe how Debye immediately recognized the basic components of a new problem and their relations to known phenomena in other areas. When he read a publication, its essentials were immediately incorporated as a constituent element in his overall picture of the physical world. This explains, in part, his phenomenal memory of everything he had read or heard. It may prove that he was one of the last of the great natural philosophers, who recognize no boundaries between the various portions of science. At the same time, he was among the first in the twentieth century to demonstrate the artificiality of the historical boundary between physics and chemistry.

Although Debye was considered a theoretical physical chemist, for many years he occupied chairs in experimental physics. And this was not an empty title. Almost unique among theoreticians, he was not only vitally interested in explaining experimental results and suggesting new experiments to test a theory, but he participated actively by giving practical advice, designing new laboratory techniques, and following the day-to-day progress of his experimental coworkers. Indeed, many of his theories were tested and confirmed by his associates in his own “institute.” He did not withhold his interest nor avoid involvement with practical applications. A number of his investigations actually started from industrial problems that came to his attention. It is thus not surprising that he was much sought after as a consultant. Were one to attempt to delineate his field of activity it would be the determination of molecular structure in its most general sense, in that he started with the underlying postulate that the geometry of molecules, the force fields around them, and their interaction with the radiation field in which they were immersed, determined the physical and chemical properties of matter.

For decades Professor P. J. W. Debye graciously received many visitors, among them scholars, students, and historians of science who came to pay their respects, to discuss, to learn, sometimes to dispute, but often simply to establish contact with a great intellect and to gain wisdom. To questions as to how he selected problems for investigation his reply was that he worked only on those problems which interested him and which he could solve; as to how he partitioned his time, he said that he devoted all his efforts to a single problem until it was resolved. He thoroughly enjoyed his scientific pursuits but balanced this with full appreciation of physical well-being. He stressed the importance of giving students enough time to think seriously about their assignments, and he frequently talked of the importance of generating and living in intellectually stimulating surroundings which could lead to scholarship and scientific discovery. He believed that the intense preoccupation of serious scientists with a problem generates an atmosphere which is pregnant with ideas, which goads the imagination of those who are immersed in it to the discovery of principles of the physical world.

With the departing of Debye the world has lost one of the few “total” scientists; total in his devotion to his task, total in the breadth of his interest; total in the mastery of his discipline, and total in his human simplicity and straightforwardness.

Henri Sack, Benjamin Widom, Simon H. Bauer

Melvin G. deChazeau

March 20, 1900 — November 28, 1985

Without the efforts of Melvin G. deChazeau, one of the small group of academic entrepreneurs who guided the then Graduate School of Business and Public Administration in its early years, it is unlikely that there would be a Johnson Graduate School of Management at Cornell today. Known affectionately as “the Silver Fox” by three decades of students, Mel was an academic in all the best senses of the word and a tower of strength to the new institution. As the “first among equals,” he provided the continuity and institutional energy that sustained the school through its early, lean years.

Together with such colleagues as Paul O’Leary and John Hutchins, in economics; Arthur Nilsson, in finance; David Thomas, in accounting; Frank Gilmore, in business policy; and Edward Litchfield, Miller Hillhouse, and Paul VanRiper, all in public administration, Mel established the atmosphere of excellence in research and teaching that distinguished the school from the outset. By the quality of his mind and the force of his personality Mel was a true leader of the school. He assumed formal leadership as acting dean when Paul O’Leary’s term ended. Afterwards he was the perennial chairman of the school’s policy committee.

Mel and those of his colleagues who constituted the senior faculty of the school had an unusual talent. They facilitated growth and change in the school with statesmanlike attitudes: younger colleagues trained in different, more-quantitative ways were welcomed as team teachers in the basic courses in the curriculum “because that made the courses better courses.” The senior faculty members gave of themselves unselfishly to the school. In many ways Mel gave of himself the most. He gave to his students and to the school countless hours that he could have used to enhance further his national reputation. Nonetheless, through his teaching and research Melvin deChazeau, along with Joel Dean, was recognized as a founder of the newly emerging field of managerial economics. The less-talented of the students in his managerial economics class sometimes facetiously referred to the course as “the mystery hour.” At the same time, students and alumni alike appreciated the course as one of the most important in providing the foundation for analytic thinking by managers.

For more than a decade Mel represented the university at the National Bureau of Economic Research (NBER), then headed by his longtime friend and Harvard classmate Arthur Burns. At NBER the two men did much of the fundamental work on business cycles.

Mel recognized that few things in real-world economics are simple. He had the ability first to understand problems

in their complexity and then to reach a reasoned judgment about their true significance, whether within the firm or at a public policy level. These qualities came through in his monumental works on the steel industry (with Dougherty and Stratton) and on the petroleum industry (with Alfred Kahn). The latter, *Integration and Competition in the Petroleum Industry*, was recognized at the time of its publication as the definitive work on the structure and performance of that industry and earned a full, highly favorable review article in the *Quarterly Journal of Economics*.

Mel treated us, his junior colleagues, with great courtesy as equals and encouraged us to speak our minds on all matters academic. It didn't take us long, however, to recognize the gap between his intellect and our own.

With Mel as a friend, we had a friend for life. The friendship extended deeply into our families and his. Mel had great personal grace but could appear brusque and imperious at times. When that did occur, Eunice was always there with sweetness, intelligence, and deep humanity, providing the leavening that permitted Mel's inner warmth to re-emerge. We can still recall his distinctive laughter, which so often echoed through McGraw and Malott halls and in our homes and his home on the Knoll.

Melvin deChazeau was born in 1900 in Olympia, Washington. He received his undergraduate degree from the University of Washington and his Ph.D. degree in 1930 from Harvard University. He justly took pride in the fact that he, as a westerner from the University of Washington, had graduated first in his doctoral class at Harvard—a class that included Arthur Burns and a number of other distinguished economists. Mel served his country during World War II as a senior official of the War Production Board. Later he served as a senior economist and as liaison between the Department of Commerce and the President's Council of Economic Advisors. Before coming to Cornell, he taught at the University of Virginia and the University of Chicago. He is survived by his wife, Eunice; his daughter, Marian Holmes; his son-in-law, David Holmes; and his grandchildren, Melvin, Rebecca, Jessica, and Robert Holmes.

We remember Mel with deep respect and great affection. The Johnson School—and the field of management education in general—owes a great debt to him and to his fellow pioneers.

Harold Bierman, Edward Flash, Seymour Smidt, Alan McAdams

Herrell Franklin DeGraff

August 12, 1908 — January 4, 1986

Herrell DeGraff, professor emeritus, died at his home, 12 Burns Road, Brooktondale, New York. Much of his life was spent as a participant and leader in the Cornell community. He was born and reared in the town of Murray, Orleans County, New York. After high school he operated a farm on a share basis, worked as an equipment salesman and office manager, and sold investment securities. At the age of twenty-five, with a wife and young daughter, he enrolled as a freshman in the College of Agriculture, working nights at a commercial dairy farm. He completed the B.S. degree with an outstanding academic record in 1937. He completed his M.S. degree the following year and the Ph.D. degree in 1941, when he was appointed to the Cornell faculty as an assistant professor. He spent the first year of his tenure in postdoctoral study at the University of Chicago to develop a new course in agricultural geography. He was promoted to associate professor in 1942 and to full professor in 1947.

For ten years his course in agricultural geography provided incoming freshmen with a broad, worldwide perspective of agriculture. He was a dynamic teacher and tireless leader in the agricultural community, highly sought after as a speaker at both state and national meetings. He was the second person to be voted the Professor of Merit Award by the college seniors and for several years was the faculty representative on the Cornell Board of Trustees. Expanding his interests to include international agriculture after World War II, he served as a Rockefeller Foundation fellow in Mexico and as a consultant to the Rockefeller Foundation Development Program in Mexico and Colombia. His friends remember well during the late 1940s that he would habitually return to his office late at night, following some speaking engagement “out in the state,” to prepare for the next day’s lecture. Though he was involved in many peripheral activities, it was in the classroom where his skills reached their zenith. His classes were always filled to capacity, and although his subject matter was aimed at the freshman and sophomore level, it was a rare graduate student that did not sit in on his lectures.

In 1951 he was chosen to be the first holder of the H. E. Babcock Memorial Professorship in the Graduate School of Nutrition, an endowed chair. His appointment was based on his original work in food economics. He held that position until 1962, when he became president of the American Meat Institute in Chicago, a position from which he retired in 1973. During much of that period he continued to serve Cornell as chairman of the College of Agriculture’s Advisory Council. On his frequent return trips to Ithaca he spoke as a guest lecturer in various

courses dealing with the food economy. On retirement from the American Meat Institute Professor DeGraff returned to Ithaca, where he resumed many of the community interests he had left in 1962.

For several years he served as a senior lecturer in marketing and food economics courses, and he renewed his involvement with the Tompkins County Hospital Board of Managers. He served as president of the hospital board during the years when it made the decisions to build a new building and to become a nonprofit public corporation. For many years before leaving Ithaca in 1962 he had also served on the hospital board of managers. Because of his long and continued interest in Cornell, and because of his outstanding achievements as a teacher of many years, the faculty voted him professor emeritus. Indeed, few faculty members over the years have served Cornell so faithfully and so well.

Professor DeGraff's wife, Gladys Pool DeGraff, died in 1977. They are survived by a daughter, Sara K. DeGraff, and a son, Peter H. DeGraff.

Wendell G. Earle, Robert S. Smith, Bernard E. Stanton, Max E. Brunk

Donald Dee Delahanty

August 4, 1923 — July 8, 1975

With the passing of Donald Delahanty, the New York State College of Veterinary Medicine and Cornell University have lost an able alumnus and dedicated teacher. A graduate of our own veterinary college and a member of this faculty since 1952, his death at the age of fifty-one ended a life of unusual activity.

Donald Delahanty returned from military service in 1947 a mature, serious, dedicated individual who mystified those companions of his student days by his seriousness of purpose, drive, zeal, and dedication. In spite of serious health handicaps dating back to precollege days, he became an excellent surgeon and a good teacher, always interested in the welfare of his patients and the progress of his students. He was most concerned for the little man, be he student or client. He had tremendous enthusiasm and physical vigor. He worked from early until late and was intolerant of colleagues or students who were less dedicated. To complement his teaching, he became an accomplished artist and photographer. When he needed another language, he learned one. He traveled widely: to South America, Mozambique, China, and Japan. He did not aspire to great riches or to fame, but simply to be a better teacher. Though it would jeopardize his personal advancement and comfort, he often rejected sophisticated procedures and techniques because many of his students would not have the facilities to duplicate them. Throughout his twenty-three years at Cornell he took just three sabbatical leaves. Typical of the man, rather than attending a foremost institution where he could advance his skills and knowledge he chose Lima, Peru; Asunción, Paraguay; and Mozambique, where he could help to improve the clinical training of the students in these countries.

Donald Delahanty had many interests: scouting, public schools, gardening, racing pigeons, and his family are but a few of his many and varied interests. He was proud of his family, spoke often of their accomplishments, and looked forward to their return to the family circle at the holidays. Unfortunately, he seldom relaxed. If he were to race pigeons, he would raise and train them in such a manner that they would win—not usually but always. His home and garden bore evidence to the attention he gave them over the years. He gave freely of his time to horse shows, trail rides, and rodeos. While he gave unlimited time and effort to the honest, the deserving, and the unfortunate, the chiselers found him to be uncompromising.

Donald Delahanty spoke and demonstrated at many scientific programs in this and many other states. However, he declined many invitations because he did not wish to leave his classes and clinics in the charge of an associate. Here was a man who truly loved students, who gave to his students far more than he received in return. He made a

lasting imprint on those with whom he was in contact. Horsemen considered him to be a most reliable consultant in solving their problems. He was truly a gifted surgeon whose techniques embraced both art and skill.

Dr. Delahanty is survived by his wife, Mrs. Elizabeth Delahanty of Dryden; two sons, Michael J. Delahanty of Salem, West Virginia, and Timothy C. Delahanty of Dryden, a student at Tompkins Cortland Community College; three daughters, Mrs. Mary Lou Zielinski of Maiden, Massachusetts, Sara Delahanty of Dryden, a student at Cornell University, and Alice P. Delahanty of Dryden, a student in the local high school; two grandchildren; his mother, Mrs. Louise Delahanty of Stony Brook, Long Island; a brother, James Delahanty of Stony Brook, Long Island; and a sister, Mrs. Alfred Jayne of Bridgewater, Connecticut.

John Bentinck-Smith, Dorsey W. Bruner, Bud C. Tennant, A. Gordon Danks

Eugene A. Delwiche

November 26, 1917 — January 14, 1994

Eugene A. Delwiche, Professor Emeritus of the Section of Microbiology, died January 14, 1994 at Tompkins Community Hospital, Ithaca, New York.

Gene Delwiche was born in Green Bay, Wisconsin in 1917. His father was a Professor of Agronomy and Director of the Branch Experiment Stations at the University of Wisconsin, Madison. In 1941, Gene received his Bachelor of Science degree with honors from Wisconsin majoring in bacteriology. Soon after graduation, he entered active duty with the United States Infantry as a Second Lieutenant. He was placed in command of a Howitzer Company and remained in active service through the Second World War. At the end of WWII hostilities, his infantry company was stationed in Germany.

After receiving an honorable discharge from active duty in

1946 at the rank of Captain, Gene decided to go to graduate school. Dean LL. Baldwin at the University of Wisconsin, was a friend of James Sherman, the Head of the Department of Dairy and Food Science at Cornell University, and Baldwin recommended Cornell. As a result, Gene entered graduate school at Cornell with Sherman as his thesis advisor. He lived for a time in a room in the basement of Stocking Hall, a room that was used for many years to house graduate students.

Gene obtained his Ph.D. degree in 1948 and became an Assistant Professor in the “Laboratory of Bacteriology,” in the Department of Dairy and Food Science. However, in

1947 and 1948, he had supported himself by working as a Teaching Assistant in the class in introductory microbiology and there he had met a nutrition major named Constance Nott. He and Connie Nott were married in 1949. They remained a true Cornell family and their two sons and two daughters all became recipients of Cornell degrees.

Gene’s Ph.D. thesis research had focused on the propionic acid fermentations of the bacterial genus *Propionibacterium*, and he continued that research area throughout his career, teaching courses in bacterial physiology and chemistry. He was awarded many grants to fund the research in his laboratory, and that research resulted in numerous publications. In later years, he also studied aspects of the physiology of the anaerobic genus *Veillonella*. In addition

to directing research and teaching courses in microbiology, each year he advised about two dozen undergraduate students.

Gene was promoted to Associate Professor of Bacteriology in 1951 and full Professor in 1955. From 1951 to 1958, he was a consultant to the Biological Division of the Oak Ridge National Laboratory. In 1963, he was awarded a John Simon Guggenheim Fellowship and spent a sabbatical leave at the Karolinska Institute in Stockholm, where he worked in the laboratory of Tord Holme, studying biosynthesis by bacteria of the genus *Bacillus* grown in continuous culture.

In 1965, his title was changed from Professor of Bacteriology to Professor of Microbiology and when the Department of Microbiology was formed in 1977, he became a faculty member in that new Department. Gene served on the Editorial Board of the *Journal of Bacteriology*; he contributed descriptions of the genus *Propionibacterium* to the 7th and 8th editions of *Bergey's Manual of Determinative Bacteriology*; he served as president, vice president and secretary of the Physiology Division of the American Society for Microbiology, and served as program reviewer and in the Postdoctoral Fellowship Program of the National Science Foundation.

Gene served on numerous departmental, college and university committees, including the Area Committee, the Fellowship Board for Biological Sciences of the Graduate School, the Honors Committee, Curriculum Committee of the Division of Biological Sciences, and the Academic Achievement and the Petition Committees of the College of Agriculture and Life Sciences.

He continued his research in the areas of microbial physiology and energy metabolism and served as the major advisor for many Ph.D. and M.S. students. He had membership in the American Society for Microbiology, the American Society of Biological Chemists, the Canadian Society for Microbiology and the Society for Industrial Microbiology. He was also elected a fellow and a charter member of the American Academy of Microbiology.

Gene Delwiche had stayed in the Army Reserve, as a member of the Chemical Corps, long after he had finished his active tour of duty. During the summer months, he would spend his required two weeks of active duty at the Army research laboratories at Fort Detrick, Maryland. He remained in the Army Reserve until his retirement at the rank of Lieutenant Colonel in 1984. Also, in 1984, after thirty-six years on the faculty of Cornell University, Gene Delwiche retired that position and was granted the rank of Professor Emeritus.

For many years, Gene was a licensed “ham” operator of a radio transmitter and generously helped others who were interested in learning the hobby. In recent years, his interest turned to computers and he worked actively through

Cornell's Computer Internet Connection. Among Gene's other interests were hunting, swimming and vegetable gardening. As a member of the Ithaca Yacht Club, he participated in many waterfront activities, especially sailing. He was also a member of the City Club, a charter member of the Statler Club and was once an active golfer.

Besides his wife Constance, Gene Delwiche is survived by his four children and twelve grandchildren.

Norman C. Dondero, Harry W. Seeley, Jr., Robert P. Mortlock

Louis Monroe Dennis

Professor of Inorganic Chemistry

— *Dec. 9, 1936*

The death of Louis Monroe Dennis, on December 9th, 1936, marked the passing of another of that small group whose long services to Cornell, beginning in the earlier years of the institution, have been constructive forces in the development of the University.

Coming to the Department of Chemistry in the Fall of 1887 as Instructor, he was advanced to an Assistant Professorship in 1891, and to an Associate Professorship in 1893. In 1900, he became Professor of Inorganic Chemistry, and he served as Head of the Department of Chemistry from 1903 until his retirement in 1931: forty-five strenuous years of active service.

These years saw the work in Chemistry transferred to Morse Hall from Franklin Hall which had previously been shared with the Department of Physics; the extension and additions to Morse Hall; and the disastrous fire which well nigh destroyed that building in the Spring of 1916.

The laying of the cornerstone of Baker Laboratory was a memorable day for Professor Dennis. It marked the beginning of an adequate home for the Department of Chemistry, and to the planning and building and equipment of this Laboratory, he devoted years of intensive study and expert knowledge. The Baker Laboratory of Chemistry is a monument and a memorial to the wisdom, the vision, the resourcefulness, the energy, and the inspiration of Louis Monroe Dennis.

During these years and under his able guidance, the department showed steady progress, not only in material things, but also in academic work and in productive scholarship and research. The establishment of the "George Fisher Baker Non-Resident Lectureship in Chemistry" is the direct outgrowth of the plan, conceived and executed by Professor Dennis, of bringing to America each semester one of Europe's leading scientists.

The wide studies of his undergraduate days in literature, languages, and music were developed and enriched by a highly sensitive and refined taste in artistic values.

Blessed with rugged strength and a love of sport, he was no mean antagonist in competition with those who were many years his juniors. This joy of a life that was clean, and fair and generous, led to his long and devoted service

to athletics at Cornell, to the inception of the annual musical festivals at the University, and to the support of other causes for the welfare of his fellows to which he gave himself persistently and unselfishly.

To those whose chief contacts with Professor Dennis were along professional lines he will be remembered as the accurate, painstaking investigator, exacting and rigorous in his demands upon himself, and equally insistent that all who were under his direction should exhibit the same high standards and ideals. It is a source of gratification to his colleagues that, during the period of his retirement, he was able, with unimpaired vigor and industry, to continue the high quality of the scientific research in his chosen field which had brought him great distinction both at home and abroad.

To those who were privileged to know him in more intimate ways, Professor Dennis was the gracious host, the welcome friend, the fair and generous sportsman, the tasteful connoisseur and gifted performer in various forms of art, the patron and supporter of many a fine endeavor, the ardent advocate of freedom in all its phases, loyal to the institution which he had served so long, devoted to the welfare of the community in which he moved. The world is finer and fairer because he lived.

Bernard E. Dethier

June 5, 1926 — February 22, 1995

Bernie Dethier was for many years the leader of the meteorology group in the Department of Agronomy. Through his leadership, meteorology at Cornell grew from a one-person operation to a vital, nationally recognized program. In 1983, he established the Northeast Regional Climate Center at Cornell and served as its Director until his retirement in 1988. The Center serves as a unique resource of climate data and applied climate information for Cornell researchers as well as for businesses, government agencies, and citizens throughout twelve northeastern states.

Born in Boston, Bernie earned his bachelor's and master's degrees in meteorology from the California Institute of Technology and a Ph.D. degree in geography from the Johns Hopkins University. Bernie joined the Cornell faculty as an Assistant Professor of Agricultural Climatology in 1958. He was promoted to the rank of Associate Professor in 1962 and to Professor in 1969. Prior to his employment by Cornell, Bernie held faculty positions at Nazareth College in Michigan and at Morgan State College in Maryland. He was also employed as Director of Climatology with a private weather service in California and served as an aerology officer in the United States Navy from 1952-54.

When he arrived in 1958, Bernie *was* the meteorology program at Cornell, serving the entire university with instruction, research and public service in all aspects of atmospheric science. The meteorology program grew in size and importance under Bernie's leadership. His entrepreneurial spirit and outgoing personality well suited him for developing a more substantial academic program. By the mid-1960s, Bernie was successful in obtaining an additional faculty position in meteorology to meet growing student interest and enrollment in meteorology courses. In the early 1970s, he greatly expanded the meteorology curriculum to give undergraduates the training necessary to meet requirements for professional employment in the field. This resulted in a surge in enrollment and led to the addition of a third faculty member to the meteorology program. By the time of Bernie's retirement, the program consisted of four faculty members, a half-dozen support staff, and over forty undergraduate majors. He is remembered for his encouragement and support of younger colleagues and for promoting a harmonious and cooperative work environment for everyone involved with the meteorology program.

Bernie taught the introductory course in meteorology for many years as well as courses in climatology, tropical meteorology, and air pollution. The introductory course was very popular with a typical enrollment of 75 to 100

students. Several thousand Cornell undergraduates received their introduction to meteorological phenomena and processes in this course and it inspired many to take up meteorology as a major and career.

Cornell's atmospheric science program was lifted to regional and national prominence through Bernie's efforts in establishing the Northeast Regional Climate Center. The Center's data resources, service, outreach, and research activities complement and enhance the teaching and research programs of the department. Bernie was appointed State Climatologist for New York in 1979 and, upon his retirement to Blue Hill, Maine, he assumed the position of State Climatologist for Maine—a position he held until his death. He was an active member and past president of the American Association of State Climatologists, a Fellow and professional member of the American Meteorological Society as well as a member of Sigma Xi.

Bernie's research focused primarily on the use of climate data and information to address problems in the field of agriculture. Much of his work was done in cooperation with colleagues in the department and at many other institutions in the Northeast and throughout the nation. These studies most often involved organizing, analyzing and summarizing large quantities of weather observations. In the early 1970s, he organized and led a large, multi-disciplinary group of scientists in a pioneering research project to explore the potential of satellite observations in monitoring the phenological development of crops, rangeland, and forests on a continental scale. Many of the publications resulting from his work are widely used to this day.

You may have wondered why only the top floor of Bradfield Hall has windows. Credit is due to Bernie Dethier. Bernie was fond of relating a tale of his meeting with the architect during the building's planning stages and his insisting that meteorologists had to have a clear, unobstructed view of the sky in order to observe and forecast the weather. His arguments were obviously persuasive, and the faculty and staff of the atmospheric science group as well as thousands of campus visitors each year enjoy the splendid views of the campus and Cayuga Lake afforded by Bernie's windows.

Robert F. Lucey, Madison J. Wright, Warren W. Knapp

A. Henry Detweiler

October 4, 1906 — January 30, 1970

With the passing of Henry Detweiler, professor of architecture and associate dean of the College of Architecture, Art, and Planning, the University lost a persuasive administrator, enthusiastic teacher, and loyal supporter. A scholar concerned with the past, he was also a man devoted to improving the present and the future.

He came to Cornell to teach architectural history. Beginning as an instructor in 1939, he rose to the rank of professor by 1948. His remarkable adaptability was tested by special wartime assignments which by 1943 included: assistant to the director of the Army Area and Language Program, geography instructor for the U.S. Military Academy Preparation Program, and instructor in aeroplane drafting techniques for Curtiss-Wright trainees. His administrative talents were soon recognized, and he served, often as chairman, on a number of *ad hoc* study groups and standing committees of the University. Following the student disturbances of 1958, as chairman of the Committee on Student Conduct, he was responsible for the implementation of recommendations made by the deans of the undergraduate colleges and the organization of a new judicial system. When the Faculty determined to make the University Lectures program more effective, he was persuaded to accept the chairmanship of the University Lecture Committee with outstanding results. In 1956 he was appointed associate dean of the College of Architecture. To the discussion of the innumerable University-wide problems with which he was concerned, he brought special talents: directness, organization, and an ability to understand the views of those who did not agree with him.

Professor Detweiler died in New York on the day he was to have begun his term of office as president of the Society of Architectural Historians. He had looked forward to this as the capstone of a lifetime of professional, educational, and administrative achievement which had already brought him many responsibilities and honors, most recently election as a fellow of the American Institute of Architects.

Of even longer standing than his association with Cornell was Professor Detweiler's relationship with the American Schools of Oriental Research. An architectural fellow from 1932 to 1935, he was acting director of the school in Jerusalem in 1949, and visiting professor, then director in 1953-54. He was chairman of the school committee from 1951 to 1954 and president of the Schools from 1955 to 1966, leading the organization from the low ebb of the post-World War II era to financial security, an expansion of facilities and activities, and new heights of achievement. After eleven years as president, he resigned and was appointed a life trustee.

His familiarity with the Near East dated back to 1930, when, as he put it, he became an “archaeological hobo.” There was in this tall, bespectacled, scholarly-looking Pennsylvania Dutchman a streak of the adventurer, the knight errant of architecture, something which responded to the age-old romantic lure of the Near East. Emerging from school in 1930, during the Depression, as a bachelor of architecture from the University of Pennsylvania, he became field architect to a galaxy of the most famous excavations of the thirties. He worked in Mesopotamia, Palestine, Jordan, Syria, and Iraq as familiar and friend of the great archaeologists and field architects of that era. He recorded the excavations and monuments unearthed by expeditions to Tell Billa, Tepe Gawra, and Seleucia on the Tigris (Iraq); Tell Beit Mirsim and Samaria (Palestine); Gerasa (Jordan); Bosra and Dura Europos (Syria).

His seven years of archaeological effort in the Near East included the survey of the d’Juma Mosque in Isfahan in 1936 and association with the great historian M. I. Rostovtzeff at Dura. His restoration drawings of Bosra Cathedral and the monumental buildings of Gerasa have become classics, while his *Manual of Archaeological Surveying*, published in 1948, is a systematic distillation of his vast experience in the field.

The breadth of his interests is suggested by his study of seventeenth-century architecture in England, undertaken in 1947 on a Langley Fellowship of the American Institute of Architects, and his investigation of Renaissance architecture in central Italy in 1953-54. Much of his research into the origins of early Christian architecture was embodied in the Haskell Lectures on “The Architectural History of the Early Church,” delivered at the Oberlin Graduate School of Theology in 1964. During the last years of his life, he was engaged in the preparation of a comprehensive study of the Lombard churches of northern Italy. Much of the field work for this was accomplished on a Guggenheim fellowship in 1961-62, but he continued his investigations on several subsequent visits to Italy, when he also kept in touch with the American Academy’s excavation at Cosa on the Italian coast where he was an adviser in 1954.

Keenly interested in problems of architectural conservation and restoration, Professor Detweiler was called upon between 1963 and 1966 by the Department of State and other authorities to serve as adviser on the protection of the monuments of Egypt, including the salvage of the great cliff temples at Abu Simbel, and as director of a U.S.A.I.D. program for the preservation of sites and antiquities in Jordan.

In 1957 Professor Detweiler joined George M. A. Hanfmann of Harvard in organizing the archaeological exploration of Sardis in Turkey. They formed an inspired team, and the Cornell-Harvard Expedition greatly enlarged on the work inaugurated by a Princeton University group before the first World War. In the central area of the historic capital of Lydia, extraordinary architectural remains were laid bare, including a monumental Byzantine shopping

street, a Roman gymnasium complex centering on a court lined with ornate multistoried marble colonnades, and an unparalleled giant synagogue% As associate director, Professor Detweiler was responsible for much of the organization of the project and participated in the campaigns for ten seasons, his keen eye and wealth of experience enabling him to make essential contributions to the understanding and interpretation of the buildings at Sardis. He was often accompanied by Mrs. Detweiler, who served as numismatist.

He first met Catharine Bunnell in Athens, where she was a member of the American team excavating the Agora. They were married in 1939 and moved the same year to Ithaca, where their family grew to include a son and three daughters.

Henry Detweiler was a well-known figure throughout Cornell University, an institution of which he was exceedingly proud and to which he was intensely loyal. He seemed inexhaustible and indefatigable, and his never-failing resourcefulness and ingenuity resolved many problems for his colleagues and associates, often without their becoming aware of the innumerable complications with which he was involved. He may have been helped in dispatching the College's business by the early experience as radio repairman and technician which paid for his architectural schooling and was reflected in his lifelong hobby of electronic tinkering. At the time of his death, he had nearly completed the assembly of a color television set. For the generations of architecture students whom he came to know well through admissions procedures and advising, he was a surrogate father. Although he could be stern and direct in counsel, he was sympathetic. Students understood his concern for their welfare, as well as for their academic and professional careers. An enthusiastic teacher and persuasive organizer, Henry Detweiler made a lasting contribution to three related professions: archaeology, architectural history, and architecture.

Thomas W. Mackesey, John A. Hartell, Stephen W. Jacobs

Edward C. Devereux

September 14, 1912 — March 14, 2002

Professor Edward C. Devereux died at nearly 90 years of age in Hawaii, where he and his wife Edwina had moved recently after some 50 years as active residents of the Ithaca community. His survivors include Edwina, now living in Ithaca; and two children: John in Madison, Wisconsin, and Catherine in Indiana, Pennsylvania.

Ed was born in Great Neck, Long Island, New York on September 14, 1912, where he attended the Kensington School. After graduating from the Phillips Exeter Academy in 1930, he went on to Harvard where he received his A.B. degree in Sociology in 1934. Following two years as a Research Assistant at Connecticut State College, Ed entered the doctoral program in Sociology at Harvard, where he was greatly influenced by the distinguished sociologist Talcott Parsons, and completed most of his doctoral work by 1940. After two years as a Sociology instructor at the University of Toronto, Ed joined the U.S. Navy during World War II, serving as Navigator and Executive Officer on a fleet tanker until 1945. He then was appointed Assistant Professor of Sociology at Princeton, where he remained for five years before joining the Cornell faculty as Associate Professor of Child Development and Family Studies in 1950, serving as Department Chair from 1966-70.

Throughout his Cornell career, Ed's major specialization was in the family as a social system and as a socialization context shaping the development of both children and adults. His strong interests in both sociological theory, and in the everyday issues faced by children and families in contemporary societies, enriched the experiences of his students as well as his faculty colleagues. He had an enduring commitment to utilizing his theoretical knowledge and experiential background to help create better community and family environments in the hope of enhancing human development. With his strong interdisciplinary interests, Ed played a significant role in bringing important sociological perspectives to his department's central focus on child development and the family, and also more broadly, in encouraging the bridging of the social sciences at Cornell.

Ed's teaching contributions at both the undergraduate and graduate level were extensive and multi-faceted, reflecting his inter-disciplinary and cross-cultural perspectives. His offerings covered basic areas such as the American family and the family in cross-cultural perspective, but also included such topics as social disorganization and deviant behavior, social structure and institutions, socialization in ecological perspective, personality and culture, and communities and neighborhoods as socialization settings for children.

Much of Devereux's research dealt with families and socialization practices affecting child rearing in a number of different societies, including the United States, Germany, Japan, Israel, and England. He began a long and fruitful collaboration with Urie Bronfenbrenner in the early 1950s, when they became involved in the detailed study of an entire small-town community and the manner in which it influenced the life course development of children and adults who lived there. According to Bronfenbrenner, it was Ed Devereux's insightful contributions to the many publications on which they collaborated that stimulated Urie's subsequent life-long emphasis on the especially powerful role of the environment in the development of human beings.

Ed's scholarly interests were surprisingly eclectic, as reflected in his writings on such topics as gambling and social structure, delinquency and criminology, the role of social research in business settings and the importance of children's play. Particularly notable were his observations and concerns about the often-impoverishing effects of excessive adult domination on the games played by children and youth. This led to the production of Ed's highly regarded documentary film entitled *Two Ball Games*, which demonstrated the positive effects of organizing children's baseball games with emphasis on cooperative, mutually supportive and enjoyable play, as compared with a more tightly controlled, adult-oriented approach.

Many of Ed's "extra-curricular" activities involved service to various community organizations such as the Boy Scouts, Youth Bureau, Mental Health Association, and the Unitarian Church. Among his favorite leisure activities were swimming and sailing, and he took great pleasure in plying the waters of Cayuga Lake in his sailboat, often with delighted guests aboard.

Ed Devereux is fondly remembered by his many colleagues and friends for his sense of humor, his collegial relationships with fellow faculty members, the congenial atmosphere he created with others around him whatever the setting, and his always spirited readiness to engage in challenging conversations on a wide range of ideas—characteristics which were valued by all who knew Ed.

Urie Bronfenbrenner, Henry N. Ricciuti

James E. Dewey

January 15, 1917 — August 29, 2009

James E. Dewey, a retired Cornell University Professor of Entomology, passed away at age 92 on August 25, 2009 in Ithaca, New York.

Dr. James E. Dewey was born in Geneva, NY on January 15, 1917. He received his BS degree in Entomology from Cornell University, his MS from the University of Tennessee, and his PhD from Cornell University in Entomology (Insect Toxicology).

In the spring of 1944 Dr. Dewey was appointed as an extension specialist in fruit insect control, with the rank of instructor. During this time he made numerous excellent contributions to the state fruit industry, establishing relationships and improving communication with federal and state agencies involved with pesticides.

In 1945, Dr. Dewey joined the faculty at Cornell becoming an Associate Professor in 1947 and a Full Professor in 1954. In the 1950s he conducted pioneering research on the use of *Daphnia magna* as an environmental biomarker and for use as a means of determining pesticide levels in water and on food crops. He served as director of the Pesticides Program in the College of Agriculture and Life Sciences from 1964-1973. His major duties, in addition to research, included teaching courses and supervising graduate students in insect toxicology. At that time he also taught a course in the biology, research and control of fruit insects. One specific graduate course in chemistry and toxicology of insecticides, in which he shared responsibility with the insecticide chemist, was regarded as the top course of its kind in the country. Later in his career, he devoted considerable effort to preparation of educational programs and manuals for the safe application and handling of pesticides in agriculture.

Over the course of his career, Dr. Dewey continued to offer his expertise to various state and federal committees that were formulating rules for the safe use of pesticides with emphasis on avoidance of residues in food and milk. His impact on the formation of state and federal pesticide legislation was significant. Dr. Dewey also served as the President of the Eastern Branch of the Entomological Society of America from 1980-1981. He was the recipient of numerous awards, including the New York State Agricultural Society Distinguished Service Citation (1975), the USDA Award for Superior Service in Cooperative Extension (presented by the Secretary of Agriculture at a ceremony in 1983), and the Northeast Agricultural Aviation Association Outstanding Service Award (1999). Dr. Dewey was elected an honorary member of the Entomological Society of America in 1984.

Dr. Dewey was predeceased by his wife of sixty- two years, Agnes. He is survived by his daughter Elizabeth of Dryden, New York.

Arthur A. Muka, Lisa E. Westcott, Jeffrey G. Scott

John W. DeWire

June 12, 1916 — September 17, 1990

John W. DeWire has left an indelible imprint on Cornell. Arriving in 1947, he became one of the most influential and respected members of the Physics Department. He was one of the earliest members of the Laboratory of Nuclear Studies and was instrumental in its development into international leadership in high energy physics. In 1983 he was appointed University Ombudsman, a position he filled with great distinction until 1988, two years after his retirement, when ill health forced his resignation.

John was born in Milton, Pennsylvania in 1916, received a B.S. degree from Ursinus College in 1938 and a Ph.D. degree from Ohio State University in 1942. In 1979 he was awarded an honorary D.Sc. degree from Ursinus College. After receiving his doctoral degree, John worked on scientific projects connected with the war effort. He joined Robert R. Wilson at Princeton University on a uranium isotope separation project. In March 1943 he accompanied Wilson to Los Alamos where he measured various nuclear properties required for the design of nuclear weapons. One of the most important of these was the measurement of the neutron multiplication constant for neutron induced fission in uranium. He also participated in measuring the neutron growth rate in the first nuclear explosion at the Trinity test site in New Mexico.

In 1946 John joined the newly established Laboratory of Nuclear Studies at Cornell as a research associate. In 1947 he was appointed to the Physics Department faculty. He was an active player in the life of the department. John enthusiastically taught courses at all levels, from freshman autotutorials to graduate-level courses on high energy physics. He took on many departmental responsibilities from graduate field representative and admissions committee to writing and directing skits for the Christmas party. His sense of fair play guided the physics faculty through many difficult decisions. In the laboratory, he was a key member of the faculty group which designed, built, and used the five electron accelerators that kept Cornell in the forefront of elementary particle physics. For seventeen years he was the associate director of the laboratory. The successful and harmonious operation of the laboratory was due, in large measure, to John's devotion to its work and to his concern for the welfare of its employees.

Over a period of forty years John carried out an active research program on each of the laboratory accelerators and he did important work in many fields of elementary particle physics. We can only touch on some of the highlights. He made the first accurate measurements of the interaction of electromagnetic radiation with matter

at high energy. In a beautiful series of experiments he demonstrated that this interaction was correctly described by the then young theory of quantum electrodynamics. He worked for many years on the production of mesons by electromagnetic radiation during which he made essential contributions to our understanding of the form of the strong or nuclear interaction. In collaboration with others at Cornell he discovered an excited state of the proton. For the last ten years he was a senior member of a collaboration working at the Cornell Electron Storage Ring studying the properties of heavy quarks. This group produced many of the most important elementary particle physics results of the last decade. Much of what we know about the properties of heavy quarks, including the discovery of more than six different particles containing one or more such quarks, comes from that work. Events with electrons are an important signature for the decay of particles containing heavy quarks; John was particularly effective in applying his years of experience in detecting electrons to the study of events of this type. Each of these subjects was at the forefront of elementary particle research when John was working on them. Together they span a large fraction of the history of elementary particle physics. John's contributions assure him an honored place in that history.

John was a prominent figure in the national and international high energy physics community. In 1960 he was a senior postdoctoral fellow at the Italian National Laboratory at Frascati, Italy. He spent the 1968 and 1974 academic years as a visiting professor at the University of Bonn in West Germany, first as a Fulbright Fellow and then as a Humboldt Senior Scientist Awardee. He developed very close professional relations and lifelong friendships at both places. He was also invited by the Soviet Academy of Sciences to lecture at a number of laboratories in the Soviet Union. In addition, he was a Fellow of the American Physical Society.

For fifteen years John was a member of the Board of Trustees of Associated Universities, the organization responsible for the management of Brookhaven Laboratory and the National Radio Astronomy Laboratory. He enjoyed his work on the board and was highly valued for his knowledge of elementary particle physics as well as accelerator design and civil construction. His characteristic outspokenness and his critical judgement were particularly useful to the board.

John was an early member of the Federation of Atomic Scientists and worked effectively in the successful effort to keep the development of atomic weapons under civilian control. He was a member of the American Association for the Advancement of Science and he served on the editorial board of the *Review of Scientific Instruments*.

Among John's many enthusiasms, railroading was a special interest; he knew routes, systems, equipment, and schedules. One of his most cherished memories was the trip arranged by his Bonn friends for a ride in the engine

of a crack train traveling along the Rhine, a trip that earned him a photograph in a Bonn newspaper which he showed with great pride. He also enjoyed travel, music, art, and gardening, being particularly proud of his grapes. However, above all other interests, John's true love was physics. His passion for physics survived, undiminished, an eight-year struggle against leukemia. The first six years he continued working normally. The last graduate student to profit directly from John's knowledge and experience is just now finishing his thesis. During the last two years he became progressively weaker. Nonetheless, he continued to maintain a strong interest in the work of the laboratory. Even when he was very weak he went to the laboratory to work for an hour or so on a research project he was particularly interested in. When finally he was unable to leave his home, his first request from visitors was for information about the activities at the laboratory and in the rest of the world of physics. This devotion to physics was but one of the reasons he was so much admired by his colleagues.

All of John's personal qualities, his integrity, compassion, sense of humor, experience as a professor, and knowledge of the entire Cornell Community, enabled him to be a particularly effective University Ombudsman. He was equally at home mediating a dispute between the campus police and an unruly hockey fan, assisting a victim of sexual harassment and her family, and fighting for students' rights when he felt that a department had abused its authority. Even though the Ombudsman's responsibilities demanded a large commitment of time and energy, he found the role immensely satisfying.

John had a happy and productive life. He loved physics and Cornell and particularly the combination. He had a loving and devoted family and a large circle of grateful friends who basked in his warmth and generosity. He was loved and honored by his many colleagues.

John DeWire is survived by his wife, Ruth*; a daughter, Susan Hosek, of Los Angeles, California; son, William, of Lewistown, Pennsylvania; five grandchildren; a brother; and two sisters.

Boyce McDaniel, Albert Silverman, David G. Cassel

*Ruth DeWire died January 2, 1992.

Robert S. Dickey

January 18, 1921 — July 1, 1991

Robert S. Dickey, Professor Emeritus of Plant Pathology, Cornell University, died at his home in Prescott, Arizona on July 1, 1991.

Professor Dickey was born on January 18, 1921 in Riverside, California. He received his early education in public schools in Riverside, California after which he attended Riverside Junior College where he earned an A.A. degree in 1941. In 1948 he was awarded the B.S. degree in Plant Science and in 1954 a Ph.D. degree in Plant Pathology at the University of California, Berkeley. His doctoral thesis research dealt with several aspects of the crown gall disease caused by *Agrobacterium tumefaciens*.

From September 1942 to January 1946 Professor Dickey was in military service. He served as Regimental Intelligence Officer and Company Commander in the 39th Infantry Regiment, 9th Infantry Division in Europe where he participated in four military campaigns. Four decorations were awarded to him for heroic action and two of these were awarded by the Belgium Government. His discharge from the United States Army was with the rank of Captain.

Bob Dickey joined the Department of Plant Pathology at Cornell as an Assistant Professor in 1952. From 1952 to 1954 he served as Extension Specialist in charge of cereal, potato, and forage crop diseases. He was Plant Pathology Extension Project Leader from 1954 to 1958 with additional responsibilities for preparing plant disease survey reports, for being in charge of the Plant Pathology Extension Office, and planning Extension conferences. With the retirement of W.H. Burkholder, Professor Dickey moved to a research/teaching position dealing with plant diseases caused by bacteria. From 1959 until his retirement in 1987, he carried out research and taught courses in bacterial plant diseases and phytopathogenic bacteria. Research on bacterial diseases of plants included the diagnosis, pathogen identification, epidemiology, and control of bacterial diseases as well as the host-pathogen interaction during pathogenesis. His investigations of phytopathogenic bacteria were concerned primarily with the taxonomy and physiology of various genera, species, and strains. A limited collection of selected bacterial cultures also was maintained as an integral part of the program.

One of Professor Dickey's first research projects on bacterial diseases of plants at Cornell was on the wilt disease of carnation caused by *Pseudomonas caryophylli*. The results of this research were published with his co-workers and graduate students in a series of papers in *Phytopathology* covering all aspects of this disease. An important

finding from this research by Professor Dickey and his graduate student, C.W.D. Brathwaite, was the discovery of the synergism between *Pseudomonas caryophylli* and *Corynebacterium* species in causing maceration of carnation stem tissue. Another of Professor Dickey's major research interests was the genus *Erwinia* particularly *E. carotovora* subsp. *carotovora* and subsp. *chrysanthemi*. A series of papers were published dealing with the affects of these organisms on chrysanthemum, *Musa paradisiaca*, *Zea mays* and other host plants as well as work on the taxonomy of this genus.

Professor Dickey was an active participant in International meetings and programs dealing with bacterial diseases of plants. In 1971 he was awarded a New York State College of Agriculture Travelling Fellowship to attend the Third International Conference of Plant Pathogenic Bacteria in The Netherlands and to visit research laboratories in Denmark and The Netherlands. He was Discussion Session Organizer and Chairman for the Ecology of Bacterial Plant Pathogens at the 2nd International Congress of Plant Pathology and on the organizing committees for Bacteriology for the 3rd and 4th International Congress of Plant Pathology held in 1978 and 1983. He also served on the Executive Committee for the International Group on Plant Pathogenic Bacteria, the Committee on Taxonomy of Plant Pathogenic Bacteria and the *Erwinia* (Soft Rot) Working Group.

Professor Dickey served his University and the American Phytopathological Society in a number of ways. He served on numerous University, College, and Department committees at Cornell. He served his professional society as Councilor of the Northeast Division, as Associate Editor of *Plant Disease*, as a member and as secretary-treasurer of the Committee on Phytopathological Classics, and on numerous committees dealing with Plant Pathogenic Bacteria and Bacterial Diseases of plants.

He was an excellent teacher and his courses on Bacterial Plant Pathogens and Bacterial Plant Diseases were well organized and thorough in subject matter covered. Although he was a firm taskmaster, students came away from his courses with a thorough grounding and understanding of Plant Pathogenic Bacteria and Bacterial Diseases of plants. His devotion to teaching was further demonstrated by the fact that a portion of each of the three sabbatic leaves he took was devoted to course revision and improvement.

In 1946 he married Muriel F. Duffy who survives along with three sons: Paul of Meadville, Pennsylvania; Mark of Buffalo, New York; and David of San Francisco, California; one sister; and a grandson.

Bob Dickey was known for his integrity, and the thoroughness and accuracy of his research. His advice and assistance were sought regularly was generous with his time in offering assistance. Many of us regret the loss of a

scientific colleague but more important is the loss of a good friend who was willing to discuss a variety of topics and listen patiently to the concerns of his friends. Bob will be sorely missed by his many colleagues and friends in Plant Pathology.

P.E. Nelson, R.K. Horst

Herbert Dieckmann

May 22, 1906 — December 16, 1986

Herbert Dieckmann, the Avalon Professor of the Humanities emeritus, died in Oak Hill Manor Nursing Home in Ithaca at the age of eighty. He was an internationally acknowledged authority on eighteenth-century French literature and in particular the work of Denis Diderot. Born and educated in Europe, he was also a fervent, demanding, generous teacher, whose influence greatly contributed to the growth and increasing sophistication of Romance studies in America during and after the war. His spirited intellect, his learning, his devotion to the highest ideals of research and teaching, and his tireless giving of himself will long be remembered by at least three generations of his students and colleagues. We join his family in their sorrow and in honoring his memory.

Many cultivated European readers of the eighteenth century failed to recognize in Diderot a figure of the stature of Montesquieu, Voltaire, Rousseau, and Buffon. In large part that was because Diderot left so many of his singular and compelling works unpublished during his lifetime. On learning, at the age of sixty, that the publication of a new, unexpurgated edition of the *Encyclopédie* he had struggled to produce would soon be undertaken in Russia, Diderot wrote to a correspondent: “[Thus] I shall not die without having imprinted on the earth a few traces that time will not erase!... When I received your letter, I was busy preparing an edition of my complete works; I let the whole matter drop. I cannot undertake both projects at once; let us do the *Encyclopédie* and leave it to some good soul to gather up my scraps and tatters after my death.” In the two centuries intervening, many good souls and many learned minds have labored to bring Diderot’s works into print; none has contributed more to that achievement than Herbert Dieckmann, who devoted the major part of his long and productive scholarly career to the establishment and elucidation of Diderot’s texts. At this writing his efforts are just coming to full fruition in the thirty-three-volume critical edition of Diderot produced by an international committee of some seventy scholars and now officially designated (after Dieckmann and his friend, the French general secretary of the editorial board) the Dieckmann-Varloot edition. Though Diderot was the most personal of writers, he gave precedence over his own works to the *Encyclopédie*, which he called “an establishment raised up for humanity.” Herbert Dieckmann was a kindred spirit; he gave his life over, not to the display of his own uncommon mental powers (great erudition, philosophical acumen, wit, imagination, and a poetic awareness of evanescence), but to teaching others and to rescuing the work of Diderot from misunderstanding or oblivion.

Herbert Dieckmann was born in Duisburg, Germany, in North Rhineland. He was the son of Gottfried Dieckmann, a businessman not especially friendly to the life of the intellect, and his wife Amanda (née Wehrhahn-MacDonald) of Scots and Latin-American ancestry, known for her beauty and sense of fashion. Herbert learned English early from his Scots grandmother, and he attended a classical *Gymnasium* in Duisburg. When he was sixteen, his mother unexpectedly died in the course of routine surgery; his whole life was to be marked by that bereavement. He studied in Heidelberg and Munich (with the philosopher Karl Jaspers, among others), spent a year in Paris, and in 1930 finished his doctorate in Bonn under the direction of the great Romance philologist Ernst Robert Curtius.

In 1930 Herbert Dieckmann was married to Liselotte Neisser, a scholar of German philology. He was to have been appointed a *Privatdozent* in Bonn, but his wife's Jewish extraction, and his own well-known political activities on behalf of socialist and Evangelical Church groups, made it seem unwise to accept a post in what was rapidly becoming Hitler's Germany. The Dieckmanns spent the year 1933-34 in Rome under the sponsorship of the Dutch Emergency Council for Refugees, and then both took teaching positions at the Turkish State University in Istanbul. In Istanbul they had as friends and colleagues two illustrious representatives of the Germanic school of Romance philology, Erich Auerbach and Leo Spitzer, who were both, like the Dieckmanns, to end their careers in the United States.

In 1938 Herbert Dieckmann undertook the long trip to Baltimore to attend the annual Modern Language Association meetings and was offered an assistant professorship at Washington University in Saint Louis, where in due course he became professor and chairman of Romance languages. Though technically an "enemy alien" during the war, he gave instruction in Italian to American servicemen. He was naturalized in 1945. In 1948-49 he spent the year in France on a Fulbright fellowship and, in a chateau in Normandy, rediscovered the Fonds Vandeul, the largest and most important collection of Diderot manuscripts, which for many years had been lost to scholarly view.

In 1950 Dieckmann was appointed to Harvard, where he succeeded the legendary André Morize and eventually became the Smith Professor of French and Spanish, serving for several years as chairman of the Department of Romance Languages. In that same year he and his wife separated, and they were divorced a few years later. Liselotte Dieckmann continued to teach German at Washington University and remained a dear friend not only to Herbert but to his second wife Jane (nee Marsh), whom he married in 1959, and to the two children of that second marriage. In 1956-57 Dieckmann was invited to lecture on Diderot at the Collège de France (a signal honor for a foreign scholar of French literature). Those lectures provided the substance of his best-known book, modestly entitled

Cinq Leçons sur Diderot. At Harvard Dieckmann continued to demonstrate his uncompromising insistence on high principle and his devotion to teaching of an open, personal sort. He made noteworthy appointments that helped to revitalize Romance languages and took measures to rationalize and modernize the teaching of French literature.

To the delight of his friends in Ithaca, in 1966 Herbert Dieckmann accepted a professorship at Cornell, where he became the Avalon Professor of the Humanities the next year. He seemed to take special pleasure in the intellectual exchanges of a small, relatively tranquil, informal department that included younger colleagues (among them the three authors of these lines) whom he had known at Harvard. His teaching continued with undiminished (even renewed) vigor. On the cover of the April 1975 *Cornell Alumni News* a stunning photograph by Sol Goldberg shows Herbert teaching in a seminar room in Olin Library. Inevitably the scene appears somewhat posed (on the blackboard, in Herbert's energetic, expressive hand, one reads the title of the course rather than the more immediate, fragmented jottings that would naturally occur); but nothing masks the fire in Dieckmann's eyes, the controlled energy of his gesture of offer and exposition, or the eagerness in his face.

Dieckmann formally retired in 1974 but continued to teach at Cornell and elsewhere. At various times he held visiting professorships at Aix-en-Provence, Berlin, Cologne, Düsseldorf, Konstanz, and Pittsburgh. On his retirement he was honored by a lecture given (at Dieckmann's suggestion) by Paul de Man (once at Cornell but by then a professor at Yale), a younger colleague whose views on philosophy and writing offered the most serious of challenges to Dieckmann's own. It is typical of Herbert's open-mindedness and his integrity that he should have proposed de Man, and not some renowned *dix-huitièmiste* or an obedient disciple. In the late seventies, with characteristic self-effacement and devotion, Herbert busied himself with preparing the text and annotations of yet another much-needed edition: the voluminous exchange of letters between his teacher Curtius and such French writers as André Gide and the critic Charles Du Bos. (That edition, completed by Jane Dieckmann, poignantly represents the sentiments of European-minded artists and intellectuals in a France and a Germany divided by two world wars.) It was about that time that Herbert felt the first crippling effects of Alzheimer's disease: he, who had remembered the least details and made intellectual capital of them, had forgetting thrust upon him. He entered a nursing home in 1981 and lived out the rest of his life in a gradual decline.

The most spectacular scholarly episode of Herbert Dieckmann's eventful life was his rediscovery of the Diderot manuscripts. He himself has told that story with wit and feeling in a carefully elaborated paper that he twice gave as a lecture but was reluctant to have printed, since he himself necessarily appeared as the chief protagonist. In

that talk he apologized for the “painful oddity” of speaking in the first person. (The paper has recently appeared in French translation.) At Diderot’s death one set of manuscripts he had carefully prepared went to Catherine the Great, who had bought his whole library as a way of providing him with financial support. Another set (autographs and scribal copies) remained with Diderot’s only surviving child, Angélique Vandeuil, who hoped with her husband’s help to produce a complete edition of her father’s works. That edition never appeared, and throughout the nineteenth century such editions of Diderot’s works as were published were for the most part prepared from clandestinely made copies of the Hermitage manuscripts. In 1929 some of the Vandeuil manuscripts were exhibited at the library of the Chambre des Députés, but their location and ownership were unaccountably not made public.

In 1931 and again in 1938 Herbert Dieckmann made fruitless attempts to ferret out information from librarians and from a scholar-bibliophile who himself hoped one day to produce the great edition. In 1948, with a combination of sleuthlike flair, help from a handful of individuals, efficacious charm, and sheer pertinacity, Dieckmann established contact with the owner of the manuscripts. Herbert was able to persuade Baron Le Vavas seur not only to allow him to spend time in the family château consulting the precious and much-deteriorated papers but even to take them to the United States. There, in the unbelievably short span of two years, Dieckmann was able to prepare and publish a meticulous history and critical inventory of the many loose pages of Diderot’s autographs and the fifty-six bound volumes of excellent scribal copies of his works (often corrected in Diderot’s hand). By the time Dieckmann found the collection, many pages had already been lost, and at least twice the whole *fonds* had narrowly missed complete destruction: once because German engineers undertook to build a V-2 launching platform on the estate, another time because occupying American soldiers inadvertently set fire to the château. With the help of the French national librarian, Julien Cain, Dieckmann undertook negotiations that ended with the sale of the manuscripts to the Bibliothèque Nationale. For the first time in nearly two hundred years the manuscripts Diderot had left to his daughter became generally available to the scholarly public.

Throughout that prolonged effort Dieckmann was sustained not only by his strong feelings about truth and scholarly probity but also by a consuming love for the departed Diderot as he is revealed in the manuscripts he has left us. Diderot’s “fine, delicate” handwriting, Dieckmann writes in his *Inventaire du Fonds Vandeuil*, “not only testifies to great sensitivity, I might even say a sort of tenderness, but also reveals a deeply artistic temperament, an exquisite sense of beauty in composition and form.” Those are precisely the qualities of Dieckmann’s own French prose at its best. Many qualified scholars find themselves quite baffled by Diderot’s hand; Herbert could not only decipher it with uncanny speed and accuracy but also, as it were, live in it.

Besides the *Inventaire* and *Cinq Leçons sur Diderot*, Herbert Dieckmann also published his two dissertations (on Claudel and Diderot), along with some sixty articles that brought a new animation to studies in the French Enlightenment. But it is in the introductions to his flawless critical editions of Diderot, in dialogue with the texts of his beloved author, that he communicates the most of himself and his own humanity. His hundred-and-fifty page introduction (or supplement?) to the *Supplément au Voyage de Bougainville*, for instance, is a model of the learned genre and much more besides. In reading that essay, one is first struck by Dieckmann's way of writing out, in decorous and objective scholarly language, the drama and poetry of loss: Diderot's text is ever threatened by entropy; this edition can transcribe certain words only because it was prepared from a microfilm made before the edges of the manuscript further crumbled; most everything, despite our best efforts, falls away. Diderot was in his late fifties when he wrote the *Supplément* and still in the backwash of what Dieckmann calls "a passion of one's ripe age... when apprehensions and fears of old age already cast a threatening shadow." Himself in his late forties, writing at a time of crisis and reorientation in his own life, Dieckmann meticulously describes (by anticipation, as it were) the affective and ethical conflicts that pervade the *Supplément*, most of them turning on the themes of constancy and desire, sex, and marriage. He argues that it is impossible to decide to what degree Diderot was conscious of writing out his own life in the representation of these tensions and complexities; such conscious awareness as he may have had is only manifest in sudden flashes, by fits and starts. Denying any independent value to his own commentary, Dieckmann writes, "to be sure, the text is always superior to any exegesis." And yet he adds that only exegesis can bring the text to life, "as teaching shows us every day."

Herbert Dieckmann is survived by his first wife, Liselotte Dieckmann, and their daughter, Beate Goree (a son, Martin, died in 1983); by his second wife, Jane Dieckmann (who has prepared one volume of the Dieckmann-Varloot edition and continues her collaboration in that enterprise), and their daughters, Katherine and Judith; and by two sisters in Germany, Helga Fischer and Gisela Tribull. He was decorated a Chevalier de la Legion d'Honneur; he held an honorary Doctorate of Letters from the University of Exeter (England); and he was a member of the American Academy of Arts and Sciences and several honorary societies. Hugo Friedrich and Fritz Schalk published a volume of essays by several hands to honor him on his sixtieth birthday. Those richly deserved honors say less about Herbert than do the admiration and gratitude of his friends, colleagues, and students, among them most of the eminent Enlightenment scholars of France, Germany, and the United States. He did not die without leaving ineradicable traces.

David I. Grossvogel, Alain Seznec, Edward Morris

Herman Diederichs

John E. Sweet Professorship in Engineering; Dean of the College of Engineering

August 12, 1874 — August 31, 1937

The death of Herman Diederichs on August 31, 1937 removes another of those outstanding figures that have brought fame to our College of Engineering and have given luster to the University as a whole.

Born at Muenchen-Gladbach in the Rhine Province, on August 12, 1874, the German lad received his elementary education in his native city. In 1888 his parents brought the family to America, settling in Dolgeville, New York. In spite of modest circumstances, means were found to send young Diederichs to the local high school, where he won a Cornell state scholarship, walking to Herkimer more than twenty miles distant, to take the competitive examinations. With this scholarship and a promise of financial assistance from friends, he entered Cornell University in 1893. Here, with a large measure of self-support and with only a recent acquisition of English he not only completed his course in engineering in the prescribed four years with a record that won him election to the honorary society of Sigma Xi, but also found time to engage in student activities, becoming prominent a shot-putter. After receiving the degree of Mechanical Engineer in 1897, he was at the end of the following year appointed Instructor in Experimental Engineering under the late Professor Rolla C. Carpenter. In 1902 he was promoted to an Assistant Professorship, and to a Professorship in 1907, and he succeeded Professor Carpenter as Head of the Department of Experimental Engineering in 1920. In 1928 he was appointed as the first incumbent of the John E. Sweet Professorship in Engineering which had been established in honor of the distinguished engineer who at one time was a professor at Cornell. Professor Diederichs had in 1911 become Director of the Sibley School of Mechanical Engineering, and in 1936 he was appointed to the Deanship of the College of Engineering—a well-deserved honor, which he was fated to enjoy for only a little over a single year.

The entire period of Herman Diederichs' manhood was, therefore, devoted to the service of his Alma Mater. His activities concerned not only his chosen field, but also many of the broader aspects of university life. As a member of the faculty he was often called upon to serve on important committees, and the confidence in which he was held by his colleagues is attested by his election in 1929 to serve as one of the Faculty Representatives on the Board of Trustees. For many years no important question in the College of Engineering, whether of academic or administrative character, has been decided without his advice and judgment.

Interested in athletics, Professor Diederichs was over a long period a member of the Athletic Council for several years he served as President of that body. Here, again, his sterling character impressed itself, and the appreciation of this service is shown by the following dedication of *The Cornellian* of 1935.

“To Herman Diederichs, who forty-two years has served his Alma Mater as student, teacher, and administrator, and who through his intense interest and untiring efforts, has succeeded in inaugurating a new era in Cornell Athletics. For his active participation in Campus affairs he will long be remembered, and as a stern teacher and a sympathetic honest friend, the Class of 1935 will revere him—”Cornell’s Man of the Year.” Surely student praise can attain no higher level.

He was an authority in the field of experimental engineering, and his contributions to the literature of this field were many and important. In 1930 the Melville Medal was awarded jointly to Dean Diederichs and William P. Pomeroy by the American Society of Mechanical Engineers “in recognition of a thesis of exceptional merit.

Professor Diederichs was a member of Quill and Dagger; Phi Sigma Kappa fraternity; Sigma Xi; Tau Beta Pi; Phi Kappa Phi; American Society of Mechanical Engineers; Society of Automotive Engineers; American Society of Metals; Verein Deutscher Ingenieure and Society for the Promotion of Engineering Education. Last year he was chairman of the Board of Honors and Awards of the American Society of Mechanical Engineers and also of its Nominating Committee for 1936. He was vice-president of the second district of the National Collegiate Athletic Association and Chairman of the Board of Athletic Policy of Cornell University.

His teaching naturally reflected his scholarly habits and thoroughness. Perhaps his best known undergraduate course included his lectures on Materials of Engineering which he gave to many generations of electrical and mechanical engineers. No student ever went to him for advice or help on any matter without receiving assistance, and as freshmen grew into seniors, they acquired respect, admiration, and real affection for his rugged personality. Of permanent value also has been his assistance in developing the course in experimental engineering. The engineering experimental laboratory had been conceived by the late Dr. Robert H. Thurston at Stevens Institute and brought by him to Cornell in 1885, and the background of the present course was further developed under the late Professor Carpenter. Professor Diederichs, therefore, carried with him to his death the inspiration of these two great pioneers, but it was his own labor to modify and adapt the course to an ever-changing industrial world, and this he did in a masterly manner. He has also kept alive at Cornell the spirit of research in mechanical engineering,

and in spite of many handicaps, the long list of scientific publications issued under his guidance continued to grow. His influence and knowledge in this important part of the work of the college will not be forgotten.

One of Dean Diederichs' outstanding virtues was his sturdy honesty, not only in matters appertaining to his professional work and his teaching, but in all his personal contacts with people. Modest to an extreme degree, he was nevertheless essentially a sociable person with a sympathetic and tender heart.

Herman Diederichs was helpful to all around him. Cornell University and this entire community are the better because he lived and worked among us.

Henry Dietrich

October 24, 1894 — November 8, 1978

The death of Dr. Henry Dietrich ended a long career of devoted service to Cornell University. His special interest was the Cornell University Insect Collection, which he saw as a foundation of the Department of Entomology in support of teaching, research, and extension for Cornell and as a resource for specialists throughout the world.

Henry Dietrich was born in Eufurt, Germany, and came to the United States as a small boy. As a graduate of the Cornell Class of 1917, he was one of the Department of Entomology's last links with John Henry Comstock. After his graduation he served from 1917 to 1919 as assistant curator of the insect collection, except for ten months in the United States Army. He spent 1920 with the United States Forest Service in California. From 1921 to 1928 he was a fruit grower in Niagara County, New York. He served as an inspector for the Mississippi Plant Board from 1929 to 1932. He returned to Cornell in 1932 and served in various capacities until he earned his Doctor of Philosophy degree in 1937. In 1939 he became curator of the insect collection. He retired in 1962 as professor emeritus.

Hank, as he was known to faculty and students, was first of all a collector and deserves to rank with such great collectors as H. H. Smith, F. H. Snow, W. T. Davis, and J. C. Bradley. Holidays and vacations were spent in the field. To collect with Hank was to learn all the best techniques, not only of collecting, but also of preparation for securing the highest quality specimens. He was usually accompanied in the field by his wife, the former Alice Stout, a descendent of a pioneer western New York family. Alice, who had done graduate work in entomology and was a specialist in Odonata, was his strong right arm in everything he did. The Cornell collection is much richer for the work of the Dietrichs. They added to every major group and many species are represented only by their material.

Henry Dietrich published very little on his speciality, the Coleoptera. His major paper, "The Elateridae of New York State," was published as Cornell University Agricultural Experiment Station Memoir 269. Hank felt that there were other, more competent people to publish revisions and describe new species. His expertise was in his ability to identify species with the aid of existing publications. In this he was outstanding, and many specialists working with the Cornell collection have expressed appreciation for the accuracy of his determinations. That publication is not necessary for recognition in one's field is demonstrated by the many species named *dietrichi* by grateful specialists. *A Manual of the Common Beetles of North America*, by Elizabeth and Lawrence Dillon, is dedicated to Henry Dietrich.

Students and faculty in and outside of Cornell called on Hank to help identify specimens involved in their work. Never did he refuse, and much of the work he did for others was well beyond the call of duty. Shortly after he retired as curator, the late Harold S. Grant, chairman of the Department of Insects, Academy of Natural Sciences of Philadelphia, said, "Henry Dietrich has done more for more entomologists than any living person." This sums it up well.

For thirteen years after his retirement Hank came to his office every day and continued to identify beetles for students and faculty and update certain Portions of the beetle collection. He was always available for advice but never volunteered any. Never did he find fault with changes being made in curatorial procedures and policies.

In Ithaca, Henry Dietrich was active in the Unitarian Church, the Boy Scouts, and Rotary.

On August 21, 1975, Hank and Alice left Ithaca to make their home near their son in Kirkland, Washington. Although contact by mail and phone remained close, this move left a big gap in many lives.

Henry Dietrich leaves Alice, his wife of 58 years, a son Ernest, two daughters, Mary Alice (Mrs. Howard E. Evans) and Dorothy (Mrs. John Gardner), and eight grandchildren.

Clifford O. Berg, Edward H. Smith, La Verne L. Pechuman

Arthur Watson Dimock

June 20, 1908 — April 22, 1972

The death of Arthur Watson Dimock in his sixty-third year brought to an end the career of one of Cornell's most distinguished plant pathologists. He was born on June 20, 1908, in Middleboro, Massachusetts, and soon moved with his family to Richmond, California. He earned the B.S., M.S. and Ph. D. degrees from the University of California at Berkeley. Immediately after completing the doctoral program in 1936, he served as assistant plant pathologist for the Division of Forest Pathology, U. S. Department of Agriculture, in San Francisco. He joined the Cornell faculty in 1938 as an assistant professor and was promoted to associate professor in 1943 and to professor in 1947.

While pursuing graduate work at California, Professor Dimock developed an enduring interest in the diseases of ornamental plants. Because of this interest, he was selected to 'develop a research and extension program at Cornell for the practical solution of plant disease problems of commercial and noncommercial flower growers.

Professor Dimock possessed an unusually broad range of skills and abilities coupled with an intense curiosity. He was a respected scientist in several areas — plant pathology, botany, genetics, and mycology; he also was a talented engineer. His breadth of understanding, together with his ability to communicate effectively with the laity and scientists in diverse disciplines, enabled him to develop perhaps the most effective and comprehensive program of research and extension on diseases of ornamental plants in the United States. He pioneered critical work on the rust diseases of ornamentals, *Ascochyta* ray blight and virus diseases of chrysanthemums, *Verticillium* wilt of roses and other crops. The culture index procedure for establishing disease-free plants, which was developed in Dimock's laboratory, is recognized as an important contribution to saving the chrysanthemum industry in the early 1950s. This technique and modifications of it were the basis for the development of the chrysanthemum, carnation, and geranium industries as we know them today. His many contributions to the science of plant pathology and to industry, and his unselfish attitude in aiding his fellow man were instrumental in establishing Cornell as a leading center for the study of diseases of ornamental plants. His advice was regularly sought by many, including graduate students, his colleagues, international scientists, and members of industry.

In recent years his interest in the effects of environmental variables on the epidemiology of plant diseases was emphasized. He was called upon by the College of Agriculture in the early 1960s to develop methods and equipment for regulated environmental control of plant growth. He attacked this problem with zeal and imagination, and

his efforts culminated in the production of research plant growth chambers which are widely used by the plant science disciplines, both at Cornell and elsewhere.

Although he was not responsible for formal class instruction, his informal conferences and discussions, for which he was noted, attracted many students and colleagues who were not directly involved in his programs. While being demanding of his graduate students, he always had them work side by side with him in his program so that he could impart to them his critical approaches to the solution of problems. He emphasized the practical aspects of research and encouraged his students to do the same. He also championed the importance of interdisciplinary programs.

The contributions of Professor Dimock were recognized by the many awards he was accorded by the scientific community and industry. He was elected a Fellow of the American Phytopathological Society and received the Award of Merit from the Northeastern Division of this society. The Foundation for Floriculture-Research Award was presented to him by the Society of American Florists. The New York State Flower Growers Industries recognized his contributions by a Special Award. He was field representative to the Graduate School for several years and a member of numerous departmental committees. He willingly served the American Phytopathological Society in many capacities. He was treasurer-business manager (1958-64), vice-president (1967), president-elect (1968), president (1969), past-president (1970), and associate editor of *Phytopathology* (1952-54). He had also served as a councilor of the International Society for Plant Pathology since 1968. He was a member of AAAS, AIBS, and Sigma Xi.

He took great pride in the Ellis Hollow community in which he lived and contributed many hours to its development. He organized or assisted in the organization of many of the activities which are a part of this community.

Professor Dimock is survived by his widow, Edith; a daughter, Anne; and three sons, Douglas, Thomas, and Bradford.

R. Kenneth Horst, Robert S. Dickey, Durward F. Bateman

Paul Albinus Dineen

March 8, 1888 — September 19, 1948

Through the unexpected death of Paul Albinus Dineen on September 19, 1948, at his summer home in New Milford, Connecticut, Cornell University Medical College lost an inspiring teacher and surgeon of wide experience, and his friends a lovable, unselfish and loyal colleague.

Dr. Dineen's early education was in the schools of New York City, after which he entered St. Francis Xavier College where he graduated in 1910. He received his medical education at the College of Physicians and Surgeons of Columbia University, completing his formal studies in 1914. Immediately after graduation he entered upon his hospital training as Junior Assistant House Surgeon in the New York Hospital, and followed this by a second year as First Senior House Surgeon.

With the beginning of World War I, Dr. Dineen enlisted in the Army as a First Lieutenant and went overseas in August 1917 with the New York Hospital Unit, Base Hospital #9. The surgical team of which he was a member made a distinguished record for itself, and special recognition came to Dr. Dineen for his skill and unflinching devotion to his work in the award of the French Croix Epidemics.

On return home and to civilian practice, he was appointed in 1920 Assistant Attending Surgeon on the Staff of the New York Hospital, and in 1933 he became an Associate Attending Surgeon. His first appointment to the teaching staff of the Medical College came in 1932, when he was made an Instructor in Clinical Surgery. He was appointed Assistant Professor in 1942, and, Associate Professor of Clinical Surgery in 1946, a post he held until the time of his death.

Schooled under some of the most outstanding surgeons of his time and developed in an era of conservative surgical methods, meticulous technic, manipulative dexterity and critical learning, Dr. Dineen entered into his chosen profession with a background of sound experience. He set for himself at all times a high standard of achievement, and he possessed moreover the determination to carry through to fruition the worthy ideals he conceived for his profession. By his ability to grasp and critically evaluate facts and interpretations, and by his warmth of understanding of the personal problems of his patients and associates, he engendered a lasting confidence as a counselor and high esteem as a friend.

In his professional life in addition to carrying on an extensive private practice he served for over 20 years as Medical Director for the International Telephone and Telegraph Company. To the employees, their families and friends he was the physician in times of sickness, a wise counselor in many of the everyday problems of life, and a benefactor in periods of reversal and stress.

A regular participant in the activities of the New York Surgical Society, Dr. Dineen served as its president in 1946, and continued as a member of its Advisory Board until his death. He held membership in the New York Academy of Medicine and the New York County Medical Society, and in these groups he gave freely of his time and interest. His special studies include publications on the surgery of bones and joints and on the operative management of acute perforated ulcers of the stomach and duodenum. Some of his most valuable contributions, however, were made in discussions in which he brought fresh and unexpected light on many subjects of broad surgical interest.

His love of sports found expression through membership in the New York Athletic Club and attendance at meets and games of various kinds. In fact practically all forms of athletics held strong interest for him, and it was through these means that he found much relaxation.

The intimate association of teaching and practice is traditional; indeed the very foundation of medicine may be traced to the increasing awareness of these ties and the influence of inspiring leaders in the art of imparting information to others. As a teacher, we think first of the fine personal qualities that endeared Dr. Dineen to students and commanded an abiding respect. Although a strict disciplinarian in the operating room and a staunch advocate of rigid attention to duty, he always had kindly and soft words in times of discouragement and an even temper to calm troubled waters. He was very generous and restrained to sudden original ideas, openminded and receptive to real accomplishments, polite and considerate in estimating achievement in others less experienced than himself.

In everyday life he had a cheerfulness, courtesy, thoughtfulness and sympathetic understanding that endeared him to all. His depth of character, nobility of instincts, and unfailing loyalty to friends remain as an enduring monument to his memory. Of the great privileges of life, none can have a deeper meaning and a richer significance than that of having known Paul Dineen.

D. J. Edwards

Robert Emmett Doherty

January 8, 1923 — February 19, 2005

Robert Emmett Doherty, known to all as Bob, trained in history, was an early student of teachers' unions, taught and mediated in the wider field of public-sector collective bargaining, and deeply influenced the School of Industrial and Labor Relations as Associate Dean and Dean from 1977 until his retirement in 1988. He is fondly remembered as a colleague, steward and leader whose astonishingly deft sense of humor allowed him to speak plainly without offense, entertain while educating, and act in a principled way without appearing dogmatic or punctilious.

Born in 1923, Bob's early years were spent in Trout Lake, Washington. Growing up as the youngest child in a family of twelve, he experienced a rural childhood of church services held in local homes, playing in a high school football league with six-man teams, being entertained and educated via radio, and creating harmless, small-town mischief with his pals. In retirement, he wrote several short stories that recounted, with great wit and insight, experiences that happened (or could have happened) in this small, western hamlet; he published many in a book entitled, *The Ambiguity of Remorse*.

Bob's undergraduate education was interrupted by World War II, in which he served as a paratrooper in the Pacific. He graduated from Oregon State University in 1949 and received a Master's degree from Teachers College, Columbia University, in 1951—teaching high school in Oregon and New York both before and after obtaining his Master's degree. In 1959, he earned a doctorate from Columbia in history and began teaching American and labor history at the State University College at Oneonta, New York. In 1961, he was hired by the ILR School to teach labor history in its adult programs, and in 1967 he was made a full Professor in the School's Department of Collective Bargaining, Labor Law and Labor History. The 1960s were a time of historic change as the nation's public school teachers became unionized and the practice of collective bargaining took hold. Bob was prominent in analyzing such emerging public-sector issues as negotiation and mediation, contract structure, the right to strike, effects on educational quality, teacher job security, and emerging organizational issues for school districts.

At heart, Bob was a keen observer of the human condition who had a sharp eye for the ridiculous, a love of words and the English language, and a creative sense of humor. Under the pen name of Peter Pedant, he wrote several very funny, but salient, essays on academic pretensions, including the "epidemic misuse" among academics of such words as "parameter" (when "boundary" or perhaps "perimeter" is meant) and "impact" (when "effect" is meant,

not Webster's "collision"). He attributed the use of "impact," for example, to "literary impotence" among social scientists:

Our contributions are of little consequence. They don't change things much, not even the views of fellow social scientists. That could be because we have been using the more gentle effect in describing complicated relationships. Effect is too tame, too amiable a word to catch anybody's attention. So we say "impact" instead since it conjures up thoughts of force and penetration.

Bob believed strongly that those professors to whom the university had made a lifetime commitment had a reciprocal obligation of service. The ILR School came to count on the respect Bob had among faculty and staff for his honesty, conscientious attention to necessary tasks, willingness to make tough decisions, and unselfish loyalty to the School. He was Associate Dean from 1977-79, served as Acting Dean in 1979-80, as Associate Dean again from 1980-85, and was Dean from 1985-88.

Although Bob chose to serve as the ILR School Dean for only three years, they were three of the most critical years in the School's history. In 1985, when Bob assumed the deanship, the world of work was dramatically different from the world that existed when the School was founded in 1945. It was apparent that globalization, technological change, the growing regulation of the labor market, the changing composition of the workforce, and other factors had undermined several of the central premises on which the School had been founded. The School, however, had not fully come to grips with the implications of these historic changes for its curriculum, research, and outreach programs. Faculty, students, alumni, and other constituencies were all dissatisfied with the direction the School seemed to be taking, but did not necessarily agree on the strategies and programs that were most likely to succeed in addressing the School's problems. In some quarters, doubts were even expressed about the survival of the School. It is not an exaggeration to say that the School faced a crisis.

Bob confronted these challenges head on, dealing with them in a principled but pragmatic fashion. Under Bob's sponsorship, a distinguished panel of academics and practitioners conducted the first outside evaluation of the School. The outside evaluation was followed by an exhaustive internal assessment by a committee chaired by Professor Ronald Ehrenberg. These evaluations resulted in dozens of recommendations, most of which were implemented in the years that followed.

It was during Bob's deanship that the School launched the Center for Advanced Human Resource Studies (CAHRS), which brought together over fifty senior human resource management executives with ILR faculty in a partnership that continues to endure. During this period, the School also offered its first executive education programs. Simultaneously, Bob expanded and strengthened the programs the School offered to the labor movement. A score

of new extension programs were launched during the Doherty deanship. Planning new classroom, library, office, and conference center facilities accelerated during Bob's deanship, which ultimately resulted in over \$50 million of new and renovated facilities.

Perhaps most importantly, Bob, exercising superb qualities of leadership, repaired frayed relationships that had existed within the School and between the School and its external constituents. The mood in the School changed from one of pessimism to one of optimism. After three short years of Bob's stellar leadership, the School had restored its prominence in the field of employment relations and no one doubted its standing as the preeminent institution of higher education in that field.

Edward Lawler, who served as Dean of the School from 1997-2005, summarized Bob's contributions as follows:

"Bob played a critical role in the School during some difficult periods. He was a straight shooter who didn't mince words and who had a special wit that many will remember fondly."

Those who knew Bob will miss both his wit and his wisdom.

Ronald Donovan, David Lipsky, Robert Smith

Martín Domínguez

December 26, 1897 — September 13, 1970

Martín Domínguez was born in San Sebastian, Spain, in 1897, brought up in the Basque country, and was a longtime resident of Madrid and Havana before he came to Cornell as a visiting professor of architecture in 1960. He shared the experience of many of the architectural pioneers of his generation who were uprooted from their homeland by political circumstance: in his case this occurred twice. He was impeccably honest, indefatigably rational, morally fastidious; a critic of sanctimony and sham, as well as the intellectually slipshod. Yet he remained vivacious and was never deserted by his deep sense of the ludicrous. His esthetic interests were avant garde, his professional work was international in character and influence, but his spirit remained quintessentially Spanish. Thus his pride was natural, his distinction unaffected, and his dignity inherent.

Professor Domínguez brought unique qualities to Cornell's architecture Program based on his long experience as an outstanding practitioner. He was able to transmit in memorable fashion (in his second language) candid criticisms of his students' design work. His comments were expressed objectively and left the recipients inspired and eager to go ahead. His colleagues valued his concern for their collective good, his willingness to undertake thankless assignments, and the enthusiasm he radiated. All were delighted that he continued to give Cornell the benefit of his extraordinary talents long after reaching the normal retirement age. His unexpected death at the age of seventy-two deprived the College of Architecture, Art, and Planning of a dynamic spirit and one of the most distinguished practitioners ever to serve on its faculty.

His father determined early that Martín would follow the profession of his architect uncle. The boy began life drawing classes at seven and later supplemented his school program with evening classes at an arts and crafts school. At seventeen he went to Madrid, completing the course of the Escuela Superior de Arquitectura in 1922. He stayed at the lively "Residencia de Estudiantes" of the Institucion Libre de Enseñanza, an organization which experimented with new teaching methods and brought to its campus, as lecturers or guest professors, leading figures in science and the arts (including the architects Walter Gropius and Le Corbusier). Here Domínguez developed his belief that rivalry between technocrats and humanists is damaging to both and militates against the development of a generally acceptable philosophy or set of values. As he saw it, "Programs of studies should not be afflicted by that dichotomy between the scientific and the humanistic disciplines that burdens the modern world, presenting knowledge in a broken-up fashion menacing for liberal ideas. For the different disciplines remain

isolated in tightly closed containers; not only in thought, but in terms of language as well, each scientist, each artist or practitioner speaking his own dialect.

“For want of a philosophy capable of uniting all the different and often disparate parts, it becomes impossible to define a scale of values. This generates indifference towards the norms of behavior, and leads to a diffuse determinism which, by preventing us from distinguishing the good from the bad, brings us defenseless to the realm where force exercises its empire.”¹

His involvement with the extraordinary intellectual and artistic ferment of the Madrid of 1924—which still retained the scale and intimacy of a small town—is reflected in the cafes, the haberdashery, the furniture, the bar, and the auto showroom designed in the first two years of his collaboration with Carlos Arniches. This association lasted until he left the country in 1936. During this period Martín Domínguez also devoted much time to discussions looking to the preparation of a new housing law for Spain. In addition to residences and hotel projects, Domínguez and Arniches produced twelve *Albergues de Carretara* for the Patronata Nacional de Turismo (1928), a kindergarten (1934), and a secondary school (1931), a series of building types for the tobacco industry (Centros de Fermentacion, Secaderos de Tobaco, Centros de Recogida for the Patronato para el Cultivo del Tobaco, 1935-1936), and a subway station (1933). For the latter, Eduardo Torroja was the engineer: two years later he was part of the team which produced the firm’s masterpiece, the Zarzuela racetrack complex. There the grand-stands are sheltered by scalloped reinforced concrete canopies with edges only two inches thick cantilevered forty-three feet from their supports.

Fascinated by the dynamic and esthetic impulses of the new as well as the old worlds, Martín Domínguez made his first trip to the United States in 1932-33, designing movie sets for Hollywood. After 1936 he continued this activity in Cuba, and his first major commission in Havana was the *Radiocentro* (1945-49), containing a movie house and office block, as well as radio and television stations. In 1951 he won first prize in the competition for the *Teatro Nacional*. In the meantime, he had designed three private houses for presidents of Cuba and married the charming Josefina Ruz. The other immediate survivors are his architect son, Martin, and two sisters in Spain.

From 1943 to 1948 his work was done in collaboration with Emilio del Junco and Miguel Gaston, and from 1948 to 1952 with Gaston alone. From 1952 until 1960 he was associated with Ernesto Gomez Sampera. The large scale of Domínguez’s major projects of the 1950s reflects the revival of building activity after the second World War, but their complexity, plasticity and structural daring recall the Madrid works of the mid-1950s. When it was

1 Felix Candela, address at Memorial Convocation for Martín Domínguez Esteban, Monday, October 19, 1970.

built in 1956, the thirty-nine-story F.O.C.S.A. was the tallest concrete structure in the western hemisphere. It is still a dominant landmark of the Havana skyline. Thirty floors were devoted to condominium apartments with cantilevered exterior access galleries. Occupying a slab structure built like an egg crate and bent in the middle, they overlook a garden atop a terrace structure. The latter contains stores at street level with offices above, and three levels of parking and a TV studio below ground. The whole is topped off by a five -story tower intended for duplex apartments and a bankers' club. The F.O.C.S.A. (Fomento de Obras y Construcciones S.A.) complex was the culmination of a series of important projects in Havana in which building elements for a variety of uses were combined on a restricted site in a sculptural manner. More restrained official projects such as the central Post Office and Ministry of Communications in Havana, and the Municipal Building for Marianao (both 1951), were developed in the same manner, with office slabs above horizontal terrace structures.

The architect also continued his efforts to develop better low-cost housing, devising in 1954 in association with Gaston and the engineer Bartolomé Bestard of the F.O.C.S.A., a prefabrication system of light precast concrete panels. After 1959 Domínguez concentrated on a series of low-cost concrete housing projects. Most interesting is the *Edificio Libertad* Tower, winning design in a competition for a high-rise structure with four hundred apartments. This fifty-story scheme was a work of extraordinary strength and vibrancy, a fitting and poetic capstone to the second phase of the architect's international career.

After he joined the staff of the Department of Architecture, Professor Domínguez was in demand as a consultant, traveling to Canada to advise on new urban commercial complexes, and, under official auspices, to South America to advise various governments and agencies on housing. For some years he also maintained an architectural office with Peter Cohen in Rochester, New York. Throughout his long and productive career as a Professional architect, Martín Domínguez retained an extraordinary ability to work with others and a determination to express in design the potential of twentieth-century technology, art, and social organization.

Many recall affectionately his beret and cape, his mustachios and sharp eye. Few completely understood his sense of affinity with King Philip II of Spain, the withdrawn emperor who built the *Escorial* and ended his life there. Like Philip II, Martín Domínguez died on the thirteenth of September. Death came to him in New York; he is buried in Spain.

Colin Rowe, Frederick M. Wells, Stephen W. Jacobs

Bennett Avery Dominick, Jr.

March 19, 1921 — April 14, 1971

The death of Bennett A. Dominick, Jr., professor of marketing, on April 14, 1971, suddenly ended the outstanding career of a dedicated student and nationally respected friend of the fruit industry.

Professor Dominick joined the Cornell faculty in 1951, was promoted to associate professor in 1956 and professor in 1962. His entire professional career was devoted to the fruit industry. This singleness of purpose made him not only an established authority in his chosen field but also a friend and confidant of fruit growers throughout the nation. His primary responsibility was to keep fruit growers informed on research and current developments in both production and marketing.

With his dissertation research he pioneered the use of controlled experimental designs for measuring the response of consumers to specific marketing practices. Over the years he continued his research in fruit marketing and production, using it effectively to provide the information which fellow researchers were not able to supply. His close working relationship with commercial fruit growers made him a keen observer of industry needs, and he freely communicated these needs to his colleagues, who readily responded to his leadership. The high degree of his effectiveness as a teamwork leader was a product of his sincerity, warm personality, and unselfish desire to advance the welfare of the fruit industry.

At the time of his death he taught a course in marketing and served as adviser to undergraduates in marketing. He was extension leader in agricultural economics, was chairman of the Northeast Regional Extension Marketing Committee, and served nationally on the Agriculture, Marketing and Related Industries Committee of the Land Grant College Association. He was a popular speaker at any meeting—state, regional or national—of fruit powers. The proceedings of the New York State Horticultural Society carry over forty articles authored by him. One of his favorite activities was the planning and conducting of county fruit school programs.

While more than fulfilling his responsibilities to Cornell, he was an active citizen of the community. He was an elder and former Sunday School superintendent of the First Presbyterian Church, and he served as president of the Bryant Park Civic Association. Being the proud parent of four daughters, he was active in both school and athletic activities.

Professor Dominick was born in South Carolina and was reared on a dairy and citrus farm near Orlando, Florida. He was graduated from the University of Florida in 1943. He served with the Army beginning in 1943 and was discharged with the rank of captain in the field artillery. He remained in Europe for two years, serving as assistant chief of food, agriculture and forestry in the military government at Salzburg, Austria. Following this he received his M.S. and Ph.D. degrees from Cornell prior to joining the faculty, which he served so well throughout his life.

Among his colleagues, students, and fruit industry audience, Professor Dominick established a lasting reputation as a hard-working, industrious person of the highest integrity. He pursued his work with lasting vigor, leaving no detail unturned. He was practical and pragmatic. When he did a job he did it right and yet he was never content with the finished product. In many respects he was his own worst critic and this provided the drive for his many accomplishments in academic, community, and social affairs. Yet at every turn he was the warm and helpful friend ready to serve those around him. His humility and constant consideration of others made him the perfect gentleman, long to be remembered by those privileged to know him.

He is survived by his wife, Emily Wright Dominick, and four lovely daughters, Linda, Nancy, Cindy, and Amy. We share with his family a deep sense of sadness and suffer the personal loss of a gracious friend and colleague.

Robert S. Smith, Melvin B. Hoffman, Max E. Brunk

Mabel Doremus

October 19, 1905 — October 9, 1988

A native of Nebraska, Mabel Doremus was graduated from the University of Nebraska in 1928 with a Bachelor of Science degree in home economics. In 1937, she received the Master of Arts degree also in home economics from Columbia University.

Education was highly valued in the Doremus family. Mabel's mother was the first woman to graduate from Middlebury College in Vermont. She taught school in New Hampshire and then in Nebraska. Mabel's father was widely known in educational circles in Nebraska, and of the five children in the family, four followed professional careers in education.

Mabel began her career as a teacher in the Nebraska public schools, starting immediately upon graduating from high school with a year as an elementary school teacher. Upon graduation from the university, she spent eight years as a high school home economics teacher before joining the University of Nebraska Cooperative Extension Service. There she served as a specialist in food and nutrition, a position she held for 14 years.

Mabel Doremus joined the Department of Food and Nutrition in the New York State College of Home Economics at Cornell University in 1950 as an assistant professor and cooperative extension specialist. She was promoted to the rank of associate professor in 1953. When she retired in 1966, she was named professor emerita.

Mabel made many contributions through her publications on foods and nutrition. One area in which she excelled was food preservation. During the World War II years in Nebraska, Mabel wrote bulletins, leaflets, lessons and articles on the subject. While at Cornell, she co-authored the "Handbook For Freezing Foods," a comprehensive 60-page bulletin that continues to be widely used in New York State and nationally. She also authored numerous consumer information publications on nutritionally important foods.

In New York, Mabel served on the governor's committee on emergency preparedness, contributing especially in the area of emergency feeding. During a sabbatical leave, she conducted a pilot study of young homemakers in Onondaga County to learn about the special interests of this audience of cooperative extension programs.

Mabel had high standards of workmanship in the handling and preparation of foods, which she stressed in her teaching. She was eager to have the leaders and agents she taught become good teachers, and she was confident that the subject matter was worthwhile. She was an effective department extension leader, a member of Epsilon Sigma

Phi, Extension's honorary fraternity, an active member of the New York State and American Dietetics and Home Economics Associations, and of the American Association of University Professors.

Mabel imparted her positive attitude, cheerfulness and zest for life to her colleagues and to the homemakers with whom she worked throughout the state. Her keen sense of humor enriched many departmental and college functions. "Good company" describes Mabel, whether you were a colleague sharing a long trip to a county in the corner of the state, a partner or competitor in solving a word puzzle, or one of the Friday night out-to-dinner group. Friends delight in recalling her recitations of childhood verses or citations from the classics. Her yarns of her Nebraska childhood, her travel, or her teaching and extension experience still bring a smile and a reminder of the way of life of a woman who was truly liberated—long before that term came into common use.

After retirement, Mabel's involvement in community activities increased. An active Presbyterian, she served on a number of church committees, was a deacon and was among the active supporters of an interdenominational group, Area Congregations Together (ACT). Through the Kitchen Cupboard, ACT continues to provide weekly supplies to families and individuals in emergencies. Mabel was also an active member of the Ithaca Women's Club.

Mabel was predeceased by two sisters and two brothers, and is survived by a nephew, Robert Doremus of Schenectady, New York; by a niece, Ann Nicholson of Dallas, Texas; and by several great-nieces and great-nephews.

Charlotte Bruce, Mary Wood, Mildred Dunn

John L. Doris

April 12, 1923 — January 22, 2008

John Doris, Professor Emeritus of Human Development and founding director of the Family Life Development Center (FLDC) in Cornell's College of Human Ecology, died January 22, 2008 at age 84.

A member of the Cornell faculty since 1963, he served terms as director of the graduate program and associate chair in the Department of Human Development and was an active and dedicated mentor of many graduate students and newly hired faculty. He introduced a graduate curriculum around individual testing and assessment and directed a graduate training in psychopathology. He served as director of the FLDC from its establishment in 1974 until his retirement and appointment as Professor Emeritus in 1993, though he continued to work on center programs until his death.

The FLDC serves as a resource for extension, research and teaching related to issues of family stress and child maltreatment. Under Doris' leadership, the FLDC established a federal regional Resource Center for Child Abuse and Neglect as well as for Foster Care and Adoption, and the New York State Child Protective Services Training Institute, the first of its kind in the country dedicated to providing basic and advanced training to child protective workers and supervisors.

Four other major programs inaugurated under his leadership that continue today and have worldwide impact include: the Residential Child Care Project to prevent abuse and increase the quality of care in residential settings; the National Data Archive on Child Abuse and Neglect to ensure that researchers have access to federally funded research data; the Internet-based Child Abuse Prevention Network, a worldwide resource to apply information technology to child abuse prevention; and the Military Projects, to prevent child maltreatment and domestic violence in families connected to the armed forces and help family members prepare for the stress of deployment.

Doris also directed the center while it was instrumental in developing the private, nonprofit New York State Federation of Task Forces on Child Abuse and Neglect. The largest advocacy organization for maltreated children in New York State, the federation, now known as Prevent Child Abuse New York, is affiliated with the National Committee for the Prevention of Child Abuse.

Doris grew up in the Bronx and graduated magna cum laude from the College of the City of New York in 1951. He earned a Ph.D. degree in 1957 in Child Clinical Psychology from Yale University. From 1958-63, he was chief

psychologist in the Yale Child Study Center and an Assistant Professor in Yale's Department of Psychology before he joined the Cornell faculty.

Doris' research and teaching broadly concerned child clinical psychology, child and family psychopathology, and learning disabilities, as well as visual acuity in infants and young children. In addition to numerous journal articles and chapters, in 1969 he published the 4th edition of an award-winning book *Psychological Problems in Mental Deficiency* with his longtime mentor and collaborator, Yale professor Seymour Sarason. Their groundbreaking 1979 work, *Educational Handicap, Public Policy and Social History*, continues to receive both scholarly and popular interest.

In 1991, he edited a landmark volume, *The Suggestibility of Children's Recollections*, published by the American Psychological Association. This highly-cited volume was the culmination of an historic three-day convocation at Cornell of top researchers throughout North America and Europe prompted by concerns about the reliability of children's eyewitness testimony in cases of alleged child abuse. The conference has been widely viewed as setting a decade-long research agenda for the field.

Predeceased by his wife, Marjorie Fouts Doris, M.D., Doris is survived by five children.

John Eckenrode, Chairperson; Ritch Savin-Williams

Arch T. Dotson

July 19, 1920 — April 6, 2006

Arch T. Dotson, Professor Emeritus of Government at Cornell University, died April 6, 2006 at the age of 85. He had been sound of mind and body virtually until the end, teaching until his voice was too weak to be heard. A “country boy” born and bred in Paris, Kentucky, he worked from his early teens on farms managed by his father. Arch left for World War II just short of his B.A. degree from Transylvania College and joined the Army Air Force as a “check pilot,” becoming a jock in every warplane up to the B-29. Discharged with the rank of major, the GI Bill got him through the Harvard Ph.D. degree and a postdoc at the London School of Economics. His entire academic career was at Cornell, beginning in 1950, as a dedicated teacher, serving beyond his retirement as a teacher and, respectively, as Director of Cornell-in-Washington, Director of Cornell Abroad and Director of the Cornell Institute for Public Affairs.

Arch’s field, his professional identity, was public administration. As was true of so many in this subfield of political science, Arch was not well known as a publishing scholar. He wrote copiously, but for clients, not journals—and for public clients, not corporate or private clients. He did this exclusively from 1958-60 as a deputy controller of the State of New York. Other clients were, for shorter durations, the U.N., the Ford Foundation, and the governments of India, Malaysia, the Philippines, Iran, Jordan, the PRC, Eritrea and Mexico. Another of his clients was Cornell University. His seven-year stint as chairman of the Department of Government (1969-76) were dedicated to rebuilding the department after the campus crisis of the late 60s. In the 1980s, he was instrumental in the founding and success of Cornell-in-Washington, Cornell Abroad and the Cornell Institute for Public Affairs.

It would be difficult to identify anyone ever associated with Cornell—faculty, administrators, trustees or alumni—who has left a more important mark on this institution. The Government Department now holds its own among the top ten in the nation. Cornell-in-Washington and Cornell Abroad became and continue to be models for universities with Washington programs and programs abroad. And the Cornell Institute for Public Affairs has grown in size and stature among schools, programs and institutes for public affairs. The Dotson legacy should not—will not—be forgotten.

Arch chose the path of reform, practice and teaching; and he pursued that path to the very end with integrity, vigor, honor and distinction. Arch was one of the exemplars of the great tribute to public service made by Louis Brownlow in the title of Volume Two of his autobiography, *A Passion for Anonymity*.

Milton J. Esman, Jerome M. Ziegler, Theodore J. Lowi

Esther Gordon Dotson

October 21, 1918 — October 28, 2009

Esther Gordon Dotson, Professor Emerita of art history died, after a long illness, a week after she and her family celebrated her 91st birthday. She was born in Westerly, R.I., a granddaughter of the Rev. Adoniram Judson Gordon, the founder of Gordon College in Wenham, Mass., and the daughter of the Rev. Arthur Hale Gordon, a Baptist minister who held pulpits in Atlanta, Buffalo, and Middlebury, VT. Her husband, Arch Dotson, a professor of government at Cornell, predeceased her in 2006. She is survived by her stepson, Bruce Dotson, a professor at the University of Virginia, his wife, Diane, their children and grandchildren, and nine nieces and nephews of the Gordon family.

Esther inherited her family's commitment to good deeds and causes and was a founding member of the Loaves and Fishes Ministry, serving meals to the poor at St. John's Episcopal Church; a long-time volunteer with the Southern Tier Episcopal Peace Fellowship and of Meals-on-Wheels; and one of the earliest drivers of the not-for-profit Gadabout Transportation Service, helping the elderly and disabled get to church and around Tompkins County. She actively supported challenged citizens, defended the rights of immigrant families, helped people to obtain affordable housing, and collected surplus food from stores for delivery to migrant workers.

Esther was an active member of St. John's, and was one of the first women to serve on the Vestry. Her brothers and sister shared in her life of active Christian commitment as well. Esther's brother John was a Presbyterian minister who, just after the Hungarian uprising of 1956, installed the erstwhile Hungarian minister of agriculture and his family on the Gordon family farm in New Hampshire. Esther's brother David administered the U.S. effort to blockade commerce with the Nazis during World War II.

At the Dotsons' farm on Danby Hill, where the whole department was invited for Christmas cheer and an opportunity to cut a Christmas tree, she sunbathed luxuriously in her solar-paneled, red barn, the first solo commission of her former student Richard Meier, Cornell '56—now an internationally known architect, and designer of Cornell's Weill Hall, the new Life Sciences Technology Building—preferring it to the old farmhouse on the property which was rented out. The barn accommodated her needs as an art historian, giving her a grand second-floor studio with a northern exposure and a twenty-foot ceiling, with a bookcase covering one whole twenty-foot wall.

Both Dotsons were interested in alternative energy and land preservation, working with the Finger Lakes Land Trust to protect large tracts of land, and helping to create a community park in Danby. They were staunch members of the “Updike Road Unimprovement Association,” a neighborhood alliance devoted to preserving their unpaved road in its unpaved condition.

Esther Dotson graduated summa cum laude (and junior Phi Beta Kappa) from Vassar College in 1939 and taught art history after graduation and during her graduate studies at New York University’s Institute of Fine Arts (IFA) back in the days when one could teach on the university level without a Ph.D. in hand. Survival was no easier then than now, however. When she was a graduate student at the IFA she subsisted on something she called the “wolf diet”—consisting of a large meatloaf that she sliced into seven pieces, one for each dinner of the week to come—though later, when she could afford it, she proved she was an accomplished French chef. She completed her Ph.D. in 1973 with a dissertation entitled “Shakespeare Illustrated,” a study of English painting, book illustration, aesthetic theory, and stage practice, and, after stints at Ithaca College and Wells College, became the first woman appointed to a full-time professorship in the Department of the History of Art at Cornell, from which she retired in 1989.

At Cornell Professor Dotson was an inspiring teacher whose course History of Art 240, “Introduction to the Renaissance,” became one of the most popular undergraduate courses at Cornell in the 1970s and 1980s, although she was a tough grader. Her ultimatum to her full-house audience was always the same: “Look at the images I am showing you. Think about what I am saying. I’ll give you a handout with all the names spelled properly and the dates written down correctly.” She received the College Art Association’s Award for Distinguished Teaching of Art History in 1986. The citation read in part: “The many letters from former students...all emphasize one quality above all others, and that is the immense amount of personal care that she takes with every one of her students.... She is praised for articulate and carefully planned lectures, for her breadth of learning, for her demanding standards and for her sense of humor, but it is by the personal attention far beyond that expected of any faculty member that she has distinguished herself.” In her acceptance remarks, Professor Dotson said with characteristic grace, “If I’ve been a good teacher, it’s because I have had good teachers.”

Esther happily contributed to team-taught courses as well as her own. For a number of years she co-taught the Renaissance Culture Course with Carol Kaske (English), and continued to offer lectures on Michelangelo after her retirement, when Bill Kennedy (Comparative Literature) took her place as course leader with Carol. Her lectures to “Art, Isotopes, and Analysis,” at the time cross-listed among five departments and three colleges, were among

the highlights of the course. Several of the engineers and scientists enrolled in the course subsequently took Art History courses. When the Sage Collection of Casts of Greek and Roman Sculpture was still on display in Goldwin Smith Hall, she would take a newly-cleaned statue and surround it with photographs of all the Renaissance and later art that had been inspired by it. The exercise was of benefit to both the classicists and the Renaissance art historians in Goldwin Smith.

Esther's commitment to her students and the time she gave to them, in person and in comments on their work, was remarkable. She was equally generous to graduate students, who were deeply devoted to her, and to her younger colleagues, not only offering hospitality, but arranging meals with some of the prominent scholars on campus. She was the engine behind the appointment of the distinguished British art historian Michael Baxandall as A. D. White Professor at Large. She also served as Director of Undergraduate Studies in the history of art department.

Esther Dotson's extensive, two-part article, "An Augustinian Interpretation of Michelangelo's Sistine Ceiling," published in the *Art Bulletin* in 1979 argued for the authorship of the theologian Egidio da Viterbo of the program for the narrative scenes. Presenting aspects of the ceiling in relationship with Egidio's writings along with the pervasive influence of those of St. Augustine, particularly *The City of God*, she reveals a profound knowledge of the religious and philosophical ideas current in the papal court. The question behind this essay and its mixed critical response is how much theological significance to give to details of the narrative scenes and what kind of theological messages were being promulgated in the papal court of the early sixteenth century. Dotson's study has been taken seriously by both critics and defenders and is still—over 30 years later—considered canonical for its valuable and original observations.

At the time of the Sistine ceiling's restoration Professor Dotson served as a consultant to the project and in recognition of her scholarly contribution was received at the Vatican by Pope John Paul II. She was also editor-in-chief of the journal *Marsyas*, and she published articles in Collier's *Encyclopedia of Art*.

In her article "Shapes of Earth and Time in European Gardens," published in an issue of the *Art Journal* devoted to earth works in 1982, Esther understood Renaissance gardens first of all as earth shaping. In a strikingly original analysis of the Sacro Bosco, or Sacred Grove, at Bomarzo near Viterbo, the creation of the aristocrat Vicino Orsini, she pointed out fallen and semi-ruined architectural elements that suggest a process of creation and destruction that was purely fictitious. She related these both conceptually and thematically to a very popular forged account of an Etruscan golden age first published in 1498 by Nanni di Viterbo.

In addition to all these serious matters, Esther set some sort of record at Cornell for locking herself out of her office, to the point where one of us was given a master key by the building manager with which to let her back in. Her many one-liners, among them: “O Salome, please, not in the fridge!” are not the sort of thing one finds in a scholarly publication, but were recalled by many former students and colleagues at the time of her memorial service at St. John’s last winter.

Esther was preoccupied over many years with the 18th-century Austrian architect Johann Bernhard Fischer von Erlach. Her research has come to fruition in a posthumous book, written in collaboration with her former student, photographer Mark Ashton, which will be published by Yale University Press in late 2010 or early 2011. On hearing of the positive reviewers’ reports and its acceptance by the press last fall, she said that at last she could rest.

Service and scholarship were the traditions in which Esther Dotson grew up and in which she lived her life. She lived greatly. She loved the world deeply, loved those around her deeply, and gave her utmost to her work, to her family, students and colleagues, and to her community.

Peter Ian Kuniholm, Chairman; Claudia Lazzaro; Carol V. Kaske

Many thanks to Esther’s nephew, John Hellegers, some of whose family information and prose we have used, with his kind permission, for this memorial statement.

Edwin John Doty

December 9, 1903 — March 19, 1948

Edwin J. Doty, Associate Professor of Clinical Psychiatry, Cornell University Medical College, died on March 19, 1948, at the age of 45. Dr. Doty's death brought to an end a promising and productive career in clinical psychiatry. He was known as an outstanding clinician, and brought to his clinical work unusual training and skill in clinical neurology, clinical psychiatry, and psychoanalysis. His outstanding personality traits were particularly suitable for the practice of his specialty; unflinching kindness, thoughtfulness, sympathy and warmth for people, broad cultural erudition, and a delightful sense of quiet humor. He had unusual intuition into human problems, and the greatest of warmth for troubled people.

Dr. Doty received his medical training at the University of Michigan, from which he graduated in 1929. During his years in medical school he served as an assistant in anatomy and in internal medicine. During the year following graduation he remained as an instructor in anatomy. He then undertook his internship in medicine at the Peter Brent Brigham Hospital, Boston. Following this he began his formal training in psychiatry, first at the University of Michigan Psychiatric Hospital, then at the Westchester Division of the New York Hospital, and subsequently for two years at the Payne Whitney Clinic of the New York Hospital. Following this intensive training in psychiatry, he undertook training in clinical neurology at the Neurological Institute of New York. In 1937 he returned to the Payne Whitney Clinic as resident psychiatrist. In 1940 he became Associate Attending Psychiatrist, and in July 1947 Associate Professor of Clinical Psychiatry at Cornell and Associate Attending Psychiatrist, New York Hospital.

For a number of years Dr. Doty acted as main consultant to the various departments of the New York Hospital. Here his combined talents proved most effective, and he accomplished much in the inter-relation of Psychiatry with the other divisions of medicine in the Hospital. He was particularly effective at this because of his sound background in internal medicine as well as neurology. He was an outstanding diagnostician, and an excellent teacher. He was particularly beloved by all the staff members of the New York Hospital, and the sorrow at his death is shared by an extensive circle of psychiatric and non-psychiatric colleagues and former students. Dr. Doty was the psychiatric consultant for several years to the medical students of Cornell and to the Cornell-New York Hospital School of Nursing.

In addition to these attributes, Dr. Doty possessed a wide knowledge of psychiatric literature and creative ability in psychiatric research. He organized a system of indexing of psychiatric records of great value, which has been adopted by other psychiatric centers. He made real contributions to our knowledge of depressive states and the psychiatric problems of ageing.

Dr. Doty's death came at the very peak of his professional and personal success. Within the year he had married; he had undertaken the part-time practice of psychiatry with every promise of a successful and active practice. He had achieved his academic goal of professorial rank. His death, coming at the very fulfillment of his life goals, brings particular sorrow to those hundreds of colleagues and friends who miss him and mourn him.

I. A. C. Rennie

Donald L. Downing

April 2, 1931 — February 29, 2008

Donald L. Downing, Professor Emeritus of Food Processing at Cornell University's New York State Agricultural Experiment Station in Geneva, New York, passed away suddenly on Friday, February, 29, 2008 after a wonderful morning of skiing. He was 76. He was an exceptional mentor, colleague and friend, and will be greatly missed by those he worked with as well as by the food-processing industry.

Don was born in Willoughby, Ohio, on April 2, 1931, to Lelah and Dana Downing, both of who preceded him in death. He grew up in Fulton, New York, where he was a member of the class of 1948 at Fulton High School.

After high school, Don received an Associate degree in Dairy Science from Morrisville (New York) College. He then spent three years in the Army including two years in Europe. Upon his return, he enrolled in the University of Georgia's Food Science and Technology Program. After receiving first his B.S. degree and then his Ph.D. degree, Don and his family moved to Johnstown, New York, where he worked for Beechnut-Lifesavers for three years before joining the Cornell University faculty at the New York State Agriculture and Experiment Station in Geneva, New York, in 1967, where he advanced to full professorship.

Don's distinguished career at Cornell spanned more than 40 years; he attained full professorship in 1980. Although his position was 100% extension, he was always available to Food Science graduate students for advice in all aspects of the food industry. He was well known for encouraging them to attend symposia, conferences and meetings to complement their academic training. He established the annual Downing Graduate Student Excellence Award. In addition, he was a valuable mentor to junior faculty in the Department of Food Science and Technology in Geneva. He gave freely of his time, and was an exceptional friend and colleague.

When he began work at the Station, Don's primary responsibilities were to assist the state food processing industry and farm wineries. To this end, he conducted pesticide training and certification for 13 years. He organized, or took part in, over 150 food related workshops and ran 22 annual offerings of the Better Process Control School required by the FDA for canning operations. He had 152 publications to his name, including *Processed Apple Products* and the three-volume *A Complete Course in Canning* both of which he edited and are industry standards. In addition, Don was one of the first Cornell faculty to work extensively with New York wineries. He was instrumental in creating the first Wine Industry Workshop in 1971 and helped start Cornell's enology extension program.

In 1988, Don created the New York State Food Venture Center in response to a growing need in the New York state food industry. The program, which began as an extension effort for the Department of Food Science and Technology, remains a valuable resource to this day. For most of its existence, Don has been an integral part of the Center's function. He was its first director, running the program until his partial retirement in 1994. After retiring, he continued to work at the Food Venture Center part time as the Process Authority, evaluating the safety of proposed recipes, making changes as necessary, and approving processes. His knowledge of Federal and State food law was inexhaustible, and he excelled in making obtuse regulations easy to understand. He was much sought after as a go between for the FDA and USDA, and could often be found with a phone to his ear, spending time with clients answering questions and offering suggestions.

He earned numerous honors and awards for his work including a Commendation from the New York State Commissioner of Agriculture in 1997 and the USDA-Group Honor Award for Excellence for NECFE program in 2004. As a Fellow of the Institute of Food Technologists (IFT), Don initiated several divisions and served as chair of several national committees. He was Councilor for Western New York IFT for 21 years, helping to maintain the section's focus and financial health at a time when it was losing industry members due to transfers and plant closings.

In addition to IFT, Don was a member of the Alumni Association at the University of Georgia, the Geneva Country Club, the Finger Lakes Forum, and the Associated New York State Food Processors. He gave consistently both to Morrisville College and the University of Georgia. He showed every day, with words and actions, with an unselfish, enthusiastic, joyful and professional disposition, how to be a Cornell extension leader and a caring mentor. He loved working with people, always providing meaningful assistance and encouragement. His colleagues will be forever grateful for his advice, support and friendship and will never forget all he taught and the kindness he showed to everyone.

Don is survived by his wife of 48 years, Rochelle (Shelly); a son Kurt (Janice), Dublin, Ohio, and a daughter Karla, Phelps, New York; granddaughter Jacklyn Downing, Dublin, Ohio; four brothers, Eugene (Nancy), Phoenix, New York, Alan Downing, Mexico, New York, a twin brother Dana (Patricia), Valparaiso, Indiana, and Stanley (Josephine), Huntsburg, Ohio; and several nieces and nephews.

Olga I. Padilla-Zakour, Chairperson; Chang Y. Lee, Randy W. Worobo

William Emerson Drake, Sr.

September 19, 1927 — April 17, 2005

William Emerson Drake, Sr. was born in Traverse City, Michigan, the son of George and Evelyn (Emerson) Drake. Bill was raised on a farm near Traverse City and graduated from Traverse City High School. He served in the United States Navy at the end of World War II; earned his B.S., M.A., and Ph.D. degrees from Michigan State University; and taught high school agriculture in Michigan until 1960.

Professor Drake supervised scores of student teachers in Agricultural Education and, through them, has literally touched the lives of thousands of young people. Writing on behalf of the active and retired teachers of agriculture in New York State, one of Professor Drake's former students and past President of the New York Association of Agricultural Educators wrote a tribute to Dr. Drake after his death.

“On behalf of agricultural educators throughout New York, thank you for a lifetime of service to our profession. ...you may never have fully known or realized your true effect on our profession or the lives you touched.... As one of your former students, I cannot begin to explain to you the impact you have had on my life. From the day I first walked into your office a naive and raw transfer (student), you took me under your wings and became my advisor. Little did I know then the impact you would have in developing my career. ... you made me feel like the most important person in the world, a true hallmark of a quality teacher ... please accept ... our gratitude for having known you, our privilege of having learned from you, our honor for having served with you, and our love for being able to have called you our teacher, our mentor, our colleague, and our friend.”

Sir Isaac Newton is credited with saying, “If I see farther than other men it is because I stand on the shoulders of giants.” In every generation in the field of Agricultural Education, a precious few giants step forward to hoist the next generation to new heights. Bill Drake was one of those giants. He was Professor of Education at Cornell University from 1960 until his retirement in 1990. During those years, Professor Drake served as Program Leader for Agricultural and Extension Education at Cornell, Eastern Region Vice President and later as National President of the American Association of Teacher Educators in Agriculture (AATEA). He received the AATEA Distinguished Service Award, the SUNY Chancellor's Award for Excellence in Teaching at the College of Agriculture and Life Sciences, and the Cornell Association of Teachers of Agriculture (CATA) Outstanding Service Award.

Professor Drake was active in various international programs sponsored by the College of Agriculture and Life Sciences. Among these efforts was advising colleges of agriculture in several African countries including Kenya, Sierra Leone, and Cameroon. In addition, he was a consultant to the University of the South Pacific, assisting policy

decisions concerning the training of teachers of agriculture for the twelve English speaking countries served by that institution.

Bill loved his family. He enjoyed teaching his grandchildren about nature and the environment including how to make maple syrup from the trees in his yard. He was also a master gardener and did extensive grafting on the fruit trees he planted. He was proud of harvesting eight different varieties from a single apple tree. One of his colleagues at Cornell said,

“The thing I remember about Bill is how warm, funny, and generous he was. He used to grow pumpkins, and would carve the administrative assistants’ names into pumpkins in the early summer—by harvest time, scar tissue had grown over the names and made the pumpkins look ‘engraved’ with the names.”

Bill’s wife, Mary; his son, William E. Drake, Jr.; his daughter, Diane Clark; and five grandchildren, Mary and Billy Clark, and Sammy, Libby and Nate Drake survive him.

William G. Camp, Richard E. Ripple, Verne Rockcastle, Dalva Hedlund

David Dropkin

September 13, 1908 — October 12, 1990

David Dropkin savored over 50 years of academic life at Cornell, first as an undergraduate, then as a graduate student, next as a research associate, eventually as a faculty member, and finally as a professor emeritus teaching part-time. This is certainly more than most of us experience and he was still showing some reluctance for final detachment when he moved to Florida to ameliorate the poor health of his first wife, Sophie.

He was born in Vitebsk, Russia and became naturalized as a U.S. citizen soon after his parents moved to the U.S.A. He attended elementary and high schools in Nyack, New York and matriculated at Cornell in 1929, graduating in mechanical engineering with the M.E. degree current at that time. He continued his studies on the graduate level, earning an M.M.E. degree in 1935 and a Ph.D. degree in 1938. During the period from 1933 to 1942, he held appointments as research assistant and research associate, with instructor being added to the latter in 1942, entitling him to become a faculty member of the Sibley School. He was appointed an assistant professor in 1943, associate professor in 1946, and professor in 1957. In 1970 he was named the John Edson Sweet Professor of Engineering and retired in 1974 as professor emeritus.

Dave was that *rara avis*, a first-class experimentalist and a first-class teacher—he had many publications to his credit and was accorded the Excellence in Teaching Award of the College of Engineering in 1968-69. His experimental work was meticulous, as shown in his published papers and his laboratory teaching, both of undergraduates and graduates. His field of interest was in heat transfer in general, and a hallmark of his work was the accurate measurement of temperature: good enough was not enough, it had to be as precise as technique and tenacity allowed. A major quality of character possessed by Dave was his innate kindness to students and it was this attribute, together with a certain ingenuousness of approach and of unaffectedness in presentation, which endeared him to them, because they perceived, either consciously or not, that he was personally concerned about their learning. This affection and respect carried through the years, and alumni returning to Sibley School after several years of absence from the campus immediately made inquiries at the school office of his whereabouts and were grieved to learn that he was retired and, later on, far away in the South.

During Dave's long attachment to Cornell from matriculation to emeritus, a number of curriculum patterns were advanced, the major one providing a significant change over the decade of World War II and following years. This innovation was engendered by the establishment of the five-year undergraduate engineering program which

emphasized a new concept, the teaching of “Engineering Sciences” in depth, before the introduction of design and applications. In Sibley, this meant separate courses of study, such as thermodynamics, fluid mechanics and heat transfer, which had been previously subsumed in ‘Heat Power Engineering’ as a single two-semester course covering both basic and application material. While a few of his colleagues might have grumbled that whatever it was called, their lecture notes would remain the same, Dave welcomed the change wholeheartedly and immediately took advantage of it. It meant that heat transfer became a required study complete with built-in laboratory, with temperature measurement and advanced heat transfer for graduate courses and for graduate research.

His publications became well-known in the late fifties, again largely for his prowess in temperature measurement and he established consultancies with a number of institutions and companies. To quote a former chairman, “Dr. Dropkin has done more good work with graduate students than any other teacher in the Sibley School. This is, I believe, one true mark of a scholar”. He was a member of the American Society of Mechanical Engineers, the American Society of Engineering Education, the American Association of University Professors and the New York Academy of Sciences.

Throughout his career at Cornell, Dave gave generously of his time to the many necessary tasks within the school beyond those of the classroom, such as advising of both undergraduates and graduates, and acting as graduate field representative of the Sibley School. Even in his retirement, he took up the office of secretary-treasurer of the Cornell Alpha Chapter of Sigma Xi, the Scientific Research Society, and brought it to a long-needed order.

Dave was a conscientious person of the highest order and could not abide intolerance, injustice, deception and hypocrisy. He could speak out forcibly whenever an event occurred that violated his high standards of behavior. At such time his friends knew that Dave could always be expected to start his objections with the characteristic phrase “I am furious”. On one memorable occasion, during the student anti-Vietnam War demonstrations, Dave arrived at Upson Hall to find that a number of protestors were carrying the Upson Hall furniture to the outside patio. Dave became “furious” and peremptorily ordered the students to return everything to its proper place. Hearing the voice of authority, possibly for the first time in many years, the perpetrators, all of whom were relatively large fellows, attended to the diminutive professor who was suddenly nine feet tall, meekly restored the furniture to the lounge, and sheepishly departed from the scene.

On September 15, 1940, Dave married Sophie Katz of Nyack, New York. Most of their 43 years of life together were spent in Ithaca, except for sabbaticals and some foreign travel. When Sophie became ill, they moved to Coconut

Creek, Florida, where she died on February 4, 1983. On March 5, 1985, Dave married Idie Kertesz in Coconut Creek, Florida, and, except for occasional visits to Ithaca and some travel abroad, remained there until his death.

He is survived by his wife, Idie, of Coconut Creek, Florida; his son, Dr. Lloyd Richard Dropkin, of New York City; his daughter, Marilyn Hoffman, of Ithaca, New York; and his brother, Harry, of Florida.

David Dropkin will be long remembered as a dedicated and caring teacher, an honored and esteemed colleague, and a true and devoted friend.

Bart J. Conta, Sidney Leibovich, Dennis G. Shepherd

Matthew Drosdoff

December 15, 1908 — April 24, 1998

Matthew Drosdoff culminated a distinguished career as Cornell's first professor of tropical soils following a long period of service as a scientist and administrator for the United States Department of Agriculture and the United States Agency for International Development.

In 1935, after receiving the B.S. degree from the University of Illinois, and M.S. and Ph.D. degrees in Soil Chemistry from the University of Wisconsin, Matt began his 31-year career in government as a research scientist and administrator. Much of his early efforts were devoted to tung oil research at the University of Florida, considered vital to the war effort. His international career began in 1950 when he first went to Central America as a member of a mission to identify soils and mineral nutrition problems of Manila hemp. In 1955, he joined the forerunner of USAID and spent five years in Peru as a soil science advisor to their Ministry of Agriculture. Matt then served four years in Vietnam and from 1961-64 was the chief of the U.S. agricultural mission in that country. He was then named Administrator of the International Agricultural Development Service of the U.S. Department of Agriculture, a position he held until he joined the faculty at Cornell in 1966.

Upon joining the Cornell faculty, Matt Drosdoff rapidly became one of its most active and distinguished members. Matt had a remarkable capacity to interact with people and involve them in the many activities that he undertook as a Cornell professor. Under his guidance, multi-disciplinary research programs on effective utilization of soil and water resources of the tropics were organized and carried out. Using discussion and persuasion, he was able to coordinate effective research among members of the faculty from Cornell and other universities and at in-country institutions. The result was a world-perspective of soil science. Even though he became emeritus in 1976, there still remains a core of soil professors in his former department active in research on soils of the tropics.

Matt's course in Properties and Management of Tropical Soils attracted many foreign students as well as students from the United States and remains a subject desired by many students interested in international development. He was heavily involved in the development and execution of an interdisciplinary course in Tropical Agriculture that included a field trip to tropical areas. This course likewise remains one that attracts many students annually. The graduate program developed by Professor Drosdoff and colleagues resulted in more than 20 M.S. and Ph.D. theses produced by students in the program. A feature of the program was the training of scientists in their own country at in-country research institutions. Building on this base, the subsequent graduate program in tropical

soils has remained very active. As a consequence, both U.S. and foreign students trained under these programs are in positions of leadership throughout the world.

At the same time, Matt interacted with faculty and students throughout the university and was highly influential in university affairs. He was a member of the Steering Committee of the Program for Science, Technology, and Society; the executive committee for Programs and Policies for Science and Technology in Developing Nations; and the executive committee for the Latin American Studies Program of the Center for International Studies. He served as a member of the Constituent Assembly and chaired the Faculty Committee on International Student Affairs. Matt was an inveterate tennis player and was a consistently formidable contender well into his eighties.

Professor Drosdoff chaired the Tropical Soils Committee of the National Academy of Sciences. He served as a consultant to the Ford Foundation and to the Food and Agriculture Organization of the United Nations among others. He was elected a Fellow by the American Society of Agronomy in 1969 and received its International Agronomy award in 1974. He also was a Fellow of the American Association for the Advancement of Science.

Matt was born and raised in Chicago and died in Ithaca. He is survived by his widow, Mildred Binder Drosdoff, of Ithaca; a sister, Naomi Weinstein, of Chicago; a daughter, Ruth Tucker, of Cincinnati; a son, Daniel, of Fairfax, Virginia; a stepson, Jonathan Prigot, of Boston; a stepdaughter, Andrea Hovaness, of Westchester County; three grandchildren; and three step-grandchildren. His first wife, Sarah Max Drosdoff, died in 1978.

It is noteworthy that a life-long public servant, however distinguished his record, could become at the end of his career, a truly outstanding and energetic example of that unique species, the Cornell University professor. Matt Drosdoff, however, contributed a decade of extraordinary achievement to Cornell University and to soil science for which he will be long remembered.

David R. Bouldin, Armand VanWambeke, Douglas Lathwell

Alexander M. Drummond

July 15, 1884 — November 29, 1956

Alexander M. Drummond, born and reared in Auburn, New York, received the bachelor's degree at Hamilton College in 1906, and the Master's degree at both Harvard (1907) and Hamilton (1909). He came to Cornell in 1907 to teach in the Department of Public Speaking and to continue graduate study. Thus began an association with this University which—except for two years (1918-1920) when he was the efficient headmaster of Cascadilla Preparatory School—continued until his death on November 29, 1956, four years after his retirement. For twenty years (1920-1940) he served as Head of his Department. The national reputation that Professor Drummond enjoyed was earned largely through his contributions to the advancement of drama and theatre in this country. Classically educated, and solidly grounded in the principles of art and in the best of the world's dramatic literature, he upheld staunchly the integrity of the art of the theatre. With brilliant success, he taught how to write a good play, how to put one into production, how to enjoy and benefit from one. He made instruction in theatre an academic subject, occupying its proper place among the liberal and fine arts. And his ultimate hope was that the theatre should become an essential element in the lives of American "folks", with a non-professional stage-company functioning in every county in the land. In 1909 he helped organize the Cornell Dramatic Club, and was its Director from 1912 to 1947—a period of flowering for one of the best dramatic organizations in the country. He performed a signal and extremely popular service as the Director (and later adviser) of the Little Country Theatre at the New York State Fair and inaugurated, with the Rockefeller Foundation as sponsor, the New York State Plays Project.

Professor Drummond's activity as author or editor was devoted to various aspects of the field of Speech and Drama. He wrote original plays (which were performed at Cornell and elsewhere), and a monograph on play production; edited *Cornell Plays*, *New York State Plays*, and *Plays for the Country Theatre*; and issued books and articles dealing with public discussion and the problems of training in speech.

Among his other endowments he will be remembered for his executive gifts. He increased the course-offerings in drama and theatre as well as in public speaking, and expanded the related student activities. Under his leadership the work of the Department was established on a firm basis of historical knowledge and philosophical principles, and his influence, and the prestige of the Department, were such that the scholars he trained now occupy responsible positions all over the country.

Fecund in ideas, he would also test them in action, and he inspired his students to industrious collaboration. Many have noted this uncommon wedding of creative faculty with strong practical sense. With a method of his own, in which a penetrating dialectic, irony, and understatement played each a role, he stimulated thought, inculcated high critical standards, and developed imagination. The distinguished actors, playwrights, lawyers, and teachers he trained in his theatre or classroom have testified to this expert teaching—and have expressed also their gratitude for his counsel and friendship.

Many honors came to Professor Drummond. He was President of the Speech Association of America in 1920; he was the first to be elected as Vice-President of the American Educational Theatre Association (in 1936), and he was the first honorary President of the National Theatre Conference (in 1948) ; in 1938 his Alma Mater awarded him the degree L.H.D. *honoris causa*; he received numerous invitations to lecture at other universities; and at the time of his retirement articles praising his personality and services appeared in various magazines, and he was inundated with letters, telegrams, dinners, receptions, speeches, and resolutions passed by professional groups—not to mention the Drummond Fund set up by former students for the purpose of fostering projects in drama that claimed his interest, nor the commemorative portrait of him, painted by his friend Christian Midjo, that hangs in the University Theatre. The loyalty and admiration that Professor Drummond commanded from his friends and pupils (who were wont to refer to him affectionately as “The Boss”) were extraordinary.

What were the personal qualities that won him such admiration and such loyalty? Imposing stature and a striking appearance, intellectual power, independence of mind, and unshakable adherence to the principle of fair play, warm human sympathy, a rare capacity for friendship and companionship, a rich sense of humor joined with a consummate talent as raconteur. Add an unusual versatility, for he was also a painter in oils; and for ten years a successful Coach of football at Cascadilla School (his advice on strategy being often sought by coaches of university teams) ; and a devoted student of American history, especially the history of the Civil War (in which his father had fought as a Union soldier) and the history and lore of central and southern New York, this region whose people and way of life he loved. And perhaps most admirable of all his virtues was the superb courage with which he endured physical infirmity since his early boyhood.

Harry Caplan, Howard S. Liddell, Herbert A. Wichelns

George Burton Du Bois

June 20, 1906 — September 25, 1988

George Du Bois was the right person in the right place for Cornell University when he returned to his alma mater in September 1947 as an associate professor in the Department of Machine Design in the Sibley School of Mechanical Engineering. World War II was over and a new era for engineering education was beginning. The sudden and great increase in the number of students had to be met by a concurrent increase in the faculty. At the same time, curricula were being completely revised to incorporate the many significant technological advances made during the war years and to meet the demands of a rapidly expanding industrial economy. George's eighteen years of industrial experience, in what we would now call "hi-tech" industries, were invaluable in the education of mechanical and administrative engineering students and in the continuing education of new, young instructors and assistant professors who came to Cornell with minimal contact with industry.

George was born and raised in Newark, New York, where his father, John Edmund Du Bois, was the editor and publisher of a semi-weekly newspaper. His early contact with printing and paper-handling machinery and with power and sailboats at the family's summer home on an island in Sodus Bay, combined with an innate curiosity as to why and how things work, made it inevitable that he would become an engineer.

He entered Cornell University in 1923 in a six-year program combining arts and sciences with engineering. He majored in mathematics and physics in the Arts College, and in the automotive option in mechanical engineering. He received the A.B. degree in 1927 and the M.E. degree in 1929.

He was a member of Delta Upsilon, the Society of Automotive Engineers, and Tau Beta Pi.

George was employed by the Sperry Development Company, Brooklyn, New York, for two years before entering what would be the focal point for the rest of his career—the field of aircraft engines. He worked for the Lycoming Division of Aviation Manufacturing Company, Williamsport, Pennsylvania, for five years, rising to the position of project engineer for a new 200-hp radial engine. He then joined the Engine Division of the Wright Aeronautical Corporation, Wood Ridge, New Jersey. At Wright he served as project engineer on a number of increasingly larger and more powerful engines until in 1945 he was put in charge of the rear section design group. In 1946, he was put in charge of the reciprocating engine design group.

At Cornell George's extensive, up-to-date knowledge and experience in design, manufacturing, and experimental testing and development were quickly put to use in many ways—from the development of the terminal, all-inclusive course in a new four-term sequence of required courses, to the development of new elective courses in automotive engineering, creative design, and design for manufacturing, to the securing of a major award from the National Advisory Committee for Aeronautics (NACA, now NASA) for research on high-speed plain bearings.

His contributions to creative design were widely recognized in industry, as well as in academia. He served as a consultant to several companies, including the A.C. Division of General Motors Corporation, the Procter and Gamble Company, and the Corning Glass Works. Reunioning alumni often bring up the names of professors whose ideas have had the greatest impact upon their professional lives. Professor Du Bois—and his approach to creative design and design for manufacturing—comes up frequently. Many alumni have said that they still keep their sets of his mimeographed notes close at hand.

A research effort of the magnitude of the NACA project was most unusual for a university in 1948. It involved, initially, the design and development of a bearing test machine with many unique capabilities. The scope of the research soon expanded to include theoretical studies, along with the analysis of the experimental data. The theoretical developments in the early 1950s by the late Professor Fred W. Ocvirk, related to the short-bearing approximation, are known and used throughout the world. The design procedure that was developed by combining experimental results with theory is still the simplest and best approach to the design of “short journal bearings.” The project continued for more than a decade with Professor Du Bois in charge, and directly involved in the details, throughout the entire period.

George was a “gentleman” in every sense of the word. He was always considerate, accommodating, very patient and forgiving. In the course of numerous, often somewhat heated, departmental and course group discussions, he was always the first to suggest what frequently became the reasonable compromise. He was interested in students as individuals; he enjoyed working with them on special project investigations, and he served enthusiastically for many years as faculty advisor to the Student Branch of the Society of Automotive Engineers, and as an alumnus advisor to Delta Upsilon fraternity.

Professor Du Bois was a registered professional engineer in the State of New York. While at Cornell he joined the American Society of Mechanical Engineers and for a number of years served as secretary of the Fluid Film Section of the ASME Lubrication Activity. He was elected to the honor societies of Sigma Xi and Phi Kappa Phi. George was promoted to professor in 1951 and to professor emeritus in 1971.

Professor Du Bois is survived by his wife, Evelyn Davis Du Bois; a stepson, Dr. Melzar T. Richards of Ithaca; a cousin; two nephews; and a niece.

Dennis G. Shepherd, Robert L. Wehe, Richard M. Phelan

Vincent du Vigneaud

May 18, 1901 — December 11, 1978

Vincent du Vigneaud was born in Chicago in 1901. He majored in chemistry at the University of Illinois at Urbana and received the Master of Science degree in 1924. H. B. Lewis and W. C. Rose introduced him to biochemistry, which became his major field of interest. At Urbana he supported himself by working as a waiter and teaching cavalry tactics and equitation as a reserve second lieutenant. He received his Ph.D. degree in 1927 from the University of Rochester for work on the chemistry of insulin. Insulin is a protein containing sulfur, an atom that became his life-long center of interest, as vividly told in his book *A Trail of Research* (Cornell University Press, 1952).

For his postdoctoral work du Vigneaud moved to Baltimore with his wife, Zella, whom he had married in 1924, to work with J. J. Abel at Johns Hopkins. There, in the first steps following the sulfur trail, he worked on cystine, a constituent of insulin which Abel had crystallized in 1925. Du Vigneaud helped to establish that insulin is indeed a protein, an unpopular viewpoint at the time. After another year of postdoctoral fellowship in Europe, du Vigneaud returned to Urbana as an assistant professor in physiological chemistry (1930-32). He continued his work on cystine and developed an important method for the reduction of the disulfide bond by metallic sodium in liquid ammonia. These reagents remained valuable tools in his hand for his later synthetic work. In 1932, at age 31, he was appointed chairman of biochemistry at George Washington University School of Medicine, where he remained for six years. Here he broadened his research interest to include nutritional studies on cystine isomers and other sulfur-containing amino acids, particularly methionine and homocystine. He also began work on the synthesis of cystine peptides. Both of these new approaches laid the groundwork for du Vigneaud's later and most important work on amino-acid metabolism and peptide synthesis. In 1938 he moved to New York City as the head of biochemistry at Cornell Medical College. Once again he broadened his sphere of interest to include studies on the structure of biotin and pituitary hormones, keeping close to the tracks of the trail of sulfur atoms. At Cornell he established the metabolic process of transmethylation. He was helped in these fundamental studies by three collaborators, Mildred Cohn, Sofia Simmonds, and Joseph Chandler, who later became well-known biochemists in their own right. It is of interest that two of these collaborators were women, an unusual pattern at the time. During World War II, du Vigneaud worked on the chemistry and synthesis of the sulfur-containing antibiotic penicillin. In this work he was aided by a team that included Robert W. Holley. After the war he concentrated on the elucidation of the chemical structure of the pituitary hormones oxytocin and vasopressin. By 1953 the

chemical synthesis of oxytocin was achieved and its biological potency established. For this and earlier work on sulfur-containing biological molecules he received the Nobel Prize in Chemistry in 1955. In 1967 he moved to Ithaca where he was warmly welcomed by the chemistry department and remained active until the summer of 1974. His primary interest in Ithaca was the relationship between chemical structure and biological activity of oxytocin and vasopressin (which he had synthesized earlier).

On a Saturday morning during a conference with one of his postdoctoral fellows, he had his first stroke, which interrupted his brilliant career. It was a tragic end because he remained mentally alert but incapable of communication and physically feeble for several years until his death on December 11, 1978, in St. Agnes Hospital in White Plains, New York. Zella, his wife, who had attended him with love and devotion during his illness, died in 1977.

Du Vigneaud's most outstanding characteristic was his devotion to science and enthusiasm for research. When he retired as chairman of biochemistry in New York, instead of taking a vacation he moved to Ithaca on July 1 with two moving vans full of equipment and spent the summer "getting started." He set an exacting example for his colleagues by extending his work week through Saturday mornings and by designing laboratory work with meticulous care. He was a great listener and stimulated young scientists to greater efforts. He remained a father image to many brilliant scientists, now leaders in the field of biochemistry.

Du Vigneaud received many awards, both before and after the Nobel Prize, including the Lasker Award in 1948, the Passano Award in 1955, and honorary degrees from several universities.

Stuart J. Edelstein, Gordon G. Hammes, Efraim Racker

Eugene Floyd DuBois

June 4, 1882 — February 12, 1959

Eugene Floyd DuBois, Professor Emeritus of Physiology at Cornell University Medical College and one of the great medical scientists of our time, died on February 12, 1959. He was born June 4, 1881, on Staten Island, New York. He was educated at Harvard University, from which he received the degree of Bachelor of Arts in 1903. From Columbia College of Physicians and Surgeons he received his doctorate of medicine in 1906. Following an internship at the Presbyterian Hospital in New York, he pursued postgraduate studies in medicine and physiology in Germany.

In 1910 he returned to become instructor in applied pharmacology at the Cornell University Medical School. The following year, under the stimulation of Graham Lusk and with the financial aid of the Russell Sage Institute of Pathology, he established a laboratory for investigation of human calorimetry. He acted as medical director of the Russell Sage Institute of Pathology from 1912 to 1951. He became Associate Professor of Medicine at Cornell in 1919 and was Professor of Medicine there from 1930 to 1940 and Professor of Physiology from 1941 to 1951.

Eugene DuBois was a man who was fortunate in acquiring early in his professional life an absorbing interest in a fundamentally important and relatively new branch of medicine. His pioneering venture in calorimetry, small and modest at its inception, was destined to have an extraordinary influence on the development of medical science. In a relatively short time there came from DuBois's laboratory contributions on metabolic disturbances in typhoid fever, tuberculosis, malaria, pernicious anemia, leukemia, thyrotoxicosis, nephritis, and cardiac disease. With his cousin, Delafield DuBois, he established a relatively simple formula for the estimation of surface area, now recognized throughout the world as basic to the study of human nutrition and metabolism. With other associates, he demonstrated the physical mechanisms of fever and the applicability of van't Hoff's law to variations in total metabolism in fever. Inferences from this work in calorimetry led directly to remarkable studies and to formulations concerning skin temperature and heat radiation.

His laboratory early became a mecca for young clinical investigators, who included Francis Peabody, James Howard Means, Joseph Aub, David Barr, William McCann, John P. Peters, Soma Weiss, Samuel Z. Levine, Edward Mason, and Nils Paul Larsen. Through these, his pupils, his influence penetrated most of our medical schools and large teaching hospitals.

This influence was extraordinary and was attributable only in part to his mastery of experimental procedure and the intrinsic value of his scientific contributions. It derived more from his own character and personality. Inspiration came to others from his abiding faith in principles of scientific and personal conduct, from his integrity and tolerance, from his sympathetic understanding of the problems of those about him, from his clear expression, unflinching courtesy, and true humility.

Dr. DuBois's military record in the service of his country was one of remarkable achievement and constant contribution. It was pursued so quietly and at times so secretly that few, even of his friends, realized its extent or significance. In the fields of submarine warfare and aviation medicine he was an outstanding authority. For heroism in the conduct of hazardous experiments during World War I he received the Navy Cross. His service during World War II was recognized by Commendation and Ribbon Bar. He was captain in the Medical Corps of the U. S. Naval Reserve from 1927 to 1950.

Dr. DuBois received many honors. He was a member of the National Academy of Sciences and the American Philosophical Society. He served as president of the American Society for Clinical Investigation, the Association of American Physicians, the Harvey Society, and the Institute of Nutrition. He was recipient of the Kober Medal of the Association of American Physicians in 1947 and the Medal of the New York Academy of Medicine in 1956.

David P. Barr

Lola Tingley Dudgeon

September 25, 1898 — October 2, 1992

Lola Dudgeon, emeritus professor of foods and nutrition, died on October 2, 1992, in Pocatello, Idaho after an extended illness. She was born in Rockford, Ohio and attended public schools there. After attending Bowling Green State Normal School she taught in rural schools in Ohio for several years. In 1934, she obtained a B.S. degree in home economics at Purdue University and in the same year entered Cornell obtaining an M.S. degree in foods and nutrition in 1938. During this period she worked as a research assistant to Professor Marion Pfund. Lola was then appointed as a country home demonstration agent at Michigan State College and in 1941 as extension nutrition specialist at the University of Arizona.

In 1943, Lola returned to Cornell as an assistant professor and extension specialist in the Department of Foods and Nutrition in the New York State College of Home Economics and became associate professor in 1948.

As an extension specialist she worked consistently and in different ways to increase public understanding of current research as it related to diet and health. She frequently consulted with research faculty in her department and experimented on her own to translate laboratory to home conditions. She was adept at motivating people to change through “how-to-do-it” demonstrations which incorporated not only the principles of food preparation and good food buying but also current research information.

She had a special interest in the bacteriological aspects of food as they related to short term food storage and the preservation of perishable foods in the home. She prepared individually and with others many extension bulletins in a variety of areas, always urging the importance of “plenty of meat” in the content. Some of these contained such useful information they are still in current use. She worked closely with the staff in food marketing particularly in the activities of the Potato Commodity Committee of the College of Agriculture. Another activity was to prepare materials on home reserves of food for the State Civil Defense Commission.

Lola was seen as a stimulating mentor to young extension staff as well as a creative co-worker in the many cooperative projects she undertook. Keenly aware of public concerns, conceptions and misconceptions and of consumer practices, her suggestions for enriching programs for consumers were sound and timely. One example from her work on the Potato Committee was her suggestion of instituting a potato peeling contest at the annual Potato Field Day. Each contestant came with a favorite knife, well sharpened, to compete in producing a batch of potatoes in the least time with the lowest weight of peelings and the fewest blemishes left on the potato. This

proved a popular activity as did her ideas for cartoon style leaflets and exhibits used at state and county fairs and other consumer events. Her understanding of consumers and their needs made her a popular figure at training meetings where her lessons were keyed to practical home conditions yet contained sound information and were a source of enjoyment as well.

Following her retirement in 1960, Lola taught courses in nutrition and food preparation to Peace Corps volunteers training for service overseas. With her experience in teaching many different kinds of people, many of whom had very limited knowledge in this area, she was invaluable in helping the volunteers to think through the essentials for them to try to teach and the importance of simple illustration to accompany new information.

Lola's Ithaca home, planned by herself to suit her needs, and her garden were a constant source of pleasure to her and to the many others who visited there. She delighted in hospitable gatherings of colleagues, students and other friends and was famous for her Thanksgiving and Christmas dinners. She remained active for many years working with Foreign Student Aid, Girls Youth Ranch and Handicapables among several other organizations. She was also a deaconess of the Presbyterian Church for many years both in Ithaca and Sun City. She was a member of several professional honor societies including Omicron Nu, Phi Kappa Phi, and Sigma Delta Epsilon; she was also a member of the American Home Economics Association, and the American Dietetic Association.

When she moved to Sun City, Arizona after retirement, she lived close to former Cornell colleagues and this congenial ground was a welcome focus for visiting friends. While in Arizona she gradually lost her vision; Cornell neighbors, especially Leola Cooper, became her "eyes" making it possible for her to continue living independently. After the onset of Alzheimer's disease she moved to a nursing home facility with special provision for Alzheimer's patients in the community in Idaho where her daughter lives.

Survived by her daughter, grandchildren and great-grandchildren, her relationship with her family was one of Lola's greatest joys as she grew older. She will be remembered by Cornell friends and colleagues not only as a kind and loyal friend but as an able teacher with a keen perception of people's needs and interests.

Nell Mondy, Hazel Reed, Kathleen Rhodes

Henry Hugh Dukes

September 9, 1895 — June 8, 1987

One of the golden eras in physiology ended with the passing of Henry Hugh Dukes on June 8, 1987, in Des Moines, Iowa.

Dr. Dukes was born in Saint George, South Carolina, on September 9, 1895. After obtaining a B.S. degree at Clemson College, he attended Iowa State College, where he received a D.V.M. with honors in 1918. His M.S. degree was earned while he filled positions as a teaching fellow and assistant professor at Iowa State and as an assistant state veterinarian of South Carolina.

He returned to Iowa State in 1921 after practicing in Greer, South Carolina, for one year. During the next eleven years his title changed from instructor to assistant professor of veterinary physiology to assistant professor of veterinary research.

Two important happenings occurred in Hugh Dukes's life in 1927 that probably set the tone of his career: he married Mary Alice Kent, his lifelong companion, and he began writing the manuscript for his famous textbook, *Physiology of Domestic Animals*.

The book was completed at Cornell in 1933, and Comstock Press assumed the publishing with the third edition. It received worldwide acclaim and has been translated into several foreign languages.

When Dukes arrived on campus in October 1932, he began to develop an innovative method of teaching physiology. It was called the lecture-demonstration method, which he developed with the help of Professors Howe and Grantham of the Department of Physics. Soon graduate students from other parts of the campus were attending the lectures along with the veterinary students.

The popularity of his course finally reached a point where the numbers were overwhelming. Dukes admitted later that at one time he was on the committees of forty graduate students. Gradually other staff members assisted him. Eventually summer courses were given to teachers of physiology in other schools and colleges so that they too could apply the lecture-demonstration method.

By that time Dr. Dukes had established himself as a distinguished physiologist and gave lecture demonstrations in this country and abroad. In 1953 he went to Brazil to lecture and received an honorary degree at Rural University. That same year Iowa State University awarded him the Alumni Merit Award, and Michigan State University

honored him with the Centennial Award in 1955. At Clemson an honorary D.Sc. was awarded him in 1966. The honors, awards, and citations that he received during his career fill five typewritten pages.

He retired in July 1960, whereupon former Dean William A. Hagan wrote to him from Ames, Iowa: "Since I had a hand in your appointment at Cornell... I should like to say now that I am very pleased at the outstanding record you are leaving. You certainly built a department that put the veterinary college on the map."

But to Dukes retirement only meant a change of direction. He immediately embarked on a career of lecturing. He covered elementary and secondary schools as well as colleges. His lectures, "Demonstrations in Living Biology," were seen by nearly a hundred thousand persons. For that work he received the Distinguished Physiologist award from the American Association of Veterinary Physiologists and Pharmacologists in 1973.

Because of his preeminent position in the world of veterinary physiology it was altogether fitting that he was invited to give the inaugural Sir Frederick Smith Memorial Lecture at the Royal Veterinary College, University of London, in 1965.

Recently an endowed fund was established at the New York State College of Veterinary Medicine on the occasion of H. Hugh Dukes's ninety-first birthday. It will be used to perpetuate the Dr. H. H. Dukes Prize in Experimental Physiology that is awarded annually to a veterinary student demonstrating evidence of scholarship in the field of physiology.

A. Gordon Danks, Robert H. Wasserman, Ellis P. Leonard

William Harold Dunn

April 13, 1898 — February 11, 1955

Word of the death on February 11, 1955 of Dr. William Harold Dunn, Associate Professor of Clinical Medicine at Cornell University Medical College and Associate Attending Psychiatrist, was received with profound regret by his colleagues on the medical faculty. Known to innumerable friends as “Jack” Dunn, he was one of the most beloved and respected members of the staff of the Medical College.

He was born on April 13, 1898 at Scottsville, New York. He received the degree of Bachelor of Arts from the University of Rochester in 1923, and a Doctorate of Medicine from Harvard in 1927. He interned at the Rochester General Hospital from 1927 to 1928, and was on the Neurology Service at Bellevue Hospital from 1928 to 1929. During the next two years he served as assistant physician at the Bloomingdale Hospital. In 1931 and 1932 he was engaged in postgraduate studies in neurology and psychiatry at Berlin. In September, 1932 he was appointed to the staffs of Cornell University Medical College and The New York Hospital, with which institutions he continued his association until the day of his death. In World War II, as a lieutenant in the Army Medical Corps, he served in this country and in the Southwest Pacific and was recipient of the Medal of the Legion of Merit.

He was an effective and conscientious teacher, who contributed to the instruction of medical students and graduates in both psychiatry and medicine. He was an active participant in the Payne Whitney Institute; he did much to form and guide the work in the Psychosomatic Clinic.

His publications, although not numerous, were weighty and wise. In the period after World War II, he was consultant in the crime trials at Nuremberg, Germany, and was assigned the task of writing a psychiatric survey of the Nuremberg trials, a report which was published in the United States Army Bulletin.

Few psychiatrists have exerted a more profound influence. He was a physician whose colleagues sought his advice for their own troubles and for those of their families. He was an approachable man, and his quiet, sagacious words were treasured. To an unusual degree he made the cares of his patients his own. He was indefatigable in his attentions; and even after the first attack of the disease that caused his death, he continued to sacrifice himself for the aid of others.

To all who knew Jack Dunn, his death was an irreparable, personal loss. There are few men of the great staff of our Hospital who could be more missed than he.

D. P. Barr

Charles Love Durham

January 2, 1872 — April 16, 1949

With the death of Charles Love Durham the University community has lost one of its best-known figures and most vivid personalities. To many generations of students his slight but wiry frame and ringing voice formed an emphatic part of their experience of Cornell—in the classroom, on the campus, at athletic rallies, in fraternity affairs, and, after they had graduated and gone, in their alumni gatherings throughout the country.

Born in 1872 at Shelby, North Carolina, Professor Durham took the M.A. degree at Furman University in 1891, and was instructor at Furman for five years thereafter. In 1922 Furman University awarded him the honorary degree of Doctor of Letters. He came to Cornell University in 1896 as Fellow in Latin and Greek, and at Cornell he remained for the rest of his life. Named instructor in 1897, he took the doctoral degree in 1899, became assistant professor in 1901, and professor in 1909. The year 1905-6 he spent in study at the universities of Leipzig and Munich. He became professor emeritus in 1940, having been in 1939-40 the first incumbent of the John Wendell Anderson Professorship. Anderson was a close friend of Professor Durham and a fellow member of Chi Psi fraternity.

In 1903 he married Jean Liddell Glendenning of Halifax, N.S., who, with their five children and eight grandchildren, survives him.

As a student and teacher of Latin Professor Durham set himself a high ideal of thoroughness and comprehensiveness, and, though he knew Greek well, never believed it possible to master both languages with the perfection which his generation of classical scholars demanded. Within the Latin field his special interests lay in syntax, descriptive and historical, of which he possessed a very subtle knowledge, and in rhetorical theory. Insistent upon a correct and scientific pronunciation of Latin, he made this the mark of all students who went out from his classroom. Most of these students best remember his freshman course in Horace, a poet in whom he took infinite delight; but he also placed special emphasis upon his work with secondary-school teachers, both in the teachers' course which he gave for many years and in the more general work of a long series of summer sessions.

But more and more Professor Durham's energies were extended to other university activities; thus plans he had made for scholarly research were regretfully laid aside, and even his teaching came to be on a reduced scale. Much of his work lay in all parts of the country among the alumni clubs, at whose meetings his vibrant and arresting style of speaking made him a most welcome guest. This service and the visiting of schools in the interests of the University kept him almost continually traveling. Especially in 1919-20, he traveled many thousands of miles, in

nearly every state, speaking on behalf of the Semi-Centennial Endowment Fund. His work among the graduates of the University was continued after his retirement from teaching, when he became special assistant to Provost H. W. Peters and later to the successive vice-presidents in charge of university development. In this capacity he had much to do with the planning and setting in motion of the Greater Cornell Committee, on behalf of which his efforts continued literally to the day of his death.

The members of the University owe him a special debt for exploring the possibilities of Group Insurance and securing the adoption of such insurance for the faculty and the administrative staff. This was in 1931. Six years later he served on the committee that developed the contributory pension system for the endowed colleges.

The list of Professor Durham's services to the university community is indeed a long one. To those mentioned we may add a few typical examples. In the years 1917-1919 he was Acting Secretary, and latterly Secretary, of the College of Arts and Sciences; and over a long period was active in the committees of this college and in the General Committee of the Graduate School. At one time he regularly revised the official publications of the University. For many years he was a member, and in 1934-5 president, of the board of directors of the Cornell Co-operative Society. He was master of ceremonies at the inauguration of President Farrand and again at the inauguration of President Day. At many successive Commencements he served as marshal of the Faculty. He was active in arranging Spring Day programs, and helped initiate the Saturday night alumni rallies at class reunions in June. As a musician, he occasionally in earlier days played the organ for Sunday services in Sage Chapel. He fostered and promoted various student organizations; was long a member of the Athletic Council; shared in the activities of the Savage Club; and in the old Town and Gown Club and other associations worked for the closer relationship of the University and the city of Ithaca.

Always alive to his duties as a citizen, Professor Durham from an early period took an active interest in politics. Twice nominated on the Democratic ticket as New York State assemblyman from Tompkins County, and twice as representative in Congress, he was defeated on each occasion after a lively campaign; not even his vigor and charm could stem the political current. He was widely known as a bitter foe of national prohibition. For years his striking oratorical gifts were in demand by his party at political meetings throughout this region. And during the first World War he delivered 275 patriotic speeches—some of them, to be sure, 'four-minute' speeches—in promotion of the several Liberty Loans.

Yet always the centre of his life was the University. To say that for more than fifty years he devoted himself heart and soul to its interests is a true statement that yet hardly conveys the completeness with which he identified himself

with Cornell. He gave his life to the University, and in return received that vitality that comes from absorption in an interest that one feels to be great and worthy. It is this vitality that his friends and pupils can never forget.

James Hutton, D.S. Kimball, E.J. Murphy

Lewis Hudson Durland

January 5, 1908 — September 1, 1982

Lewis H. Durland was born at nearby Watkins Glen, the son of Charles Mortimer and Clara Johnson Durland. His death at the age of seventy-four, following a courageous fight against cancer, brought to a close a very full life as investment manager, financial consultant, corporate director, enthusiastic sportsman, and loyal Cornellian.

After attending schools in Watkins Glen and Middletown, New York, Lew entered Cornell as a freshman in the fall of 1926, in the era of the racoon coat, bathtub gin, and the Stutz bearcat. While an undergraduate at the University he was a member of the Chi Phi Fraternity, where he also served as an alumni adviser until his death. He was a member of Quill and Dagger Society and the Mummy Club. He also was manager of the baseball team and was elected to the honorary Aleph Samach Society. He received the A.B. degree in economics in 1930 and set forth to make his way in the world at the very bottom of the Great Depression.

Following up his interest in baseball, for three years Lew was on the road as a salesman for a local sporting-goods emporium. Then followed three more years in local banking and brokerage businesses.

Lew joined the University staff as an investment assistant in 1936. The following year he became secretary to the former and very distinguished Finance Committee of the Board of Trustees. He was named assistant treasurer in 1939 and was elected treasurer of the University in 1948. On June 30, 1973, he retired as treasurer and was named treasurer emeritus of the University.

During the twenty-five years of Lew's stewardship of the investment portfolio supporting the University's endowments, that portfolio grew in market value from 45.2 million dollars to 332 million dollars. The *New York Times* on September 24, 1972, cited Cornell as an "example of enlightened endowment management," noting a 43 percent appreciation in its capital fund over the previous four years. According to the *Times* only one mutual fund had exceeded this record. Under his direction the unit share plan was established in 1963, providing a more uniform and fairly stated system of accounting for the University's endowments. In 1968 the unrestricted portion of the portfolio was transferred to a new capital fund whose investment objectives successfully broke away from the orthodox trust concept, with its conservative investment precepts, to the modern concept of total return, with its emphasis on maximizing the return, whether from dividend or interest income or from capital appreciation. In addition to managing Cornell's investment portfolio, Lew found time to become one of the early trustees of the

College Retirement Equities Fund (CREF), thus making a substantial contribution to the protection of college and university retirement plans across the land from the ravages of inflation.

Lew's outside business interests were extensive. He was a director of the present First Bank and Trust Company of Ithaca from 1941 until 1978 and served twenty-five years as chairman of that board. He also served as director and/or as financial consultant to a number of regional and nationwide business corporations.

Through his stature and financial acumen, Lew became a friend and adviser of many business leaders among the alumni of the University. He combined these associations with his deep interest in Cornell to make an important contribution in obtaining major gifts and bequests for the University. He served as a trustee and director of the Griffis Foundation, which had been established by Stanton Griffis, Cornell class of 1910. In conjunction with that foundation he established the Lewis H. Durland Fund at the University. Among other programs the fund provides major support to the Anne Carry Durland Alternatives Library in Anabel Taylor Hall in memory of a deceased daughter.

Throughout his extended career as a member of the official Cornell family, as a corporate director and financial consultant, or simply as a friend, neighbor, or family member, Lew was widely known for his characteristic good humor and his penchant for attacking problems with both imagination and pragmatism. He was always good social company and he always made a contribution in whatever situation he became involved.

Robert T. Horn, Deane W. Malott, Neal R. Stamp

Mary Eva Duthie

June 26, 1892 — August 19, 1972

Dr. Mary Eva Duthie, professor of rural sociology, emeritus, died August 19, 1972, in Ithaca, New York. She joined the New York State College of Agriculture and Life Sciences staff in 1924 as extension instructor in what was then the Department of Rural Social Organization. Until her retirement in 1955, Dr. Duthie served as an extension specialist in community recreation and drama. She was named extension assistant professor of rural social organization in 1928, a title which was changed to rural sociology in 1939, and was promoted to associate professor of rural sociology in 1946. After her retirement, Dr. Duthie was active in local community affairs, particularly the programs of the Ithaca Women's Club, the Campus Club, the Ithaca Community Players, and the Presbyterian Church.

Mary Eva was born in Grand Rapids, Michigan. She received a teaching certificate in 1913 from what is now Western Michigan University and taught in the public schools of Grand Rapids for six years. Her Bachelor of Science degree was completed in 1924 at Teachers College, Columbia University, and her Ph.D., with a major in rural sociology, at the University of Wisconsin in 1937. Professor Duthie left public school teaching to be a recreation director for War Camp Community Service in 1919. She was in charge of the girls' club department, Y.W.C.A. Recreation Unit, in Prague, Czechoslovakia, in 1920-21. She served as an assistant home demonstration agent at Pennsylvania State University for a period in 1922 and then became executive secretary, Rural Unit of the Y.W.C.A., in North Dakota in 1922-23.

In her thirty-one years on the extension staff, Dr. Duthie planned and promoted a variety of dramatic and recreational programs for the communities of New York State, with emphasis on training for group leadership. Dramatics leader training schools were given in the county seats of many counties in the period before World War II, usually under the auspices of the County Extension Association. Those who attended were representatives of schools, churches, Granges, local units affiliated with the Extension Service, and similar groups who brought theatre to their local communities. Beginning in 1926, county and intercounty dramatic contests and festivals were held, and, until they were interrupted by World War II, drama performances were an annual feature of Farm and Home Week at Cornell. Dr. Duthie also developed a loan library of more than one thousand plays.

Probably best known was Dr. Duthie's work leading to the organization in 1946 of the New York State Community Theatre Association, with its annual conference and workshops. She served as executive secretary of the Association

and was responsible for producing the quarterly publication, *Community Theatre Bulletin*. At the first annual conference, representatives of nineteen groups met in Ithaca; nine years later eighty-four member groups honored Dr. Duthie upon her retirement. A recognition plaque presented to her by the Association in 1955 is in the custody of the Department of Rural Sociology.

Dr. Duthie had a continuing interest in the role of the community theatre in changing the self image and the citizen's image of performers. Among her favorite stories were those in which theatre participation served to initiate the transformation of community citizens into active local leaders.

Mary Eva Duthie organized a wide range of recreational activities for the 4-H Club programs. Also, a State Drama Festival was incorporated into the annual 4-H Club Congress held at Cornell. Another activity Miss Duthie instituted in the 1920s was training in pageantry. Many local pageants were held as a result, and, in 1924, a pageant of agriculture was put on as a demonstration. Professor Duthie understood and appreciated the various roles of drama and recreation in people's lives and used her many talents to promote their use.

Dr. Duthie wrote a number of extension bulletins on recreation and dramatics. Her doctoral dissertation on 4-H Club work was reproduced by the National Committee on Boys and Girls Club Work. She authored several articles for professional theatre journals, one reporting on her interviews in 1949 with representatives of sixty-four amateur theatres in sixteen states. She was responsible for the compilation of a directory of nonprofessional theatres in the United States, published by the American Educational Theatre Association in 1952.

The Duthie apartment was a meeting place for students, University staff, and other members of the Ithaca community. Her wide circle of friends always looked forward to invitations to her home, for the conversation was interesting, the food superlative, and the atmosphere friendly and warm.

O. F. Larson, W. W. Reeder, R. A. Polson

Leonard B. Dworsky

January 5, 1915 — March 28, 2008

Professor Leonard B. Dworsky, a long-time Civil and Environmental Engineering faculty member, passed away in March 2008. He was 93 years old.

Born in Chicago in 1915, Leonard earned a B.S. degree in Civil Engineering at the University of Michigan in 1936, and an M.A. degree in Public Administration from American University in 1955. From 1936-41, he worked as a sanitary engineer with the Illinois Department of Public Health. During WWII, he served as an officer in the Army Sanitary Corps rising to the rank of Lieutenant Colonel. His responsibilities included water supply engineering and malaria control in the American Theater of Operations centered in the Caribbean, and staff training for military government field operations in preparation for the Far East military occupation.

In 1946, he became a commissioned officer of the U.S. Public Health Service, retiring after 18 years with the (Naval) rank of Captain. The USPHS was the focus of the nation's post-war federal effort in pollution control. As a senior administrator, Leonard formulated and administered legislative and policy initiatives that became the basis of the nation's environmental programs for decades to come. Together with Sanitary Engineering Director Carl Schwob, Leonard wrote the Congressional testimony for Surgeon General Thomas Parran on the Water Pollution Control Act of 1948. When the Act became law, Schwob was named the first Administrator of the Federal Water Pollution Control Program, and Leonard was his first appointee. Leonard prepared and presented testimony for the subsequent extension and the 1956 revision of the Act.

The 1948 legislation was noteworthy for recognizing that environmental and political boundaries often differed, and that formal interstate arrangements were necessary for successful pollution control. Participating in the implementation of the legislation he helped create, Leonard supervised the publication of 15 major basin summary reports covering the nation's 226 sub-basins. He was also a member of the first Federal Interagency Committee's River Basin Committee (1947), Secretary of the Missouri Basin Interagency Committee (1956), Chairman of the Columbia Basin Interagency Committee (1959-62), and HEW representative to the Federal Committee on Water Resources (1962-64).

Leonard joined the Cornell faculty as the first director of the Water Resources and Marine Sciences Center in 1964. For ten years as Center director, Leonard positioned Cornell as a major player in the development of the field of water resources research. The Center demonstrated the value of bringing together expertise from different disciplines

including faculty from Engineering, Law, Economics, City Planning, Remote Sensing, Agriculture, Geology, and Human Ecology. Studies sponsored by the Center ranged in focus from the local Finger Lakes Environmental Studies program to the international Canada/U.S. Inter-University Seminar that laid the groundwork for the Great Lakes Water Quality Agreement.

Leonard's move to Cornell amplified his enthusiasm for the important role of government in improving environmental quality. He commuted to Washington where he was an advisor on water resources to Presidents Lyndon Johnson and Richard Nixon; he served on the President's Science Advisory Committee (1966-70), chaired the Federal Council for Science and Technology's Water Resources Research Committee (1965-67), was Senior Staff Assistant for Water Resources in the White House (1967-68), and served on the President's National Environmental Panel (1968-72).

For over 40 years at Cornell, Leonard studied and taught about river basin management, water quality planning, management of resources in international boundary areas, and conflict resolution. His teaching and research concentrated on water and land policy and institutional issues. He sought to bridge the gap between social problems and science and technology. His seminars frequently provided analyses and recommendations directly to state and national policy makers.

After becoming Emeritus in 1985, Leonard and his colleague David Allee, taught their water policy seminar course for another 15 years. Well into his 80s, Leonard continued to write and lecture nationally and internationally, to mentor graduate students, and lobby his colleagues about the bigger issues of resource management. His vision is illustrated by the conclusions in his 1963 speech, *The Problems of Water Quality Management*:

"Man's relationship to water is vital and cannot be limited by engineering-economics or market-place economics. This nation has voluntarily taken on the task of blending massive industrial and urban society with high social and cultural goals in support of a seemingly boundless improvement in its standard of living. We cannot foretell the end result of this effort. It is clear, however, that water, the management of its quality and related factors, will play a large part in determining the outcome.

"Our job is to do all we can to guarantee to our children and generations to follow, the widest possible range of choice without loss of flexibility of action today."

Leonard was active through the Universities Council on Water Resources, the Engineering Foundation, the American Water Resources Association, the National Academy of Sciences, the American Academy of Environmental Engineers, and the American Society of Civil Engineers. Leonard was also an environmental consultant to the Rockefeller Foundation where he initiated the first comprehensive study (11 volumes!) of the

Hudson Basin. To the delight of his family who accompanied him, Leonard was also a consultant to the Governor of Puerto Rico for nine years. He was a member of the International Joint Commission's Great Lakes Science Advisor Board (1972-79) and he was a Senior Associate of the Utton Trans-boundary Resource Center at the University of New Mexico Law School, writing frequently for the *Natural Resources Journal*. He traveled on behalf of the State Department, the United Nations and the OECD. Honors he received included a "Commendation Medal" from the Surgeon General; the "Caulfield Medal for Exemplary Contributions to National Water Policy," from the American Water Resources Association; and the "Outstanding Professional Achievement Award" by the Hudson River Environmental Society.

Leonard was happily married for nearly 50 years to Diana Levin. Together they had five children. In Ithaca, he found time to earn his private pilot's license at East Hill Flying Club, and he was an avid glider pilot, hiring sailplanes at any location that had an airport. He also sailed, was a scuba diver and in his mid-60s, took up skiing. He was a trustee and president of Temple Beth-El.

Leonard Dworsky never quit caring about water policy, the wise use of water resources, inter-government cooperation, and the development of his students and colleagues. He was on a mission, and encouraged his colleagues to join him by thinking larger thoughts and exploring broader issues. He was always talking about new ideas and paradigms: watershed-based, ecosystem-based, and risk-based planning. If we could just work together, he knew we could all be better off. He served as a tremendous role model for us all.

Jery R. Stedinger, Chairperson; Richard I. Dick, Daniel P. Loucks

Elton James Dyce

July 15, 1900 — February 23, 1976

Professor Emeritus E. J. Dyce passed away at his winter home in Florida on February 23, 1976. Dyce served as assistant professor, associate professor, and professor of apiculture in the University's Department of Entomology for twenty-three years. He had retired on December 31, 1965. A native of Ontario, Dyce served as demonstrator, lecturer, and professor of apiculture at the Ontario Agricultural College in Guelph, now Guelph University, from 1924 to 1940. He was the first manager of the Finger Lakes Honey Producers Cooperative in Groton, New York, between 1940 and 1942; in that position he worked to develop a wide market for New York State honey.

Dr. Dyce was born and raised in Meaford, Ontario. He obtained his B.S.A. from Ontario Agricultural College in 1923. He earned his M.S. degree at McGill University where he was a Macdonald scholar. He obtained his Ph.D. degree at Cornell under the direction of Professor E.F. Phillips.

Dyce was best known for his process for controlling the crystallization and fermentation of honey. His process is used throughout the world in all major honey-producing countries. The United States patent rights were given to Cornell University with the stipulation that any monies earned be used solely for research on bees and honey. The patent earned more money than any other patent ever held by the University. In Canada the patent was granted to the Province of Ontario. A small portion of the monies earned in the United States was used to endow the E.F. Phillips' Library, the world's most complete collection of apicultural literature.

Money earned by the Dyce patent was also used to build the Dyce Laboratory for honey bee studies on the Freese Road near Varna in 1968. The three-thousand-square-foot laboratory is devoted exclusively to honey bee studies, especially studies on reproduction and behavior.

During his tenure at Cornell, Dyce traveled to many of the major honey-producing countries in the world and wrote extensively about bees and beekeeping problems that he witnessed. He advised on methods of bee management, honey production, and marketing; his advice has had a profound effect on the development of the worldwide beekeeping industry.

Professor Dyce spent one sabbatic leave in Central America where he was engaged by the Institute of Inter-American Affairs to make a survey of the beekeeping industry in Costa Rica and Peru. On a separate tour, he was invited by the government of the Dominican Republic to advise on honey processing and handling in that

country. During one period he went around the world and spent considerable time in Australia and New Zealand, major honey-producing countries, advising on honey processing techniques there. He subsequently visited India, the East, and Europe.

Students came from many countries to study under Professor Dyce, both to obtain degrees and just to study. He trained more professional apiculturists during his time at Cornell than any other man in the United States had ever trained before him. Several men had also obtained advanced degrees under his tutelage at Guelph as well.

Dyce was elected an honorary member in the International Bee Research Association; he was the second American apiculturist to be so honored. He was also honored by being elected a vice president of that organization. He was awarded the Silver Medal of the Apiculture Society of Argentina and was elected to honorary membership in the Pan American Association for apicultural investigators. He was a member of Sigma Xi, Epsilon Sigma Phi, the Entomological Society of America, the American Beekeeping Federation, and the Empire State Honey Producers Association for which he acted as field secretary for a great number of years.

William L. Coggshall, LaVerne L. Pechuman, Roger A. Morse

Joseph A. Dye

March 8, 1892 — December 17, 1966

Dr. Joseph A. Dye was appointed Professor of Physiology, Emeritus, August, 1960, after having served Cornell for more than a third of a century. His death occurred in Ithaca, December 17, 1966.

Professor Dye was born March 8, 1892 in a one-room cabin at Basalt, Idaho. His academic career included attendance at Weber Academy, Ogden, Utah; Ricks Academy, Rexburg, Idaho; Brigham Young University; and the University of Chicago. Professor Dye joined the Cornell faculty in 1923 as an instructor and two years later was awarded a Ph.D. degree. He became an Assistant Professor in 1926. In 1933 he served for a year as a Physiology Fellow at Harvard Medical School and in 1941 was a resident in research at the Medical College at Cornell. For twenty years he taught physiology in the Ithaca Division of the Cornell Medical School. In 1939, when the teaching of the first year of medicine was discontinued on this campus, he moved to the Veterinary College as Assistant Professor of Physiology. He was promoted to Associate Professor in 1941 and was named Professor in 1946.

He had a fine, analytical mind. This, together with his excellent training and wide experience in physiology, enabled him successfully to attack complicated problems in the field of intermediary metabolism. They included studies on fats, carbohydrates, proteins, experimental diabetes, ketosis, the pancreas, thyroids, parathyroids, the anterior pituitary, sympathin, the prevention and cure of rickets, and the *in vitro* metabolic investigations of rumen microorganisms in sheep.

He is credited with fifty-eight scientific papers. His book, *Human Physiology Syllabus*, was published in its third edition in 1955. He was co-author with A. D. Gould of the book, *Exercise and Its Physiology*, which appeared in 1932. He contributed to Dukes's *Physiology of Domestic Animals* and *The Vitamins*, a supplement to the *Book of Popular Science*.

Numerous scientific organizations as well as many honor societies and fraternities claimed Professor Dye as a member. He was listed in *Who's Who in America*, *American Men of Science*, and *Who's Who in the East*.

Along with the eminence that Professor Dye attained as an excellent teacher and scientist, he won the reputation of true kindness. His students were treated as individuals who deserved special attention and consideration and not as groups or masses to be met with briefly and dismissed. Those who knew Professor Dye agree that he would go to great lengths to help them in all situations, and the ones who worked with him are thankful that they had

the opportunity to do so. One of his special skills was his ability to make any type of equipment “fit the occasion.” He could take an ancient, long-paper kymograph instrument, wire it together, and make “classical tracings.” He always insisted that basic studies be complemented by clinical observations and trials. This enabled him and his graduate students to develop a broad understanding of both physiological and pathological processes. His scholarly studies on the metabolic diseases of large domestic animals were of marked significance to the members of the clinical departments of the Veterinary College and to practicing veterinarians.

Professor Dye was a member of the Church of Jesus Christ of Latter-day Saints in Ithaca and had served as president of the Susquehanna district. He was active in Boy Scout work and other community organizations.

He will be remembered by his students and colleagues for his scholarship, his unassuming ways, his intellectual and personal integrity, his quiet devotion to duty, and his unswerving loyalty to Cornell.

Professor Dye is survived by his wife, Dorothy Young Dye, who is a great-granddaughter of Brigham Young; a daughter, Mrs. James W. Spencer; four sons, J. Gordon, Howard S., H. Wesley, and Richard W.; 17 grandchildren; two brothers, Warren E. and Lynn; and four sisters, Mrs. Florence Hanny, Mrs. Rachel Hale, Mrs. Alice Brewington, and Mrs. Ida Gardiner.

P. P. Levine, S. J. Roberts, D. W. Bruner

W. Robert Eadie

May 5, 1909 — March 17, 1991

Born in New Hampshire, W. Robert Eadie received the B.S. and M.S. degrees from the University of New Hampshire, where he began teaching in 1933. After completion of the Ph.D. degree at Cornell University, he became a faculty member of the New York State College of Agriculture in 1942. His special knowledge of vertebrate zoology, particularly the biology of small mammals, led him into a productive research and extension career in animal damage management.

With the buildup of the New York deer herd during the war years, problems of the fruit growers increased. Now, along with the ever present rodent problems the deer population began impacting the fruit industry. The challenge of the problems of control of orchard damage along with his teaching of undergraduate and graduate students in the area of mammalogy brought cooperation with co-worker William Hamilton and the development of an extension program for orchardists. As the plantings of Christmas trees in the state grew, transfer of the orchard mouse baiting programs was a logical extension of Bob's work and orchardists and plantation growers alike quickly accepted the findings which were likewise approved by the U.S. Fish and Wildlife Service. This pioneering work on deer repellents and mouse baiting in orchards and Christmas tree plantings was done at the Cornell Orchards and the Arnot Forest.

Professor Eadie led in the development and application of zinc phosphide rodenticide including aerial baiting methods that were readily adopted by orchardists. During his career he also conducted benchmark studies of the reproduction and ecology of the mammalian family Talpidae (moles). Further, he combined research efforts with his friend and colleague, William J. Hamilton Jr., to produce a number of other important scientific articles on the mammalian fauna of New York State. From the outset, both Dr. Eadie and Dr. Hamilton were leaders in advocating safety in the use of rodenticides, and in devising methods to target them to particular species. This concern long predated the development of our current general concern about the welfare of non-target species.

In August of 1944, Dr. Eadie, like many others of that period, left the employ of the University to serve in World War II, where he specialized in rodent control while serving as a U.S. Navy Lieutenant in the South Pacific.

Professor Eadie's broad interest in mammals carried him in his travels throughout the United States, Europe, the South Pacific, and the Orient, as well as East Africa, on study tours where he collected and exchanged numerous museum specimens. He served as summer visiting professor of zoology at the University of Oregon in 1949 and

at Montana State University at Flathead Lake in 1964. His widely known reputation in rodent control led to an invitation by the then United Fruit Company and its banana plantations in Guatemala to help solve continuing problems there in 1958. Throughout his career, his special interest and expertise was the biology of mammals and methods of control of species injurious to crops and homesteads while keeping environmental impact to a minimum.

At Cornell, Dr. Eadie taught courses in wildlife damage management (titled Economic Zoology) and in mammalogy. He conducted research and extension programs in wildlife damage and was advisor for many graduate students who worked on mammal damage problems, including early research on repellents for deer and rabbits. He published in professional journals, technical and extension publications, and in popular periodicals. His book, *Animal Control in Field, Farm and Forest* (Macmillan, 1954), was an early practical handbook for homeowners, nursery operators, and foresters; it is still noteworthy for an early emphasis on natural means of controlling wild animal populations to prevent damage. Professor Eadie clearly was an early conservationist in the field of economic zoology.

Throughout his career he provided leadership and guidance to several professional organizations. He was a three-term director of the American Society of Mammalogists; Editor of the *Journal of Mammalogy* (1952-57); an elected Fellow of the American Association for the Advancement of Science; a member of Sigma Xi; Phi Beta Phi; the Wildlife Society; the Audubon Society; the American Institute of Biological Sciences; and the Ecological Society of America. He was named Professor of Zoology Emeritus upon retirement from Cornell in 1969.

In spite of, or perhaps because of, his numerous activities in his field Bob was a very private person seeking much of his recreation and quiet time fishing the local waters and his favorite activity, bow hunting, yearly at the Connecticut Hill Game Management Area or the University's Arnot Forest. After his retirement to Chatham, Massachusetts in 1969, he continued to renew his acquaintance with his old hunting areas.

During his retirement years Bob was active in the Chatham Conservation Foundation and its concern for the endangered shoreline, the wildlife, and the increasing pressures from the influx of a huge mobile population on Cape Cod. His activities also involved volunteer work with the Eldredge Public Library of Chatham.

The field of mammalogy and wildlife management has lost one of its prominent pioneers with the passing of Robert Eadie. Indeed, for those who knew him well, and benefitted from his broad knowledge, practical wisdom, and unlimited kindness, we have lost a giant in our own field.

Bob is survived by his wife, Laura; two sons; a stepdaughter; stepson; and four grandsons.

Harlan Brumsted, James Caslick, Milo Richmond, Fred Winch

Arthur Johnson Eames

October 10, 1881 — February 13, 1969

The death of Arthur Johnson Eames, professor of botany, emeritus, ended an era. Eames, Edmund W. Sinnott of Yale, and Irving W. Bailey of Harvard were youthful contemporaries at Harvard. All three subsequently exerted a major influence on American botany. All three were elected president of the Botanical Society of America. All have passed away recently. Eames was also the last of a group in morphology, cytology, physiology, and taxonomy which brought world-wide renown to botany in the College of Agriculture and Cornell University.

Eames was born in Framingham, Massachusetts, October 10, 1881. His three degrees, A.B., A.M., and Ph.D., were earned at Harvard University. During the academic year 1910-11 he and E. W. Sinnott held Sheldon Travelling Fellowships from Harvard, and they traveled around the world together spending time especially in Australia and New Zealand. This experience contributed much to the direction of their future research, particularly as it involved the morphology and evolution of gymnosperms and primitiveness among angiosperms.

Eames came to Cornell in 1912 when the Department of Botany was still in the College of Arts and Sciences. A year later he became part of the staff in a newly organized Department of Botany in the College of Agriculture. By 1914 he was made assistant professor, and in 1920 he became professor. He retired in 1949 after thirty-seven years of service and was granted the title professor emeritus. Twelve years later, in 1961, at a party honoring his eightieth birthday, it was possible to say, "His service to Cornell did not stop at retirement, he is still serving the College after what are now forty-nine years of activity." This was true, literally, because he had continued advising graduate students unofficially, carrying on research, and compiling his notes for a projected text on the morphology of gymnosperms.

One can divide Dr. Eames's career into six eras chosen partly because of the impact of each on the botanical world and partly because they demonstrate a versatile man always striving toward a goal, always building on his preceding experience, always meeting a challenge:

1. The anatomy-taxonomy era. At the outset of his career he was asked to teach plant anatomy. The available textbooks written in English were mostly highly inaccurate accounts by teachers in schools of pharmacy. They dealt with bits and pieces of plants rather than with organized wholes. Along with his first doctoral student, L. H. MacDaniels, and others, he sectioned and studied vigorously a wide range of plant materials. In 1925 Eames and

MacDaniels produced the first edition of *Plant Anatomy* which rapidly became the major textbook of anatomy in North America. A revised edition appeared in 1947 and an Asiatic edition is now available.

In 1926 *The Flora of the Cayuga Lake Basin* by K. M. Wiegand and A. J. Eames appeared. Although the two authors wrote the monograph, all of the members of the Department of Botany had participated in the drive for completeness of coverage. The flora was long regarded as a model of its kind after which many others were patterned.

2. The carpel era. Evidence of Eames's interest in the structure of the flower appeared publicly with the presentation of his general paper on the morphology of the flower at the Fourth International Botanical Congress in Ithaca, New York, in 1926. It was followed by another on the complex carpels of Cruciferae in collaboration with C. L. Wilson. At the Fifth International Congress (1930) he again talked on the flower, this time stressing the carpel. One year later his most influential paper appeared. It was entitled "The Vascular Anatomy of the Flower with Refutation of the Theory of Carpel Polymorphism." These contributions and the continued productivity of a long series of graduate students made Cornell and Eames synonymous with floral morphology and the classical theory of the carpel.

3. The first morphology era. These were the years during the completion of *Morphology of Vascular Plants: The Lower Groups*, which appeared in 1936. The outstanding characteristic of this book was the superbly clear and succinct "Discussions" and "Summaries" that transformed the essential descriptions into a text that was truly comparative and evolutionary morphology. Students during these years were caught up in the drama of interpretation and captivated by the wealth of data from which to draw conclusions. If ever teaching was stimulated by the research of the teacher, this was surely the era. Like the earlier anatomy, his book enjoyed a world-wide reputation.

4. The growth regulator era. During and after World War II, Eames worked intensively on the anatomical effects of 2, 4-D on plants. He had been impressed by the inaccuracies in the anatomical descriptions in early work on the effect of its application as a weed killer. With his characteristic energy and thoroughness he conducted a long series of experiments and analyses which demonstrated that phloem was the tissue affected by the chemical treatments. throughout much of this period he served as consultant for the United States Army Chemical Corps (Camp Derrick, 1947-52).

5. The second morphology era culminated in another text *The Morphology of Angiosperms*, which appeared in 1961, just before his eightieth birthday.

6. A third morphology era commenced immediately as Dr. Eames, now eighty, began to pull together his many notes and research achievements for a proposed morphology of gymnosperms. Unfortunately ill health prevented its completion. Many of his peers had expected this gymnosperm volume to be the most authoritative one available. This era is important to the present account as recognition of a man who was never without a major project, a man always alive to the demands of his subject.

Dr. Eames received the honors that go with work of the magnitude of his. The Botanical Society of America made him secretary from 1927-31, vice president in 1932, and president in 1938. At its fiftieth anniversary banquet in 1956, a number of distinguished botanists were awarded the newly created Certificate of Merit. Dr. Eames was among these first recipients. He was American editor for the British Journal *Annals of Botany* 1927-47; president of the Section of Morphology of the Seventh International Botanical Congress in Stockholm in 1950; a member of the American Academy of Arts and Sciences; and in 1956 the University of Glasgow, an institution with a long tradition of leadership in plant morphology, granted him an honorary LL.D. degree.

Throughout his career Dr. Eames maintained constant contact with undergraduate and graduate students through his courses in anatomy and morphology. Forty-seven graduates took advanced degrees under him. For countless others he served as minor adviser.

Dr. Eames enjoyed puzzles. This was reflected in the questioning attitude which he brought to teaching. Rather than dry descriptions, morphology appeared as a series of problems. This approach led his students to adopt specific methods of solving morphological enigmas. The methods proved to be applicable to disparate groups of plants. Thus many of his students came to realize that methods and approaches replaced the necessity of formal courses in every group of plants, a realization that was reached without Eames ever having been forced to enunciate it.

A group of former graduate students headed by Professor Emeritus L. H. MacDaniels has formed a committee to honor Dr. Eames by purchasing a tract of land in the Ithaca-Freeville area. The tract, to be held by Cornell as a nature preserve, will include an orchid bog and many of the species of the local flora which were so close to his heart.

Dr. Eames is survived by his wife, Rita Ballard Eames, whose deep insight into morphological problems enabled her to make an invaluable contribution to his morphology books. She was the artist who contributed the drawings. Her understanding and her constant encouragement were a vital sustaining force in his career. They had one son, David.

George C. Kent, Lawrence H. MacDaniels, Harlan P. Banks

Wendell G. Earle

June 16, 1923 — April 3, 1990

The faculty in the Department of Agricultural Economics, the College of Agriculture and Life Sciences and the University, lost one of its strong contributors and supporters in the passing of Wendell Earle. He was an innovator in his teaching, a developer of new University programs, an effective fund raiser, and an active leader and worker in the University community. We have all learned from his timely counsel, his quick wit and his selfless commitment to higher education for students of all ages.

Wendell G. Earle was born June 16, 1923 in Hardwick, Vermont, son of Blanche Earle of East Hardwick and the late Sidney Earle. He received his B.S. degree from the University of Vermont in 1946, after having his college work interrupted by a tour of duty in the U.S. Air Force. He came immediately to Cornell, completing his masters degree in 1948 and his Ph.D. degree in 1950.

Professor Earle began his professional career in the Department of Agricultural Economics in 1950 when he was appointed assistant professor of marketing. At that time, he was given responsibility for developing an extension program in poultry marketing. In this capacity, he demonstrated his leadership ability in program development and his skill as a teacher. He published nearly 150 articles in the six years that he conducted the program. He was promoted to associate professor in 1953, and to professor in 1959.

Professor Earle spent the 1957-58 year on sabbatic leave directing a research project for the National Agricultural Extension Center at the University of Wisconsin. He studied problems of organizing and operating marketing programs with business firms.

When Professor Earle returned to Cornell, he began the phase of his professional career for which he is most recognized. At that time he assumed responsibility for developing a new program in food industry management within the department of agricultural economics. Because of his vision, leadership, and tireless efforts, this pioneer program has gained international recognition. The program developed by Earle was designed to train persons with food industry experience for management positions; to interest undergraduate students and prepare them for food industry careers; and to upgrade the skills of food industry employees. He recognized the benefits that would result from exposing promising young food industry personnel to an academic environment as well as the exposure of undergraduate students to experienced food industry leaders. Under Earle's tutelage, a Home Study Program was developed which offered more than 20 different courses reaching nearly 100,000 people.

More recently, he was instrumental in developing the Personal Enterprise and Small Business Management Program (PEP) at Cornell. Although many people from the business and university communities have made major contributions to the program, PEP would not exist today had it not been for the vision, wisdom, enthusiasm, patience, and tireless efforts of Wendell G. Earle. He played an important role in recruiting and counseling four visiting faculty who were key to the development of the program from 1987 to 1989. As one visiting faculty put it, "Wendell was always there to offer me steady support, never interfering, but always willing to answer my questions with insightful, patient answers." He was instrumental in raising funds that led to the endowment of the Personal Enterprise Program with the Bruce F. Failing Sr. Chair in Personal Enterprise as its major component.

He served as an academic advisor and taught more than 3,000 students during his 33 years at Cornell. He was a member of the Faculty Committee on Physical Education and a member of the Cornell University Athletic Board. He also served as faculty advisor to the men's hockey team from 1976 to 1988, and he and Fran housed hockey players for over 15 years. In 1975, more than 300 of his former students, together with representatives of the food industry, honored him at a testimonial dinner in New York City and endowed a scholarship in his name. In 1977, he was named Professor of Merit by students in the College of Agriculture and Life Sciences. In 1989 he received the Distinguished Alumni Award from both the University of Vermont and Cornell University. He was a member of the University of Vermont Fund Executive Committee and an alumni representative to the University of Vermont Board of Trustees. In January 1990, he received the National Grocers Association Industry Service Award for his lifetime of commitment to raising the academic and professional standards of the food industry.

He has served on the board of directors of P&C Food Markets, Syracuse, NY; Actmedia, Inc., West Hampton Beach, NY; Pet, Inc., St. Louis, MO; Fisher Foods, Inc., Cleveland, OH; Pneumo Inc., Boston, MA; Harrington's, Inc., Richmond, VT; and Hartstrings, Wayne, PA; and he was chairman of the Site Selection Committee for Wakefern Foods Corp. in Elizabeth, NJ.

His community service contributions include the presidency of the Tompkins County United Way and more than 36 years of service to scouting. He received the coveted Silver Beaver Award, and was president of the Louis Agassiz and Baden-Powell Boy Scout Councils.

He is survived by his wife of 47 years, Francelia Connor Earle; three sons: Brian and wife Jody of Freeville, NY; Bruce and wife Peggy of Devon, PA; Terry and wife Jean of Bernardsville, NJ; two daughters: Wendy and husband

Adam Brayshaw of Lake Clear, NY; Shelley and husband Michael Mitchell of Sapulpa, OK; two brothers: Ronald of East Hardwick, VT and Walton of St. Johnsbury, VT, and seven grandchildren.

Theodore Hildreth Eaton

May 23, 1877 — February 15, 1961

Interviews with colleagues and neighbors of Theodore Hildreth Eaton, made sixteen years after he left Ithaca in 1944, at the time of his retirement, give us a reasonable picture of the man and of his work. Without specific reference to authorship, here is the way he is remembered by most of his friends who had a decade and a half to form a seasoned judgment of one with whom they had worked, lived, and associated.

He was a kind neighbor who “did little neighboring.” He was an affectionate father and devoted husband in a family whose many interests kept them busily concerned with the better things of life. He was the kind of man who advised a younger associate not to get involved in politics, to avoid writing to the papers no matter how disturbing a situation might be. In spite of this, in a major emergency he would write in longhand a marvelously understanding letter of sympathy while others did nothing. He was the kind of man who in a deliberative group would calmly tamp the tobacco in his pipe, adjust his ever-present green eyeshade, and with excellent accuracy and effectiveness hit the nail he chose to hit squarely on the head. As is often the case in groups concerned with controversy, there were those who sometimes felt that he hit the wrong nail, but it is doubtful if anyone ever thought that Professor Eaton was not expressing his honest and respected judgment. He could criticize without rancor and without raising resentments. He loved to back a cause but insisted that both sides of a case be presented even at the risk of losing needed support.

These evaluations given after his death may explain in part why at 31 his career in politics closed in one year after he had been sent as a high school teacher to represent Gilmanton, New Hampshire, as a delegate to the Republican State Convention.

Professor Eaton’s career was a varied one. Yet each experience seemed to leave its mark on his major life activity. Graduating from Harvard in 1900 with an A.B. degree, he went to Massachusetts Agricultural College for a year and in 1901 took his M.A. degree there. With this part of his life’s pattern set he went into farming. From 1901 to 1906 he was a farmer. From 1906 to 1910 he was a high school teacher at Gilmanton, New Hampshire, where he may have formed some important conclusions relative to the vocational possibilities of politics. In 1912-1913 he was an instructor in agriculture at Cornell University and the following year an instructor in agricultural education at the Central State Teachers College at Mt. Pleasant, Michigan. Following this he served as instructor in education at Columbia University. During the period from 1916 to 1920 he further enriched his experience and

training for his life's work. In that time he served as a high school supervisor of agriculture and as Professor and Dean of Teacher Training at the Connecticut Agricultural College. During that same period he received his Ph.D. degree in education at Columbia University.

Professor Eaton returned to Cornell in 1920. This time he came as Professor in Rural Education with responsibility in the field of the philosophy of education. He served there with distinction and did much to lay the groundwork for the program for which the University now grants a doctorate in education.

During his professional career Professor Eaton wrote and published over sixty books and papers in the field of education. Of these, five significant books were *Agricultural Education*, 1916; *Vocational Education in Agricultural Occupations*, 1923; *Education and Vocation*, 1926; *College Teaching*, 1932; and *An Approach to the Philosophy of Education*, 1938.

Dr. Eaton was not a joiner in the looser sense of the word, but he was a member of the major significant professional honorary groups of his profession. He was a member of Phi Kappa Phi, Phi Delta Kappa, the National Society for the Study of Education, and the American Association of University Professors. Born in Missouri he lived during his lifetime in over a dozen states and traveled in most of them. He was known for his strong scholarly interests. Nevertheless he was decidedly human.

Professor Eaton loved to fish and, for a while at least, returned many of the fish he caught to the water after putting his own mark on the fish by removing certain scales from the side of the body. It was most fitting that he spent a major portion of his retired life near good fishing water in Damariscotta, Maine. He left his mark on many of the fishes of those waters by removing scales. More important he had left his mark on thousands of students and associates by adding something to their philosophy of education. Probably most important in his judgment would be the fact that his two children Julia and Theodore, his survivors, are continuing to serve collegiate education on the staffs of institutions of higher learning in Maine and in Kansas. Incidentally his son made some significant studies of the life habits of earthworms, of some importance in bringing men and fishes together.

John M. Echols

March 25, 1913 — June 16, 1982

When John Echols and his family arrived at Cornell in 1952, he had already had a distinguished career. In completing his doctorate in linguistics at the University of Virginia and in subsequent study, he mastered a full dozen tongues, specializing in the Germanic languages and, with that powerful intellectual curiosity that always fueled his scholarship, encompassing Hittite as well. (Fortunately for Cornell, his love affair with Hittite later yielded place to the attractions of the Indonesian languages.) During World War II he had served in Naval Intelligence, first in Washington, and from 1944 to 1947 as assistant naval attaché in Stockholm—one of the many places where he was at home in the local language. Then, as deputy director of the language program in the State Department's Foreign Service Institute, he was challenged to prepare its first Indonesian language program so that our foreign service officers could finally learn to speak the language of the world's fifth most populous country. So well did he fulfill that difficult assignment that in the course of a single year—1952—the American Council of Learned Societies invited him to prepare an Indonesian-English dictionary, the Ford Foundation asked him to organize and direct an English-language teaching project in Indonesia, and he was invited to Cornell as associate professor of linguistics and Asian studies, in charge of instruction in Indonesian, Malay, Javanese, and Malayo-Polynesian.

Once settled in Ithaca, with his enormous energy Professor Echols was able to carry forward all three endeavors to success. Very quickly he established himself as one of the foremost authorities on Indonesian languages and literature. He developed new methods for teaching Indonesian languages, and his students went on to form the main cadres for its instruction in this country and in Australia. English teaching in Indonesia owes him a similar debt. And he also pioneered the teaching in this country of Southeast Asian literature in translation. As a valued member of the Department of Modern Languages, where he was promoted to full professor in 1957, he also taught courses in linguistics, Dutch, Swedish, and Norwegian and served as external examiner for these languages at other institutions throughout New York State.

John Echols never much liked administration, but at Cornell he did considerably more than his share—serving as chairman of the Department of Asian Studies from 1956 to 1961, and as associate director of the Southeast Asia Program from 1961 and of the Modern Indonesia Project from 1955 until his retirement four years ago. Towards all of them he had a strong sense of responsibility and was vital to their growth and success.

Outside of teaching he focused most of his scholarly efforts on producing what have become the standard Indonesian-English (1961; revised edition, 1963) and English-Indonesian (1975) dictionaries and was in the process of compiling a third edition of his Indonesian-English dictionary when he died. He was devoted to this staggering task, which he enjoyed despite his fondness for quoting those who disparaged such work—a Dutch colleague who chided him with, “What crime have you committed to be saddled with this?” and the French scholar who remarked that “the worst criminals should neither be executed nor sentenced to forced labor but should be condemned to compile dictionaries.” In a more serious vein, he frequently acknowledged that without the help of his wife, Nancy, he could never have seen these projects through. And it is certain that her cheerful and supportive involvement in the typing and other tedious aspects of this work made it possible for him to do so.

There was yet a third major contribution John Echols made to Cornell. It was as much a labor of love as were his teaching and dictionaries, but it was not a function of his academic appointment nor supported by any foundation grant. This was his prodigious input in building up the University Libraries’ Southeast Asia collection. In this sustained thirty-year effort he gave constant support to its curator, Giok Po Oey, and was crucial to making the collection the strongest in existence. Working late into the night, he maintained an enormous correspondence with hundreds of scholars and collectors around the world to enlist their help in acquiring rare and ephemeral items. It is entirely appropriate that the collection has been given his name.

Professor Echols was a member of many professional associations, including the Linguistic Society of America, the American Anthropological Association, the American Oriental Society, Societas Linguistica Europea, and the Indonesia Council of the Asia Society. He acted as consultant to institutions in this country and abroad, among other things serving as external examiner in linguistics and Malay studies at the University of Malaya and assessor for appointments to its Department of Malay Studies. He wrote an extraordinary number of articles and reviews in the fields of Indonesian languages and literature, being an especially conscientious reviewer for the *Journal of the American Oriental Society*. To the *Encyclopedia of World Literature in the Twentieth Century* he contributed articles on Dutch as well as Indonesian authors. He translated and edited A. S. Tselekin’s *Old Javanese (Kawi)* and as well edited *Modern Indonesian Literature in Translation* and half a dozen bibliographies. He received many honors. He was awarded fellowships from the Ford, Guggenheim, and Rockefeller foundations and from the National Endowment for the Humanities; he served as president of the national Association for Asian Studies; he was representative for North America of the Koninklijk Instituut voor Taal, Land en Volkenkunde; and he was one of only eight people to be elected honorary member of the Malaysian branch of the Royal Asiatic Society.

But this recognition aside, what does his work all add up to? One can fairly say, we believe, that his career has built a bridge between this country and Indonesia and that over it there is a heavy two-way traffic. Thanks to his development of language programs in the United States and in Indonesia and thanks to his unrivaled dictionaries, communication, verbal and printed, between peoples of the two countries is enormously greater than would otherwise have been the case. And it is to the John M. Echols Collection—now a magnet for scholars from all over the world—that Indonesians as well as other Southeast Asian, European, Japanese, and Soviet scholars come to carry out research in a collection unmatched in their own countries.

While the fruits of Professor Echols's work are known far beyond Ithaca, his modesty and unassuming mien will, we believe, have obscured these accomplishments for many of those who have known him here. He was refreshingly unpretentious, and his accomplishments were achieved quietly and without fanfare.

Above all he will be remembered here for the qualities of his character and the ways in which he affected the lives of so many people. Some of his many friends will recall his exhaustive and precise bibliographic knowledge and, similarly, his ability to keep in mind the name of practically everyone he ever met. Some will remember his low-key, deliberate, and reticent manner of conducting business or his generosity and patience with his students. Others will remember his delight in music—the classical operas, operettas, and chamber works—as well as his enthusiasm for a wide range of sporting events. All will remember his equable temperament, the breadth and liveliness of his range of interests, his absolutely irrepressible sense of wry humor, and his inability to overlook the possibility of a pun. None will forget his deep concern for the welfare of those around him and his spontaneous impulse to help them.

He is survived by his wife, Nancy Doner Echols; two daughters: Jane E. Libbey, of Largo, Florida, and Renny E. Staples, of Newfane, New York; two grandchildren: Dorinda and Brooke Libbey; a brother, Edward C. Echols, of Exeter, New Hampshire; a sister, Mrs. William B. Patterson, of Waynesboro, Virginia; and nephews.

Martha Henning Eddy

October 28, 1881 — August 26, 1957

The death, on August 26, 1957, of Martha Henning Eddy, Emeritus Professor of Home Economics, was received with profound regret and a sense of great personal loss by her host of friends and former associates on campus, and in all parts of the world. All who knew her, remember her as a gracious, yet forceful, kind and generous person who worked unselfishly at all times without thought of praise or gain for herself, but only for the many public enterprises which occupied the major part of her life.

Mrs. Eddy was born in Saratoga Springs, New York on October 28, 1881. She was elected permanent president of her class at Vassar College from which she was graduated with an A.B. degree in 1905. She was appointed to the Cornell faculty in 1932, shortly after the death of her husband, Edward D. Eddy, who was County Attorney for Saratoga County. They had three children, David Henning (deceased), Marjorie Linden (Mrs. McCarthy Hanger, Jr.) and Edward Danforth, Jr., and an adopted son Frederick C.

During her life as a wife and mother in Saratoga Springs, she found time to do many worthwhile things outside of the home. Among other things, she was one of the founders of home economics extension education in Saratoga County. In connection with this she served as member, local leader, unit officer and member of the Home Bureau Executive Committee. She was the first woman in New York State to serve as President of a County Farm and Home Bureau and 4-H Club Association.

She was State President of both the Federation of Home Bureaus and the Federation of Women's Clubs. For five years she was a representative of the Federation of Home Bureaus on the New York State Conference Board of Farm Organizations. In 1947, she represented the Federation of Home Bureaus at the meeting of the Associated Country Women of the World, in Amsterdam, Holland. Almost until her death, she served as Counselor to the Board of Directors of the State Federation of Home Bureaus.

While at Cornell, Mrs. Eddy was a member of many policy-making committees in both the Colleges of Home Economics and Agriculture. At times, she was referred to as "our roving ambassador" by the Director of Extension. Her tact and friendly smile were enough to gain entrance to any official, or any group. Once there, her intelligence and knowledge of the situation gained the respect and confidence of those contacted and, without exception, created good will for the administration of Cornell University.

Martha H. Eddy had many important assignments during World War II, all of which she did thoroughly and with dispatch. She made many of the official contacts with several statewide organizations and departments, particularly with the State Nutrition Committee and the State departments of Labor and Health.

Perhaps her most important responsibility during this period was as head of the Women's Land Army in New York State, a branch of the huge Federal farm labor program. This was organized to provide mostly seasonal and parttime help, as a substitute for the shortage of man labor, particularly on the fruit and vegetable farms.

Not only did she perform her administrative duties in the office but she was on the road almost constantly, supervising the girls located in camps or in foster farm homes. Characteristically, she drove herself far beyond her strength and the call of duty. Many critical relationships within the camps and outside, in the communities, were handled by her personally with perseverance and skill. She commanded the respect and admiration of everyone who worked with her or who knew about her activities, including the top State and Federal public officials. The girls, many away from home for the first time, thought of her as a splendid substitute for their mothers and as a sympathetic counselor in their troubles and successes.

After her retirement in 1949, Governor Thomas E. Dewey appointed her as Director of Women's Activities at the New York State Fair, where she developed this division to a high standard of efficiency and accomplishment. She was instrumental in obtaining funds for a new wing for the Women's Building to house the steadily growing number of educational exhibits. Appropriately in 1955, it was named in her honor.

Martha H. Eddy's life was devoted to serving people—all kinds of people. She loved them all and they loved her. Her presence in any group or with any individual, was an inspiration. She was an optimist with sound advice for a better future for everyone with a problem. In the hearts of her associates and friends, her memory will live forever.

L. R. Simons, Lillian Shaben

James Clifton Edgar

June 14, 1859 — April 7, 1939

Dr. James Clifton Edgar died at his home in Greenwich, Connecticut, on April 7, 1939. He was born in New York City on June 14, 1859, the son of the late James Alexander Edgar and the late Eliza Maria Coe Edgar. He attended St. Paul's School at Concord, New Hampshire, and Lafayette College, from which he received a Ph.B. degree in 1882 and an M.A. degree in 1884. His medical degree was received from New York University in 1885. In 1888, after a two-year internship on the second medical division at Bellevue Hospital, he pursued post-graduate studies at the Royal Frauenklinik in Munich. Upon his return he began private practice and a long teaching career. He first served as lecturer in Obstetrics and later as adjunct professor of Obstetrics at New York University Medical College. He became professor of Obstetrics at Cornell University Medical College in 1900 and held that position until his retirement in 1922, when he became emeritus professor.

Although Dr. Edgar's teaching methods were delightfully informal, his ability to place great emphasis on important facts impressed his pupils. He was respected and revered by the students. Among his distinguished students in the field of obstetrics was the late Harold Hailey, who succeeded him at Cornell University as associate professor of Obstetrics and Gynecology. During the early part of the twentieth century obstetrics underwent changes which caused it to be considered more of a surgical than medical speciality. Dr. Edgar was intensely interested in these changes. He took an active interest in and participated in all the advances of scientific obstetrics.

Dr. Edgar's most important literary contribution to medicine was his textbook *The Practice of Obstetrics*, which had five editions under his editorship. It was a textbook of great practical value. He also edited Winckel's textbook and wrote several monographs on obstetrical topics.

At various times he served on the visiting staffs of the following hospitals: Lying-in, New York City Maternity, Manhattan Maternity and Dispensary, and Bellevue Hospital. He was a member of all the regular medical societies, the New York Academy of Medicine, the American College of Surgeons, the American Gynecological Society and the New York Obstetrical Society, serving as president in 1908.

Surviving are his widow, Mrs. Ellen Muriel Beatrice Soutter Edgar, and two sons, Clifton and Charles Soutter Edgar.

Louis J. Edgerton

January 28, 1914 — July 26, 2007

Louis J. Edgerton, 93, Professor Emeritus in the Department of Horticulture, died July 26, 2007 in Ithaca, New York.

Professor Edgerton was born in Adena, Ohio on January 28, 1914, the son of Quaker parents Walter J. Edgerton and Anna Taber Edgerton. He attended the Friends (Quaker) elementary school in Barnesville, Ohio (near Adena), then Olney Friends School, a small boarding school in Barnesville for high school level students. After graduating from Olney in 1932, he attended the College of Wooster (Ohio) from 1932-34, and then transferred to The Ohio State University where he received his B.S. degree in 1937, with a major in Horticulture.

Cornell's Graduate School accepted him in 1937, where he began work toward his Ph.D. degree in Pomology (fruit studies). Interest in this subject was, no doubt, related to the fruit farm on which he was raised. At Cornell, he was one of several graduate students of that period who worked under the guidance of the late A.J. Heinicke, a pioneering fruit tree physiologist of considerable renown. Louis was granted the Ph.D. degree in 1941.

He spent four years with the USDA Forest Service during the war years, and then was appointed to the faculty of Cornell University in 1946 as an Assistant Professor.

As a Cornell faculty member, he had research, teaching and extension responsibilities. As a teacher, he introduced many students who were interested in fruit growing to their first course in the subject, and many of those students, in their time, became leaders in the fruit industry in New York State and elsewhere. He committed a substantial amount of time to extension duties, speaking to numerous groups throughout New York and other venues with respect to the latest developments in the fruit industry. But it is his research activities that are best known.

His research interests included, among others, cold hardiness of deciduous fruit plants, chemical fruit thinning, control of premature apple fruit abscission in the fall, mechanical harvesting, and various aspects of synthetic chemical plant growth regulators and their use in the fruit industry.

These studies took him from the Cornell greenhouses and orchards to numerous growers' orchards from one end of New York State to the other, as well as to orchards and laboratories in other parts of this country and the world. His sabbatical leaves and other travel and research expeditions found him at various times at the University of

California at Davis, in England, Scotland, France, Italy, Switzerland, Germany, The Netherlands, and Belgium. A Fulbright Award in 1966 allowed him to spend several months in Egypt, and yet another sabbatical leave, in 1977, found him in Australia and New Zealand. His numerous publications and other professional activities attracted students from the United States and from around the world.

He was a Fellow of the American Society for Horticultural Science. He established the Edgerton Career Teaching Award for outstanding teaching by members of Cornell's College of Agriculture and Life Sciences.

During his busy schedule, he found time to serve as Chairperson for the Department of Pomology from 1970-75.

He retired as Professor Emeritus in 1979. However, in retirement he continued for many years to be active in research, extension work, and student advising, and could be found in his office nearly every day till near the end.

Dr. Edgerton married Edith Hartz of Chestnut Hill, Pennsylvania in 1946. She was deceased in 2004. His son, John Edgerton and family of Akron, Ohio; daughter, Mary Edgerton of Albany, New York; and daughter, Sara Edgerton Thompson and family of Cape Girardeau, Missouri survive him.

Dr. Edgerton was a longtime member of the Ithaca Friends (Quaker) Meeting. Memorial Services were held at Kendal at Ithaca on September 2, 2007.

Loyd E. Powell, Jr., Chairperson; Leroy L. Creasy, Edwin B. Oyer

Cary Eggleston

August 1884 — November 15, 1966

Dr. Eggleston was born in Brooklyn, New York, and educated in private schools in this country. Later he went to Germany for special work in the Jena University Medical School. In 1903, on his return to New York, he entered Cornell University Medical College, graduating in 1907. He continued his medical education as an intern in the Department of Medicine in The New York Hospital from 1908-1910. During these years of formal education he became interested in research, teaching, and writing on subjects in pharmacology and therapeutics. His ability as a teacher and his unusual success as a research worker were recognized at once, and in 1911, he was appointed instructor in therapeutics and pharmacology at Cornell Medical College.

Dr. Eggleston's research on digitalis and allied drugs and their therapeutic effect on heart failure changed the focus of his work from the laboratory to clinical cardiology. His meticulous clinical research led to the determination of the best method for administering digitalis in cardiac failure. The principles laid down by him and taught to his students are still the basic rules that cardiologists follow today.

He contributed many papers to the leading medical journals on the treatment of cardiac decompensation with digitalis. Through his writings and teaching he soon became known as an outstanding cardiologist. He served as a consultant to Willard Parker Hospital, to the Cornell Division of Bellevue Hospital, and many other hospitals in New York.

Because of his interest in medical education he became a member of the editorial staff of the Medical Journal of New York State and contributed generously to other medical journals.

He was a member of numerous medical societies including state, county, and national chapters of the American Medical Association, the Academy of Medicine and the Harvey Society.

Throughout his medical career, Cary Eggleston served his alma mater and the New York Hospital as research worker, teacher, and clinician. He was at all times a student searching for new knowledge to enable him to better serve his fellow man. All who came under his influence appreciated his high standards of scholarship and his meticulous care of patients.

He served the Cornell faculty as instructor, 1911-1921, Assistant Professor of Clinical Medicine, 1921-1939, Associate Professor, 1939-1953, and Professor of Clinical Medicine, Emeritus, from 1953. At The New York Hospital he

was appointed as Assistant Attending Physician, 1932-1933, Associate Attending Physician, 1933-1943, Attending Physician, 1943-1950, and Consultant in Medicine, New York Hospital, from 1950.

Dr. Eggleston is survived by his widow, Mrs. May Parker Eggleston; a daughter, Mrs. Edward S. Holcomb; a son, Dr. Forrest Cary Eggleston, Professor of Surgery at the Christian Medical College in Ludhiana, India; and four grandchildren.

Connie Guion, M.D.

George C. Eickwort

June 8, 1940 — July 11, 1994

George Eickwort, Professor and Chairman of Entomology, died July 11, 1994 as the result of an automobile accident on the Caribbean island of Jamaica. George will be remembered by many people for diverse reasons. To his children, Alex (Mary), Robert and Jeffrey, George was a devoted father who participated fully in their lives; he especially enjoyed his free time visiting them at their colleges. To his brother, George will be remembered as a person of exceptional talent who displayed enthusiasm and determination for the lifelong interests he pursued. To his students, both the undergraduates who knew him as a teacher and the graduate students who worked closely with him, he represented a kind mentor and an insightful advisor who achieved the highest pedagogical skills. And to his many friends and colleagues at Cornell and throughout the World, he was a forthright, scrupulous, dedicated, and imaginative person with a multitude of talents.

George grew up in Brooklyn and studied insects as long as his younger brother Jerry can remember. He took this interest to Michigan State University, where he obtained a B.S. degree with high honors in 1962 and an M.S. degree in 1963. He went on to the University of Kansas, where he studied with CD. Michener, and obtained a Ph.D. degree in 1967. Thereupon he joined the Department of Entomology at Cornell as an Assistant Professor. During his career at Cornell, George regularly taught the Introductory Insect Biology, Insect Morphology, and Insect Behavior Seminar courses. Upon student request, he also offered Acarology and advanced seminars and courses on bee biology and systematics. His reputation as a skillful teacher ranged widely; it was not unusual for graduate students at other universities to visit Cornell in order to take one or more of his classes. National recognition of his teaching skills came through the 1986 Distinguished Achievement Award in Teaching from the Entomological Society of America.

George was equally active in graduate student advising: he guided twenty-four Ph.D. and six M.S. recipients during his 27 years on the faculty. His influence in teaching extended beyond the classroom through his contributions to textbooks, reviews, monographs, and as series editor for the Cornell University Press Arthropod Biology Series.

George's long-term research interest focused on the biology of the sweat bee family Halictidae—so-called because some species are attracted to human perspiration—and the evolution of sociality in these diversely social bees. The Halictidae embraces a wide spectrum of species with habits ranging from the solitary—in which a mother provides for her offspring by herself—to rather highly social, with several to many adults of the same or consecutive

generations cooperating to raise a brood. This range provides the opportunity to throw light on the evolution of social behavior, not just in these little bees, but as it turns out, in animals in general, humans included. George was fascinated, as is his whole generation of sociobiological investigators, by such questions as: What is the role of genetic relatedness in the evolution of the social state? What behavioral traits predispose the bees to sociality? What is the relationship of particular social structures to the environment? These interests led to extensive field work throughout the Americas and interaction with researchers in the fields of behavior, systematics, chemical ecology, and genetics. Because of his broadly based curiosity and his many talents, George became a pivotal person who brought together other colleagues and students in those disciplines and guided the way toward novel syntheses of ideas. His acumen in research received recognition through extensive invited service to the National Science Foundation, participation on numerous external reviews at other institutions, and the presidencies of the International Society of Hymenopterists and the Acarological Society of America.

George's unique service to Cornell University hinged on his ability to blend the interests and activities of sometimes disparate groups of individuals. At the time of his death, he had served only one year of his term as Chairman of Entomology. But, during that single year, he had forged close ties among diverse groups of insect biologists working on campus and at the Geneva Experiment Station; he placed high priority on fostering the research and training activities of the many people at Cornell whose work focuses on insects. Aside from teaching and guiding students in Entomology, he served as a joint appointee in the Section of Neurobiology and Behavior and participated very actively in that group.

George's success as a teacher and researcher was based on his incredible enthusiasm. Whether the subject was tennis, ornithology, or bee biology, he would convey his enthusiasm without artifice, thereby initiating people into the subject. George's teaching activities never ceased. He taught not only at Cornell, but also on sabbatic leaves at the University of California at Davis and the University of Arizona; during summers he taught at the Rocky Mountain Biological Laboratory. He actively participated in the Programa Cooperativo Sobre la Apifauna Mexicana, a program that combined teaching Mexican students about bees with a comprehensive survey of the biodiversity of the Middle American wild bee fauna.

George took students on numerous field trips and showed them firsthand the excitement of observing living organisms in their own environment. He also played the role of a classic entomologist, with net and jars in his luggage wherever and whenever he travelled to a location suitable for collecting sweat bees; given these bees' catholic habitat preferences, that meant everywhere.

Many former students trace their achievements as entomologists, insect behaviorists, or acarologists to George's guidance and example. He added to all of our lives through his gentle nature, thoughtfulness, accessibility, expertise, and enthusiasm. But in all ways he did much better than simply add to people's lives. He expanded their thinking and brought together people and ideas in a synergistic manner. As a result, his influence will extend well into the future. So strongly do his students identify with George's principles that they consider themselves "Eickwortians," a legacy that will be carried forward by many well-trained, highly talented scientists.

His explosive laugh which often rang down the hall or across crowded rooms, rose above the rest. It is hard to accept that we will not hear it again. However, George continues to live in the hearts and minds of his friends and colleagues.

William L. Brown, Jr., John G. Franclemont, Maurice J. Tauber, James K. Liebherr

Mario Einaudi

September 8, 1904 — May 15, 1994

Mario Einaudi, Goldwin Smith Professor Emeritus and founder of Cornell's Center for International Studies, died on May 15th, 1994 in Piedmont, Italy, in the house in which he was born almost 90 years ago. The eldest son of Luigi Einaudi, economist and Italy's first President (1948-55), his wisdom, dignity and love of freedom inspired generations of students at Cornell and at the Foundation he later created in his father's memory.

Einaudi received his degree from the University of Turin, where he specialized in European political philosophy. His first scholarly works were on the French thought of the eighteenth century and his first published volume in English was *The Physiocratic Doctrine of Judicial Control* (1937). He would return to the eighteenth century repeatedly as the fount of modern political thought and practice, especially in his *The Early Rousseau* (1967). He found amusing the current academic fashion to denounce the Enlightenment.

Einaudi first came to this country as a Rockefeller Fellow in the 1920s, returning to Harvard in 1933 as a political exile when he refused to swear allegiance to Mussolini's fascist state. Raising his three sons in America with his wife, Manon Michels Einaudi (1904-90), he taught first at Harvard, then at Fordham, and finally at Cornell from the end of World War II until his retirement.

As a teacher of Government, Einaudi opposed the growing specialization in American academia and continued to teach and write in both political theory and comparative politics until the end of his career. He served twice as the Department's chair, presiding over its heroic period, when teachers like Rossiter, Berns and Hacker—and Einaudi— had the largest enrollments of any department in the College of Arts and Sciences. The many letters that have arrived from former students since his death testify to his lasting influence as a teacher.

Proud at having become an American citizen, Einaudi yet never lost his European roots. He saw part of his vocation to try to explain Europe to Americans (especially in his three collaborative books on European communism, Christian Democracy and nationalization), and America to Europeans. In the latter respect, his most significant work was his magisterial, *The Roosevelt Revolution*. This book was an attempt to make the New Deal part of the remembered experience of the Western World, "a bold and important message for the 1950s/' notes his Government Department colleague, Theodore Lowi. The book was written out of fear that, as Europeans fell out of love with the Soviet model, they would drift towards fascism, rather than towards the liberalism of the New Deal. Italy's move to

the extreme right during the last weeks of Einaudi's life left him distressed and fearing for the future of his native country and the West.

Even as he approached retirement, the 1960s were a watershed for Einaudi. His intellectual breadth and humane universalism had their most concrete expression in founding the Center for International Studies. The Center embodied Einaudi's belief in the land-grant university, a notion quite at odds with the experience of the European universities he had grown up with. His main effort as the Center's first director was to build bridges across boundaries, linking it to the College of Agriculture and Life Sciences at a time when the work of that College was highly technical. He was, as Davydd Greenwood notes, "twenty-five years ahead of his contemporaries in creating a multi-disciplinary center which combined the best in international relations, foreign language and area studies and international development and technical assistance/' As Milton Esman, his successor as Center Director, remembers, "He introduced programs that he hoped would reach across areas and disciplines and focus the attention of Cornell's students on the emerging problems of an interdependent world/' In honor of his vision, C.I.S was renamed the Mario Einaudi Center for International Studies in 1991.

The 1960s were also troubling years for Einaudi. Though no radical, he resisted the instinctive conservatism of some of his colleagues faced by the tumultuous events of 1969 at Cornell. His refusal to take a negative attitude to student activism was part of his lifelong preoccupation with the expansion of freedom: from his dissertation on the eighteenth century French philosophers to his condemnation of postwar European communism to his *The Early Rousseau*, Einaudi believed in activism, despite the contradiction between its frequent excesses and his own sense of measure and austerity.

As he approached emeritus status, Einaudi began what amounted to a second career, founding and presiding over the Italian foundation that bears his father's name and is based on the elder Einaudi's remarkable library. For most of his last 30 years, he and Manon divided their time between the Turin, where the Foundation was located, Ithaca, and their family retreat in the Val d'Aosta. At the Foundation, at the cost of constant worry and effort, he shaped an institution where young scholars could carry out their research removed from the tumult of the Italian University system. And by bringing scholars from all over Europe to spend periods of study in Turin, he also assured the Foundation's universal mission.

In all this time, Einaudi's commitment to Cornell never wavered. When he and Manon returned twice a year, he would quickly and incisively inform himself about affairs both in international studies and in the Arts College. A

penetrating interviewer, he would interrogate junior colleagues who crossed the quad about the latest happenings in the college and in the university. Those who braved inquisitorial spirit would be rewarded by his quiet approbation. At the Center, he was instrumental in the founding and expansion of the Western Societies Program, and in establishing a rotating chair for distinguished European intellectuals. With reluctance, he allowed himself to be convinced that it be called the Luigi Einaudi Chair in European and International Studies after his distinguished father. When the Berlin wall fell and Western Societies and the Center's new Slavic and East European Studies Program began to move together, he felt great satisfaction that—at Cornell too—the Cold War had been symbolically ended.

Survivors include his sons, Luigi of Bethesda, Maryland; Robert of Rome, Italy; Marc of Stanford, California; his three daughters-in-law; nine grandchildren; and two brothers, Roberto and Giulio. At the Einaudi Center and the Government Department, he leaves us bereft of a distinguished colleague, a shrewd counsellor and a dear friend.

Arch Dotson, Davydd Greenwood, Sidney Tarrow

John Einset

August 15, 1915 — March 11, 1981

John Einset, born in Lofthus, Norway, came to Geneva, New York, in 1924 with his father, Olav Einset, who was a member of the research staff in the Department of Pomology, New York State Agricultural Experiment Station. John was educated in schools in Norway, Geneva, and Ithaca. He was graduated from Cornell with a bachelor's degree in 1938 and a Doctor of Philosophy degree in 1942. His Ph.D. studies were in cytogenetics with Professor L. F. Randolph.

Interest in pomology, for Professor Einset, had its beginning at Geneva, where, as a boy, he worked picking fruit in the Experiment Station orchards. He joined the staff of the Station's Department of Pomology in 1942, and, upon his retirement in 1973, Cornell appointed him professor of pomology and viticulture emeritus.

Professor Einset was one of the outstanding fruit cytogeneticists and fruit breeders of the world. From his laboratory came a series of papers on the ploidy of apple cultivars that will always mark a milestone in the study of chromosome numbers of fruits. His discoveries of cytochimeras in apples, grapes, and other fruits represent a classic contribution to horticultural science. His studies on the cytogenetics of the genus *Rubus* led to a new understanding of its hybridization. In addition to his full-time duties at the Experiment Station, he taught a course in cytogenetics at the University of Rochester in 1947-48.

Professor Einset was a very successful fruit breeder, as the cultivars of grapes and apples which he introduced can attest. His efforts in fruit breeding resulted in several new cultivars and potential cultivars which will have an impact on the grape industry for many years to come. These efforts climaxed in 1972 when he introduced 'Cayuga White' the first grape bred by the station exclusively for the wine market. Other new grape cultivars which he introduced were 'Canada Muscat' and 'New York Muscat' (1961), and 'Suffolk Red' and 'Lakemont' (1972). He also cooperated in introducing six new apple cultivars: 'Wayne,' 'Niagara,' and 'Spigold' (1962), 'Empire' (1966), and 'Jonagold' and 'Spijon' (1968). The very high quality apple, 'Spigold' resulted from his cytological studies. Thomas Jefferson once said, "The greatest service which can be rendered any country is to add a useful plant to its culture." In introducing several excellent new fruit cultivars, John Einset has rendered yeoman service to his country.

Although Professor Einset was primarily a specialist in cytology, genetics, and fruit breeding, he added the role of generalist in the third decade of his career. In that role he was an author of reports on growth-regulator trials on seedless grapes, on grafting of mature grapevines, on cultivar and seasonal effects on wine quality, and on

the cultivar–site problem for vineyards. He was a consultant for out-of-state commercial vineyards. The broader application of his many talents was a real service to his colleagues and to fruit production in New York State.

As head of the Department of Pomology from 1953 to 1971, Professor Einset was a capable and forward-looking administrator. He made changes in the department's organizational structure which are still retained. He believed that the research personnel should carry on the research, while he did many lesser administrative chores that another chairman might have assigned to someone else. He encouraged intradepartmental cooperation and kept the department morale high. As head of the Department of Pomology, Professor Einset was a fine leader. This was primarily by example, but also by his encouragement, and by his understanding of both the wide array of projects and of the people conducting them. He emphasized projects through which the department could contribute to the understanding of the production of New York fruits.

Professor Einset was a firm believer in the value of the New York State Fruit Testing Cooperative Association to the department and worked very hard to ensure the well-being of the association. As department head he was automatically the association's secretary-treasurer and did everything in his power to maintain it as a strong, viable organization and to expand the services it provided to the fruit industry in New York State. On his retirement he was made an honorary director of the association.

Professor Einset's talents were well recognized not only in New York but also nationally and internationally. Nationally, the American Society for Horticultural Science presented to him the 1953 Gourley Award for the year's best scientific paper in pomology and in 1970 elected him a fellow of that society; and in 1978 the American Society of Enologists recognized him as an honorary life member. Internationally, the Rockefeller Foundation sponsored his collaboration in research and teaching at the University of Chile in 1959; and in 1967 he was chosen as a Fulbright research scholar to consult in horticulture at the National Agronomical Station in Portugal.

Through the publication of more than seventy scientific papers, and through his skillful administrative contributions, Professor Einset made a lasting impact on the scientific and agricultural communities for which he so eagerly worked.

Dr. Einset's hobby was the great out-of-doors—hunting and fishing. He was competent at both and travelled widely on hunting and fishing trips. His other hobby, at which he also excelled, was the making of wine.

Professor Einset had many ties to his native land: his father returned there after his retirement; he had two sisters living there; and his wife, Hjördis, was a native of Norway. He made frequent trips to that country.

Surviving are his wife, Hjördis R. Einset; three sons: Dr. John W. Einset of Riverside, California, Peter O. Einset of Amherst, New York, and Erik Einset of Teale Beach, Geneva; a daughter, Mrs. Anne Einset Vickrey of Menlo Park, California; a granddaughter, Rebecca Anne Vickrey of Menlo Park, California; a brother, Dr. Eystein Einset of St. Joseph, Michigan; and two sisters: Helga E. Skodvin of Oslo, Norway, and Ingebgorg E. Sekse of Hardanger, Norway.

Helene Eliasberg

December 4, 1890 — December 16, 1957

The Department of Pediatrics and The New York Hospital-Cornell Medical Center share with her family, friends and patients a deep sense of loss in the death of Dr. Helene Eliasberg on December 16, 1957.

She was born in Riga, Latvia in 1890. After receiving her medical degree from the University of Berlin in 1919, she taught post-graduate courses for physicians and nurses at the Leningrad Institute in Russia and at the Kaiserin Friedrich Haus fur Arztlche Fortbildung and the Charlottenburger Zuglinge— und Kinder Klinik in Germany, attaining the rank of Head Physician at that institution before she was obliged to leave Germany in 1936. When she arrived in this country in 1937, she had already reached great distinction in the field of pediatrics.

The broad scope of Helene Eliasberg's scientific interests is reflected in her medical writings. They covered, to mention only a few, tumors of the spinal cord, infantile diarrhea, jaundice, typhoid fever, scarlet fever, burns, and anemia. Her greatest contributions were in the field of childhood tuberculosis. In 1920 she discovered a childhood form of the disease to which she gave the name, epituberculosis. Her description of this condition remains a classic in medical literature to this day. She was recognized as an outstanding clinician and diagnostician in tuberculosis and in blood disorders.

For the last twenty years of her life, she led a distinguished career at The New York Hospital-Cornell Medical Center. At her death, she was an Associate Professor of Clinical Pediatrics at the Cornell Medical College and Consultant to The New York Hospital. She was a diplomate of the American Board of Pediatrics and a member of the New York County and State Medical Societies. Her distinction in research and her clinical contributions were equalled by her endowments as a teacher of medical students and house staff. She possessed a basic knowledge of medical history; a trained and systematic mind for organizing this material for presentation; a moral integrity; a scrupulous honesty; a personal dignity; a great humility; and above all, an abiding interest in young people. These qualities made her a much sought after teacher. Her dedication to work, her unswerving loyalty and capacity for friendship endeared her to all her colleagues within the college walls as well as to her patients. Helene Eliasberg was an inspiring teacher and an outstanding pediatrician.

Above and beyond this, she was first and foremost a fine human being; kindly and courteous, dignified and sensitive, modest but disciplined, without malice or subterfuge. She was a woman of quiet courage and high character.

All of Dr. Eliasberg's friends, students and professional colleagues honor her, and extend to her family their heartfelt sympathy in this tragic loss.

Samuel Z. Levine

Scott Elledge

January 9, 1914 — December 23, 1997

Scott Elledge, a distinguished scholar, a graceful stylist, and a kindly presence died at the Cayuga Medical Center in Ithaca Tuesday afternoon, December 23 at the age of 83. He was Goldwin Smith Professor of English Literature at Cornell, a university with which he had a long association. Following his undergraduate education at Oberlin College, he came to Cornell for graduate studies, receiving his M.A. degree in 1936 and his Ph.D. degree in 1941. After serving as Instructor in English at Harvard, he was appointed in 1947 as an Associate Professor of English at Carleton College, becoming a full Professor and Chair of the Department in 1951, positions he held until his return to Cornell in 1962. He retired from Cornell in 1984.

To the general public, he is best known for two books published in his later years. One of them is a biography of another Cornell alumnus—the essayist and *New Yorker* staff member, E. B. White—whose writing had long attracted him. *E.B. White: A Biography*, was published in 1984, the year Elledge became an Emeritus Professor. In the foreword to that book, Elledge remarks that in writing his biography he was following the advice—“to please and satisfy” himself—that White gives to all prospective writers in his *The Elements of Style*; Elledge achieved the clarity and unassuming grace that marks the style of his subject. The other book, *Wider than the Sky* (1990), is a collection of poetry for children that he edited, an anthology praised for the editor’s ability to choose poems that, while appealing to the young, were rewarding to readers of any age.

Elledge’s earlier writing was largely devoted to seventeenth and eighteenth century literature. In addition to many articles, he wrote two books on Milton, the first on *Lycidas* (1965) and the second on *Paradise Lost* (1975). He was co-editor of *The Continental Model: Selected French Critical Essays of the Seventeenth Century* (1960) and editor of the two-volume *Eighteenth-Century Critical Essays* (1961). He also edited the highly regarded Norton Critical Edition of Thomas Hardy’s, *Tess of the D’Urbervilles* (1965), as well as the revised editions that have kept its scholarship current.

Interested throughout his professional career in matters pertaining to education, he was associated in many capacities from 1941-68 with the College Entrance Examination Board, and served from 1964-67 as a member of the commission on the English curriculum for the National Council of Teachers of English. From 1964-66, he was a member of the supervising committee of the English Institute, becoming its chair in 1966. On a grant from the Rockefeller Foundation, he was Visiting Professor in 1969-70 at Thannasat University in Bangkok, Thailand,

and returned to Carleton College in 1976 as Benedict Distinguished Visiting Professor. In the year following his retirement, he was appointed Visiting Professor at Williams College.

Elledge's relationship with the Salzburg Seminar in Austria began early in his career as educator and provides a remarkably fitting closure to it. Following the end of World War II, Elledge, then a young instructor at Harvard, and two Harvard students—augmented by the fortuitous circumstance that gave them the use of a war-ravaged Salzburg castle—gathered enough financial support to institute a “center in which young Europeans from all countries, and of all political convictions” could come together to foster the spiritual and intellectual healing that Elledge and his companions felt to be at least as important as the rebuilding of the physical structures damaged by the war. From the beginning, the Salzburg Seminar flourished, attracting as lecturers eminent cultural and intellectual figures from Europe and America; Elledge himself was brought back as lecturer in 1953. As part of the celebration of its fiftieth anniversary, the Salzburg Seminar invited Elledge to return once more. It was here that Elledge gave his final public address. As part of its anniversary celebration, the institution published a book, *The Salzburg Seminar: The First Fifty Years*, dedicating it to Elledge and the other two founders.

The generous impulses that led Elledge and his two companions to undertake that successful enterprise in open dialogue among individuals of diverse national groups can be found within all aspects of his life. *E.B. White: A Biography*, his last major work, is dedicated to his wife, Liane; they were married in 1950. The epigraph from Henry David Thoreau that Elledge chose for the biography can be applied to him as well as the subject of his book: “All that a man has to say or do that can possibly concern mankind, is in some shape or other to tell the story of his love--to sing; and, if he is fortunate and keeps alive, he will be forever in love.”

In addition to Liane, Scott Elledge is survived by two brothers: Daniel Elledge, of Naples, Florida, and Richard Reese Elledge, of Chicago; and two sisters: Mrs. Bonnie Baxter, of Gainesville, Florida, and Mrs. Eva Kathryn Shepard, of Saxton River, Vermont.

M.H. Abrams, Stephen Parrish, James McConkey

Frank Oakes Ellenwood

November 10, 1878 — September 7, 1947

Frank Oakes Ellenwood, John Edson Sweet Professor of Engineering and head of the Department of Heat-Power Engineering in the Sibley School of Mechanical Engineering, died in Rochester, New York, on September 7, 1947, after a short illness.

Professor Ellenwood was born in Little Hocking, Ohio, on November 10, 1878. He was educated in the public schools of Ohio and in the Academy of Marietta; in 1904 he received the degree of A.B. (in Mechanical Engineering) from Stanford University and in 1922 he received the degree of Mechanical Engineer from the same institution. He came to Cornell University in 1911 as an assistant professor of heat-power engineering after serving as an instructor of mechanical engineering at Stanford from 1908 to 1911. In 1915 he was made Professor of Heat-Power Engineering; in 1940 he was made head of that department, and in 1941 he was appointed John Edson Sweet Professor of Engineering.

In addition to employment in other industries, Professor Ellenwood had served as consultant for The Detroit Edison Company and the Goodyear Tire and Rubber Company. During World War I, he was head of the engine department of the U. S. Army School of Military Aeronautics at Cornell University.

Professor Ellenwood was very active in honorary societies at Cornell and was a member of Phi Kappa Phi, Sigma Xi, Tau Beta Pi, Atmos, and Triangle. He had been president of the Cornell Chapters of Sigma Xi and Phi Kappa Phi. Instrumental in the admission of the C.E.M. Club to the national fraternity of Triangle, Professor Ellenwood was received as one of the first honorary members of the Cornell Chapter of Triangle in 1947. He was also a member of professional societies including the American Society of Mechanical Engineers, the American Society of Refrigerating Engineers, and the American Society for Engineering Education.

Author of numerous articles on thermodynamics, steam power plants, and internal combustion engines, Professor Ellenwood was co-author of the three-volume text "Heat-Power Engineering" and of "Thermodynamic Charts." These books have had an extremely widespread use in schools of engineering throughout the world. Through his membership on committees of the professional societies, his contributions to periodicals, and his inspiring teaching, Professor Ellenwood had a large influence on the content of courses in his field and on the methods used in teaching such courses not only at Cornell University but at many other colleges. He maintained high standards and demanded clear thinking and accuracy of statement on the part of his students; rigorous in these respects, he

was well liked and greatly respected by all. An indefatigable worker, he sought constantly to improve his courses and to add to scientific knowledge.

Professor Ellenwood had broad interests. An outstanding track performer at Stanford, Professor Ellenwood was keenly interested in athletics. He was an enthusiastic golfer and bowler. Above all, however, his students and his colleagues will remember him as a patient, thorough, and inspiring teacher, a wise counselor, and a kind friend.

W. J. King, C. O. Mackey, C. L. Walker

Herbert Charles Elmer

Professor of Latin

1860 — Sept. 24, 1935

Announcement was made of the death, on September 24, 1935 of Herbert Charles Elmer, Professor Emeritus since 1928.

Source: Records p. 1894, October 9, 1935

RETIREMENT STATEMENT

Professor Herbert Charles Elmer retired from active teaching at the close of the academic year 1927-28, and has been appointed by the Trustees of the University Professor Emeritus.

Professor Elmer was born in Rushford, New York, in the year 1860, held a state scholarship in Cornell University during the years 1879-83, and, after a career of distinction as an undergraduate, received the degree of Bachelor of Arts in 1883. He immediately proceeded to The Johns Hopkins University for further study of the Classics during the two periods of 1883- 85 and 1886-88, with an interval of study abroad, in Germany and Italy, in the academic year of 1885-86. On receiving the degree of Doctor of Philosophy from Johns Hopkins in 1888, he was appointed Assistant Professor of Latin in Cornell University. In 1909 he was appointed Professor of Latin. Apart from two other periods of study abroad, in 1895-96 and in 1909-10, he has for forty years been continuously active at Cornell University as a teacher and scholar of the best gifts, the most distinguished training, and the highest attainment.

Professor Elmer early made himself known throughout the scholarly world as an authority on Latin syntax, and has an enviable reputation besides as an editor of Terence and Plautus. His learning has made him vital in helping others to learn. As an effective, exact, patient, sympathetic teacher, he has endeared himself to generations of classical students in our College of Arts and Sciences. He has been a good and wise friend to his colleagues and to his University. Nor will his helpful influence cease. Many of his pupils are now teaching throughout the country. His latest achievement, a Latin Grammar, the fruit of great knowledge and long experience, has been perfected and issued in his first year of release from academic duties. It is a model book; its expert method, lucid expression, and simplicity of arrangement, with no lowering, but rather an elevation, of standards, will do much to promote the study of Latin and humanity in America.

The Faculty and Trustees herewith express for Professor Elmer their high esteem, their affectionate regard; their regret at his retirement in the fullness of his power from active teaching; their gratification that he will continue

amongst us, a sympathetic member of our academic community; their confident hope that in his well-earned leisure he will keep adding to those tasteful and scholarly productions which have shed lustre upon himself and upon Cornell University.

William James Elser

November 28, 1872 — July 6, 1952

Dr. William Elser's first appointment at Cornell University Medical College started in 1901, and he was closely associated with the College and the New York Hospital until his retirement in 1940. During this period he held several positions in pathology and bacteriology.

Dr. Elser's parents were of German descent and his scientific training was German. After graduating from Bellevue Hospital Medical College in 1895 and serving an internship, he spent the years from 1897 to 1901 in the medical schools of Berlin, Vienna and Graz. He often spoke of his training under Virchow. When he returned to New York in 1901 he became an assistant in Pathology; in 1904, Instructor in Bacteriology; from 1909 to 1932, Professor of Bacteriology and Immunology. In 1932 his title was changed to Professor of Applied Pathology and Bacteriology; and he held this non-teaching position until he became Emeritus Professor in 1940.

In the period before the Medical College moved to its new building in 1932, a large part of Dr. Elser's work was centered at the New York Hospital where he was appointed Assistant Pathologist in 1902 and Pathologist in 1905. Here he introduced the careful techniques he had learned in Germany and Austria.

Most of Elser's research and teaching were connected with bacteriology and immunology. His publications were few in number. In 1909 with Huntoon he issued a long monograph on meningitis and then continued on this same subject for many years. He never felt the work quite complete; and before he was ready to publish it some one else had written on the subject. It was the same with his important discovery of the method of preserving the original qualities of microorganisms by quick freezing and drying. After twenty-five years of labor he published in 1935 his article with Ruth Thomas and G. I. Steffen when it seemed that his method might be patented by others.

All of Dr. Elser's friends agree that he was an extreme perfectionist. He presented the curious phenomenon of a man whose recognition was hampered by the superabundance of a virtue. In this age when people rush into print he went to the other extreme, and received but little credit for years of hard labor and careful research.

Dr. Elser contributed his full share as a loyal American and as a public servant. He joined the New York Hospital Unit in World War I as Captain and left the service as Lieutenant Colonel. He served on the New York State Board of Medical Examiners. He belonged to many scientific societies.

Apart from his profession Elser had rather few outside interests. As a young man returning from Austria in 1901 he brought with him some of the first skis used in New York. Later in life he became interested in gardening at his home in Kent, Connecticut. He will be remembered most happily by his friends as the center of lively discussions at the luncheon table.

E. F. DuBois

George Charles Embody

November 23, 1876 — February 17, 1939

Professor Embody died of heart disease on February 17, 1939, at Daytona Beach, Florida, where he had gone on sabbatic leave.

George Charles Embody was born in Auburn, New York, on November 23, 1876. He was a graduate of Auburn High School and of Colgate University, where he received the bachelor's degree in 1900 and the master's degree in 1901. Although his interest as an undergraduate lay in the field of physical sciences and he held an assistantship in physics at Colgate, a love of the outdoors soon turned him toward biology and natural history. One of his first publications was *Birds of Madison County*. He collected several hundred specimens of birds and mammals which he gave to the Cornell museum in 1938. When he could do so he obtained further training in the biological sciences, in 1906-07 at Johns Hopkins and from 1908 to 1910 at Cornell. Here he held an instructorship in Vertebrate Zoology in 1909-10, and in 1910 took the doctor's degree. Colgate University awarded him the honorary degree of doctor of science in 1924.

Although Dr. Embody is best known for his research, he was not less eminent in teaching, being adept in the art of planting the germ of an idea in a student's mind, nourishing it through the formative stages, and then, by gradual withdrawal, creating an independent scientist in the true Comstock tradition. His teaching began in 1901 at the Delaware Literary Institute; the next year he taught science at Bradford High School in Pennsylvania; then for three years he was professor of Natural Science at Bethel College in Kentucky. After his year at Johns Hopkins he taught at Randolph-Macon College and, after his two years at Cornell, at Butler University as professor of Biology, whence he returned to Cornell in 1911 to remain here as instructor, assistant professor, and after 1920 as professor of Aquiculture. In 1921 he obtained leave of absence to teach at new newly organized College of Fisheries at the University of Washington.

Research led him into many fields, as is often the case with men pioneering in an unexploited area of knowledge. His investigations included birds, the Crustacea, the life history of fishes, the genetics of fishes, fish diseases and nutrition, and a host of field and laboratory studies bearing on the problems of game-fish production. One of his great achievements was the formulation of a standard stocking policy for streams, published in 1927 and widely adopted in the United States and Canada. Fish stocking had been hit-or-miss, often based on political expediency rather than biological principles. The policy that Dr. Embody established insists that an actual survey of stream

conditions must be made before a satisfactory planting program can be adopted. Such an actual survey had been developed, first under Professor Embody's guidance by Dr. W. A. Clemens, who published in 1917 working plans for increasing fish production in the streams of Oneida County, then by Dr. Embody himself in a study of the waters of Tompkins County. The foundations were then laid for a biological survey of the watersheds of New York which has been conducted under the leadership of Dr. Emmeline Moore and is now near completion. Dr. Embody's hatchery on Cascadilla Creek was one of the first experimental stations of its kind on this continent and there he developed many of the modern practices in fish culture. He published some fifty technical papers and reports. He had completed a work on the toxicology of fishes which his son, Daniel R. Embody, is preparing for publication, and he left in manuscript a manual of goldfish culture and a text on general fish culture with particular reference to trout.

He served as field biologist of the New York State Conservation Department for many years as adviser to the hatchery service of that department for the last ten years, and as consultant to the New Jersey Fish and Game Department and to the U. S. Bureau of Fisheries. While on leave in 1932 he was in charge of the California trout investigations under the supervision of the Bureau of Fisheries. Many persons, from the owner of a garden pool or a farm fishpond to the sportsmen of the State, sought his advice.

He was a member of the American Fisheries Society and of its special Committee which drew up a policy of fish culture for North America; in 1918 he received the society's award for original work and in 1924 he was president of the society. He belonged to the American Association for the Advancement of Science, the Genetics Society, the American Society of Ichthyologists and Herpetologists, the Ecological Society of America, and the American Wild Life Institute. He was a member of Delta Kappa Epsilon, Gamma Alpha, Phi Beta Kappa, and Sigma Xi.

As an undergraduate Dr. Embody had excelled in track and field athletics, but such sport soon gave way to his love of sports afield. He was a crack shot and a skillful angler. From early boyhood—when it was a novelty to amateurs—he had been keenly interested in photography, and he learned to use motion pictures to illustrate some of the techniques of fish culture.

His students, many of them following paths which he pointed out to them, will remember his sympathetic and self-sacrificing help. His colleagues will recall his ease and graciousness in the midst of work.

Eleanor Emerson

June 1, 1896 — December 7, 1978

By the time that Eleanor Emerson joined the faculty of the School of Industrial and Labor Relations in 1946, she had already spent over a quarter century working in the interests of workers and their organizations. She continued that career during the years of her association with Cornell until her retirement in 1964.

Born in Buffalo, New York, Miss Emerson graduated from Vassar College in 1918. Her first job was a director of the Industrial Service Center in Bridgeport, Connecticut, a community center for industrial war workers which continued to operate after the war under the auspices of the Young Women's Christian Association. Following a year as a teacher of history and English at the American Junior College in Athens, Greece, Miss Emerson returned to Buffalo as director of the Urban League Memorial Center from 1926 to 1928. For the next six years she served in Philadelphia, Pennsylvania, as YWCA metropolitan industrial secretary, a job that brought her into increasing contact with trade unions. In 1934 she was asked by the Pennsylvania Department of Public Instruction to supervise the establishment and development of a program of worker education throughout the state, a program that reached tens of thousands of employed and unemployed alike and that also offered employment to large numbers of unemployed teachers. During the war Miss Emerson worked for the National Labor Relations Board, the Division of Labor Standards of the United States Department of Labor, and Rockwell Manufacturing Company as a plant director of labor relations.

The extension program of the School of Industrial and Labor Relations was just getting underway when Eleanor Emerson was appointed in 1946 as assistant professor and extension specialist. Drawing upon her considerable organizational and administrative skills, she contributed importantly in those early years to the formulation of extension division policies, to the forging of links with the labor and management community, to the recruitment and training of extension teachers, and to the development of educational resources in support of the teaching program. The early skepticism and suspicion of the labor movement about the school and its role increasingly gave way as trade unionists around the state came to know and trust Eleanor Emerson. She took the lead in the establishment of an advisory committee on labor education, an important step in gaining union support for the school. She became the school's statewide specialist in labor education, counselled district staff on labor programming, and initiated a large on-campus program of union conferences.

Recognition of Eleanor Emerson's contribution both in and out of the University came with her appointment as professor in 1959 and in 1961 with her selection as secretary of the Adult Education Association of the United States. In 1960 she served as the school's acting director of extension.

Although the foregoing recitation touches upon some of the events in Eleanor Emerson's career, it fails to convey the enormous respect and affection with which she was regarded by those whom she encountered, even the tough-minded, unsentimental among us. This response was engendered by a deep sense of caring coupled with her perceptive intelligence and high standards. She was gentle, yet strong; kindly, yet demanding of the best of each of us. It was not uncommon for Miss Emerson to be mistaken at some large public event for Eleanor Roosevelt (a matter of some amusement and occasional embarrassment to her) and indeed there was some striking physical resemblance to that other great lady. The resemblance, however, would seem to go beyond outward appearances, for the two women shared many other characteristics, among them graciousness and stubborn determination.

A tribute to Eleanor Emerson by one of her colleagues sums it up very well: "Fond as she was of the school and its faculty, however, Eleanor would probably want to be remembered most by the thousands of workers and trade union leaders she taught and counseled over a career that lasted more than forty years. They were the ones who mattered."

George W. Brooks, Alice B. Grant, Ronald Donovan

Lynn A. Emerson

July 20, 1890 — April 1, 1985

Lynn A. Emerson was born in Twin Lakes, Minnesota, on July 20, 1890. He died in Portland, Oregon, on April 1, 1985, where he had been living in a retirement home for an extended period of time.

Lynn received a degree in electrical engineering from the University of Minnesota in 1911, did part-time graduate study in the School of Education at the University of Chicago from 1923 to 1925, and received a Ph.D. from the New York University School of Education in 1932.

After receiving his engineering degree, he worked in a number of businesses, where he gradually became interested in industrial education. Because of his interests he went into the teaching of vocational education in private and public schools. In 1918 he was state supervisor of vocational education in Maryland. At Joliet, Illinois, he was director of vocational education at Joliet Township High School and Junior College. Later he accepted the position of director of the Y.M.C.A. Schools in New York City and then became assistant superintendent of schools in Yonkers, New York.

Professor Emerson joined the Cornell faculty on January 29, 1938, as a professor of industrial education in the College of Agriculture. In September 1944 he was appointed assistant dean of the College of Engineering but continued his duties as professor of industrial education.

He was appointed a professor of industrial and labor relations in the School of Industrial and Labor Relations on April 1, 1946, and served first as assistant director of extension and subsequently as associate director of extension. Prior to Martin P. Catherwood's appointment as dean of the school after Irving Ives's resignation, Professor Emerson served on the Committee on Administration of the school.

Professor Emerson gained wide recognition as one of the outstanding authorities in the United States in the fields of industrial, vocational, and technical education. He made a substantial contribution to both the resident teaching and adult education of the school in those subjects. He also served frequently as a consultant to the state and federal governments.

Professor Emerson retired from the School of Industrial and Labor Relations on March 1, 1955, and was appointed professor emeritus. He then accepted a position as a consultant with the Foreign Operations Administration project in Israel, which was administered by the Research Foundation of the State University of New York. His

duties included advisory service with representatives of the Ministry of Labor of the Israeli government and with school officials and leaders in the vocational education field.

He is survived by five children, all Cornellians: Mary Bragg, of Sunset, South Carolina; Margaret Emerson, of Kensington, Maryland; Ruth Zilk, of Milwaukee, Oregon; Helen Barbano, of Mitchellville, Maryland; and Robert Emerson, of Sharon, Connecticut.

Felician F. Foltman, Maurice Neufeld, Philip J. McCarthy

Rollins Adams Emerson

May 5, 1873 — December 8, 1947

Rollins Adams Emerson, who for twenty-eight years was Professor and Head of the Department of Plant Breeding at Cornell University, died in Memorial Hospital, Ithaca, New York, December 8th, 1947. He was born at Pillar Point, Jefferson County, New York, May 5th, 1873. At the age of five years, he removed with his family to Kearney County, Nebraska where his early years were spent on a farm. Amid considerable hardship and only by determined effort, he acquired the grade and high school education necessary for entrance to the University of Nebraska. He was awarded the degree of Bachelor of Science by that institution in 1897. The two years following his graduation he spent in the Office of Experiment Stations of the United States Department of Agriculture and in 1899 returned to his Alma Mater where he served as Assistant Professor, Professor and Head of the Department of Horticulture until 1914. He gave a year, 1911-12, to advanced study at Harvard University where the degree of Doctor of Science was conferred upon him in 1913. On July 1st, 1914 he became Head of the Department of Plant Breeding in the New York State College of Agriculture at Cornell University which position he held until his retirement from active administrative duties, October 1st, 1942. As Emeritus Professor, he continued his work of research in corn genetics and his practical breeding work on celery and field beans.

Professor Emerson's compelling scientific interest was in Genetics and he was among the first to recognize the corn plant as material particularly suitable for genetic analysis. His clear grasp of the numerous and perplexing problems presented and his skill in devising methods in attempting their solution were such that he became the acknowledged leader in this exacting field of research. Through his work and that of his students, he gained world-wide reputation and more is now known about the genetics of corn than of any other plant. To his initiative, inventiveness and persistent efforts are largely due the establishment of the ten linkage groups and for the location of a large number of genes in the linkage maps of the corn chromosomes. His brilliant analysis of gene interaction in relation to plant color, of multiple alleles affecting pericarp color patterns and his approach to a genic interpretation of quantitative inheritance in relation to ear row number and other characters of economic importance are classic examples of the best type of genetic research. Though the major part of his effort was directed toward theoretical genetics, he was also very much interested in the application of genetic principles to practical plant breeding.

His achievements as a scientist and his forcefully attractive personality brought to him students from all parts of the world. Gifted with sound judgment in evaluating the work of others, his constructive imagination was

constantly suggesting new and fascinating lines of investigation. As a teacher he had the unique gift of imparting to others his own contagious enthusiasm and zeal for research. Students went out from his laboratory to positions of leadership and responsibility in numerous high ranking institutions in this country and abroad. Their noteworthy achievements and continuing devoted loyalty stand as an enduring monument to him, a truly great teacher.

Professor Emerson's efforts were not wholly confined to scientific research, practical improvement of crop plants and to teaching. He also served with distinction in other positions of high responsibility at Cornell University. For six years (1925 to 1931) he was Dean of the Graduate School and for three years (1925 to 1928) he acted as Faculty Representative on the University Board of Trustees. In 1923-24 he visited the principal maize-producing areas in South America and brought back a large collection of maize seeds for further genetical study. This trip was sponsored jointly by the United States Department of Agriculture and Cornell University. In 1935 he went to Yucatan at the request of the division of archeology of the Carnegie Foundation to collect information on the probable kinds of food crops grown and consumed by the ancient Mayan peoples. His administration as Dean of the Graduate School was characterized by a devotion similar to that he gave to his Professorship. Though attentive to the detailed work of that office, he had also a wide perspective which embraced the relationship of Graduate studies to the whole university. As chairman of the General Committee his openness of mind and willingness to consider all shades of opinion gained for him the respect of all members of that body. In all his University assignments he showed leadership which eventuated in quiet steady progress.

Professor Emerson was the author of many papers on the technical phases of Maize Genetics. Other and earlier publications dealt with matters pertaining to general horticulture. His wide interest and outstanding ability as an investigator in the fields of Plant Science won for him the distinctive honors of election to both the American Philosophical Society and the National Academy of Sciences. For many years he was a member of the National Research Council. In 1923 he was President of the American Society of Naturalists and in 1933 President of the Genetic Society of America. He was a charter member of the American Society of Horticultural Science and a Fellow of the American Association for the Advancement of Science. Other affiliations were the American Association of University Professors, American Society of Agronomy and American Genetic Association. He was also a member of Gamma Alpha, Phi Kappa Phi, Sigma Xi and Phi Beta Kappa.

But no statement regarding Professor Emerson's achievements would be complete without mention of the fine personal qualities which endeared him to his friends and were known and appreciated by all who were privileged to have contacts with him. It was his wont to give unstintingly of time and helpful interest to all who sought his
