January 18, 1923 — February 10, 2005

Maurie Semel, Professor Emeritus of Entomology, died on February 10, 2005 in Bucyrus, Ohio. Maurie was born and raised in Brooklyn, New York. He attended the N.Y.S. Institute of Agriculture at Farmingdale, Long Island, receiving an Associate in Applied Science degree. After serving in an aviation unit of the U.S. Coast Guard during World War II, he attended Cornell University, earning a Bachelor of Science degree in 1949 and his Ph.D. degree in 1954.

In 34 years on the Cornell faculty, Maurie distinguished himself as an applied entomologist working at the Long Island Horticultural Research and Extension Center (formerly the L.I. Vegetable Research Farm) in Riverhead, succeeding Dr. Hugh Hockett in 1954. His research program emphasized improvement of insect control in vegetable, potato and floricultural crops. Maurie was a pioneering investigator of beneficial biological agents for insect control and one of the first U.S. scientists to evaluate use of the insect pathogens *Beauveria bassiana* for control of Colorado potato beetle and *Bacillus thuringiensis* (BT) for corn insect control. BT is now widely used in agriculture. His research provided the necessary data to support labeling of novel chemicals to control important pests on Long Island and elsewhere. Two sabbatical leaves, at the University of Arizona and at the International Potato Institute in Lima, Peru, South America, were opportunities to gather both research and technical information useful to the agricultural industry of Long Island. Dr. Gerald Wilde, a former graduate student of his, remembers him as a fantastic mentor and teacher and credits Maurie's direction and support for a great deal of his own success and accomplishments.

In addition to his professional duties, he was a popular and active community leader. His interests, expertise and ability to recognize the importance of both sides of an issue were well received. Maurie was especially dedicated to service in Rotary International and a supporter of the Rotary Foundation. As a Paul Harris Fellow with 45 years of perfect attendance, he served as Club President and District Governor. He was also appointed by then-governor Hugh Carey to the New York State Advisory Council for Agriculture, and participated on many other Long Island committees concerned with land use and planning issues.

After retirement from Cornell, Maurie and his wife Marilyn moved to Bucyrus, Ohio where he continued his work with Rotary and other civic groups, 4H and Cooperative Extension. Maurie was devoted to his loving family and

is survived by his wife of 55 years, Marilyn; daughter, Valerie; sons Mark and Brad; and three grandchildren. His three children are also Cornell graduates.

His daughter, Valerie, has fond memories of his days with Cornell.

“My brothers and I were introduced to Entomology at a very early age. We were reminiscing about how we would all jump into the old green pick-up and set off on a balmy summer’s evening to ‘help’ Pop check his light traps. We would wind through potato fields until we came to a remote corner of a field or woods to explore the contents of the previous night’s catch. We marveled that he knew the name of each species, knew which ones to keep of interest and which ones to leave for the raccoons. He taught us about mounting insects and of the importance of documenting each and every find. More than that, he taught us about the important part that each and every creature plays in nature and the delicate balance, which must never be disturbed. Pop was one of those rare individuals who never wanted to stop learning. Entomology was his passion but the world was his challenge. After retirement to Ohio, it took maybe two weeks before Pop was riding out on farm calls with the local Ohio State County Extensionist. He would call and away they would go, troubleshooting and helping out a farmer whose crops were being attacked. Pop was a kind and gentle man, a very loving and devoted father. His legacy is one of care and compassion.”

Daniel Gilrein, Joseph B. Siczka, Arthur A. Muka

Sergio David Servetto

January 18, 1968 — July 24, 2007

Sergio David Servetto, Assistant Professor of Electrical and Computer Engineering, died at the age of 39 in the early morning of July 24, 2007, in the crash of his recently purchased single-engine plane during the final segment of a trip from the Midwest to Ithaca. Sergio's enthusiasm for flying began in his native Argentina and was reawakened in Spring 2007 when he saw it as a way to be with his family in Ithaca for long weekends during a year he was about to spend as a visiting faculty member at Notre Dame. In a haunting coincidence, Sergio started his life in the United States in Urbana, Illinois, and ended it in Urbana, New York.

Sergio was educated first at the National University of La Plata in Argentina, after which he worked for three years as a programmer for IBM in Buenos Aires. He then came to the U.S. from 1994-99 as a graduate student in computer science and electrical engineering at the University of Illinois Urbana-Champaign. Upon graduation from UIUC, he received the coveted David J. Kuck Outstanding Thesis Award in Computer Science at UIUC. Sergio then joined the Ecole Polytechnique Federale de Lausanne, working for two years with the eminent Professors Martin Vetterli and Bixio Rimoldi. In 2001, he was offered an Assistant Professorship at Cornell and joined our ECE faculty.

Sergio was a colleague of great intelligence, intense conviction, boundless energy, and tremendous enthusiasm for research, teaching, and ideas. He maintained high ideals for himself and expected the same of others. His friends enjoyed his great personal warmth. Sergio was an individual of strong principle who believed with Theodore Roosevelt:

"The credit belongs to the man who is actually in the arena...who strives valiantly...and who at the worst, if he fails, at least fails while daring greatly..."

He was widely read in his native Spanish as well as in German and English, and was known to quote aptly from Cervantes and Kafka. Sergio's restatement of the engineer's creed of "can do" was the proverb, "If there is no wind, row."

At his untimely death, Sergio was already highly regarded worldwide for his work in information theory and its applications to such areas as sensor networks and media compression. He had the respect and affection of many outstanding researchers in these specialties. In an unprecedented gesture, his professional society, the Information Theory Society of the IEEE, held a session at the September 2007 Allerton Conference on Communication, Control,

and Computing to honor him and his work. In addition, a Sergio Servetto Memorial Session was held in July 2008 at the IEEE International Symposium on Information Theory, where papers were presented that were cognate to Sergio's unremitting work on the challenging information theory problem of multiterminal source coding, in which two correlated sources are encoded separately subject to distortion criteria.

While Sergio was actively engaged in journal editorial work and served on technical program committees, his favorite professional outreach activity was the Student Committee of the IEEE Information Theory Society, the purpose of which is to interest graduate students in the discipline and then support their research endeavors. Sergio was a founding member of the Committee, established its website and had recently assumed the responsibilities of Committee Chair. He assiduously laid the groundwork for an ongoing School of Information Theory for graduate and post-doctoral students. Indeed, the First Annual School of Information Theory, held in June 2008, was dedicated to Sergio Servetto.

Sergio is survived by his beloved wife Viviana Sitz and his two young sons, Luciano and Alejandro.

Alexander Duncan Seymour, Jr.

February 1, 1884 — August 25, 1957

Alexander Duncan Seymour, Jr., Emeritus Professor of Architecture, died in 1957 at the age of 73, after a long and varied career as an architect and teacher and an equally active one in the world of yachting.

In the profession of architecture, he distinguished himself as a designer by placing prominently in several national architectural competitions, as a painter by his sketch water colors and oils, and as a teacher by gifts of wisdom and humor which are today present in the colorful traditions of the College of Architecture at Cornell University.

Evidence of his interest and activity in yachting is carried by Lloyd's Register, which notes that his private signal has flown from the yard arm of seven different power or sailing yachts. Although for many years he was a member of a number of distinguished yachting associations, his most dynamic interest was most obvious in the activities of the New York Yacht Club and the Cruising Club of America.

The richness of his contributions to the art of teaching and to the worlds of culture and yachting are only eclipsed by the esteem in which he was held by those friends who were privileged to enjoy his charming and stimulating company beside the flowing bowl and at the board of gourmets. Full of irrepressible and spontaneous good humor, gentle and provocative satire, ribald and mirthful reminiscences, the "Skipper" or the "Admiral", as he was known to his intimate friends, was a rare and delightful companion.

Duncan Seymour joined the faculty of the College of Architecture as a Visiting Critic in 1926, became Professor of Architecture in 1928, and in 1940 was elected Andrew Dickson White Professor of Architecture. He retired in June of 1950 and became Emeritus Professor.

During the years following his retirement from teaching, he revived and enhanced his skill as a painter of water colors. After his health forced him to give up yachting, he devoted most of his time to this hobby. The collection of these paintings which he left, especially those done in Mallorca, Spain and in the Boothbay area of Maine, bear witness to his delight and skill in the field of the graphic arts.

For a list of those conventional honors which the "Skipper" regarded and frequently alluded to as his "vanities", his biographers refer you to Volume #28 of *Who's Who*.

S. M. Barnette, B. K. Hough, F. M. Wells

Lillian Shaben

October 21, 1894 — May 3, 1997

Lillian Shaben lived for more than 100 years, a rare accomplishment today. She was born in Minneapolis, Minnesota and graduated from Iowa State University in 1921. Following work experience in extension in Iowa and in industry as a demonstrator for the Russell Miller Company, she was appointed to an extension position in Food and Nutrition at Cornell University in 1928. Her original appointment was signed by Martha Van Rensselaer in Home Economics and Dean Mann of the College of Agriculture. In 1932, she received a Master's degree from Columbia University. After 27 years of service at Cornell University, she retired in 1953 as Professor Emerita.

As an extension educator in the field of food and nutrition, Lillian Shaben was widely renowned as an exceptionally talented teacher and had a large following of devoted listeners. She repeatedly drew huge audiences for her presentations throughout the State of New York. She was meticulous in her demonstration preparations and she was known as someone who could reach a lay audience. Her publications covered subjects such as food preservation, the relationship of preparation procedures on the nutritive value of foods, and the importance of nutritious school lunches. Her presentation style was a model for 4H members and leaders to follow.

On Lillian Shaben's retirement, Ruby Greene Smith said, "In the retirement of Professor Lillian Shaben, the Cornell University Faculty and the homemakers of New York State lost a teacher who was loved and respected by many. In her career as an Extension specialist and as a Professor, she has proved to be scholarly and tactful, an inspiring teacher and leader, and a loyal friend."

She was a member of Phi Kappa Phi, Omicron Nu, Mortar Board, Theta Sigma Phi, and Epsilon Sigma Phi, the Cooperative Extension fraternity. At Iowa State, she helped to establish the Iowa State College chapter of Chi Omega, a social sorority. She belonged to a women's athletic fraternity and received her athletic letter while in college. In addition, as an undergraduate, she counted her most educational experience in college as being the women students' representative on a committee of faculty members who planned the building of Iowa State's Memorial Union.

While she lived in Ithaca, she owned a cottage on the west side of Cayuga Lake where she went in season to refresh her aesthetic interests. She shared this grand experience with many colleagues, as well as students.

Lillian Shaben moved to East Lansing, Michigan several years after her retirement to be near her sister, Irene. She continued to be active in the fields of art and design, the loves of her life. When her health began to fail, she moved into the Burcham Hills Health Center in East Lansing. She eventually lost her sight and died in May 1997.

Mildred Dunn, Gertrude Armbruster

Charles Chauncy Shackford

Professor of Rhetoric and General Literature

— *December 25, 1891*

RESOLVED, that the Faculty of Cornell University has heard with profound sorrow of the death of Charles Chauncy Shackford, a scholar, colleague, and gentleman, loved and respected by all who knew him. With his death this Faculty drops from its roll a name endeared to many of its present members during a long acquaintance, in which his ripe scholarship and his many virtues were fully appreciated by his numerous friends, colleagues, and pupils. His probity, ability, industry, affable character, and purity of life will be long remembered at this Institution, as one of the forces which helped to lay the foundations upon which this University has been built, and for the success of which he contributed a noble share with loyal devotion and untiring effort. This Faculty is pleased to see that the portrait of this distinguished man of letters presented by his students to the University realizes their expressed wishes, “that the presence of Professor Shackford in our Library among the worthies of Cornell should serve as an inspiration to the labors of succeeding generations of young men.”

RESOLVED, That we tender to the widow and surviving family of Professor Shackford our sincere sympathy.

RESOLVED, That these resolutions be spread on the book of records of this Faculty, given to the press for publication, and a copy of them attested by the Secretary of the Faculty be delivered to the family of our departed colleague.

Harold Shadick

September 30, 1902 — December 21, 1993

It has been said much more than once that Harold Shadick was a man of two cultures and two careers. Although he was born in London and died in Ithaca, he was in spirit Chinese. His first career took him to China, teaching Western history and literature at Yenching University, Peking; his second career as a Chinese scholar, teacher, and translator brought him to Cornell University.

Harold Shadick was educated at Westminster City School in London and studied philosophy at Wycliffe College, University of Toronto, where the Principal, Dr. O'Meara, took a personal interest in his development. So, too, did Dr. Hwang—also associated with the University of Toronto—who introduced Harold Shadick to the idea of working in China by identifying the educational needs of China as an appropriate challenge for Harold Shadick's talents.

In 1925, just fourteen years after the overthrow of the Manchu dynasty, Harold Shadick began teaching Western history and literature at Yenching University in Peking (Beijing). He also took every opportunity to study classical as well as colloquial Chinese, and made the acquaintance of many Chinese scholars and writers. Beijing was occupied by the Imperial Japanese Army in July 1937, after which Harold Shadick continued to teach at Yenching University. Following the attack on Pearl Harbor, Japanese military authorities entered the campus and closed the university, interrupting a lecture he was giving on Shakespeare's "Romeo and Juliet" and ordering him to dismiss his students. Subsequently, Harold and his first wife, Helen Lamkert Shadick, were interned at the Weixian Concentration Camp in Shandong Province for the duration of World War II.

After the end of the war, he resumed teaching at Yenching University during 1945-46, before becoming a Visiting Professor at Cornell, where he was given a regular appointment as Professor of Chinese Literature in June 1946 to the then Department of Far Eastern Studies (renamed Department of Asian Studies in 1962). He taught Chinese language and literature and in 1952 published his translation of the novel, *The Travels of Lao Ts'an*. The Introduction to the Columbia University Press edition (1990) provides his recollection that he began the translation in 1934 after a train trip from Beijing to Tianjin during which he happened to meet Dr. Hu Shih '14, the scholar who first called critical attention to *The Travels of Lao Ts'an* and became the patron of its author, Liu Tiejun. Another of Harold Shadick's most notable works is the three-volume textbook, *A First Course in Literary Chinese* (Cornell University Press, 1968), which is still in use at Cornell and other universities. Harold's interest in Chinese literature led to the

formation of the Conference on Chinese Oral and Performing Literature (CHINOPERL), which meets annually. For eighteen years, until 1987, he served as editor of the journal, *CHINOPERL Papers*, on the study of all types of spoken or sung performance in Chinese.

When Harold Shadick joined the Cornell faculty in 1946 he worked with the chair of his department, Knight Biggerstaff, to plan a center for Chinese studies in upstate New York. China and Chinese language were then still regarded as exotic subjects, and no center of Chinese studies existed anywhere, with the exception of Harvard. In 1950, Harold Shadick founded the China Program and served as its director until 1966. During this time, with generous grants from the Ford Foundation and the Rockefeller Foundation, he established Cornell as one of the major centers of Chinese studies in North America. Together with a succession of able curators, he made the Wason Collection one of the five best Chinese collections in America at that time, knowing well that to attract a distinguished faculty to an isolated location such as Ithaca, Cornell must provide an excellent Chinese library. Among the distinguished scholars he helped recruit as Cornell faculty were Liu Ta-chung and John Fei in Economics, William Skinner and Arthur Wolf in Anthropology, John Lewis in Government, and Nicholas Bodman in Linguistics. As a result, while Harold Shadick was Director of the China Program, Cornell became pre-eminent in the social sciences in subjects related to China. One of his most memorable achievements in teaching programs was his collaboration with the eminent linguist Y.R. Chao '14, with the support of the American Council of Learned Societies (ACLS), to establish the Inter-University Program for Chinese Language Instruction in Taipei, first administered through the China Program at Cornell.

After his retirement in 1972, Harold Shadick continued to be involved actively in the China Program (today the East Asia Program) and CHINOPERL. In 1986, he revisited China for the first time since 1946 and reestablished contact with several of his numerous friends there, many former students among them. At the invitation of Peking University, he there delivered two lectures, one of which he presented as the conclusion to his lecture on "Romeo and Juliet," interrupted by the Japanese Imperial Army forty-five years earlier. Several years after the death of his first wife, Helen, who had also served Cornell teaching her native Russian language, Harold married Wu Hsin-min (Lydia), who had been his student at Yenching University in 1929-30 and later came to Cornell as his Teaching Assistant (1947-52). He is survived by his sister Winifred Woodgate.

Knight Biggerstaff, Edward Gunn, Tsu-lin Mei

Robert S. Shallenberger

April 11, 1926 — December 28, 2008

Robert Shallenberger was a scholar and a teacher in the highest tradition: he was a man who had a remarkable impact on both science and society. His book, *Taste Chemistry*, will be a classic not so much for the science it introduces as for the creative way it organizes the knowledge of taste around chemical structure. His galvanizing effect on science through his influence on students and colleagues will be felt for generations to come.

What was distinctive about Shallenberger? Like the most gifted scientists, he was fearless; he made intellectual connections that were unusually innovative. Colleagues noted that he never seemed afraid to put forth an idea that wouldn't hold up, and even enjoyed the process of proving himself wrong.

Robert (Bob) Sands Shallenberger was born in Swissvale, Pennsylvania on April 11, 1926. He attended public schools until the age of 17, when he enlisted in the Navy. He served as quartermaster on the U.S.S. Butternut during World War II, ending his tour of duty in February 1946. Bob immediately returned to Swissvale High School, graduating in June of the same year. With support from the G.I. Bill, he studied at the University of Pittsburgh (B.S. 1951); with the help of scholarships he received advanced degrees from Cornell University (M.S. 1953, Ph.D. 1955).

From Ithaca, Bob moved to Hoboken, New Jersey, where he took a position as a research chemist at the General Foods Research Laboratory; there, he developed chromatographic methods for the analysis of sugars in foods. With these methods, he studied the complex chemistry of caramelization and browning until October 1956, when he joined the faculty of Cornell University's Food Science and Technology Department at the New York State Agricultural Experiment Station in Geneva as a Professor of Biochemistry.

Charged with the dual tasks of studying carbohydrate chemistry of horticultural crops and helping improve New York's own crops, Bob became fascinated with the relationship between the three-dimensional structure of sugar molecules and their physical properties and taste chemistry. This led to his life-long quest to determine why different isomers of simple sugars produce such divergent taste sensations.

Although Bob was passionately engaged in the study of structural chemistry, he also made significant contributions to food science. In the beginning of his career at Cornell, he campaigned to convince growers to allow apples to remain on the tree long after the first fruits began to drop. By increasing the sugar-acid ratio the fruit would

become tastier and fetch more profit, even with a one to two percent loss caused by harvesting late. Within two years, applesauce produced in New York went from grade C to grade A.

Later, during a study of carbohydrate sweetness, Bob demonstrated that high fructose corn syrups could duplicate the chemistry and taste of hydrolyzed sucrose (invert sugar) as a replacement for sucrose in beverages. It was a discovery with significant implications in a state where corn is a major agricultural product. Bob never stopped searching for practical applications of his science even as he became more engaged with the fundamental chemistry of sugars.

In 1961 and 1962, while on sabbatical leave at the University of California in Berkeley, Bob embarked on his most important work when he began an exhaustive comparison of the physical properties of the crystalline sugars (mostly hexoses), looking for something that could predict their taste. He could find only one correlation that related to the sweetness intensity per unit mass of the sugars: the presence of hydroxyl hydrogen bond signals in their infrared spectrum. In discussions with faculty and students, he made convincing arguments that these signals could be used to predict the three-dimensional structure of sugars in solutions.

In May of 1963, I met Bob for the first time in a bar on University Avenue in Berkeley. He talked about the subtle and complex structure of sugars with such passion that I was thrilled when, after several drinks and many marked-up napkins, he asked me to be a student in his lab in Geneva. Together in 1967, we published "The molecular theory of sweetness" in *Nature*; it was a paper that contained ideas still valid at the time of his death. Working in his basement in Geneva, Bob had machined metal models of sugar molecules to use in simulating the transition-state energies between different molecular shapes: sweet molecules could easily be transformed into a specific shape he called A-HB, while non-sweet molecules could not.

Although Bob was hired on a 100% research position at Cornell, he insisted on teaching to help develop his ideas and on maintaining an active extension effort. Two of his students, CY Lee and myself, became Cornell professors and Lee recently completed a six-year term as Chair of the Food Science and Technology Department. During his tenure, Lee has developed programs in nutraceuticals, functional ingredients and enology, all in keeping with Bob's broad view of the mission of agricultural research and role of the Experiment Station. Until his death, Bob continued to share his unique vision through his work on several commissions and committees at both the College and the University levels.

Bob is survived by his wife, Carol; two sons, Richard of Sacramento, California, and Paul of Lake Worth, Florida; two daughters, Susan of Oakland, California, and Eve Tapscott of Geneva, New York.

Terry Acree, Chairperson

William Hartley Shannon

November 27, 1906 — December 12, 1959

With the passing of William Hartley Shannon, the Cornell community suffered the loss of an exceptional teacher and dedicated student in his chosen field.

Professor Shannon was appointed to the Faculty of the School of Business and Public Administration in its first year, 1946. He organized the first professional accounting program at Cornell and played a major role in preparing students for careers in public accounting and in training others in the use of accounting as a management tool. He also held an elected membership on Cornell's Law School Faculty from 1949 until his final illness, teaching courses in legal accounting and negotiable instruments.

Whether his class consisted of students in an introductory course in accounting or of mature executives in the School's Executive Development Program, he was equally effective and stimulating as attested by the testimony of students and colleagues alike.

As a counselor of students his performance was almost unique. In part because he was without an immediate family, he spent long hours in his office, where he made himself readily accessible to students. Always he demanded from them high and often exacting standards of personal conduct and intellectual vigor, but his genuine interest in their problems made him an objective and sympathetic protagonist for those who had tried and failed to come up to expectations.

During its formative years Professor Shannon demonstrated an unwavering loyalty to the best interests of the School, often at personal sacrifice. He contributed importantly to the improvement of the School curriculum and fought ably and effectively in Faculty and committee meetings any disposition to compromise on standards for an opportunistic purpose.

William Hartley Shannon was born in Fennville and graduated from the public high school at Allegan, both in Michigan. After receiving the A.B. and M.B.A. at the University of Michigan he earned the LL.B. degree at the University of Kansas. His certificate to practice as a Certified Public Accountant was from the State of Kansas. He was also a member of the Kansas Bar and was admitted to practice before the United States Tax Court and in 1957 before the United States Supreme Court.

Before coming to Cornell, Professor Shannon taught at the University of Kansas. He also served as a visiting professor on the summer session faculties of the University of California at Los Angeles, the University of Southern California, and the Stanford University Law School. Among his publications, *Legal Accounting* and *Accounting and the Law* were the most important.

Within six weeks after the beginning of World War II, Professor Shannon entered the Supply Corps of the United States Naval Reserve and continued his military service until June, 1946. Subsequently he was recalled to active duty for limited periods and rose to the rank of Captain.

In his day-to-day relationships he was friendly and helpful, albeit in a slightly formal and old-school manner. His sensitivity and the austerity of his personal habits combined to focus his energies on his work and to restrict his participation in social life. Professor Shannon was impartial and objective, uncompromising in matters of principle and insistent on absolute accuracy. At the same time he was thoughtful, gracious, and self-sacrificing in his personal relationships, deeply concerned for the welfare of others, soft-spoken and even humble in the expression of his own views. He will be sorely missed.

John M. Rathmell, Melvin G. De Chazeau, Albert M. Hillhouse

Sanford Reuben Shapley

October 15, 1906 — March 12, 1997

Blessed with curiosity and a mind that loved knowledge, combined with the practical skills required for application, S. Reuben Shapley made significant contribution to Cornell and to New York State agriculture. He did it with confidence and with a thoughtful manner, recognized both on and off campus.

Born on October 15, 1906 in Hamilton, New York, he was the son of Sanford L. and Minerva C. Shapley and was raised in South Otselic, New York. His formal training began when he enrolled as an undergraduate in the College of Agriculture at Cornell University in 1924. While a student, he was a member of Alpha Zeta Honorary Fraternity, Ho-Nun-De-Kah and winner of the first Farm Life Challenge Contest (now Rice Stage Debate). The application of his acquired knowledge was made available via the Extension Service starting in 1928 and extending through 1939.

He was then appointed District Agricultural Agent in Land Use Planning. Recognition of his dedication to public service and his skill in delivering agricultural knowledge to his clientele led to positions of leadership from associates and Extension administrators. In 1943, he was appointed Associate Professor in Extension Service and Assistant Leader of County Agricultural Agents. During the trying years of World War II (1943-45), Professor Shapley gave unique leadership to the State's Farm Labor Program in the capacity of Supervisor.

In 1945, Shapley was named Professor of Farm Practice for the college. In this role, he guided the diverse Farm Services of the college and in addition developed farm practice opportunities for literally thousands of students so that they might meet their work experience requirements for graduation. Being able to assist students gain essential experience with recognized successful practitioners was a high point for many of our students and a personal delight for "Reub". For many, this became a life-long association and a valuable part of their Cornell experience.

In 1958, he was named Professor in Personnel Administration in the Office of Resident Instruction. During the 1960s, Professor Shapley expanded the operations in the work experience area to encompass an intern program with interested agri-business organizations, an innovation well received in a period where relevancy was becoming a key goal of students. He also wrote several articles and other publications regarding the work experience requirement of the N.Y.S. College of Agriculture.

After serving Cornell for 44 years, Reuben retired in 1972. In recognition of his many duties and responsibilities with the Cooperative Extension Staff, with fellow faculty and with undergraduate students in particular, Professor Shapley retired as Professor Emeritus.

In addition to his career at Cornell, Professor Shapley was an active community leader. He was a member of the First Presbyterian Church and a trustee and elder in the church. He helped establish and was a charter member of the Ellis Hollow Community Center, Inc. From 1950-56, he was member and chairman of the Ithaca area school study committee that led to the consolidation of 44 school districts. In 1958, he was presented a citation by the Ithaca Teachers Association for services to education. He was a member of the Rotary Club and a local 4-H leader.

Reub enjoyed gardening, growing Christmas trees, raising Airedales, traveling, photography, refinishing furniture, hunting, fishing, making wine and playing bridge. Through 1991, he lived in his country home in Ellis Hollow. Later he moved to Concord, New Hampshire to live at the New Hampshire Odd Fellows Home in Concord to be near his daughter, Judy. He died March 12, 1997.

He was survived by two sons, S. Philip Shapley, Owen Sound, Canada; Bruce D. Shapley (deceased, 7/25/97); a daughter, Judith Waterman, Bedford, New Hampshire; eight grandchildren; four great-grandchildren; and a sister, Esther S. Day, Bainbridge, New York. He was predeceased by his first wife, Elizabeth D. Coon, April 1955; his second wife, Mildred R. Coon, November 1991; and a brother, Charles S. Shapley.

A man of substance, integrity and honesty, each of us who knew him did profit from the encounter. To be called an associate was an honor.

Herbert L. Everett, Leonard W. Feddema, Richard A. Church

Lester Whyland Sharp

April 21, 1887 — July 17, 1961

It was a most fortunate coincidence that the period during which Dr. Lester W. Sharp devoted a lifetime of service to Cornell University as a distinguished professor of cytology included the years in which this long-established science became allied with the rapidly developing new sciences of genetics and cytogenetics. His contributions to this alliance as a teacher and investigator were indeed very significant.

Born at Saratoga, New York, April 21, 1887, Dr. Sharp moved at an early age with his family to Alma, Michigan and completed his undergraduate training at Alma College in 1908. After spending the next two years in graduate study at Johns Hopkins University he transferred to Chicago where he specialized in plant morphology and received a Ph.D. in 1912. The following year was spent in travel abroad and in six months of study with Professor Victor Grégoire at the University of Louvain.

Dr. Sharp joined the staff of the Department of Botany in the College of Agriculture as an instructor in 1914, the year following the formation of the department and Dean Liberty Hyde Bailey's appointment of Professor K. M. Wiegand as head. Promoted to Assistant Professor in 1915 and to Professor in 1920, Sharp served continuously until his retirement in 1947 after thirty-three years of distinguished service to the University. Shortly thereafter he moved to Nuevo, California, where he lived in quiet retirement with Mrs. Sharp, close to the home of his sister, until his death July 17, 1961.

Soon after coming to Cornell, Dr. Sharp organized one of the first courses in plant cytology to be offered in an American university. His *Introduction to Cytology*, published in 1921, was the first American textbook of cytology with primary emphasis on the plant cell. Considered the standard textbook of plant cytology for many years, numerous editions were printed and a German translation was issued in 1931. Sharp's *Fundamentals of Cytology* was written in 1943, primarily for use as an elementary text, and a Spanish edition was published from Buenos Aires in 1947. In addition to his textbook, Sharp was the author of numerous scientific papers on embryogeny, spermatogenesis, and chromosome structure in plants. Most of these publications appeared early in his scientific career, his Ph.D. thesis being his ninth publication. Thereafter his efforts were devoted chiefly to teaching and the publication of his textbooks of cytology.

Professor Sharp's excellent reputation as a teacher was based on his extraordinary grasp of the literature of cytology and the new science of cytogenetics at a time when rapid growth was taking place in these fields. His critical

evaluation of new contributions was based on a broad background of knowledge in his own and related fields. Sharp's lectures and publications were models of orderly arrangement and of lucid, concise presentation, reflecting meticulous care in their preparation.

In addition to his classroom and laboratory teaching, Dr. Sharp made a great contribution through his personal conferences with his students. He was always available for conferences with those who came to him for help and was generous with his time when serving in various advisory capacities. His gracious manner and pleasing personality made the student's visit a most pleasant occasion.

Membership in honorary societies included Phi Beta Kappa, Sigma Xi, and the Gamma Alpha scientific fraternity. He was vice president of the American Society of Naturalists in 1924, secretary of the Program Committee of the International Botanical Society of America in 1929 and president in 1930. He was a member of the editorial boards of the *American Journal of Botany*, of *Stain Technology*, and the *Botanical Review*. He received an honorary degree from Alma College in 1930 and from the University of Louvain in 1947—the highest distinction to be awarded by one of the oldest and botanically most distinguished European universities.

As examples of Sharp's unusual diversity of nonscientific accomplishments may be cited his presentation in blank verse of his address as retiring president of the Botanical Society of America (commemorating the one hundredth anniversary of Robert Brown's discovery of the nucleus); his co-authorship with a student of *Eoörnīs pteroveloxy gobiensis*, a masterful scientific hoax; and his love of classical music shared with students and colleagues.

During this active scientific career Professor Sharp's influence stimulated many promising young scientists to concentrate their efforts in the broad field of cytogenetics, where their brilliant researches have contributed substantially to the spectacular progress which has been and is continuing to be achieved in this field.

R. Lauriston Sharp

March 24, 1907 — December 31, 1993

In November 1926, Lauriston Sharp, nineteen years old, published a prize winning essay in the undergraduate *Wisconsin Literary Review*. He wrote: "...perhaps on the whole, the greatest happiness throughout life...is given in...the lasting contentment of the quiet man rather than the stormy passion of him who is susceptible to the emotions." Many who knew Lauri Sharp might agree that he embodied the "quiet man" in his demeanor, not given to displays of "stormy passion". But Lauri's long life, his professional career, service to his discipline, to academe, to his university, to his students, colleagues, family and friends demonstrate that this "quiet man" was also a person of prodigious energy and notable accomplishments.

Born after the turn of the century, son of Professor of Philosophy, Frank Chapman Sharp and Bertha Pittman Sharp, and raised in the university town of Madison, Wisconsin, it is not surprising that Lauri decided to be an academic. However, his choice of anthropology as his discipline is remarkable, for there were few trained professional anthropologists in those days. Not long before his death, Lauri recalled that he may have "been nudged toward anthropology" when he studied *The Iliad* in a Greek course as a junior in high school. He remembered wondering if the "manic" qualities of the ancient Greeks reflected a distinctive attribute of their culture, or whether it was a universal characteristic rooted in human nature. He suggested this question was a precursor of anthropology's subsequent interest in "culture and personality". This same curiosity may also have led Lauri to several summer horseback trips with a number of peers (and later colleagues), traveling through the American Southwest, visiting archaeological sites and the Indians living there. If Lauri was already cultivating the bearing of the "quiet man", it may have concealed not only an underlying curiosity but also, perhaps, an enduring youthful quest for adventure and fascination with the unfamiliar.

After earning a B.A. degree in Philosophy (1929), Lauri spent a year at Wisconsin as a Freshman Dean while he explored his career options. He eventually chose anthropology as his profession and the then little known region of Southeast Asia as his area of special interest. Following an archaeological dig and ethnographic encounters with Berber culture in Algeria, Lauri went to study Southeast Asian ethnology at the University of Vienna with Robert Heine-Geldern, one of the few experts on the region at the time. Completing a Certificate in Anthropology at Vienna in 1932, Lauri entered the Ph.D. Program in Anthropology at Harvard. Senior mentors offered Lauri an extraordinary opportunity—funding for two years of dissertation research (1933-35) on Australian aborigines

(then the prototypic “primitives”). Although his research on the Yir Yoront postponed his plans for Southeast Asia, Lauri was proud to be one of a handful of researchers who had worked with aborigines in an area he characterized as “beyond the settlements” and “empty on the map”.

Except for eighteen months (1945-46) as Deputy Assistant Chief of the State Department’s Southeast Asia Division, Lauri’s personal life and professional career were closely tied to Cornell. He accepted an Instructorship in Anthropology here in 1936, the year before his Ph.D. degree was awarded. Holding the first specifically anthropology appointment at Cornell, Lauri was housed in the Economics Department until 1939 when a separate Sociology and Anthropology Department was established (which he chaired in 1942-45 and 1949-56). Lauri rose through the academic ranks and was Goldwin Smith Professor Emeritus of Anthropology and Asian Studies at the time of his death.

Emeritus Professor Urie Bronfenbrenner (B.A. ‘38) has recalled that he and his close friend John Clausen (B.A. ‘36), subsequently a distinguished Professor of Sociology at Berkeley, were students in the first anthropology course Lauri taught at Cornell. Bronfenbrenner reports that Lauri “brought to life for us a whole new world in his quiet, unassuming way...and changed forever our conceptions of what human beings and the world they lived in not only could be, but actually were”, a view of humanity and of the world that has informed Bronfenbrenner’s subsequent life and career. Professor Robert J. Smith (Ph.D. ‘53) recalls that Lauri’s graduate teaching, “drawing on philosophy, literature and an extraordinary range of anthropological knowledge, dazzled us all with his urbanity and wit.” Professor Paul Doughty (Ph.D. ‘63) also remembers that the graduate students of his generation vied with each other to serve as Lauri’s TAs to perfect their craft as scholars and teachers.

Professor Stanley J. O’Connor, Lauri’s long time colleague, vividly projects yet another image of Lauri in an *Arts College Newsletter* article (Fall 1981). O’Connor describes Lauri as “...a familiar figure crossing the Arts quad... charging through that space at such a clip that the air around him seemed lit with an overflow of energy.” That image evokes another aspect of Lauri’s life and career and adds a dimension that further modulates the tranquil image of the “quiet man”. Lauri was strongly committed not only to expand his discipline and enrich his University but also to have an impact on the lives of people in a rapidly changing world. In the post War era, Lauri and colleagues obtained support from various foundations (Carnegie, Ford, Rockefeller) to enlarge the infrastructure of the university and to address the needs of this changing world. This included a substantial increase in the anthropology faculty and founding a graduate program known as the “Cornell Studies in Culture and Applied Science” that emphasized Lauri’s vision of anthropology as an “applied” as well as a “pure” discipline.

Field research stations were established in the American Southwest and in India, Peru and Thailand. In 1947, Lauri at last realized his dream of research in Southeast Asia, founding the multidisciplinary Cornell-Thailand Project, a pioneering effort gathering baseline data in Bang Chan, a farming village near Bangkok. Lauri was also founder and first Director (1950-60) of Cornell's internationally renowned Southeast Asia Program which served as a model for area programs at Cornell and elsewhere. He took special pride in the number of non-Western scholars in diverse fields who received training and experience through these programs and became productive scholars and teachers in their homelands. He was also concerned that the results of research be made accessible for development programs initiated by local governments. Additionally, Lauri chaired the faculty committee which ushered in Cornell's Center for International Studies.

Lauri's professional career was multifaceted. Besides teaching generations of Cornell undergraduate and graduate students, he held numerous visiting appointments at universities in the U.S. and abroad. He was a founding member of several scholarly organizations, including the Society for Applied Anthropology and the Asia Society, and served on the executive boards of various organizations such as the American Anthropological Association, the Association for Asian Studies (President in 1961-62), and the National Research Council's Pacific Sciences Board. He had experience as a scholar-researcher with the indigenous cultures of four continents, most especially the diverse peoples of Southeast Asia. Several of his publications attained the status of classics, notably *Steel Axes for Stone Age Australians* (1952), *People Without Politics* (1958) and his presidential address to the Association for Asian Studies: *Cultural Continuities and Discontinuities in Southeast Asia* (1962).

On his formal retirement in 1973, Lauri was presented with a two volume festschrift by colleagues, students and friends. One volume (Robert J. Smith, ed. 1974) celebrated Lauri's contributions to studies of cultural change and applied anthropology, the other (G. William Skinner and A. Thomas Kirsch, eds. 1975) honored his contributions to Thai Studies. Even after retirement, Lauri remained active. He attended meetings of the Southeast Asia Program, held office hours, contributed lectures, and supervised courses. Although increasing health problems made field research difficult, he continued to work on his earlier research materials. Thus, the extensive files of the Bang Chan Project have been deposited in the University Archives. Lauri also worked on his field notes from his Yir Yoront research and guided an anthropological linguist in preparing a linguistic sketch and lexicon of this unwritten tongue (Alpher 1991). These materials are also accessible to interested scholars in the Cornell Archives.

Lauri's achievements as scholar, researcher and administrator were recognized in a variety of ways. In addition to the two festschrift volumes, a group of his former Thai students established a Lauriston Sharp Essay Prize in

1967 and a Lauriston Sharp Scholarship Fund to promote social science research in Thailand. The Southeast Asia Program similarly established a Lauriston Sharp Prize awarded annually to an outstanding student completing his or her degree program. In 1989, Lauri received the Bronislaw Malinowski Award from the Society for Applied Anthropology for his lifelong contributions to that field. And, in April 1993, Lauri was honored by the Anthropology Department, the College of Arts and Sciences and the University by having an Anthropology seminar room in McGraw Hall named in his honor (shared with Allan Holmberg). On this occasion, Provost Nesheim cited Lauri's contributions as teacher, scholar and humanitarian to improving the quality of education and the quality of life at Cornell.

Many facets of Lauri's life—scholar-researcher, teacher-advisor, administrator-official—were played out in the public sphere. There was, of course, a private sphere as well, centering on his home and family, his wife, Ruth; children, Alexander (Zander) and Susannah (Suki) Sharp Starnes; grandchildren; and brothers, Malcolm and Eliot. Lauri's public and private lives complemented each other in various ways. Lauri and Ruth Burdick Sharp married in 1936, the year he began teaching at Cornell. This was the first and longest of their joint odysseys. Ruth shared in the overseas research experiences as well as the teaching assignments elsewhere. The children also participated when possible. More than a companion, Ruth's interest and self-acquired knowledge of ceramics made its own contribution to the scholarly work in Southeast Asia. Theirs then was a synergistic relationship at many different levels.

Lauri built their house on Highland Road in 1951 following designs of Cornell's noted architect John Hartell. (Vladimir Nabakov briefly lived there while teaching at Cornell and describes the house in his novel *Pale Fire*.) The living room is furnished with family heirlooms and mementos of the Sharps' Asian experiences. Books and periodicals stacked here and there testify to its residents' voracious reading habits. Visits with a few friends or colleagues and lively cocktail parties were held here. The Sharps often hosted gracious dinner parties. These occasions, simultaneously simple and elegant, brought together colleagues from all over the University, local professionals, distinguished (even princely) visitors, renowned academics from abroad and others. Such gatherings were memorable for their congeniality, urbanity and charm.

Though age brought more infirmities, Lauri maintained his lively interest in scholarship, happenings on campus and world affairs. Problems with his legs and back reduced but did not halt his mobility, and dimming eyesight, which he tried to overcome by various reading aids, limited his reading ability. While colleagues marveled at his indomitable spirit, none of these problems diminished Lauri's enduring curiosity and enthusiasm for life itself.

But, as 1993 drew to a close, our colleague, mentor and friend quietly embarked on another adventure into the unfamiliar and unknown. In farewell we can do no better than echo the words of Dean Fred Kahn in 1972 on the occasion of Lauri's assuming the Goldwin Smith Chair: Lauri Sharp was "a learned diplomat, a cultivated scholar, a remarkable teacher and a great man."

Stanley J. O'Connor, Robert J. Smith, O.W. Wolters, A. Thomas Kirsch

Francis Robert Sharpe

January 23, 1870 — May 18, 1948

Francis Robert Sharpe, Emeritus Professor of Mathematics, died at his home in Ocean City, New Jersey, on May 18, 1948.

Professor Sharpe was born in Warrington, England, on January 23, 1870. He studied at the University of Manchester and at Cambridge University. At the latter institution he worked under the tutorship of E. W. Hobson, and received the B.A. degree in 1892. He was a Lecturer in Mathematics at Queen's University, Kingston, Ontario, from 1901 to 1904; and then came to Cornell in 1905 as a graduate student and assistant, receiving the Ph.D. degree from Cornell in 1907. He was appointed to an Instructorship in 1906, an Assistant Professorship in 1910, and a Professorship in 1919, which latter position he held until his retirement as Emeritus Professor in 1938. He was always interested and helpful in departmental administration, and served as Chairman of the Department from 1923 to 1926.

Professor Sharpe's earlier interests were in the field of applied mathematics, especially hydrodynamics, and he published a number of papers in this field in various American mathematical periodicals between 1905 and 1912. At about that time, under the influence of Professor Virgil Snyder, he became interested in the subject of algebraic geometry, and, beginning about 1912, his publications were mostly in this field. He was one of a committee of six mathematicians appointed by the National Research Council to prepare a report on Rational Transformations, which was published in 1928 under the title *Selected Topics on Algebraic Geometry*.

He was an Associate Editor of the *Transactions of the American Mathematical Society* from 1917 to 1939, and one of the three Editors from 1930 to 1935.

Professor Sharpe will be remembered by many former Cornell students as a patient and kindly teacher with an unusual English accent. He took a keen interest in the work of his students, both graduate and undergraduate, and gave generously of his time in helping them over their difficulties. He was a devoted husband and father, and took an unusually live interest in the musical training and general education of his daughters.

His colleagues remember him for his mathematical skill, his accurate mathematical intuition, and, above all, for his complete sincerity and integrity.

W. B. Carver, W. A. Hurwitz, M. G. Maltz

Nelson J. Shaulis

September 10, 1913 — January 15, 2000

Nelson J. Shaulis was a renowned viticulturist at Cornell University's New York State Agricultural Experiment Station, in Geneva, New York. His extraordinary career had a profound impact upon the grape industry worldwide.

"Nelson Shaulis was one of the truly great minds in viticulture of the 20th century," said Hugh Price, Chairman of the Department of Horticultural Sciences at the Experiment Station.

"His research and writings have a profound influence on grape production in New York and around the world. He will be sorely missed by friends, colleagues and admirers and remembered every time one sees a vineyard trained to the Geneva Double Curtain system."

Shaulis' long and distinguished career began at Penn State, where he graduated with a B.S. degree in Pomology in 1935, and a M.S. degree in Soil Science in 1937. He received his Ph.D. degree in Soil Science from Cornell University in 1941. He served as a Soil Conservationist with the USDA Soil Conservation Service from 1938-44 and as an Instructor in Pomology at Penn State. In 1944, he was appointed Assistant Professor of Pomology at Cornell's Agricultural Experiment Station in Geneva, and was awarded the title of Professor in 1948. He retired as Professor Emeritus of Viticulture in 1978, and remained very committed to viticulture until his death.

Shaulis' research on grapes in New York emphasized an integrative approach to optimizing vine growth and cropping via soil and canopy management. His research in New York was conducted primarily at the State Agricultural Experiment Station in Geneva, as well as Cornell's Vineyard Laboratory at Fredonia.

Experts in modern viticulture consider Dr. Shaulis the father of "canopy management", a term used in the industry for a spectrum of techniques to control shoot growth and leaf display to improve yield and quality. The core principle of canopy management is to ensure the exposure to sunshine of critical parts of the grapevine to achieve good yields and high fruit quality.

While working with the Concord grape, Dr. Shaulis observed that excessive shade inside canopies reduced grape yields and fruit ripeness. He discovered that by separating one dense canopy into two less dense ones, the vine could intercept more sunlight and fruit yields were therefore increased. Better sunlight distribution in the vine improved not only vine maturation, but also fruit quality.

This “Double Curtain” technique was first tested at Geneva in 1960, and four years later field trials with growers began. Although Concord belongs to the North American species *Vitis X Labruscana*, Dr. Shaulis’ discovery was quickly applied to vinifera grapes, the classical European variety. The principles elucidated by Dr. Shaulis form the basis of modern canopy management worldwide.

Dr. Shaulis also worked with Professor Shepardson of Cornell’s Department of Agricultural Engineering to develop the mechanical grape harvester. Today, harvesters modeled after the Cornell machine are in use around the world.

Dr. Shaulis was an outstanding integrator of knowledge. He looked beyond narrow fields of expertise and developed concepts on the proper siting of vineyards, the physiology of grapevines, mineral nutrition, rootstocks, and microclimates. He also developed standard terminology for viticultural terms, and insisted that terms be defined before discussions could proceed. He will especially be remembered for his precise way of thinking.

Shaulis’ research and extension efforts on grapes in the field of viticulture have had a lasting impact upon the industry in New York State and throughout the world. According to the Station’s current viticulturist, Robert Pool:

“Nelson’s concepts have been applied in every major grape producing region of the world, and served as the knowledge base that allowed New World wine growing to emerge as a major factor in international trade in the last 20 years.”

His contributions to world viticulture were recognized posthumously in June 2000, at an international conference on grape physiology held in Crete.

Because of his vast knowledge and intense research techniques, Shaulis was frequently called upon to assist or advise others throughout the world. In 1961, he spent the fall studying grape culture in France, Switzerland, Germany, and associated areas. In 1967-68, he was the Fulbright Senior Research Fellow in Australia, where he conducted viticultural research.

In 1972, Shaulis was named a Fellow of the American Society of Horticultural Science, the most prestigious award of that organization. In 1997, 19 years after his retirement, Dr. Shaulis was the recipient of the Merit Award given by the American Society for Enology and Viticulture, also the highest award of that society. He was also the recipient of Merit Awards of the Society of Wine Educators, the American Wine Society, the New York State Wine and Grape Foundation, and the National Grape Cooperative, and received the award for Outstanding Achievement from the ASEV-Eastern Section.

Shaulis was a member of the American Society of Horticultural Science, the American Society of Agronomy, the

Soil Science Society of America, Sigma Xi and the American Society of Enology and Viticulture of which he was made an honorary life member.

“Even though Nelson retired in 1978, he continued his research and his writings and, above all, his great enthusiasm for New York’s grape industry”, stated James E. Hunter, Director of the Experiment Station.

In addition to his extraordinarily active career in research and extension, Shaulis served on the Board of Education for the Geneva City School District in the 1960s, and was a leading member of the Zion Lutheran Church from 1944 until his death.

Shaulis—a devoted and loving husband, father, and grandfather—is survived by two daughters, Catherine Santomartino, of Scotia, New York, and Margaret Harty, of Sodus, New York; three grandchildren; and three great-grandchildren. He was predeceased by his wife of 55 years, Lillian, on July 30, 1996.

Alan Lakso, Hugh Price, Bruce Reisch

R. William Shaw

July 7, 1904 — March 14, 1995

Professor Emeritus of Astronomy, R. William Shaw, who had been confined to his residence on Halycon Hill in Forest Home due to a long siege of arthritis and declining health, died following a short hospitalization on March 14, 1995, at the age of 90.

Born July 7, 1904, he was raised on a farm near Meadville, Pennsylvania. Primary schooling took place in a one-room school near the farm; high school was in town necessitating a long walk and trolley ride. Farm chores demanded his time outside school hours, so he was trained early in discipline and hard work. He graduated from Allegheny College in 1926 and went to Purdue for graduate study, earning a Master's degree in 1929. He came to Cornell and earned his Ph.D. degree under Professor R.C. Gibbs in 1934. He became thereafter an Instructor in the Physics Department, teaching spectroscopy in the Advanced Laboratory course. One of his students in 1934 was Charlotte Throop, granddaughter of the Department's venerable one-time head, Edward L. Nichols. A year or so later, Shaw and Miss Throop were married. He was appointed an Assistant Professor of Astronomy in 1939, serving with Professor Samuel L. Boothroyd who earlier had been named by the School of Civil Engineering to head an Astronomy Department in the Arts College at Cornell. Boothroyd's forte was on positional or practical astronomy. Shaw served to bring some physical astronomy to the small Department. At Boothroyd's retirement in 1942, Shaw was named Director of the Fuertes Observatory and Chairman of the Astronomy Department.

Astronomy remained a small Department with Shaw as its Chairman until expansion was undertaken during the late 1950s. The Department played an important role in navigational instruction during World War II. Following the war, augmented with an added Assistant Professor and Instructor, the Department was quartered in a barracks type structure behind Rockefeller Hall until construction of Clark Hall necessitated its removal. Inspection of the laboratory manual he wrote shows a broad diversity of subject matter and a nice approach to some fairly sophisticated techniques. His interest in all aspects of the subject never lapsed; he subscribed to the astronomy magazine, *Sky and Telescope*, until his last year, holding a complete sequence of issues beginning with Vol. 1, No. 1, 1941. He retired and became Professor Emeritus in 1971.

Shaw's main interest was in teaching, and his laboratory manual reflects this. For many years, under the auspices of the National Science Foundation, he ran one of the first summer institutes in graduate studies for earth science teachers.

In the early thirties, Shaw and Boothroyd mounted an observational expedition to San Francisco Peaks near Flagstaff in Arizona to test the relative efficacy of aluminum coating for telescope mirrors compared to the conventional silver coating. The process of coating glass with aluminum had been worked on in the Physics Department. Shaw was essentially the chief scientist, while Boothroyd handled the logistics, and two or three graduate students served as “sherpas.” The expedition was a distinct success; for stellar spectra into the ultraviolet, aluminum turned out to be quite superior to silver and remains the coating of preference today even for the largest reflectors.

Also in the thirties, Shaw conceived the idea of building a 24-inch telescope to be used in Arizona for obtaining stellar spectra. A glass disc was obtained, ground, polished, and tested here in Ithaca. The War intervened and the project was put on hold. The telescope never did make it to Arizona; a mounting was built by the local BOCES and the assembly was installed where it now resides in the Hartung-Boothroyd Observatory on Mt. Pleasant. It is used in advanced laboratory courses in Astronomy.

Shaw was a very private person. He was committed to his teaching and it was done well, eliciting much praise from students. He was devoted to home and family, which included three sons, all of whom graduated from Cornell. His last years were rather lonely, his wife having died a few years earlier.

He is survived by a sister near Philadelphia; sons, Robert (Ph.D.) of Potomac, Maryland, Montgomery (Ph.D.) of Mansfield, Connecticut, and James (M.D.) of Hummelstown, Pennsylvania; as well as five grandchildren.

James R. Houck, Yervant Terzian, Paul L. Harttnan

John Sanford Shearer

Professor of Physics

1865 — May 17, 1922

In the death of John Sanford Shearer, Science in America has suffered a great loss.

He entered the university as an undergraduate with some previous experience as a teacher and with a decided taste for the study of physics and mathematics. He received the degree of B.S. in 1893 and of Ph.D. in 1901.

He was a member of the instructing staff from the time of graduation until his death on May 17, 1922 and during this long period of nearly twenty nine years he was continually in active service with the exception of the year 1910-11 when he was on leave of absence and acted as associate professor of Columbia University and of the war period (1917-19) when he was in war service. Skill and originality as a demonstrator combined with unusual mathematical ability characterized Professor Shearer's work as a teacher and in his capacity as one of the lecturers on experimental physics he exerted an inspiring influence upon many thousands of undergraduates

The installation of the department of physics in Rockefeller Hall afforded opportunities for the development of an eminently practical side of his character and he was largely responsible for the planning and successful operation of the liquid air plant and for many other important features in the equipment of the laboratory.

Later on Professor Shearer turned his attention particularly to the development of courses in X-rays for students of medicine and in connection with this work he acquired a knowledge which included with almost equal intimacy the theoretical, technical and therapeutic aspects of radiology. In this specialty he became an eminent authority and his advice was sought far and wide by physicists, instrument makers and physicians.

Upon the entrance of the United States into the world war Professor Shearer was called to the service of his country and was charged with the development and organization of the X-ray equipment of the army and with the training of its personnel for field and hospital duty at home and abroad. For his distinguished services in France he was three times decorated and received among other honors the *medaille d'honneur*. In 1919 he retired from the Sanitary Corps with the rank of Lieutenant Colonel.

There is reason to believe that Professor Shearer's early death was due to his exertions in war service and that he is to be counted among those who gave their lives for the country. In him the Trustees and Faculty have lost a valued colleague, the community a public spirited citizen and the sciences of Physics and Radiology a worker of eminence and renown.

Instructor, Assistant Professor and Professor of Physics, 1893 — 1922

Raymond Sheldrake, Jr.

September 7, 1923 – October 21, 2008

Professor Emeritus Raymond Sheldrake, Jr. was born in Prospect Park, New Jersey on September 7, 1923. He began his education in the public schools of Hawthorne, New Jersey and graduated from the Central High School in Paterson, New Jersey in 1942.

World War II had just started and Ray joined the U.S. Army in 1942. He was assigned to the U.S. Army Corp of Engineers and spent three years in the European theater. Ray was honorably discharged in 1945 and enrolled at Rutgers University, New Jersey.

Ray graduated from Rutgers in 1949 with a B.S. degree, majoring in Horticulture and Agricultural Education. He immediately enrolled at Cornell University for graduate studies and was awarded an assistantship in the Department of Vegetable Crops at the Geneva Experiment Station. At Cornell, he majored in Vegetable Crops, Soils and Plant Pathology and completed his studies for the Master of Science degree in 1950 and his Doctorate in 1952.

Upon receiving his Doctorate degree, Sheldrake was appointed as Vegetable Specialist in the Extension Service at the University of Georgia. He served in this professorial position for two years. In 1954, he returned to Cornell and the Department of Vegetable Crops as an Assistant Professor, was promoted to Associate Professor in 1957 and to full Professor in 1969.

Ray's first assignment at Cornell was in extension with youth where he introduced many innovations to the 4-H program. Later he achieved notoriety both statewide and nationally in teaching and research in addition to extension. He assumed responsibilities for teaching the beginning course in Vegetable Crops 101 (general horticulture). The course became a great success with increased enrollment of students from other departments in CALS and other colleges. Ray's successful approach included a number of "hands on" laboratories that the students loved. The spring semester course culminated with a public sale of the plants grown by the students during the semester. Amateur horticulturists from all over the local area looked forward each spring to observe and purchase the student's products. This was a great practical experience for the students and good public relations for the department and CALS.

Ray's communication talent was perhaps his finest attribute. He had the correct personality, charisma and enthusiasm to work with horticultural growers as well as students. They had instant respect and clearly understood

what he was teaching them. He became a popular statewide and national speaker. His talks attracted large crowds whenever he was on a program. In addition, his extension expertise included the written word where he authored a number of popular monthly columns and articles for extension as well as commercial publications, including the *American Vegetable Grower*. He wrote a number of Cornell extension bulletins, which received wide distribution. His instructions and plans for the “Cornell 21 Greenhouse” were for years one of the most popular publications produced by CALS. He and Emeritus Professor James Boodley of the Department of Floriculture, wrote a bulletin on the preparation and use of the artificial media, “Cornell Peat-lite Mix”, for the production of bedding plants that had state, national and international distribution. A number of companies were started that just commercially manufactured this mix for growers.

Professor Sheldrake especially enjoyed applied research to solve problems and made some very important contributions to the Horticultural Industry. Ray was at the forefront for innovations with uses of plastics in horticulture. Plastics products, especially polyethylene, were becoming available in the mid 1950s. Thin sheets of the plastic were manufactured in various lengths, widths and thicknesses. He was first involved in using large sheets as coverings for greenhouses, an inexpensive substitute for glass greenhouses. This allowed growers to increase production facilities quickly and cheaply as compared to glass greenhouses. He later demonstrated that two layers of plastic applied to the greenhouses would save about 30% of winter heating, a number still in use today. Ray also designed a plastic greenhouse that could be inexpensively built by small farmers, called “Cornell 21”. The design used standard materials and featured minimum waste of construction materials to produce the 100 feet by 21 feet greenhouse. Hundreds of these plans were sold by the Vegetable Crops Department. He also studied using polyethylene sheets to cover large surfaces of soil, which acted as a mulch to reduce weeds, reduce moisture loss and warm up the soil for early spring plantings. These systems are still used today on thousands of acres.

In the early 1960s, “bedding plants” were just becoming popular with home gardeners. A whole industry was evolving to become today a major part of the floriculture industry, and included both vegetable and flower growers. Bedding plant production fit well into the vegetable grower expertise, availability of facilities and seasonal schedule. At the time there was a major problem with seedling production, which involved disease, uneven production and lack of reliability. The cause was with the soil used for seedlings germination and growth. The standard was to use native soil and mix in ingredients such as sand, fertilizer and organic matter. Variation from grower to grower and location to location was large. Ray and his colleague, Emeritus Professor James Boodley, developed an artificial

media called the “Cornell Peat-lite Mix” composed of the common materials peat moss, vermiculite and/or perlite, plus lime and fertilizer. This product was an immediate success and today, forty years later, this is the media used by most bedding plant growers in the country, producing billions of seedlings per year, which add to the beauty and quality of life for many households nationwide.

In the late 1950s, Ray and his wife Elsie started a greenhouse business in Ithaca called “Early Bird Farms”. He used this facility to commercially prove many ideas he was expounding to growers. The business was very successful and is still run by his children and grand children today. Ray’s business motto was “Grow and Offer Quality Produce and People will Come and Buy”, and consumers did come and bought. Ray initiated an annual Poinsettia Show every Christmas at Early Bird Farms that continues to be a favorite holiday experience for the Ithaca community.

Professor Sheldrake took early retirement from Cornell in 1979 so he could spend more time consulting. He joined the W.R. Grace Company as a full time consultant, traveled for the company and helped develop their different bedding plant media and specialized fertilizers. After retiring from the Grace Company, he built a home and small research facility in Trumansburg, New York. He continued operating this facility for 10 years, then moved to Palmetto Florida and finally to a retirement home in Sun City Center, Florida.

Ray was an avid pilot and purchased his own plane in the 1960s. This was followed by two more, the last a twin-engine plane, which he used it to travel all over New York State and, in fact, the whole country. He was an avid golfer, particularly after retirement. He always carried his golf clubs in his plane and played golf at every stop. When he built his research greenhouses and home after retirement from Cornell, they were located right next to the Trumansburg Golf Course and Ray was seen every morning playing his early morning golf game.

Bowling was another of Ray’s sports. He was an accomplished bowler who participated in the Monday evening Agricultural Bowling League for a number of years.

Ray had four children: two sons, Gregory R. and George A. of Ithaca, New York; and two daughters, Barbara Bendzunas of Comer, Georgia, and Connie O’Connell of Mooresville, North Carolina. He also had five grandchildren. His wife, Elsie, died in 2002.

Ray made many contributions to Cornell students, state, national and international growers. Many of his innovations are still in use today. His special charisma gave him the ability to gain both students’ and growers’ confidence. The horticultural industry and his colleagues will miss his enthusiasm for horticulture.

Robert Langhans, Chairperson; Edwin Oyer, Leonard Topoleski

Shan-Fu Shen

August 31, 1921 — December 22, 2006

Shan-Fu Shen, Professor Emeritus of Mechanical and Aerospace Engineering at Cornell University, passed away after a short illness in Ithaca, New York, on December 22, 2006. He was 85 years old.

Born in Shanghai, China, in 1921, Professor Shen received the Bachelor of Science degree in 1941 from the National Central University in Chungking. In 1943, he won the prestigious Tsin-Hua Fellowship in Aeronautical Engineering by placing first and winning its fifth national competition. This fellowship supported postgraduate work at any U.S. institution. In 1944, he won the prestigious Sino-British Boxer Indemnity Fund Fellowship in Aeronautical Engineering by placing first and winning its ninth national competition. This fellowship supported postgraduate work at any British institution. In 1946, he accepted the Tsin-Hua fellowship and began graduate study at MIT. He brilliantly completed the Sc.D. degree in Aeronautical Engineering in 1949, with Professors C.C. Lin and H.S. Tsien, two of the world's leaders in theoretical and engineering fluid mechanics, as thesis co-advisers.

Following two years as a Research Associate in the Mathematics Department at MIT, Professor Shen joined the faculty of the Aeronautical Engineering Department at the University of Maryland, where he became a full professor in 1957. Then, in 1961, after eleven years at Maryland, he was convinced by W.R. Sears to become a Professor in what was then the Graduate School of Aeronautical Engineering at Cornell University, and there he remained for the rest of his professional career. A distinguished scholar in aerodynamics, fluid dynamics, and heat transfer, Shan-Fu Shen taught and advised Cornell undergraduates and graduate students, conducting his own research and guiding others until his retirement in 1991 as the John Edson Sweet Professor Emeritus.

During his career, a number of special appointments attest to his international distinction. He was a Guggenheim fellow at the Eidgenössische Technische Hochschule, Zürich in 1957; he served two one-year terms (1964, 1969) as Visiting Professor at the University of Paris; in 1977, he was a Visiting Professor at the Technical University of Vienna; and in 1984-85, he was a Visiting Professor at the Institute of Space Sciences at the University of Tokyo, and at three universities in China. Dr. Shen has also been a consultant to the David Taylor Ship Research and Development Center of the U.S. Navy on matters concerning the seaworthiness of marine vessels on rough seas, the dynamics of giant helicopters with circulation-controlled rotors, and design modification of aircraft for carrier landing.

Professor Shen's work over the years is striking for its diversity. He made important contributions in all regimes of aerodynamics including transonic and hypersonic, in aeroelasticity, in finite-element methods for aerodynamics, in hydrodynamic stability (including a notable review of the subject in the "Princeton Series"), in the kinetic theory of gases, in non-Newtonian flows, including modeling of polymer flows with heat transfer, in rarefied gas dynamics, and most recently, in the theory and computation of boundary-layer separation, especially in unsteady flow over maneuvering bodies.

Professor Shen made other notable engineering contributions in the years from 1974-88, when he was a Co-Principal Investigator, along with Professor K.K. Wang, who was the leader of the Cornell Injection Molding Program (CIMP). This program was conceived at Cornell in the early 1970s to help manufacturers facing difficult problems in producing plastic parts. The program initially was supported for one year by the National Science Foundation via its RANN (Research Applied for National Needs) program in the high risk—high potential benefit category. Because of the program's successes, the NSF support continued for a total of 12 years, as part of its aim to foster university-government-industry collaboration. In 1979, an industrial consortium was established so that a membership of more than 50 major corporations throughout the world might benefit from the results of the Cornell effort. The goal of CIMP was to establish a scientific basis for solving practical problems of injection molding, and Shan-Fu Shen contributed the necessary theoretical understanding of relevant fluid mechanics and heat-transfer issues. He made significant contributions to the success of this effort through research, with colleagues and graduate students, on transient and non-isothermal flow and solidification in polymeric materials. Professor Shen and colleague Dr. C.A. Hieber (Cornell Ph.D., 1970) published their results in the *Journal of Non-Newtonian Fluid Mechanics* in 1980; their predictions of flow-front positions and cavity pressure distributions agreed very well with experiments. The efficient numerical scheme that they developed paved the way for further advances in the analysis of flow and solidification of polymer melt in realistic mold cavities. Today, Shan-Fu Shen's studies of non-Newtonian flow and properties of polymer melts are recognized as important for enabling the efficient design and manufacture of the countless plastic products needed in the modern electronics and consumer products industries.

In recognition of these wide-ranging contributions to engineering science, Shan-Fu Shen was elected to the National Academy of Engineering in 1985. Professor Shen has received many other awards as well. He received the Achievement Award from the Washington Academy of Sciences in 1958 and was elected Fellow the same year. He was elected corresponding member of the International Academy of Astronautics in 1969 and in 1985 received

Germany's Alexander von Humboldt Senior Award. He became a member of the Academia Sinica (Republic of China) in 1972.

Over the course of his career, Dr. Shen has authored 75 refereed and invited articles appearing in, among others, *Annual Reviews of Fluid Mechanics*, *Advances in Applied Mechanics*, Vol. 4 of the Princeton series in *High Speed Aerodynamics and Jet Propulsion*, *Journal of Fluid Mechanics*, *Journal of Math and Physics*, *Journal of the Aeronautical Sciences* and *AIAA Journal*, *Journal of Statistical Physics*, *Journal of Computational Physics*, *Journal of Non-Newtonian Fluid Mechanics*, *Israel Journal of Technology*, and *Rheologica Acta*. Also, through the years, he has supervised many graduate students and post-doctoral fellows who went on to dot the map of universities and companies throughout the world.

Professor Shen always showed the greatest sense of responsibility for the fortunes of the graduate students he advised and led in research; they attest to the integrity, decency and imagination as well as scientific depth with which he inspired them, along with his rigor and occasional severity! One former student (W.G. Habashi, now of McGill University, a leader in the burgeoning field of computational fluid dynamics) especially remembers how tough and uncompromising Professor Shen was in his final Ph.D. exam. But, he also remembers Dr. Shen's friendly concern for his subsequent career, urging him to be independent, to go beyond his thesis subject and to do new things.

Shan-Fu Shen's faculty colleagues at Cornell remember him as a serious-minded but warm and helpful friend. K.K. Wang, recalling his association with him in the injection-molding program described earlier, says that at a critical time when he needed a partner to initiate interdisciplinary research on injection molding of plastics, Shan-Fu stepped in; and that for 14 years, Shan-Fu generously contributed his vital expertise in fluid mechanics and heat-transfer to the program; that, during that time, he was always a sincere and constructive critic, a reliable advisor and major contributor in matters of computational fluid mechanics; and that he was highly regarded not only by the students and research staff in CIMP, but also by program collaborators from industry and other institutions. Now, Professor Wang adds, "He will be remembered fondly by all of us who have worked closely with him for so many years."

Shan-Fu Shen was devoted to China and its culture, and to his family—his wife Ming-Ming and their son Hsueh-Yung and daughter Hsueh-Lang, who all survive him. He was certainly proud of the musical talents and accomplishments of Ming-Ming and both his children. And he was the proud host of many dinners at his home, where Ming-Ming showed her mastery of classical Chinese cuisine, to the delight of privileged guests!

So we must say farewell to Shan-Fu Shen, distinguished scholar, engineering scientist, faithful teacher, colleague and friend.

Franklin K. Moore, Chair; David A. Caughey, P.C.T. deBoer

Max Adams Shepard

May 8, 1907 — June 28, 1939

Max Adams Shepard, assistant professor of Government, was killed in an automobile accident on June 28, 1939. At the time of his death he was thirty-two years of age.

The son of distinguished parents, Max Shepard may well have derived his ability as a student of government from his father, Walter James Shepard, an outstanding political scientist who was for some years dean of the college of arts and sciences of the Ohio State University. After completing his undergraduate work at that university Professor Shepard entered the graduate school of Harvard University, where he received the degree of doctor of philosophy and remained to serve as fellow and tutor. Even at this early state he showed wide knowledge of his chosen subject, the theory of law and government, and unusual power as a critical thinker. He won general recognition as one of the best young scholars in his field upon the appearance of his first essays and articles; notably a study entitled *William Occam and the Higher Law*, and a discussion of the political and constitutional theory of Sir John Fortescue, which was printed among the *Essays in Honor of Charles Howard McIlwain*.

On coming to Cornell in 1935 Professor Shepard took up a full program of teaching in the department of Government, specializing in the exposition and criticism of the more recent theories of politics and law. He was a lively, provocative teacher, so successful in stimulating thought among his students that many a discussion begun in the classroom was continued in his office and even adjourned to the luncheon or supper table. On the campus Professor Shepard was rarely alone.

The fertility of suggestion and good humor which he carried into teaching also marked Professor Shepard's participation in committee work and discussion with his colleagues. By temperament he was an experimenter and liberal reformer in matters affecting educational method. Like his father he took keen interest in university administration. His help was a prime cause of the introduction and success of the co-operative seminar established in 1938 for students majoring in Government, Economics, Philosophy, and History. He had an active part in preparing the first syllabus for a general introductory course in the Social Studies.

No mere recital of achievements can convey the sense of loss which his students and colleagues have suffered. For them it is not so much that a career full of promise has been cut short as that a lively, warm-hearted friend has vanished.

E. Stanley Shepardson

January 13, 1913 — December 10, 2004

Edwin Stanley Shepardson (E.S.S.) and his twin brother, Walter Stanton, were born on January 13, 1913 to Stokes and Agnes Stanton Shepardson on a farm in the Town of Otselic, and reared on a farm in the Town of Smyrna in Chenango County, New York. In his youth, Stanley assisted his father with the operation of a 120-acre dairy farm, a practice that continued through the summers while he attended college. This background not only developed his keen interest in agriculture, but also set the path for his professional contributions in the years to come.

Stan, as he was affectionately called, received his B.S. degree from Cornell University in 1936, and that same fall joined the extension staff of the Department of Agricultural Engineering at Cornell as an extension instructor in agricultural engineering with responsibilities for 4-H programs in farm electrification. He was soon working with adult audiences, not only in farm electrification but also in farm machinery, farm power and related home applications. He was well suited to this work because of his farm background, readily developed a variety of related publications, and was popular with farm audiences—he knew their needs. He assisted the WWII Food Production Agency by developing and presenting programs and demonstrations throughout New York State on the repair and maintenance of electric motors and equipment, which were scarce resources due to the war effort. Later, he developed custom spray equipment for potatoes, fruits and vegetables, and trained operators in their use.

In 1941, he married his beloved life long companion, Mary Ward, and, after nine years in extension work, astutely recognized the need for advanced training to support his desire to contribute further to the field of higher education. He subsequently received his M.S. degree from Cornell University in 1947 and that same year was appointed Assistant Professor in the Department of Agricultural Engineering. The year 1949 marked his move to teaching and research responsibilities, where his extensive personal experience on the farm and in his highly successful extension outreach programs aptly served students whom he taught in courses on farm machinery, farm power, rural electrification and mechanics. This also began his service as a faculty advisor to undergraduate and graduate students, bringing a special real world flavor to the research programs of the latter. In 1950, he was promoted to Associate Professor and to Professor in 1958.

Stan's specialty in research was the development of mechanical harvesting machinery and he held several patents on his work. He had a great appreciation for the removal of drudgery from food production activities. He was the recognized leader in the development of a mechanical harvester for grapes, an application that reduced labor by a

factor of forty and was rapidly adopted in the U.S. and abroad. He was also involved in the development of cabbage and lettuce harvesters, mechanical grape vine pruners, mechanical apple harvesting, and the mechanics of the milking process in dairy cows, submarine cultivation of pond soils to increase fish production, seed pelleting, waste management and environmental applications. He authored or coauthored over fifty technical or research papers. Stan worked abroad with USAID in Israel, IRRI in the Philippines on their agricultural engineering development program, and in Australia with the Commonwealth Scientific and Industry Research Organization's fruit and vegetable harvesting programs.

He made a special contribution to the department during the 1950s when the Agricultural Engineering Department's new 2-acre building, Riley-Robb Hall, was approved for construction on campus. Stan led the effort to determine the physical system needs for the department's teaching, research and extension programs, which included all aspects of the equipment and instrumentation required to support the faculty, staff and students, and was responsible for its selection, as well as supervision of its acquisition. In 1958-59, he was named Acting Head of the department while O. C French was on leave in the Philippines, was Coordinator of Research from 1960-72, and Department Head from 1972 to his retirement in 1978. During his tenure, the department gained national and international prominence under solid leadership.

Stan was an active member of the American Society of Agricultural Engineers (ASAE) and chaired the North Atlantic Region during 1968-69. In 1973, he was elected a Fellow of ASAE, and designated a Life Fellow in 1978. Within ASAE, he was instrumental in obtaining accreditation approval for the Master of Engineering degree at Cornell in this field, the first in the nation. He was also a member of the American Society for the Advancement of Science, the Northeast Society of Conservation Engineers, and the American Society for Engineering Education.

Stan was an active and enthusiastic supporter of Cornell. He served as Treasurer of the Class of 1936 for many, many years and was its local representative for organizing and operating Class of 1936 reunions. He was the first contributor to the department's capital campaign, establishing the E. Stanley Shepardson Scholarship Fund for the benefit of its undergraduate majors. In addition, he designated funds for unrestricted support of Cornell's football, lacrosse and hockey programs, and donated to other scholarship programs in the College of Agriculture and Life Sciences. He was a member of Phi Kappa Phi and Sigma Xi, and in 1987, was honored by the Alumni Association of the College of Agriculture and Life Sciences with its Outstanding Alumni Award. Additionally, he was a past Master of Hobasco Lodge 716 of the Free and Accepted Masons, and a member of Rotary International.

Stan greatly enjoyed the outdoors, and he and Mary traveled extensively in the U.S. and Canada, with their trailer regularly heading to Florida in later years to follow the sunshine. He also enjoyed hunting, fly tying and fishing, but the greatest of these was fly fishing, and he had the black fly bites to prove it following trips to their summer hideaway in the Adirondacks. Surprisingly, the insect bites did not bother him one iota!

Stan was appointed Professor Emeritus in 1978, and on the occasion of his retirement, it was noted that the number 13 was well suited to Stan's life. He and his twin brother came into the world at a combined weight of 13 pounds on January 13, 1913, he spent four 13 year periods of professional practice at Cornell University, and was honored at the celebration of his retirement on June 13, 1978. And he enjoyed every bit of it. He was a grand gentleman to know.

David L. Call, Everett D. Markwardt, Ronald B. Furry

Dennis G. Shepherd

October 6, 1912 — January 9, 1994

The loss of Dennis G. Shepherd, the Joseph Edson Sweet Professor of Mechanical Engineering, Emeritus, is mourned by his colleagues and friends at Cornell, and the many Cornell students for whom he was such a devoted teacher. We remember and honor, too, the accomplishments of his career, and his dedicated service to the Sibley School of Mechanical Engineering.

Following his birth in England, Dennis came with his family to the United States in 1930. He attended the University of Michigan, and received degrees in mathematics and physics. During World War II, he returned to England, where he participated as a young engineer in the epochal development of the aircraft gas-turbine engine. He was in charge of combustor and turbine design as a member of the elite team which, under Sir Frank Whittle, developed the gas turbine that preserved our air superiority then, and which defines the world of flight today. He never told “war stories” about those years, which seems a great pity, given his talent for historical exposition. No doubt, his strong sense of modesty deprived us of some interesting and technically instructive stories!

Passage of time has made our victory in WWII seem inevitable, but one should remember those, like Dennis Shepherd, whose strivings were crucial to our success in that desperate struggle. During that time, he suffered the hearing damage of which we all became aware in later years.

In 1948, when he was 36, following a brief time as an engineer at A.V. Roe in Canada, he came to Cornell as an Assistant Professor. From that time until his retirement, and thereafter until his death, he was one of the World’s most notable teachers of engineering. It is important to note that Dennis was first an engineer, and then a teacher – being an engineer, he was able to teach about real machines. One of us has heard an old grad of the fifties tell about launching rockets at the (then) East Hill airstrip, under Professor Shepherd’s anxious supervision!

Dennis Shepherd’s fame as a teacher is, of course, in the memories of Cornell Students, but also, around the world, in the appreciation of his carefully-constructed, beautifully-written textbooks. *Introduction to the Gas Turbine* first appeared just after his arrival at Cornell. It was revised nine years later, and in that same year, his *Introduction to Turbomachinery* came out. A bit later, he completed his textbook *Elements of Fluid Mechanics*. Later still, his *Aerospace Propulsion* appeared. One realizes that these fine books are the legacy of a long career in engineering education; they were of a new type; they incorporated the underlying sciences of fluid mechanics, thermodynamics

and heat transfer into engineering analysis in a scholarly but lucid way. His books on Fluid Mechanics and on Turbomachinery remain in especially wide use, in industry and in academia.

In 1976, the American Society of Mechanical Engineers recognized these contributions to the technical literature by awarding him the Worcester Reed Warner Medal, and in 1984 by electing him Fellow of the ASME. During his career, he was honored by invitations to be Visiting Fellow at Imperial College (London), Technische Hogeschool (Delft), the University of Cardiff (Wales), and Jilin University of Technology (Jilin, China). Dennis Shepherd was modest and self-effacing; he appreciated the honors (too few) that came his way, but would certainly never solicit them. Never did he, in the midst of our self-absorbed academic culture, ever ask anything for himself or make personal complaint. And never did he fail to respond when some service was asked of him.

Dennis also expressed his love of engineering in a love of its history. In his mid-sixties, he became interested in wind turbines, and at his death he was writing a new book on wind power. His interest in this subject was in the understanding of principles and the appraisal of options for today. By way of introduction, he had completed a fascinating and thorough historical treatise covering 900 years of wind-power development. Despite the ecological enthusiasm for wind power, and despite his own enthusiasm for the subject, Dennis' professional integrity did not allow him to play promoter or advocate. No doubt, many students were disappointed by the limitations and difficulties he so carefully set forth concerning the prospects for wind power.

As a teacher of Engineering, Dennis Shepherd has a unique place in the story of Cornell. He was thorough, and quite strict, but students loved him anyway; he was fair and kind, and they knew he was devoted to their progress. In 1968, he received the "Excellence in Teaching" award of the Cornell Society of Engineers. He won that same award for an unprecedented second time in 1975! These teaching awards were not just nice for Professor Shepherd, but they signify a lifelong satisfaction and happiness on the part of numberless Cornell Alumni concerning their educational experience here; that is Dennis Shepherd's ongoing, one may say perpetual, gift to Cornell, one which we will always honor.

Dennis served as Director of the School of Mechanical Engineering for seven years beginning in 1965. During that time, he developed a Master of Engineering program which entailed design projects supervised cooperatively with Industry. After a few years, this initiative faded because his vision was not shared by the School's faculty at that time. But his vision was in fact prophetic, because such cooperative, interdisciplinary projects are now considered the mark of a forward-looking engineering curriculum! Also during his Directorship, he oversaw a major revision

of the undergraduate curriculum, one that streamlined and broadened the foundation courses of the field which, for twenty years, have provided a smooth transition to higher-level studies in modern technology.

In 1979, Dennis Shepherd retired, and during the first eleven years of his //retirement,./ continued to teach a course each term, and for two of those years was in charge of modernizing the Senior Laboratory of Mechanical Engineering, a remarkable assignment for an emeritus professor!

Dennis Shepherd was a deeply devoted husband and father; his wife, Gertrude, his son, Julian, and his daughters, Joanna and Barbara, survive him. With them, his colleagues and students will always hold this good and faithful man in fond memory. Each year hereafter, the Sibley School will especially remember Dennis Shepherd, the great teacher, by making a teaching award in his name, from a special endowment established for that purpose.

Edwin L. Resler, Jr., Kenneth E. Torrance, Franklin K. Moore

Giles F. Shepherd, Jr.

November 21, 1912 — March 9, 1979

Giles F. Shepherd, a long-time leader in academic librarianship and for twenty-eight years assistant director and associate director and acting director of the Cornell University Libraries, died after a short illness on March 9, 1979. All during the 1950s and 1960s Shep had worked in close partnership with Stephen McCarthy to restore and enhance the Cornell Libraries and bring them to their position among the best of North America's academic research libraries. He presided over the planning and construction of six major library buildings on the Cornell campus, including the John M. Olin Research Library and the Uris Undergraduate Library, which together form Cornell's central library.

An indefatigable and curious pursuer of the treasures of scholarship and history, he was a true librarian, even though he found himself inevitably carrying a heavy administrative load. Among his major contributions to the enrichment of the record of Cornell's own history was his tracking down and identifying the long-lost diaries of Andrew D. White, Cornell's first president.

When he retired from Cornell as acting director in January 1975 he left to his successors a large reservoir of good will among the faculty who used the libraries and among the staff who were his colleagues. He had arrived at Cornell for his first interview with Stephen A. McCarthy just twenty-eight years before. With Dr. McCarthy and Professor Felix Reichmann he formed a triumvirate that together succeeded in rebuilding one of North America's richest library collections and at the same time created a campus-wide library system and assembled a library staff that was worthy of a great university.

The influence that Shep exercised among his colleagues in academic librarianship extended across the country. Nowhere was it stronger than in his adopted state of New York where he served on the New York State Commissioner's Committee on Libraries and was a close adviser of successive state librarians. He participated actively both as an individual and through the New York Library Association in the successful efforts that led to the establishment of the New York State Interlibrary Loan network and the New York regional research library councils. With Steve McCarthy and, subsequently, David Kaser, he shared in the founding of the Five Associated University Libraries, one of the earliest of the cooperative library consortia, which later became the instrument for the introduction of the OCLC shared cataloging system into New York State.

Though his professional interests were thus diversified and he came to Cornell from afar, Shep was first and last a Cornellian. He absorbed the lore and the legends, but even more importantly he was a valued colleague and resource among faculty in every department across the entire range of the campus. His view of Cornell was not focused on the Library Tower or even on his critical responsibilities in the library system, but he saw Cornell in its wholeness and in all of its breadth and richness as an institution.

His retirement in 1975 did not loosen the bonds with Cornell. He extended his activities as a gifted photographer of birds and an enthusiastic amateur ornithologist. This second career, which his wife Margaret shared with him, carried them both on fascinating and unconventional tours, and they shared their experiences with their friends in the generous hospitality of their home.

Shep was born November 21, 1912, near Burlington, North Carolina, and after going through the public schools he went to the University of North Carolina at Chapel Hill, from which he graduated in 1934. He earned his master's degree in librarianship at the University of Illinois in 1942 and then returned to the University of North Carolina library as head of the circulation department, where at the same time he undertook graduate work in American history.

He married Margaret Langley of South Boston, Virginia, in 1937 and she was always closely associated with him in his professional life and shared with him and the Cornell library staff the labors, troubles, and triumphs of his efforts in building and leading the University's library program. Shep's and Margaret's children are Barbara, married to Philip Brunskill, living in Mayville, New York; and Freemont, married to Sue Loveland, and living in Everett, Washington. Their four grandchildren are Douglas and Gordon Brunskill and Kelly and Geoffrey Shepherd.

As we all expected, his devotion and loyalty to Cornell continued to be demonstrated past his retirement. Until the day before his death he was engaged on University library business. We in the Cornell libraries feel his loss grievously and his memory will long be with us.

W. Donald Cooke, Felix Reichmann, J. Gormly Miller

Arden Frederick Sherf

August 7, 1916 — September 19, 1989

Arden Frederick Sherf, professor emeritus of plant pathology, died at Tompkins Community Hospital on September 19, 1989, at the age of seventy-three after a brief illness. He was born in Brooklyn Center, Minnesota, son of the late Fred E. and Alice Lavina Stubbs Sherf. He received the B.S. degree in plant pathology from the University of Minnesota in 1939. Work toward an advanced degree in plant pathology, started at the University of Nebraska in 1939, continued until 1942 when it was interrupted for military service. While in the U.S. Navy, Arden served as a pharmacist mate, a submarine communications officer, and a research plant pathologist at Fort Detrick, Maryland. Following World War II, Arden resumed his studies at the University of Nebraska, receiving the Ph.D. degree in plant pathology in 1948. He also remained active in the U.S. Naval Reserve for 20 years after the war, retiring with the rank of Commander.

Before coming to Cornell in 1954, Arden served as extension plant pathologist at the University of Nebraska from 1946-49, moving to Iowa State University in 1949 where he was assistant plant pathologist and later associate plant pathologist and extension specialist. Arden became professor of plant pathology in 1959, and also served as department extension leader at Cornell until his retirement in 1981.

Arden became widely known for his contributions to extension plant pathology and to extension's motto of "helping others to help themselves," a philosophy he followed for his entire career. His dedication to the dissemination of disease control information affected all facets of the vegetable industry—growers, processors, county agents, and other agricultural specialists and agribusiness personnel. A major contribution in this area was co-authoring the textbook *Vegetable Diseases and Their Control* with Professor Charles Chupp in 1960. This useful text was revised extensively in 1986 in collaboration with his former student, Dr. Alan MacNab. This edition, like the first, is a significant contribution to the art and practice of plant pathology.

Dr. Sherf's reputation as a leader in extension brought demand for his services on both national and international levels. He served as a member of review panels for several plant pathology departments. He was an unpaid consultant to seedsmen, vegetable-processing firms, and fungicide companies. His research on control of vegetable diseases by seed treatments, soil fumigants, and foliar fungicides brought requests for his counsel on registration of chemicals for minor crop uses, and rebuttable presumption against registration (RPAR) consideration for several fungicides.

In addition to his work at Cornell, Arden served as a vegetable consultant to the British Ministry of Agriculture in 1968 and to the Department of Agriculture of New South Wales, Australia, in 1975.

Dr. Sherf was an active member of the American Phytopathological Society since 1942 and served as chairman of numerous APS committees. He was elected a Fellow of the Society in 1980. In 1983, his professional colleagues bestowed the northeastern division APS award of merit upon him.

Aside from his professional accomplishments, Arden devoted his considerable energies to supporting youth activities and community affairs. He had a life-long interest in music, particularly jazz. As a youth, he played the saxophone and had his own dance band in high school and as an undergraduate student in college. He also served as manager of the University of Minnesota football team.

In the eight years of his retirement, Arden was active in volunteerism, including the Kitchen Cupboard and the Tompkins Community Hospital Auxiliary where he worked closely with families whose loved ones were facing serious operations. Arden and his wife, Jean, also traveled extensively and served as tour group leaders in Europe on numerous occasions. They especially enjoyed the many new friends they made.

Arden is survived by his wife, Jean; two daughters, Carol Flower and Andrea Smith; two sons, David and Stephen; a brother, Glenn; eleven grandchildren; and several nieces and nephews.

Carl W. Boothroyd, Edward D. Jones, Thomas A. Zitter

Jacob Theodore Sherman

September 5, 1898 — January 6, 1950

Jacob Theodore Sherman, Assistant Professor of Clinical Obstetrics and Gynecology at the Cornell University Medical College, died on January 6, 1950. Born on September 5, 1898 in Brooklyn, he attended the public schools, DeWitt Clinton High School and the Long Island College for premedical training. He was graduated from the New York College of Homeopathy in 1923 and interned at the Flower Hospital. After his marriage in 1936, he went to Europe for a year studying at the University of Vienna, Leipsig and Stuttgart. He was Assistant Outdoor House Surgeon at the Lying-in Hospital from August to October 1927 and House Surgeon on the Outdoor Service from October to July 1928. He was Indoor House Surgeon from September 1 to December 31, 1928. Two years later he was appointed Associate Attending Surgeon.

Several years ago he had a serious heart attack. At that time he was relieved of his teaching responsibilities and yet, even on his private cases, he continued his efforts to teach both in the delivery rooms and on the pavilions. He never missed an opportunity to give the younger members of the staff the benefit of his knowledge, for he was an avid reader, and of his experience. He had learned from his associations with the older men and especially from Dr. Jellinghaus who had taken him under his wing, so to speak. He seemed imbued with the idea so beautifully expressed by John McCrea in his poem, "In Flanders Field". "To you from failing hands we throw the torch, be yours to hold it high."

His death was not entirely unexpected; nevertheless it came with dramatic suddenness on January 6, 1950 when he dropped while waiting for an elevator and expired immediately. With intimations of the end he had left word that he preferred no ceremonies at his death, no flowers and no gathering; only a few words like Tennyson's "Crossing the Bar".

"Twilight and evening bell,
and after that the dark
And may there be no sadness of farewell
when I embark."

We have lost an associate, a friend, a teacher but we will retain the memories of a fine character. Brave, bold honest and true; he was a faithful comrade.

Meyer Rosensohn

James Morgan Sherman

May 6, 1890 — November 5, 1956

On November 5, 1956, Professor James Morgan Sherman died at his home in Ithaca. His death terminated an active scientific career in dairy science and bacteriology, where his contributions earned him world-wide acclaim. His scientific publications, numbering more than 100, spanned the years from 1914 to 1955 and paralleled the period of rapid development of bacteriology in the United States. Through his research and that of his students, through his teaching, and through his active participation in scientific societies, especially the American Dairy Science Association and the Society of American Bacteriologists, his influence in the development of agricultural bacteriology was not surpassed by that of any other scientist of his generation. His philosophies, engendered in his many successful students, continue to be dominant in the bacteriological thought of this country.

Professor Sherman was born at Ash Grove, Virginia, on May 6, 1890. He attended primary school in Virginia and high school in Washington, D. C. After he received the B.S. degree from North Carolina State College in 1911 he undertook graduate study at the University of Wisconsin where he was a Graduate Assistant and was granted the M.S. degree in 1912 and the Ph.D. degree in 1916.

From 1914 to 1917 he was Instructor and Assistant Professor at Pennsylvania State College. In 1917 he became Bacteriologist with the U. S. Department of Agriculture and held this position until 1923 when he came to Cornell University as Head of the Department of Dairy Industry. In 1955 he retired as Head, but continued on as Professor of Bacteriology.

Professor Sherman's major research work concerned the microbes in agriculture, industry, and medicine, and centered in particular on the bacteria of importance in the dairy industry. One cannot read far into the literature of the streptococci without encountering the "Sherman criteria", a term that has come to embrace a series of cultural and physiological reactions described by him and used widely in the study of these bacteria. His introspective monograph, *The Streptococci*, which appeared in the first issue of *Bacteriological Reviews* in 1937, described in detail and firmly established the taxonomic relationships between many species of this important genus. For his pioneering work with a cheese-ripening microorganism, *Propionibacterium*, his colleagues honored him by assigning the species name "shermanii" to this bacterium.

Professor Sherman's preoccupation with his many university and professional duties left him little time for outside activities or hobbies. He approached his formal teaching, of which he did a great deal at Cornell, with the same

Careful preparation and thought that marked his research. He recognized the important role of the university teacher and encouraged good teaching.

In research, Dr. Sherman promoted individual and independent thought. Under his administration his staff enjoyed and were grateful for a free rein in the pursuit of their separate researches.

Professor Sherman was a member of various educational, scientific and professional societies, numbered among which were the American Chemical Society, the Society for Experimental Biology and Medicine, and the American Association for the Advancement of Science, of which he was a Fellow. He was a member of the honorary and professional societies Sigma Xi, Phi Kappa Phi, Alpha Zeta, and Gamma Alpha.

His more prominent positions and activities also included the following. From 1923-34 he was Secretary-Treasurer of the Society of American Bacteriologists, in 1936 its Vice-President, and in 1937, President. From 1937-1944 he served as Associate Editor of *Bacteriological Reviews*. During this same period, from 1936-1944, he served as Associate Editor of the *Journal of Bacteriology* and was Editor-in-Chief of this publication during the years 1944-1951. He was a member of the Editorial Committee of the *Annual Reviews of Microbiology* from 1944-1955, and a member of the Board of Editors of the Cornell University Press from 1938-1943.

His offices in the American Dairy Science Association during the years 1928-1930 included those of Secretary-Treasurer, Vice-President and President. In 1931, he was a delegate from the United States to the World Dairy Congress. At various times during his career he was consultant to the Surgeon General of the United States Army, the Chemical Corps of the United States Army, the Federal Security Agency, the United States Public Health Service, the National Research Council and the New York State Department of Health. In recognition of his outstanding contributions, in 1948, the University of North Carolina awarded him the honorary degree of Doctor of Agriculture.

Professor Sherman's quality of humbleness, so striking to many on first meeting him, reflected itself in the simplicity of his daily life. He had no sympathy with pretention, and little time for the publicity-seeking scientist. Although by nature he was a retiring person, he never hesitated to defend his principles, and could do so in a forceful and persuasive manner. He found a deep but modest satisfaction in his own accomplishments and those of his students. In many ways, by his own example, he impressed on his students the importance of good workmanship and of accuracy in detail, whether in the laboratory, in teaching or in writing. He was a relentless critic of shoddy thought and the hastily-drawn conclusion.

Professor Sherman sought and enjoyed the fellowship of his colleagues at Cornell. Among his professional associates throughout the country he numbered a host of loyal friends, young and old. His acquaintances and friends who are not in a position to judge his merit as a scientist and teacher, remember him for his personal charm and dignity, his gentle manner, and his warm concern for the welfare of others.

W. H. Burkholder, R. F. Holland, H. W. Seeley

John Harold Sherry

December 19, 1902 — December 26, 1984

In spring 1935 the School of Hotel Administration made one of its finest decisions for its future. John H. Sherry of New York City was invited to come to Ithaca once a week to present a course about the law as it related to innkeeping. At that time he was counsel for a number of hotels in New York City and for the American Hotel Association. His services were to be rendered without compensation. He accepted the lecturer's appointment on July 1, 1935.

For twenty-five years he left New York on Wednesday night aboard the Lehigh Valley Railroad and returned on Thursday night. He expanded his offerings to two courses, "Business Law" and "Law of Innkeeping." He was able to balance the demands of his active practice and family to commute on a regular basis for that one day a week at Cornell. He was promoted to professor on July 1, 1956.

When the railroad no longer offered service to Ithaca, he opted for an alternative, Mohawk Airlines. John used this and its successor organizations for fifteen years in spite of the uncertainty of reliable service. A combination of commercial airlines and air charters were used when necessary. The closest call he experienced in meeting his obligation came when a spring blizzard struck the Ithaca area. A private plane chartered by the University was scheduled to leave the Teterboro airport with five other passengers. The pilot learned that the Ithaca airport was closing, and a vote was taken whether to fly. John argued eloquently in favor of going but lost the case 5-1. On appeal, as the weather deteriorated even further, John lost again and accepted the realization of missing his first Cornell class in thirty-six years. However, with this perfect record hanging in the balance, the gods of mercy smiled. For the first time in its history, Cornell University closed down and all classes were canceled. John's record remained unblemished.

In fall 1975 John relinquished his teaching responsibilities at Cornell to his son, Professor John E. H. Sherry. At a reception in John's honor upon the occasion of his retirement, a testimonial resolution read:

*JOHN H. SHERRY, Professor of Law, Counselor, Scholar. **Whereas**, we, his colleagues, associates and friends desire to witness his forty years of continuous instruction at the School of Hotel Administration; and **whereas**, we desire to testify to the prosperity of his students because of his wisdom, dedication and leadership; **be it resolved**, noted by all men, and sealed by those present that we express our appreciation and acknowledge our gratitude for his loyalty, service, and friendship. Ithaca, New York, September 4, 1975*

John remained active in the practice of law. His book, *The Laws of Innkeepers*, was revised and continues to be a seminal contribution to the hospitality field. He remained active in many industry, legal, and professional associations and visited the school regularly. The School of Hotel Administration established a scholarship in his honor. He was elected professor emeritus by the board of trustees on January 26, 1980.

John Sherry was renowned for his skillful instruction, colorful use of language, wise counsel, genial graciousness, and most remarkable record of teaching at Cornell. We were saddened to learn of his passing on December 26, 1984.

Richard A. Compton, Donal A. Dermody, Robert M. Chase

Albert C. Sherwin

March 23, 1922 — July 14, 1969

The medical staff of the New York Hospital, the Department of Psychiatry of Cornell Medical College, and the personnel of the Westchester Division, were shocked and saddened by the sudden death of Dr. Albert C. Sherwin on July 14, 1969, at forty-seven years of age. At the time of his death he was associate professor of psychiatry at Cornell Medical College and associate attending psychiatrist in New York Hospital, serving as chief of the in-patient services at the Westchester Division of the New York Hospital.

Dr. Sherwin was a native of New York City, born on March 23, 1922, one of two children. His father was an attorney and his brother, who survives him, is also a member of the legal profession. He attended secondary schools in New York City and then entered Columbia College, graduating in 1942. He had, besides an outstanding scholastic record at this institution, distinguished accomplishments in extra-curricular activities, especially in music. In this field, his work as a pianist, arranger, and conductor was outstanding. This talent produced conflicts regarding his life's goal and his indecision between a law career and medicine. It was society's good fortune that he decided upon a medical career.

He was graduated from the Columbia University College of Physicians and Surgeons in 1947 and served an internship at the Hospital for Joint Diseases in New York City. He selected the field of psychiatry as a specialty and received his graduate training at the Payne Whitney Psychiatric Clinic from 1949 to 1952. Following his residency he served as a captain in the United States Air Corps, functioning as a psychiatric medical officer from 1952 to 1954 in the European theater of operations. After his discharge he returned to the full-time staff of the Payne Whitney Psychiatric Clinic and continued to serve there until he joined the staff of the Westchester Division in September 1968 where he continued until his untimely death.

At the New York Hospital he attained the ranks of assistant attending and associate attending psychiatrist. Following his return to the Payne Whitney Clinic he joined the out-patient department as assistant chief of the entire psychiatric out-patient department until 1956, when he assumed the directorship of child psychiatry and chief of the children's out-patient department. He continued in this capacity until 1966, when he transferred to the Westchester Division, at first as a part-time supervising consultant and then assuming the position of chief of in-patient services in September 1968. Throughout this period of service he held the ranks of instructor, assistant professor, clinical associate professor, and associate professor of psychiatry at Cornell University Medical College.

In his professional career he attained distinction as a physician and psychiatrist. He was recognized as an excellent clinical psychiatrist based on a firm foundation of structured principles of psychopathology. He was a skilled therapist with a dynamic orientation, aware of all therapeutic tools and techniques. As a teacher, he was held in the highest esteem by all who had any contact with him. The basic course on psychopathology for second-year medical students was revitalized and reorganized by him. This course is held in high regard in the school's curriculum. Residents and fellows were stimulated by his grasp of clinical and therapeutic concepts and the ability to impart his gifts to them. He was always available as a teacher to all professional personnel, including pediatricians, social service workers, and psychologists, giving freely of his wisdom with consultation and advice. He assumed the directorship of the children's service with a reluctance to commit himself completely. Nevertheless, his contribution to this field regarding autistic children, diagnostic criteria for schizophrenia, and the interaction of families with sick children to their social, cultural environment, were outstanding.

In September 1966, at the Westchester Division, he returned to his favorite area of psychiatry as director in charge of the treatment of patients and supervisor of residents and was in the process of formulating research plans of a wide variety. He contributed many other articles to the literature in the field of psychiatry, involving application of creativity, arts, and music in the field of psychopathology. He held memberships in various professional societies: the American Board of Psychiatry and Neurology Inc., the New York County Medical Society, the American Psychiatric Association, the New York District branch of the APA, the New York Council for Child Psychiatry, and others.

Despite his active psychiatric career, he had a reputation among the entire personnel of the New York Hospital for his musical talents. At most social functions he would end up "on the piano," playing to the delight of all the guests present. He organized and conducted choir groups for the resident staff as well as the nurses and other interested persons. He was short in stature, somewhat obese, with pyknic features. All who knew him will remember him as an intelligent, warm, friendly human being with a kind, sensitive, and humorous charm. He was conscientious and devoted to his patients almost to a fault. He was a dedicated family man and is survived by his wife, Dr. Marie Louise Schoelly, also a psychiatrist, who shared not only his personal life but collaborated with him in many of his professional accomplishments. In his passing, the New York Hospital, Cornell Medical College, and society have lost a physician, clinician and teacher and we will miss a distinguished colleague and a devoted friend.

Francis J. Hamilton, M.D.

W. Frank Shipe

March 8, 1920 — May 20, 2008

Born in Middletown, Virginia, March 8, 1920, W. Frank Shipe received his B.S. degree in Dairy Science in 1941 from Virginia Polytechnic Institute. Immediately after graduation, he was called into the Army. He served over four years, mostly in the Pacific theater in the artillery and achieved the rank of Major. Upon discharge, he returned to VPI as an Instructor. In April 1946, he entered graduate school at Cornell and earned his Ph.D. degree in September 1949. He majored in Dairy Chemistry and minored in Organic Chemistry and Bacteriology.

Since joining the Cornell faculty, October 1, 1949, Professor Shipe devoted most of his time to teaching and associated educational activities, but also maintained a very active research program, publishing over 100 scientific papers and articles. His research efforts were devoted primarily to determining the factors influencing fluid milk spoilage and in developing methods for monitoring quality. His work on the freezing point of milk led to the universal adoption of the thermister type of cryoscope and the use of standard salt solutions for their calibration. He introduced the Infrared Milk Analyzer (IRMA) for milk fat and protein analyses in New York State. His studies as associate referee for the Association of Analytical Chemists (AOAC) led to the adoption of turbidometric instruments (e.g. Milko-Testers) for determining the fat content of milk. He also developed improved methods for measuring free fatty acids and the Vitamin A contents of milk.

Much of his work on milk quality pertained to factors affecting milk flavor. His findings relating to lipolytic and oxidative changes during storage of milk contributed to the control of these defects. Professor Shipe and his graduate students demonstrated beneficial and harmful effects of various milk enzymes. These studies led to the development of procedures for immobilizing enzymes. He and his colleagues developed pigmented plastic milk containers that protect the flavor and the vitamin A and riboflavin contents of milk. His research on dried beans helped to elucidate the causes for decreases in protein digestibility during storage.

During his teaching career, Professor Shipe taught over 4,000 students and advised more than 300 undergraduate and 40 graduate students. He always took a personal interest in his students and he and his wife, Margery, generously extended the hospitality of their home as an expression of friendliness and genuine interest in each individual.

As a teacher, Professor Shipe's dedication and performance was outstanding. One of his greatest assets was his untiring willingness to work with both undergraduate and graduate students on a one-on-one basis as well as in

the classroom and laboratory, and his motivation and stimulation of students came not from a heavy hand, but by subtle direction toward self-discipline and inquiry. He also was very innovative in the classroom, being one of the first department members to use the overhead projector and videotapes. In recognition of his excellence in teaching, he received the coveted American Dairy Science Association (ADSA) Kraft Teaching Award in 1982.

The first course Professor Shipe taught, beginning in 1952, was entitled Commercial Grades of Dairy Products, which dealt with the grading of the sensory qualities of dairy products. With Professor Shipe's coaching, the Cornell Dairy Products Judging team entered seventeen national contests and eight northeast regional contests. Throughout those years, a number of the team members won awards for judging milk, ice cream, butter, cheese and yogurt. These contests gave the team members and coach an incentive to improve their sensory acuity and sensory vocabulary. When the dairy emphasis was replaced with the food science curriculum in 1964, he modified this course to include all foods and placed more emphasis on the principles of sensory evaluation and statistical analysis of data. He taught this course, Sensory Evaluation of Foods, from 1965-88. Similarly, his Introductory Dairy Science Course, taught from 1957-64, was revised to include other foods and renamed Food Properties and Analysis. From 1972-86, he supervised the course in Food Chemistry for seniors and graduate students. In 1972, he developed a new course entitled Food Facts and Fads, currently called Food Choices and Issues. It was developed for non-majors to provide specific information about foods and the food industry and to dispel misconceptions about them. Since its inception, the course has had the largest enrollment of any food science offering, currently over 200 students from various disciplines.

In addition to chairing the department's Scholarship and Curriculum committees for over 20 years, Professor Shipe served the College of Agriculture and Life Sciences on the Program Area, Physical Science, Honors and Curriculum Committees. He was also a member of the University Faculty Council for four years.

During periods of sabbatical leave, he conducted research on the evaluation of stabilizers for ice cream at North Carolina State College in 1956-57, served as Flavor Project Director for the New York State Department of Agriculture and Markets in 1963-64 and conducted studies on milk fat globule membrane at the National Institute for Dairying, Reading, England in 1970-71. In 1985, he worked as a volunteer for Bread for the World by drafting legislative proposals pertaining to aid for developing countries. Other professional activities include: AOAC Associate Referee for Cryoscopy; AOAC Associate Referee for Automated Fat Tests; Secretary-Treasurer, Vice President and President of the Eastern Division of ADSA; Student Affiliate Committee of ADSA; Secretary-Treasurer, Vice Chairman and Chairman of Central NY Institute of Food Technologists, and Flavor Nomenclature

and Reference Standard Committee of ADSA. He has been a member of the American Chemical Society, American Dairy Science Association, Institute of Food Technologists, International Association of Milk, Food and Environmental Sanitarians, Alpha Zeta, Phi Kappa Phi and Sigma Xi.

Professor Shipe and his wife were active members of Saint Paul's United Methodist Church for over 40 years, where he served on several committees and as Lay Leader. He was also a very public spirited individual, frequently sending letters or telegrams to his state and federal representatives, the President and occasionally to the editor of the *Ithaca Journal*.

Professor Shipe retired from full time department activities July 1, 1986. He continued contributing to the department for several years. He spent time every week in Stocking Hall where he continued some of his research on milk quality and gave lectures in the Food Chemistry and Food Choices and Issues courses. His retirement allowed him more time to spend with his wife, Margery. They were married 59 years when Marge died in 2007. He attributed much of his success to her advice and support. Their two daughters and their husbands, 11 grandchildren and six great-grandchildren survive Professor and Mrs. Shipe.

John W. Sherbon, Chairperson; David K. Bandler, James C. White

Ephraim Shorr

June 1, 1897 — January 6, 1956

We have come together to honor the memory of our friend Ephraim Shorr. To us who knew and loved him, his sudden and untimely loss is inexplicable and almost unbearable. But in our grief and bereavement it is appropriate that we think for a few moments of the meaning of his life and the influence it has had and will have on us and on others.

Ephraim Shorr's remarkable intellectual qualities were recognized from his earliest school days. His retentiveness was prodigious; his synthesis of ideas, intuitive; his critical capacity, precocious. Edward Tolstoi, a classmate in high school at New Haven, his roommate and close associate in college and medical school, tells us of his photographic memory, his effortless leadership in all classes, his skill as a pianist, his artistic appreciation and rendition of Chopin, Mozart, and Bach, his facility as a draftsman, his enthusiastic participation in sports and other extracurricular school activities. He tells also of his generosity and helpfulness to those who were less gifted—a trait that characterized him throughout his life.

During his education at New Haven, Ephraim Shorr received many honors. Great expectations were entertained for him not only by his family but also by enthusiastic friends and teachers. These good opinions he took seriously as obligations for fulfillment; and with all the industry, pertinacity, and faith that were in him he strove throughout his later life to match in achievement his own great talents and the confident anticipations of his friends. To everyone who is both ambitious and conscientious, the laudable but vain desire for fulfillment is a compelling motive. To Ephraim Shorr it was a passion which was responsible in no small part for his later erudition and accomplishment.

Upon his graduation from Yale Medical School he sought internship at Mount Sinai Hospital, where his examination entitled him to first choice of places and where he spent the next two and one-half years in clinical service and study.

Then in 1924 came the time for decision concerning his future course. He chose, perhaps because of the influence of his great teacher Lafayette B. Mendel, to focus his efforts on the field of metabolism and nutrition at Cornell, where Graham Lusk had established a school of metabolic research and where Eugene DuBois was pioneering in the application of calorimetry to study of disease.

Eugene DuBois tells of Ephraim Shore's arrival at Cornell and the Russell Sage Institute of Pathology. He came armed with a fine letter of recommendation from Lafayette Mendel and with preparation and qualifications meriting an important post in any medical school. His demands were modest. He did not care for high-sounding titles, big budget, or elaborate equipment. All he wanted was a place to work and opportunity to test some ideas in research. When he was told that the only available post was that of a laboratory technician, he accepted it eagerly and gratefully. Although the position was unimpressive, it offered the inestimable advantage of freedom to engage in basic fundamental investigation without consideration of immediate practical application.

This was the modest beginning of a distinguished career in research and teaching that was conducted over a period of thirty-five years entirely at Cornell University Medical College, the New York Hospital, and the Russell Sage Institute of Pathology

To his lifework Ephraim Shorr brought remarkable qualifications. The scope of his detailed information was phenomenal. To the study of problems of metabolism and endocrinology he could apply assimilated knowledge of biochemistry, physical chemistry, and general physiology that aided in the creation of new and challenging hypotheses and afforded direction and continuity to his explorations and research. He reacted adversely to the idea of the amateur in research. He knew, as few men have, the background, preparation, and concentration that are necessary in the evolution of valid hypotheses and secure establishment of the simplest facts. Because of his own extraordinary capacity and fertile imagination, many of his investigations became immediately productive. It was a pleasure to watch him develop a problem and then devise method and decisive experiment for its solution; lines of approach were so precisely anticipated and planned that without false starts or perceptible delay they were translated into trial and action. Ephraim Shorr was an excellent technician, meticulous in detail; his experiments were painstakingly executed and they were repeated until he could convince himself of their accuracy and significance. This in itself was a difficult task, for he was an exacting critic of his own work. He once spoke of Mr. Fabian Soderstrom, the remarkable mechanic who built and operated the Sage Calorimeter, as a man who made every piece of apparatus a little better than was necessary. It could be said of Ephraim Shorr that he always took care to have his own technique and experiments a little better than was necessary. Once he had convinced himself of the accuracy of his own work he never feared to defend it.

The extent and variety of his investigations were impressive. It was his principle that in his laboratories there should be at least three projects going at all times; one so involved that completion could not be expected in a lifetime; another with a likelihood of solution in several years; and a third that might be completed in several months.

This is neither the place nor the time to recount all of the problems that engaged Ephraim Shorr's attention. It is possible only to indicate the weight of his contribution to science. His interests ranged over the field of endocrinology and metabolism. They included studies of parathyroid diseases, examination of creatin metabolism in maladies of the thyroid, influence of the pituitary on the pathogenesis of diabetes, calcium and phosphorus disturbances in diseases of bone, urinary stone formation, the action of sex hormones on citric acid excretion, the effect of menstruation and varying clinical states on epithelium of the vaginal tract, action of adrenal hormones in shock and hypertension, infrared spectra of steroids. During the past decade the major focus of his interest was a study of substances formed in liver and kidney during anaerobiosis and their action upon circulation in various normal and pathologic conditions. This exploration, one of the most productive of our time, led among other things to definition of the functions and actions of ferritin and its identification with a harmful substance elaborated by the liver during the development of shock. Some of this important work was presented in 1954 in Ephraim Shorr's Harvey Lecture.

This phase of his researches was never more productive than during the last year. Recent conversations with him disclosed his joy over the success of some of the newer experiments in which he saw the possibility of ultimate success in his long campaign to elucidate the mechanisms of shock. It appeared that his whole concept could soon be launched and projected on a bolder scale and with revolutionary implications.

In spite of the magnitude of his accomplishment, Ephraim Shorr was never satisfied. Never once did he feel that he had attained his goal of fulfillment. Above his desk was a quotation from Whitman which said

"It is provided in the essence of things that from any fruition of success shall come forth something to make a greater struggle necessary."

This truth, always with him, spurred him constantly to new exploration and experiment.

Above his desk there was another quotation, attributed to Stravinsky, and this was

"We have too much to do to be in a hurry."

This somewhat enigmatic reminder had partial explanation in a statement of Samuel Johnson that also attracted Ephraim Shorr. Johnson said

"A large work is difficult because it is large, even though all its parts might be performed with facility. Where there are many things to be done, each must be allowed its share of time and labor in the proportion only which it bears to the whole."

Ephraim Shorr saw in their entirety large concepts as few men have seen them. If, however, we are seeking today the meaning of Ephraim Shorr's life, we cannot rest with estimate of his scientific achievements. He was, above all, a humanitarian.

There was goodness in him, and its expression which arose neither from ambition nor from expediency was the natural spontaneous outflowing of a warm and generous nature.

He understood and was helpful to adolescents, who so frequently are uncomfortable in the presence of adults. He understood medical students and the house officers and Fellows who surrounded him. The doors to his offices and laboratories were always open; and the exacting detail of his investigations and other activities never limited the time that he spent sympathetically with his younger associates. His advice was sought by an amazing variety of people; he liked to help, and he had so much to give.

He had an engaging habit of offering imaginative, appropriate, and unexpected gifts to his friends, a new edition of his favorite "Tristram Shandy," or a record of South African folk songs, or a simple book-holder for a man who habitually wrote in bed.

Ephraim Shorr was an accomplished and warmhearted physician, capable of offering keen diagnosis, effective therapy, and also sympathetic understanding. Although his research and much of his clinical work was in a restricted field, he resisted the thought of rigid specialization and maintained for himself and his colleagues the ideal of comprehension of the whole of medicine. The Endocrine Clinic, which he formed at the New York Hospital, illustrated the breadth of his vision of medical service. Long before group practice or psychosomatic medicine was generally emphasized, indeed over twenty years ago, he fostered an enterprise where internists, endocrinologists, psychiatrists, surgeons, dermatologists, and social workers could serve a common purpose.

All of his life Ephraim Shorr was a teacher who never tired of teaching. His instruction was seldom formal; it was more a sharing of some of his vast erudition and penetrating philosophy with those about him. In the aggregate, its influence on the able young men who surrounded him was incalculable. In the guidance of associates, he encouraged and led but never dictated.

Ephraim Shorr was a dedicated man, and he was interested in anything that might better his fellow men. In Public Health he was active on various committees and in fostering its increased support. During the last Presidential Election he campaigned for the candidate of his choice and was already renewing his preparations for participation in the coming election.

In spite of his many activities, he lived quietly. His life apart from the laboratory, lecture room, and clinic was spent in his home. There, surrounded by some of his favorite etchings and his music, he shared similar tastes and enthusiasms with the gentle and understanding woman who was his wife and companion almost thirty years. In the summer their cottage at Martha's Vineyard was a haven where they could see their friends and indulge their love of flowers and the outdoors. Their affection for each other was beautiful to see. Ephraim Shorr never tired of telling of the happiness of his home life.

Although he was never satisfied with his work, and it was not in the nature of things that he should be, he was happy in the accomplishment of each day; and never more than during the last few months, when progress of his experiments was so gratifying. Also, he occasionally found comfort in a statement of Samuel Johnson made at the time he published his dictionary. "In this work," Johnson said, "when it shall be found that much is omitted, let it not be forgotten that much likewise is performed."

To us who do not have Ephraim Shorr's inner drive for fulfillment and who can view his life more dispassionately, his achievement and accomplishment seem to place him among the greatest scientists. He lived and worked in the tradition of Lavoisier, Liebig, Voit, Lusk, and DuBois—immortal contributors to the science of nutrition. His teaching, his philosophy, and his spirit will endure in the thoughts and acts of the scores of brilliant young men who have looked to him for guidance. The thoughts that his genius has brought to medicine will never die.

We are still appalled that Ephraim Shorr is no longer with us. Carl Binger, who loved him, sent, yesterday, lines that express much that we feel

Quiet friend, with critical but smiling mind

Why have you gone so soon

Before your work was done

And all the beauty that you cherished turned to truth

And long before the love you gave could be repaid.

We all are still desolate with our loss, but each of us can glory in the privilege and satisfaction of having known Ephraim Shorr and seen him at work. We can find comfort in the assurance that in spirit and influence he will remain with us.

D. P. Barr

Edward C. Showacre

September 21, 1896 — February 28, 1978

Long before Doctor Showacre's sudden illness and death his varied accomplishments and talents were recognized and acclaimed by all his colleagues, who bade him a reluctant farewell at his retirement party in 1972.

Born in Cumberland, Maryland, he attended Allegheny High School, where he played football and developed the groundwork for a lifelong interest in sports. He obtained his premedical education at Bucknell University, and in 1917 he was graduated from Loyola University School of Medicine in Chicago, earning his Doctor of Medicine degree. Internship followed at Cook County Hospital.

Showy, as he was affectionately called, came to Cornell in 1920, assuming at once the position of team physician, a post that he held for three years. (It was the golden period of Cornell football when its teams, sparked by all-American players, enjoyed undefeated seasons.) Subsequently, he taught hygiene for several years. The developing field of radiology drew his interest, and eventually it became his specialty.

A long, productive period followed, in which his well-grounded knowledge of radiology was put to use in the Student Health Service; in addition, he became the medical consultant throughout the University in matters pertaining to ionizing radiation. He was among the first to recognize and to report on the clinical entity of virus pneumonia in the 1930s, and he had a strong hand in writing the provisions of the New York State Sanitary Code that dealt with ionizing radiation in educational institutions. In advance of most of his medical colleagues, he recognized the hazards of clinical overuse of X rays and adopted measures to limit unnecessary exposure. When Gannett Medical Clinic came into being, it was Dr. Showacre who designed its modern X-ray facility. He also wrote a manual for Cornell University department heads dealing with safety measures for students and faculty doing research with ionizing radiation—a manual that became the model for all the higher educational institutions of New York State.

Dr. Showacre had other talents no less noteworthy. He used a scholarly approach to his problems and was a perfectionist. A project assigned to him was guaranteed to be done well. He was also an enthusiastic, knowledgeable, and lucid teacher who contributed enormously to the professional development of his medical colleagues. His organizational ability was put to use in such projects as developing a medical record system and planning and implementing mass medical screenings for the physical education and ROTC departments.

A profile of Dr. Showacre would hardly be complete without mention of his genial personality, his modesty, his sociability, his enthusiasm for sports. He was an excellent photographer and a formidable bridge player. He enjoyed

good conversation and a good laugh. He will be remembered with respect and affection by those of us who had the good fortune to work with him.

Dr. Showacre was granted the title of professor emeritus in 1967 and retired in 1972. He was a past member of the board of trustees of Acacia Fraternity and a member of the board of directors of the Tompkins County Red Cross Chapter.

Surviving him are his wife, Margaret Burlingam Showacre; two sons, James C. and Richard E. Showacre; two daughters, Elizabeth A. Showacre and Mrs. Ann Hemken; and four grandchildren.

C. Douglas Darling, Norman S. Moore, Alexius Rachun

Robert Pelton Sibley

March 26, 1879 — November 3, 1957

Robert Pelton Sibley was born in Westfield, Massachusetts. He received the A.B. degree from Amherst in 1900, an A.M. from Columbia in 1903, and an honorary L.H.D. from Lake Forest College in 1920. He was Instructor in English at Ohio Wesleyan from 1907 to 1909 when he went to Lake Forest, where he passed through the grades instructor to professor. He left there in 1920 to become Professor and Secretary of the New York State College of Agriculture at Cornell. In 1926, he transferred to the College of Arts and Sciences, where he served as Secretary until 1946. He also taught English and was made Professor of English in 1932. In 1926, he was made the Secretary of the University Faculty and, in 1928, he became Assistant Dean of the College of Arts and Sciences. He held both offices until 1946. In 1947, he retired from active service and was named Emeritus Professor of English.

Professor Sibley was ever active in Phi Beta Kappa, to which society he was elected while a student at Amherst. He served as president of the Cornell chapter during the academic year 1942-43. He was also a member of the honorary society, Phi Kappa Phi, and served as the local president in 1934-35.

As a teacher of English at Cornell, he had time, in the midst of many administrative duties, for only one course of study. But this course made a deep impression. Many of his students have acknowledged their indebtedness to him for making writing seem less an irksome task than a pleasurable adventure. Usually he stirred them to animated discussion, then attempted to induce them to transfer to their writing the energies thus generated. Out of his own wide and continual reading, especially in older and current American literature, he would comment upon and recommend books that his classes, sometimes to their surprise, found enjoyable and timely. And his own easy style served as a model to the alert and high-spirited undergraduates who enjoyed having things well said. When he retired, a colleague characterized him as one of the few remaining scholars and teachers "of the old school". This was in fact, and was intended to be, a compliment of a very high order.

Professor Sibley was fond of students. They came to him freely, both in his office and at his home, where he entertained many of them at breakfast or tea. While taking his work and his responsibilities seriously, he did not take himself too seriously, but was able to maintain a sense of humor.

After his marriage, on December 20, 1934, to Cora B. Wickham of Cutchogue, Long Island, the Sibleys kept a most hospitable home. Upon his retirement, they removed to his wife's former place of residence where they established

another charming home to which his friends and former students continued to come. Here he lived quietly with his family and his books until he died on November 3, 1957.

Robert Sibley was a professor of the humanities. He was a humanist, both in the technical sense of the term and also in his human relationships. Ever considerate in his treatment of others, his generosity of spirit and quiet personal dignity gave tone to the Colleges he served at Cornell and to the University as a whole.

R. M. Ogden, F. S. Freeman, W. H. French

Jerome W. Sidman

August 30, 1930 — June 21, 1958

The untimely death of Professor Sidman on June 21, 1958, as the result of a tragic automobile accident, came as a great shock. His passing is a loss, not only to his loved ones, but to those of us who knew him as a friend. The loss of this young and brilliant mind will also be felt by the scientific community.

Professor Sidman was born in New York City on August 30, 1930. At an early age, his interests were directed toward science. He attended the Bronx High School of Science and from there went to New York University where he obtained an A.B. in Chemistry in 1951. He received an A.M. degree from Columbia University in 1952 and in that year moved to Berkeley, California to pursue further graduate work in Physical Chemistry at the University of California. At Berkeley, his brilliance was manifested by his outstanding record in academic studies and research. It was not unusual to find him leading a scientific discussion. His fellow graduate students cannot help but recall his amazing versatility of scientific interests. After receiving his Ph.D. in Chemistry in 1955, he spent a year as a postdoctoral fellow at the University of Rochester. Later, as a National Research Council Fellow, he attended Cambridge University in England to pursue theoretical studies. He joined the Chemistry Department staff at Cornell in 1957.

Professor Sidman's research interests were both experimental and theoretical. For the few years of his scientific career, he contributed many notable publications in the fields of molecular spectra and structure. Speculation concerning further contributions that he was to have made both as a teacher and scientist, leaves his colleagues and fellow scientists with an even more overwhelming sense of loss.

Aside from teaching and research, he had many other interests in the arts and was particularly fond of classical music. This was reflected, for instance, in his love for the recorder. Without taking formal lessons, he had already learned to play this instrument with considerable skill.

To those whose loss is the greatest, his wife, Luanne, his daughter, Jennifer, his mother, Mrs. Lillian Sidman, and other members of his family, we humbly extend our deepest sympathy.

R. F. Porter, W. D. Cooke, A. C. Albrecht

Benjamin M. Siegel

March 26, 1916 — March 22, 1990

Dr. Benjamin Siegel, professor emeritus of applied and engineering physics, died on Thursday, March 22, 1990, four days before what would have been his 74th birthday. While Ben was one of the earliest (1949) appointments to the faculty of the then-new and experimental Engineering Physics Department at Cornell and had a distinguished career in electron microscopy as a scientist, he will also be remembered for the personal example he set and the life he led.

Ben taught—by example, not precept—that it was possible to be deeply moral, deeply virtuous and deeply serious without being self-righteous, priggish or solemn; that it was possible to make judgments without being judgmental, and to have opinions without being opinionated. He never said an uncomplimentary thing and could always be counted on for good advice on the right way to proceed in a moral dilemma. No matter how competitive the environment, he demonstrated that it was possible to be good, kind and gentle. At least one former department chairman remembers this aspect of his life with deep gratitude.

His scientific career was devoted to the art and practice of electron microscopy and particle optics. At the beginning of his career at Cornell in 1949, use of this technique was very much in its infancy. Through special summer courses, he introduced it to a large number of researchers (including at least one future Nobel laureate and two future presidents of the Electron Microscopy Society of America) in both the physical and biological sciences. His influence on modern electron microscopy continues to be felt through the successes of his many former students and research associates. Indeed, his most significant contribution to teaching came through the one-on-one situations involved in his research programs.

Ben became interested in achieving the highest possible spatial resolution with the microscope. In a timely paper with Claire Eisenhandler, he explored theoretically the phase contrast mechanisms of imaging single atoms. Following this, he established a program identifying various elements of the theoretical and experimental steps necessary to make this a reality. This required work with field emission electron guns, superconducting electron lenses, digital image acquisition, and image processing and ultrahigh vacuum techniques. Many of the ideas Ben was working with in the seventies appear likely to be widely exploited in the nineties. Transmission electron microscopes with field emission guns are now available commercially, and the proposals to exploit the coherence of this electron source will build on the image analysis procedures developed by Earl Kirkland while working with

Ben. Vastly improved vacua are now available, reducing the propensity of the instrument to cover the specimen with some unknown contamination layer.

The program he established had a grand design which probably did not come to fruition in the way he hoped. It nevertheless was a success in that many of the features he saw as necessary to achieve high-resolution have indeed been seen as solutions to problems and have become available to the community. His students and associates went into programs in which they were unique and badly needed. In recognition of his contributions to attaining high resolution, the Electron Microscopy Society of America awarded him the EMSA Distinguished Scientist Award in 1982. He had served as president of the Society in 1973, and an issue of the international journal, *Ultramicroscopy*, was dedicated to him in 1984.

Ben was a key member of the Cornell faculty team that prepared the proposal that brought about what is now the National Nanofabrication Facility. Following this, he carefully reviewed the prospects for particle-based lithographies and initiated work on high brightness gaseous field ion sources for ion beam lithography. This work started a flurry of research activity in this area in Japan that continues to the present day, and he was actively engaged in attempting demonstration of such a tool up to the time of his death.

The personal example Ben set in his life stemmed from a deep faith. He was active in the affairs of the Temple Beth-El of Ithaca, its Rabbi Felix Aber Hebrew School, and in the activities of the Ithaca Jewish Welfare Fund. He served on the Cornell Hillel Foundation Board and for some years on the Cornell United Religious Work Board. In addition, he identified himself with the Zionist movement through his membership in the American Jewish League for Israel.

Ben Siegel was truly a gentleman and truly a scientist. We are the lesser for his passing, but his family, students, friends, and colleagues are much the better for his life.

Milton Konvitz, David Saxon, John Silcox

Robert Hermann Siegfried

January 19, 1899 — December 23, 1992

Robert H. Siegfried died after a short illness on December 23, 1992. Bob was born in Pittsburgh, Pennsylvania and attended high school in Asheville, North Carolina. From 1917 through 1920 he was in the machinist apprentice program at the Norfolk Naval Yard. In 1921, he entered the Sibley School of Mechanical Engineering—as a special student because of the need to fulfill missing entrance requirements before a degree could be awarded. He completed the program of courses in mechanical engineering in 1925, but he had not found time to complete making up the missing entrance requirements. This circumstance had a major influence on the direction of Bob's career in engineering, in that he was hired as an instructor in engineering drawing during the time he was completing the entrance requirements. He received the M.E. degree in 1926.

Bob accepted a position as a test engineer with the Duquesne Light Company in Pittsburgh. After one year there, he moved to the Jones and Laughlin Steel Company. In 1928 he joined the faculty of the Mechanics Institute in Rochester, New York, to teach mechanical drafting, mathematics, and physics. Three years later he was drawn back to Ithaca to be a draftsman in the City Engineer's Office. In 1937, Bob moved over to C.S. Robinson Aerial Surveys, where he was a draftsman and laboratory technician.

In 1941, the opportunity again arose to teach, and in March, he joined the Trumansburg Central School National Defense Training Program, to teach in the areas of blueprint reading, sketching, shop mathematics, shop theory, and machine shop work.

In September 1941, Bob accepted the position of instructor in the Department of Engineering Drawing in the Sibley School of Mechanical Engineering at Cornell, where he taught mechanical drawing and descriptive geometry until his retirement in 1964. From 1942 until 1961 he was in charge of the engineering drawing courses for students in the School of Chemical and Metallurgical Engineering, with offices in both East Sibley and Olin Halls. During the period 1943-55 he also served as consultant/draftsman for the U.S. Nutrition Laboratory at Cornell in relation to drawings and charts for publications. He was promoted to assistant professor in 1946, to associate professor in 1952, and to professor emeritus in 1964.

Bob Siegfried is remembered as a dedicated family man, a competent engineer, a gifted and conscientious teacher, and a loyal Cornellian. He was admired and respected by both his students and colleagues.

Bob was a member of the American Society for Engineering Education, the American Association of University Professors, the New York Society of Cornell Engineers, the First Church of Christ Science, and he was active in the Boy Scouts of America and Masonry.

Upon retirement, the Siegfrieds moved to Hendersonville, North Carolina.

Professor Siegfried is survived by his wife, Edith Harris Siegfried of Hendersonville; a daughter, Judith Licht of Cincinnati, Ohio; two sons, Robert of Cincinnati, Ohio and John of Cleveland, Ohio; sixteen grandchildren and three great-grandchildren.

Bart Conta, Robert L. Wehe, Richard M. Phelan

Michell J. Sienko

May 16, 1923 — December 4, 1983

Michell J. Sienko exerted a major influence on the field of inorganic chemistry through his teaching, writing, and research. His influence was also felt by his friends and colleagues, who admired his industry, his creativity, and his integrity.

Mike was born in Bloomfield, New Jersey, and grew up in Middletown, New York. He received the B.A. degree from Cornell in 1943. He was a Cornell Scholar, a New York State Scholar, and a Boldt Fellow. He was awarded the Ph.D. degree from the University of California, Berkeley, in 1946 and spent a year in postdoctoral work at Stanford University. He then returned to Cornell as instructor and was promoted to assistant professor in 1950, to associate professor in 1953, and to professor in 1958. During his thirty-six years on the Cornell faculty, he taught more than 25,000 undergraduate students and supervised some 350 graduate student teaching assistants. At the same time, he carried out a major research program in which he supervised the graduate training of over 25 graduate students and 15 postdoctoral associates.

Mike was a superb teacher. He has been described by Roald Hoffmann, Nobel laureate and chairman of Cornell's Department of Chemistry, as "the best general chemistry lecturer any of us has ever heard." From his teaching experience he developed a fresh new approach to chemistry that he and Robert Plane implemented in a series of four textbooks that have by now sold well over a million copies here and abroad. In addition, he wrote two advanced texts and was a co-author of two others. His brilliant teaching was recognized by the Cornell College of Engineering and College of Arts and Sciences, from which he received the Sporn Award and the Clark Award, and by the American Chemical Society, from which he received the Award in Chemical Education.

Mike did his research in an area that is on the borderline between inorganic chemistry and solid-state physics. Just as his teaching was characterized by ventures into new approaches, so was his research directed toward new concepts in the structure of materials. The results of his studies have been reported in more than one hundred papers published in leading American and foreign journals. Typical of his research was the synthesis of a new material, the determination of its structure, and his interpretation of its properties in terms of condensed-matter chemistry and physics. He liked to work with unusual materials that exhibited special behavior that could provide answers to important fundamental questions. He worked with metal-ammonia systems, nonstoichiometric oxide bronzes, and layered compounds. He was interested in the electronic properties of these materials as revealed by

X-ray analysis, by magnetic resonance, and, in some cases, by superconductivity. It was typical of his research that he opened up new areas of investigation that have become subjects for intensive study by other chemists and physicists.

Mike developed strong ties with many colleagues in Europe during his frequent visits to major European laboratories. He was a Fulbright lecturer at Toulouse and a Guggenheim Fellow at Grenoble. He also held visiting professorships at Paris and Vienna and was a visiting fellow at Clare Hall College, Cambridge. He brought young chemists from these institutions to Ithaca to work with him as postdoctoral associates.

Mike had a deep commitment to the community of chemists. He frequently gave lectures to high school and college groups. For a number of years he was a lecturer designated by the American Chemical Society in a program to sponsor visits to colleges by outstanding chemists. He was active in the affairs of the society, was a member of the Examination Committee in the Division of Chemical Education, and was chairman of the Inorganic Subcommittee. He recognized the need for a new journal in the field of research and so, in 1969, was a cofounder of the *Journal of Solid State Chemistry* and served as an editor until 1982. The October 1984 issue of the *Journal* is being planned as a memorial in his honor.

Mike had very close ties to his graduate students and postdoctoral associates. Every Friday he took them all to lunch, a working lunch, since he used the occasion to discuss matters of general interest to the group. But he also made strong personal bonds to each of them. He knew their families and continued his close relationship with them long after they left Cornell.

Mike was a rather private person. He obviously enjoyed spending many hours alone in his office or laboratory, writing or making experimental observations. He also enjoyed working in his woodlot, clearing brush, or cutting firewood. His social life was centered about his family—his wife, Carol, and daughter, Tanya, and a small group of fortunate friends to whom he was loyal and most generous. His generosity was also directed toward the arts, in particular toward music and ballet, which were special interests of Carol and Tanya. He also gave generously to support office seekers who shared his political concerns. When he believed in something or someone, he backed his belief with commitment and support.

Mike's untimely death, which followed by less than four months the death of Carol, is mourned by his friends and colleagues, who enjoyed his company and learned from him and who had looked ahead to a continuation of their

association with him. But he has left us with pleasant memories of a man who achieved great distinction in his profession and who enriched our lives by being with us.

Harold Scheraga, Benjamin Widom, John DeWire

Thomas W. Silk

March 24, 1904 — October 1, 1971

To the faculty, alumni and friends of the Cornell School of Hotel Administration, the news of Professor Emeritus Thomas W. Silk's passing on October 1, 1971 tolled the end of an era. In the three decades from his appointment in 1938 to his retirement in 1968, he taught the essential elements of accounting to thousands of students. Tom will be remembered especially for his enthusiastic ability to counsel and guide the students with whom he came in contact. He also was active as an adviser to the international students in the Hotel School.

Although Tom was often considered a native "easterner," he was born in Forestville, California, and spent his early years in the public hospitality industry working in hotels in the San Francisco area. Having received a B.S. degree from the University of California in 1925, he matriculated at Cornell in 1936 and received his B.S. in Hotel Administration in 1938. World War II interrupted his teaching career, and he saw active duty as a finance officer in the Air Corps from 1942 to 1946. He served in the continental United States and Korea. Tom then returned to the Cornell faculty and completed his M.S. in 1946.

Professor Silk is survived by his wife, Mary Dodge Silk, of Whitefield, New Hampshire, two stepsons and one stepdaughter.

Although he was responsible totally for the freshman accounting course, Tom continually sought involvement in many other areas. University committees on which he served, either as a member or chairman, were: Faculty Committee on Student Conduct (1949-53); National Scholarship Committee (1954-58); Committee for Undergraduate Education (1954-58); and the Administrative Committee for Unclassified Students (1954-57). For the School, he was an active member of the Admissions Committee and the Faculty Committee on Petitions.

Tom's academic accomplishments were attested to by his membership in both of the academic honoraries for which Hotel students are eligible: Ye Host Society and Phi Kappa Phi.

After Tom's retirement in 1968, he maintained an active interest in the management of the Mountain View House, in Whitefield, New Hampshire.

Tom always will be remembered fondly, respected deeply, and missed by all who knew him.

Myrtle H. Ericson, David C. Dunn, Paul R. Broten

Henry Augustus Sill

— *August 13, 1917*

The Professor of Philosophy, Professor Thilly, introduced the following resolutions which were adopted by rising vote:

The University Faculty deeply deplores the loss of Professor Henry Augustus Sill, who, in mid-August, just before the completion of his summer lectures at Columbia University, was snatched from life by sudden illness. He had served the University with loyal zeal and marked ability, and he died in the prime of his manhood before the fulfillment of all the high hopes which his gifts of mind and rich scholarship had inspired.

At his coming to us, fifteen years ago, he identified himself promptly and fully with the life of the University. In the work of this body, as in all the Faculties in which he held membership, his interest was ardent and unflagging. Advancing their purposes by his facility in suggestion and never losing sight of the educational purpose to which their action was directed, he won the respect and admiration of us all by his honesty of purpose, his warmth of heart, his frankness and straight-forwardness, his good humor and generous temper. Although his regard for the opinions of his colleagues was great and he yearned to have their confidence and good-will, he did not fear to embrace the unpopular cause, and no one was ever left in doubt as to where he stood. He met every call for service willingly and enthusiastically, and performed with energy and loyal devotion every duty he undertook.

An inspiring class-room teacher, who brought the treasures of varied study and a full mind to the illustration of his theme, he was also, in the quiet of his office, a helpful counselor to many a perplexed student, who came to appreciate in no common measure the stimulus of his many-sided comment, often humorous but never frivolous, upon the concerns of scholarship and the larger problems of life.

A progressive by temper as by political conviction, he was actively concerned for the betterment of the University and the community, giving his time and energy without stint to all projects which might promote good scholarship or good citizenship. The University Club was largely his creation, the Arts Association his protege, the project for a Student Union eagerly furthered by him; and these are but a few of the activities which were always outrunning his time and his strength and crowding into the background his work as investigator, thinker, and writer, for which he seemed else so admirably fitted. Few among us could so ill be spared.

Committee: Geo. L. Burr, Charles H. Hull, Frank Thilly, Chairman.

David Malcolm Simons

May 24, 1925 — August 19, 1983

Professor David Malcolm Simons died August 19, 1983, after a valiant twenty-year battle against cancer. Thus ended a long, distinguished, and productive life. He is survived by his wife, Virginia, their sons, Jonathan and Jeffrey, and their daughter, Elizabeth.

David Simons was born in Baltimore, Maryland, and reared in Washington, D.C. After obtaining a Bachelor of Science degree in civil engineering from Cornell in 1945, he enrolled in the U.S. Naval Officer Training Program. Subsequently he taught at the Naval Pacific University in Guam, attaining the rank of lieutenant. Upon completion of his naval service he worked for a prominent engineering firm in Baltimore, Maryland, for several years. He then attended graduate school at Princeton University, from which he obtained a Master of Fine Arts degree in architecture in 1951. At graduation he was awarded the Gold Medal of Excellence by the American Institute of Architects. Professor Simons then practiced as an architect in Washington until 1959, when he became an assistant professor of architecture in the College of Architecture at Cornell.

Throughout his teaching at Cornell he took a lively interest in his students and showed special concern for their interests and problems. As a professor of architecture he was particularly interested in developing methods for the better integration of the scientific and artistic aspects of the building design process in order to obtain a more unified architecture. This was a matter he continued to pursue until the time of his death.

David had a very active mind and devoted all the energy he could command to his role as a teacher, steadfastly nurturing in himself and his students the ability to think critically and creatively. His standards were high, and his colleagues and students had great respect for him.

During the early years of his illness he rose above physical pain to share with his students his knowledge and views of architecture, always with a positive outlook and a delicate touch of humor. But in 1978-79 his illness forced him to take a medical leave of absence from his teaching responsibilities.

During the last years of David's life his role as husband and father received an increasing share of his attention. He also became interested in the education of younger children and made many contributions to his wife's elementary school teaching program in the Ithaca city schools. As his physical strength declined, he continued to nourish his mind through voracious reading and discussions among family members, colleagues, and friends. David was

a gentle and self-effacing man. Despite adversity his great strength of character, his concern for others, his love for his family, his pride in his children, and his constant optimism sustained the vitality of his spirit. He used his life to grow intellectually and emotionally and to give to others, gifts that will long be greatly appreciated by his many friends, his colleagues, and his family, who remember him with deep affection as a devoted husband, father, teacher, and friend.

Charles W. Pearman, Francis W. Saul

Lloyd Rhoderick Simons

November 8, 1886 — August 20, 1978

Lloyd Rhoderick Simons was known to his associates and friends as Si. He was also known as a well-organized administrator, a forward-looking agriculture leader, an avid sports fan, and a dedicated gardener.

A native of Sardinia, New York, where he was born to Julian Seymour and Alice Amelia Bigelow Simons, he spent most of his life in this state and in the service of its agricultural industry. His early experience included work on tile home farm in Erie County and in his father's grist mill. In 1911 he was graduated by Cornell University with the Bachelor of Science degree.

Professor Simons' career began with three years as a teacher of agriculture in the Gowanda public school system. The remaining forty years of that career were in the extension service of Cornell or in the United States Department of Agriculture (USDA). It started in 1914 when he went to Nassau County as the county agricultural agent. Two years later he accepted an appointment as specialist in extension methods for USDA. In 1920 he returned to his native state and Cornell as assistant state leader of county agricultural agents. Eight years later he became state leader and, in 1932, director of extension, a position he occupied with distinction for twenty-two years until he retired and became professor of extension emeritus in 1954.

During those twenty-two years, he was frequently called upon to serve as a member or chairman of various state and national committees and organizations. These included such activities as farm flood relief coordinator in 1935 and leadership in key committees of the Association of Land-Grant Colleges and Universities.

Despite the demands made upon his time by state and national leaders, Si's principal attention was given to developing an effective extension service that could bring new technology to the state's most important industry. He was concerned with and worked to achieve close coordination between college, state, and federal agencies. He was the chief architect of numerous organizational structures through which such agencies could meet and work together to develop cooperative efforts with farm families.

Long before the days of women's liberation, Director Simons supported and facilitated the development of strong home economics programs in which professional home economists and farm women throughout the Empire State developed as effective leaders. Likewise, he was highly interested in the 4-H program and did much to achieve adequate financing for that work in his own state and in the rest of the nation. The plight of out-of-school rural

youths was of particular interest to him, and he pioneered efforts to create effective ways to help them meet their needs.

As a professional educator and leader of adults, he perceived that an important part of his opportunity was to help farmers, farm women, and farm youths develop their abilities to think and act for themselves in both the private and public sector. He believed in farm organizations and their leaders. He wanted them to be heard, and he wanted them to work together cooperatively for the benefit of all farmers.

In his retirement Si continued a professional interest in extension and wrote numerous publications describing the development, organization, philosophy, methods, and accomplishments of various parts of that program.

To the casual observer Si appeared tall, erect, austere, and meticulously groomed, with eyes that could penetrate steel. Those who knew him best would also add that he possessed a keen sense of humor and an empathic relationship with associates whose directness and diligence he respected.

Si was as meticulous with his work as he was with his grooming. He had uncanny ability to cut through needless minutia, to collect and organize relevant facts, and to plan for the future with outstanding foresight. With new programs, he clearly delineated the objective and then recruited the person or persons necessary to reach the goal. The responsibilities thus delegated posed a great challenge and were invariably met by those who had assumed new positions. Si made it clear that the details of work were theirs— the objectives were joint and must be achieved.

Director Simons' leadership in extension work brought him both state and national recognition and several awards. Among those were the United States Department of Agriculture Superior Service Award, a citation by the Syracuse Chamber of Commerce, an American Farm Bureau Award for Distinguished Service to Organized Agriculture, and a citation awarded by the deans of the New York State Colleges of Agriculture and Home Economics.

His leadership was described by former dean of the College of Agriculture, Carl E. Ladd, when he said:

Director Simons, more than most men, is able to look down the road and past all the details and see clearly how any program will affect the farmer and his organizations and build the partnership that he conceives as existing between the extension service and the individual farm families.

Professor Simons is survived by his widow, Lucy Ada Simons; his son, Howard Julian Simons of Washington, D.C.; his daughter, Pauline Hixon of Ithaca; four grandchildren; and nine great-grandchildren.

Arthur E. Durfee, Elmer S. Phillips, Hazel E. Reed, Clifford R. Harrington

Sutherland Simpson

Professor of Physiology

February 3, 1863 — March 2, 1926

In the death of Sutherland Simpson, Cornell University has lost one of its ablest teachers and most tireless research workers. Born on Flotta, one of the Orkney Islands, February 3, 1863, he spent his early years on his father's farm and on the sea. In 1884, at the age of twenty-one, he went to Edinburgh to work in the physiological laboratory under Professor Rutherford. During the fifteen years spent in this post he found time to complete his education, securing the degree of B.Sc. in 1894 and the degree of M. B. Ch. B. in 1899. In that year Sir. Edward Sharpey-Schaefer became Professor of Physiology at Edinburgh and under his stimulating leadership Sutherland Simpson entered upon his life work as a teacher and investigator in Physiology. He received the degree of Doctor of Medicine (Gold Medal) in 1901, and D.Sc. in 1903. Nine busy years passed in Edinburgh, years filled with conscientious teaching and productive research, which, in 1908, brought him the call to Cornell University as Professor of Physiology. This position he held until his death, devoting himself to the development of his subject, organizing, and equipping his department. Throughout these years he has given himself tirelessly to teaching, administration and research, acquitting himself with honor in each of these fields. In Cornell his research activity resulted in the production of fifty-six scientific studies of which the majority dealt with the glands of internal secretion. This work was greatly facilitated during the later years by the development of the Physiology Field-Station. Untiring devotion to research, although enthusiastically prosecuted, did not in any way interfere with his teaching duties. As a lecturer he was clear and forceful; but it was in the personal contacts of laboratory and demonstration that he particularly imparted much of his inspiration and enthusiasm.

Dr. Simpson was a Fellow of the Royal Society of Edinburgh and a member of the American and British Medical Associations, the American and British Associations for the Advancement of Science, the American and British Physiological Societies, and other special scientific bodies,

Possessing a genial personality, a sympathetic nature, a keen intellect, great energy, and high ideals of scientific work, he was as big of mind and heart as of body and his presence radiated good feeling and friendliness wherever he went. These qualities endeared him to his colleagues and students. His loss is keenly felt by all who knew him.

Arnold Singer

March 4, 1920 — January 10, 2005

Arnold Singer was born in New York City in 1920. After graduating from Flushing High School, he was awarded the St. Gaudens Prize and scholarship to the Art Students League of New York. He studied there with the celebrated artist/teachers Bridgman, Nicolaides, and Abels. During World War II, Singer served as a camouflager for the Corps of Engineers returning again to the Art Students League after the war to work under the guidance of Cameron Booth, Byron Browne, and most importantly, Will Barnet, who remained a long time devoted friend and mentor. While at the Art Students League, he gravitated to a group of young artists interested not only in the European modernist tradition of Picasso, Mondrian and Matisse, but also Gothic and Romanesque painting, eighteenth and nineteenth century classicism, Cezanne, as well as works produced by the indigenous peoples of Africa and the tribes of the northwest coast. While very much influenced by abstraction and what at the time was referred to as “non-objective” abstraction, Singer focused a great deal on the study of the human figure and the urban environment—a source of imagery seemingly at odds with the most rigorous forms of abstraction. As a result, he forged an approach to image making that conflated the formal purity of abstraction and the intense observation of nature.

He was a founding member in 1952 of the Hansa Gallery, one of the pioneer cooperative galleries on the lower east side in New York City. During the 1950s, Singer had three solo exhibitions at the gallery, as well as a solo exhibition at the Stein Gallery in 1956. Since the early Hansa exhibitions, solo exhibitions have been held at the Arkansas Art Center in Little Rock; the Pratt Graphic Arts Center; The Gallery in Morgantown, West Virginia; and at Wells College in Aurora, New York. He has participated in numerous group exhibitions in this country—at the Chicago Art Institute, the Philadelphia Print Club, the Brooklyn Museum, and the Kornblee Gallery in New York City—and abroad at the Studenterforenigen in Denmark and the Galeria Wstolzesna in Warsaw. The collections of the Brooklyn Museum, the Pasadena Art Museum, and the Print Club in Philadelphia, among others, include Arnold Singer graphics.

While still a student at the Art Students League, Singer studied lithography (the first printmaking department in the country founded by Joseph Pennell), eventually teaching the printmaking medium at the League as well as Pratt Graphic Arts Center, where he became a master printer. A major participant in the renaissance of lithography that took place in New York in the fifties, Singer assisted in establishing some of the earliest workshops and introduced the medium to many leading American artists. He printed editions for Rufino Tamayo, Stuart Davis, Larry Rivers,

Ellsworth Kelly, Adolf Gottlieb and Barnett Newman. Considered an authority on graphic processes, he published technical articles in educational journals, and his work has been reproduced in *Art News*, *Artist's Proof*, and many others. He has published lithographs for *Time-Life, Incorporated* and provided technical data for the section on lithography in the Life Science Library series. A 1957 woodcut collage by Singer appeared on the cover of Fortune magazine, and another Singer print was selected for the 1966 UNICEF calendar.

Arnold Singer came to Cornell in 1966, recommended by Peter Kahn (late Professor Emeritus in the History of Art Department) as a leading expert in lithography. He inaugurated the program in lithography at Cornell and devoted all his energy to its development. A few years into his career at Cornell, he encountered a certain technical problem and began research to find a solution. His inquiries led him to the work of a leading British practitioner who declared that the ultimate authority was an American named Arnold Singer. By the 1970s, he had focused his teaching and studio practice on painting and drawing. He was a dedicated and generous teacher and took great pleasure in discussions of principles and style, conveying to his students the importance of drawing, composition and design as the prevailing and fundamental structure of works of art. His intense interest in cultural history had a profound effect on the development of his own artistic production and guided his approach to teaching and the mentoring of younger artists.

Singer had a passion for music, with a strong inclination toward the classical—periods and styles incorporating clarity of structure and form.

“Arnold loved traditional jazz and he exposed his art students to the beauties of New Orleans and Chicago styles. He would play recordings during class and encourage them by noting that this was music that Mondrian had loved. He himself harkened to these eras because he could hear the individual voices.”

Marty Laforce

He drew and painted continuously, working and reworking every painting and often creating numerous interpretations of a single subject. His paintings and drawings of still life subjects, figures, portraits and landscapes were composed with incomparable elegance and simplicity. He was a passionate believer in the Classical tradition and had little patience with what he looked upon as the frivolous experimentation of the avant-garde.

“A classicist he certainly was but he was, first and foremost, a humanist. His sensitivity to and intimate involvement with people could not help but surface in his classically arranged depictions of them. This was abundantly clear in his images of his family, and also in the many compositions with friends and students he found to be interesting subjects. He was brilliant in selecting the telling gesture or pose or physical characteristic, never reduced to caricature, that would reveal deep levels of observation, empathy and understanding.”

James Zver, MFA 1969

Arnold had a great passion for debate over a wide variety of topics including painting, photography, music, politics, and literature. He often held unpopular positions, but reveled in discussions with friends who represented opposing views. Those on the other side of the conversation were continually challenged to clarify and re-evaluate their positions. For Arnold, the debate was an expression of respect and friendship. He surely would have been very disappointed if everyone had agreed with him.

In addition to maintaining his deeply held artistic convictions, he will be remembered for his love of children, his friends and the ocean. He lived on Parker Street in Ithaca until December 2004, when he joined his son, Tony Singer, in Ringwood, New Jersey. He is also survived by his daughter, Poppy Singer of Ithaca, and four grandchildren, Simnia and Leo of Ithaca and Michael and Christopher of New Jersey; as well as his brothers Herb Singer in California and Morton Singer in Florida.

Victor Colby, Gregory Page, Stanley Taft

Samuel Thomas Slack

April 6, 1918 — February 28, 2000

The formative years of Samuel Thomas Slack, ably prepared him for a long and effective career as a Cornell Dairy Cattle Specialist for New York. He was born in Sykesville, Maryland near the well-known, local, family landmark, “Slack’s Corners.” He grew up on a dairy and crop farm located in Howard County, Maryland and was active in 4H and FFA projects. During high school, he was a member of the state 4H-Club Dairy Cattle judging team that placed first place in the national contest. After graduating from high school, he worked for two years on the home farm and for one year with the Agricultural Adjustment Administration of the Roosevelt era. He entered the University of Maryland with a major in Dairy Husbandry working “in the barns” to defray expenses. His education was interrupted in 1941 when he entered the U.S. Army and was in charge of a station hospital laboratory in the Middle East Theater. Upon his return to the States, he entered Officers Candidate School and received a Second Lieutenant’s commission. He served as a Medical Supply Officer until his discharge in 1945.

Slack reentered the University of Maryland and graduated with honors with a B.S. degree in Dairy Science in 1947. He entered Cornell University’s Department of Animal Science and earned an M.S. degree in 1949 and a Ph.D. degree in 1951. Slack was then appointed an Assistant Professor of Animal Science with responsibilities in extension and research in the areas of dairy cattle nutrition and management. He quickly became an effective interpreter and purveyor of research data for the practical dairymen. He became an Associate Professor in 1963 and a full Professor in 1972.

In 1951, the post-war era of dairy husbandry was characterized by expanding herds, combined with a surge of vital new information. His research and communicating skills combined to present a unique opportunity for dairymen to improve their herds. The value of early cut forage, the usefulness of heavier grain feeding and the importance of wilting silage were all factors the dairymen could use immediately. As one colleague wrote:

“It cannot be emphasized too strongly how much easier it was to sell farmers and feed manufacturers these ideas because they had heard the story from Professor Slack. By virtue of having helped to plan the research and in some instances having helped carry it out, he could speak authoritatively about it in rhetoric that they understood and accepted”.

Other areas that received his attention included housing, feeding and management of herd replacements and veal production. He was an expert at relating to field problems, encouraging research and returning to the field with solutions.

In 1957, Professor Slack became Superintendent of the Dairy Cattle Section of the New York State Fair, a post he held continuously until 1982. He was required to interact annually with about 120 dairymen and 1200 cows, a feat he performed with aplomb and skill. His concern was always for the cows and their owners and helped them project a positive image to the fairgoers. At his retirement from that position, he was presented with a lifetime pass to the Fair, the only one in existence.

For four years, Slack, taught courses in Dairy Cattle Selection; and coached the Dairy Cattle Judging Teams, which represented Cornell in national contests. His teams finished first or second on a number of occasions, thus maintaining Cornell's preeminence in this arena. In his honor, his name was affixed to the alumni-sponsored Harrison-Trimberger-Slack fund, which is a repository for voluntary contributions to help defray judging teams' expenses. In addition, Sam conducted many judging sessions for breeders and was frequently called to be the official judge at National and International Dairy Shows.

With the advent of the new Teaching and Research Center at Harford, New York in 1972, Sam relinquished his extension responsibilities and became the faculty member in charge of the center. He capably turned the new facility into a productive unit in nutrition, breeding and management research for many faculty.

He was a willing cooperator. He served on numerous intra- and inter-departmental committees, which planned the extension strategies. He also served as an undergraduate advisor to a number of students.

A method of communication used effectively by Professor Slack was extension publications. He had 28 technical papers or bulletins and 192 popular articles of specific interest to the practicing dairymen. Of particular note was his sequence for the Dairymen's League News. In this venue, he wrote a regular article, in some cases monthly, between 1959 and 1973. The wide range of topics was spectacular.

Sam served as a Consultant with the Rockefeller Foundation in Bogotá, Columbia in 1963 on their dairy industry. He spent six months as a Visiting Professor at the University of Georgia and a brief tour with the Minister of Agriculture in Guatemala.

Professor Slack was an effective extension specialist. His accomplishments resulted from a dedicated, unrelenting and direct, though low-key, almost casual approach. The accuracy, credibility and persistence of his efforts, have had an impact that has meant much to dairying in New York State.

As a devoted husband, father and grandfather, Sam was able to devote more time to them following his retirement in 1982 as Professor Emeritus. He was an avid gardener and friendly advisor to would-be gardeners. Volunteer

activities were important to him. He was active in the Saint Catherine of Sienna Catholic Church, the Ithaca Cayuga Rotary Club of which he was Past President and a Paul Harris Fellow, and more recently the Reach Out 2000 Ministry to Children.

He is survived by his wife of 55 years, Mayrene Hallmark Slack, of Ithaca; a daughter, Teresa Slack Hargett (son-in-law, Daniel Hargett); and granddaughters, Lindsey Beth, Caitlin Leigh, and Chelsea Rae Hargett, all of Ithaca.

William G. Merrill, Richard G. Warner, James D. Burke

George Lewis Slate

June 27, 1899 — April 16, 1976

George L. Slate, professor emeritus of pomology and viticulture at the new York State Agricultural Experiment Station, Geneva, New York, was born in Bernardston, Massachusetts. He graduated from the Massachusetts Agricultural College, now the University of Massachusetts, in 1921 and received his master's degree from Harvard University (Bussey Institute) in 1926. He joined the staff at the New York State Experiment Station in 1922 as a research assistant and was promoted to an assistant professor of pomology in 1928, to associate professor in 1945, and professor in 1951. He retired from the station in 1969 after forty-seven years of dedicated service to all phases of horticulture. Throughout his entire career he was responsible for the distinguished program of small fruit breeding at the New York State Agricultural Experiment Station. As a part of his research program, he raised and evaluated more than a quarter-million small fruit seedlings, forty-one of which were named and introduced into commercial production. Many of these continue to be important in the small fruit industry of New York as well as of the eastern United States.

As part of Cornell's extension teaching, Professor Slate was the specialist in many meetings with New York fruit growers. With scientists, he was active in evaluation of the technique and the progeny of fruit breeding. With fruit growers and with scientists he was articulate and respected for his competence.

Professor Slate was a prolific writer, having more than six hundred published articles to his credit. Technical articles on plant breeding and genetics were published in the scientific journals and the yearbooks of the plant societies. He had a unique ability to convert his experience and research findings into language that was easily understood by gardeners and lay people and was well known for his frequent articles in farm and garden publications, including the *Boston Sunday Herald*, *Country Gentlemen*, *Better Homes and Gardens*, *The New York Times*, *Philadelphia Inquirer*, *Encyclopedia Americana*, *Horticulture*, and the *Reader's Digest Book of the Garden*.

Although much of his writing dealt with small fruits, his interests were much broader, leading him to grow, hybridize, and raise seedlings of many kinds of plants, particularly lilies in which he received national recognition for the new varieties which he produced. He was an avid gardener and grew large collections of many plants. His garden in Geneva was a great joy to him, where he shared his knowledge and his plant material with his friends and colleagues; many of these were visitors from Europe and elsewhere.

Professor Slate's society affiliations include membership in the American Society for Horticultural Science since 1922; the Northern Nut Growers Association, in which he served as secretary from 1943-45, president 1954-55, and editor of the association's annual reports for many years; and the North American Lily Society, an organization that he helped organize and for which he edited the yearbook from 1947-73. He was also an honorary member of the Massachusetts Horticultural Society, was an editorial consultant of *Horticulture* magazine, and was a corresponding member of the Lily Committee of the Royal Horticultural Society from 1948-67.

During his career, Professor Slate won numerous awards in horticulture, including the Mackson Dawson Medal from the Massachusetts Horticultural Society in 1949, the Johnny Appleseed Gold Medal from the Men's Garden Club of America in 1959, the American Horticultural Society Citation in 1965, the E. H. Wilson Award from the North American Lily Society in 1960, and in 1968 the Wilder Medal from the American Pomological Society, which elected him president in 1973-74.

A year after his retirement, he was named a fellow of the American Society for Horticultural Science. In 1972, he received the James R. Jewett Prize for research on native American plants presented by the Arnold Arboretum of Harvard University. In 1974, he received the Merit Award from the Northern Nut Growers Association.

Next to lilies, Professor Slate's hobby interest was centered in old books dealing with horticulture. He was always on the alert to purchase the rare and unusual and through the years assembled a notable collection, some of them first editions of historical value. Books on birds and wild flowers were also included. Politics were also one of his interests; *The New York Times* and the *Congressional Record* were received regularly and clipped for articles dealing with his interests.

Although Professor Slate did not officially participate directly in the formal education program at Cornell, he was called on frequently to give lectures and conduct laboratories dealing with fruit varieties at Ithaca. His expertise in this area was unexcelled, and his colleagues frequently sought his opinions on variety identification and performance. Cornell students visiting him at Geneva were always welcome and received inspiration from seeing the amount and quality of his work. He will be remembered by his friends and colleagues as one of the outstanding horticulturists of our time.

Professor Slate is survived by his wife, Muriel Wilson Slate, a daughter, Barbara (Mrs. John R.) Abbott of Hilton, New York, and four grandchildren.

Donald K. Ourecky, Nelson J. Shaulis, Laurence H. MacDaniels

Walter Slatoff

March 1, 1922 — February 16, 1991

Walter Slatoff was a gentle and reflective person whose belief in the importance of all human beings frequently made him an eloquent and impassioned supporter not simply of principles of justice and freedom but of oppressed individuals and groups. His concern for people was crucial to his interest in literature, and made him an unusually effective teacher of both undergraduate and graduate students. His lecture classes as well as his seminars were filled to capacity—and sometimes beyond. His gifts as a teacher, which included the ability to listen as well as to speak, brought him the Clark Distinguished Teaching Award in 1978, and were the same gifts that made him an unusually able, if reluctant, English Department chair in 1973-74.

Throughout the 36 years of his association with the English Department as assistant, associate, and full professor, Walter taught courses both in American literature and creative writing, and served in a number of editorial capacities—including terms as editor and co-editor—of *Epoch*, the nationally-distributed magazine of new fiction and poetry published by the department as part of its creative writing program.

Walter was the author of three books. The first, *Quest for Failure: A Study of William Faulkner* (1960), has been referred to in recent years as a precursor of deconstruction, because of its central concern with the ambiguities, ambivalence and antithetical elements to be found in Faulkner's prose; and the second, *With Respect to Readers: Dimensions of Literary Response* (1970), sometimes has been classified with books dealing with reader response theory. His last, and most remarkable, book, *The Look of Distance: Reflections on Suffering & Sympathy in Modern Literature—Auden to Agee, Whitman to Woolf* (1985), makes evident, though, his personal distaste for both theories. That book is a compendium of quotations from works of poetry, fiction, and non-fictional prose that are organized and illuminated in a new way by a mind as generous as it is skeptical. Literature itself deeply mattered to him, and he took it seriously as a manifestation of human thought and behavior. He entered into a kind of dialogue with any text that he valued or scorned, and that dialogue sometimes resulted in a confrontation, a verbal battle. Disliking theory, suspicious too of detachment and spiritual remove, he brought to his reading his own humane judgments, based on personal experience and a lifetime as a reader. He disliked hypocrisy and personal cruelty as well as social injustice, and to find them casually accepted in literature or life aroused his indignation and sometimes his anger.

At Cornell, he served on committees seeking to end racial and other forms of discrimination, and remained in passionate disagreement with the university's continuing refusal to divest its holdings in South Africa. One of his last public acts before his retirement was an address to the large audience participating in, or simply watching, the construction by Cornell faculty of a shanty on campus, one built in protest of university investment in corporations doing business in South Africa; one of his last private acts as a citizen was a letter written shortly before his death to the nation's president, appealing to him—for the sake of those who would suffer or die on both sides of the conflict—to find another solution than war for the problems in the Persian Gulf region. The unique contribution he brought to his classes, his editorial work for *Epoch*, and everything he wrote was a sensibility that combined matters of conscience with a sensitivity to language—to the implications of structure and style. Some texts immediately won his admiration; but if a text contained a whiff of corruption, he sniffed and tossed it about, trying to get at the source. “We always turned to him when we had a particularly troublesome story” a fellow editor of *Epoch*, who once had been a student of his said, following the news of his death. “I think he was the wisest man I ever knew.”

As serious as he was about ethical concerns, Walter enjoyed banter and recreational activities with his family and friends. He liked gardening—but weeding his flower beds never took precedence over poker or the race track. Winning—either at cards or the races—never concerned him much; what he liked was the playing itself, and the company of good friends. It is agreeable to note that the concluding chapter of *The Look of Distance*, those pages of Walter's in which—as he told an old friend—he managed at last to put into print what he always had most wanted to say about literature and life, contains a reference to poker.

Walter's immediate survivors are his wife, Jane (Jimmy); his daughter, Joan; and his son, Don. His friends want them to know that they, too, miss the presence of one they continue to love.

Glenn Altschuler, W. Donald Cooke, James McConkey

Fred Slavick

July 2, 1923 — August 5, 1999

Fred Slavick joined the faculty of Cornell's School of Industrial and Labor Relations in Fall 1953, following study for the Ph.D. degree in Economics at Princeton University and employment there as a Research Assistant in the Industrial Relations Section and as a Teaching Assistant in its Department of Economics. Except for two years at the Bureau of Labor and Management at Iowa State, Fred served Cornell until his retirement in 1978.

Fred was born in Milwaukee, Wisconsin and was educated in its public schools until he entered the University of Wisconsin at Madison. Like many of his generation, his undergraduate education was interrupted by military service during World War II. After special training at Kenyon College and in England as an interpreter of German, he served in that capacity in prisoner-of-war camps in France.

After discharge from the U.S. Army, Fred returned to the Madison campus to complete his B.A. degree in 1946 and an M.A. degree in 1947. There as a Graduate Assistant, Fred studied with Professor Edwin Witte, one of the leading scholars in the field of social insurance and one of the architects of the Social Security Act. That influence continued at Princeton where he matriculated for his Ph.D. degree in Economics, serving as a Teaching and Research Assistant to J. Douglas Brown, also a major figure in the legislative development of the Social Security Act. Fred received his Doctorate from Princeton in 1953, with a dissertation on disability and medical care insurance through collective bargaining. He joined the ILR faculty in that year as a Research Associate, and was promoted to Assistant Professor in the following year. He became an Associate Professor in 1960, and received his promotion to full Professor in 1966.

Fred's teaching and research from his student days onward were consistently in the field of income security and protective social legislation. During his tenure at Cornell, his research in that field ranged broadly, though perhaps with most emphasis on aging and retirement policy. Fred's approach to issues in the field invariably was to test the validity of the underlying policy assumptions. For example, in his monograph on retirement policies (*Compulsory and Voluntary Retirement in the American Economy*, 1966), he exposed the heterogeneity in the provisions of formal pension plans, whether unilateral or collectively bargained. In another study of eligibility for unemployment insurance of voluntary quits, Fred's research challenged the inflexibility of the prevailing policy of disqualification in most state plans. Other important research efforts included an assessment of unemployment insurance under prolonged economic recession, and a study of the employment problems of older workers.

Both as teacher and a “citizen” of the academic community, Fred cheerfully fulfilled his obligations with distinction. He was admired for the quality and content of his course offerings, and respected for the rigor and impartiality of the performance standards he expected from his students.

No less important in his life than his devotion to professional interests was music. Trained as a boy on the violin, later switching to the viola, Fred’s capability on the instrument and his knowledge of the string quartet repertoire well exceeded that of most amateur and even some professional musicians. His friend, Professor John Hsu of Cornell’s Department of Music, told us that “(Fred). . . reached such a high level of proficiency that he was able to play all the great works in the string quartet repertoire.” After his return to Milwaukee at retirement, Fred played regularly in several string quartets and quintets. There and during his travels abroad to Great Britain and Israel, playing music and attending concerts was often his principal interest. These activities brought him great happiness.

During the last several years of his life, Fred was afflicted by Alzheimer’s disease. His devoted brother, Monroe Slavick and sister-in-law, Florence, cared for him during these last years. He died in Milwaukee on August 5, 1999 at the age of 76.

Ronald G. Ehrenberg, Duncan M. MacIntyre, Robert L. Aronson

Mark Vernon Slingerland

Assistant Professor of Economic Entomology

— *March 11, 1909*

On Wednesday, March 11, 1909, death removed from among us our respected friend and valued colleague, Mark Vernon Slingerland. His death is a serious loss to the world of natural science in which he was a conscientious and honored student, as well as to the Faculty of this University where his opinion and voice were respected, and a deep source of grief to a wide circle of friends in University and town.

He came to this community as a student in 1888, was graduated in 1892 and entered the instructing staff of the University in the same year. His progress thereafter was rapid, but also substantial. As a student, his career was marked by earnestness, courage and industry. As a teacher, he was direct and forceful. As an investigator, he was conscientious, unbiased, persevering and accurate. In his special field of economic entomology, his authority and leadership received unquestioned recognition. As a student of the life history and means of controlling insects which prey upon domestic animals and cultivated plants, his investigations embraced an exceptionally wide range. While the numerous monographs he prepared have been of incalculable benefit to those engaged in the field of plant and animal production, they remain also as enduring monuments to a life which, though lamentably short, yet overflowed with a special type of beneficent usefulness. His opinion, advice and judgment were valued alike by student and colleague. Those who knew him as a friend were privileged. They appreciated him as a man of character wedded to truth, unswerving in conviction, and consistent in maintaining his ideals. Though diffident in expressing opinions, his mind was of the eminently practical kind, which, discarding unimportant details, concentrates on the immediately essential. His memory is cherished as a man whose life, though short, stands as a notable example of one who gave his years unselfishly and devotedly to the discovery of useful truths in the realm of natural history in their relation to the economy of plant and animal life. Measured by years, his life was short ; measured by achievement he lived long. As a scientist we honor his memory; as a man and a colleague, we mourn his loss.

J. H. Comstock, John Craig, W. W. Rowlee

Harold R. Smart

May 4, 1892 — November 22, 1979

Harold Smart died on Thanksgiving Day 1979 in Poughkeepsie, New York. He was eighty-seven and had lived away from Ithaca since retiring from Cornell in 1960 as a professor emeritus.

By birth, he was a New Englander. He was born in Searsport, Maine. He went to the public schools there and later attended Kent's Hill Seminary, Kent's Hill, Maine, from which he graduated in 1909. At Wesleyan University, he majored in economics and mathematics, receiving the Bachelor of Science degree in 1915.

During World War I, 1917-19, he was an enlisted man in the United States Army. He spent nineteen months in France as an ordnance sergeant with the Seventy-seventh Division. From March through June of 1918 he studied at the University of Lyons. He always read and spoke French with ease and taught it at the Hill School, Pottstown, Pennsylvania.

After his discharge from the army, he came to Cornell as a graduate student, majoring in philosophy and minoring in physics. He received his Master of Arts degree in 1921 and his doctorate in 1923. Except for one year, 1923-24, when he was an assistant professor of philosophy at the University of North Carolina, he spent his entire academic career at Cornell, on the faculty of the Sage School of Philosophy.

At Cornell, Smart was one of the best students of James Edwin Creighton (1861-1924), a renowned philosophical idealist and one of the founders of the American Philosophical Association and *The Philosophical Review*. Creighton's influence on Smart was profound and lasting. Smart's philosophical thinking was strongly idealist: his interpretation of Kant, on whom he taught a graduate seminar throughout the thirties, was as the precursor of idealism. In the years immediately following Creighton's death, he completely revised Creighton's highly successful logic text, *An Introductory Logic*, and in 1932 published a new, fifth edition of it with himself and Creighton as joint authors.

Smart was especially interested in logic, the history of logic, and the history of modern philosophy: he taught and wrote on all of these. His books include: *The Philosophical Presuppositions of Mathematical Logic* (Longmans, Green), 1923; *The Logic of Science* (D. Appleton), 1931; and *Philosophy and Its History* (Open Court), 1962. He was also keenly interested in aesthetics, which he taught to undergraduates for a number of years. From 1930 to 1937, he was an editor of *The Philosophical Review*. He was a member of the American Philosophical Association and the Creighton Club (the philosophical association in upstate New York named for James E. Creighton).

As a person, Smart was kind and quiet, thoughtful and fair. He listened carefully and well. Beginning in 1946, he was for a number of years an assistant to the dean of the College of Arts and Sciences, working on particularly difficult student problems. Students remember him with warmth and gratitude. He was a patient and understanding counselor, a gentle and devoted teacher, a staunch friend and colleague.

Max Black, Sydney Shoemaker, Stuart M. Brown, Jr.

Albert William Smith

August 30, 1856 — August 16, 1942

Few graduates of Cornell University have contributed as much to the spirit and service of Cornell as has Albert William Smith, one of its earlier graduates, and a teacher and administrator during twenty-one years, preceding his retirement as Professor of Mechanical Engineering, Emeritus.

Born in Westmoreland, New York, on August 30, 1856, Albert Smith entered Cornell as a student in 1874, and was graduated in 1878. During this period he distinguished himself as a student and as an oarsman on the first of the outstanding Cornell crews. He returned to Cornell in 1886 as a graduate student. In 1887 he was made assistant professor of mechanical engineering in Sibley College at Cornell, where he remained until 1891 when he became professor of machine design at the University of Wisconsin; he left there a year later to become head of the department of mechanical engineering at Stanford University, returning in 1904 to his Alma Mater to become dean of Sibley College until his retirement in 1921. He was acting president of Cornell University from April 3, 1920, to October 20, 1921.

After his retirement, writing, which had been his avocation, became his vocation. Seven books published in this period are: biographies of John Edson Sweet, Walter Craig Kerr, and Ezra Cornell; *Poems in Varying Moods*; *Poems of Cornell*; *Facing Life*, The commencement address at Cornell in 1921; *A Springtime Odyssey on the Shores of Southern Seas*.

Also, during his retirement he influenced alumni and others to make gifts to Cornell and guided the direction of those gifts.

As an engineer he added honor to his profession; as a teacher and writer in his professional field he clarified abstruse problems; as an administrator, he was incisive, patient, considerate, and sympathetically understanding.

Without the least detracting from his success as an engineer, teacher, and administrator it may be said that his outstanding contribution came through the example of his character, the breadth of his culture, his enthusiasms for the best in literature, music, and art, and his wholesome influence on students, who at one time voted him the most respected and most beloved teacher at Cornell.

Sorrow at his death is tempered by thankfulness for his inspiring life.

Alpheus W. Smith

March 29, 1898 — January 23, 1977

Professor Smith, who taught human relations, joined the Cornell faculty in 1946 and retired as professor emeritus in 1966. During his twenty years in the School of Industrial and Labor Relations he taught in both the extension program and the resident instruction program of the school. He was for many years assistant director and for several years director of extension, the school's statewide adult education program.

Born at Lake Arrowhead, California, Professor Smith moved in 1905 to Ithaca, New York, with his parents, the late professors Albert W. and Ruby Green Smith. He graduated from Ithaca High School in 1915 and entered Cornell the same year. As a student at Cornell, Smith was active in student affairs, including Theta Delta Chi, Aleph Samach, and Quill and Dagger; and he was editor-in-chief of the *Cornell Daily Sun*.

He left college for military service in 1918, having been promoted from Private to second lieutenant in the U.S. Army Artillery by 1919, when he returned to Cornell to complete his A.B. degree. After graduation Smith was employed by Standard Oil of New York as an accountant and office manager in Turkey and Greece.

Upon his return to the United States, Smith started his teaching career in literature at the University of Minnesota where he also did part-time graduate work. In 1922 he married Launette Nichols, art and English teacher, and a graduate of the University of Wisconsin. Later he joined the faculty of Northwestern University, completed a Ph.D. in English and German philology at Harvard, and returned to Northwestern where he taught contemporary American, English, and European literature for over fifteen years.

During his years at Northwestern, Smith became well known not only as an excellent teacher and college administrator, but also as a broadcaster and radio director of educational programs. Among the best known of his programs was the CBS weekly "Of Men and Books." In the summer of 1937, he participated in the American Today Program of the British Broadcasting System. He was also active in professional and community organizations and held various offices in the North Shore Cooperative Society, the Evanston University Club, the Chicago Council for Democratic Action, and Locals 400 and 635 of the American Federation of Teachers. He served for many years as secretary and later as chairman of the Prose Fiction Section of the Modern Language Association.

In 1942 Smith took a leave from his teaching duties at Northwestern to serve with the armed forces during World War II. He directed the Army School in Lexington, Virginia, and organized two overseas schools, one in Naples,

Italy, and another in Honolulu. He was field director of the Army Information Unit in the Central and South Pacific and of similar units in the Netherlands and Germany. Smith wound up his active army career even more directly involved in planning and implementing innovative educational programs.

Smith became chief of the Schools Branch, Office of the Provost Marshal General in June of 1945 and from then until July of 1946 was involved in the program designed to furnish instruction in democratic citizenship to German prisoners of war who were to be returned to Germany to assist in its reconstruction. After serving as commandant of three army schools in Rhode Island, he became commander-in-chief and commandant of the special project center in Fort Eustis, Virginia, from which selected prisoners of war were sent back to Germany for repatriation.

It was a dramatic story made public only after the program had been in operation for over a year and a half and the Fort Eustis project was underway. Columnist Quentin Reynolds spent several days at Fort Eustis. In an article in *Colliers*, May 25, 1946, he wrote the following tribute to Smith: "The whole atmosphere of Fort Eustis is a reflection of the personality of Colonel Alpheus Smith, and if it begins to look as though I were completely overboard on this big guy with the odd first name, you're right. He is one hell of an American, a man with a great intellectual gift and the humility of the true scholar."

Smith's attributes as a scholar, a man of letters, and educator par excellence and his experience with management made him a most attractive candidate for the faculty of the New York State School of Industrial and Labor Relations that was just getting started at Cornell. He was appointed to the faculty in 1946 as professor of industrial and labor relations and as assistant director of extension.

Smith played a decisive role in the development of the school's extension program, establishing a strong and enduring link between practitioners in industrial and labor relations and the world of ideas. In his first years at Cornell, Smith lectured in every major city in New York State and inspired interest in the school and its programs. He introduced many innovations in adult education, including courses for training trainers and human relations courses for managers, supervisors, and training specialists. Associates remember Smith as an inspirational teacher of students in the resident program as well as of practitioners in the field. His humanistic philosophy emerged in his teaching as did his deep social commitment and emphasis on the responsibilities of both labor and management.

Frank B. Miller, Maurice F. Neufeld, Lois S. Gray

Carl H. Smith

July 14, 1895 — April 23, 1971

Dr. Carl H. Smith, professor of clinical pediatrics, emeritus, of Cornell, and consultant pediatrician to the New York Hospital, died on April 23, 1971. His death is a poignant landmark in the development of the pediatric department. For more than half a century Dr. Smith had been a devoted member of the New York Nursery and Children's Hospital and the Medical Center, and wholly dedicated to the Department of Pediatrics and to the institution. He was one of those gifted persons possessing a rare admixture of intellectual and personal attributes which on the one hand made him an able clinician and a superb investigator, an inspiring teacher, and a notable author, and on the other hand, a good husband, a devoted father, a loyal friend, and a fine human being.

Professionally, Carl Smith's knowledge was encyclopedic, his curiosity insatiable, his judgment sound, his wisdom Socratic, and his spirit indomitable. His contagious enthusiasm, his gift of expression, and his rich humor stimulated his peers and his students.

There are two distinctive traits which especially characterized Carl Smith. One was humility exemplified by the aphorism, "knowledge is proud that he has learned so much; wisdom is humble that he knows not more." The second trait was a sense of intuition which closely bordered on serendipity. Dr. Smith was fully able to take advantage of fortuitous circumstances and it was this faculty that explained in large measure his many medical discoveries.

Professional recognition came to Carl Smith in many forms. He was an active member of eleven national scientific and medical organizations and he held important posts in many of them. He was a member of the editorial board of the *Journal of Pediatrics*. He is credited with being a founder of the new specialty of pediatric hematology and he established the pediatric hematology unit of New York Hospital where, in 1944, he introduced the first out-patient transfusion clinic in the United States. In 1952, friends of his founded the Children's Blood Foundation, which has since then generously supported Dr. Smith's work and now supports the Division of Pediatric Hematology. He was the author of the classic textbook, *Blood Diseases in Infancy and Childhood*, now in preparation for its third edition, and of more than one hundred scientific papers in medical journals. Amongst his many honors, he was elected to membership in Phi Beta Kappa and Alpha Omega Alpha; he received the Townsend-Harris Medal conferred by the City College of New York; and he was the recipient of the Order of Merit conferred by the Republic of Italy.

His talented and devoted wife Peggy was an active collaborator in Dr. Smith's medical writing. His son, Carl H., Jr., is a member of the Department of Pathology at Washington University, St. Louis, and his daughter Christine is a social worker who lives in San Francisco.

Few such professional careers have aroused so much admiration from so many. The Pediatric Department, the institution, his associates and his patients will long remember him and note his passing with sadness.

Samuel Z. Levine, M.D.

Earl Young Smith

February 27, 1893 — August 8, 1972

Professor Earl Young Smith, known to all of his friends far and wide as “E.Y.,” was born in Tunnel Hill, Illinois. He obtained a Bachelor of Education degree from Southern Illinois State Normal School and a Bachelor of Science degree from the University of Illinois. He taught vocational agriculture and was director of the agriculture department of Herrin Township High School, Herrin, Illinois, for seven years before coming to Cornell as an extension instructor in poultry husbandry on November 1, 1931. He was an associate professor of poultry husbandry from 1941 until his retirement in 1955.

His professional duties at Cornell were divided equally between extension and research. Soon after his arrival at Cornell, he organized the First Annual Poultry Nutrition School, which was held on the Cornell campus in October 1934. This School, the first of its kind, was so successful that it soon became the annual Cornell Nutrition Conference for Feed Manufacturers. This Conference has attracted as many as seven hundred feed manufacturers, poultry- men, and animal husbandrymen from all over the United States and from many other countries.

E. Y. Smith’s major interest always dealt with turkeys. He was a leader in the development and promotion of the meat-type turkey. He directed the turkey exhibit at the Poultry Industry’s Expositions in New York City in 1935 and 1936. E.Y. was very active in the National Turkey Federation and helped to organize the New York State Turkey Growers Association. He arranged many educational programs, tours, and demonstrations. He was chairman for the Northeastern Poultry Producers Council, Inc. He was very instrumental in encouraging turkey breeders to improve their stock, to breed toward broader breasted turkeys, turkeys with greater livability and greater productivity. E. Y. helped organize and was very active in the New York State Dressed Turkey shows during the 1950s. These attracted large numbers of contestants and consumers and promoted the consumption of turkeys. Professor Smith was a pioneer in the artificial insemination of turkeys. He was superintendent of the Cornell Turkey Farm and conducted a turkey breeding research program which produced the Empire White turkey, the first truly broad-breasted white turkey.

E. Y. Smith was a member of the Illinois State Poultry Association, the Poultry Science Association, and the Illinois Academy of Science. He was the author or coauthor of several bulletins and technical reports.

Upon retirement in 1955, Professor Smith joined with his son, Donald E. Smith, in the operation of the Empire Turkey Farm in Genoa, New York. Two years later he and his wife, Lillian Mae, moved to Maitland, Florida. He

also had two daughters, Mrs. Vera Mae Netteland and Mrs. Lucille Alexander, eleven grandchildren, and two great-grandchildren.

Professor E. Y. Smith spent his professional career helping in every way possible to improve the American turkey and to promote the turkey industry. He had much to do with the development of the present-day turkey, which is so meaty and so economical that it is eaten not only at Thanks- giving but also the year around.

E. Y. Smith was one of the first of a new breed of extension workers. He not only informed and interpreted for the farmers the new findings of research, but he also conducted research of his own which supplied direct answers to many problems facing the turkeymen of his day.

Frederick Miller Smith

June 6, 1870 — November 11, 1954

When in 1910 Frederick Miller Smith came to Cornell at the invitation of his friend Martin W. Sampson, he had acquired a background all too uncommon in teachers of English. He had published or had in hand some hundred short stories, two novels, and several informal essays; he had served for five years as an editor of the *Woman's Home Companion* (then an important literary journal) ; and yet he had continued to feel the attraction of an academic existence and had lived by choice near his own University of Indiana. During many trips abroad he had studied at Jena and Berlin, spending his leisure in visiting attractive regions as they can best be visited—on foot.

He soon became a valuable and influential member of this community. Partly through his contact with active and interesting friends, he could recruit well-qualified men for places of importance in the College of Arts and Sciences, and through them he exerted much quiet influence. In his service upon various committees, he campaigned effectively for many causes which later events showed desirable. But his accumulated talents perhaps found their most important employment in his long service as head of the courses in freshman English. Instructors who got their start under his direction will not soon forget the taste he displayed in selecting material for them to teach, or his sturdy support of them in trying to realize worthy objectives. Even his staff conferences, which might easily have led to friction or dull routine, under his presidency became sources of good ideas, seasoned with humor, gaiety, and pleasant conversation. He assembled for the courses an anthology, *Essays and Studies*, with a fine preliminary "Explanation" defining the purpose of education as the discovery that "life is a thoughtful man's job which must be faced cheerfully and courageously." When after using this book for some years he proposed to withdraw it in the interest of variety, his staff protested that proposed substitutes would compromise standards that all felt must be maintained.

As a teacher he believed in a large measure of spontaneity in classes. He disdained formalities if only he could induce his students to recognize, admire, and write clear, natural, energetic prose. Although he seemed to have read a good deal by most living authors, he would often be found reverting with interest to such distant figures as Caedmon and William of Wykeham. Perhaps Boswell's brilliant company, with its wit, diversity of character, lively conversation, and preference of art to politics, interested him most; his chapters in *Some Friends of Dr. Johnson* contain the only readable studies of several minor personages. The nice balance of his taste, which restrained him from overvaluing the old merely because it was old, or the new merely for its novelty, exerted a beneficial influence

upon his students and colleagues. And his famous course in the short story launched so many of our alumni upon at least part-time literary careers that he could sometimes find three or four of their publications in the issues of a single month.

Yet if his professional services in directing fundamental courses had importance that can scarcely be assessed, his friends and former associates will probably prefer to think of him in a very different setting. They will remember him as a lover of the outdoors and especially of spots in Six-Mile and Butternut Gorges, or of hilltop views and forgotten roads; as an expert in birdsong at a time when such knowledge was not especially common or easily acquired; or as the best of companions in a walk or excursion to places familiar or unfamiliar. They will recall his ready wit—sometimes in tart comment upon a subject deserving scorn, sometimes in a quotation very droll in its new context, or perhaps in recounting an amusing experience which the conversation suggested to him. It appears everywhere in his *Eight Essays*, in which the subjects range from a tallow-chandler's wife to the value of education, but all display to advantage his enthusiasm and lively style. Or what comes to mind may be little oddities: wearing a Tyrolean hat and carrying an alpenstock; or rendering a tedious discussion more tolerable to himself by composing gay paragraphs having little connection with the dull rumbling about him; or secretiveness about plans for a trip even after he had bought his tickets and arranged accommodations, and reticence after his return. And many colleagues and students can recall times when a man who based his own conduct upon independence and self-reliance came effectively and unobtrusively to their aid in time of trouble. It is revealing that despite the regular work and continuous publication he exacted of himself, he could still write with sympathy and interest of Topham Beauclerk, a delightful fellow, but so idle that he left behind as evidence of his many talents only scattered mentions: and this partly because Beauclerk understood good fellowship, and partly because "he knew very well what was fine and real, and often and often he sought it."

M. G. Bishop, W. H. French, F. C. Prescott

Goldwin Smith

— June 7, 1910

By the death of our beloved colleague, Goldwin Smith, this Faculty has lost its senior member, and Cornell University one of its truest and most sympathetic friends. From its opening, in 1868, through all its existence he has identified himself with the University's interests. During its earliest years, while he was resident with us, by his brilliant and inspiring lectures and not less by his personality he was an inestimable influence. His very presence was a power. After his retirement to Canada he still for many years continued to return to us for his course of lectures; and always his coming was hailed, alike by Faculty and students, as a great and inspiring occasion. None were too mature to listen to him gladly; and, whether in the class room or in that social converse to which he so generously welcomed even his boys, he was not only a rare intellectual force but a potent inspiration to character. Who of us can ever forget that spare and stately though slightly stooping figure,—that face so eloquent of thought and of experience, so noble in its grave and lofty calm,—that mirthful and mirth-provoking smile which ever and anon broke like a sunbeam through its sadness,—that quizzical twitching of the mouth which heralded and softened his satire,—that voice, so quiet yet so expressive? These, with his pure and noble life and his loyal and unselfish services to Cornell, will be a memory long cherished by this Faculty. He will stand out in the history of the University as one of those who did most to shape and to vitalize its early career.

Committee: Professors G. L. Burr, Hiram Corson, C. E. Bennett.

Helen Powell Smith

September 1, 1899 — February 6, 1997

Professor Helen Powell Smith died on February 6, 1997, at the age of 97. She was born in Washington, D.C., in 1899 and attended high school there. She received her B.S. degree from Pennsylvania State University in 1921. After graduation, she co-managed a tea room and inn at Ormond Beach, Florida, during the winter months and supervised the Lake Placid Tea Room during the summers of 1922 to 1923. In the summer of 1924, she supervised the dining room at Canyon Camp, Yellowstone Park.

In 1925, Professor Powell Smith became a home demonstration agent in Bergen County, New Jersey, and the following year became an Associate Clothing Specialist for the New Jersey Extension Service. In 1929, she left the extension service and began working in private industry, first as a promotion advisor for Hahne Company and then as Director of the Color Research Bureau and the Educational Bureau of the Spool Cotton Co. of New York, selling agents for J and P Coats and Clarks threads. During this period, she was a resource person for both college home economics programs and the extension services of New England and southern states. In this capacity, she developed teaching materials, bulletins, clothing kits, and educational services.

While in New York City, Professor Powell Smith began taking courses at Columbia University, primarily in art, and later in summer programs in Maine and North Carolina. In 1937, she married Culver Allan Smith. He was hired by Cornell in 1935 as Assistant Director of Placement Services. In 1946, he became Director of the University Placement Service and by 1953, he was the University Employment Counselor in the Office of the Dean of Men.

Professor Powell Smith joined the faculty of the College of Home Economics as Acting Assistant Professor and Extension Specialist in clothing in 1937. She was appointed Assistant Professor in 1939 and Associate Professor in 1943. In 1952, she became head of the Department of Textiles and Clothing, a position she held until her retirement in 1958. As an administrator, she was very interested in the development of educational resources, and she was able to allocate a fund for the purchase of a valuable collection of ethnic clothing and textiles, which was acquired from a professor of Art History at Columbia University. This collection is now one of Cornell's most valuable. While serving as head of the department, she was also the Extension Clothing Project Leader.

Professor Powell initiated a radio program "Let's Make a Dress," a set of 15 discussions about how to cut, fit and sew a dress. The series was an experiment in the effectiveness of teaching a technical subject over the radio. It was also a way to reach rural homemakers who could not attend local home demonstration meetings. She

conducted live presentations for Extension audiences that were recorded for use at various stations around New York. Listeners registered for the program and participants over the five years of the program exceeded 15,000. Registrants received lesson helps so that they could keep abreast of the presentations over the radio.

Professor Powell Smith was a member of Phi Kappa Phi, National Honorary Scholastic Fraternity and Epsilon Sigma Phi, National Honorary Extension Fraternity. In 1947, Epsilon Sigma Phi awarded Professor Powell Smith its Certificate of Highest Achievement for the radio program she developed. She also received an Award of Merit from WHCU as a result of the radio program originated and produced at WHCU.

After her retirement, she and her husband moved to Black Mountain, North Carolina. They continued their interests in gardening and traveling. She also enjoyed spending time weaving on her own loom. In 1983, Professor Powell Smith moved into Highland Farms Retirement Community, where she was active in the center's activities, including the thespian group. She also enjoyed reading, playing classical music on the piano, and walking around the campus. Professor Powell Smith spent her remaining years at Highland Farms, and was there when she died. She is survived by her sister-in-law, Dora Powell, of Ashville, North Carolina; her niece, Sarah Wall, of Black Mountain, North Carolina; and her grand nephew, Douglas Powell III, of Long Beach, California.

Howard Godwin Smith

April 9, 1910 — October 28, 1983

For some fifty-six years of his life Ithaca was home to Howard G. Smith. Born in Brooklyn, New York, in 1910, where he spent his early youth, he came to Cornell at the age of sixteen from his family home in New Rochelle, New York, to enroll in the School of Electrical Engineering. From that September in 1926 Cornell, engineering, and the Ithaca community were to be his lifelong and abiding interests.

As an undergraduate Howie joined Delta Sigma Phi fraternity and worked for the *Cornell Daily Sun* both as a reporter and as a member of the editorial board. He was managing editor of the *Sibley Journal*, forerunner to today's student-managed publication *The Cornell Engineer*. He received his bachelor's degree in 1930, his master's degree in 1931, and his doctorate in 1937—all in electrical engineering from Cornell. Following the receipt of his doctorate, Howie spent a year as an instructor at Clemson in an exchange with his college roommate and best man, Berry Credle. As a member of the Cornell electrical engineering faculty he served as an instructor, an assistant professor, and an associate professor and became a professor in 1947. He had been an emeritus professor since 1974.

On the surface—unless you knew him—Howie seemed to be a rather unremarkable man. President emeritus Dale R. Corson wrote, “If I had not known the people in the General Electric Company in Syracuse who were responsible for radio and television transmitting equipment, I would not have known about Howie's role in antenna design.” One such design, a helical antenna, developed by Howie while he was on leave at General Electric, has been widely used in the industry.

His speciality was in communications engineering and high-frequency techniques, and his professional experiences in support of his specialty were broad. They included service on the engineering staffs of the New York Telephone Company, Bell Telephone Laboratories, and radio station WESG, later to become Cornell's radio station WHCU, and assistance in the establishment of the General Electric Advanced Electronics Center in Ithaca.

Of his intellectual abilities, Professor True McLean, adviser for both his Master's and Ph.D. degrees and the individual who started station WESG, wrote, “I must say that he was among the two or three best students I ever had —graduate or undergraduate [in forty-three years of teaching at Cornell].” Another faculty colleague and former advisee, Professor Ralph Bolgiano, added another human dimension when he commented, “I shall miss most deeply the merry twinkle in his eye.”

At the University during the hectic days of World War II Professor Smith was supervisor of radio communications training within the U.S. Army Signal Corps program. Later, from 1957 to 1961, he served as educational supervisor for the New York Telephone Company's extension training course in communications techniques. During the war period and for several years afterward Howie was responsible for much of the administrative support services within the School of Electrical Engineering: course scheduling, admissions to the school, and student advising.

It was in recognition of these talents that the then dean of engineering, Dale R. Corson, in 1961 appointed Professor Smith as the first director of the College of Engineering's Division of Basic Studies. This unit was created to administer a college-wide unified freshman and sophomore program— common courses and coherent academic support services such as advising and counseling. Up to this period, engineering at Cornell had operated as a collection of rather autonomous schools with separate admissions, advising, and curricular policies.

For ten years Howie performed this largely thankless but very significant task essentially alone, with a small staff of administrative aides. During these years his efforts impacted upon the academic careers of about a third of Cornell's current engineering alumni body. He thrived in this work and more often than not helped countless students in a fashion such that they never realized who really had helped them. He was forever crediting the results to a committee of one sort or another. Many of those committees were Howie Smith.

Howie retired in 1974 to enjoy his later years with his devoted wife, Jane Blakeslee, Cornell '31; their three children, John '58, Donald, and Barbara; and Donald's two sons, Nathan and Kevin. He maintained an active interest in the affairs of the School of Electrical Engineering and, with Donald Berth, wrote the definitive history of the development of electrical engineering at Cornell. Indeed, up to the time of his death he was involved in organizing background information in preparation for the Centennial of Electrical Engineering at Cornell, to be celebrated in 1985.

A longtime friend and colleague, Professor Joseph Rosson, sums up Howie's career: "In my opinion no faculty member was more dedicated to the ideals and missions of Cornell University, the College of Engineering, and the School of Electrical Engineering. His whole professional career was devoted to maintaining and enhancing the quality of education and university life for engineering students. Howie was a complete Cornellian in the truest sense of the word."

We may never see *his* likes again.

Paul D. Ankrum, Robert E. Osborn, Donald F. Berth

Laura Lee Whitely Weisbrodt Smith

July 16, 1903 — February 28, 1993

This past February the Hotel School lost one of its best known and most loved faculty members, Dr. Laura Lee Smith.

Laura Lee was born in Georgetown, Ohio in 1903. She graduated from the St. Bernard, Ohio public schools and was the only female to receive a B.S. degree in chemistry from Miami University of Ohio in 1925. Laura Lee continued her education earning an M.S. degree in chemistry from Iowa State University in 1927 and the first Ph.D. degree in nutrition from the University of California at Berkeley, in 1930.

In June of 1927, Laura Lee married Ora Smith in the Rose Gardens at Iowa State University. They spent the next 65 years together, both enjoying outstanding careers at Cornell.

Laura Lee began her Cornell career in the Home Economics Department, teaching from 1937 to 1942. After some time away and the birth of her son, James Stanley, and daughter, Sarah Jane (Burton), she returned to Cornell as professor of food chemistry in the School of Hotel Administration, teaching there from 1956 to 1972.

During this time Laura Lee became the quintessential expression of the concept that “good things come in small packages.” Although small of stature, she rose to become one of the University’s best lecturers and perhaps the most energetic and revered faculty member at the Hotel School. Laura Lee made chemistry come alive for her students. She played a major role in creating a generation of hotelmen and restaurateurs who were not only technically competent but strong decision makers as well, due in part to Laura Lee’s teaching that the scientific method applied to life as well as chemistry. She was well known in the Hotel School for expecting disciplined excellence, and her students’ commitment to excellence carried well past their days in chemistry class.

Laura Lee was quite active outside the classroom. Professionally, she was author and editor of *Food Service Science*, published in 1974. Her research interests addressed the uses of modified starches in packaged food products as well as the breakdown of cooking oils in the frying process. She was a member of the American Chemical Society, the Institute of Food Technologists, and a fellow of the American Institute of Chemists and the New York Academy of Sciences. She also served as a nutrition consultant to the Inter-American Institute, Turrialba, Costa Rica, from 1946-48.

In the community, Laura Lee was an active volunteer for the American Red Cross, the Girl Scouts, and Sampson Air Force Base Hospital during World War II. She was a charter and life member of the Finger Lakes Kennel Club and authored its history. She served as chairperson of the Bethel Grove School Board, was founding treasurer of the Ithaca Ballet Company and taught math and science in the Ithaca public school system.

Laura Lee had a tremendous affinity for the out-of-doors, devoting time to her garden and grounds. She had one of the largest oak trees in New York in her front yard, and her flowers and white picket fence were a landmark on Route 79. She and Ora donated fourteen acres around the Six Mile Creek drainage area to the Finger Lakes Land Trust in order that the land's natural beauty be preserved.

Laura Lee Smith—student, scholar, writer, wife and mother, beautifier, disciplinarian, teacher, artist, conservationist. These talents, interests and commitments created a legacy of appreciative alumni at the School and of grateful admirers in the community.

Robert M. Chase, Peter Rainsford, Thomas John Kelly

Ora Smith

April 13, 1900 — February 4, 1993

Dr. Ora Smith, who lived to be 92, was one of the world's most productive and best known potato researchers. Dr. Smith was born in Freeburg, Illinois. He received a B.S. degree from the University of Illinois, an M.S. degree from Iowa State University, and a Ph.D. degree in plant physiology from the University of California in 1929. The following year Dr. Smith joined the Department of Vegetable Crops at Cornell University, where he devoted more than 50 years to research, teaching, and writing about the potato. During this time he was author or co-author of more than 500 popular and scientific articles, numerous contributions to encyclopedias and handbooks, and two books.

Dr. Smith's career by no means ended upon his appointment as professor emeritus in 1967, for he continued his writing as long as his health permitted. The fourth edition of the popular book *Potato Processing* appeared in 1987, and he had almost completed a third edition of *Potatoes: Production, Storing, Processing* to update the edition that appeared in 1983. Both books are well known by potato growers, processors, and researchers around the world.

Although Dr. Smith carried out research and teaching on many aspects of potato production and storage, he was best known for his work on potato quality, especially quality for processing. After World War II, when he began to give major attention to processing quality, only 2% of the U.S. crop was processed. Dr. Smith anticipated the growing popularity of potato chips and french fries and pioneered studies on how to grow, store, and evaluate potatoes that would have acceptable quality for these uses. He was the first director for research of what was then the Potato Chip Institute International (now the Snack Food Institute International), carrying out these duties for 26 years while continuing to serve as a member of the Cornell faculty.

Dr. Smith stressed the importance of tuber specific gravity for processing quality and developed the "potato hydrometer" that is still used widely to measure specific gravity. Another aspect of potato quality emphasized by Dr. Smith was the role of reducing sugars in producing the browning of chips and french fries. He was a pioneer not only in quick methods to measure quality for processing, but also in finding cultural and storage practices that would lead to better quality. Dr. Smith was a forceful spokesman for his views and effectively used both the written and spoken word to persuade others to change.

Under Dr. Smith's supervision, 27 students received the Ph.D. degree, many of whom have led prominent careers in research institutes, universities, and agricultural and food industries. These included three members or former

members of the Cornell Faculty: W.C. Kelly, Professor Emeritus of Vegetable Crops; R.S. Shallenberger, Professor Emeritus of Food Science and Technology; and R.L. Sawyer, former Professor of Vegetable Crops and founder and first Director General of the International Potato Center.

Dr. Smith himself had a strong international interest. During 1946-47 he was a member of the staff of the Inter-American Institute of Agricultural Sciences in Costa Rica. In 1938 Dr. Smith visited 75 colleges and experiment stations in 18 European countries. Dr. Smith was the only U.S. delegate to the Northwest Europe Potato Association Meeting in 1955; and he regularly attended meetings of the European Association for Potato Research, to which he belonged from the time of its founding.

Dr. Smith was an active member of the Potato Association of America, serving as its secretary for four years and as its president. He was awarded a plaque and cited for his outstanding service to the potato industry in 1959 by the National Potato Council, the first member of the academic field to be so honored. In 1967 and again in 1970, Dr. Smith was cited by the National Potato Utilization Conference for outstanding contributions to the meetings of that organization from its inception in 1947. He was the only person who has ever been made both an Honorary Life Member of the Potato Association of America (1960) and an Honorary Member of the European Association for Potato Research (1972).

Other honorary and scientific societies to which Dr. Smith belonged included the New York Academy of Sciences, American Association of University Professors, American Society for Horticultural Science, Soil Science Society of America, American Society of Agronomy, American Oil Chemists Society, Canadian Institute of Food Science and Technology, Institute for Food Technologists, American Institute of Biological Sciences, and the American Association for the Advancement of Science (of which he was a fellow). He was a member of Alpha Zeta, Alpha Tau Alpha, Phi Sigma, Phi Kappa Phi, Phi Tau Sigma, and Sigma Xi fraternities and scientific organizations. He was a member of President Eisenhower's Commission on Utilization of Farm Products and a member of the Advisory Board of Food Technology International, Inc. Dr. Smith also contributed many hours of voluntary service to youth and educational organizations in the Ithaca community.

Dr. Smith was married for 65 years to Dr. Laura Lee Weisbrodt Smith, Professor Emeritus in the Cornell School of Hotel Administration. Mrs. Smith died a few weeks after her husband. They are survived by a son, Dr. James S. Smith; a daughter, Sarah Jane Burton; a brother; nine grandchildren; and one great-grandchild.

W.C. Kelly, J.B. Sieczka, E.E. Ewing

Preserved Smith

July 22, 1880 — May 15, 1941

Preserved Smith, who was proud to be the tenth member of his line to bear the name Preserved, was born in Cincinnati, Ohio, on July 22, 1880. His father, Henry Preserved Smith, an ordained Presbyterian minister and a distinguished Hebrew and Old Testament scholar, suffered for his enlightened views by being brought to trial and then dismissed from his office for heresy. The harsh experience like the scholarly pursuits of the father made a deep impression on the son, in whose own writings in due course erudition and broad tolerance were to be happily combined. In 1897, after a preparatory year at Lawrenceville, Preserved Smith entered Amherst College, and in 1901 he received his Bachelor's degree. The next six years he spent partly in graduate study at Columbia University, partly as an instructor in Political Science at Williams College. He then returned to Amherst for seven years as a Fellow in History. During the session 1919-20 he lectured at Harvard University and two years later he came to Cornell first as lecturer, and then as Professor of Medieval History. In 1931 his title was changed to Professor of History.

From 1907, when his doctoral dissertation, *A Critical Study of Martin Luther's Table-talk*, was published, Preserved Smith for many years concentrated his main interest on the religious and intellectual history of the sixteenth century. In 1911 there appeared the *Life and Letters of Martin Luther*, a book which attained a second edition only three years later. There followed, in 1920, *The Age of the Reformation*, which has since been used widely as a college textbook and is still perhaps the best general survey of the subject in English. His profound admiration for Erasmus found special expression in a *Life of Erasmus* (1923) and in a *Key to the Colloquies of Erasmus* (1927). Always a man of wide intellectual interests, he now turned his attention to a broader field, no less than a *History of Modern Culture*, which he planned to complete in four volumes. The first appeared in 1930, the second, which carried the story down to the later part of the eighteenth century, in 1934. He was actively engaged on the third volume when, in the autumn of 1940, he was stricken down by the illness from which he was never to recover. In addition to these larger works he contributed at various times articles to the *Encyclopaedia Britannica* and the *New International Encyclopaedia* and reviews to American and European journals.

By his studies in the period and on the leaders of the Reformation, Preserved Smith won notable recognition from scholars on both sides of the Atlantic. He was awarded the degree Doctor of Letters by Muhlenberg (1922) and by Amherst College (1927), and he was for a number of years a valued member of the Advisory Board of Editors of

the *American Historical Review*. His last and most ambitious work was intended for a wider educated public. Even though it may be vulnerable to criticism by specialists on points of detail, it was a remarkable undertaking for one man to attempt, and the two published volumes will always stand out as an impressive achievement.

Somewhat retiring by nature, Preserved Smith nevertheless won the respect and affection of his students. He was perhaps most successful in his more advanced classes, and several of his graduate students now occupy responsible positions in important universities. He was always a loyal and valued colleague, who had at heart the interests of the University as a whole and of the department of which he was a distinguished member. His death has left a gap in the University community which will not easily be filled. His many friends will long remember him as a man of liberal views with a gift of dry humour, a lover of landscape, literature, and music, and a kindly and courteous host.

Robert Samuel Smith

June 15, 1920 — January 25, 2004

Cornell University and the Ithaca Community lost one of its highly regarded and widely respected citizens in the unexpected and untimely death of Robert S. Smith on January 25, 2004 at the age of 83. He was a family man, an inspiring teacher and educator, a community spirited citizen, who enriched our lives with his good humor and his willingness to carry out assignments wherever he was needed. He leaves behind a legacy of commitment to the improvement of rural life and the natural resources, which make farming and forestry possible. His heritage in Cooperative Extension and service to others filled his life wherever he was—in small communities, at the university, or in banking and finance.

Born on June 15, 1920, Bob grew up in New Hampshire on a farm near Laconia as part of a big family. He returned regularly throughout his life to his native state and often reflected on his happy, rugged New England heritage. Early in his life, Bob's father set about teaching his son how to train a team of oxen. Bob often talked about that experience and many others from his days on the farm, as he spent much of his life teaching others—first as county agent, then as college professor, banker, board member and community leader. Often you teach by example, and in all these roles we learned from him about thrift, persistence, loyalty, and the solid results achieved from hard work.

Bob's education started on the home farm and with life in rural New England in the 1920s and 1930s. As one of ten children on a farm, there was always enough to eat, but often not a lot of extras. He had heard a lot about the agricultural college at Cornell during his youth from his older brother, and what others had gained from a degree there; so he came; found his partner for life, Mary Morgan; and graduated in 1942. After graduation, he became the Assistant Agricultural Agent in Livingston County and was quickly named to be the County Agricultural Agent in Lewis County. With United States entry into World War II, he joined the Army and served as a field artillery officer in Europe. Returning after the war, he became the Agricultural Extension Agent in his home county in New Hampshire. But the GI Bill made more education possible and he returned to Cornell where he completed his Master's degree in Agricultural Economics in 1950 and his Ph.D. degree in 1952.

His academic advisor at Cornell was Stan Warren, a master teacher and friend of agriculture. Bob completed his doctorate with Stan studying father-son and other types of business arrangements, seeking to establish a set of principles that underlay success in making such arrangements work effectively. Bob's first major publication after

completing his thesis was an experiment station bulletin, *Transferring the Farm to the Next Generation*. Much of what he wrote in that 80-page bulletin applies as well in the 21st century as it did 50 years earlier.

Smith was immediately appointed by the College as an Assistant Professor in Extension as coordinator of statewide, young-adult programs. He joined the faculty in Agricultural Economics in 1954 as an Associate Professor in Farm Management with primary responsibility for extension programs. He was promoted to Professor in 1958—just six years after completing his thesis. He worked closely with Van Hart on farm credit programs and directed the Bankers School of Agriculture from 1960 onwards. He was appointed Professor of Farm Finance in 1961 and made this the center of his professional work for the rest of his life at the university.

Bob took two sabbatical leaves overseas. The first was in Israel in 1960-61 as Agricultural Advisor to their Ministry of Agriculture. In 1968, he went to Teheran as Advisor to the Agricultural Development Fund of Iran where he worked closely with its President, a former graduate student at Cornell. These were both teaching and learning experiences, part of his life-long effort to improve the life and education of people making their living from the land.

Because he was such an effective teacher of county agents and farmers, he was asked to teach the department's courses in Farm Finance and agreed to teach a course in Personal Finance in the late 1960s. Not surprisingly, his students appreciated his efforts in the classroom and the seniors of the college chose him as their Professor of Merit in 1972. Earlier, he had been recognized by the Farm Credit Banks of Springfield with their first Agricultural Counselor Award in 1965. The Internal Revenue Service honored him with a Special Citation for his tax education programs in 1974. Epsilon Sigma Phi recognized his continuous contributions to extension education with their Superior Performance Award.

As a successful teacher and leader in his field at the university, he believed in giving back to the institution where he had worked, taught, and learned. Bob was instrumental in organizing and successfully completing two major fund raising efforts for the college. With the strong support of Dean Kennedy, the funding of the W.I. Myers Chair in Agricultural Finance was completed in 1977 and Bob became the first holder of that Chair until his retirement. To recognize the many contributions of his mentor and teacher, Stan Warren, he led the campaign to establish the Stanley Warren Teaching Endowment, largely funded by Stan's former students. He and Mary have given back in many other ways to their colleges and university, most recently funding an endowment for the Morgan Smith Trail at the Cornell Plantations in October 1999.

Bob was invited to join the Board of Directors of the Tompkins County Trust Company in part because of his responsibilities at the university in agricultural finance. His abilities as a banker were quickly recognized by the rest of the Board. He was elected Chairman of the Board and took early retirement from the university in 1980. As Board Chairman, he took an active role in the community and strongly encouraged young professionals at the bank to accept responsibilities in community affairs. He took an active role in the American Bankers Association and was particularly pleased when one of his former Ph.D. students living in Iowa became its President. He served for many years on the Board of Mutual of New York and took an active role on the Board of Hospicare here in Ithaca. He was an active member of the City Club of Ithaca for 20 years and served it well as sergeant, judge and speaker.

The Smith household was a welcoming place. Bob and Mary's five children came to know many of their parents' colleagues and friends. They always took an interest in what others were doing and rejoiced with them in their achievements and comforted their sorrows. They took rightful pride in the achievements of their five children located throughout the northeast quadrant of the country. Pat, Peggy, Sherry and Starlee have all had successful lives and careers. Bob was particularly pleased to see his son, Scott, become Dean of Agriculture at the University of Kentucky.

Farms, farming and rural people were especially important to Bob. He spent much of his productive life finding ways to help others improve their well-being. He has left a special mark on the university, his colleagues and the local financial community. All of our lives are the better for our years and close association with Robert Samuel Smith.

Ruby Green Smith

January 6, 1878 — May 13, 1960

News of the death on May 13, 1960, of Ruby Green Smith, Professor Emeritus of Home Economics, the widow of Albert W. Smith, was received with profound regret and a source of great personal loss by her host of friends and former associates on campus and in many parts of the United States. All who knew her remember her as a gracious, personable, and kindly person who made an outstanding contribution to home and community life. She was able to instill confidence in those with whom she worked. She was known affectionately by many of the homemakers and her associates as “Aunt Ruby.” Mrs. Smith was born January 6, 1878, on an Indiana farm, the daughter of Dr. and Mrs. Alpheus W. Green. She is survived by a son, Alpheus W. Smith; a daughter, Ruth (Mrs. Robert P. Ludlum); and five grandchildren. Another daughter, Dorothy (Mrs. Harold Reynolds), died in 1938.

Mrs. Smith was associated with the Cooperative Extension Service for nearly thirty years. She began her association with it in 1917 as a member of the staff of the States Relations Service of the United States Department of Agriculture. This staff, at that time, was engaged principally in work designed to aid the government in winning World War I. Mrs. Smith was the leader in organizing food bureaus, later called Home Bureaus, and establishing home demonstration agents in many cities of the United States. The chief purpose of these bureaus and agents was to aid the Federal Food Administration in conserving and processing essential food products.

In 1918, Mrs. Smith was appointed Deputy Food Commissioner for New York State. About two years later, she became State Leader of Home Demonstration Agents at Cornell University, a position she held with only a slight interruption until her retirement in 1946. As State Leader, she served at a time when a gracious personality was needed to develop the urban phases of the program and to cement good relations between the rural and urban Home Bureau membership.

Her work as State Leader brought her into contact with many organizations, and she was in great demand as a speaker and consultant with many of them. She addressed audiences in some of the outstanding colleges and universities. She was a speaker at many national organization meetings, particularly those of the Association of Land-Grant Colleges and Universities and the Associated Women of the American Farm Bureau Federation. The latter group was organized through her effort. She initiated the idea and, later, at the request of the officers of the American Farm Bureau Federation, drafted the constitution and by-laws. Her advice and guidance helped that

Association to perform many useful services for the homemaker and greatly increased the prestige of the parent organization.

Mrs. Smith was one of the organizers of the New York State Federation of Home Bureaus and served as its counselor during her entire period as State Leader. She had relationships with many other organizations, including the Playground and Recreation Association of America, the New York State Library Association, the Parent-Teachers Association, the State Grange, and cooperatives such as the Dairymen's League and the G.L.F.

She was a prolific writer. She was best known for the "Home Bureau Creed" and the book entitled *The People's Colleges*, primarily a history of the Extension Service of the New York State Colleges of Agriculture and Home Economics at Cornell University. She also edited *The Comstocks of Cornell*.

Mrs. Smith received the B.A. and M.A. degrees from Stanford University in 1902 and 1904 respectively, and the Doctor of Philosophy degree from Cornell University in 1914. She was a member of the American Home Economics Association, the American Association for the Advancement of Science, Sigma Xi, Phi Beta Kappa, Kappa Alpha Theta, and Epsilon Sigma Phi.

When Ruby Green Smith retired in 1946, many tributes were paid to her. Among these was one by Sarah Gibson Blanding, then Dean of the New York State College of Home Economics, who said, "Mrs. Ruby Green Smith has brought real distinction to her work as State Leader of Home Demonstration Agents. Her genuine interest in people, the ability to bring out the best in them, combined with her scholarly attainments, administrative ability, and foresight, have contributed materially to the strength of the extension movement in the United States, of which she has been a part since the first World War."

At the time of Mrs. Smith's death, the present Dean, Helen G. Canoyer, said, "Dr. Ruby Green Smith combined in her professional career the qualities of scholar, humanitarian, writer, and teacher. Through her vision, initiative and organizational ability, she provided leadership to her colleagues in the College, the state, the nation, and the world. Her warm and lovable qualities, even more than her administrative ability, made possible her great contributions to the home life of New York State. Such contributions do not die—they live on in others."

L. R. Simons, Ruth B. Comstock, Lillian Shaben

Sedgwick E. Smith

April 4, 1914 — February 11, 1990

Sedgwick E. Smith, known to his colleagues and friends as “Sedg,” died on February 11, 1990, after devoting over 41 years of loyal, scholarly service to Cornell University. He contributed immensely to the development and character of the present Department of Animal Science.

Sedg was born in Elkins, West Virginia, in 1914 and studied animal husbandry at Pennsylvania State University, graduating with the B.S. degree in 1935. In that year, he enrolled as a graduate student at Cornell, with an assistantship in animal husbandry, for majors in animal breeding, and minors in biochemistry and physiology. He received the Ph.D. degree in 1939 under the direction of Professor Sydney A. Asdell.

After completing graduate studies, Sedg was appointed in 1939 as animal physiologist with the Plant, Soil and Nutrition Laboratory, U.S. Department of Agriculture, located on the Cornell campus. At the same time, he held an appointment as research instructor of animal husbandry for two years and assistant professor for four years on the staff of the Department of Animal Husbandry at Cornell. In 1946, he was appointed to the Cornell faculty as associate professor of animal husbandry and resigned from the Federal Laboratory. Sedg was promoted to professor in 1951. He retired from the department in 1977 with the title professor of animal science emeritus.

Professor Smith served eminently in his teaching and student advising. He advised over 350 undergraduate students and was major professor for 23 graduate students. He taught “Livestock Nutrition” 36 times to a total of 5,308 students. In that effort, 131 graduate assistants benefitted from his guidance in teaching techniques. Professor Smith also taught a graduate course, “Special Topics in Animal Nutrition,” for 12 years and the course, “Advanced Nutrition of Dairy Cattle,” during three summer sessions.

At various times, Sedg served on one of these committees of the College of Agriculture and Life Sciences: Educational Policy, Petitions, Scholarship, Library, and Nominations. As a member of the Committee on Revision of Graduate Requirements, Sedg was instrumental in establishing the undergraduate distribution of required courses in the College of Agriculture and Life Sciences.

In addition to his formal teaching, Sedg also taught on an informal basis. He was an outdoorsman and hobbies and extracurricular activities included hunting, fishing, gardening, and wood carving. He was knowledgeable of the habits of animals and gave excellent advice for success in hunting and fishing; he was an excellent fisherman

himself. He loved trout fishing, and his advice in this area gained him much esteem and respect. He taught many others the art of good fly tying and was a member of the Cornell Fly Tying Club and worked with the Adirondack League Club.

Professor Smith's research covered a wide range of subjects, with special emphasis on mineral nutrition and metabolism, in several animal species. Perhaps his greatest contribution was the hypothesis that cobalt is utilized by rumen bacteria to synthesize an unknown metabolically active compound—eventually proven to be vitamin B₁₂. He and his colleagues were the first to demonstrate that dietary cobalt deficiency in ruminants is primarily a metabolic deficiency of vitamin B₁₂.

In all of his research, Sedg was noted for the thoroughness with which he attacked problems. A good example was his comprehensive and definitive investigations of the sodium chloride requirements of high-producing dairy cows, which are recognized as classic. Special contributions were made by Sedg in his Ph.D. thesis, "Functional Sterility in Dairy Cows," which served as a major base for practical recommendations in New York until 1960.

In other research, Sedg examined the genetics and physiology of "lethal anemia" in the rat, the composition of urinary calculi in fur-bearing animals, the hematology and vitamin A and D, and thiamine requirements of foxes and mink. Other studies included hereditary cataract and the "black-blue" mosaic in Dutch rabbits. Sedg's work added greatly to the knowledge of iron, copper, zinc, manganese, calcium, phosphorus, magnesium, sodium, chloride, and molybdenum in animal nutrition.

Throughout his career, Sedg faithfully served his department, the College of Agriculture and Life Sciences, and the university. He was acting head of the department for a period of 15 months in 1954-55, and again for 6 months in 1959, and for shorter periods on several other occasions. He was chairman of the Departmental Planning Committee for Morrison Hall, 1953 to 1961, Graduate School Field Representative in Nutrition, 1960 to 1964, and in the Graduate Field of Animal Science, 1965 to 1975. Also, Sedg was the chairman of the Graduate Selection Committee in the Department of Animal Husbandry (later Animal Science) for 23 years, 1952-1975.

For many years, Professor Smith was a member of the National Research Council Committee on rabbit nutrition, and the feed survey committee of the American Feed Manufacturers Association. He was an active member of the American Society of Animal Science, American Dairy Science Association, American Institute of Nutrition, and the Cornell Research Club. He was a member of the scholarly and scientific societies of Sigma Xi, Phi Kappa Phi, Gamma Sigma Delta, and Alpha Zeta.

Sedg is survived by his wife of 50 years, Margaret Gainey Smith; two sons, Edward J. and Mark F., of Ithaca; one daughter, Eileen S. Kinsey, of Flanders, New Jersey; two grandchildren; his mother, Annie Lothes Smith, of Ridgway, Pennsylvania; three sisters; several nieces and nephews; and many friends and associates.

Douglas E. Hogue, George W. Trimberger, Kenneth L. Turk

William A. Smith

July 6, 1897 — January 4, 1984

Professor Emeritus W. A. Smith died on January 4, 1984, at the age of eighty-six. He was active in community and education affairs since his retirement in 1965.

A native of Indiana, Professor Smith received the B.S. degree at Purdue University in 1919, the M.S. at Cornell in 1929, and a Ph.D. in agricultural education at Cornell in 1937. His early interest in rural youth led him to teach agriculture and work with 4-H groups from 1919 to 1928. In 1928 he joined the staff of Purdue University as itinerant teacher-trainer in agricultural education but left that position to accept an assistantship at Cornell to study for the doctorate. Following completion of the Ph.D. in 1937, he was appointed assistant professor of agricultural education in the Department of Rural Education. He rose to full professor, serving on the staff for the period 1937-65. In 1958 he assumed the position of director of the Summer School and Extramural Division, combining it with his role as professor of education.

“W. A.,” as he was known to his colleagues and friends, led a challenging and productive life as a scholar in his field. His early interest in research brought him national and international prominence. His ability as a writer was recognized early on, when he was chosen as editor of *The Agricultural Education Magazine*, 1952-57, the premier publication in his field. The development of a systematic approach to the job of teacher of agriculture resulted in the first series of publications on teacher education in the Northeast. They were later used as a model for nationwide assessment of the job.

He was a pioneer in the movement to provide in-service and extramural courses to professional persons and, in 1948, was appointed director of extramural courses. In this position, which he undertook in addition to his regular teaching load, he greatly expanded a program of night courses offered in Ithaca and a number of neighboring cities. These courses were taught by Cornell faculty and provided a very valuable service to area teachers.

In 1959 the decision was made to merge the Cornell Summer Session with the Division of Extramural Courses, and Professor Smith was appointed director of the new division. At that time each of the statutory units had its own budget for summer school courses, but all were administered by the Summer Session director. Both the statutory and endowed units offered special summer programs that used Cornell faculty and facilities and frequently gave Cornell credit but were completely independent of the Summer Session. In addition, many of the summer courses had been offered on a less rigorous basis than the equivalent courses offered in the fall and spring terms. As a

result, many Cornell students were warned that they might not get credit towards their degree for summer work, and faculty, particularly in the endowed colleges, were advised that teaching summer courses was a waste of time.

W.A. set to work immediately to try to straighten out what was really an intolerable situation. By working with the University controller and other University officials, he was able to combine the finances for both state and endowed units in one Summer Session budget. Tuition, which had been a fixed fee for the summer, was changed to a credit-hour basis with a smaller charge per credit for statutory college courses. After a lot of maneuvering he was able to get special summer programs put under the jurisdiction of the Summer Session director and, gradually, to improve the quality of summer course offerings so that a majority of them were accepted as the equivalent of regular-term courses.

Notwithstanding the significant contributions in his administrative roles, Professor Smith is best known and remembered for his teaching style and personal involvement with students and advisers. He was very thorough in his presentations and expected students to perform at the same level. His preciseness and willingness to spend the necessary time for students to develop the mastery needed were highlights of his work. He was the type of professor long remembered after the course was over.

W.A. was an avid gardener and lover of nature. This interest was maintained during his retirement, when he assumed responsibility for the garden at the retirement community where he spent the last several years of his life. He continued to volunteer his services to schools, especially in working with children with reading difficulties.

Professor Smith always had a friendly greeting and smile for all persons whom he contacted, was a great booster of Cornell in every way, and will be missed by many generations of Cornellians. He is survived by two daughters, seven grandchildren, and nine great-grandchildren.

W. E. Drake, M. W. Sampson, Jr., J. P. Bail

Robert M. Smock

October 21, 1908 — April 22, 1986

The name remained the same on the office door for nearly fifty years. The bearer of that name, whose professional life changed emphasis through the years and was punctuated with a variety of rewarding personal adventures, was Robert Smock. He enjoyed a bountiful career of personal interaction and postharvest pomology.

Although Bob had an interest in laboratory physiology, exemplified by his published observations of orchard, handling, and storage factors that influenced the respiration rate of apples, applied research was the hallmark of his career in pomology. Most practical pomologists would consider their careers to be a success if they made one major contribution to the fruit industry. Bob made two.

The first was his research on, and development of recommendations for the controlled-atmosphere (CA) storage of apples. From the late 1930s to the early 1950s his CA research was carried out under the physically adverse conditions imposed by the location of his storage laboratory in the wet basement of an old barn. He developed recommendations for the temperature and concentrations of oxygen and carbon dioxide to be used during CA storage of most apple cultivars grown in the United States. These recommendations are currently followed by most CA operators in North America and by many CA operators in other apple-growing regions. In addition to developing recommendations for the CA temperature and atmosphere, he personally worked with fruit growers for several years to develop recommendations for the construction, gas sealing, testing for air tightness, and operation of commercial CA rooms. The growth of the commercial CA industry in New York and New England, which preceded and set the example for the establishment of CA operations elsewhere in North America, can be attributed almost exclusively to Bob Smock's adherence to the philosophy that changes are brought about by the actions of dedicated people.

The physiological disorder *storage scald* caused multimillion-dollar losses to the world's apple industry every year until Bob discovered that diphenylamine and ethoxyquin, used as postharvest treatments, controlled the disorder. This was his second major contribution. He spent several years screening scores of antioxidants before he found those two compounds, which consistently gave complete control of storage scald. He then acted through the U.S. Department of Agriculture to obtain the toxicological data to clear the compounds with the Food and Drug Administration, and he cooperated with commercial chemists to develop suitable formulations. Finally, since these were the first postharvest-prestorage materials to be applied to apples, he worked with growers to develop suitable application equipment.

Other noteworthy research contributions include his early work with waxing apples and *bitter pit* and his later work with enhancement of red color development and with the influence of mineral nutrition and plant growth regulators on apple quality and condition. Bob was a member for several years of the small school of researchers who thought that nonethylenic apple volatiles may influence the development of storage scald. The lack of consistency in his research data led to his withdrawal from that school, which soon thereafter became defunct. Current research suggests that that theory was correct—that a volatile from apples may induce other apples to develop storage scald.

Although his formal credentials classified him as a professor of pomology, a semester in his classroom or a few intimate visits to his office left most students and professionals with the impression that he was also a distinguished professor of human relations. His philosophy that education is supposed to engender a little curiosity and that research should be fun, not work, inspired several generations of undergraduate and graduate students. It is not at all surprising that he was the first person to have received the L. M. Ware Award for Distinguished Teaching (1964) from the American Society for Horticultural Science.

Bob was mistaken in thinking that “the only reward (*professor perfectus*) one can look forward to is to be flattened into a herbarium specimen and put away on a shelf and never looked at again.” Although he did not admit it, he was a *professor perfectus* (cv. emeritus). During the years of retirement, there was a meshing of his vocation (pomology) and avocation (human interactions). He maintained an active research program, but most of his time, we observed, was spent following the calling of his heart, that is, counseling undergraduate students and teaching English to foreign students.

Gene H. Oberly, Loyd E. Powell, G. D. Blanpied

Virgil Snyder

November 9, 1869 — January 4, 1950

Virgil Snyder was born in Dixon, Iowa, on November 9, 1869. After receiving the M. Sc. degree from Iowa State College in 1889, he came to Cornell as a graduate student in 1890. In 1892 he went to Germany to complete his graduate study, and received the Ph. D. degree from the University of Göttingen in 1894. While at Göttingen he married Margarete Giesinger. Returning to Cornell in 1894 as Instructor in Mathematics, he became Assistant Professor in 1903, Professor in 1910, and Professor Emeritus in 1938.

Professor Snyder's mathematical work entitles him to a place among the best of American mathematicians. His special field was algebraic geometry, and for thirty years he was the outstanding authority on the subject in this country. His early training in Germany and subsequent study in Italy gave him a mastery of the methods of these two great schools of geometry. Of his seventy odd published papers, about a dozen are registered as having made fundamentally important contributions in the field of algebraic geometry. These are concerned with the classification of ruled surfaces of order six, and with the study of involutorial transformations in three-dimensional space.

The mathematical ability of Professor Snyder was well known to his American and European colleagues. He held various positions of importance in the American Mathematical Society, including editorship of its Bulletin, its vice-presidency and presidency. The University of Padua awarded him an honorary doctorate, and he was several times chosen as a delegate to international mathematical congresses. Probably the most definite recognition of his ability was his selection by the National Research Council as the chairman of a committee to prepare a bibliography on algebraic geometry. The resulting volume has proved to be an indispensable tool for workers in this field.

Of equal importance to his contributions to the body of mathematical knowledge was his success in spreading that knowledge. He was a joint author of four textbooks on calculus and analytic geometry. His skill and enthusiasm as a teacher are shown by the fact that forty students prepared doctoral dissertations under his guidance.

Professor Snyder was notably community-minded. Whatever the circle in which he moved, the University, its Department of Mathematics, the church, the city or the small group of closer friends with whom he lunched weekly during his later years, he was quietly considerate and quickly responsive, so that to an admiration for the wide range of his interests and the penetrating insight of his comments was quickly added a warm regard for the man and the comrade.

W. R. Carver, R. J. Walker, W. F. Willcox

Donald F. Solá

February 24, 1922 – July 29, 2008

Donald F. Solá, “Don”, Professor Emeritus of Linguistics, passed away July 29, 2008, in Hospicare, Ithaca. Don was born on February 24, 1922 in Herkimer, New York. He leaves his wife of 62 years, Daphne Joyce Solá; three children, Michèle, Cristina, and Matthew; and five grandchildren. At the outbreak of WWII, he joined the U.S. Army Air Corps, serving in the Signal Intelligence Corps in India. After being mustered out, he worked at the New York Herald Tribune, affirming interests in quality journalism, history, and political affairs.

In 1950, Don enrolled in Cornell University receiving his B.A. degree in 1952 in Spanish Linguistics continuing with graduate studies at Cornell and majoring in Linguistics with Anthropology and Social Psychology as minor fields. He developed a lifelong interest in Quechua and Andean Studies, and in 1958, he received his Ph.D. degree with a dissertation on Quechua, “Huanaco Kechua: The Grammar of Words and Phrases”. He followed up his dissertation research with in-depth field studies in Quechua dialectology with support from a two-year Rockefeller Foundation grant.

Don was appointed Instructor in Spanish linguistics in 1953 and Assistant Professor in 1958. His responsibilities were to Spanish language teaching, but Don recognized the need to make instruction in Quechua available to Americans and took it on as an additional duty. Since this was the first attempt to teach Quechua in the United States, no relevant teaching materials were available. By chance, his efforts came at a time when American public opinion awoke to the need to support instruction in less-commonly taught languages, and in 1958, Congress passed the National Defense Educational Act, a bill that provided support for languages “critical to the national defense”. Fortuitously, Quechua was one of those languages, and Don led in the preparation of Quechua instruction materials. He began the project in 1961, and after five years, he had a complete curriculum for Quechua. To make the language available to students outside of Cornell, Don secured funding to establish a summer program in Quechua, a program which more than forty years later continues to function.

Don’s background in Andean language and area studies and expertise in bilingual issues led to involvement until 1978 in various UNESCO and U.S. government projects concerned with language policy and literacy development in Peru. He focused on the development of programs of bilingual education for Peru’s Quechua speakers. Don was also interested in developing a cadre of Peruvian experts in bilingualism and applied linguistics. From 1961-69, he directed a cooperative project between San Marcos University in Lima and Cornell for collaborative development

in linguistics and language teaching in Peru, whereby Peruvian scholars came to Cornell for M.A. and Ph.D. studies. This project enabled Don not only to enrich our graduate student body but also to introduce issues of language policy and bilingualism into the linguistics curriculum at the graduate and undergraduate levels.

A Fulbright teaching and research grant in 1973 saw him in Cuzco, Peru, where he did further research on bilingualism. He continued consulting on issues of bilingual education for the U.S. Agency for International Development until 1978. Throughout his two decades of work promoting linguistic studies and bilingual education in Peru, Don was a founder and active in directing the Inter-American Program for Linguistics and Language Teaching (PILEI), whose main function was to present linguistic institutes attended by graduate students from throughout the Americas.

In his later years until well after his retirement, Don was active in developing software for computer-assisted language learning and received several contracts to maintain a laboratory for preparing software for the learning of Spanish, called "Interlex".

Don had broad interests. His friends and family knew him as a lover of music, classical and popular, an avid attendee of the theater, and a spirited and talented ballroom dancer. He was famous for his generosity and hospitality. His beautifully restored home in Jacksonville was the scene of frequent social events through the years, where Don and his wife, Daphne, regaled their guests with gorgeous food, music, and good fellowship.

John U. Wolff, Chairperson; Richard L. Leed, Margarita Suñer

Fred Somkin

May 12, 1924 — February 1, 2009

Born in Detroit, Michigan, Fred Somkin received instruction at the Yeshiva school there, earned his B.A. degree in English from Wayne State University (1946) and his LL.B. degree from Columbus Law School (now Catholic University Law School in Washington, D.C.) in 1952. He had served in the U.S. Army during World War II and in its reserves as a sergeant from 1949-53. From 1952-59 he practiced law in Washington, where he became a member of the bar of the Supreme Court of the U.S. He served as counsel for the penultimate capital defendant in Washington.

Through his legal practice Fred met Bodil Hammergaard, a Danish woman who served as an apprentice to Frank Lloyd Wright (1950-54). They married in 1959, and she designed their home on Cornell Walk in Ithaca. Bodil predeceased him in 2000 and they had no children.

While completing his Ph.D. degree in American History at Cornell (1967), Fred taught history at Queen's University in Kingston, Ontario, from 1963-68, when he joined the Cornell faculty as Associate Professor of History. His specialty was American cultural and intellectual history, and his courses included "The American Dream," "Law and Authority in American Life," "Crime and Punishment," "The Jewish Immigrant Experience," and undergraduate seminars on a variety of topics.

His best-known work, which remains an influential classic, is *Unquiet Eagle: Memory and Desire in the Idea of American Freedom, 1815-1860* (Cornell University Press, 1967), an exploration of American concerns about the meaning of democracy, prosperity, national security, and occasions rich with symbolic significance, such as Lafayette's triumphal return visit to the United States in 1824-25. Fred's ultimate concern in this beautifully written book is the quest for a sense of national identity. He quoted from a symptomatic committee report in 1845 that sought for the young country "a distinctive name, one that would express the American 'nationality' more meaningfully than the United States." Hence its recommendation: The Republic of Allegania. The committee's purpose, of course, was to eliminate or smooth over the growing estrangement between North and South and strengthen the Union.

The range of Fred's reading and erudition astonished his friends. He could identify the source of quotations from literature and historical figures that sounded familiar to others who nonetheless could not place them. In a notable essay that appeared in the *Journal of American History* (1981), "How Vanzetti Said Goodbye," he employed

his deep knowledge of American literature to demonstrate the likely influence of Walt Whitman's poetry on a famous prison statement made by the Italian-American anarchist Bartolomeo Vanzetti in 1927, and to show more broadly that "Vanzetti's prose took a marked impress from Whitman's words."

That kind of literary detective work appeared early and often in Fred's scholarship. It began with "Tocqueville as a Source for Edwin Arlington Robinson's 'Man Against the Sky,'" and in 1963 occurred again in "Scripture Notes to Lincoln's Second Inaugural," which appeared in *Civil War History* in 1981.

During the later phase of his career at Cornell, Fred's special focus became the world of Jewish-American theater and music that thrived in New York City during the late nineteenth and early twentieth century. That led to his last major publication, "Zion's Harp by the East River: Jewish-American Popular Songs in Columbus's Golden Land," which appeared in *Perspectives in American History* (1985). His research interests during the 1990s reached back to his legal training and activity on behalf of civil liberties during the 1950s. For his final project he turned to the doctrine of self-defense in the United States during the first half of the nineteenth century, which from a cultural perspective was a hitherto undeveloped field of inquiry. After examining more than 400 cases of self-defense during the early republic, he focused on a notorious manslaughter episode that occurred in Massachusetts in 1806, a court case in which the defendant, whose trial was tainted by partisanship, was eventually cleared. That case became the basis for many other self-defense decisions during the half-century that followed.

Fred retired from teaching at Cornell in 1994. During his later years, he shared a close friendship with a kindred spirit, Rabbi Eli Silberstein of Ithaca. They met weekly to study the Talmud, a practice they both loved, and to share stories about their similar backgrounds as Yeshiva students. Fred is remembered for his love of music and poetry along with 'Yiddishkeit' and lively storytelling. The history of American humor had engaged him as a professional interest, and close friends recall with affection his own delight in jokes and anecdotes that revealed the foibles of his students, his colleagues, and himself.

Michael Kammen, Chairperson; R. Laurence Moore, Richard Polenberg

Robert Wilbur Spalding

May 27, 1920 — January 2, 2004

Dr. Robert W. Spalding was known by all his friends as Bob. Bob Spalding was born on May 27, 1920 in St. James, Missouri. He grew up on a general farm, and was active in the 4-H Program. Also, in high school, he played basketball and was in the band. He gained special experience with dairy cattle by working on a number of dairy farms.

He entered the University of Missouri in 1939, majoring in Dairy Husbandry. He was a member of the intercollegiate judging team. In addition to receiving a Sears Roebuck scholarship, he worked his way through college financially by employment in the Department of Dairy Husbandry. Also, he worked on the Hatch Experimental Dairy Farm during the summer of 1941. Other undergraduate activities included membership in the Dairy Club and the Agriculture Club. He received the B.S. degree in 1943.

In 1943, he married Margaret Ann Gibbs, and volunteered for duty in the Navy. After midshipman's school, he served for three years as an antisubmarine and radar officer. His Navy experience took him to many countries. He held the rank of Lieutenant when discharged in 1946.

He immediately continued his education by enrolling at the University of Missouri, studying for an M.S. degree, 1946-47. He was granted an assistantship, which, along with the GI bill, provided financial support. The assistantship afforded an opportunity for Bob to help teach courses in artificial breeding, production testing, and feeding and management of dairy cattle. For his Master's thesis, he worked on factors affecting gestation length in dairy cattle. This information was published in a Missouri research bulletin, a series for which the University of Missouri is famous.

In 1947, Bob Spalding came to Cornell where he was appointed as an Assistant Professor. He participated in all phases of the extension program, with a focus on reproduction and breeding. This was a critical period for the development of the artificial breeding program. Professor Spalding conducted intensive training programs to prepare inseminators for artificial insemination under the auspices of the Department of Animal Husbandry. As no suitable written training guides were available, he prepared a manual for training inseminators. Along with Professor H.W. Carter, he was instrumental in convincing dairymen that new methods of sire selection and testing developed by Professor C.R. Henderson must be adopted to replace the old natural service proofs, if the objective of

attaining the tremendous potential of genetic improvement of dairy cattle was to be achieved. Professor Spalding was appointed Associate Professor in 1952. The program continued to flourish with Cornell and the New York Artificial Breeders Coop., Inc. leading the world in breeding better dairy cattle through artificial insemination.

During this time, Professor Spalding utilized the three months off appointment and sabbatical leaves to initiate research toward his Ph.D. degree at Ohio State University, which was awarded in 1962. Following receipt of this degree, his position was changed to a joint extension-research appointment. He was promoted to full Professor in 1963. Professor Spalding was also made a member of the graduate faculty. New responsibilities included advising undergraduate and graduate students.

In the early 1950s, Cornell University developed a model program in international agriculture with the University of the Philippines at Los Banos, which resulted in advanced training of the Philippine staff, rebuilding the physical plant and improved teaching and research. Professor Spalding was given a leave of absence to serve as Visiting Associate Professor in the Department of Animal Husbandry, Los Banos, during 1957-58. His interest in international programs continued. In 1968, he served as a consultant to the Food and Agricultural Organization of the United Nations, and he assisted the Ministry of Agriculture, Barbados, West Indies, in solving some of their livestock production problems.

Throughout his career, Professor Spalding took the leadership on many department and college committees. Among others, he served for 10 years on the College Extension Dairy Committee (Chairman 1962-64). He headed the College Farm Labor Program in 1966-67, and 1969-70, and then he served as the Program Leader for the Agricultural Manpower Program, New York State College of Agriculture, 1970-72. In 1972, he became the College Dairy Industry Program Leader, a position he held until retirement in 1977.

Professor Spalding served the university in other ways. He was treasurer of the Grad-Fac Club in 1948-49. He chaired the Program Committee of the Statler Club, 1964-66. He served on the Faculty Council of Representatives for two years, and served as Vice-chairman (1973) and then Chairman (1974) of the United Way for Cornell University. This responsibility expanded to Vice-Chairman (1976) and Chairman (1977) of the United Way of Tompkins County.

He authored many extension publications prepared as mimeographs, extension bulletins, and newsletters to extension agents, and as articles in farm magazines. Many of these publications discussed the selection and evaluation of sires used in artificial insemination, providing recommendations enabling dairy farmers to improve

their herds. He held management schools for dairymen and for extension agents to bring them up-to-date on the latest information on feeding and dairy management, on regulations concerning water pollution, and on testing for cattle diseases.

He initiated a seminal study in 1972 on breeding efficiency involving 200 herds of Holstein cattle. In 1975, this resulted in the first paper clearly documenting the dramatic negative effect that high milk production had on conception rates. Also, he conducted research on estrous cycle regulation. An illustrated flyer highlighting the effective methods of detecting estrus was used by extension, and by a commercial company (with permission), resulting in 100,000 copies being distributed. This was the largest circulation of any leaflet prepared in the Department of Animal Science.

Professor Spalding was a member of the American Dairy Science Association, the Dairy Shrine Club, Epsilon Sigma Phi, and Alpha Gamma Sigma. In Ithaca, he was an active member of the First Presbyterian Church and the Rotary Club.

Professor Spalding had many other interests. He was a master gardener, golfed, bowled, enjoyed dancing and fishing, and he was an avid bridge player. He and his wife, Margaret, raised three children, Jacqueline, Belinda and Steven. They spent many summers vacationing on Bob's Lake in Canada.

Professor Spalding lived in Ithaca for many years after his retirement as Professor Emeritus in 1977. During these years, he continued several of his hobbies, including traveling. Soon after the death of his wife, Margaret, in 1992, he moved to Sarasota, Florida. Summers for a few years were spent in Ithaca exploring the expanding wine trails and the great Adirondacks, but most of the time was spent in the mild climate of Florida.

He married his high school classmate, Eileen Bishop, in 1994. He continued his golfing, walking, and travels until ill health curtailed these activities. He passed away on January 2, 2004.

He is survived by his wife, Eileen; four sisters, Mary Lloyd, Maxine Birdsong, Iola Dean, and Meredith Morrison; three children, Jacqueline Woo, Belinda Spalding, and Steven Spalding; and several stepchildren and grandchildren.

Douglas E. Hogue, R. David Smith, Robert H. Foote

Leland Spencer

April 25, 1896 — June 12, 1990

Dr. Leland Spencer, professor emeritus of agricultural economics, died June 12, 1990, at the age of 94. He was a dominant figure in the area of milk marketing throughout his career and was instrumental in making this area a recognized specialization for agricultural economists. He was a pioneer in the study of market institutions and the role of government in market regulation for perishable products.

Although there were earlier studies that related to milk markets, during the 1920s he was one of the first to conduct comprehensive, formal research in the field of dairy marketing and the first to develop and teach a course in this specialization. At the time, there was very little statistical material pertaining to the dairy industry. Dr. Spencer's careful and painstaking work was to be a model for later research and gained him the respect of industry leaders. His personal characteristics contributed to that respect. He was meticulous in dress, speech, and personal habits; careful and kindly, but strong in convictions and moral principles. He opened many doors in the dairy industry that helped others, particularly his graduate students, to obtain needed statistical data to carry on research work.

Leland Spencer was born April 25, 1896 on a dairy farm in northern Pennsylvania, the beginning of his lifelong association with milk marketing and the dairy industry. For most of his youth he lived in Elmira, New York, near Ithaca. His long and distinguished research, teaching and public service career began with his graduation from the College of Agriculture, Cornell University, in 1918. He entered military service in February 1918 and served in France and the Meuse-Argonne offensive and in the allied occupation of Germany. Following his discharge in 1919, he taught a course in farm management for two semesters at the Massachusetts Agricultural College. He returned to Cornell for his Ph.D. program in 1920 under the supervision of Dr. George Warren and Dr. William Myers. His dissertation, "The Use of Store Credit by Farmers," completed in 1923, was the first study of this growing practice. Subsequently he was offered a position in the Economics Department at the University of Illinois-Urbana. In recommending Dr. Spencer for the appointment, Dr. James Boyle spoke of him as "the strongest of the younger men now available for accepting a position outside of this department."

Dr. Spencer chose to stay at Cornell. After a year serving concurrently on the research staff of the College of Agriculture at Cornell and as an agent of the U.S. Department of Agriculture, he accepted an appointment as an assistant professor of marketing in 1924. He was promoted to professor in 1926 and taught the first milk marketing course in 1928. Despite increasing research and extension responsibilities during the 1930s, Dr. Spencer

supervised the work of a number of graduate students in the department. He took a personal as well as a professional interest in his graduate students. He expected the same painstaking care in their work that characterized his own research. He followed the careers of his graduate students throughout his lifetime, and carried on voluminous correspondence with them as well as with other research workers in the field, and with dairy industry leaders.

Dr. Spencer attended the First International Conference of Agricultural Economists held in Devon, England, in 1929. Already the recognized leader in this area, he presented a paper at that conference entitled, "Method and Results of Research in Dairy Marketing in the United States." The contacts made at that conference and those that followed increased his interest in dairy marketing research and industry problems throughout the Western world. He maintained contact with international colleagues through correspondence and exchange of research results. As a result, he attracted graduate students from many foreign countries, and he continued his contacts with them after they returned to their homes. His own research took on more international dimensions around the time of World War II, and continued thereafter. In 1949, Dr. Spencer served as a U.S. delegate to the World Dairy Congress in Stockholm, Sweden. He was active in international dairy marketing activities during the 1950s, with studies of cooperative dairy marketing in Sweden in 1950 and rationalization of milk marketing and marketing boards in Great Britain in 1953.

Dr. Spencer's work in milk marketing was highly regarded by public policymakers. It became the basis for New York legislation and affected the evolution of U.S. policies. When a joint legislative committee was formed in New York in 1932 to investigate the rapidly-worsening conditions in the dairy industry and to recommend corrective legislative action, Dr. Spencer was appointed its research director. Dairy farmer testimony at the many public hearings held by the so-called Pitcher Committee convinced legislators of the seriousness of the situation and led to the passage of the first state milk price control law in the United States. Dr. Spencer wrote most of the final report of the committee and helped in the drafting of the legislation which, among other things, provided for the government administration of milk prices on a classified pricing basis by the state. The legislation, a drastic departure from existing pricing practices, was conceived as a temporary emergency measure, but the regulation of milk prices by the state and U.S. governments evolved to become an ongoing and dominant feature of milk markets.

Dr. Spencer's interest in public intervention in the pricing of milk continued throughout his career. After the breakdown of state regulation of milk prices in the New York City market, Dr. Spencer assisted in several attempts

to develop a federal milk order, and in the eventual promulgation of a federal-state order in 1938. He presented testimony as a public witness at many New York milk order amendment hearings, and served as a member of several committees that dealt with pricing problems in New York and other markets.

The 1932 New York Milk Control Law also sought to strengthen dairy cooperatives as a countervailing force to the economic power of milk dealers in the milk pricing process, which was the original objective of the Pitcher Committee. Dr. Spencer continued his interest in the role of dairy cooperatives in pricing milk long after his work with the Committee was completed. From 1934 to 1939 he served part-time as a marketing specialist for the U.S. Farm Credit Administration during which time he conducted a study of the surplus milk problem in northeastern milksheds. During the decade of the 1930s, a majority of Dr. Spencer's research dealt with cost analysis at the farm, processor, and retail level.

Dr. Spencer's research interests in the 1940s focused principally on pricing policies and supply and demand analysis. He was particularly interested in effects of the war on milk marketing, including U.S. war-time rationing, the establishment of price ceilings, and the increasing demand for milk and dairy products coupled with a dwindling milk supply. His research activities in the 1950s were not limited to international studies. He began a project that extended through the remainder of his professional career that involved recording the history of distribution and pricing of milk. In the 1960s, he served as a member of the Federal Milk Order Study Committee appointed by U.S. Secretary of Agriculture, Orville Freeman, and as a member of a New York State Committee on Milk Marketing appointed by Governor Rockefeller.

Dr. Spencer was a lifelong member of the American Farm Economics Association and one of its national officers in 1935. He was also elected to Phi Kappa Phi and Sigma Xi.

Dr. Spencer retired in 1964 after more than 40 years of devoted service to Cornell and the dairy industry. His professional activities, however, did not end with his retirement. Working regularly through 1967, he completed eleven departmental publications after his retirement, and, with the assistance of Dr. Charles Blanford, a former graduate student and a former market administrator of the New York milk order, published five books. Six of the department publications and all of the books were histories of milk marketing in the New York market.

Dr. Spencer is survived by his wife, Ruth; two sons, Gordon and John; two grandchildren; and two great-grandchildren. He was an active Rotarian throughout his life in Ithaca and a participant in community affairs. His long-time colleagues in agricultural economics remember him with fondness and great respect as an

unequivocating gentleman, a distinguished scholar, and a true public servant who left an enduring mark on the field he did much to fashion, and sought to serve with compassion and unswerving principle.

Bernard Stanton, Robert Story, Andrew Novakovic

Frank L. Spitzer

July 24, 1926 — February 1, 1992

Frank Spitzer was one of the most original probabilists of his generation. He was born in Vienna, Austria on July 24, 1926. Fleeing from the Nazis, he spent the second world war in Sweden and finished high school there. He came to the U.S. after the war, did a stint in the U.S. Army and became a student at the University of Michigan. He received a B.A. degree and then a Ph.D. degree in 1953 from this same university.

After receiving his Ph.D. degree, Frank Spitzer was an Instructor at the California Institute of Technology from 1953-55, an Assistant and Associate Professor at the University of Minnesota from 1955-60, and then came to Cornell University as a Full Professor in 1961, where he stayed for the rest of his life, except for sabbatical leaves. He spent a year at Princeton University on an NSF Senior Postdoctoral Fellowship in 1960-61 and a year in Strasbourg, France on a Guggenheim Fellowship in 1965-66. He also participated in a special probability year at the Mittag-Leffler Institute in Djursholm, Sweden in 1972-73. Frank retired from Cornell in 1991 because his struggle with Parkinson's disease for a number of years had made teaching and doing research very difficult for him.

Apart from the Fellowships named above, Frank received a number of honors. He was elected a Fellow of the Institute of Mathematical Statistics in 1971, was invited for a lecture in the probability section at the International Congress of Mathematicians in Vancouver, Canada in 1974 and was the Wald Lecturer to the Institute of Mathematical Statistics in 1979. Frank was elected to the National Academy of Sciences in 1981. For about twenty years Frank was an editor of one of the principal probability journals, the *Zeitschrift für Wahrscheinlichkeitstheorie und verwandte Gebiete* and its successor, *Probability Theory and Related Fields*.

Frank Spitzer's main contributions to probability theory were in the area of Brownian motion, fluctuation and potential theory of random walks and Brownian motion, and interacting particle systems. He discovered remarkable combinatorial identities which give expressions for the characteristic function of the maximum of a random walk, as well as for the ladder heights. By delicate estimates Frank proved the existence of the potential kernel for an arbitrary random walk on the d -dimensional integer lattice. This result has led to much further work, and has been generalized to random walks on groups. Interacting particle systems are perhaps the most exciting and active subfield of probability these days, and Frank Spitzer is widely regarded as the father of this area. It is closely related to statistical physics and Frank contributed greatly to the rigorous study of statistical mechanics models which is a joint activity of probabilists and statistical physicists nowadays. His work was instrumental in

bringing about a strong interaction between these two groups. Several of Frank's most influential articles have been reprinted in a recent Festschrift in honor of him, which was edited by Rick Durrett and Harry Kesten (*Random Walks, Brownian Motion and Interacting Particle Systems*, Birkhauser-Boston, 1991).

Frank Spitzer had a strong sense of elegance and a feeling for which result was beautiful and worthwhile. He would show great enthusiasm for such results, be they his own or due to others. All this comes through very well in this 1964 book, *Principles of Random Walks*, which is still one of the best sources for many properties of random walks. A second edition of the book appeared in 1976 and the book has also been translated into Russian and French. Frank's enthusiasm also showed in his lectures. He was an inspiring lecturer who taught with pleasure at some special summer schools such as the Mathematical Association of America in Williams College in 1971 and in St. Flour, France in 1973.

Frank was always very generous with his time. He was always available for all kinds of help, professional and personal, to his students and friends. He showed considerable concern for the well being of his students and knew how to stimulate and encourage them. This has led to thirteen Ph.D. students, several of whom are now well known probabilists in their own right. Frank was also generous with his ideas and loved to discuss his work with colleagues and to make them coauthors. The high regard in which he was held was apparent from the enthusiasm shown by the contributors to the Festschrift in Frank's honor last year and by the many sincere messages of condolence which were received.

At the time of his retirement, Frank was contemplating volunteer work, both in the local community and in the mathematical community. He tried to follow up a call for help from the Rumanian mathematicians to help them reestablish a functioning library system after the upheavals in their country; unfortunately, no effective help seemed feasible. Frank's principal hobby was a love of the outdoors. He greatly enjoyed hiking and skiing. He jogged regularly together with students and colleagues and kept this up till the end despite the fact that Parkinson's disease forced him to slow down. He was an avid mushroom hunter and one of his great but unfulfilled ambitions was to find morels in Ithaca.

Frank Spitzer is survived by his daughter, Karen of Rhode Island; his son, Tim of New Jersey; two granddaughters; and a sister. Frank Spitzer's death is a heavy loss for his family and friends as well as for probability theory.

Lawrence Brown, Harry Kesten

Donald Frederick Splittstoesser

August 17, 1927 — December 23, 2001

Don Splittstoesser was born in Tomah, Wisconsin and received his Bachelor's, Master's and Doctorate degrees at the University of Wisconsin-Madison in Agriculture, Bacteriology, and Bacteriology and Biochemistry in 1952, 1953 and 1956 respectively. Don was a Project Associate at the University of Wisconsin-Madison for a brief period of time immediately following his graduate work. He then worked for two years as Chief of the Serology Branch (1st Lieutenant) in the 6th U.S. Army Medical Service Corps at Fort Mason, San Francisco, California. In 1958, Don was hired as an Assistant Professor in the Department of Food Science and Technology at Cornell University. He was promoted to Associate Professor in 1964 and to Professor in 1969. Don served as Departmental Chair from 1982-89. In 1995, he was named Professor Emeritus, but continued an active research program as well as his participation on several editorial boards, and as a contributing editor for several books.

Don was active in numerous professional organizations, including: the Institute of Food Technologists, American Society for Microbiology, and the American Society of Enology and Viticulture. He served as President of the Central New York Branch of the American Society of Microbiology (1966), Chairman of the Western New York Section of the Institute of Food Technologists (1970), and Chairman of the Eastern Section of the American Society of Enology and Viticulture (ASEV). In 1984, he was named a Fellow of the Institute of Food Technologists. The Eastern Section of the American Society for Enology and Viticulture honored Don with the Outstanding Achievement Award in 1991 for his wine research and personal contributions to ASEV. In 1994, Don was awarded the William V. Hickey Award by the New York State Association of Milk and Food Sanitarians. He was invited by USAID in 1990 to assist the Indian government regarding the development of their fruit and vegetable industry.

Within a very short time after joining Cornell, Don established himself as a leading researcher in the area of fruit and vegetable microbiology. Don's research focused on the microbiology of frozen fruits and vegetables that has now become the basis for assessing the microbiological quality and safety of fruits and vegetables. Other active research areas included the physiology of heat resistant molds and the preservation and safety of fruit juices, ciders and wines. His research resulted in significant contributions to the food and beverage industry. As a result of his active research program, he published more than 200 research papers as well as numerous book chapters and served as the co-editor for several editions of the internationally recognized, *Compendium of Methods for the Microbiological Examination of Foods*.

Don is survived by his wife, Clara Splittstoesser, a former microbiologist in the Entomology Department at the New York State Agricultural Experiment Station; and by his sister, Ruth (Harley) Erbs, who lives in Rhinelander, Wisconsin. He was an avid amateur wine maker and an enthusiastic supporter of the arts.

Don's concern for others, his kindness, his honesty, his quality work and administrative abilities were highly appreciated by his colleagues, his department, the university, and throughout the worldwide scientific community. We have truly lost an outstanding scientist and a dear friend.

Don Downing, Andy Rao, Gil Stoewsand, Randy W. Worobo

Frances Spratt

June 13, 1906 — July 9, 1997

Frances Marion Spratt, Associate Professor in the Department of Textiles and Clothing in the College of Human Ecology, died on July 9, 1997, at the age of 91 in Mt. Holly, North Carolina.

After her retirement on June 15, 1967, Frances returned to live with her sisters: Elizabeth Spratt and Mrs. George Hacker in the family home in Mt. Holly where she was born. The imposing homestead was a working cotton plantation when her grandfather brought her grandmother there as a bride. Union soldiers were stationed there during the Civil War and a union sword is evidence of their occupation. After her grandfather died, her father took a position in town, but maintained the home place as a country home with all of the advantages of a self-sufficient farm with orchards, vegetable gardens, farm animals and gardens so that very little else was needed. Entertainment was almost completely centered at home, with visits from friends and summer reunions with relatives from South Carolina. Frances was proud of her southern heritage and claimed a signer of the Declaration of Independence as one of her ancestors.

With this background, Frances and her sisters developed a strong family relationship, a love of the land and their home, and the homemaking skills, which influenced their lives and their careers.

After attending Mt. Holly High School, Frances graduated from Women's College in Greensboro (now the University of North Carolina in Greensboro). She taught home economics in several high schools in North Carolina including at Mt. Holly High School where she set up an innovative project of a model home in a vacant building. Her students learned how to shop, do banking and other home activities including taking a trip to Charlotte to lunch at a nice restaurant so they could learn how to order a proper meal. Many of her former students still remark about the wonderful experiences they had in Miss Spratt's classes.

During World War II, Frances was asked to head up a community project, "The Community Canning Center," where residents in and around Mt. Holly could bring their produce to be canned in a safe, easy, and quick manner. She received great praise from the community for this hard and confining work.

Frances attended summer school at Cornell in 1946 and later returned for her M.S. degree. She served as a teaching assistant in the Department of Textiles and Clothing in 1948-49 while working on her degree that she received in June 1949. After this, she taught for four years at the University of Texas until she returned to Cornell in 1953 as a faculty member of the College of Human Ecology (Home Economics).

Frances was exceptionally knowledgeable in her field. She also had great skill in disseminating this knowledge to her students through her courses in apparel design. In 1964, she was selected as “outstanding professor in the College for her superior teaching ability, her warm and friendly personality and her helpful attitude in all matters in the College.”

In addition to her regular academic responsibilities, she also served as advisor to Omicron Nu, a scholastic fraternity, chair of the college undergraduate awards committee, and a member of the college student-faculty committee. She was a member of Pi Lambda Theta, The American Home Economics Association, and membership chairman of the southern region of the N.Y. Home Economics Association.

Frances enjoyed travel and developed an especial fondness for Denmark, where she lived for several months. Frances and her two sisters spent considerable time in restoring and refurbishing the old homestead. The large, high ceilinged gracious rooms were furnished with family antiques and mementos and many examples of exquisite embroidery lovingly executed by Frances, her sisters and past generations as well as by her three nieces. Frances’ special pride was the elegant dining room with its crystal chandelier, which Frances had found in Ithaca, Swiss tambour embroidered curtains and her collection of blue and white Royal Copenhagen porcelain displayed in shell carved corner cabinets.

Frances and her sisters were excellent cooks in the old southern tradition, and true southern hospitality was always a way of life. Frances was famous for her delicious home baked bread, and her old-fashioned spoonbread was a toothsome delight along with Southern fried chicken, garden vegetables and ambrosia dessert. Not to ignore the garden, Frances loved her roses and peonies. The home was surrounded by huge southern magnolias, azaleas, live oaks and a tremendous beech tree, which shaded the front lawn and was planted by her grandfather.

Frances will always be remembered for her gracious manner, her beautiful prematurely snow white hair and her petite well-tailored style. She epitomized the very best of the southern gentlewoman.

W. Jean McLean, Elsie McMurry, Raymond T. Fox

Frederick Josiah Spry

October 18, 1888 — December 17, 1958

Frederick Josiah Spry, the son of Josiah and Elizabeth (Joel) Spry, was born in Plymouth, Pennsylvania. He became an orphan at an early age and by hard work in the coal mines was able to finance his college education. He was graduated from Lafayette College, now Lafayette University, with a Bachelor of Civil Engineering degree in 1914.

Professor Spry began his professional career as a maintenance-of-way engineer with the Lehigh Valley Railroad and was stationed successively at Easton and Sayre, Pennsylvania, and Auburn, New York. His service to the railroad was interrupted by a period of service in the U.S. Army during World War I. Following his work for the railroad, Professor Spry served as assistant city engineer in Auburn, New York.

He came to Cornell University as an instructor in the School of Civil Engineering in 1923 and was awarded the Master of Civil Engineering degree in 1929. Following this event, he was promoted in due time through the several ranks in the university to that of Associate Professor of Civil Engineering.

His service to his country during World War II was as civilian instructor in geodetic surveying in the Navy V-12 program at Swarthmore College, Pennsylvania, and in similar programs at Cornell. He was secretary of the faculty of the School of Civil Engineering from 1950 until his retirement in June, 1956, as a Professor Emeritus.

Professor Spry also served on the staff of the Cornell Summer Survey Camp from 1924 through 1958. He was director of this camp in 1949. In his later years, he also served on the summer surveying camp staff at Manhattan College and at Alfred University. He especially enjoyed his work at these camps and remembered for a long time afterwards the details of many happy incidents that occurred at each camp.

He used his summers to keep in touch with the nonacademic part of engineering by working on various projects, such as power house construction-surveying near Hawley, Pennsylvania; pipeline surveys for the Herkimer Water Commission; public health inspection for the New York State Department of Public Health; and numerous projects in Ithaca sponsored by the City Engineer's Office and the Water Department.

Professor Spry was active in both professional and civic organizations. He was a member of the American Society of Photogrammetry, the American Congress on Surveying and Mapping, the American Society for Engineering Education, and the American Association of University Professors. He was a life member of the American Society

of Civil Engineers and a charter member of the Ithaca Section of this Society. He was a Licensed Professional Engineer and Licensed Land Surveyor in the State of New York.

He served a term as president of the Central New York Section of the American Society of Photogrammetry and was on its executive committee for several years. At the time of his death, he was editor of the Newsletter for the section.

He was a member of the First Presbyterian Church of Ithaca and served as a deacon and as an elder. He was Scoutmaster of the Boy Scout Troop sponsored by his church for 10 of his 25 years of activity in the Boy Scout movement.

Professor Spry was married to Mary Williams in Plymouth, Pennsylvania, on August 27, 1919. He is survived by his widow, a son Frederick J. Spry, Jr., and a granddaughter.

As a teacher Professor Spry took a great interest in each individual student. Many generations of students have affectionate memories of Professor Spry as a friend and confidant. His friendly greeting, interest in all who came into contact with him, and fatherly advice for those who solicited it earned him the love and affection of all who knew him—students, friends, and co-workers alike.

A. J. McNair, G. B. Lyon, John Perry

Adrian M. Srb

March 4, 1917 —May 24, 1997

Adrian Morris Srb, Jacob Gould Schurman Professor of Genetics, Emeritus, died in his Cayuga Heights home on May 24, 1997. He was 80 years old. Adrian was born in Howells, Nebraska on March 4, 1917. He graduated with High Distinction from the University of Nebraska in 1937 with a major in English Literature. He remained at the University of Nebraska to obtain a Master's degree in Agronomy in 1941.

Srb entered Stanford University in 1941 to begin graduate studies in the laboratory of George W. Beadle, also a Nebraskan, who had received his Ph.D. degree from Cornell in 1930. At Cornell, Beadle had been a member of a group of students who worked on the cytogenetics of maize under Rollins A. Emerson of the Department of Plant Breeding. Srb began his studies at Stanford thinking he would work on the eye pigment system of *Drosophila*. Beadle, in collaboration with Boris Ephrussi, had developed techniques for transplanting eye discs among larvae as a means of probing the nature of gene action in determining eye colors. By the time Adrian arrived at Stanford, Beadle had recognized that an entirely different approach was needed to examine the problem of gene action. He had selected the bread mold, *Neurospora*, as an organism that could be grown on a chemically defined synthetic medium, a decided experimental advantage for studies designed to elucidate the role of genes in metabolism. Thus began Adrian's attachment to *Neurospora*. Beadle and his students were busily engaged in producing and characterizing what were called biochemical mutants. These mutants showed that the biosynthesis of substances essential for the growth and maintenance of *Neurospora* is under the control of genes, each gene responsible for conferring specificity on a single enzyme that in turn controls a single step in the biosynthetic pathway. These studies helped usher in a new era of genetics that culminated in the advent of modern molecular genetics. The pioneering studies of Beadle were recognized in 1958 when he shared the Nobel Prize with Edward L. Tatum and Joshua Lederberg.

After completing his graduate studies in 1946, Srb remained at Stanford for one year as an Assistant Professor. In 1947, he began his Cornell career when he accepted a position as Associate Professor in the Department of Plant Breeding. This career lasted 39 years until his retirement in 1985. He was named Professor of Plant Breeding in 1951. With the formation of the Division of Biological Sciences, Adrian's title changed to Professor of Genetics, and in recognition of his distinction in teaching and research he was named Jacob Gould Schurman Professor of Genetics in 1976.

No account of Adrian's contributions to Cornell would be complete without recognition of the central role that he played in the formation of the Division of Biological Sciences in the mid 1960s. Srb was a leading member of a group of distinguished biologists at Cornell who convinced the newly appointed Cornell President, James Perkins, of the need for Cornell to take steps to enhance its efforts in the basic biological sciences. The result was the formal establishment of the division in 1964. Srb's advice and counsel were critical in the early days of the division as it discussed and debated the organizational structure that would best serve basic biology at Cornell. The revitalization of biology at Cornell that establishment of the division brought about is in no small measure a tribute to the insightful advice that Srb and his colleagues provided.

One of Adrian's greatest contributions to Cornell, and to the academic world in general, was his dedication to research and teaching. He understood, and was a strong advocate for, the need to develop a variety of experimental model systems including yeast, ciliates, fruit flies, and plants. In his own laboratory at Cornell, steady and significant contributions were made to the genetics, physiology, and development of his favorite experimental organism, *Neurospora*. Graduate students and post-doctoral fellows in his group investigated cytoplasmic inheritance and other epigenetic phenomena, quantitative inheritance, the nature of dominance, and the genetic and biochemical basis of differentiated phases of the fungal life cycle. In later years, Adrian's interests shifted towards the study of morphogenesis, an area that he foresaw with his usual insight as being at the intersection of molecular genetics, cell biology, physiology, evolutionary biology, and systematics. As a result, his research program became focused on the genetic and cellular basis of ascus and ascospore development, an investigation that was based on the generation and analysis of a large number of mutations that disrupted normal morphogenesis and its underlying orderly pattern of meiotic and mitotic divisions. Adrian's publications were models of clarity and lucidity as were his verbal accounts of his research. In reading his papers, those who knew Adrian had the sense that they were engaged in a conversation with him. Few achieve this felicity of expression.

In 1952, Adrian and Ray Owen published the textbook, *General Genetics*, that was not only widely adopted throughout the world, but served as well for years as the model that other authors sought to emulate. It is interesting to note that an advertisement for a new genetics textbook that was published twenty-eight years later still made comparison to the original Srb and Owen text.

Adrian was an extraordinarily gifted teacher. His course in physiological genetics, which was given from 1947-71, was for generations of Cornell graduate and undergraduate students one of their most challenging and significant exposures to an advanced biology course. Even the required term paper for the course is fondly recalled as a labor

of love because every student knew the paper would receive Srb's careful scrutiny and would benefit from his detailed comments on style as well as content. After the division was formed, Adrian collaborated with Gerald Fink and Peter Bruns in offering a course on the Genetics of Lower Eucaryotes, with Srb responsible for the component dealing with fungi. For many years, he taught a course in Human Genetics, intended to highlight the relevance of genetics to medicine and human health biology. His mastery of teaching was clearly demonstrated in this course as he communicated difficult material to a non-specialist audience in a lucid, logical and interesting manner. Srb's teaching talents were recognized by his being named Cornell Professor of Merit by his students, and receiving the Edgerton Teaching Award upon nomination by his colleagues.

Adrian was a devoted and conscientious citizen of Cornell. He served as a faculty trustee on the Board of Trustees. He chaired the Interim Executive Committee for the formation of the Division of Biological Sciences. He was a member of numerous important university committees. Among these were the Music Committee, the University Press Board, the Committee for the Revision of Faculty Procedures and the Committee for Andrew D. White Professorships.

Adrian received many honors for his scholarly contributions. He was elected a Fellow of the American Academy of Arts and Sciences and elected to membership in the National Academy of Sciences. He was named an Honorary Foreign Fellow of the Botanical Society of Edinburgh and an Honorary Member of the Chilean Genetics Society. He was elected a Fellow in both the American Association for the Advancement of Science and the American Society of Naturalists. In 1969, he was awarded an Honorary D.Sc. degree by his alma mater, the University of Nebraska.

Adrian enjoyed two sabbatical leaves in France, and one in Scotland. Working with his long time colleague, Boris Ephrussi, at the University of Paris, he extended his interest in fungal genetics to include baker's yeast. There can be no doubt that Adrian's experiences in France were highly stimulating and productive scientifically. His French experiences also contributed greatly to his joy of living, for he knew full well how to take advantage of the good food and wine that France offered. In the laboratory of Robert Brown at the University of Edinburgh, Scotland, Adrian became interested in exploring mutations that affected the morphology of *Neurospora*, an interest that he developed further upon his return to Ithaca.

Perhaps it was as a colleague and friend that Adrian is most admired. He maintained a lively interest in the world about him, catholic in his interests that ranged from literature to art, to current events, to music, to politics, to gardening, to religion, to stamp collecting, to sports. He was a most engaging and informed conversationalist with

a delightful sense of humor. He held a special place in the minds and hearts of his graduate students. He gave them freedom to develop their own ideas, and expected them to take responsibility for their research and to be able to defend their interpretations. The respect his graduate students felt for him was abundantly evident during the celebration that honored him upon his retirement in 1985.

His colleagues at Cornell and elsewhere will always admire and respect Adrian for his intellect, his contributions to genetics, his superb teaching talents, his loyalty in friendship, his companionship, and his zest for life.

Srb was married to Jozetta Helfrich, a fellow graduate student, in 1940. His wife completed a Master's degree at Stanford in Sociology and Economics at the same time that Adrian received his doctorate. The Srbs had two daughters, Rosalind (Mrs. Robert W. Mayberry) and Katherine (deceased); and a son, Jerome.

Royse P. Murphy, June B. Nasrallah, Harry T. Stinson, Jr.

Walter Hutchinson Stainton

April 19, 1897 — December 9, 1987

Walter Stainton's academic training was gained entirely at Cornell: a bachelor's degree in engineering in 1920 and a Ph.D. in physics in 1927. He first taught physics at Cornell from 1921 to 1927 and public speaking from 1925 to 1927. Then, after a year at Dartmouth, where he abandoned the sciences to become Director of the Dartmouth Players, he returned to Ithaca in 1928 and became an assistant professor in the Department of Public Speaking (later known as Speech and Drama). Here he received imaginative support and seasoning from J.A. Winans and Alec Drummond.

Mr. Stainton's scientific background was put to use in many ways in his work in theatre and cinema, two of which stand out: in his use of optics in developing a wide knowledge and broad use of stage lighting and in his special interest in early films. For the very rare films which he placed in the Archives of the Library, he treated the pictures registered on early, combustible film stock in such a way as to make them safe to copy onto contemporary film stock. Indeed, his great interest in silent film-making in Ithaca led to his becoming an authority on that subject, and in his last years he was working on a book dealing with its history. Additionally, he founded the Cornell Film Collection, collecting assiduously and shrewdly throughout his active career, both films and extremely rare cameras and projectors.

Within and outside his department he brought imagination and vigor to whatever he turned to. He was a long-time supporter of Cornell's library system and established endowments for purchasing books in various fields of American literature and drama and theatre. In 1936 he founded and for many years directed Cornell Theatre's Film Division; in that context he taught a pioneer course in cinema history. After he retired and was named professor emeritus in 1965, he served as president of Ithaca's Dewitt Historical Association from 1969 to 1974.

Beyond this, he was active in both world wars: as an Army aviation ground instructor at Cornell in World War I and as a Captain in Chemical Warfare in Europe in World War II. He continued in the Army Reserves beyond the war and retired in 1953 with the rank of Major.

Mr. Stainton is survived by his wife, Elsie Myers Stainton; a sister, Annette S. Ashworth; and two sons and a daughter, John, David, and Catherine, from an earlier marriage.

Anthony Caputi, Don Fredericksen, H.D. Albright

George Staller

May 7, 1927 — July 13, 2009

George Staller was introduced to Economics in the traditional European manner –as a student in the law faculty at the Charles University (Prague) from which he received his degree in 1949. He continued his studies at Hastings College (Hastings, Nebraska) earning his B.S. in 1952 and entered Cornell's Ph.D. program in Economics that same year.

George quickly acquired an enviable reputation as a graduate teaching assistant for the large lecture courses in introductory Economics, taught by senior members of the faculty. He combined a conscientious dedication with a remarkable capability of exposition and patience in explaining the key concepts introduced in the lectures, made palatable by a generous supply of Czech humor.

He completed his Ph.D. degree in 1957 with the defense of his thesis entitled Czechoslovakia's Industrial Production 1947-1957 and spent the academic year 1957-58 at Harvard working at the Russian Institute with Professor A. Bergson.

George was a scholar who studied the planned economies of the Soviet Union and Eastern Europe with a special interest in Czechoslovakia. Most of his scholarly work involved trying to compile data for these countries so that it would be possible to measure their growth rates and then to utilize that information to make comparisons in a consistent fashion between planned and free-market economies.

Several of his papers dealt specifically with trying to understand the economy of Czechoslovakia. During the 1940's and 1950's, the centralized system of Czechoslovakia worked extremely well. In fact, Czechoslovakia did as well as or better than not only many of its communist neighbors but also many of the European nations that maintained a free-market economy after the War. As George argued in his work, Czechoslovakia's success could largely be explained by strong demand within a completely protected market, underutilized and expanding capacities, and a skilled labor force. The Soviet bloc nations needed Czech-manufactured goods for their reconstruction and, in return, were willing to supply Czechoslovakia with fuels, raw materials and foodstuffs at favorable rates. In the 1960's, however, the situation was very different: the Communist bloc nations slowed down their industrialization drive; their manufactures started competing with Czech exports; and, in addition, they could reach outside the bloc for sophisticated, high-quality machinery the Czechs could not match because their research and development

had fallen behind. Thus, between 1961 and 1965, unlike during the 40's and 50's, the Czech economy virtually stagnated.

In trying to understand the workings of the Czech planned economy, George had much broader interests in mind. He wanted to discern not only whether planned economies in general could compete with capitalistic ones in terms of growth but also whether they could overcome some of the flaws inherent in the capitalistic system. When adherents tout the superiority of planned over free-market economies, they typically make several claims. These claims include: planned economies grow faster, they provide full employment, they are not subject to fluctuations in output, and they have more stable international trade. Many economists had studied the first two of these claims. George decided to analyze the veracity of the last two. In his paper, "Fluctuations in Economic Activity: Planned and Free-Market Economies, 1950-60" in the *American Economic Review*, 1964, George argued that the planned economies of the Communist bloc were subject to fluctuations in economic activity to a degree equal to or greater than that experienced by the free market economies of the OECD. In a second paper, "Patterns of Stability in Foreign Trade: OECD and COMECON, 1950-1963," *American Economic Review*, 1967, he found that the OECD countries and the United States had more trade stability than COMECON countries and the Soviet Union.

Thus, while a large part of his academic career was spent studying planned economies as such, his special interest focused on trying to determine how planned economies stacked up against capitalist ones, and from his research he concluded that planned economies could not be shown to be superior to free market economies.

George's research formed the basis for his undergraduate courses on the Soviet Union, Eastern Europe and his graduate seminar on Comparative Economic Systems. He particularly enjoyed participating with his friends Myron Rush (Government) and George Gibian (Russian Literature) in teaching multi-disciplinary courses on the Soviet Union and Eastern Europe. These efforts, coupled with his continued involvement with the Introductory and Intermediate Macroeconomics courses, now in the role of professor guiding a half-dozen graduate teaching assistants, led to his receipt of the Clark Teaching Award (College of Arts and Sciences.) Other forms of recognition followed: in 1998, on the occasion of its 650th anniversary, his alma mater, Charles University (Prague), where he had taught annually since 1990, awarded him its Doctor *Honoris Causa* degree; in 2002, he received an Outstanding Alumni award from Hastings University; and in 2009 the first annual George J. Staller Lectureship in Economics was delivered by Nobel Laureate Amartya Sen in honor of George's teaching at Cornell.

In addition to deep devotion to, and pride in his family, George will be remembered by his students and colleagues for his generous hospitality, centered around good food and drink, both at home and in the office, where his door was always open, and often the last to close. He could be as entertaining as any stand-up comedian when the occasion required, and could offer profound insight and advice—often with a proverb in Latin, French, German, or Russian, which he would quickly, if somewhat loosely, translate.

Tom E. Davis, Alfred E. Kahn, Uri M. Possen

Neal R. Stamp

September 19, 1918 — March 15, 2002

Neal Roger Stamp, farm boy from Watkins Glen, Cornell University College of Arts and Sciences 1936-40, Law School 1940-42, World War II military service 1942-46, Rochester law firm after war, returned to Cornell in 1947 as Assistant Secretary of the Corporation.

Enrollment at Cornell was delayed to 1936 so that adequate funding would be available since it was during depression years. He always was grateful to his sister, Florence, for helping him financially as a student. He worked his way through Cornell in positions such as waiter and later desk manager at Willard Straight Hall. While working at the Straight, he met many members of the Board of Trustees inasmuch as it was the sole campus space for visitors. After receiving his LL.B degree in 1942, he went into the U.S. infantry and was part of the liberating force of North Africa, and then moved to the boot of Italy. He often mentioned arriving in the Bay of Naples on Thanksgiving with the radio announcing all service men would have traditional turkey, yet there was none to be had on his ship! Memories of a year in Florence were important to him.

Neal's service to the university came over a 37-year period. He became Secretary of the Corporation in 1959 (which included the responsibility of Secretary of the Board of Trustees, *ex officio*) and University Counsel in 1962, and held both positions until November 1979. During that time, he worked with University Presidents Day, Malott, Perkins, Corson and Rhodes, and Board of Trustees' Chairmen Becker, Collyer, Dean, Purcell and Noyes. He enjoyed reminiscing about tutoring he continuously received from Mary H. Donlon, judge in the U.S. Customs Court in New York State; checking matters with Arthur H. Dean, senior partner of the prestigious law firm of Sullivan and Cromwell, while he was in Switzerland negotiating the SALT treaty; and Walker Cisler, Chairman of the Board of the Detroit Edison Company, on Executive Committee problems while he was in Russia consulting on electricity. He remembered with fondness New York City meetings of the Law and Investment Committees in his early years as Assistant Secretary.

On the University Counsel side, he dealt with a broad variety of matters often having to do with questions for which there were no precedents. His term spanned the years of rapid university expansion in the post-sputnik era as well as the eras of civil rights revolution, the campus demonstrations and disturbances growing out of the Vietnam War, and the massive promulgation of government regulations. All this occurred while the university experienced unprecedented and exciting innovations emanating from faculty studies and research. Neal was

Henricus Johannes Stander

June 21, 1894 — May 2, 1948

Henricus Johannes Stander died suddenly at his home in Scarsdale, New York, on the evening of May 2, 1948. From the year 1929 when he was appointed Professor of Obstetrics and Gynecology at Cornell University Medical College and Obstetrician and Gynecologist-in-Chief to the New York Hospital, he worked unceasingly for the best interests of the College and the perfection of the Hospital. His untimely death is a grave loss to the University and to the medical profession.

Dr. Stander was born near Georgetown, Cape Colony, South Africa, on June 21, 1894. His father's family had migrated there to escape religious persecution in Holland; his mother's family, being French Huguenots, left their native land for a similar reason. His father fought in the Boer war, and at the conclusion of the conflict much of the family property was appropriated by the British which drastically reduced the family resources. He was educated in the public schools of South Africa and attended South African College in Capetown from 1911-13. In latter year he borrowed funds, engaged passage on a ship, and worked his way to the United States.

Dr. Stander then continued his studies in chemistry at Harvard University (1913-1914), at the same time serving as an instructor. He subsequently attended and graduated from the University of Arizona in 1916 with the degree of Master of Science. He was appointed consulting chemist to the Hercules Powder Company of Wilmington, Delaware. Dr. Stander was not satisfied with this promising future in industrial chemistry and gave up this work to enter Yale Medical School. He received his M.D. degree from Yale University in 1921. During the following year, while interning at the New Haven Hospital, he made lifelong friends who influenced him in his decision to go to Johns Hopkins University in 1922.

Dr. J. Whitridge Williams soon recognized in his new associate the dynamic personality, tremendous capacity for work, investigative zeal and other qualities which assured a promising future. During his years in Baltimore, his interest in eclampsia led him to the clinics of Europe for observation and further study. A leave of absence from Johns Hopkins for an additional period of clinical experience with Dr. W. W. Chipman at the Royal Victoria Hospital in Montreal was arranged in 1925.

In 1929 Dr. Stander was appointed Professor of Obstetrics and Gynecology at Cornell University Medical College and Obstetrician and Gynecologist-in-Chief to the New York Hospital. He immediately began planning the physical and administrative organization of the Department of Obstetrics and Gynecology in its new location on

the East River. Before permanently residing in New York, he spent a year abroad visiting various European clinics and making friends with heads of departments.

Dr. Stander moved permanently to the New York area in the spring of 1932 to supervise more closely the completion of construction, installation of equipment and the organization of the new department. Many difficulties had to be overcome and these were multiplied by the depression of the early 1930's. At no time did he swerve from his fundamental principles. The welfare of the Hospital and the Medical College was kept constantly in the foreground, and nothing was allowed to interfere with his concepts of an institution for the care of patients and the teaching and training of young doctors and nurses.

Dr. Stander's contributions to medical science dealt with placental interchange, blood volume, heart output, toxemias of pregnancy, urea excretion, basal metabolism and acidosis in pregnancy, eclampsia, chloroform poisoning, the respiratory quotient of the human fetus, kidney disease and function, yellow atrophy of the liver, purine metabolism, diabetes in pregnancy, the heart in pregnancy, and many other subjects. He was the outstanding champion on this continent of the concept of placing the teaching of Obstetrics and Gynecology on a comparable basis with the other major clinical departments. He spoke on this subject on many occasions during the past twenty years and published a number of articles on the subject. He was a leading advocate of combined departments of Obstetrics and Gynecology. Dr. Stander edited Williams' "Obstetrics" in 1936 and 1941, and in 1945 his third revision, entitled "A Textbook of Obstetrics," was published in his own name. At the time of his death the book was in the process of revision.

Dr. Stander was President of the Medical Board of the New York Hospital from its inception in 1934 until the time of his death. He was a Fellow of the American Gynecological Society, having been Vice-President in 1941-1942, and President of the Travel Club of that Society during the past year. He was a Fellow of the American College of Surgeons and a member of the American Medical Association, the New York Medical Society, the Academy of Science and Medicine and the New York Obstetrical Society of which he was President in 1941. He retired from the Council of that Society in 1946. He was, in addition, a member of Phi Kappa Phi, Sigma Xi, and Nu Sigma Nu. In 1937 Dr. Stander was awarded the Medal of the Order de Finlay of Havana, and in 1947 he was given the degree of Doctor in Medicine *Honoris Causa* at Trinity College in Dublin, Eire.

In September, 1927, he married Florence Mary Leigh Creelman of Vancouver, British Columbia, who survives him, as do his two sons, Robert and John, and his two daughters, Leigh and Margaret. He is also survived by two brothers and one sister in South Africa.

It is difficult to find words adequate for a man of such force and integrated strength. From the very beginning of his career, his intellectual honesty and dynamic moral courage commanded the greatest respect, and he will be remembered by his associates and friends as always tolerant, fair and courteous.

R. G. Douglas

Clifford Nicks Stark

June 14, 1891 — October 14, 1978

Clifford Nicks Stark died on October 14, 1978, at the Murfreesboro Health Care Center, Murfreesboro, Tennessee. He had been a professor of bacteriology from 1932 until his retirement in 1951.

Clifford N. Stark was born on a farm at Cumberland Furnace, Dickson County, Tennessee, on June 14, 1891. He attended rural schools and worked on farms until he was fourteen. By working, trading, and saving he accumulated \$1,000 during this period. He spent the next four years working his way through the Industrial and Training School at Huntingdon, Carroll County, Tennessee. His college training was interrupted by a seven-month tour of duty in the Signal Corps as a machine gunner in World War I.

He attended Valparaiso University, Valparaiso, Indiana, and graduated from Middle Tennessee State University in June 1919. He earned his way through college doing farm work. From 1920 through 1922 he taught and was principal at a high school in Christiana, Tennessee. During this time he also attended George Peabody College for Teachers.

On June 28, 1921, he married Pauline Whitson of Centerville, Hickman County, Tennessee, a home economics teacher. They had no children. They continued high school teaching and both received the Bachelor of Science Degree from Peabody College, Kentucky, in 1924. In the fall of 1924 they both entered Cornell University as graduate students. They continued to be associated with the Department of Dairy Science in the College of Agriculture for the next twenty-seven years. Pauline Stark was granted a Master of Science degree in 1928 and continued teaching as well as conducting research in microbiology until her retirement. Clifford Stark was granted a Doctor of Philosophy degree in 1927. He became an assistant professor in 1927, a professor in 1932, and an emeritus professor in 1951.

His primary area of research interest was in the microbial contaminants of food and water. Among his research contributions in this area were the development of culture media for the detection of microorganisms indicating fecal pollution in water and foods. His formate ricinoleate medium for the detection of enteric bacteria is still in use today. He published some sixty papers based on his research while at Cornell University. For many years he acted as a consultant on problems related to sanitation and contamination in the food industry and in quality control of water supplies.

After his retirement from Cornell he returned to Tennessee and joined the staff of the Middle Tennessee State University where he taught and served as the head of the Department of Agriculture and as the manager of the University's farm. Because of his many contributions to Middle State Tennessee University, the Stark Science Center and the Stark Experimental Farm at that institution have been named in his honor. Following his retirement from that university in 1961 he spent the ensuing years raising beef cattle on his farm near Murfreesboro, Tennessee.

Professor Stark will be remembered by his students for his dedication to the principles of sanitation. His lectures were spiced by illustrations of poor sanitary practice that he encountered and discouraged. Clifford N. Stark was an active and dedicated member of the generation of microbiologists who decreased human suffering and increased longevity by bringing scientific sanitary practices and laws to the food and water supplies of America.

W. Dexter Bellamy, James C. White, Paul J. VanDemark

Kyle Bear Steele

January 11, 1890 — June 18, 1942

Dr. Kyle B. Steele, Associate Professor of Clinical Obstetrics and Gynecology in the Cornell University Medical College, and Associate Attending Obstetrician and Gynecologist in the New York Hospital, died suddenly at home on the evening of June 18, 1942. His untimely death, after a busy day of professional activities, came as a shock to all who knew him.

Dr. Steele was born in Covington, Virginia, on January 11, 1890, the son of William Isaac and Mary Ashton Steele. The family came to this country from England in the early colonial days of the Old Dominion. During Dr. Steele's boyhood his parents moved to Charlottesville, where he received his preliminary education. He later entered the medical department of the University of Virginia from which he received the degree of Doctor of Medicine in 1913. In the same year, in competitive examination in New York, he obtained a coveted appointment on the interne staff of St. Luke's Hospital, where he served for two years in general surgery. During the following year he served on the resident staffs of St. Mary's Hospital for Children, and of the Lying-In Hospital in New York.

War clouds of World War I were gathering over the country at this time, and Dr. Steele, after a brief period in private practice, applied for an appointment in the Medical Reserve Corps of the Army, and on January 1, 1917, was commissioned First Lieutenant in the Officers Reserve Corps. With the declaration of war in April of the same year he was ordered on active duty, and in the fall of 1917 went to France with the A.E.F. where he served for nearly eighteen months, chiefly with General Hospital No. 41. After his return and discharge at Fort Dix in February 1919 he resumed his practice in New York, which he continued until his death.

His interest in the practice of obstetrics led to his appointment on the Attending Staff of the Lying-In Hospital, a position which he held with increasing responsibilities during his lifetime.

With the consolidation of the New York Hospital, the Lying-In Hospital, and the Cornell University Medical College, Dr. Steele became a member of the teaching staff of the College.

In spite of the demands of a large and distinguished private practice, Dr. Steele maintained a deep interest in the advancement of obstetrical knowledge and practice, to both of which he made notable contributions.

Several years ago his keen intuition grasped the life-saving possibilities of the application of newly developed methods of roentgenographic examinations in obstetrics. He enlisted the support of his own private patients

who generously supplied the funds to install and maintain this equipment in the New York Hospital. He gave unsparingly of his time in developing this method of examination and in arousing the interest of colleagues. A continuation of the support of this department would be a fitting memorial to this gallant physician, whose own life may well have been shortened by his devotion to his patients and to his profession, to which he gave so much.

In addition to the positions held in the Cornell University Medical College and in the New York Hospital, Dr. Steele was also Attending Obstetrician and Gynecologist in the Booth Memorial Hospital, and Consulting Obstetrician and Gynecologist in the New York Infirmary for Women and Children. He was also a member of the following professional organizations: Fellow in the American College of Surgeons, Diplomate of the American Board of Obstetrics and Gynecology, Fellow in the New York Obstetrical Society, Member of the American Medical Association, Member of the New York State and County Medical Societies, Nu Sigma Nu Medical Fraternity, Hospital Graduates' Club, Riverside Practitioners' Club, Alumni Association of St. Luke's Hospital, Alumni Association of the Lying-In Hospital, of which he was Vice-President.

To his colleagues Kyle Steele was more than an accomplished and skillful physician. He was a fine and loyal friend, sympathetic and helpful at all times. His natural modesty, quick intuitions, and genial sense of humor made his presence always welcome. He was a true gentleman of Virginia in the best tradition of that expression. He will be greatly missed, and his memory always cherished.

Dr. Steele leaves a widow, Marjorie Coats Steele, and two children, Kyle W. and Marjorie Steele. To them we offer our sympathy, and pray that their loss may be supported in some part by the knowledge that it is shared by so many others.

Grace Steininger

October 30, 1901 — January 13, 1966

The sudden death of Grace Steininger, Professor Emeritus of Food and Nutrition, stunned her friends and colleagues, many of whom had seen her as her usual vibrant self at a College faculty meeting less than two hours before her untimely and fatal heart attack.

Grace Steininger was born in Sedalia, Missouri, the daughter of Anna Morris and William Frederick Steininger. She received her early education in Missouri and the Bachelor of Science degree from the Kansas State College in Manhattan. Following a dietetic internship at Johns Hopkins Hospital she returned to Kansas State College for further study and was awarded the Master of Science degree with a major in nutrition. She was an Associate Professor of Food and Nutrition at Oklahoma A. and M. College for ten years before continuing her studies. She received the Ph.D. degree in 1939 from the University of Chicago where she began a long and close association with her major professor, the late and eminent nutritionist Lydia J. Roberts. Immediately after obtaining the Ph.D. degree, Dr. Steininger became Director of Home Economics at Ohio University in Athens.

Professor Steininger served with distinction as a member of the Cornell University faculty. She was appointed Assistant Professor of Food and Nutrition in July, 1943, Associate Professor in 1945, Professor in 1947, and Professor Emeritus upon her retirement in August, 1965. She was also a member of the faculty of the Graduate School of Nutrition.

Grace Steininger was above all a master teacher; she was equally effective in stimulating the minds of freshmen and graduate students. She developed the core course in the Department of Food and Nutrition, a course in which the fundamental concepts of human nutrition and the basic principles of food preparation were meaningfully integrated. The young instructors and numerous graduate assistants who participated with Professor Steininger in this course gained an unusually valuable teaching experience. Those who continued in the teaching profession have expressed their desire to pass along to their students some measure of the fine qualities that Grace Steininger possessed—warmth in manner, tolerance in attitude, competence in knowledge, and patience in guidance.

Although the core course was her primary teaching responsibility, her contributions were outstanding to curriculum development in the Department, to the Honors Program for undergraduate students majoring in food and nutrition, and to formal and informal graduate seminars in nutrition. As a scholar with an alert and questioning mind, she had an exceptional gift for asking questions that would stimulate discussion in small or

large groups. She also served on the Special Committees of many graduate students, including a significant number of international students, each of whom found her a warm friend as well as a scholarly adviser.

At the invitation of personnel from the U.S. Office of Education with responsibility for education in home economics, Miss Steininger met with a small group of professors to consider ways of improving college teaching in food and nutrition. From 1954 to 1962 she played a leadership role in the establishment of the organization which now arranges regional and national meetings of college teachers devoted to the improvement of instruction in this field. In 1963 she served as a curriculum consultant to the College of Home Economics at the University of Tennessee; in 1964, as a consultant for the development of a graduate program at the School of Home Economics at the University of Puerto Rico. She was an active member of the College Advisory Committee for the Winneba Training Center in Ghana. Her success as a consultant may be attributed to her keen insight, to her firm but kindly manner in dealing with people, and to her awareness of the personal relationships involved.

For twenty years Professor Steininger carried certain administrative responsibilities in the Department of Food and Nutrition where she was affectionally called the "straw-boss." She actively participated in numerous standing committees and major ad hoc committees of the College faculty. She served on various standing committees of the University faculty and on the Summer Session Administrative Board. She was the Graduate Representative for the Field of Food and Nutrition from 1959-62 and a member of the General Committee of the Graduate School from 1955-60.

Professor Steininger was active in professional and honorary organizations at local and national levels; notably the American Home Economics Association, the American Dietetic Association, Omicron Nu, and Phi Kappa Phi. She was also a member of Sigma Xi, Delta Sigma Lambda, Sigma Delta Epsilon, and an honorary member of Alpha Lambda Delta; she was a Fellow of the American Association for the Advancement of Science.

Grace Steininger found time for her many hobbies which exemplified her wide interest in the world around her. She was an enthusiastic traveler at home and abroad, an avid reader of science and fiction, a talented flutist and pianist, an accomplished photographer, an amateur artist, and a "green-thumb" gardener. She was challenged by puzzles, and she possessed unusual skill with her hands which she employed in numerous activities ranging from the preparation of minutely decorated and fragile ornaments to the assembly of a knocked-down work bench. No problem seemed too large; some solution would be found through her tireless efforts.

Her friends, colleagues, and students, recognizing her as an exceptional teacher, will also long remember her as a person—a person of integrity, one with strong loyalties and a sensitivity to the feelings of others, and one with a delightful sense of humor who could always laugh at herself. She increased the richness of the lives of many because she gave so freely of herself.

A general expression of our personal loss and an appreciation of our heritage from a wise and kindly friend may best be said by paraphrasing a verse from *The Torch Bearer* by Margaret Parsons.

*She has taken her bright candle and has gone
Into another room we cannot find,
But anyone can tell where she has been
By all the little lights she left behind.*

Frances A. Johnston, Catherine J. Personius, E. Elizabeth Hester

Keith Hartley Steinkraus

March 15, 1918 — October 23, 2007

Dr. Keith H. Steinkraus, Professor of Microbiology and Food Science at the New York State Agricultural Campus of Cornell University received his B.A. degree cum laude from the University of Minnesota in 1939. After working several years in the food industry and the U.S. Army Quartermaster Corps, he returned to academia receiving his Ph.D. degree from Iowa State University in 1951. He became an Assistant Professor at Cornell in 1952, Associate Professor in 1955, Professor in 1962 and Emeritus Professor in 1988. After his retirement, he remained very active in research and publishing until shortly before his death.

Keith grew up in Bertha, Minnesota, and attended a one-room schoolhouse. While a student at the University of Minnesota, he met another former student from the same schoolhouse, Maxine Curtiss. They were married in 1941 and spent 65 idyllic years together until Maxine's death on December 11, 2006. He was even more dedicated to his family than to his research.

His research specialized in indigenous fermented foods and food microbiology. Over a long career at Cornell, he studied fermented foods including tempe, tape, trahanas, idli/dosa, and the fermented fish sauces and soy products of the Far East including miso and tofu. Throughout his career, he worked to share his knowledge and research not only with his Cornell students, but also with an international audience. His interest in fermented foods, unknown in America, was stimulated further by his students at Cornell who came from places like Taiwan, Thailand, Mexico, Kenya, Zaire and Egypt. These students were interested in studying the microbiology of the foods from their own countries, and this interest coincided with and expanded Dr. Steinkraus' research efforts.

In 1959, Dr. Steinkraus was invited by the Interdepartmental Committee for Nutrition for National Defense (NIH) to participate in surveys of the nutritional status of military personnel, their dependants, and the general populations of South Vietnam, Ecuador and Burma. The project was later extended to include Indonesia, the Philippines, Korea, Taiwan, Thailand, and Malaysia. In 1974, UNESCO/UNEP/ICRO invited him to lecture at the Institute of Technology in Bandung, Indonesia. Because of his contributions to the subject, and his teaching experience, Dr. Steinkraus was asked and accepted the responsibility of compiling a book on indigenous fermented foods. The finished reference, a 671 page *Handbook of Indigenous Fermented Foods*, was published in 1983 and was the first comprehensive and authoritative book on the subject.

Over the course of his distinguished career, Dr. Steinkraus contributed his knowledge to institutions, students, and colleagues worldwide. He maintained and developed his connections with Asia, consulting on food processing issues in Indonesia and as a teacher and researcher at the University of the Philippines College of Agriculture and the Institute of Technology in Bandung, Indonesia. He lectured as a Visiting Professor in Thailand and Singapore. He was also a Visiting Professor at the Polytechnic of the Southbank, London, in Germany at the Universitat Gottingen, and at the Central Division of Nestle Products Technical Assistance Co. in Switzerland.

Dr. Steinkraus' work had significant international impact; he was the American Delegate to the UNEP/UNESCO/ICRO panel on Applied Microbiology and Biotechnology and worked as a consultant to the United Nations Industrial Development Organization to determine how genetic engineering and biotechnology could be used to help developing countries in Africa. He was a fellow of the American Associate for the Advancement of Science, American Academy of Microbiology, Institute of Food Technologists, and the International Academy of Food Science and Technology. In 1985, the Institute of Food Technologists gave him the prestigious International Award for his contributions to the international exchange of ideas in food technology to developing nations.

Keith's physical impression was enlivened by his shock of prematurely white hair, signature bowtie, and forward leaning rapid-fire speech. To students or anyone working in his lab, Keith displayed an infectious, nearly irrational optimism that inspired them to search for solutions to tough problems. This optimism carried over to international venues where he frequently was asked to speak or organize workshops and symposia on indigenous fermented foods. His approach of grounding research in the daily realities of indigenous food producers helped ensure that the right questions were addressed and locally sustainable methods were developed. A particular emphasis in editing and negotiating the publication of his *Handbook of Indigenous Fermented Foods and the Industrialization of Indigenous Fermented Foods* was to provide information useful in developing countries in a format that was affordable.

His broad experience and first-hand knowledge of indigenous food production problems, methodologies and microflora enabled him to bring his experience in the fields of microbiology, food chemistry and nutrition to bear on problems faced by producers in countries with limited resources for research. He had a great interest in improving the nutritional status of less developed countries by making nutritious, safe, shelf-stable foods available through locally sustainable production methods.

His trips through rural areas of Southeast Asia and Africa were notable for their grueling timetables and peripatetic itineraries. Travel companions would comment that if you weren't running you were falling behind. He would be

taking pictures, asking local producers about production methods and sharing his enthusiasm and knowledge in a torrent. Stairs were taken two at a time. His belief that hunger and poor nutrition were inexcusable drove him to search for solutions before time ran out.

Life in the lab was experienced at a similar pace. Students would be working simultaneously on a wide range of problems important to food producers in their home countries. The atmosphere could be at once exciting and maddeningly chaotic. Keith would bounce from student to student, problem to problem, each quite unrelated and not skip a beat. Having completed a tour of the lab, he would return to his office and type furiously at a manuscript or one of the innumerable letters he wrote to colleagues and meeting organizers before email was in wide use. This continual networking was an outgrowth of his belief that by connecting well resourced labs and students with those working on indigenous food problems, affordable solutions would be found, increasing the supply of regionally palatable foods. His enthusiasm and sense of purpose enlivened discussions and problem solving, blunting sharp disagreements even among students and visiting scientists from wildly different cultural backgrounds.

Chang Lee, Chairperson; Malcolm Bourne, Roger Cullen

Victor Russell Stephen

December 10, 1924 — February 1, 2000

Vic was born in Philadelphia and grew up in Providence, Rhode Island. His immediate family includes Virginia, his spouse of 53 years; sons, Craig Russell and Scott David; and Craig's son, Evan Parker-Stephen, and daughter, Elise Parker-Stephen.

Vic studied illustration at Pratt Institute prior to World War II. After serving in the military as Bombardier, Navigation Instructor, and Second Lieutenant, he returned to Pratt and graduated in 1947.

His first employment at Cornell came in 1948, when he accepted a position as Publications Production Manager for the College of Agriculture. Then he attended Pennsylvania State University, receiving his B.S. and M.S. degrees in Art. Vic was Staff Artist at Penn State and headed the Division of Visual Services at the University of Illinois' College of Agriculture. Vic returned to Cornell in 1968 when he joined the Department of Communication Arts. He was named Emeritus Professor in 1983.

His international work led to advisory positions with the Inter-American Institute of Agricultural Sciences in Costa Rica (1951), with the Ministry of Agriculture in Jordan (1965), and with the USAID Basic Village Education Program in Guatemala (1976).

Vic was actively engaged as an artist his entire life. He looked forward each day to working on his drawings, etchings, and paintings. He won many prizes for his artistic endeavors in local and regional competitions and shows, such as the *Star-Gazette* Twin Tier Prize, Arnot Art Museum (Elmira); "Best in Show" Award, Ithaca Art Association Art Exhibit; and first in oil and graphics, Cayuga Museum of History and Art (Auburn).

The College of Agriculture and Life Sciences published prints of four of his Cornell campus and local scenes—"Libe Slope, Afternoon," "Taughannock in Winter," "Buttermilk in the Fall" and "Moonlight Over the Bridge at Beebe Lake." Recently, an alumnus wrote to express his happiness of giving a print of the latter to his wife as a reminder of the place where he proposed to her. Vic's work had the evocative power to recall time and place in the memories of any viewer familiar with his subject matter. Prints of Vic's artistry hang in homes and offices of many alumni and friends.

Vic's colleagues in the Department of Communication remember fondly his pride in his students' work and the many hours he spent with students as they worked together to develop their ideas into effective visual messages.

He kept a jar of colored pencils on his desk and often was seen sketching ideas and rough drafts with students at his elbow in rapt attention.

Vic also reached out to people in the State of New York. He worked for many years on the State Fair exhibits for the College of Agriculture and Life Sciences and for the College of Human Ecology. His students included many Cornell Cooperative Extension field staff who attended his training workshops and used his visual materials in their work.

Truly, Victor Russell Stephen was a gifted artist and a dedicated, effective teacher who gave unselfishly of his time and tremendous talent.

Royal D. Colle, Donald F. Schwartz, Ronald E. Ostman

J. Earle Stephens

June 19, 1890 — November 28, 1957

Professor J. Earle Stephens died suddenly in Detroit, Michigan, on November 28, 1957. He is survived by his wife, Mary Gail Stephens, and two daughters. Professor Stephens was born June 19, 1890, in Cambridge, Ohio, and was educated there.

Certified in 1947 as a professional engineer by the State of Michigan, Professor Stephens was a specialist in the planning of food service facilities. He was the founder and principal practitioner of a firm of food service consultants, and one of the founders of the Food Facilities Engineering Society, of which he was vice president at the time of his death.

Professor Stephens had just inaugurated instruction in his speciality, the design and layout of food service facilities, and had just begun the task of organizing for teaching and publishing the material available on that speciality when his work was cut short by death. His loss will be keenly felt.

F. H. Randolph, C. I. Sayles, H. B. Meek

Carl Stephenson

August 10, 1886 — October 3, 1954

Carl Stephenson, eminent mediaeval historian who had served as professor of history at Cornell for 24 years, died on October 3, 1954, three months after he had retired from active teaching.

Professor Stephenson was born on August 10, 1886, at Fayette, Iowa, the son of Julia and Andrew Stephenson. His father was a historian, and as a student of mediaeval history had attended the seminars of Herbert Baxter Adams at Johns Hopkins University in the company of Charles Homer Haskins. The association of the elder Stephenson with Haskins, who was later a distinguished figure at Harvard, probably caused Carl Stephenson to turn to Harvard for his advanced graduate work, after he had taken the Bachelor's and Master's degrees at De Pauw University. Like most graduate students he mixed his studies with teaching. He had already taught at the University of Arkansas, Princeton, and Harvard when he received his doctor's degree from Harvard in 1914. As a teacher he had further experiences at Washington University, St. Louis, and at Wisconsin, before he came to Cornell as a full professor in 1930. He was a Fellow of the Mediaeval Academy of America and served on committees of the American Historical Association.

The interest in research and writing, which had been aroused in him as a Harvard student, never flagged. A fellowship, granted in 1924 by the Commission for the Relief of Belgium, gave him opportunity to study in Europe, where he worked alongside many historians, notably Henri Pirenne, a mediaevalist of international reputation. These associations Professor Stephenson cherished throughout his life, as is shown by the continuing exchange of books and articles which he and his colleagues maintained across the Atlantic.

The research begun by him at Harvard and carried forward in the libraries of Europe came to focus on the institutions of government in Western Europe, particularly upon the history of taxation in the Middle Ages. Through study of taxation Professor Stephenson, like others, was able to probe into the organization and government of local communities and to deal with such subjects as the history of representation in mediaeval Europe. His first article on the subject, 'The Aids of the English Boroughs', appeared in 1919. His most elaborate and best known work, *Borough and Town: A Study in urban origins in England*, was issued in 1933. Yet these are mere fragments of the scholarly studies that he published in the form of books, essays, and reviews throughout the period 1919-1948.

Drawing on his long experience as a teacher, Professor Stephenson in 1935 wrote a notable text-book, *Mediaeval History: Europe from the fourth to the sixteenth century*; and, in association with F. G. Marcham, he translated

and edited an extensive selection of constitutional documents, *Sources of English Constitutional History*. The textbook, which he carefully amended and adapted in later editions, has become a standard work for college students throughout the United States. The simple organization, direct approach to historical problems, and plain yet vigorous prose, as shown in his writing here, were the hallmark of an unusually gifted teacher.

Many Cornellians will remember his clear, incisive, and carefully planned lectures in the elementary course in mediaeval history. A smaller and select number will cherish the memory of the advanced courses and seminars conducted in his office. In the intimacy of a small group he was able to display and to explain piece by piece illustrations and working models of things mediaeval. In this kind of teaching he was at his best; for no one took more pains than he to understand the hows and whys of castle building or account keeping or land drainage. For him the key to historical knowledge was to know how something worked. He carried this approach into the study of constitutional records where his famous first question to the student was always, 'What does the document say?'

Careful training of this kind was the mark of Professor Stephenson's work with graduate students. Of these he had during his first years at Cornell only a few. As his scholarly reputation spread the number grew; and during the last part of his university career he taught a distinguished group of graduate students from the United States and Canada. His concern for them was deep and abiding. He reported to his colleagues on their academic success as though he were speaking of his own children.

For much of his life Professor Stephenson wrapped himself up almost completely in research and teaching. His only important hobby was stamp collecting, which he followed with his usual exactitude, energy, and success. Then the untimely death of his wife in 1950 was a shock from which he never fully recovered. In the latest years of his life he believed that he had completed the principal task he had set himself as a scholar; and, as the time for retirement approached, he tidied up his office, as it were, and put his scholarly business in order. He taught his last class in May, 1954, and was appointed Professor Emeritus on July 1, 1954. While in retirement he watched, in the making, a volume of essays drawn from his earlier works, which the Cornell University Press was publishing under the title, *Mediaeval Institutions: Selected Essays by Carl Stephenson*. The galleys and the page proofs had passed his careful scrutiny. The book itself was about to appear, when sudden death robbed him of the satisfaction of rounding out his life in this last detail, as he would have wished it.

Harry Caplan, M. L. W. Laistner, F. G. Marcham

Hadley C. Stephenson

January 16, 1893 — August 25, 1976

Hadley C. Stephenson, professor emeritus of small animal medicine and consultant to the Cornell Research Laboratory for Diseases of Dogs died on August 25, 1976, ending almost sixty years of professional service to Cornell University. Dr. Stephenson was a lifelong friend of dogs, a veterinarian's veterinarian, and a member of a vanishing breed of Cornellian. If there were a better life than that of a doctor of veterinary medicine at Cornell University, Dr. Hadley C. Stephenson — Steve as everyone knew him — did not recognize or acknowledge it. With his passing the dog world has lost a true champion. He was indeed the gentle doctor, a role he played in a short film honoring doctors of small animal medicine produced by the Gaines Dog Research Center. His love for his profession came naturally, as his father, his grandfather, and a brother, were veterinarians.

He was born in rural Ogdensburg, New York. Cornell granted him the Bachelor of Science degree in 1919 and the D.V.M. in 1920. He joined the faculty upon graduation and remained the eternal teacher both in and out of the classroom. It was his firm conviction that progress was possible only through research, and its application to teaching and field problems. “Everything I was ever taught was somebody's research” was more than just another expression to Steve, it was his creed. He used it as a spear to prod and to inspire his colleagues and all dog lovers as well.

His teaching methods were revolutionary: question the past, innovate, experiment, and improve tomorrow today. As a result, he helped develop many new methods for the treatment of small animal disorders. These advances were concentrated in the therapeutic usage of new drugs for small animal disease. He recognized early that if biologicals were to be completely effective, sound vaccination regimens had to be developed for use in clinical control programs. For many years he was editor of the *Veterinary Drug Encyclopedia*, an invaluable aid to all veterinarians.

Steve's zest for life and all that it had to offer was reflected in his love for competitive sports. He enjoyed the well-played game—all the better if Cornell won. He was a conspicuous figure at Cornell athletic events where, surrounded by friends and colleagues of all ages, his enthusiasm could be felt when a play was executed with skill, his despair sensed when perfection was flawed.

His imagination and persistent effort resulted in many honors and awards. In 1960 he was elected by his peers to the presidency of the New York State Veterinary Medical Society. Other citations for his conspicuous contributions

came from the National Dog Welfare Guild, the Ithaca Dog Training Club, the Tompkins County SPCA, and the Finger Lakes Kennel Club. In 1974 he was honored with the Fido award by the Gaines Dog Research Center.

This same year, his colleagues at the James A. Baker Institute for Animal Health honored Steve by dedicating a laboratory for the study of canine diseases in his name. This was in recognition of his twenty-one years of service to the development and maintenance of a cooperative relationship between the Cornell Research Laboratory for Diseases of Dogs and its collaborators and supporters.

It is in this laboratory where the spirit of this inspiring colleague will live on, where continued progress for the better health of dogs will be fostered by “asking the dog.”

Leland E. Carmichael, Robert W. Kirk, Ben E. Sheffy

Peter L. Steponkus

September 18, 1941 — July 14, 2001

Peter L. Steponkus, the Liberty Hyde Bailey Professor of Crop Physiology, died July 14, 2001 in Ithaca, after a long battle with cancer. He was 59.

Born in Chicago on September 18, 1941, he graduated from Colorado State University in 1963 with a B.S. degree in Horticulture. He received an M.S. degree in Horticulture/Plant Physiology from the University of Arizona in 1964, and a Ph.D. degree in Plant Physiology/Biochemistry/Horticulture from Purdue University in 1966. Upon completion of his graduate studies, he rose through the professorial ranks at the University of Arizona (1966-68) and Cornell (1968-2001). In 1987, he was appointed Liberty Hyde Bailey Professor of Crop Physiology in Cornell's Department of Agronomy (now the Department of Crop and Soil Sciences), College of Agriculture and Life Sciences, a title that recognized his outstanding commitment to scholarship and excellence as demonstrated by his teaching and research programs.

An international authority in the area of environmental stress physiology of plant systems, his research focused on low-temperature biology (cryobiology) for the study of cold acclimation and freezing injury of herbaceous plant species, such as winter cereals (rye, wheat, barley and oat) and the development of procedures for the cryopreservation of biological tissues. Over 400 publications elucidate his body of research on cold acclimation and freezing injury of cellular membranes, drought resistance and osmotic adjustment in rice and wheat, and the cryopreservation of *Drosophila melanogaster* embryos, mammalian tissues, and plant cells, tissues, and organs. His recent research was focused on determining the fundamental biophysical mechanisms of membrane destabilization and the identification and mode of action and processes of cold-regulated genes that are involved in the cold acclimation of *Arabidopsis thaliana*.

“Peter Steponkus was a study in contrasts. He was a rigorous, disciplined, extraordinarily hard-working scientist and an imaginative and talented sculptor. He was a doting and intensely proud father of his three daughters and one son. He was a fiercely loyal friend and mentor, but a formidable intellectual adversary. He was a demanding yet inspiring teacher, with a unique sense of humor, and he set extraordinarily high standards of performance both for himself and for those around him. He disdained shoddy science, often antagonizing its practitioners because he did not conceal his opinion of their work.

“Peter’s creativity manifested itself in many ways, most importantly, of course, in his science. Over a period of some 20 years, he used plant protoplasts first to describe, then to analyze, and finally to explain the molecular mechanisms by which plants acclimate to cold and other stresses. The overwhelming majority of his published research was concerned with cold hardiness

and drought resistance in various species of plants...Peter was a skilled and articulate speaker who paid close attention to details, so that his lectures were informative, lucid, and often brilliant. They were illustrated with superb light and electron microscopic images. He had a special talent and ability to incorporate a wide variety of data into coherent and very persuasive arguments.” (Excerpt from S. Leibo, J. Wolfe, and M.C. Ball. 2001. In Memoriam: Peter L. Steponkus (1941-2001). Cryobiology 43:1-3.)

He served on numerous editorial boards, held many positions within the Society of Cryobiology, and was an invited speaker at numerous national and international meetings sponsored by the International Botanical Congress (Leningrad), American Association for the Advancement of Science (Washington), Royal Microscopy Society (Cambridge), several Gordon Research Conferences, the American Chemical Society (Toronto), and The Royal Society (London).

Survivors include his four children: Peter of New Bern, North Carolina; Dana (Christopher) Selvarajah of Boynton Beach, Florida; Karen of Boynton Beach; and Kristen of Phoenix, Arizona; his former wife, Laila K. Steponkus, of Ithaca; a sister, Carol Landesman, of Spencer, North Carolina; a grandson, Peter D. Steponkus, of New Bern; and nieces and nephews.

Ralph L. Obendorf, Timothy L. Setter, Stephen D. DeGloria

Robert Stern

May 12, 1948 — April 22, 2001

Robert Stern was a superb teacher and scholar, and an inspiration to faculty, staff, and students in the ILR School. Bob joined the School in 1974, after earning an A.B. degree from Washington University in St. Louis in 1970, and M.A. and Ph.D. degrees in Sociology from Vanderbilt University. He struggled with diabetes throughout his life, and his health deteriorated in the last decade, yet he gave an immense amount of time and energy to Cornell, his students, scholarly organizations in his field, and the Ithaca community.

Professor Stern's research focused on problems of organizational governance and on the sources and nature of organizational conflict. Early in his Cornell career, he became part of a research team studying the effects of employee stockownership, which was then becoming a mechanism for preventing plant closures. He concentrated his efforts on the conflicts that ensue when new ownership structures emerge but old patterns of governance remain. When a series of case studies of worker buy-outs demonstrated the failure of existing corporate governance structures to accommodate the interests of employee owners, he turned his research attention to employee membership on corporate boards as a possible labor voice mechanism. Ever the sociologist, it irked him no end that two of the articles from this research were published in the *Journal of Applied Psychology*, but as he acknowledged with a sigh, it was the price he had to pay for collaborative research. Bob liked collaborative research, however, because it afforded an opportunity to examine organizational problems from multiple perspectives. It also gave him the chance to correct his co-authors' poor syntax. He felt there was much to do on that score. Most of his other research on industrial democracy, strike duration, and trade union membership programs, also was joint with ILR faculty, appearing in more palatable journals in industrial relations, sociology, and organizational theory.

Bob Stern was a productive scholar, producing seven books and monographs and dozens of articles, but he was first and foremost a teacher and mentor. As Professor Deborah Balsler, one of his former graduate students, has written:

"Bob knew that the way he dealt with students had an important impact on their lives. He understood that he could publish a hundred articles in academic journals but it was in dealing with students that he made a difference."

Bob was an original member of the ILR School's Teaching Advisory Committee, and he was the committee's spark, always looking for ways to improve his own teaching and that of others. He also was a mentor of young faculty members, both in his own department of Organizational Behavior and in other departments within the School.

Bob taught courses on regulating corporations and on the sociology of industrial conflict. Perhaps his favorite course was on organizational behavior simulations, in which students participated in games that modeled running a company and executive and cooperative decision making. The course required large blocks of time to play the simulations, so Bob taught it at night, even when his health was failing and he was no longer able to drive after dark. It was difficult for him to continue teaching the course, but he thought it was intellectually stimulating and useful for students, so he found ways to do it.

Bob was a colleague of wide-ranging interests in an era of rigid disciplinary boundaries. Professor Balser writes that Bob “liked learning new things.” Professor Robert Hutchens, who worked with Bob and Professor David Lipsky on an interdisciplinary study of the role of government transfers in strike behavior, recalls that:

The three of us shared a common interest, but came from different disciplines. Bob wanted us to go beyond disciplinary boundaries and produce joint work. Part of his excitement for the project arose out of bringing us together and encouraging us to work on the same question.

One way that Bob learned new things and met new people was through travel. He used his sabbaticals to visit new places: in 1981-82, he was a Fulbright Lecturer at the University of Leiden in the Netherlands; in 1988-89, he visited the University of California at Berkeley; and in 1996-97, he visited Queensland University of Technology and Monash University in Australia. The year in Australia was a triumph over adversity. Bob had already lost a leg, but he carried on with the trip, visiting and lecturing at various universities and doing things that tourists do, including white water rafting. He had a marvelous year and brought back stuffed toys and other knick-knacks that still grace faculty offices.

In 1997, despite mounting health problems, Bob became the Director of Graduate Studies in the ILR School. He reasoned that if he could not do as much scholarly research as in the past, he could still serve the School in another capacity. Bob was an excellent choice for the job: he was committed to both the professional masters program and to the M.S./Ph.D. program, he enjoyed meeting prospective students, he was interested in the work of people in disciplines other than his own, he was fair, and he always was sympathetic to students with academic, personal, or financial problems.

Bob had a wonderful and irreverent sense of humor, which he applied to his and other’s academic work and to his physical ailments. Professor Hutchens writes that for Bob,

“ideas were not to be taken too seriously. They were just ideas. One could poke fun at them. . . . Bob loved to pose a question that couldn’t be fully answered by an economic model. This was always done gently, with a smile and a twinkle in his eye. That was part of the fun of joint work.”

Professor Lee Dyer writes that Bob would occasionally appear outside his office door in his wheelchair, and with a big grin on his face, say in a loud voice: “Dyer, you are in violation of OSHA standards. I have urgent business to conduct here and my chair won’t fit through the door.” In this way, Bob “managed to convey a subtle awareness of his physical condition coupled with his uncanny ability to make the most of that condition for the greater good.”

Bob also led a full life outside of Ives Hall. He was an active member of Temple Beth El; he did volunteer work for the Greenstar Cooperative Market; and he served on the Board of Directors of the Finger Lakes Independence Center. He was an avid sports fan, frequently attending Cornell sporting events, especially hockey games, and he enjoyed going to minor league baseball games in Binghamton and Syracuse. He developed a passion for baseball cards and other sports memorabilia relatively late in life, and became a regular attendee at weekend card shows, where he would buy, sell, and trade cards. Although it was unclear if his sports card business was profitable, he obtained many hard to find cards for faculty and staff at Cornell, and he developed a whole new set of friends in the process.

Family was important to Bob. He and his wife, Corinne, brought up two accomplished, loving, and spirited children, Danielle and Ethan, who, like their father, have not been afraid of choosing unusual paths.

The words most often used to describe Bob by his colleagues are “courage,” “spirit,” and “inspiration.” No matter how sick he was, he continued to do his job and to give of himself to others. Professor Ronald Ehrenberg recalls that when his son was seriously ill with a malignant brain tumor, Bob visited him in the hospital and gave him some sage words of advice:

“Don’t compare yourself to what you were. Don’t compare yourself to the people around you. Just ask how you can make yourself and the people you love as happy as possible.”

Archivist Richard Strassberg sums up the view of many of us when he writes that:

“Bob’s determination to continue his work no matter what, his good humor and kindness to others as his own body was failing him, is a tribute to the human spirit and must be an inspiration to all who knew him. He is likely to be the bravest person that we will ever know.”

James A. Gross, Tove H. Hammer, George R. Boyer

John Robert Sitlington Sterrett

— June 15, 1914

The Secretary on behalf of a committee appointed by the President (Hammond, chairman, Bennett, Bristol) reported the following resolutions on the death of Professor Sterrett, which were adopted by rising vote:

“At the close of the last College year Professor John Robert Sitlington Sterrett, head of the Department of Greek, passed from life in the hospital of the City of Ithaca. The Faculty of the University places on its records this memorial of its appreciation of the personality and services of the departed scholar.

For twenty-seven years he was professor of the Greek language and literature in various institutions of this country, nearly half of which time he spent at Cornell University. As a young scholar he traveled through Greece and Asia Minor and by his archaeological and epigraphical work, filling practically the whole of the first three volumes of the publications of the American School of Classical Studies at Athens, he established a world-wide reputation. These earliest labors were in the field for which he had a peculiar aptitude. Down to the last days of his life he had an intense desire to return to the problems of Hellenic Archaeology, in which the achievements of his young manhood had won the approbation and applause of the chief scholars of Europe.

He was a valuable contributor to the education both of his colleagues in the Faculty and of his students in the class-room. To the former he was an exemplar of single hearted devotion to his work and the incarnation of the spirit of veracity. To the latter he imparted intimately the precious ideas and ideals of Greek civilization, which he so deeply loved and understood.

He was a man of very conservative views, of extremely rigorous, even stoical ideals of duty. He had a passion for the scholar's labor and the long exacting hours spent daily in his study in Goldwin Smith Hall were to him as the breath of life.

His last work was unfortunately left a torso,—his translation of Strabo's Geography and the reconstruction of the text. Most of it was done under the strain of ill health, but with unflagging industry.

His outward life imaged his inward character, a character marked by simplicity, transparent candor, and rugged dignity.”

Alexander R. Stevens

May 9, 1876 — June 1, 1968

Dr. Alexander Raymond Stevens died on June 1, 1968, at the age of ninety-two years, after a brief decline associated with a fractured femur. He was born in Baltimore and received his B.A. degree from Johns Hopkins University in 1896. His collegiate expenses were partly met as a pianist in summer hotels, but to enter medical school it was necessary that he spend a period with the United States Coast and Geodetic Survey. During this time he helped draw the original map of Guantanamo Bay, Cuba.

In 1904, after he received his M.D. degree from Johns Hopkins, he served a year as a medical intern under Sir William Osier. A vacancy occurred on Halsted's surgical service so he served three months as an intern there. The famous Dr. "Popsy" Welch suggested that he become associated with Dr. Hugh Hampton Young who was just developing a urological service. The association with Dr. Young lasted approximately eighteen months. I once heard Dr. Young refer to Dr. Stevens as his first resident, though no doubt the residency was then quite informal. Dr. Stevens' first medical paper was one with Dr. Young and Dr. John T. Geraghty on chronic prostatitis in 1906.

Additional training was received at Presbyterian Hospital in New York, and Dr. Stevens' practice of urology was begun in that city in 1908. By at least 1911, he had transplanted the ureters into the bowel—and the patient on whom his operation was performed was still alive in 1940! In 1913, and again in 1914, he reported his experiences with transurethral electrocauterization to remove the obstructing prostate and thus became a "grandfather" of transurethral electrosurgery on the prostate. Because Dr. Stevens' sister was the wife of Dr. Guy Hunner, it was impressive to Dr. Stevens' later associates that he rarely dilated ureters in spite of what must have been strong influences to do so!

In World War I, he served in France as a major in the Medical Corps.

In 1919 he married Miss Mary Lane Davis, a nurse at Presbyterian Hospital. Early in his urological career he became associated with Bellevue Hospital and in 1925 was appointed Surgeon-in-Charge of Urology. In 1937 he succeeded Dr. E. L. Keyes, Jr., in charge of the Cornell urological service in the New York Hospital. Retirement came in 1946, and he was elevated from Attending Urologist to Consultant on the hospital staff and from Professor of Clinical Surgery (Urology) to Clinical Professor, Emeritus, of Surgery (Urology) in the Medical College.

In addition to the famous medical personalities already mentioned, he was at some time associated with F. Tilden Brown, David MacKinzie, Benjamin Barringer, and Meredith Campbell. His fellowship in the American College of Surgeons extended over a period of forty-seven years. He was certified by the American Board of Urology. His memberships included the American Medical Association, the Harvey Society, the Practitioners Club of New York, and the Century Association of New York. He was president of the New York Urological Society in 1923 and of the American Association of Genito-Urinary Surgeons in 1944.

In addition to his urological achievements, Stevie is fondly remembered by his former associates and trainees as a gentle gentleman and a wise counselor. Few have adjusted so well to retirement. Once a professional organist, he played the march at his son's wedding in 1947. He still skied in his eighties and drove his automobile in his nineties. He lived for twenty years after a coronary occlusion. Fortunately, his gallstone remained completely quiescent for about thirty years. He was among the last of the founding generation of urologists, and his personal high qualities will rarely be encountered again.

His devoted wife; a physician son Alexander R. Stevens, Jr.; and three grand-children survive.

Victor F. Marshall, M.D.

Robert Sproule Stevens

May 29, 1888 — November 17, 1968

Robert Sproule Stevens died in Ithaca at the age of eighty, following a distinguished career at Cornell which spanned nearly half a century. He was one of the great figures on the law faculty, where for seventeen years he had served as dean and from which he had retired as an active teacher in 1959 as Edwin H. Woodruff Professor of Law, Emeritus. His service both as professor and as dean was the longest in the history of the Law School.

Dean Stevens was a master teacher, a renowned and productive scholar, a wise and understanding dean, a congenial and beloved faculty colleague, and a dedicated Cornellian. He was universally recognized for his fairness, his integrity, and his deep sense of professional and public obligation. He was always unassuming, modest, and considerate of others. He was a good companion and a warm and generous host, held in deep affection by a wide circle of devoted friends and former students.

He was born May 29, 1888, in Attica, New York. After earning his A.B. in 1910 and his LL.B. in 1913 at Harvard, he practiced law in Buffalo until 1917. Volunteering for World War I military service in the spring of 1917, he attained the rank of second lieutenant in the field artillery and air service.

Dean Stevens's career of teaching and scholarship began in 1919, following his military discharge, with an initial appointment as lecturer on law, followed by promotion to professor of law in 1921.

Dean Stevens taught a broad spectrum of courses, eventually specializing in corporations and equity. In teaching he utilized a masterful Socratic approach. He delighted to make his courses, especially those in equity, a means of developing the student's conscience, and of instilling a strong sense of fairness and ethics.

As a scholar, Dean Stevens was best known for his work in the field of corporations. His two editions of *Stevens on Corporations*, though prepared primarily for students, won wide recognition from scholars, practicing lawyers, and judges. He also prepared, in collaboration with colleagues, two leading corporate casebooks and was a frequent law review contributor.

Apart from teaching and writing, he made many contributions towards improving the law. From 1926 to 1948 he served as a New York commissioner on the National Conference of Commissioners on Uniform State Laws. He was a leader in the movement to modernize and reform corporation statutes, making major contributions as draftsman of the pioneer Uniform Business Corporation Act, as consultant in the drafting of the Ohio Corporation

Law, and as chief consultant to the New York Joint Legislative Committee to Study Revision of Corporation Laws, in drafting the present New York Business Corporation Law.

After succeeding Charles K. Burdick as the Cornell Law School's eighth dean in 1937, Dean Stevens was primarily responsible for several important educational innovations.

Prior to becoming dean, he had experimented with and developed the problem approach to legal education. His novel problem-seminars were designed to expose small groups of students to demanding problems typical of those likely to be met in actual practice. They not only afforded a stimulating educational change of pace but also gave to students needed training and experience in research, drafting, and solving legal problems. They also became a welcome vehicle for close faculty-student contacts. As dean, he initiated a substantial expansion in the number of such course offerings, with the taking of at least one problem course becoming a graduation requirement. These seminars remain an established feature of a Cornell legal education. Similar courses are now widely offered elsewhere.

Other landmarks for which Dean Stevens was responsible were the Law School's comprehensive examination program, the school's first legal aid program, and the development of an orientation course designed to introduce entering students to law study and the legal process.

During World War II Dean Stevens again responded to the call of government service, involving a variety of legal assignments, principally in Washington, D.C. Successively he served with the Office of Lend-Lease Administration as assistant general counsel, with the Foreign Economic Administration, and with the Office of Contract Settlement as the first chairman of the Contract Settlement Appeals Board.

In the fall of 1945, Dean Stevens resumed his active role at Cornell as dean and professor. Under his leadership the school greatly expanded to meet the needs of returning veterans. During this period increasing amounts of the dean's administrative time and energy became necessarily devoted to fund raising and promotional activities. Between 1949 and 1954, four new professorial chairs were established, each with a substantial endowment. The year 1952 saw the inauguration of a major alumni annual giving program, now in its eighteenth year, which has provided the school with essential and increasing support in this era of ever rising costs.

In 1954 Dean Stevens elected to retire both from the deanship and from teaching, though continuing his scholarly activities and his close connection with the law school. In 1957 he was named Edwin H. Woodruff Professor of Law, and undertook a half-time teaching assignment for his courses in equity. In 1959 he retired as Edwin H.

Woodruff Professor of Law, Emeritus. Thereafter, he continued his work on the proposed revision of the New York Business Corporation Law, a project which was completed in 1963.

Dean Stevens served the University and the Ithaca community in many ways. From 1931 to 1934 he was a trustee of the Village of Cayuga Heights, and in 1934 acting mayor of the Village. From 1934 to 1939 he was an elected faculty representative on the Cornell University Board of Trustees. In 1953-54, he was president of the Statler Club.

During the years, Dean Stevens contributed generously and anonymously to a Law School fund, adding a substantial bequest by his will, and leaving the use of these funds to be determined by the Law School faculty. Designated as the Robert S. Stevens Fund by the faculty, these funds, together with contributions from others, will be devoted to the establishment of an endowed chair in the Law School to be known as the Robert S. Stevens Professorship.

Dean Stevens is survived by his wife, Eva Howe Stevens, whom he married in 1940; a son, Robert Croll Stevens, of Pittsford, New York; and four grand-children. His first wife, Pauline Croll, whom he married in 1922, died in 1936.

On December 15, 1968, memorial services for Dean Stevens were held in the foyer of Myron Taylor Hall. Interment was in the Stevens family lot in Attica, New York.

Harry G. Henn, Gray Thoron, John W. MacDonald

Frederick Campion Steward

June 16, 1904 — September 13, 1993

Frederick Campion Steward FRS, better known as “Camp” or F.C., died at age 89 at his home in Tuscaloosa, Alabama, after several years of poor health. He came to Cornell as Professor of Botany in 1950 and subsequently became Charles A. Alexander Professor of Biological Sciences and Director of the Laboratory for Cell Physiology, Growth and Development. Steward was one of the most vigorous, productive, persuasive, and scholarly faculty members in the New York State College of Agriculture and Life Sciences at Cornell University. A Symposium held at Cornell in May 1973 on the occasion of his retirement was entitled “Historical and Current Aspects of Plant Physiology: A Symposium Honoring F.C. Steward”.

Dr. Steward was a leading figure in the development of modern plant physiology, cell biology, and plant tissue culture, and his research in the late 1950s reshaped scientific knowledge of how plants regenerate. He is perhaps best remembered, certainly most cited, for his demonstration that cells cultured from carrot roots can give rise to embryo-like structures, and eventually to entire plants. This showed that individual plant cells are totipotent—they retain all the genetic information necessary to regenerate and regulate a mature plant, with all its specialized cells.

This finding revolutionized the world of plant cell biology. It established for the first time that the cumbersome process of cultivating plant cuttings and shoots was no longer required to increase clones. Instead hybrids can be propagated and mutants discovered much faster in the laboratory. His discovery of the means to obtain such regeneration has provided a foundation that supports much of modern plant molecular biology.

Steward was always concerned with broad concepts and he took pride in the breadth of the work undertaken in his laboratory. In addition to his findings on plant regeneration, he also made important contributions in other areas. His work and that of his associates provided major insights into plant cell physiology, nitrogen metabolism and protein synthesis, ion uptake and nutrient accumulation, morphogenesis, growth and development, where he recognized the significance of hormonal regulation in cell division. The importance of liquid endosperm in providing plant growth substances led some of us to regard coconut water as the “elixir of life”.

From his Cornell classrooms and laboratories, Steward was responsible for creating and inspiring a generation of botanists. Former students said that his lectures in advanced plant physiology were the high point of their education, and he taught this distinguished course to a large number of students for eighteen years. Over thirty

advanced students from various nations completed the Ph.D. degree under his direct supervision, and his laboratory attracted many postdoctoral scientists from the United States and abroad. He could be a spellbinding lecturer, and his classroom and seminars became a kind of international salon for visiting scientists from all over the world. He spoke by invitation to audiences on every continent, and it would be difficult to find a major university in the United States or Canada where he did not give one or more exciting reports of work carried on in his laboratory.

F.C. Steward, was born in London on June 16, 1904, and received a B.Sc. degree in Chemistry with First Class Honours from the University of Leeds. He completed the Ph.D. degree in Botany, also at Leeds, in 1926 under the direction of J.H. Priestley, a scientist with innovative and unconventional views, who instilled in him a strong sense of independence. From the outset of his career, Steward was often associated with scientific controversy and he often tended to be at its epicenter. He believed that one could be, and maybe should be, a “majority of one” if scientific convictions dictated it.

A Rockefeller Foundation Fellowship brought Steward to Cornell in 1927 and then to the University of California at Berkeley to work with Dennis R. Hoagland in plant mineral nutrition, and this led to his interest in ion uptake in plant cells. A second Rockefeller Fellowship in 1933 took him again to work with Hoagland and then to the Dry Tortugas, where the Carnegie Institution of Washington maintained a Marine Laboratory. Here he worked on the large coenocytic alga, *Valonia*. After returning to Britain he was appointed in 1934 as Reader in Botany at Birkbeck College, University of London, where Dame Helen Gwynne-Vaughan was Head of the Department.

During World War II (1940-45), he served Britain in the Ministry of Aircraft Production as Director of Aircraft Equipment and Assistant Secretary of the Ministry. His administrative and organization skills were crucial to the task and were further honed at this time. He returned to the United States after the war, holding appointments at the University of Chicago and the University of Rochester, where he was Professor and Chairman of the Department of Botany and where he began his work using paper chromatography to study nitrogen compounds. He came to Cornell as Professor of Botany in 1950. He was a tireless worker on University and College committees, and many major committee reports carry the stamp of his incisive thinking and literacy. His renown in research brought industrial consulting contracts with Beech Nut Packing Company, the DuPont Company, and the United Fruit Company, each of which contributed financially to his research over various periods of time. In his later years he held forth eloquently against the overspecialization and fragmentation of scientific research.

Among many honors, FCS was elected Fellow of the American Academy of Arts and Sciences in 1956, and Fellow of the Royal Society of London a year later. In 1961 he received the Merit Award of the Botanical Society of

America, and three years later the Stephen Hales Award of the American Society of Plant Physiologists. He also received several Honorary Doctorates. He wrote several books and more than 200 articles in scientific journals, and he was editor and contributor to the 10 volumes and 15 books of *Plant Physiology: a Treatise* (Academic Press, 1959-91). He had the gift of communication, both in speech and in the written word, and a very personalized style, with an intense feeling for the historical continuity of plant science.

He is survived by his wife of nearly sixty-four years, Anne Temple Gordon, whom he met when he was a Postdoctoral Fellow in the Department of Botany at Cornell; by his son and daughter-in-law, Frederick Gordon and Muir of Tuscaloosa; and two grandchildren.

Abraham Krikorian, Pamela Ludford, John Thompson, Charles Uhl, Harlan Banks

Fred Carlton Stewart

February 13, 1868 — April 24, 1946

Fred Carlton Stewart, Emeritus Professor of Botany, died on April 24, 1946, ten years after his retirement in 1936 which concluded a period of more than a third of a century of distinguished service to the agriculture of the State and Nation.

Professor Stewart was born at Clymer, N. Y. on February 13, 1868, but the family moved to Iowa while he was quite young. He received the B. S. and M. S. degrees from Iowa State College, and in 1894 was named mycologist for the Geneva Station and assigned to duty at the newly created substation at Jamaica, Long Island where under trying conditions, he attacked the new and varied problems of plant disease control. After three years he resigned this position and entered Cornell for graduate study, only to decide that he could accomplish more through European travel and contact with leading mycologists of that day. Upon his return to this country, he was appointed Botanist of the newly created Department of Botany at the Geneva Station and thus began a period of thirty-eight years of most distinguished service in the field of botany, particularly, plant pathology and mycology.

He was a member of the American Phytopathological Society and served as its president in 1913. He always gave of his best to his scientific interests, to the American Association for the Advancement of Science, and to the Mycological Society of America. Seemingly, his first interests were in the field of plant diseases. In the field of potato diseases he did pioneer work with virus troubles. The tuber-unit idea, as well as the means of control developed by him are still largely standard practices. He was the author of more than seventy bulletins, papers, and articles dealing with plant pathology, mycology, and allied subjects, and in his early years lectured widely about plant diseases and their control.

All of his work is a record to be proud of and those who had the good fortune to be associated with him know that no call on his time and energy went unheeded. He was ever attentive to the incidental tasks of the day, the meeting of visitors, conferences with farmers as well as with the leading pathologists, in addition to routine duties. His impact upon agriculture must have been great. His exceptional ability to observe and to record precise notes, his strict integrity, his keen sense of justice, and his constant interest in the welfare of his fellow men were greatly to be admired and prized. He was a kindly person who took sincere pleasure in being helpful to others. He left a legacy of a life well lived, a service well rendered.

L. M. Massey, M. T. Munn, O. A. Reinking

Rolland Maclaren Stewart

November 27, 1878 — June 12, 1963

Dr. Rolland M. Stewart was born in Winslow, Illinois. His early education was in Winslow, and his preparatory school training was at Western College (now Coe College) in Iowa. He began his teaching career in the rural schools of Wisconsin and Illinois at the age of seventeen. The A.B. degree was earned at the University of Iowa in 1904, where he was one of four men among fourteen students elected to Phi Beta Kappa. Following graduation he became Professor of Greek, English, and Education at Graceland College in Iowa; later he became president of the college. In 1908 he resigned from the college to reenter the University of Iowa to pursue candidacy for the Ph.D. degree and to serve as a teaching assistant. The degree was granted in 1912, whereupon Dr. Stewart remained at the University as a member of the faculty in education, teaching courses in psychology and education.

In 1918 he accepted the invitation of Cornell University to become a member of the Department of Rural Education, which was then in a formative stage in the State College of Agriculture.

Coincident with the beginning of Dr. Stewart's tenure at Cornell, the National Vocational Education Act was enacted by Congress, creating an immediate need for teachers of vocational subjects, including agriculture, for the secondary schools. It was due largely to Dr. Stewart's influence and leadership, with the support of other early members of the Department of Rural Education, that Cornell University rapidly became the leading institution in two phases of agricultural education. The first phase was to develop an undergraduate program for the preparation of teachers of agriculture for the secondary schools; the second was to develop a graduate program to educate leaders in the field of vocational education in agriculture. Cornell's position of prominence was maintained during the 28 years of Dr. Stewart's tenure at Cornell, during which period well over a hundred graduate students studied under his direction and subsequently attained positions of leadership in vocational education throughout the United States and abroad.

Dr. Stewart was in the vanguard of those who recognized that the proper direction and growth of any new venture in education must depend upon constant appraisal and evaluation. Consequently, as he sought to promote vocational education throughout the state and nation, he insisted upon a continuous program of research as the basis for charting growth and development. He was instrumental in the organization of a research committee for the agricultural education section of the American Vocational Association and served as a member for more than

25 years, the last eleven as chairman. He edited and contributed to the first publication of the committee, which listed over 800 studies completed throughout the country, many of these under his direction.

In 1944, Dr. Stewart became head of the Department of Rural Education and acting director of the School of Education in 1946, immediately preceding his retirement. From 1927 through 1934 he was director of the summer session for the state college units at Cornell. He also taught in summer sessions at Purdue University, the University of Kentucky, and Hampton Institute.

Dr. Stewart's published works have been extensive. Included was one of the earliest and most widely used text and reference books in his field, *Teaching Agricultural Vocations*, with A. K. Getman as co-author. In addition to the many bulletins and papers he published, he was contributor to or editor for other publications, including an early encyclopedia entitled *Book of Rural Life*.

He held membership in the professional organizations of Phi Beta Kappa, Phi Delta Kappa, Kappa Phi Kappa, American Vocational Association, National Education Association, National Society of College Teachers of Education, National Society for the Study of Education, Society for the Advancement of Education, and the American Association of University Professors.

Following his retirement in 1946, Dr. Stewart conducted a survey of the Negro institutions of higher education in the South at the request of the General Education Board. This gained for him much commendation from both the institutions served and the Board for his assistance and advice in upgrading standards and programs. The sincere, conscientious, and knowledgeable manner in which he approached and conducted this assignment was characteristic of the relationships that he had established earlier in the University and the profession.

Dr. Stewart was always active in matters related to the public welfare of the community. He was identified with the local chapter of Red Cross for about 25 years, serving as chairman during the last eleven years preceding retirement. Another example of his community service was his important work on a Mayor's Committee on Revision of the Assessment Plan for the City of Ithaca. He was a member of long standing in Rotary and St. Paul's Methodist Church.

Death came to him June 12, 1963, at his residence in Williston Park, Long Island, where he and Mrs. Stewart, the former Hattie R. Philips, had resided since his retirement. In addition to Mrs. Stewart he is survived by a son, Harold P. Stewart of the same address, and a brother, Oliver M. Stewart of Winslow, Illinois.

Charles W. Hill, Frederick H. Stutz, William A. Smith

Laurence D. Stifel

August 29, 1930 — April 19, 1995

Laurence D. Stifel, Visiting Professor with the Cornell International Institute for Food, Agriculture and Development (CIFAD) and the Southeast Asia Program (SEAP) from 1991 until his untimely death in April 1995, had devoted his life to economic and agricultural development in Asia and Africa. His international career began in 1960, when he spent a year at the University of the Philippines as a Fulbright research scholar, doing research for his doctoral dissertation. He returned to the U.S. to teach economics at Willamette University for a year while finishing his thesis, and then he joined the U.S. Agency for International Development (USAID), which assigned him to Rangoon, Burma, 1962-64, as a program economist. From there he went to Bangkok, Thailand, for three years, 1964-67, to the National Economic Development Board as an economic advisor for USAID. Larry joined the Rockefeller Foundation in 1967 as a Visiting Professor at Thammasat University in Bangkok where he managed the Foundation's Social Science Project to nurture the development of young academic professionals in Thailand.

Larry viewed these years in Thailand as among the most rewarding in his career. During this time, he did some path-breaking research and superbly crafted writing on Thailand's economic history, which together with the quality of his personal interactions and guidance made him a loved and influential figure among a larger number of Thais. He established the English-medium program in Economics at Thammasat, and several of the students whom Larry worked with and selected to go abroad for further study have become national leaders.

With this knowledge of the problems of developing countries, Larry was brought back to New York to serve first as Associate Director for Social Sciences for a year and then over the next seven years, as Secretary of the Rockefeller Foundation, as Secretary and Vice President, and finally as Vice President for Program. During this time, he took a year off (1969-70) to spend as a Visiting Fellow at the Economic Growth Center of Yale University.

In 1985, Larry took on a major challenge, becoming Director-General of the International Institute for Tropical Agriculture (IITA) based in Ibadan, Nigeria. This was one of the international agricultural research centers operating within the system overseen by the Consultative Group for International Agricultural Research. IITA had made some significant research contributions in previous years, but had become too overgrown and ingrown according to knowledgeable observers. Larry's task was to reorganize and redirect this institution, and he carried out this responsibility with firmness, deftness and fairness. IITA as a major actor in the effort to reverse Africa's agricultural decline was reinvigorated through his leadership and strategic skills. When Larry stepped down as

Director-General of IITA in 1990, an appreciative staff and local villagers had him inducted as an honorary Yoruba chieftain.

Searching for an opportunity to return to academia for writing and teaching, Larry was immediately attracted to Cornell with its unparalleled reputation in agricultural development and Asian studies. He could bring a wealth of experience in administering and evaluating programs of agricultural and rural development and an extensive and intimate knowledge of Southeast Asia to the Ithaca campus. In 1991, he became a Visiting Fellow with CIIFAD, and in 1993, he was appointed as a Visiting Professor with both CIIFAD and the Southeast Asia Program. His concern for students' own intellectual developments was much appreciated by them and his faculty colleagues. He joined in teaching a graduate course on the Administration of Agricultural and Rural Development, and together with Thak Chaloemtiarana, he took over the introductory course on Southeast Asia. His knowledge and teaching skills helped to make this course a showcase for Southeast Asian Studies to undergraduates, and he had a particular knack for working with students and whetting their appetites to do further work in Southeast Asia.

During 1993, the International Center for Living Aquatic Resource Management (ICLARM) located in Manila, encountered serious management problems. Following the resignation of the Director-General and the Chairman of its Board of Directors, Larry was called in to serve as interim Director-General and put the Institute back on its feet. This was to be his last extended visit to the country which he had first visited as a graduate student and to the Asia that he had grown to love. He returned to Cornell to resume teaching during the spring semester of 1994, and sadly, in June of that year, while hiking in the French Alps with his son, he sustained a serious fall that caused injuries leading ultimately to his death.

Larry Stifel received his B.A. degree in Economics from Harvard University in 1952, and his M.B.A. degree from the Harvard Business School in 1954. He earned an LL.B. degree from Cleveland Marshall Law School in 1959 and a Ph.D. degree in Economics from Western Reserve University in 1962. He was 64 when he died and is survived by his wife, Dell; a son, David of Ithaca; a daughter, Laura Murphy of Sarasota, Florida; and two sisters, Irene Smith and Gretchen Larson, both of Cleveland, which was the city where he grew up.

Larry is remembered by his colleagues for his full and fruitful dedication to solving the problems of economic poverty and agricultural underdevelopment. From 1975-80, he served as Secretary of the International Agricultural Development Service, based in New York. At the time of his death, he was serving as a trustee of the Thai Development Research Institute in Bangkok and as a member of the Board of Directors of the International

Institute for Rural Reconstruction, which is based at Cavite in the Philippines. His good sense and good humor, his unfailing modesty, and his eager engagement with the ideas and interests of old colleagues as well as new acquaintances made him a constructive partner in many ventures. We had been looking forward to many more productive years in which Larry would continue to contribute to our teaching and research programs at Cornell. He leaves behind many positive memories of what he had already contributed here and to the world beyond Cornell.

Norman Uphoff, John U. Wolff, Randolph Barker

Ralph Griffith Stillman

February 21, 1882 — November 16, 1950

Ralph Griffith Stillman, Assistant Professor of Medicine (Clinical Pathology), died on November 16, 1950 at the age of 68. He had been a member of the faculty of the Medical College for thirty-eight years. In 1912, Dr. Stillman was appointed Clinical Pathologist and from 1938 to 1948 he was in charge of the Central Laboratories, the organization and effective management of which were in a large measure due to his professional and administrative ability. As a teacher of clinical microscopy to the students of the Medical College, he was a potent influence in the inculcation of accurate observations and scientific method. He was active in the Associations of Clinical Microscopists and was at one time President of the Association of Blood Banks.

In 1917, Dr. Stillman joined the Medical Corps of the United States Army and during the next two years held successively the commissions of First Lieutenant, Captain and Major. Quiet in his demeanor, sparing of words and at times even reticent, he never sought popularity or honors. To those who knew him best, he was a delightful companion. By his fellow workers in the Central Laboratories and in the affairs of the Center his wisdom, equanimity, tolerance and kindness were revered. His loss will be felt by all who have studied at the New York Hospital-Cornell Medical Center.

David P. Barr

Harry Theodore Stinson, Jr.

October 26, 1926 — January 30, 2008

During his 36 years on the Cornell Faculty, Professor Harry T. Stinson had a lasting impact on the Biological Sciences at Cornell in the roles of teacher, department chair, and Associate Director of the Division of Biological Sciences. In the latter position, Harry was chiefly concerned with the Biology curriculum and advising of undergraduate students. Harry passed away on January 30, 2008, at the age of 81, ten years after retiring.

Harry attended the College of William and Mary and earned his Ph.D. degree in Botany from Indiana University in 1951. He established himself as a leading plant geneticist in positions at the College of William and Mary, and subsequently at the Connecticut Agricultural Experiment Station. Harry came to Cornell as a full Professor in 1962. At Cornell, Harry continued his research on the inheritance of traits in plants of the genus *Oenothera*, including fascinating examples of non-Mendelian inheritance of genes later shown to be in plastids. Harry also instituted an introductory undergraduate course in Genetics, a class that has evolved over the years and is still a central part of the Biology curriculum, leaving a lasting contribution.

With the founding of the Division of Biological Sciences in the mid 1960s, several new Genetics faculty were hired, and Harry became Chair of the newly formed Section of Genetics, Development, and Physiology. Harry continued, as Chair, after the unit became the Section of Botany, Genetics, and Development. He ended his service as Chair in 1980, just as the unit was split into the Section of Genetics and Development, and the Section of Plant Biology.

In 1978, Harry became the Acting Director of the Division of Biological Sciences, stepping into the breach left by the departure of Richard O'Brien. He served in this role until 1979 when Robert Barker arrived to become Division Director. At that point, Harry became Associate Director of the Division. Thus, from 1978-80, Harry simultaneously shouldered two major administrative responsibilities. He continued to serve as Associate Director of the Division until the Division structure was dissolved in 1999. Harry was highly regarded as a fair, effective administrator, and was particularly well known for his parsimoniousness in the husbanding of institutional financial resources.

In the position of Associate Director of the Division, Harry had a tremendous positive influence on the evolution of our undergraduate Biological Sciences major, at the time the largest major at Cornell. Harry participated actively in all aspects of the program, from the Curriculum Committee, which considered an endless stream of course proposals and petitions from undergraduate students, to overseeing faculty search committees, to serving

as faculty advisor to a very large number of undergraduate Biological Sciences majors, including all the transfer students. As the administration of Biology and Life Sciences grew more complex at Cornell, Harry was a source of information and wisdom about previous mistakes that did not need to be repeated.

This recitation of Harry's contributions to Cornell does not capture the humor, energy, and enthusiasm that he brought to all tasks at hand. Spirits tended to lift when Harry entered a conversation; there was usually laughter, and always the expression of strong opinions.

As he approached retirement, and continuing on well into his Emeritus years, Harry participated actively in The Cornell Tradition, an alumni-supported program that recognizes and rewards outstanding undergraduates. Starting in 1986, he again, became a classroom teacher, collaborating with Dr. Rita Calvo to present an extremely popular seminar course on Human Genetics and Society that was offered to senior students concentrating in Genetics and Development. In this class, in addition to learning about human genetics, students research, discuss, and write about controversial issues in human genetics and development. Thus Harry ended his service to Cornell as he had begun it, in the classroom teaching a cutting edge course in close contact with students.

In 2007, the Office of Undergraduate Biology, the lineal descendant of the office Harry directed for so many years, instituted an award to honor faculty members chosen by the graduating seniors. It is the Harry T. Stinson Award for Outstanding Service to Biology Students. The award was presented on May 27, 2007, for the first time before the assembled graduating students and their parents. All in attendance were graced by Harry's participation in the ceremony, and it was clear that Harry was delighted at his being honored in this fashion. Remembering Harry and his legacy of contributions to Biology at Cornell brings appreciation, warmth, and smiles to all who knew him and benefited from his efforts.

Thomas Fox, Chairperson; Rita Calvo, Ross MacIntyre, Rebecca Sparrow

Charles Rupert Stockard

February 27, 1879 — April 7, 1939

With the passing of Dr. Stockard on April 7 of the current year Anatomy has lost an inspiring leader, and our medical college one of the oldest and most distinguished members of its active faculty.

Dr. Stockard was born in Washington County, Mississippi, on February 27, 1879. The son of a physician, he showed in his early youth great enthusiasm in the field of Zoology, attested by numerous observations on the nesting habits of birds and a collection of eggs which he fondly kept until his death. He entered the Mississippi Agricultural and Mechanical College, receiving the degrees of bachelor of science in 1899 and master of science in 1901. During the Spanish-American War he was acting professor of Military Science at the above institution, and afterwards he held the same position in Jefferson Military College from 1901 to 1903.

In spite of this early experience, a military career had no appeal for young Stockard. His love of nature reasserted itself and he decided to become a zoologist, entering Columbia University, from which he received the Ph.D. degree in 1906. While at the Columbia department of Zoology he conducted investigations on various subjects, including Botany, and wrote articles on the natural history of the spoon-billed sturgeon—abundant in the lakes of the lower Mississippi area—and the nesting habits of birds in Mississippi. Under the direction of Professor Bashford Dean he studied the development of the thyroid, the lens of the eye, and the mouth and gills of the cyclostome fish *Bdellostoma stouti*. This early work on fish embryology determined the direction of subsequent studies; at the suggestion of Professor T. H. Morgan and following the trend initiated by the German experimental embryologists, particularly Herbst, Stockard undertook a series of important investigations on the influence of external factors on development, selecting the embryos of the minnow *Fundulus* as a favorable object. One of his first papers was on the development of *Fundulus* in solutions of lithium chloride, followed by a study of the artificial production of a single median cyclopean eye by means of sea water solutions of magnesium chloride, and later by an analysis of the influence of external factors, chemical and physical, on the development of the same fish. This work was carried out at the Marine Biological Laboratory at Woods Hole, Massachusetts, where Dr. Stockard spent most of his summers and where his absence will be deeply felt.

Dr. Stockard joined Cornell Medical College in 1906 as assistant in Embryology and Histology, and in 1908 he became instructor in Comparative Morphology. His inquiring mind found a stimulus in the teachings of Professor James Ewing and led to work on tissue growth and regeneration—mostly in the jelly-fish *Cassiopea*—which he

carried out at the marine laboratory of the Carnegie Institution at the Dry Tortugas, Florida. These investigations were aided by the Huntington fund for cancer research.

In 1909 he was appointed assistant professor of Embryology and Experimental Morphology. His attention was once more focussed on the problems of embryonic development and he returned to his early interest in the origin of the lens of the eye. Experiments on this subject had already been performed by several investigators who had destroyed the optic vesicles by mechanical means, but Stockard followed an entirely different approach and showed that certain chemical substances such as magnesium salts, alcohol, chloretone, and other anaesthetic agents generally inhibit the normal outgrowth of the optic vesicles. Under these conditions the lens originates from the ectoderm without any direct stimulus whatever from an optic vesicle. Continuing his work along these lines, he carried out experimental studies on the position of the optic anlage in *Amblystoma* (1913) and of the artificial production of eye abnormalities in the chick embryo (1914). From these investigations he concluded that specific defects are not specific responses to a given chemical substance, as advocated by Herbst, Hertwig, and himself in earlier papers. Congenital defects of the eye he regarded as an index of developmental deficiencies in the whole embryo, an idea expanded later (1923) in the course of experiments on the influence of alcohol on mammalian development.

Dr. Stockard was appointed professor of Anatomy in 1911. That year he went abroad and worked in the Zoological Station at Naples and in the Anatomical Institute at Munich, visiting the most important zoological and anatomical laboratories of the continent. He returned to Germany the following summer to marry Miss Mercedes Müller of Munich.

As a natural consequence of his findings on the effects of alcohol and other narcotics on development, Dr. Stockard attacked the problem of the influence of alcohol on the germ cells and development of embryos in mammals, and the first contribution on this topic appeared 1912. He devised methods whereby guinea pigs were made to inhale alcohol fumes for variable periods, and the effects on the offspring were carefully noted. As often happens in scientific research, one problem led to another which was apparently unrelated but the solution of which was indispensable for the successful continuation of the work. One of these problems arose in the course of the experiments with alcohol when it was realized that the available data on ovulation of the guinea pig were inadequate and often misleading. With the collaboration of Dr. G. N. Papanicolaou, Dr. Stockard undertook a daily examination of the vagina of guinea pigs, preparing smears of the contents which were found to vary according to the stage of the sexual cycle. In this way the existence of a typical oestrous cycle for this animal was firmly established. The influence of this discovery on anatomical research in this country was widespread, judging from the large number

of studies on the same subject in diverse animals which followed. It also led to a painstaking study of the human sexual cycle by Dr. Papanicolaou, published in 1933.

The experiments on the influence of alcohol on the mammalian germ cells did not fill Dr. Stockard's mind to the point of displacing other interests, and once more he returned to the field of experimental Embryology. But this time he was concerned with the origin of the vascular endothelium and the blood cells. The exponents of the monophyletic theory on the origin of blood had been scoring heavily, it seemed, and claimed to have demonstrated that the different types of blood corpuscles spring from a common stem cell. Dr. Stockard sought light on this important problem in a study of blood development in *Fundulus*, but he did not limit himself to observations on normal embryos. He found that treatment of eggs at the two-celled stage with weak solutions of alcohol in sea water neither arrests the formation of the blood nor interferes with the development of the heart, but that the latter is often closed at its posterior end and that this prevents the free circulation of the blood. Nevertheless, the heart which does not contain blood may be fully developed and have a normal endothelial lining. Undoubtedly, the latter does not arise from a cell capable also of producing blood elements. Furthermore, these studies also showed that the origins of the white and red blood corpuscles, respectively, are distinct and that these two different types of cells cannot be considered to have a common origin except in so far as both arise from mesenchyme cells. The latter, however, also give rise to pigmented cells (chromatophores).

The work on the influence of alcohol on the germ cells and development lasted for a period of over thirteen years, with more than one hundred guinea pigs treated from a few months to six years, and records available from over 5,000 animals in the several generations. It aroused immediate interest not only in the medical profession but also among the laity. This was due in large measure to the adoption of the Eighteenth Amendment. Reports on these experiments—with the collaboration of Dr. Papanicolaou—appeared in various publications. While admitting that alcohol exerts a deleterious influence on the individual and causes defects and even the death of some of the offspring *in utero*, Dr. Stockard concluded that “when we consider the welfare of the race or stock rather than that of the individual, it is found that the descendants of those groups of animals which suffered the highest mortalities and thus withstood the most rigorous elimination are superior in quality to the descendants of the groups less severely affected. This individual selection furnishes a great advantage to the later generations.” Similar thoughts were expressed later by him (1924) to the discomfort of those who have cherished the idea that alcohol, even when used in moderation, spells the doom of our race.

Aside from their social implications, the alcohol experiments furnished proof that the germ cells themselves may be adversely affected because males that inhaled alcohol fumes gave rise to defective offspring although mated with vigorous untreated females. The effect of this injury of the germ cells is not only shown by the immediate offspring of alcoholized animals but is conveyed through their descendants for several generations.

In breeding such a large number of guinea pigs Dr. Stockard noticed the presence of an extra toe in some of the animals, which he regarded as the atavistic reappearance of a digit lost in the course of evolution. These observations furnished the basis for an interpretation of a similar reappearance of the great toe in the hind limbs of certain dog breeds, and it was found that when the latter are crossed with breeds which lack the great toe, its development in the first generation of hybrids seems to be inherited as a single-factor Mendelian dominant. An interpretation of true polydactyly in the human was also advanced on the basis of the findings in the guinea pig and dog.

The problem of the origin of identical twins in humans and other mammals is also a subject which had engaged Dr. Stockard's attention since his early experiments in the influence of the external factors on development. In 1921 he published an extensive article entitled "Developmental rate and structural expression: An experimental study of twins, 'double monsters' and single deformities, and the interaction among embryonic organs during their origin and development" which shed considerable light on the fundamental processes involved.

The idea that constitutional differences in humans may depend upon definite hereditary patterns of the endocrine complex of the individual held a preeminent place in Dr. Stockard's mind during the latter half of his fruitful career. His early views on this subject were largely speculative, but he was a man of great mental resourcefulness and he was determined to test their validity in the same experimental fashion that he had applied to his studies on development. The existence of wide dissimilarities in the modern breeds of dogs led him to select this animal for the experiments, especially since certain extreme human types are duplicated in the dog. With the aid of the Rockefeller Foundation he acquired a farm in Westchester County and began to assemble dogs of various breeds. At the beginning the experiment was beset with unforeseen difficulties. To raise dogs in the pure air of the country with enough space to roam about sounds like an easy matter. But even under these ideal conditions confinement in adjoining, though spacious, runs, on the one hand, and the susceptibility of some of the breeds to disease, on the other, led to problems which had little to do with the aim of the investigation. Distemper, parasitic worms, mange, and unsuspected dietary deficiencies were some of the obstacles that had to be surmounted. Dr. Stockard, however, was not a man who could be easily defeated and he immediately began to cast about for remedies and

when none existed he applied himself to discover them. This accounts for his brief excursions into the realm of veterinary medicine, especially his contributions to the treatment of distemper (translated into Norwegian by O. L. Mohr) and the transmission of immunity to this disease. Within a few years the problems of disease and diet in the dog colony had been conquered. Considering that at times there were nearly 400 dogs in adjoining kennels and with an almost negligible mortality this was no mean achievement.

An experiment of the scope of Dr. Stockard's, involving crosses between different breeds; rearing of young with pronounced disharmonies in some cases; studies on the inheritance of morphological characteristics; observations on behavior and instincts; and histological examinations of the endocrine glands, requires considerable time and patience. In the course of the last twelve years a wealth of data had been slowly accumulating. Some of the results have already been reported in various publications. At his death Dr. Stockard left an extensive manuscript covering the diverse aspects of his work. It is expected that it will be published in the near future. Had he been granted a few more years of life he could have experienced the satisfaction of having accomplished a task with the thoroughness which was so characteristic of his scientific undertakings.

Besides being a leader in scientific research Dr. Stockard was a born teacher. He had the gift of clarity and the ability to impart knowledge. He was always popular as a lecturer because he could simplify the abstruse and digest it for his hearers. Among the many lectures that he gave the following deserve special mention: Harvey Lecture, 1921; DeLamar Lectures, Johns Hopkins, 1925; Harrington Lectures, University of Buffalo, 1926; Beaumont Foundation, Detroit, 1927; Lane Lectures, Stanford University, 1930; Potter Memorial Lecture, Jefferson Medical College, Philadelphia, 1934; and the Joseph Collins Lectures at the Academy of Medicine, New York, 1937. The subject of the Lane Lectures was expanded into a volume under the title *The Physical Basis of Personality* (New York, W. W. Norton, 1931), translated into German as *Die Körperliche Grundlage der Persönlichkeit* (Jena, G. Fischer, 1932). He contributed chapters to several books. His remarkable capacity for work made it possible for him to attend to numerous duties not related directly to teaching and research. He was at one time secretary-treasurer of the American Association of Anatomists, managing editor of the *American Journal of Anatomy*, coeditor of the *Journal of Experimental Zoology* and the *American Anatomical Memoirs*, trustee of the Marine Biological Laboratory, Woods Hole, Massachusetts, the Long Island Biological Association and the Bermuda Biological Station, and for a number of years member and then president of the board of scientific directors of the Rockefeller Institute for Medical Research, a position which he occupied at the time of his death.

During a visit to Germany in 1922 he received the M.D. degree from the University of Würzburg. Previously, in 1920, the University of Cincinnati had conferred on him the degree of doctor of science. He was president of the American Association of Anatomists (1928-30) and the American Society of Zoologists (1925), section vice-president of the American Association for the Advancement of Science; member of the Harvey Society (honorary), the American Philosophical Society, the National Academy of Sciences, the New York Academy of Medicine and the Institut International d'Embryologie of Utrecht, Holland, and others.

The friendliness of his manner, his keen sense of humor, and his frankness were duly appreciated by those who were associated with him. His influence on research in his own department is attested by the seventeen volumes of collected studies issued since 1910. Yet he did not believe in research as a duty. He preferred to speak of it as an "opportunity." This wholesome point of view explains his own attainments as an investigator, because only love of research for its own sake can lend the patience and courage required to overcome difficulties and bring the task to a successful termination. A man of his scientific stature can be substituted but not replaced.

William Alonzo Stocking, Jr.

Professor of Dairy Husbandry

May 13, 1872 — February 3, 1926

The Trustees and Faculty deeply deplore the death of Professor William Alonzo Stocking, Jr., who died on February 3, 1926, after a long and painful illness. Born in Connecticut on May 13, 1872, he was graduated from the Agricultural College of his native state in 1895. Entering Cornell for further work, he was graduated B.S.A. with the class of 1898. After spending the next four years as Assistant Professor of Dairy Bacteriology at his Connecticut Alma Mater, he returned to Cornell to study for the advanced degree of M.S.A., which he received in 1904. Then began his useful and distinguished career of more than twenty years at Cornell as a teacher of dairy bacteriology, a subject which he developed from modest beginnings to a position of great importance. Becoming an instructor in 1904, he was advanced to an assistant professorship in 1906 and in 1909 was made a full professor and head of the Dairy Department. In a state in which the dairy industry has a large place, he was thus charged with great educational and administrative responsibility. He did his work with unvarying efficiency, patience, and tact. He took an active and significant part in the organizations of dairymen in the state and the nation, serving as President of the American Dairy Science Association from 1916 to 1918 and of the New York State Dairymen's Association from 1922 to 1924. In 1924 he represented the University and the United States Department of Agriculture at the International Dairy Exposition at Milan, and traveled in various European countries studying the problems of the dairyman.

As acting Dean of the College of Agriculture in 1913-14 he held the confidence and respect of the Faculty, the students, and the agricultural interests of the State.

He had the scholar's passion for learning, and in 1913 resigned the headship of his department in order to be relieved of administrative duties and devote himself exclusively to teaching and research.

A man of simple and refined tastes, he loved the open, and was never happier than when close to nature at his summer home in the Adirondack Mountains. Yet he was no recluse, and for his large humanity was honored and beloved by those with whom he came into close contact, in the classroom, in his Faculty relationships, in the church, and as a citizen. In all the walks of life which he trod, he gave of his best without stint; and his works do follow him. The pupils whom he taught and we, his colleagues, shall treasure the memory of his kindly and beneficent personality.

Esther Harriette Stocks

January 21, 1902 — September 3, 1988

Born in Lowell, Massachusetts, daughter of the late Harry and Etta (Ramsdell) Stocks, Esther Stocks grew up in a family rich in the history, culture and traditions of New England. Esther was a firm believer in the tenet, "Learning is for all of life." She received both bachelor's and master's degrees from Smith College. She did further graduate work at Harvard, the Merrill Palmer Institute, the University of Minnesota, and Simmons College. In 1938, she left Detroit city life for the beauty of rural New York State and joined the faculty of the New York State College of Home Economics at Cornell University as instructor and college secretary. As the college grew, so did Esther's responsibilities. She became placement secretary in 1947 and director of placement in 1953. Even in the busiest professional years, she continued to attend seminars and audit graduate courses on campus.

As director of placement, she was endlessly patient with undergraduate and graduate students who tended to give higher priority to the place where they wanted to live rather than the particular job opportunity for which they were best qualified. Never imposing her own ideas, she usually was able to guide the students through friendly discussion and a realistic approach.

Esther had many friends among the college's alumnae. For many years she represented the college at meetings of alumnae officers, editing and contributing to the Alumnae Association Newsletter. She was named an honorary member of the College Alumnae Association some years before all college faculty were invited to become members. The Esther Stocks Loan and Fellowship Fund was established as a result of one alumna friendship. First awarded in 1978-79, the proceeds help graduate students who enroll in courses in human development and family studies.

As a counsellor to foreign students, Esther demonstrated unusual ability to empathize and "walk in another's shoes." Friendships were formed which extended over many years and later motivated many of her visits abroad. Meticulous and thoughtful, it was her practice to arrange interviews between new foreign students and the faculty advisers selected to assist the students with their academic development. Her interest and support were unflinching throughout the student's life on campus. However, she could be very firm with the recalcitrant student, admonishing her to "do the next thing; do it NOW."

A special talent enjoyed by both students and colleagues was Esther's skill in flower arrangement. Every year a true sign of spring would be her beautiful arrangements of forsythia and pussy willows adorning the main foyer and lounge of the college. At any season of the year, she might return from a country outing with the materials for a

handsome arrangement. She had a fund of information about the plants, wild life, and history of the area, and she was generous in sharing her knowledge with her walking companions.

Esther was named assistant professor in 1942 and associate professor in 1947. She was a member of the American Association of College Personnel and of the American and New York State Home Economics Associations. Upon her retirement in 1964, she was appointed professor of home economics emeritus by the Board of Trustees of Cornell University.

After retirement, Esther was invited to write a history of the college to accompany and update the history of the college's growth from 1900 to 1940, written by Flora Rose. The ensuing publication, *A Growing College: Home Economics at Cornell University*, encompassed 65 years and was issued in 1969, the year that the name of the college was changed from Home Economics to Human Ecology. *A Growing College* is a constant source of reference for people interested in Cornell and higher education during the first seven decades of the century.

Through most of her life, Esther maintained a lively correspondence with colleagues from many parts of the university. Creative in her choice of words, sensitive to beauty, and fun-loving, her letters reflected these qualities to a remarkable degree, and were treasured by those who received them. Equally, she was an asset in a social group, fascinating her listeners with anecdotes and stories, many of them derived from her life in New England.

A resident of Lowell, Massachusetts, for 15 years, Esther spent many summers at Rockport, Massachusetts, in a house overlooking the ocean where she entertained many friends. She was a member of the Smith College Club, the American Association of University Women, and the Fortnightly Club, a group devoted to literary expression.

Music was vital to Esther. She attended concerts at the university regularly, enjoyed piano duets and recorder sessions with musical companions, and sang in a church choir. After returning to Massachusetts, she continued to attend concerts, to sing in her church choir, and to play in a recorder group. She assisted her pastor by playing the piano at services held in local area nursing homes.

Esther's relationships with her family, as with her friends, were characterized by love, pride in their accomplishments, and confidence in the ability of each to live fully and well.

She is survived by a niece, Ruth R. Proctor of Westford, Massachusetts; a nephew, Richard Proctor of Lowell; two grandnephews; three great-grandnephews; and a great-grandniece.

Alice Davey, Kathleen Rhodes, Mary Wood

Vladimir L. Stoikov

December 25, 1929 — August 2, 1976

On this occasion, the characterization of a death as untimely is more than a ritualistic acknowledgment of the inevitable. At the age of forty-seven, the prospects before Vladimir Stoikov appeared exceptionally bright. His recent marriage to Gabrielle, a charming and talented woman, was providing strong support in his professional role as well as meeting his emotional and affective needs. An infant son, Sasha, was opening new perspectives and relationships for an adoring father. Painting and sketching were developing a heretofore latent talent, from which Vladimir derived great satisfaction. His scholarly reputation and competence in the field of labor economics, already assured, was continuing to grow.

Vladimir was born in Sofia, Bulgaria, and received his early education there and in Switzerland. All of his higher education, however, took place in the United States. In 1953 he received the B.S. degree, with honors, in the field of chemical engineering from the University of Illinois, and was admitted to honorary societies in both chemistry and engineering. Although these fields of study were to influence his early interests as an economist, they didn't hold him very long. In 1956 the University of Wisconsin awarded him the M.S. degree in economics, and in 1960 he received the Ph.D. in economics from The Johns Hopkins University. A succession of research and teaching assignments followed: Smith College, Princeton University, Wesleyan University, Queens College of the City University of New York, and the University of Illinois.

Vladimir's first appointment at Cornell was in 1968 as visiting professor on leave from his post at the Institute of Labor and Industrial Relations, University of Illinois. A permanent appointment to the rank of associate professor in the School of Industrial and Labor Relations followed, beginning in 1969. Because of his special interest in the economics of education and applications of human capital theory, he served as a joint member of the Department of Labor Economics and Income Security and of the Department of Manpower Studies.

As both teacher and scholar, Vladimir's reach was wide and varied. His scholarly output almost invariably appeared in leading journals in the fields of general economics and industrial relations, and his teaching spanned major segments of both theoretical and applied economics. Vladimir also had a strong interest in programmatic and policy research. At various times this interest led him to serve as consultant to such agencies as the International Labour Organization and the Organization for Economic Cooperation and Development. At his death he was on

leave as a visiting fellow at the International Institute of Management in West Berlin, assisting in the development and strengthening of its program of labor market studies.

Vladimir Stoikov combined a strong and disciplined intellect with an urbane and cultured personal life style. He left a gap in our ranks that will be exceptionally difficult, if not impossible, to fill.

Robert L. Aronson, M. Gardner Clark, Walter Galenson

Earl L. Stone, Jr.

July 12, 1915 — July 23, 2007

Earl L. Stone, Jr., Charles Lathrop Pack Professor of Forest Soils, spent a productive 31-year career at Cornell during which he pursued interests in soil science, forestry, ecology, tree nutrition and physiology, natural history, and land use history. After retiring from Cornell, he spent 23 productive years at the University of Florida. Earl died at age 92 at home in Gainesville, Florida

Earl Stone was born in Phoenix, New York and received his B.S. degree in Forestry from the New York State College of Forestry at Syracuse in 1938. He received an M.S. degree in Soil Science from the University of Wisconsin in 1940 and his Ph.D. degree in Soil Science from Cornell in 1948. He served with the 8th Photographic Reconnaissance Squadron, 5th Air Force in the Pacific, in World War II (1942-45). From 1958-60, he was Visiting Associate Professor at the College of Forestry, University of Philippines.

As a scholar, Stone had the unusual ability to design studies that were based on deep empirical knowledge of soils and plants, pertinent to theory, and clever in exploiting opportunities presented by nature (e.g., natural experiments). A good example is the study that grew from Stone's realization that fertilized pine plantations could be used to address a fundamental issue in the cycling of nutrient elements in forests. This study hinged on the distinctive chemical signature of rubidium in potassium fertilizers, as opposed to native soils, and allowed him to determine that the vast majority of the potassium of fertilizer origin was still present in the trees and the soil 40 years after the fertilizer had been applied. This result indicated a surprising ability of the ecosystem to retain an important nutrient element in the face of high leaching potential (water soluble nutrient on a deep sandy soil). A second example relates to a recurrent theme in Stone's work: documenting the persistent effects of people on soils. Stone suspected that careful sampling of soil nutrients around old houses or barnyards would reveal "hotspots" for elements such as phosphorus long after the inputs ceased. He showed such enrichment of the soil even 50-75 years after farm animals last contributed manure to the sites, thus anticipating more recent studies documenting such legacies of Roman agriculture in parts of Europe. In the same vein, he suspected soil amendments associated with Native American maize cultivation as the cause of high soil phosphorus contents in some local forests near Cayuga Lake but was never able to provide conclusive corroborating evidence.

We mention one more study as an example of the breadth and depth of Stone's scholarship. He observed in the field that fairy rings were sometimes recognizable in the growth of ground pines (*Lycopodium*) here in New York,

and that other plants were noticeably more vigorous in some rings compared to others. Stone and colleagues documented higher nitrogen content in the rings with the more vigorous growth. Finally, the study was taken to the molecular level by describing the enzyme, produced by the roots of the ground pines, responsible for making more nitrogen available to plants in the zone of greater growth. This study could have been based on observations in nature alone, or it could have also included the documentation of greater plant growth in some rings, but under Stone's guidance it went further and included the detailed molecular mechanisms.

Earl Stone was a keen observer in the field. His abilities to see both obscure details and broad relationships of soils and species in a forest—and through these to interpret the history of that forest—were legendary. An Earl Stone field trip was guaranteed to be fascinating, informative, and a jaw-dropping experience based on how much complexity and nuance he could marshal at a field site using experience, his eyes, a shovel, and perhaps a soil pH kit.

In his philosophical outlook, Stone could be the consummate “particularist,” seeing each forest stand as unique with its own history, its own mosaic of soils, and assemblage of plants. He was such a keen observer that he could see nature as a wealth of details and particular circumstances, and this quality made him impatient with generalizations that did not take account adequately of the variability of the real world. At the same time, Stone could look past much of the detail to offer important generalizations and syntheses. For example, he wrote papers proposing compelling and perceptive general frameworks for understanding forest management, site quality, nutrient cycling, and man's use of forest land. Earl Stone was hard to classify using conventional categories like “soil scientist” or “forest ecologist” because he made use of so many disciplines in his research and teaching.

Stone was a gifted writer; reading his scientific papers was a treat quite apart from their content. His facility with the language produced writing that was pithy, incisive, yet elegant. Stone was also a great storyteller and one of the funniest people we have known. In conversation, he would often quote an author (George Bernard Shaw was a favorite) usually to make a humorous point. He regularly used colorful language to get points across. One of us witnessed a graduate student committee meeting at which the student was running on and on in response to a question from Stone, who interrupted with: “I expect you to tell me the truth, and nothing but the truth, but not the WHOLE truth.” On other occasions, he would use the phrase “where the dog died” to indicate the importance of past chance events as explanations for spatial patterns that we see in forests today.

With his wonderful stories, great sense of humor, sharp intellect, generous personality, and vast knowledge of many scientific fields, Earl Stone was a stimulating and engaging colleague. A brother, John R. Stone and his children survive him: Dr. Jeanne Fox, Dr. Earl Stone III, and Dr. Nathan Stone.

John Lemuel Stone

Professor of Farm Practice

July 6, 1852 — March 8, 1933

John Lemuel Stone, Emeritus Professor of Farm Practice at Cornell University, was born at Waverly, Pennsylvania, July 6, 1852, and died at his home in Ithaca, New York, March 8, 1933, in his eighty-first year.

Professor Stone was reared on the ancestral farm and there spent the major portion of an active, useful life. The dominant motives of his life were his love of nature, his devotion to agriculture, and his concern for the welfare of his fellowmen. These qualities made him a successful farmer, an inspiring teacher, a faithful churchman, a good neighbor, and a respected citizen.

Professor Stone was a pioneer in agricultural education. He was graduated from Cornell University in, 1874 with the degree Bachelor in Agriculture, in the second class to receive that degree. For twenty-three years following graduation he was a good farmer and leading citizen. His advice was widely sought.

In 1897 he became one of the original agricultural extension workers and an important factor in the development of the college extension and farm bureau movements. He became Assistant Professor in 1903 and Professor of Farm Practice in 1907.

He contributed largely to the development of the Agricultural College farms. Much of the careful planning and allocation of lands best suited to the needs of the departments is due to his wide knowledge of land utilization. Although not directly responsible for research in agriculture, his scientific training and first-hand knowledge of farm management problems made him a valued adviser in the organization of crop-growing and livestock projects.

As a teacher, Professor Stone won the confidence and esteem of his students. This attitude found expression in the "Stone Club," the organization of the Winter Course students in Agriculture.

Many of the valued publications of the College are of his authorship. Among them is the bulletin on "Tables for Computing Rations," which has had the largest circulation of any Cornell agricultural publication.

In 1919, after twenty-two years of devoted service to the University and to the people of the State, Professor Stone was retired as Emeritus Professor. During the remaining years of his life he maintained an active interest in numerous public welfare agencies, to which he had always given generous support.

Stone Hall serves to perpetuate the name of one who because of his efficient service and loyal devotion to agriculture and to his Alma Mater is eminently worthy of the honor. His living memorial is the immeasurable influence which he exerted upon his colleagues, his students, his neighbors, and his farmer friends. Such influence is passed on from generation to generation. It is immortal.

Retired: 1919 (Fac. Rec. p. 1056)

Walter King Stone

March 2, 1875 — June 21, 1949

Walter King Stone, Associate Professor Emeritus of the Fine Arts, died in Ithaca on June 21, 1949. In his death Cornell University suffered the loss of one of her most loved faculty members.

Professor Stone had taught in the Department of the Fine Arts in the College of Architecture for twenty-three years, beginning in 1920, teaching many different courses in drawing, painting, and in the other graphic arts. He was unfailingly loved and respected by all his students, and by his fellows on the faculty who remember him not only for the soundness of the presentation of his subject but as much for the richness of his personality, his generosity, and sympathy, his kindly humor and for his tolerance.

Walter King Stone was born in Barnard, Monroe County, New York, on March 2, 1875, the son of William Talmage and Jenny Filer Stone. He was a descendant of Enos Stone, one of the first settlers of Rochester; his family had been intimately associated with the early history of that city. He attended the public schools of Rochester, received his formal training in art at Rochester's Mechanics' Institute and Athenaeum and then at Pratt Institute in Brooklyn.

Beginning in the early 1900's and until his coming to Cornell in 1920, he was active in the career of independent illustrator, painter and writer. In the first years of the century he won wide-spread recognition for his nature illustrations. His work appeared in Scribner's Magazine, in Century Magazine, in Colliers', Outing, Country Life in America, St. Nicholas, and in the Country Gentleman, as well as in various books. He brought to this work the happy combination of sensitive and imaginative artistry and an unlimited interest in nature and its wild life. His first sketches and studies of the world about him began in his boyhood when he and Charles Livingston Bull were intimate friends.

His favorite medium for his illustrations was flat water color wash combined with charcoal drawing. Later, and in general while at Cornell, he worked principally in oil paints. Two of his paintings are in the Rochester Memorial Museum. Mural paintings are in the homes of Clinton Fish, Rochester; Walter Pritchard Eaton, Sheffield, Massachusetts; Bristow Adams and Liberty Hyde Bailey of Ithaca.

His pictures are in many private collections. Books illustrated by him include the Log of the Sun by William Beebe; Barn Doors and Byways, Green Trails and Upland Pastures, and In Berkshire Fields by Walter Pritchard Eaton.

His intense interest in and love of his fellows led to a profound understanding of their outlooks, their mannerisms,

their codes of life. This, plus his natural instincts as a story teller led to a wide reputation as a humorist and raconteur. He was a member and one-time president of the Savage Club of Ithaca.

Many who cherish their memory of him first came to know him in his "Thursday Nights". Shortly after coming to Cornell he and his wife, Edith Adams Stone, instituted the custom of entertaining guests in their home on those nights. All were welcome, young and old, students or otherwise, strangers as well as friends. Much as the many guests contributed in humor or wisdom, those evenings will be remembered by a host of friends for Stoney's kindly humor which colored and penetrated all conversations.

His teaching method stemmed from his own interests and convictions. He taught not a particular way or means, but the fundamentals which underlie all drawing and composition. He encouraged initiative on the part of his students and drew out from them their own contributions of knowledge and personal reaction. He discovered and respected integrity in their individual approach. Both his students and his confreres recognized his inherent honesty and his devotion to his ideals. The students who sat in his classes came, not only from all departments of the College of Architecture, but from many different fields of interest; from the scientific departments, from liberal arts courses and from engineering. Because of this catholic appeal, his influence was felt widely in the University.

Walter King Stone served Cornell University as Acting Professor of Drawing beginning in 1920, as Assistant Professor beginning in 1922, as Associate Professor in 1942, and as Associate Professor Emeritus from 1943.

He was a member of the Unitarian Church, of Alpha Sigma Phi Fraternity and of the Salmagundi Club.

He is survived by his wife Edith Adams Stone and by his son Alan Stone, Cornell 1926.

His death at the age of seventy-four brings sorrow to all who knew him.

Bristow Adams, E. D. Montillon, K. L. Washburn

Robert P. Story

April 8, 1919 — March 12, 2002

Robert P. Story, 82 when he died at home, was born in Middletown Springs, Vermont. The son of Edgar Prescott Story and Harriet Dewey Prindle, he grew up on a small Vermont dairy farm. After graduating from Gloucester (MA) High School in 1936, he attended the Vermont State School of Agriculture and went on to the University of Vermont, graduating in 1943.

Dr. Story enlisted in the U.S. Army in May 1943 and served as First Lieutenant in the 8th Regiment of the 4th Division, which landed on Utah Beach on June 11, 1944, as part of the D-Day Invasion. He commanded a mortar platoon, serving as a forward observer, and was awarded the Silver Star, Bronze Star and Purple Heart.

After discharge, he resumed his education, earning a Master's degree in Agricultural Economics from the University of Vermont, where he became an Instructor in Farm Management and Farm Finance. In 1948, he began doctoral studies at Cornell University, earning a Ph.D. degree in 1952. There he spent the next 28 years, serving as Assistant Professor (1952-55), Associate Professor (1955-60) and Professor (1960-79) of Marketing in the Department of Agricultural Economics. He was named Professor Emeritus in 1980.

Dr. Story was the second faculty member to specialize in the department's 80-year commitment to programs in the area of dairy markets and policy, a specialization for which Cornell has an international reputation. He was especially appreciated and remembered for his work with New York and Northeastern milk marketing cooperatives. A trusted analyst and adviser, his advice was sought for business and policy decisions. A hallmark of his career was the respect he earned by being extremely knowledgeable about the industry and its complex regulatory policies and the respect he demanded in keeping academic objectivity about the merits of policy choices.

Highlights of his research included several projects on the consolidation of Federal Milk Marketing Orders in the Northeast and coordination of milk assembly and other marketing services. His testimony at regulatory hearings at the State and Federal level was routinely sought and always appreciated. His intimate knowledge of marketing institutions and milk pricing and keen analytical insights gained him recognition in identifying current and future problems and solutions. He was routinely called upon to collect, analyze and present data on milk pricing programs. He achieved a unique position of respect, trust, and confidence that permitted him to work effectively across groups and with regulators as well as those regulated.

He served on numerous industry and public committees at state, regional and national levels, including the hallmark Rockefeller Commission in the 1960s. However, he was noted for shunning the limelight and preferred to work “behind the scenes” in a way that facilitated his ability to work with a broad group of players.

Although spending much of his time working with industry and governmental leaders, Dr. Story never missed an opportunity to meet with producers, listen to their concerns and provide or seek answers to their questions. Early in his career he worked closely with Cornell Cooperative Extension agents to establish milk marketing study groups and participated in and helped develop educational meetings for producers and cooperatives. Shortly before his retirement, the New York State Association of County Agents recognized him for his long-standing and excellent support of extension programs.

Dr. Story brought the same intensity and commitment to his teaching. He viewed education about the industry he loved, the subjects of whom he was a master, and the people he served as a life-long learning commitment, starting with the future agricultural leaders who were his students. Many in the industry regarded him as a mentor, and indeed a couple of generations of young faculty viewed him as such also. A quiet man, he was noted not for his flashy style but rather for his deep understanding of his subject, commitment to rigorous analysis, unmistakable commitment to his students, and unflagging high standards. Many regarded him as the quintessential Vermonter, unflinching in his honesty, completely reliable, possessed of uncommon common sense, and stoic to a fault.

Never one to let much grass grow under his feet, he either plowed it up in his 3-acre garden or wore it out while he and his wife, Ruth, raised their six children. He was an avid golfer a legendary fisherman, and tireless sports fan.

Robert is survived by his wife of 58 years, Ruth Arms Miller; his six children: Susan Porter (Roy), of Farmington, Connecticut; Sara Geld (Kenneth), of Sao Paulo, Brazil; Christine Hogan (Patrick), of LaGrange Park, Illinois; Prescott (Kathleen), of Weston, Connecticut; Robert, Jr. (Carol), of Ashland, Massachusetts; and David (Elizabeth), of Northbrook, Illinois; and fourteen grandchildren. A brother Edgar Prescott Story (Betty), of Gainesville, Virginia, and his family also survive him.

Richard Aplin, Walter Wasserman, Andrew Novakovic

Evelyn E. Stout

March 29, 1908 — November 6, 1991

Evelyn E. Stout was on the faculty of the New York State College of Human Ecology, Cornell University, from 1953 until her retirement in 1973. At the time of her retirement, she was the Acting Chairman of the Department of Design and Environmental Analysis. With the department reorganization in 1975, her status as Professor Emerita was in the Department of Textiles and Apparel.

Before coming to Cornell, she taught chemistry, physics, and home economics in high schools and junior colleges. She then taught textiles and clothing at Washington State College, and at Louisiana State University. At Cornell, Professor Stout was involved in numerous textile research projects, and was active in training graduate students. She published many articles on textiles and related subjects including a popular college text, *Introduction to Textiles*. With three editions, this book became one of the publisher's best sellers, and was reprinted for use in India.

Professor Stout received her doctorate from the University of Illinois in 1953. Her B.S. and M.S. degrees were from Kansas State University. She was a member of the American Association of Textile Chemists and Colorists, the American Home Economics Association, and the College Professors of Textiles and Clothing; also Omicron Nu, Sigma Delta Pi and Phi Kappa Phi honoraries. She served as president of the Cornell Chapter of Phi Kappa Phi.

Evelyn Stout was an active member of the Ithaca community, where she resided until her return to her native Kansas in 1989. She was an active member of St. Paul's United Methodist Church where she sang in the choir. She also took responsibility for the choir robes spending many hours each year mending, cleaning and replacing where necessary. An extraordinary accomplishment was the church chancel drapery. She not only selected the color and fabric, but did the cutting and sewing for this enormous textile, saving the church a major expense.

For a number of years, she was a medical aide in the Tompkins County Civil Defense organization. She was a member of the Tompkins Community Hospital Auxiliary, and for several years, served on the board. She was a dedicated volunteer at the hospital spending many hours at the front desk greeting and directing visitors and training other volunteers. She also was an active volunteer with Friends of the Library, serving one year as chairman of the annual book sale.

In retirement she used her knowledge and organizational skills for the benefit of church, community and family. Although living far from her family, they were much on her mind. She provided financial support for the education of nieces and nephews, encouraged family reunions and worked on the family genealogy.

Evelyn Stout enjoyed travel. In addition to her trips to many parts of the U.S. and Canada, she visited Egypt. She was also fond of classical music, opera and ballet and was an avid bridge player. She was a loyal colleague, friendly mentor to students and young faculty and a devoted friend to many. She will be remembered as a person of integrity who took life and her profession very seriously.

At Cornell, a graduate fellowship was established in her name in 1983. Major contributions were from her former graduate students, many of whom she had financially supported as an anonymous donor. The first recipient of the Evelyn E. Stout fellowship received her Ph.D. in fiber science in 1991.

S. Kay Obendorf, Hazel Reed, Nancy Saltford

Phyllis E. Stout

December 16, 1922 — June 1, 2006

Professor Emeritus Phyllis E. Stout invested her professional and personal life in the development of others—particularly young people. She worked at George Jr. Republic School for six years following her graduation from the College of Home Economics at Cornell in 1944. She received her M.S. degree from the University of Wisconsin. She excelled in her 4-H Youth Development work with Cornell Cooperative Extension for over 32 years. A member of the 4-H staff at Cornell, she was the liaison with youth program areas in the College of Human Ecology. Phyllis also served as the CCE Director's representative to county CCE Boards of Directors. She was committed to having new staff in counties prepared to meet the challenges of their work with youth, providing sound orientation and ongoing support to them. Phyllis also developed extensive educational materials for 4-H volunteers to enable them to share their talents and achieve the goals of the 4-H programs. In special assignments, she often provided leadership for CCE 4-H participation in the National 4-H Congress, Capital Days, NYS Fair, and NYS 4-H Club Congress. She was influential in defining the future of the 4-H Youth Development program across New York State. Phyllis was an active member of the National Association of 4-H Extension Agents.

Phyllis believed that ordinary people can do extraordinary work in their local communities. And she invested much time and effort herself in community building, particularly in her retirement. She served on the Hangar Theater Board of Directors 1985-95 and the Tompkins County Cooperative Extension Family and Consumer Advisory Committee 1988-93, and the Board of Directors 1989-91. While she lived at Longview, she was a member of the Independent Residents Council in 2001-2002 helping to identify problems and solutions for the operation of the new facility. As a Longview resident, she attended classes at Ithaca College and for several years was interviewed by Ithaca College students for their class projects.

Phyllis loved sports. She attended Cornell football games for decades. Lake Placid figure skating practices and performances were special for her, and she loved to play golf. When she could no longer play the golf greens herself, she continued to express her love of the game by sponsoring a green for the annual Cornell 4-H Open Golf Tournament.

Over several years, Phyllis gradually lost her eyesight. She fought this in many ways—seeking the best medical care traveling by bus to and from Rochester, using magnifying equipment with her computer, organizing her living

space at Longview, accessing books on tape and CDs. She used the Gadabout Service to travel to appointments. Though finally legally blind, she continued to volunteer as a way of coping with her difficulties and to be an example to others with handicaps so that they might also decide to volunteer. In recognition of this, the Tompkins County Office for the Aging selected Phyllis as the recipient of the “Outstanding Contribution by a Senior Citizen” Award in 2004.

Phyllis infected others with her curiosity to learn and her love of travel. One of her favorite New York State sites was Lake Placid, particularly for its simplicity in the beauty of nature. She was a strong resource for her siblings, many nieces and nephews, great nieces and great nephews, and friends. She was always ready to help a friend by listening and, if asked, offering advice.

Though Phyllis respected the past, and liked the “tried and true,” she was always interested in current Cornell Cooperative Extension programs while she continued to look to the future.

Ann Mathews, George Preston, Harold Sweet, Jane McGonigal

Everett M. Strong

January 23, 1900 — September 23, 1988

Everett Milton Strong was born on January 23, 1900, in Portland, Maine. After prep school work at Yarmouth Academy, he attended the Massachusetts Institute of Technology and graduated with a Bachelor of Science degree in electrical engineering in 1922. After graduation he was employed by the General Electric Company at their National Lamp Works in Cleveland, Ohio, as an illumination engineer until September 1924, when he became an instructor in electrical engineering at Cornell. He became an assistant professor in 1929, an associate professor in 1941, and a professor in 1944. He was appointed professor emeritus upon his retirement on June 30, 1967.

From his first appointment Everett was concerned with the teaching of electrical fundamentals to beginning students. He soon found that no existing tests were suitable for what he wanted to teach in the way that he wanted to teach it, and he therefore began the production of a mimeographed text. After a number of revisions, incorporating the ideas of his students and his colleagues, the work resulted in the text *Electrical Engineering—Basic Analysis*, published by John Wiley in 1943.

Everett was an excellent teacher who was well remembered by returning alumni long after his retirement. They remembered that his problems were engineering oriented and relied on a knowledge of the basic sciences studied before his course. They felt that his teaching gave them excellent preparation for the courses to follow. They also remembered his sense of humor and his use of the pun—he was a master punster who would spring one at any opportunity.

Everett's research was concerned with illumination, and he was a consultant on this subject for a number of companies and individuals. His expertise was recognized when he was elected national president of the Illuminating Engineering Society for 1952-53. He received the Gold Medal of that society in 1966 and its Distinguished Service Medal in 1967. He was a contributing member of many Illuminating Engineering Society technical committees, as well as those of the American Institute of Electrical Engineers, and was honored as a Fellow in both organizations. He was an early member of the American Society for Engineering Education and was chairman of its Electrical Engineering Division in 1951.

Everett demonstrated his administrative abilities in 1943-45 when, upon the resignation of Director Lewis, he was appointed chairman of a three-man committee consisting of himself and Professors Ballard and Burckmyer to

be interim caretakers of the school. A number of his colleagues thought he should be appointed to the director's position, but the administration had other ideas. In the light of what he did for the school subsequently, it was probably just as well.

In 1947 Everett started an Engineering Cooperative Program that was unlike any existing at that time and which he headed until his retirement in 1967. In other co-op programs students spent alternating periods in industry and in school, the purpose of the industry periods being to earn money for the school periods, that is, the industry periods were not related to the students' education in any other way. The industry periods were in companies in the same general area as the school, and often each period was the same as the preceding.

In Everett's program the student spent three periods in industry—a summer, fall, and spring, but not consecutively—and went to school the remainder of the time, graduating at the normal time. (Cornell was on the five-year plan when the program was started.) In the beginning, students from electrical engineering and mechanical engineering were in the program,

Many aspects of his program were unusual, and the whole idea received much attention from educational colleagues in other universities and colleges. However, Everett had to work hard and long for 20 years to make the program the success it was.

First, the students were selected for the program by the industrial sponsors they were going to work for—after an interviewing process similar to that which they would undergo when applying for a job after graduation. Everett had to work out the interviewing arrangements.

Just getting the sponsors took a lot of time and effort. They had to be sought out by Everett and convinced that they should participate. The nature of their participation was primarily financial—they were to contribute to the student's tuition, his salary while working for them, and to the school and college for the faculty salaries during the two summer school terms that were a part of the program. However, they also had to work out industrial assignments that would develop the student's abilities progressively through the three industrial periods (an important feature of the program).

Second, Everett had to convince reluctant faculty that they should work on the programs in those two summers. Even though they were to be paid at better than their normal rate, they weren't inclined to give up their summers. Younger faculty members resisted because they couldn't see getting any stars in their crown when it came to promotion time.

Third, as part of the program, Everett visited every student to make certain the student was getting the education that was the purpose of the program. This entailed considerable travel since students were scattered throughout the Northeast. It was said that Everett knew all of the airline schedules for that area by heart, and that if you were at the local airport when the last flight came, in the odds were very good that Everett would be on it.

Everett did all he did for a long time supposedly on a half-time assignment—he continued to teach the basic course and supervise the staff assigned to it. He also did all he did because of his loyalty to Cornell. On this assignment he was certainly overworked and underpaid—but it was something he undertook himself—and Cornell benefited.

Along the way Everett was inducted into the honoraries Tau Beta Pi, Eta Kappa Nu, and Sigma Xi. He was a licensed professional engineer, and his name is included in *The American Men of Science*, *Who's Who in America*, and the *World Biography*.

Everett's recreation, like his close friend and contemporary Burckmyer's, was his boat. His was a cabin cruiser, appropriately named the Seabattic, while Burck's was a sailboat. They often good-naturedly argued the merits of each.

Everett was very active in the Ithaca Yacht Club and at one time was its Commodore. He also was Commander of the Coast Guard Auxiliary and the Power Squadron and taught courses in piloting and navigation for both organizations. Related to his experience in yachting and his technical background was his appointment as the U.S. delegate to the Hague International Conference on Maritime VHF Radio Telephony in January, 1957.

Everett was a loyal parishioner of the First Congregational Church and was a contributing member in ways other than financial—ranging from firing the furnace on a cold Sunday morning to installing an individual hearing-aid- type sound system for the hearing impaired.

Everett was survived by his wife of 62 years, Ella Sheffield Strong, who died on April 30, 1989. They are survived by sons Robert Strong of El Toro, California, and Walter Strong of New Orleans, Louisiana; a daughter, Ruth Ann Johnson of Bowdoinham, Maine; thirteen grandchildren; and ten great-grandchildren.

Paul D. Ankrum, Robert E. Osborn, William H. Erickson

William Strunk, Jr.

July 1, 1869 — September 26, 1946

William Strunk, Jr., was born in Cincinnati on July 1, 1869, the son of William and Ella Garretson Strunk. He took his A. B. at the University of Cincinnati in 1890, his Ph.D. at Cornell in 1896. He studied at the University of Paris, 1898-99. He married Olivia Emilie Locke in 1906; three children survive. He began his teaching career as instructor in mathematics at Rose Polytechnic Institute, Terre Haute, Indiana. In 1891 he came to Cornell, and here remained, in effect, for the rest of his life. Appointed Assistant Professor of English in 1899, he became Professor in 1909 and Professor Emeritus in 1937. He was the author of *Elements of Style* (1918), and *English Metres* (1923), and was the editor of various texts. The decoration of Officier d'Academie (France) was awarded him. In 1935-36 he was literary consultant in the screen production of *Romeo and Juliet*.

Attracted to the study of letters by his innate love of the word and of creative thought, he gave his life to the communication of beauty and wisdom. Disdaining specialization, he ranged over many fields of knowledge. He began as a teacher of mathematics; he was at home in the classic and foreign literatures and cultures. Though his scholarship was exact and extensive, though his effervescent curiosity led him into endless explorations of curious and knotty problems, he maintained in word and practice that the end of the literary scholar is not to solve problems but to lighten the environing darkness. His year in Hollywood was, in a way, a suitable crown for his career. In the supervision of an admirable motion picture, *Romeo and Juliet*, he helped to present his beloved Shakespeare to an audience of millions. He found the creative purpose of Hollywood a stimulation and a delight, there is evidence that Professor Strunk, typed as The Professor, was a stimulation and a delight to Hollywood.

A photograph in the office of the Department of English recalls Professor Strunk in a pose familiar to many generations of Cornellians. He sits in an easy chair, absorbed in a wide book opened on his knees. The book rests on another book, from which protrudes an array of marking slips. Beside him, on the desk, stands a pile of volumes, of the forbidding format reserved for scholarly works. He is verifying some obscure quotation; he is settling some quaint dispute proposed by a time-pinching colleague. He is happy in this pursuit of this bit of knowledge, trifling, perhaps, but he maintained with Dr. Johnson that no bit of knowledge is so trifling that he would rather know it than not know it. With such a habit of mind, he became a well of information, a mine of reference. He was, however, preserved from the dangers of omniscience by his unfailing sense of proportion, his deep humor, and his philosophy—in the old meaning of philosophy: the love of wisdom.

So formed and shaped, Professor Strunk was for a good half century on this campus an exemplar of the humane scholarly life. The benign quality of his mind showed forth in all his dealings. When his old students and his old companions gather, their talk is all of his kindness, his helpfulness as teacher and colleague, his boyish lack of envy and guile. And so his serene spirit lives on, in that of Cornellians of fifty years.

Morris Bishop, A. M. Drummond, F. C. Prescott

Frederick H. Stutz

December 26, 1912 — April 22, 1983

The death of Frederick H. Stutz, professor of history of education emeritus, closed a lifelong commitment to education and its role in developing and sustaining a democratic society.

Stutz grew up in Ithaca with a foot in the country, for the division between city and open country was abrupt then. An interest in Cornell University, which he entered in 1931, was fostered by his parents and teachers at Ithaca High School, in the 1920s primarily a preparatory school for Cornell. Stutz obtained a B.A. degree at Cornell in 1935 and an M.A. degree in 1937 with a concentration in American history. Jobs during the depression were hard to get, but at six feet two inches he looked as if he could handle discipline problems. He later learned that his stature had something to do with obtaining his first secondary school teaching post at Bainbridge in Chenango County.

When asked what he expected to accomplish in that job, he said, "I saw the power of civic instruction and the study of history as having an enormous potential for helping us to improve society and for helping individuals to straighten out their lives and fly straight. Now," he added, "I regard that as a naiveté of youth....I failed to understand how complex social structures were and how difficult it was to enable individuals to change that through the power of their learning." Stutz moved to Ithaca, where he taught social studies in Ithaca High School and chaired his department. Stutz's work for the Ph.D. degree in education, which he received from Cornell in 1945, included extensive studies in United States and European history.

Stutz's first position after receiving the Ph.D. degree was as assistant professor at Michigan State College, then beginning the transition to a state university. Two years later Stutz returned to Cornell as an assistant professor of education in the College of Arts and Sciences, where he supervised students preparing for secondary school teaching and carried on research in the history of education. Stutz also served as director of the Summer Session from 1949 to 1952. In 1952 he joined Rural Education, a department that carried Liberty Hyde Bailey's commitment to return to a quality-of-life emphasis in the College of Agriculture.

As a member of the school board for the Ithaca City School District from 1952 to 1958, Stutz returned to the problem of how to make education serve both the needs of society and individual citizens. Educators were caught between those who would meet the challenge of Sputnik by tightening educational standards and those who favored giving priority to the development of the individual. As board chairman in 1957-58 Stutz encouraged

the development of alternative approaches to education, an allocation of resources he found quite consistent with concerns about quality in education.

From 1958 to 1966 he was dean of the School of Education. Under his vigorous leadership the school grew in size and significance, bringing together many new faculty members in both endowed and statutory units of the University. Dean Stutz was instrumental in securing Ford Foundation support for an experimental junior high school project featuring teaching internships in selected cooperating public schools throughout New York State. He and the deans of the upstate Universities of Buffalo, Rochester, and Syracuse obtained a substantial grant from the Ford Foundation to develop interinstitutional Master of Arts in Teaching and administrative intern programs. In the mid-sixties Stutz served as project leader for the New York State Regents Advisory Committee on Educational Leadership. In 1967 the School of Education was merged with the Department of Education in the New York State College of Agriculture and Life Sciences.

As a Cornell professor from 1954 to 1978, Fred was a productive teacher. From his classes came many students who accepted responsibilities in all areas of academic life—as counselors, educators, professors, administrators. Fred’s character in service was open, honest, fair, hardworking, liberal, and flavored with wit and humor.

In teaching, Fred taught by questioning, turning facts into puzzles, turning the conventional policy into an inquiry in history or philosophy or sociology. There was no doubt that Fred loved educating and did not turn away from those sometimes terrifying tasks of teaching deliberately, firmly, carefully, and with ever-present support for novice and experienced alike. Fred made accessible to others the wisdom of many sources. He became an expert in what can be called the social humanities, a blend of tradition and pertinence, ideas and persons. Fred lived out the land-grant philosophy Cornell holds dear. He was a formidable teacher—a scholar who was graced with a common touch. Whoever you were, you could not help but learn something every time you had a conversation with Fred Stutz.

His many roles as an administrator—department head, dean, school board president, member of many service committees—revealed his compassion and commitment. He seemed to lead easily and well, and tasks just seemed naturally to have his name on them. He knew how to leave just as easily so others could take charge and grow through such responsibilities. He was active in local and state politics and helped many good causes develop into programs.

At the time of his retirement, Stutz the administrator was instrumental in establishing a closer linkage between research efforts at Cornell and the small and rural school systems of the state and nation. Fred Stutz believed that planning could improve the educational opportunities of rural and disadvantaged youth. He had a clear vision of how the community of which he was a part and the school system in which he was so deeply interested could be brought together. The Rural Schools Program, established in 1979, carries Stutz's vision. Fred served as the program's first director, and under his guidance some three hundred school districts joined the program Fred did so much to develop, guide, and support. The success of the program is testimony to the clarity of his vision and the steadfastness of his commitment as an administrator.

Stutz the historian was also active to the night he died in his sleep. Fred was interested in community decision-making processes, especially those occasioned by proposals to consolidate school districts. Fred used his retirement to study the history of school district organization in New York State. While this project remains incomplete, Fred had the foresight to involve others in this work, and these colleagues share Fred's determination to see the project through to completion. The work is continuing.

The many social receptions at the Stutz house were both entertaining and edifying in the often complex blend of assembled talent and experience. Sally Stutz, with her own highly developed competence as an educator, was Fred's equal in joy and good sense. They were definitely a well-matched team.

Fred personally suffered the demise of the Graduate School of Education, but he protected junior and senior faculty members. Many felt that to have gotten through is to have done it well. An optimist looking forward, he did not suffer the pain of vindictiveness or retribution. His character lasted.

He was a keen and bemused observer of events, a recorder like a good journalist with a public conscience; some things, like civic virtue, were sacred. He experienced many little joys every day and felt progress from science, technology, and agriculture improved everyday living.

We are grateful for the life of this inspiring man and thankful for his continuing presence in so many of the things we do.

Gould P. Colman, David H. Monk, D. Bob Gowin

George J. Suci

April 24, 1925 — February 11, 1998

George Suci was born and grew up in Gary, Indiana. He was the only child of Aron and Adela Suci, who immigrated from Romania early in this century. George's Romanian heritage shaped his character and his traditions — friends in Ithaca will remember the spring lamb roast he held for many years.

During World War II, George was stationed in the Aleutian Islands where he was responsible for the maintenance of communications equipment. In his spare time, though, he studied the art of boxing, which in later years appealed to some of his graduate students who, like George, had not grown up in an academic world.

After the war, George was educated as an electrical engineer and psychologist at Purdue University and the University of Illinois. He went on to hold positions at the American Institute for Research in Newport, Rhode Island, the Institute of Communications Research and the Department of Psychology at the University of Illinois, and the National Institutes of Health. He joined the Department of Human Development at Cornell in 1959.

George's research and scholarly writing was concerned primarily with language and the way it carries meaning. He did pioneering studies on the measurement of meaning (the semantic differential method) with Osgood and Tannenbaum at the University of Illinois. Later, at Cornell, he and his students developed psychological and psychophysiological methods to study early language development and the relations between thought and language in infants and children.

George served as adviser and mentor for many graduate students who went on to successful teaching, research, and administrative careers in universities and government agencies. He taught core courses in cognitive development at both the undergraduate and graduate levels. He served as Department Chairperson from 1986-91 and as Director of Graduate Studies from 1978-81 and again from 1993-94. He was appointed Professor Emeritus in December 1996, but continued to teach through the spring of 1997 and served as Acting Department Co-Chairperson during the summer of 1997.

George died at home on Wednesday, February 11, 1998, after a brief illness.

George meant a great deal to many people at Cornell. The comments that follow reflect the thoughts of a few of his friends and colleagues, written since the time of his death.

“When we first met, I was just beginning my professional career and George was on the home stretch of his, entering the stage of life Erik Erikson called ‘Generativity.’ George was very generous and was a valued professional advisor. I regularly sought him out for counsel because I could count on him to listen to my concerns and give me solid, sensible advice. I was often surprised when he would completely transform my perspective on a troubling issue. I didn’t expect to find such deep wisdom and professional sensitivity from this humble man.

“George was a colleague. We team-taught a course in cognitive development for several years and I came to admire his ability to be completely non-defensive when he lectured. He gracefully turned my interruptions into learning opportunities for the students, modeling for them the practice of scientific dialogue. George’s seminal research on the semantic differential gave him a impressive depth of appreciation for issues of scientific measurement. His lectures and readings on the philosophy and practice of operationally defining scientific constructs was unparalleled. I’m glad I was taking notes during those lectures, because I can now provide my students with George’s excellent lessons. It was always a pleasure to discuss science with George. He had an uncanny ability to look at research and immediately cut through the fluff to see what was valuable and what was not.

“George was a friend, a good friend. Despite the difference in our ages, we became fast friends. It was easy to be friends with George, mostly, I think, because I knew I could trust him and he knew that I did. He never treated me as just an ‘assistant professor.’ In fact, one of the nicest things about George was his nearly total disregard for a person’s social or professional status. Even in an academic setting where status differences are institutionalized, George treated everyone, students, junior faculty, and staff as individuals. I think that’s why so many people liked and trusted him.

“It was also easy to be friends with George because he was so much fun. He always made me smile. It could be something simple, like coming in to work wearing his Art Carney hat, or when he got tickled by something and would throw his head back in a wonderful snaggle-toothed laugh.

“My grief is alleviated a little because I have so many happy memories of George. In all their cacophonous variety, from the sacrilegious to the sublime, all these memories are George to me.”

“Sometime during the winter of 1997, I took advantage of the fact that George had just retired to finally tell him what I thought of him. I told George that there were two qualities of his that were most important to me as his former student, his colleague, and his friend.

“First, I admired his street smarts. He had a sense of what made individual people tick, what was most meaningful to them, what motivated them. He also had a strong and accurate sense of how things in the world really worked, whether it was the relation between thought and language in infants, or department politics.

“What he didn’t have was any grand illusions of control. This was one part of his street smarts – he worked the system for solutions to problems, instead of thinking he could dictate or impose them.

“And another part of his street smarts that I liked very much was that he had no particular respect for authority per se. He didn’t show disrespect. But respect was something people earned by their actions and their principles, not something that came along with power.

“Besides his street smarts, the other thing about George that was important to me was his big heart. His genuine interest in your well being. His ability to focus on people’s strengths and not their weaknesses. The open and supportive atmosphere that he created among the people he worked with — faculty, staff, and students alike.

“These two qualities – street smarts and a big heart – were even more valuable because, in George, they were combined. And it was that combination that I sensed 24 years ago when I joined other grad students in the east basement to work with George.

“That was a wonderful time. Having ideas, lots of them. Remodeling the lab on weekends and during breaks. Building our own apparatus and inventing Rube Goldberg solutions to the endless electrical and mechanical problems, trying to record heart rate from 12 month-olds while keeping the pens on the Grass polygraph unclogged, using an old blues tune as the lab’s theme song; the list seems endless. From those days until now, George was a model for me — and I know, for others.

“He was down to earth, unpretentious proof that someone from a background that didn’t have much money or education could go to college, get a Ph.D., and actually make it in this bizarre world of academics without losing his identity, his mind, or most of all, his heart.”

“George was a mensch. The general translation of ‘mensch’ is ‘honorable man’. More specifically, it refers to someone who is kind, merciful, righteous, and has integrity. Traditionally, a mensch is explicitly not a hero. Practically, living life as a mensch is often itself a heroic act.

“Traditionally, a mensch is not necessarily wise, but George was. He could cut through the cobwebs and see what the important issues were. His advice often seemed quirky, as though it were coming out of left field. However, it was his very quirkiness that often provided an entirely different, and invariably useful, way of seeing and understanding things.

“George was amazingly non-judgmental. It was possible for a colleague to confide in George about one’s anxieties without having to worry that at some point in the future, the information would be mentioned in a context that would make it hurtful or embarrassing.

“George was the person of choice to talk with about ideas that were only imperfectly formulated. He never treated them as evidence of intellectual inferiority; instead, he treated them as being first steps, and provided feedback to make them better. He had a clear, incisive mind and he was generous in sharing it. In the institution of academia, where worth is often equated at best with mere intelligence and at worst with glibness, George based his academic evaluations on the actual scientific quality of a person’s professional work; he based his personal evaluations on the integrity of a person’s actions. He was equally comfortable, and non-condescending, talking with janitors as with administrators.

“It was not surprising that George was chosen to occupy leadership positions, as director of graduate studies, and as department chair. People trusted George. Academia, like many political institutions, is frequently a hotbed of interest groups jockeying for power, often at other people’s expense. George, too, had interests and preferences and, in certain administrative positions, could have acted on them. However, one of George’s frequent expressions was, ‘Nah, I’m not gonna do that. I’d like to, but you do stuff like that, you lose your integrity.’

“George was entirely without artifice. He didn’t posture; he didn’t lie by omission; he didn’t promote himself. Those who didn’t miss the hoopla found a man of integrity, a listener, a source of wise advice, a loyal friend. George was a mensch.”

“The characteristics which always come to mind when I remember George as a long-standing colleague and friend are his high sense of personal and professional integrity, a sharpness of critical intellect combined with a generosity of spirit and personal modesty, and a capacity to appreciate the simple joys of life and to share them with others. He greatly enjoyed being helpful to others dealing with problems, be they graduate students or faculty colleagues, whether concerned with technical issues or interpersonal questions.

“In his administrative roles, his hallmark was a commitment to fairness and allowing for differing views to be heard and discussed on the way to group decision making. In essence, George seemed to be able to live his professional life, with its commitment to excellence and achievement, within the larger guiding framework of his personal life as a caring human being.”

Rick Canfield, Barbara Koslowski, Henry Ricciuti, Steve Robertson

Ravindra Nath Sudan

June 8, 1931 – January 22, 2009

Ravindra Nath Sudan, the IBM Professor of Engineering Emeritus and a member of the EE/ECE Faculty for 50 years, died of congestive heart failure in St. Petersburg, Florida at age 77.

Ravi, born in Chinani, India on June 8, 1931, obtained the B.A. degree in English (with honors) from the University of Punjab in India in 1948 and the D.I.I.Sc. degree from the Indian Institute of Science in Bangalore in 1952. Continuing his studies in England, he obtained the D.I.C. degree from Imperial College, London in 1955 and the Ph.D. degree from the University of London in the same year, both in Electrical Engineering. From 1955-57, he was an engineer with the British Thomson-Houston Company in Rugby, England, followed by a year with Imperial Chemical Industries, Ltd., in Calcutta, India. In 1958, he came to the School of Electrical Engineering (now Electrical and Computer Engineering) at Cornell as a Research Associate, joined the faculty as an Assistant Professor in 1959, became an Associate Professor in 1963, advanced to full Professor in 1968, and was named the IBM Professor of Engineering in 1975. He retired as Professor Emeritus on July 1, 2001.

Professor Sudan's career at Cornell was characterized by innovative research and rigorous teaching in the EE/ECE School, and dedicated service to the College of Engineering and the worldwide plasma-physics community. Since his initial study and research had been in electric power and machinery, his first years in the School were spent with the electric power group, where his research was concerned with power circuit breakers in vacuum and the physics of electrical breakdown in vacuum. This research stimulated a strong interest in the then emerging field of plasma physics, to which he devoted most of his career and in which he rapidly became one of the world's leading theorists.

He began by studying space and solar plasma physics, including the structure and dynamics of the solar magnetic field, and plasma turbulence in the ionosphere and in the equatorial electrojet. His first work in this area was the independent discovery in 1963 of the "whistler instability," which subsequently was shown to be the physical mechanism causing very-low-frequency radio emissions from the magnetosphere.

Although he never lost his interests in space physics, most of his research was concerned with aspects of controlled thermonuclear fusion such as the physics and technology of pulsed high-power electron and ion beams and their application to inertial fusion, ion rings and their application to magnetic fusion, intense laser-plasma interactions, plasma stability, nonlinear interactions in plasmas, solitons, and the physics of intense relativistic electron beams

and intense ion beams. He enjoyed interacting closely with experimentalists and trying to understand their results. This often required resorting to computer simulation, which led him to seek bright theoretically inclined graduate students and post doctoral associates who were willing to become, or already were, experts at computer simulation.

From 1975-85, he was Director of the Cornell Laboratory of Plasma Studies. In 1984, he joined the 1982 Nobel Laureate in Physics, Professor Kenneth G. Wilson, to found Cornell's Center for Theory and Simulation in Science and Engineering and was the deputy Director of that Center from 1985-87. He held visiting appointments in Plasma and Fusion Physics in England, Italy, and the United States; was an invited Lecturer in the former Soviet Union, France, former West Germany, and Japan; and chaired several international conferences. For a period, Ravi served as Head of the Theoretical Plasma Physics section at the U.S. Naval Research Laboratory and was a consultant to a number of other government, industrial, and university laboratories. He was on the editorial boards of several technical journals and was a co-editor of Volumes I and II of the *Handbook of Plasma Physics*. His many awards included the 1989 James Clerk Maxwell Prize in Plasma Physics of the American Physical Society and the Gold Medal in Physical Sciences of the Academy of Sciences of the Czech Republic in 1994. At the June 2002 International Conference on Intense Charged-Particle Beams, in Albuquerque, New Mexico, Ravi received the 2002 Beam Award "for original contributions as well as for helping to create the field of beams and sustaining it over the years." He was a past Chairman of the Plasma Science Committee of the National Research Council and a Fellow of the American Physical Society, the Institute of Electrical and Electronic Engineers, and the American Association for the Advancement of Science. Ravi published over 225 papers with his students and colleagues.

During his long career at Cornell, Professor Sudan brought many major research programs to the EE/ECE School and the College of Engineering. He received research grants and contracts from the National Science Foundation, the U.S. Department of Energy, the Office of Naval Research, the Naval Research Laboratory, and Sandia National Laboratories. For the extensive numerical studies required by many of these programs, Ravi had access to the Cornell National Supercomputing Facility, the National Magnetic Fusion Computing Center in Livermore, California, and the NCAR Computing Center at Boulder, Colorado. These programs collectively established Cornell as a major center of plasma physics research and supercomputing capability and also provided support for many Cornell graduate students who have gone on to distinguished careers in these disciplines.

In the classroom, Professor Sudan was a rigorous lecturer who set high standards of performance. In his earliest days at Cornell, he introduced two new mathematically oriented courses, one on the generalized theory of electrical machines and the other on the unified theory of electromechanical systems. In the early 1960s, he developed and introduced two new senior and graduate-level Plasma Physics courses in the EE School and in the School of Applied and Engineering Physics. Members of the Faculty who assisted Ravi in these courses have testified to the difficulty of the exercises and their educational effectiveness. Outside the classroom, Ravi was easily available for student conferences and gave freely of his time in advising his many graduate students on their research projects throughout his active years. He was equally generous of his time with the many visiting scientists and graduate students from foreign lands who came to study with him during his tenure on the Faculty.

Ravi was a person with a great sense of humor who enjoyed life. On one occasion, he was visiting a large observatory near Lima, Peru, where he enjoyed watching live radar displays of echoes from some of his favorite plasma instabilities. At a group dinner afterwards in Lima, he ordered a traditional spicy Peruvian dish. One of us (DTF) convinced the waiter that this foreign visitor really did like very “picante” food. In due course, the dish arrived, covered with far more chopped hot red peppers than usual, and with another plate of peppers on the side! Many of the waiters discretely gathered around in the darkened dining room to see what would happen. Ravi took a bite, smiled, dumped the extra peppers on his plate, and finished it all off with gusto, as the astonished waiters melted away. It was a memorable evening.

In 1996, Ravi suffered a major medical setback that essentially ended his active research career. He made a remarkable recovery, however, that allowed him to host visiting scientists and graduate students who had been inspired to study plasma physics at Cornell because of Ravi’s major contributions to the discipline. He was also able to attend occasional conferences and important events in the field of plasma physics. A gala celebration of Ravi’s achievements was held on the evening of May 11, 2002 in the Ithaca College Tower Club. The event was attended by over 100 distinguished members of the plasma-physics community from this country and abroad.

In his early years at Cornell, Ravi was fond of playing squash with several of his colleagues. On one occasion he was returning from the squash courts and stopped to watch a cricket match that was in progress on Hoy Field. Ravi, obviously quite impressed with some outstanding play that he had just observed, called out, “Well played, Sir!” Without question, the same accolade summarizes Ravi’s career at Cornell.

Ravi and Dipali Ray married on July 3, 1959 in Calcutta, India, spent their 49 years of life together principally in Ithaca. Ravi is survived by his wife, Dipali (Dipu), of Ithaca, New York; his daughter, Rajani, of Dallas, Texas; his

son, Ranjeet, daughter-in-law, Melissa, and two grandchildren, Anil and Anjali Sudan, of San Jose, California; a brother, Virendra Nath Sudan, of Andhra Pradesh, India; and a sister, Indira Agnjhotri, of Faridabad, (Hariyana), India.

Professor Sudan will be long remembered as a brilliant scholar, inspiring teacher, highly respected colleague, and devoted friend.

Simpson Linke, Chairperson; Donald T. Farley, Jr., David A. Hammer, John A. Nation

James Batcheller Sumner

November 19, 1887 — August 12, 1955

James B. Sumner, Professor Emeritus of Biochemistry and Director of the Laboratory of Enzyme Chemistry until his retirement on July 1, 1955, died of cancer on Friday, August 12, 1955, at the Roswell Park Memorial Institute, Buffalo, New York. He is survived by his wife, Mary Morrison Beyer Sumner and five children. His untimely death removed from the Cornell scene one of its most distinguished scientists and colorful personalities. His 41 years as a teacher and an outstanding exponent of individual research at Cornell were marked by exciting and revolutionary discoveries. His crystallization of the first enzyme, urease, and masterful defense of its nature, has been credited with being the most significant advancement in the field of biochemistry of the first half century. This accomplishment was recognized by the award of the Nobel Prize in Chemistry in 1946.

Professor Sumner was born in Canton, Massachusetts, on November 19, 1887. He received his A.B. Degree from Harvard College in 1910, A.M. in 1911, and Ph.D. in 1914. He taught chemistry for one term each at Mt. Allison College, Sackville, New Brunswick, and Worcester Polytechnic Institute at Worcester, Massachusetts, prior to entering the graduate school at Harvard. In the fall of 1914 he accepted an invitation to become assistant professor of biochemistry at the Cornell Medical College at Ithaca. He taught medical students and home economics students at Cornell for fifteen years as assistant professor, and was made a full professor in 1929. He became a member of the College of Agriculture Faculty in 1939.

Much could be written concerning Professor Sumner's scientific and academic career. At seventeen he lost his left arm in a hunting accident. Having been left-handed, it became necessary for him to learn to do things with his right hand. This loss led him to exert every effort to excel in all sorts of sports such as tennis, skiing, skating, billiards, and clay-pigeon shooting. It also deeply influenced his highly independent personality and his strong desire for personal accomplishment and recognition in his field. In an interview with Professor Otto Folin concerning graduate work in biochemistry at Harvard, he was advised to take up law, since "a one-armed man could not make a success at chemistry." In spite of such discouraging advice he persisted in his goal and carried the same type of determination in his first major research effort—to isolate and crystallize an enzyme. This also was considered to be an impossible task by leading biochemists of that era. The lack of recognition of his paper announcing the crystallization of the enzyme, urease, and the severe criticism of his research by the leading German biochemists, Willstätter, Pringsheim, Waldshmid-Leitz, and Steigerwaldt, was a bitter experience. His courage in defending his

research results, however, was surely instrumental in shifting biochemical thinking concerning enzymes from the old German Träger theory to the proved observation that enzymes are proteins.

Immediate success and national recognition was not the lot of Dr. Sumner. His earliest honors were conferred in Sweden by the award of the Scheele Medal in 1929 and later by election to the Polish Institute of Arts and Science. The Nobel Prize in Chemistry came in 1946, and election to the National Academy of Sciences in 1948.

The development of research and of teaching in biochemistry at Cornell was synonymous with Dr. Sumner's 41 years as teacher and research worker. There is some doubt that a Department of Biochemistry would have been established in the College of Agriculture at Cornell except for the desire to retain Professor Sumner within the Cornell community. In this instance the subject was of much less importance than the individual. A common expression until recent years was "Biochemistry at Cornell (Ithaca) is James B. Sumner." Professor Sumner's lasting contributions are embodied in his more than 100 published research papers, his basic textbook, "Chemistry and Methods of Enzymes," and his authorship with Karl Myrbäch of the two-volume, four-part classic, "The Enzymes", which immediately gained worldwide recognition.

In 1921 he spent his sabbatical leave at the University of Belgium as a Belgium-American Fellow, in 1929 at the University of Stockholm, and in 1937 as a Guggenheim Fellow at the University of Upsala, Sweden. Professor Sumner reached the pinnacle in his field and left a solid foundation for future scientists to guide them in the understanding of the fundamental forces governing all living things. Cornell recognized these contributions when a special symposium on biochemistry was held in his honor on May 25-26, 1955.

W. L. Nelson, C. M. McCay, J. M. Sherman

Earl Sunderville

October 5, 1886 — November 4, 1958

Dr. Earl Sunderville, Professor Emeritus of Veterinary Anatomy, died November 4, 1958, in Tompkins County Hospital after a prolonged illness. His wife preceded him in death by about a month.

Dr. Sunderville was born in Newark, New York, of Dutch parentage on October 5, 1886. He took pride in having received his grammar school education in an old country school near Newark, New York. After completing the then three-year course in Veterinary Medicine at Cornell, he received the D.V.M. degree in 1908. Although 22 years of age at this time, he felt he was too youthful in appearance to go into practice, although that was his ambition. To gain maturity he accepted an assistantship in anatomy that fall and an instructorship a year later. He never went into practice but stayed in the Department of Veterinary Anatomy for 39 years. In 1914, he was made Assistant Professor and, in 1934, Professor and head of the department, a position he held until his retirement in February, 1947. In addition to his teaching duties, Dr. Sunderville was secretary of the Veterinary Faculty from 1925 to 1945. He was held in high esteem by his students, and his deeply entrenched conviction was that the most experienced teachers should instruct the least experienced students.

The former students and friends of Dr. Sunderville defrayed the cost of the painting of his portrait which now hangs in the James Law Auditorium among those of other faculty members of the Veterinary College. During the time between the death of Dean P. A. Fish on February 19, 1931, and the appointment of Dr. W. A. Hagan as Dean, on July 1, 1932, Dr. Sunderville served with Dr. R. R. Birch and Dr. W. A. Hagan on an interim committee which administered the affairs of the College.

Among Dr. Sunderville's better-known publications are: "Lymphatic System of Cattle," "Postmortem Anatomy of Chickens," and "Tonsils in the Dog."

Prior to World War I, he served on Dr. Septimus Sisson's committee of the American Veterinary Medical Association which compiled a glossary of anatomical terms applicable to the gross structures of veterinary species. These terms have composed the standard nomenclature used in English veterinary medical publications ever since. In a recent comparison of this nomenclature with the new international anatomical nomenclature (Paris, 1955), they were found to be surprisingly similar.

Dr. Sunderville attended the International Veterinary Congress in London as the representative from Cornell in 1930. For over a decade, varied exhibits of College activities were largely prepared and displayed by him at the State Fair. His three sabbatic leaves, in 1923, 1932, and 1940, were largely spent touring the United States and visiting the other veterinary colleges. During the leave of 1932 he also attended the Medical School at the University of Rochester.

From the very beginning of the national professional fraternity, Omega Tau Sigma, he was one of its staunchest supporters and counselors, having been elected secretary of the Grand Council for 12 years and Grand Treasurer for a number of years. Even after retirement he maintained an active interest in the local chapter and more than any other man was responsible for its present fine physical facilities. Dr. Sunderville was also a member of Sigma Xi, Phi Kappa Phi, Phi Zeta, Acacia, and the local, state, and national veterinary medical associations.

He was active in Masonry from 1911, having become early a 32nd degree Mason. He belonged to the Scottish Rite bodies of Ithaca and Binghamton. He was past master of Hobasco Lodge 716 F. and A.M. and a member of its Fellowcraft Club. In addition to serving as presiding officer and trustee of the Lodge of Perfection, he had served as Grand Representative of the Grand Lodge of Michigan.

Dr. Sunderville possessed great love and loyalty for his family and for Cornell. For nearly 40 years each student who attended the Veterinary College at Cornell was personally known to him. In the dissecting laboratory, his answers to questions were concise, accurate, and to the point. Often, the person who asked the question felt a degree of guilt upon being shown the answer since the structure could be revealed so easily and quickly by Dr. Sunderville.

As a youth, he helped his father who was a contractor and thus he developed a vital interest in carpentry, particularly cabinet making, and built many items which served their home. In fact, he built two houses in the village of Forest Home as well as their cottage at Sodus, New York, in which he and his family spent many enjoyable vacations and weekends. Other hobbies included gardening and fishing.

Dr. Sunderville will be remembered most vividly for his close attention to anatomical detail in the dissecting room, where he served not only as a most precise instructor but also as a strict disciplinarian. Outside the classroom his wise counsel was always freely and cheerfully given to the numerous students who consulted him during a generation when drastic changes were being made.

M. E. Miller, H. H. Dukes, H. L. Gilman

John Curtis Swan

November 26, 1917 — October 12, 2008

John C. Swan, Professor Emeritus of Extension Administration, resident of Longview, Bella Vista Drive, Ithaca, New York, died October 12, 2008. He was born on the family farm at Schroon Lake, New York, and graduated from Schroon Lake Central School in 1936. He earned his B.S. degree in Agriculture from Cornell University in 1943.

Professor Swan devoted his entire 31-year career working for the Cooperative Extension Service (now known as Cornell Cooperative Extension). From 1943-55, he served the agricultural community in Rensselaer County as County Agricultural Agent. In 1955, he moved to Cornell as Assistant State Leader of Country Agricultural Agents.

During his tenure at Cornell, he received a Farm Foundation Fellowship Award in 1959 to study at Michigan State University where he received his M.S. degree. Professor Swan went on to become State Leader of Agricultural Agents, Assistant Director of Cornell Cooperative Extension and Extension Program Leader for Commercial Agriculture and Natural Resources. He retired from Cornell in 1973.

Professor Swan played a major role in coordinating the delivery of research based knowledge from Cornell to the commercial farmers and agribusinesses across New York State through Cornell faculty and Cooperative Extension field staff. While in his position of leadership at Cornell, he helped to organize and served on numerous program development committees composed of faculty, county agents and regional specialists. He was a leader in recognizing the many changes going on in commercial agriculture, such as the decline in the number of farms, much larger and more specialized farms, and the implications of these changes in the organization and delivery of agricultural extension and community development programs. He provided leadership as the chairperson of the College of Agriculture's "Special Task Force" to determine how Cooperative Extension could best meet the needs of the increasingly sophisticated agricultural industry in New York State. He saw the need for and was a strong proponent of specialized staff at the county level. As a result of Professor Swan's leadership, multi-county and regional teams of agricultural specialists were formed in many parts of the state. More than 35 years later, teams of Area Extension Educators serve the farm community today throughout the state. Examples of this are the Regional Dairy and Regional Fruit Teams serving commercial producers in Western New York.

He recognized the need for new extension education programs in public issues, particularly as they pertain to commercial agriculture. Extension programs initiated under his leadership concerned challenges of evolving land use patterns, preserving and improving water quality and tax policy affecting land used in agriculture.

Professor Swan was active in a variety of community, professional and agricultural related organizations. For a number of years, he was responsible for organizing the selection and documentation of individual farm families being recognized as Century Farm Families by the New York State Agricultural Society. The Society awarded him their Distinguished Service Citation in 1974 in recognition of his outstanding service to the agricultural industry.

He and Mary Warren Swan, daughter of the late Professor George Warren (for whom Warren Hall on the Cornell Campus is named) were married in 1943 and had four daughters: Julie, Dorothy (Parrill), Molly (Denison) and Barbara (Lopez) all of whom survive him as well as four grandchildren, one great grandchild, and two sisters, Mary Swan Connell and Rita Hooley. He was predeceased by his wife, Mary, and his brother, Robert Swan.

William E. Worth, Chairperson; James C. Preston, David T. Smith

Harold B. Sweet

November 15, 1913 — December 1, 2008

Harold B. Sweet, Professor Emeritus and lifelong learner and teacher spent most of his career in the Cornell University Cooperative Extension System. He was born on a small farm near Smyrna, New York on November 15, 1913. Harold joined the 4-H Club program, the youth development program of the Cornell Cooperative Extension System, when he was age ten. He participated in garden and swine programs and was a member of the 4-H county band that performed at the World's Fair in Chicago. During his high school years, Harold participated in a 4-H mechanics program taught by professors in the Agricultural Engineering Department at Cornell University. This early participation in the programs of the land-grant university, inspired Harold to choose Cornell Cooperative Extension, 4-H as a profession.

Harold applied to and was accepted at Cornell University where he attended 1931-35 and earned his degree. He was a member of the Alpha Zeta honor fraternity and played trumpet in the Cornell Big Red band as well as participating in the Cornell University Collegiate 4-H Club. To earn extra money, Harold corrected papers from the 4-H mechanics program, he waited tables three times a day for meals at the Kappa Alpha Theta sorority, and was employed to visit 4-H agricultural projects carried by youth in Chenango County during summer vacations.

After graduation, Harold started his career in education as a teacher of Agriculture at the Harrisville High School, Harrisville, New York in the foothills of the Adirondacks. During his second year of teaching, an offer to work as an Agent-at-Large came from Cornell Cooperative Extension to work in the Agricultural Program. From this start, Harold then became a 4-H Agent in Lewis County Cooperative Extension. Harold's work consisted of enrolling youth in the 4-H program, recruiting, training and recognizing volunteer leaders, providing interesting supportive county wide programs based in the research of Cornell University, enlisting private and government support, and conducting a public information program. He served as a 4-H Agent in Lewis, Wyoming, and Broome counties from 1938-56. During World War II, the 4-H program supported the Victory Garden program that was widely adapted across New York State. 4-H was also instrumental in bond programs to support troops and even collecting milkweed pods for flotation devices for the troops.

The next phase of Harold's career was at Cornell University as a State 4-H Program Leader. He was liaison with 4-H faculty specialists in the College of Agriculture at Cornell and provided leadership for programs and activities at the state and national level. Harold was a Cornell Cooperative Extension Director's representative with Cornell

Cooperative Extension Association Boards of Directors. He served in these roles at Cornell University from 1956-75.

Harold did not stop his 4-H career when he retired from Cornell Cooperative Extension. He accepted an assignment with the National 4-H Center in Chevy Chase, Maryland, the fund development and program support arm of the nation wide Cooperative Extension 4-H Youth Development program. He served in this leadership role from 1976-87. Travel related to his long career in 4-H took Harold to Europe, Africa, the Caribbean, the Philippines, Japan, Canada and all but four states of the United States.

In addition to his fulfilling career, Harold enjoyed playing bridge, traveling and spending time with his friends and family. Harold was supported in his career by the love of his wife Elizabeth (Betty) Lawlor Sweet, and their children, daughters Charlotte and Margaret, and sons Charles and Robert. The Sweet family was a source of pride with their services to others including community development in a variety of nations, law, insurance and help to those most needing help in our society.

Harold contributed to the mission of Cornell, the state Land Grant University System. He exemplified the access to formal education, existing degree programs and the constant integration of new knowledge in to every day activities. His loyalty, commitment and dedication to helping people make informed and considered decisions is a great and lasting contribution to society.

Glenn J. Applebee, Chairperson; Lucinda A. Noble, William Worth

Joshua Edwin Sweet

August 9, 1877 — April 8, 1957

Joshua Edwin Sweet, Emeritus Professor of Surgical Research, was born in Unadilla, New York, August 9, 1877, son of a country doctor. After completing his preliminary education in the local schools, he matriculated at Hamilton College where he earned the A. B. in 1897 and received the A. M. in 1900. In 1922 the D. Sc. was conferred upon him. In 1901 he received the M. D. degree at Giessen. He was Scott Fellow at the University of Pennsylvania 1901-02. From 1902 to 1906 he was a Fellow of the Rockefeller Institute. He was a Root Fellow, Hamilton College, 1907-1908; Assistant Professor of Experimental Surgery, University of Pennsylvania, 1906 to 1917; and Professor, 1917 to 1926.

His society memberships included The American College of Surgeons, Surgical Research Society, American Medical Association, Physiological Society, Society of Experimental Pathology, Society of Experimental Biology, New York Academy of Medicine.

He was called to Cornell to establish a new department of Surgical Research in 1926, and headed this department until his retirement in 1941. In his philosophy, he visualized a department to which any member of the instructing staff might bring his problems and find enthusiastic help in their solution. His success was measured by the many men who came to work under his direction and the large numbers of papers published from his department. His own publications were numerous and varied. His own research interests were widespread but his greatest enthusiasm was claimed by the gall bladder and the biliary tract.

During World War I he served in France with the Army Medical Corps, and at the end of hostilities he was Lt. Col, consultant on experimental surgery to the Commanding General A. E. F.

Dr. Sweet never lost his love for the rural region in which he was born. Summer vacations were invariably spent on the family farm where he developed an outstanding herd of dairy cattle producing certified milk. His dairy herd was not his only interest; for many summers were also occupied with building his house for retirement. With the help of local carpenters he conceived the plans and performed much of the work himself. Being a resourceful man he made use of his many horsechestnut trees killed by the widespread blight. This wood, cut at a local mill, was used for floors, stairways, and much of the interior woodwork. The final finishing of this beautiful chestnut was done by Dr. Sweet by hand, and his love of accurate work resulted in a handsome and useful home.

On retirement Dr. Sweet did not confine himself to his farm and dairy herd. He took an active part in the affairs of his community, serving for some time as president of the local hospital at Sidney, and acting as consultant in the neighborhood.

After a lingering illness Dr. Sweet died in a nursing home at nearby Bainbridge April 8, 1957. Sincere sympathy goes to his widow, Florence West Sweet, his daughter Mrs. George Kittell (Ruth Sweet), and his grandchildren.

An old friend and fellow worker has passed on, leaving the world a better place for his having lived and worked in it.

John E. Sutton

Michael Szkolnik

August 23, 1920 — March 26, 2002

Michael Szkolnik was Professor Emeritus in the Department of Plant Pathology at the New York State Agricultural Experiment Station in Geneva. He joined the department as an Assistant Professor in 1951 and retired in 1984. After receiving a B.S. degree in Biochemistry from Rutgers in 1943, Mike served in the U.S. Army in the European Theater during World War II before returning to Rutgers for his Ph.D. degree in Plant Pathology in 1949. Prior to joining Cornell, he worked in Guatemala from 1949-51 for Experimental Plantations, Inc., a subsidiary of Merck and Company.

Mike was born in Clifton, New Jersey and attended high school in Freehold, New Jersey, where he developed an interest in vocational agriculture, biology and chemistry. Early in his life, he gained practical experience working on several different types of farms as well as employment for three summers with the Dutch elm disease program of the Bureau of Entomology and Plant Pathology, U.S. Department of Agriculture.

The chemical control of fungal diseases of deciduous orchard fruit crops was the focus of Dr. Szkolnik's research throughout his career at Cornell. During his tenure, the arsenal of fungicides available to fruit growers shifted from a small number of inorganic compounds with broad-spectrum activity to organic compounds with very different properties. These included systemic activity in plants and, in some cases, the ability to eradicate disease in the early stages of the infection process rather than having to be present as a protectant before arrival of a pathogen on a plant surface. Mike developed procedures to evaluate these new types of fungicides and determine how growers could best use them to obtain practical and economic control of diseases.

In addition to field trials conducted in the experiment station and growers' orchards, Mike maintained several thousand potted apple, pear, peach and cherry trees that were used in conjunction with a precision sprayer, artificial rainfall facility, and walk-in, temperature-controlled mist chambers to conduct research on trees year-round in the greenhouse. In addition to using the chambers to determine the practical mode of action of fungicides, a term Mike may have coined, he used the chambers for disease-biology studies including determination of the effect of split-wetting periods on scab infection and the time required for scab infection to occur at temperatures below 42 F. This facility, which Mike helped design, was probably one of the finest in any university at the time and was used for studies on control of scab and cedar-apple rust of apples and leaf spot disease of cherry, among other major fungal diseases occurring in the northeastern United States.

One practical mode of action of fungicides that Mike discovered was particularly interesting. By hanging strips of cheesecloth or cords that had been soaked in certain ergosterol biosynthesis-inhibitor fungicides in a closed greenhouse, he determined that powdery mildew could be controlled for two to six months through “vapor action.” This was impressive because mildew is particularly hard to control in greenhouses, even with weekly sprays of conventional fungicides.

Dr. Szkolnik was one of the very first to prove the development of resistance to a fungicide, in this case resistance to dodine, also called Cyprex. Szkolnik and others had demonstrated the effectiveness of this chemical and it was widely used by apple growers to control scab disease. After a few years, some growers reported that the chemical was no longer effective. Laboratory studies by Mike demonstrated that a strain of the fungus had evolved that was resistant to dodine. Although some individuals tried to persuade Mike not to disclose this information, he felt strongly enough about the need to inform the growers and suggest other control products that he and his colleagues decided to do so immediately.

Mike was committed to helping the New York tree-fruit industry obtain effective and economical control of the numerous fungal diseases that affect their crops. He was often invited to speak to growers at meetings in the state and he was a regular speaker at the annual pesticide conference at Cornell that was attended by a large number of researchers, industry personnel, and extension and other agricultural service providers from throughout the northeastern United States and beyond. Chemical companies that conducted research to develop new fungicides followed the results of his research closely.

Dr. Szkolnik was a member of the American Phytopathological Society, the New York State Horticulture Society, and the New York Academy of Sciences. He was the author of research publications in outlets ranging from scientific publications to those with fruit growers as the primary audience. He was a serious gardener and an avid card player, especially of poker, with his colleagues at the experiment station.

Dr. Szkolnik is survived by his wife, Louise, of 57 years, three daughters, two sons, nine grandchildren and two great-grandchildren.

George S. Abawi, Herb S. Aldwinckle, James Hunter

Philip Taietz

July 8, 1910 — April 23, 2000

Philip Taietz died in Sarasota, Florida at the age of 89. He was born in Lithuania in an era when national borders in that region shifted frequently and some records give his native country as Poland. As a consequence of this instability, his family emigrated to the U.S., several members at a time. As part of this exodus, Philip and his mother arrived in New York City in 1921 and managed to find a family contact despite no knowledge of English.

Philip attended Boys High School in Brooklyn and graduated from Brooklyn College in 1934. He did graduate work at the New York School of Social Work (1937-39) and began his career as a social worker starting in 1939 and continuing until 1946. He was appointed to the Cornell faculty as Assistant Professor in the Department of Rural Sociology in 1946, at first teaching undergraduate courses to prepare students for rural social work positions. Later, he specialized in social gerontology in rural areas. He took leave in 1950-51 to finish his graduate work at Cornell, where he received his Ph.D. degree in 1951. He was advanced to Associate Professor in 1952, and to Professor in 1963, holding that post until his retirement as Professor Emeritus in 1976. He was Acting Chair of the department in 1961-62. He also taught briefly at Wells College and the New York School of Social Work at Columbia University.

Professor Taietz initiated one of the early courses in the Sociology of Aging at Cornell, along with courses on Community and Public Policy Toward Older People. He also offered a course on Work and Society and another on Social Work and Social Welfare. Through his teaching and his supervision of graduate students, he influenced the life work of many persons who went on to outstanding careers. From 1947-59, he coordinated the New York State Institute for Public Welfare Training and in 1953, he organized the Cornell Institute for Nursing Home Administrators, directing it for five years. The Institute for Nursing Home Administrators became one of New York's premiere programs in the training of individuals actively involved in nursing home management and was one of the pioneering efforts in the United States attempting to upgrade the quality of nursing home care through university-affiliated training programs. Solid, current research was brought to bear with good teaching techniques on these problems.

Taietz's research in aging and retirement, community, and occupations gave him national and international recognition. In 1957-58 he was a Fulbright Research Scholar in the Netherlands where he established professional connections that he continued all his life. His use of the sabbatical leave program was outstanding. Early in his

career, he developed a pattern of visiting significant institutions on a periodic basis. Besides domestic teaching outside Cornell, he was a Visiting Professor at the Andrus Gerontology Center at the University of Southern California (1975), a Visiting Fellow at the Australian National University (1980) and at the Fondation Nationale de Gérontologie in Paris (1984 and 1987). Some of these contacts were initiated after his formal retirement from teaching, but never a retirement from intellectual inquiry. For example, in Paris he conducted research on American expatriates, sometimes working in his favorite second language. He continued to teach a course in the Sociology of Aging in Cornell University Summer Session for many years after his retirement. Even in 1990, Dr. Taietz and Dr. Nina Glasgow, in collaboration with the American Association of Retired Persons, conducted a national conference on successful aging.

Most of Taietz's writing concerned aging and social welfare, but occasionally he produced little gems such as his article on "Conflicting Group Norms and the 'Third Person' in the Interview" (*American Journal of Sociology*, July 1962). This article reported a quantitative analysis of the effect that another person in the room has on a respondent. Only someone who was a close observer of micro interactions could have teased out these patterns. He also participated in an excellent study of the differentiation of health services across New York State. This study, conducted with Professor Dan E. Moore, was significant because it documented the close relationship between community size and complexity and the presence of increasingly complex medical services.

A specific topic of interest to him was the change that occurs in the lives of professors upon their retirement. As early as 1967, he and Dr. Paul Roman published *Organizational Structure and Disengagement: the Emeritus Professor*. His principal post-retirement research project focused on the productive activities of emeritus professors in conjunction with Drs. Donna Dempster-McClain and Phyllis Moen.

Professional society memberships included the American Sociological Association, the Gerontological Society of America, the Rural Sociological Society and the New York Association of Gerontological Society Educators, for which he served as president, 1980-81. So far as we know, he attended every annual meeting of the American Sociological Association after he became a member.

Taietz was active in the local community, fostering what he regarded as important community services. Among them he served as co-chair, along with Mrs. Jeannette McCay, of the first Board of Directors of the Tompkins County Senior Citizens Council. The number of senior citizens in this organization has increased year by year. He also served on the Board of Directors of the Family and Children's Service of Ithaca and the West Side Community Center.

He is survived by his wife of 50 years, Miriam; a daughter, Elizabeth McSorley, of Dublin, California; and a stepson, James Lawson, who lives in Rochester, New York. He has a surviving brother who resides in Yonkers, New York. There are numerous grandchildren and great grandchildren for who the Taietz family served as models for their many years.

Philip Taietz was a genial person, quick with puns and wry comments, and a source of much laughter. His wide circle of friends stretched across the social sciences and he contributed to the integration of these sometimes-divergent groups.

Gene Erickson, Olaf Larson, Frank Young

George Walter Tailby

November 1, 1882 — December 23, 1965

George Walter Tailby, Professor of Animal Husbandry, Emeritus, died in Ithaca, New York following a long illness.

Professor Tailby was born in Ithaca and grew up on the Cornell campus. His father worked for Professor I. P. Roberts as farm superintendent, and Professor Tailby frequently talked of working, as a student, for Dean Liberty Hyde Bailey.

He graduated from the Ithaca High School in 1901 and from Cornell University College of Agriculture in 1906 and worked the following two years in the United States Department of Agriculture with the Soil Survey Bureau in South Carolina. In 1907 he returned to Cornell and was superintendent of livestock under Professor H. H. Wing until 1920. At this time he took over the supervision of New York Dairy Herd Improvement Associations which before 1920 were under the supervision of the New York State Department of Agriculture and Markets.

During the period 1909 to 1920 Cow Testing Associations, as they were then called, had increased in number from 1 to 20. Professor Tailby had the entire responsibility for the organization and operation of these Associations until 1929 when an increase in their number to 54 required additional help on the part of other members of the Department of Animal Husbandry. Professor Tailby trained association supervisors in two-week training schools held bimonthly at Cornell. A large part of his time was spent in the field, helping D.H.I.A. supervisors with their record keeping problems. The steady growth in the number of Associations and the service they rendered to association members was due in large part to the conscientious, capable, and understanding personal help Professor Tailby gave to both supervisors and members out on the farm. From 1925 to 1950 the Dairy Herd Improvement Associations increased in number from 24 to 201. During this same period the number of cows tested annually increased from 9,485 to 119,882 and the average yearly milk production of association cows increased from 7,475 pounds to 9,106 pounds. Professor Tailby's efforts after 1920 were confined mostly to the development of the D.H.I.A. record keeping program, and his contribution to herd improvement in New York State was very great. The production and feed records available from the large number of Dairy Herd Improvement Association cows were essential to the success of the breeding and feeding programs of the Extension Service.

Professor Tailby richly deserves the honors and recognition given him for the many years of service to the dairymen of New York State.

Professor Tailby was promoted to Assistant Professor in 1947 and was retired from the Department of Animal Husbandry as Professor Emeritus on August 31, 1950, after 43 years of continuous service.

Professor Tailby was a member of Sigma Xi, Epsilon Sigma Phi, Alpha Zeta, Masonic Order, and the American Dairy Science Association, and was active in the First Baptist Church of Ithaca.

His wife, Eloise L. Osmond Tailby, preceded him in death. He is survived by a daughter, Mrs. Elvira Tailby Bossack, two sisters, and a brother.

Robert W. Spalding, Clarence G. Bradt, James D. Burke

John Henry Tanner

March 1, 1861 — March 11, 1940

John Henry Tanner, Emeritus Professor of Mathematics, died on March 11, 1940, fourteen years after his retirement in 1926 had concluded a period of more than a third of a century of distinguished active service at Cornell University.

Professor Tanner was born at Fort Plain, N. Y., on March 1, 1861. After completing his secondary school education he taught for several years in the Clinton Liberal Institute before coming to Cornell, where he was graduated in 1891 with special mention for proficiency in Mathematics and was at once appointed instructor in that subject. During the following thirty-five years he showed unflinching zeal and loyal devotion in all his academic and professional activities. He was author or joint author of four widely used textbooks, and in these, as in his teaching, he showed his ability to present mathematics in such a way that the student would not merely accept but would understand. He gave his full share of time to the usual committee work, and from 1897 to 1904 he served as secretary of the faculty of the College of Arts and Sciences. He was one of the early members of the American Mathematical Society and took a keen interest in its problems of organization, and as its treasurer for more than a decade he succeeded in placing the society's finances on a secure foundation.

The permanence of his interest and faith in Cornell University is impressively attested by the gift which he and Mrs. Tanner have made for the eventual establishment here of a Mathematical Institute. Throughout his career his generous and unselfish spirit found innumerable ways of sympathetic assistance, always rendered with his characteristic unobtrusive graciousness, whenever a student or a friend or a cause was in need.

The noble life of John Henry Tanner will remain a living inspiration to all who knew him, and his colleagues in the University Faculty would record this expression of their love and admiration for him and of their respect for his memory.

William Thorpe Tapley

October 5, 1893 — December 18, 1977

William T. “Bill” Tapley, professor of vegetable crops emeritus at the New York State Agricultural Experiment Station, Geneva, died December 18, 1977, at his home in Gulfport, Florida. Professor Tapley was born October 5, 1893, at Revere, Massachusetts. A graduate of the University of New Hampshire in 1916, he spent a year in the Graduate School at the University of Minnesota before embarking on twenty-three months of service in France in World War I, serving with the American Field Service and the U.S. Army. He returned to Minnesota in 1919, received his M.S. degree in 1920, and stayed on as instructor in vegetable gardening and then as assistant professor and head of the department. He moved to Pennsylvania State University in 1923, serving as assistant professor and head of the Department of Vegetable Crops at that institution. In 1928 he joined the Francis C. Stokes Seed Company in Philadelphia as a plant breeder, leaving in 1929 to operate the family vegetable farm in Revere. In 1930 he joined the staff of the experiment station at Geneva as assistant professor of vegetable crops. He was promoted to associate professor in 1947 and to professor in 1955. He retired December 31, 1959, after almost thirty years of service to the New York vegetable industry.

Professor Tapley’s first duties at Geneva were to assist in growing and describing varieties of vegetables, and in publishing these descriptions in three of the books in the Vegetables of New York series: beans, sweet corn, and cucurbits. He spent the rest of his career developing new and improved varieties by breeding, working particularly with tomatoes, squash, and snap beans for processing. Three of his tomato originations, Gem, Red Jacket, and Longred, constituted the major varieties grown for processing in New York State at the time of his retirement. Another tomato introduction, Red Top, a paste-type tomato, enjoyed wide acceptance by both growers and processors and is still a popular variety in many parts of the world. He collaborated closely with station plant pathologists in developing Geneva 11, a verticillium wilt-resistant tomato. A processing squash named Red Skin culminated many years of effort to develop a superior squash for use in pumpkin pie mixes and baby foods to replace the standard Boston Marrow type, which has many faults from the standpoint of the grower and the processor.

Because of his wide knowledge of vegetables and a keen eye that could detect minor differences in plants and produce, Professor Tapley was frequently asked to judge vegetable and Grange exhibits at the state and county

fairs. For several years, starting in 1938, he served as secretary-treasurer of the New York State Vegetable Growers Association as well as editor and manager of the *Bulletin*, which at the time was the association's official publication.

Professor Tapley was a member of the First Church of Christ Scientist, Boston, Massachusetts, and was former first reader of the Geneva church. He was active in the Seneca Yacht Club for many years, serving as fleet captain and race official. He was also active in the Central New York Racing Association.

Surviving are his wife, Pauline Russell Tapley; two daughters, Mrs. John R. (Helen) VanFleet of Canandaigua, New York, and Mrs. Jack (Suzanne) Howard of Greenville, South Carolina; seven grandchildren; a niece; and a nephew.

James C. Moyer, Nathan H. Peck, Morrill T. Vittum

Ralph Stockman Tarr

— *March 21, 1912*

By the sudden death of Ralph Stockman Tarr, Professor of Physical Geography, the University Faculty have lost a beloved colleague, an active investigator, and a teacher of attractive and stimulating personality. Coming to Cornell as Assistant Professor of Geology, and soon winning a Professorship, he gave to the University the best twenty years of his life. Eminently an outdoor geologist, he pushed his physiographic studies into remote regions. For whatever was significant in the forms or surface of the earth he had a keen vision. And what he had seen he described with insight into its causes. His teaching was quickened by his work afield. The fresh air of the glacier stirred in his class room, and the pictured landscape lived because he knew the meaning of its parts. The gift was his in an exceptional degree of simple and vivid presentation. By his writings he not only contributed to advance our knowledge of the work of ice in sculpturing the land, but he raised the whole field of physiographic studies to a collegiate plane by basing his exposition of them upon a competent scientific knowledge. As a man he was sincere and outspoken; steadfast in his convictions, but tolerant of the views of others. For youth and the interests of youth he retained without effort a sympathy as helpful as it is rare. This expression of esteem for a colleague cut off in the midst of his achievements and his plans is enscribed with sorrow upon the-minutes of the University Faculty.

C. H. Hull, Chairman, H. S. Williams, E. W. Olmsted

Source: Records, p. 547, April 19, 1912

Emil Frederick Taschenberg

June 4, 1916 — February 5, 2002

Emil Frederick Taschenberg, Professor Emeritus of Entomology-Geneva, was a tireless worker for the New York grape growers at the Vineyard Research Lab in Fredonia, New York, where he lived and served as Director from 1945 until his retirement in 1983. In 1991, the main laboratory building at the research station was renamed the “Taschenberg Lab” in his honor.

“I’m sure the thing most remembered about Tasch by growers, industry representatives, and the Lab staff was his work ethic”, said Rick Dunst, Research Support Specialist at Fredonia. Wendell Roelofs, Liberty Hyde Bailey Professor, a close collaborator of Taschenberg’s and the current Chairman of the Entomology Department-Geneva corroborated this, when he said, “Tasch was one of the hardest working entomologists I know”.

Taschenberg’s career began at Gettysburg College where he graduated with an A.B. degree in Biology in 1938. He received his Ph.D. degree in Entomology from Cornell University in 1945. He was appointed that year as Assistant Professor of Entomology at Cornell’s Agricultural Experiment Station at Geneva, and was stationed at Cornell’s Vineyard Laboratory at Fredonia throughout his career as Associate Professor (1948-59) and Professor (1959-83). He retired as Professor Emeritus in 1983, but continued to contribute to the grape industry through research and extension for several years.

Taschenberg’s research focused on the biology, ecology and control of minor and major insect pests of grape. Most of the research was on the control of major grape pests, such as the grape berry moth, Eastern grape leafhopper, and currant borer. He also was instrumental in the design and refinement of a hooded boom sprayer for vineyards that applied materials effectively and reduced pesticide drift compared with standard sprayers. He was concerned with the tractor operator’s safety and helped to eliminate the need for wearing protective clothing and a respirator when applying insecticides by developing an air-filter pressurization unit that was mounted on a tractor cab.

In work on the direct control of pests, he evaluated insecticides not only from the standpoint of performance against insects, but also determined the persistence of the insecticides on grapes. He developed spray programs that shifted from the persistent insecticides to those that were relatively short-lived without sacrificing effectiveness and without increasing the number of spray treatments. He was renowned for working weekends and holidays to evaluate experimental treatments in his dedication to the grape industry. His advice on control of grape pests was widely sought and well respected.

Taschenberg also was a pioneer in using insect sex pheromones in the field for pest control. He collaborated with Dr. Roelofs for many years on projects in which he mass reared insects, such as the grape berry moth, choke cherry leafroller, and cecropia moth, for identification of the sex pheromone compounds. He developed innovative methods to produce the tens of thousands of individuals needed for these studies, and his great interest in the projects was reflected in the long hours of his spare time that he spent on these projects. He also conducted many field trials on the use of pheromones in vineyards for monitoring and control of pests. In this regard, he was one of the first scientists to test a number of experimental techniques to permeate a field with pheromone for the mating disruption technique. His efforts led to a commercial product for pheromone control of the grape berry moth.

Dr. Taschenberg took a sabbatical leave in 1970-71 at the USDA Caribbean Fruit Fly Investigations Laboratory in Miami, Florida to work on the biology of the Caribbean fruit fly. He was a member of the Entomological Society of America, the Entomological Society of Florida, the American Association for the Advancement of Science, the American Institute of Biological Sciences, Sigma Xi, and Phi Kappa Phi.

Tasch was an avid fisherman and displayed many mounted specimens at the Fredonia Lab that he donated to the Buffalo Museum of Science after his retirement. He also played golf, which he took up in his later years and especially enjoyed in his years of retirement in Florida.

Surviving Tasch are his wife, Shirley, Hudson, Florida; two daughters, Ellen Marle Minor, Clearwater, Florida, and Sharon E. Taschenberg of Lafayette, California; a brother, Ernest J. Taschenberg, Baltimore, Maryland; three grandchildren; and numerous nieces and nephews.

Richard Dunst, Haruo Tashiro, Wendell Roelofs

Haruo Tashiro

March 24, 1917 — *December 8, 2009*

Haruo Tashiro, Cornell University Professor Emeritus in the Department of Entomology at the New York State Agricultural Experiment Station, passed away peacefully in Golden, CO at the home he shared with his son Steve and Steve's wife, Patricia. He was 92 years of age. "Tash," as he was affectionately called by his many friends and colleagues, was a world leader in the biology and management of insects and mites on turfgrass and woody ornamentals.

Tashiro received his B.S. (1945) in botany and zoology from Wheaton College in Illinois and his M.S. (1946) and Ph. D. (1950) in entomology from Cornell University. He was a research entomologist with the U.S. Department of Agriculture (USDA) in Geneva, NY, from 1950 to 1963, before becoming the investigations leader and research entomologist with USDA at Riverside, California. In 1967, he returned to Geneva to serve as professor of entomology until his retirement in 1983.

Throughout his active scientific career, Tashiro produced numerous publications on the biology, ecology and management of insects affecting horticultural crops and turfgrass. Perhaps best known is his 1987 publication, *Turfgrass Insects of the United States and Canada*. This book was the first comprehensive reference to bring together under one cover a discussion of practically all insects and other arthropods destructive to turfgrass in the United States and southern Canada. It soon became the standard reference for the subject. The book was revised in 1999 by Tashiro, his former graduate student, Pat Vittum, and Mike Villani, who succeeded Tashiro as the turfgrass and soil ecologist at Cornell.

Among his many accomplishments, Tashiro conducted seminal studies on the European chafer (*Rhizotrogus majalis*) during the 1950s and 1960s, elucidating the biology of the insect, identifying trapping techniques, and identifying management strategies. He also studied the grass webworm (*Herpetogramma licarsisalis*) and the fiery skipper (*Hylephila phyleus*) during sabbatical leaves in Hawaii.

Tashiro was not only an excellent scientist but an accomplished artist. His detailed drawings of insects, his skill in cartography and his photos grace the pages of his books on turfgrass insects. His artistic skills were recognized by many, including his colleagues Paul Chapman and Siegfried Lienk. Since they were not able to find an artist who could provide the morphological accuracy necessary to illustrate a book on insects affecting apples in New York, they asked Tashiro if he was willing to try. After a few trial paintings, they were pleased with the efforts and asked

him to collaborate. From 1963 to 1968, Tashiro prepared watercolor renditions of 56 species of tortricid moths whose larvae damage leaves and fruits of apples. The book, *Tortricid Fauna of Apple in New York*, was published by Cornell University in 1971 and remains a classic.

Tashiro was born in Selma, California, on March 24, 1917. During his youth, Tashiro was among the approximately 110,000 Japanese Americans interned in camps during World War II because of their ancestry- an act the federal government apologized for in 1988. In 1942 he married Hatsue Morimitsu whom he had met at their church in Sacramento. Rumor has it that he courted her by bringing gifts of vegetables from his family's farm in nearby Orosi. Tashiro and his wife moved east to Cornell so he could obtain his advanced degrees at Cornell University and together developed many long-lasting friends in the area. Tashiro always considered Geneva his home and he and Hatsue raised three children there. He was involved in many civic organizations including devoting many hours to leadership activities in the Presbyterian Church. Tashiro was an avid golfer, even into his late 70's, and was a renown horticulturalist who created an arboretum around his home.

He is survived by his daughter Elaine Gerbert and her husband, Pierre (Lawrence, KS), his son Steve and his wife Patricia (Golden, CO) and his daughter Wendy (Byron Bay, Australia). Tashiro was predeceased by Hatsue on April 7, 2006. She was buried in Dinuba, CA, where Tashiro was also laid to rest. Tashiro will be remembered as a gentleman, excellent scientist and an inspiration to his family and friends.

Anthony M. Shelton, Pat Vittum (University of Massachusetts), James Hunter

Carrie Williams Taylor

1892 — August 6, 1988

Carrie Williams Taylor came to Cornell in 1935 as an assistant state leader of home demonstration agents. She had previously been employed as a home demonstration agent in Orange County, New York, for five years. Prior to coming to New York State, she was a state clothing extension specialist at Michigan State University. While at Cornell she married Charles A. Taylor, professor in extension service and a pioneer in the development of Cornell's educational radio program.

Carrie began her career as an elementary school teacher at age 18 in Ada County, Idaho, to earn money for a college education. Her teaching experience also included teaching at the high school level in Idaho and Washington and serving as head of a home economics department in Idaho. She graduated from the University of Washington, and in 1934 she received a Masters degree from Columbia University. In 1938 she became a full professor at Cornell.

During her years at Cornell (1935-1949), Carrie worked with college specialists and county home demonstration agents to adapt programs to the needs of homemakers and families during the Depression and World War II. Homemakers could always count on Carrie to raise during the program-planning process the question, "Will this program help win the war?"

Carrie helped the women of Columbia County to organize and secure funds from county government so they could participate in Cooperative Extension programs. She also was instrumental in developing and implementing a unified filing system for county extension offices. Colleagues remember her as cooperative and conscientious.

Carrie was a family oriented person, extremely interested in people. As an extension agent in Orange County, she never missed an opportunity to interest individuals in the program. She sought out community leaders and involved inexperienced homemakers. In addition, she was skillful in interpreting and presenting homemakers needs to the college faculty. Homemakers liked her friendly ways and respected her leadership and organizational ability.

In 1949, she and her husband retired. They pursued many hobbies. One they especially enjoyed was gathering gem stones and polishing them. This hobby took them on many interesting trips through the western states and Mexico.

Carrie died in a nursing home in Portland, Oregon.

Ethel Samson, Hazel Reed

Charles Arthur Taylor

June 6, 1886 — May 7, 1964

Charles Arthur Taylor devoted his whole life to the improvement of agriculture and rural life—especially in New York State. “Charlie,” as his friends knew him, was noted for his down-to-earth philosophy and happy countenance. He always looked at things from the farmers’ standpoint. Being a professor did not change him. He had spent too many hours as a county agricultural agent with a Model-T Ford on the dirt roads of Herkimer County and in the barns, kitchens, schoolhouses, and milk stations ever to stray far from the rural viewpoint.

He was farming and teaching agriculture in a secondary school at Hancock, New York from 1911 to 1914. On January 1, 1915, less than a year after the Federal Smith-Lever Act of 1914 created the national Cooperative Extension Service, he began work as a county agricultural agent in Herkimer County. The fast growing Extension Service noted his dynamic leadership and on June 1, 1920, called him to the New York State College of Agriculture as Assistant State Leader of County Agricultural Agents. In 1928 he was made administrative specialist in the Extension Service and was put in charge of Winter Short Courses and the editing of the *Extension Service News*.

As an administrative specialist he could always be depended upon to accept any assignment and to initiate many on his own responsibility. He seemed to do things so easily and without any fanfare or expectation of praise or extra reward. He was most unselfish in his dealings with others and never resented the advancement of his associates.

He was primarily responsible for obtaining the cooperation of the Cornell administration in establishing the first Cornell radio station. It was through his effort that General Electric erected the first radio broadcasting towers for the Cornell Station on the north side of Beebe Lake.

He started the first local Cornell radio program dealing primarily with agricultural information. Later he organized and directed the selection and distribution of radio material to the many cooperating radio stations in the state.

During World War II, he served as executive secretary of the Extension Service Wartime Council of the New York State Colleges of Agriculture and Home Economics. This Council was composed of the chairmen and secretaries of the many subcommittees of both Colleges dealing with wartime activities; it met each Saturday forenoon during the war to hear the reports of these subcommittees and to coordinate their many activities. During this period, at the request of the Cornell administration, he gathered and preserved all of the records and the many wartime

publications of the two Colleges; that material provides a complete history of the wartime activities of the Colleges of Agriculture and Home Economics.

He was honored by his colleagues in being elected first president of the New York State County Agricultural Agents Association in 1919. He also served in 1940 as chief of Epsilon Sigma Phi, the honorary Extension fraternity.

Charles A. Taylor was born in Norwich, and grew up on a small farm near the village of McLean in Tompkins County. He early earned the reputation of a master craftsman at farm skills and that of a most efficient and reliable worker. Any farmer who could get Charles Taylor to help him out for a few days felt himself fortunate and was willing to pay him top wages. The equipment on the Taylor farm did not include a grainbinder, and it took cash to hire grain cut. One year when cash was especially scarce in the Taylor family, Charles Taylor cradled and raked and bound, all by hand, over 20 acres of grain, and did most of it evenings after putting in full days of work on a neighbor's farm.

After taking his high school work at the McLean Union School he entered the Cortland Normal School, from which he received a classical diploma in 1910; he knew Latin, Greek, and Shakespeare as well as mathematics and sciences. In 1928 he received his B.S. degree from the New York State College of Agriculture.

He published thousands of news articles and radio briefs as well as magazine articles, including some fiction.

During his lifetime, Charles Taylor was called on to do many different kinds of both mental and physical work, and he did all of them well. He was a happy worker whether the job was digging a ditch or writing an extension bulletin, provided the work was productive and those for whom or with whom he was working wanted a good job done. He had no use for poor workmanship or poor materials on the farm, in the classroom, or in the office.

On August 22, 1912, he married Louise Ferris; after her untimely death, he married, on March 30, 1941, Carrie Colver Williams, well known to many extension workers as a State Leader of Home Demonstration Agents. Upon his retirement on June 30, 1948, after a short period in Ithaca Charlie and Carrie took up residence in Union, Oregon, where he passed away.

His three children are Charles Arthur Taylor, Jr., of Brookings, South Dakota; Florence Louise Taylor, now Mrs. Robert Trapp of Ithaca, New York; and Robert Barrows Taylor of Los Angeles, California.

V. B. Hart, L. R. Simons, Lincoln D. Kelsey

Dean Lee Taylor

July 2, 1949 — July 31, 1997

Dean Lee Taylor, a Cornell University Professor of Mechanical and Aerospace Engineering and a leading researcher and educator in computer-aided design (CAD), died at home in Ithaca, July 31, 1997. He was 48 years of age.

Professor Taylor joined the faculty of Cornell's Sibley School of Mechanical and Aerospace Engineering in 1976 after graduate study at Stanford where he completed his Ph.D. degree in 1975. His undergraduate degree was earned at Oklahoma State University in 1971. He served as the Sibley School's Associate Director from 1991-96, leading a major curriculum review and revision. He was elected as a Fellow of the American Society of Mechanical Engineers in 1995, and was honored with the Cornell College of Engineering's Excellence in Teaching Award in 1989. He was a Visiting Research Fellow at the University of Birmingham, United Kingdom, in 1981 and a Visiting Scholar at the University of California at Berkeley in 1990.

He will be remembered as an effective researcher and educator in the fields of system dynamics, computer-aided design, design theory, micromechanical machines, and concurrent engineering. In addition, he made important contributions to the design of bone-implant systems by directing the development of software for determining the geometry and material properties of bones from CT scans. Dean developed important laboratories for research and education, including the Integrated Mechanical Analysis Project Laboratory and its successor, the Biomechanics Computing Laboratory, which is now used extensively for the analysis and design of orthopedic implants and other aspects of the musculoskeletal system.

His textbook, *Computer-Aided Design*, presented a new approach to using the computer for design and analysis. Whereas early computer-aided design systems concentrated on the design and graphical representation of individual components, Taylor sought to expand the capabilities of computer-aided design to represent assemblies of interacting parts and their function as an engineering system.

In addition to teaching in the College of Engineering, Taylor contributed to the continuing education of industrial executives through short courses taught in the Johnson Graduate School of Management at Cornell. He also was active in the Realization Consortium, a national engineering educational effort, and the Cornell Manufacturing Enterprise.

These are the basic facts. We, however, remember him more personally as a colleague who was an innovator, a servant, an innovative teacher, a family man, and a friend.

He was an innovator. Dean was curious and thirsty for knowledge; he wanted to learn about the next thing that would be important. He had a broad horizon and he was more interested in learning about new things than becoming the expert in a narrowly focused area. And so his students worked on the next thing too: on mesh generators for finite element structural analyses; on computer-aided modeling capabilities that enabled other students to analyze and design bone-implant systems; on imaging techniques that could be used to implement robotic orthopedic surgery; on magnetic bearings; on micro electro-mechanical devices; on design theory and product design. Dean wanted to bring the computer to bear on the analysis of mechanical systems and he did by creating the Integrated Mechanical Analysis Laboratory, which evolved into our Biomechanics Computing Lab.

He was a servant. Computer Science needed a computer graphics course and Dean taught one. He served the school during a time of transition. Dean was the Associate Director with three directors in five years, which must be some kind of a record. He served the College of Engineering as Director of the Computer-Aided Design Instructional Facility, one of those next things, in its early years. He served us all—we, his colleagues, always had someone to go to with our questions about computing and computer systems, and someone who more than likely could cut a deal with industry to get the equipment we needed.

He was an innovative teacher. He thought of new ways to teach computer-aided design and produced a textbook to do it. He envisioned new ways of teaching design and analysis to sophomores and moved a curriculum to include it and developed a design studio, “The Design Studio of the Future”, to implement it. “We as engineers”, he said to a colleague only a few weeks before he passed away, “have a lot to learn from the professional schools—business, law, veterinary medicine”—and he worked with architecture to develop the design studio and with the Johnson School to teach leaders from industry.

He was a family man. We knew that he was proud of his wife, Kathy, and his daughter, Lauren, and their many accomplishments. His ability to juggle the responsibilities of family and career was admired.

He was a friend. An avid sailor, he shared his enthusiasm for the sea by taking students and a colleague’s son with him on summer sailing excursions. He introduced friends to good books, technical and otherwise, and his easy way with students was appreciated by those of us who are more introverted.

He was away from the Sibley School during the 1996-97 academic year. He came back to Cornell toward the end of the summer of 1997 after his sabbatical leave, after a family vacation in Europe and England, eager to innovate, ready to teach, ready to advise members of the Class of ‘01, full of energy, and ideas, and enthusiasm, and great

joy. We shall miss him. The design studio of the future now bears his name. We are grateful for the reminder it provides of his contributions to Cornell and to those of us privileged to know him as a colleague and friend.

Now finale to the shore!

Now, land and life, finale, and farewell!

Now Voyager depart! (much, much for thee is yet in store;)

...Depart upon thy endless cruise, old Sailor!

From Now Finale to the Shore, Walt Whitman, Leaves of Grass

Albert George, Frank Moon, Donald Bartel

Cyrl Waldie Terry

July 15, 1905 — April 25, 1994

Cyrl W. Terry was born in Brooklyn, Pennsylvania, and during his early years he worked there with his father in a hardware and farm machinery business. He came to Ithaca in 1922 and earned all of his degrees at Cornell University, the M.E. in 1926, the M.M.E. in 1929, and the Ph.D. in 1948.

With the exception of nearly four years during World War II, Dr. Terry, Emeritus Professor of Agricultural Engineering, served Cornell University continuously for thirty-six years. He began his teaching career as an Instructor in 1926 and retired as a full Professor on July 31, 1962.

From 1926-36, he was an Instructor in the College of Engineering, teaching materials testing, experimental engineering, kinematics, and machine design. During the summers of 1928-29, he served as Assistant Technical Director of Product Testing for Sears Roebuck & Company. In 1936, he was in charge of instruction in mechanics, aerodynamics, and shop processes for Luscombe Airplane Company. From 1936 to 1941, he was Assistant Professor in charge of the Aero option courses, including aerodynamics, aircraft engine design and flight test methods. He also taught diesel engine courses for the U.S. Navy.

In the fall of 1941, Professor Terry left Cornell to become Ground School Instructor for Plains Airways. During World War II, he was the Director of Flight Research for Ryan Aero Company and was in charge of the flight test program for the FR-1 Ryan "Fireball".

Dr. Terry returned to Cornell in 1945 as an Associate Professor and Acting Head of the Aero Engineering Department. He joined the faculty of the Department of Agricultural Engineering in 1946 as a Research Associate and Ph.D. candidate, with thesis research on hay drying. He was promoted to full Professor in 1948. He continued in this capacity until his retirement in 1962. His research interests were in pesticide application equipment, tractor stability and effective braking systems. His teaching was in farm power, agricultural machine design and special problems for seniors and graduate students.

Dr. Terry's broad experience in the application of the physical sciences and engineering theory made him a valuable consultant to members of the staff and faculty of the Department of Agricultural Engineering. Cy often suggested simplified solutions to perplexing problems and greatly enjoyed the variety of challenges that agricultural applications posed.

Dr. Terry was active in professional and honorary societies, including: American Society of Agricultural Engineers, Institute of Aeronautical Sciences, Society of Automotive Engineers, American Society for Advancement of Science, Sigma Xi and Phi Kappa Phi.

He obtained his license to fly in 1932 and was an enthusiastic member of the Cornell Glider Club in the 1930s.

An active Mason, Professor Terry was Master of the Hobasco Lodge 716 in 1948 and President of the Tompkins County Shrine Club in 1955. He also held the post of Thrice Potent Master for the Ithaca Lodge of Perfection, Scottish Rite Masons.

Upon retirement in 1962, Dr. Terry became Assistant to the Head of Mechanical Engineering at the Navy Civil Engineering Laboratory at Port Hueneme, California. This position required his presence on numerous projects in Antarctica.

Cy was an avid square dancer and in recent years was an active member of the Men's Group of the Senior Citizens of Tompkins County.

W.F. Millier, E. Stanley Shepardson

Glenn Hanna Thacker

March 20, 1914 — October 15, 2002

Glenn Hanna Thacker was born in Falls City, Nebraska on March 20, 1914 and grew up on farms in Richardson County, Nebraska. He obtained a Bachelor of Science degree in Agriculture from the University of Nebraska in 1940 and following graduation, operated a general farm for twelve years in Case County, Nebraska. Thacker served as Extension Poultryman at the University of Nebraska, Lincoln, 1952-56, and held a similar position at Iowa State University, Ames, in 1956 and 1957. He entered graduate school at Cornell University, majoring in business management with a minor in farm management and conducting his graduate research on the economics of turkey production in Iowa. As a graduate student, Thacker served as Acting Assistant Professor in the Department of Poultry Husbandry at Cornell University. He received the Master of Science degree in 1958 and was appointed Assistant Professor of Extension. He was promoted to Associate Professor in 1964.

Glenn Thacker's appointment at Cornell University was primarily in the area of poultry extension with emphasis on poultry business management. Thacker's program served most kinds of poultry farming in New York State, but his greatest effort was in the areas of egg production and turkey production. He was well known throughout the State as a result of his many farm visits and extension presentations and numerous articles in *Cornell Poultry Pointers*, extension bulletins, and extension newsletters. He cooperated with the Department of Agricultural Economics in the preparation of Poultry Outlook and co-authored the annual *Poultry Business Summary* and the newsletter, Egg Business. Thacker's appointment also included an instructional component. Glenn Thacker especially enjoyed teaching his undergraduate course in poultry business management and supervising undergraduate students in independent projects.

Glenn Thacker's contributions to poultry extension extended to many aspects of poultry management. Thacker, for example, studied poultry feed prices in New York State, Texas, and Washington while he was on sabbatic leave at Washington State University and Texas A & M University in 1965-66. He found wide variations in the prices paid by farmers for feed. His study resulted in the development of a quarterly feed price survey that was a valuable tool for the poultry industry for more than a decade. Thacker also became interested in factors influencing losses of eggs due to breakage, a major economic problem for the egg industry. He investigated eggshell damage on farms in New York State and subsequently studied egg breakage on farms in Arkansas while on sabbatic leave at the University of Arkansas in 1974. He wrote numerous extension articles on the control of eggshell damage on the farm.

Glenn Thacker was a member of the Poultry Science Association and the American Economics Association, and was a participant in the Northeast Poultry Extension Specialists organization. He was elected Professor Emeritus of Poultry Science after 20 years of service in 1977. Glenn and his wife, Ruth, resided in retirement in Buena Vista, Arkansas.

Robert C. Baker, Robert J. Young, Richard E. Austic

Romeyn Yatman Thatcher

November 9, 1885 — February 11, 1963

Professor Emeritus Romeyn Yatman Thatcher had a long and distinguished association with Cornell University that started with his enrollment in the Class of 1909 and was broken by his death February 11, 1963. He served his University with a steady consistency, which was characteristic of his life.

Professor Thatcher was born in Buffalo, New York, November 9, 1885, the son of Frank H. and Marietta Taylor Thatcher. He was educated in the Buffalo school system, graduating first in his class from Public School No. 19 and third in a class of 200 from Buffalo Central High School in 1904.

Professor Thatcher entered the Civil Engineering at Cornell in September 1905. As a student, he was active in the Andrew D. White Debating Club, belonged to the Scalp and Blade Society, and was a member of the varsity cross-country team and track squad. He graduated from Cornell with a fine scholastic record in June 1909. His interest in track continued after graduation as he served for over thirty years as an official for both indoor and outdoor meets. His specialty in officiating was the pole vault in which he was an expert.

After graduation, Professor Thatcher joined the civil engineering staff of the New York Central Railroad in the maintenance of way department, where he remained until 1915. During the years 1915-1918 he was engaged with the Interstate Commerce Commission on a project dealing with the valuation of railroads. In 1918 he joined the Bethlehem Steel Company, Lackawanna Plant, as head of their civil engineering department, where he remained until 1924.

Cornell University called Professor Thatcher back to Ithaca as an instructor in 1924 to teach engineering law, engineering economics, engineering construction, and route surveying. His promotion to Assistant Professor came in 1926, to Associate Professor in 1942, and to Professor in 1946. He served in the School of Civil Engineering as the head of the Department of Engineering Management from 1946 until his retirement in 1953.

Professor Thatcher served on innumerable committees of the school, college, and university. He also served on the Board of Managers and Governors of Willard Straight Hall, as well as acting as consultant on various railroad investigations. He will be remembered for his help to the *Cornell Engineer* as a contributor and as a member of the Board of Advisors. During World War II he supervised war-training classes in seven New York State cities and was active in the development of Camp Atterbury, Columbus, Indiana.

Professor Thatcher faithfully served his country, his community, and his church. He was active for many years in the Boy Scouts as a committeeman and worked for the Ithaca Community Chest. The influence of his father, a Y.M.C.A. Secretary, was evident in his lifelong close association with the Presbyterian Church in which he held the office of Elder.

The associates of Professor Thatcher remember him for his devotion as a teacher, for his solid judgment, for his sound philosophical outlook, and for his calm and firm attitude. He took pride, in particular, in his effectiveness as a teacher. His teammates in bowling remember him as “anchorman” on University No. 1, in the Old Forest City League. An “anchorman” must be as steady as the name implies. It is believed that “Thatch” lived up to those specifications as closely as was humanly possible.

John C. Gebhard, John E. Perry, Taylor D. Lewis

Frank Thilly

Professor of Philosophy

— Dec. 28, 1934

In the death of Professor Frank Thilly the University has lost one of its most revered teachers and the community one of its best loved members.

Professor Thilly was twice connected with Cornell University, as Fellow of the Sage School of Philosophy and as Instructor, in 1891-93, and as Professor of Philosophy from 1906 until his death. As a young man, at a time when European training was less common than it now is, he brought to America the sound tradition of philosophical scholarship which he learned from the great teachers of Germany and notably from Kuno Fischer. His eleven years of service at the University of Missouri had a permanent influence on the standards of higher education in the Middle West. He returned to Cornell with a rich experience gained both in that University and in the two years of his professorship at Princeton.

His main concern, as a teacher and as a member of many faculty committees, was to center attention upon the essential values of education. This was manifest in the policies which he advocated as a member of the Faculty and as Dean of his College, and in his activities outside the University. With him the freedom of teaching and the perfect democracy of the intellectual life were the roots of every thought and every act. It was this conviction which led him to take an active part in the founding of the American Association of University Professors, of which he was national president.

The breadth and the accuracy of his learning made him a notable figure in his profession. By his translations he made accessible to readers of English some of the best works of German philosophical scholarship. To the leading American and European philosophical journals he contributed, for a long period of years, searching reviews of current works and authoritative articles on a wide range of topics. He was editor of the *International Journal of Ethics*, associate editor of *Kantstudien*, and one of the editors of the *Philosophical Review*, to which he was a contributor from its first number. His *Introduction to Ethics* and his *History of Philosophy* not only raised the standard of instruction in those parts of his subject in which he was especially interested but also displayed his devotion to truth and opened to many the way of understanding in a difficult science. It was his effort largely which led to the founding of the American Philosophical Association, of which he was president. His teaching was marked by a wealth of knowledge, but it was informed also by a winning and beautiful personality. His courses

exerted a lasting influence on the lives of many students, and of those who owed their professional training to him many have risen to important posts.

In him the cultivation bred of humane studies and the urbanity drawn from a cosmopolitan experience united with the simplicity of innate democracy to form a nature that embodied the best of the American spirit. His honesty of thought and deed, his industry and persistence in all good causes, and his aspiration toward the highest ends are built into the universities in which he taught, into his profession, and into the characters of those who studied with him. His gentleness and humor, his gaiety of spirit, and his singular charm are a green memory in the minds of many friends.

Source: Fac. Rec., p. 1870-73 Resolutions of the Trustees and Faculty of Cornell University, February, Nineteen Hundred And Thirty-Five

David A. Thomas

July 5, 1917 — June 28, 2004

Over a thirty-one year period, David A. Thomas was a Professor of Accounting, Associate Dean, Dean, and Dean Emeritus of the S.C. Johnson Graduate School of Management of Cornell University. The Johnson School was called the Graduate School of Business and Public Administration (B and PA) and housed in McGraw Hall and Malott Hall for most of Dave's career.

Dave was born and grew up in west Texas and he earned his B.A. degree from Texas Tech (Lubbock, Texas) in 1937 at the age of 20. He was elected to Phi Beta Kappa. Dave loved to tell tales of his childhood. He told of his father taking out his six-gun and going to the Texas Rangers and joining their posse searching for outlaws. He had a difficult youth in a hard part of the country (he did not enjoy riding horses) and he loved living in Ithaca.

Dave served as a combat staff intelligence officer and rose to the rank of Captain in the Army Air Corps during World War II, and was one of the early arrivals on Iwo Jima. When World War II ended, he returned to Texas to earn his M.B.A. degree at Texas Christian University. He also earned his C.P.A. degree in 1948 and taught accounting at TCU. He was an Instructor, 1946-48; an Assistant Professor, 1948-49; and then an Associate Professor.

In 1949, he went to the University of Michigan to work on his Ph.D. degree in Accounting, studying with Professor W.A. Paton (one of the leading accounting educators of the 20th century). He received his Ph.D. degree in 1956.

He was the twelfth professor hired by Cornell's young Graduate School of Business and Public Administration, appointed as an Assistant Professor in 1953. In 1956, Dave received tenure as an Associate Professor, and was appointed a full Professor in 1957. In 1956, he became the School's Associate Dean—a position he held for over twenty years. He was a Dean who got things done. He never said no to a reasonable request. During his time as Associate Dean, he continued to teach the basic accounting course. He also served as the School's Acting Dean, 1961-62 and 1968-69, building the skills that would serve him well in his later deanship.

Dave was named Dean in 1981 and under his leadership, several critical changes were implemented. The primary change was to drop the public and health programs in order to better focus the School's resources on its core strengths. Unfortunately, when he became Dean he was unable to continue teaching. While an outstanding dean, he will be primarily remembered as a beloved teacher by many students he shepherded through accounting.

Dave was also importantly involved during most of his career with the Charles E. Merrill Trust, a family foundation engaged in philanthropic activities. He recommended the distribution of more than \$120 million to education institutions, religious charities and social service organizations. One of his many recommendations led to the University of Chicago's famous collection of stock price data that has culminated in dramatic research insights and advances in the art of investment. Dave was the President of Cornell University's Faculty Statler Club from 1977-79.

After his retirement in June 1984, Dave expanded his hobby of painting pictures, one of which currently hangs in Sage Hall.

Dave's wife, Libby, survives him, as does his daughter, Ann, and her two children. Dave died on June 28, 2004 in Venice, Florida. He was 86 years old. Dave was always a soft-spoken gentleman who treated everyone with whom he associated with respect and in a gentle firm manner. Let it be said that no teacher of accounting was better loved by his students.

Tom Dyckman, Sy Smidt, Hal Bierman

George Jarvis Thompson

August 26, 1886 — January 9, 1957

George Jarvis Thompson for thirty years lived with us in our university and in our community. He came to Cornell with an established standing in the world of legal scholarship. China had known him in his youth, he had taught elsewhere in the United States; but it was at Cornell that Thompson flowered and it is upon his Cornell students that he most impressed himself. On them he lavished a paternal care that was always personal on his side yet always individualized on theirs. He guided the gropers and the fast-paced with equal skill and understanding. He was not only a wheel horse in the Law School. His activities extended into civic, fraternity and church affairs. To his Cornell duties and these other multitudinous aspects of good citizenship he gave himself without stint. Always the busy man, he never found it possible to refuse more work to do. It was typical that when the call came for him he was in harness.

Yet the load of things which he had “got to do” never lessened his cheerfulness. The light that was in him and his good heart were manifest in the most casual of contacts with him. He could show righteous indignation over principles and for causes; but for the fellow mortal he had no meanness of spirit. His insight into men and motives was penetrating; but his attitude was tolerant and it kept his hard words few. Within his world, he lived with students, with colleagues, and with others on a plane of serene good will. For George Thompson the phrase “fragrant memory” is real.

Professor Thompson was born in Asbury Park, New Jersey in 1886. He received the B. S. from the University of Pennsylvania in 1909; the LL.B. from the Harvard Law School in 1912, and the Harvard graduate degree in Jurisprudence—the S.J.D.—in 1918. After practice in various cities and teaching at Pei Yang University in Tientsin, China and at Pittsburgh University, he came to the Cornell Law School in 1926 as Professor of Law. In 1951 he was elected to the E. H. Woodruff Professorship and he was still in full career when he died. Next year he was due to start anew at the University of California Hastings College of Law. He had been approached to teach thereafter at Kyoto University in Japan, thus rounding out his teaching in the Orient where it began.

His wide contacts are shown in his membership in the Bar of the United States Court for China, of the States of Massachusetts, New York, New Jersey and Pennsylvania. In 1918-1919 he held the Thayer Fellowship at the Harvard Law School. He was a member of learned and professional societies and a consultant on various legal undertakings both state and federal.

His writings were voluminous. He was a historian of the law. He wrote "The Development of the Anglo-American Judicial System". But he is best known for his work in the field of Contract Law especially as the co-author of the revised edition of the monumental *Williston on Contracts* in eight volumes.

In the Law School curriculum he had taught and remained at home in a long list of subjects both in the private and public field. But in recent years he had confined himself to Contract Law with the first year students and with the maturer men to the impact of law on Business. His temperament and his personality made him particularly effective with beginners, and his wide experience made his other classes no less notable.

In the Law School world outside Cornell he sat on various committees of the nationwide Association of American Law Schools, and was chairman of its committee which produced "Selected Readings in the Law of Contracts." Thompson edited a series of specialist articles into a comprehensive treatise on the general subject. He was a long time Member of the American Law Institute which for years has been restating and defining specific parts of the law, devoting himself primarily to the law of contracts.

In the university world generally Professor Thompson was active in the American Association of University Professors and took part in the investigation of various educational institutions which the Association examined from time to time. From 1946 to 1948 he was President of the Cornell Chapter of the Association, and in 1949 a member of the National Council.

In 1914 on the eve of his departure for China Mr. Thompson married Ruth Warren Barnes and took her into the hazard of new fortunes in an ancient land. The long and happy marriage ended with his death. Their two boys, George, Jr. and Leonard, who both served in the Navy during World War II, also survive and there are five grandchildren.

G. H. Robinson, R. S. Stevens, O. D. Von Engeln

Harold William Thompson

June 5, 1891 — February 21, 1964

The academic world has lost a vigorous, wise, and popular teacher of English and American literature; an internationally recognized scholar; a talented musician as organist, composer, and critic; and a folklorist who by his teaching, lecturing, and writing did perhaps more than any other man of his time to develop the interest of New Yorkers in their lore and traditions. Few men have managed so successfully as Harold William Thompson, Goldwin Smith Professor of English, Emeritus, to achieve distinction in the pursuit of so wide a variety of interests.

Of second-generation Scotch-Irish extraction, Thompson was born in Buffalo, New York, the son of Samuel Joseph and Katherine (Kernahan) Thompson. Until he was ten he lived chiefly near New York City; but, upon the death of his father, his mother moved her family of three children to the home of his paternal grandfather in Westfield, New York. The Thompson family roots were and are in Westfield, and, though Harold Thompson lived there only from the age of ten until he entered Hamilton College, Westfield was always home to him and he chose finally to be buried there.

The influence of Hamilton College was strong in the village, and there was probably little thought of choosing any other college when Thompson was graduated from the Westfield high school in 1908. Hamilton, a “classical” college of about two hundred students, in those years was presided over by a dynamic personality, the Reverend Melancthon Woolsey Stryker, whose twenty-five year presidency has been called “a despotism tempered by epigram.” Something of the vigor of expression and manner of the “Old Prex” may well have had effect on Thompson. His association with Stryker was close, since throughout his four college years Thompson was the organist at the seven-day-a-week chapel at which the president was both preacher and choir leader.

Thompson’s Hamilton years were busy. He directed a village choir, sang first tenor in the Glee Club, won prizes for excellence in German and oratory, and was elected to the senior honorary society. Though suffering from a lifelong handicap, extreme nearsightedness, he never allowed the handicap, then or subsequently, to prevent omnivorous reading and intensive scholarly work. He was graduated as Bachelor of Philosophy in 1912 and chosen valedictorian of his class.

Thompson went on to graduate work in English at Harvard University, which had at that time perhaps the most distinguished English department any university has ever gathered together. George Lyman Kittredge, Ernest Bernbaum, George Pierce Baker, Fred Norris Robinson, William Allan Neilson, Bliss Perry, and Barrett Wendell

are still names to conjure with in American literary scholarship. Neilson and Perry supervised Thompson's doctoral dissertation on Henry Mackenzie, which was completed with distinction and dispatch in 1915.

He began his career as a teacher in the New York State College for Teachers at Albany, which had recently been changed into a liberal arts college for the training of high school teachers. Here his advancement was rapid. After only six years he was promoted to a position created by a special act of the Legislature—"Professor of American Literature and Public Address." In spite of the limitations of this title, he regularly taught a large course in Shakespeare and courses in eighteenth-century English literature and in Scottish literature. His popular courses in folklore were a later development. From 1920 to 1924 he served also as head of the Department of Music, and for some years he directed a chorus, as well as serving as organist of the First Presbyterian Church of Albany. He coached debating teams and was a leader in the development of the intercollegiate New York State Debate Assembly.

The early years of his career left little time for scholarship, but the urge to writing and research persisted. Finally in 1925 the award of one of the first fifteen Guggenheim Fellowships gave him the opportunity to go to Scotland and complete the work on Henry Mackenzie he had begun at Harvard. As the first American candidate for the degree of Doctor of Letters at Edinburgh University, he worked under the supervision of Professor (later Sir) Herbert J. C. Grierson. Thompson's efforts to locate the long-unpublished manuscript of Henry Mackenzie's "Anecdotes and Egotisms" were successful, and in 1927 the Oxford University Press published his edition of the work. It is still a model of editing, accurately rendered and annotated with judgment and restraint. Edinburgh awarded Thompson the degree of Doctor of Letters, and he was elected a Fellow both of the Society of Antiquaries of Scotland and of the Royal Society of Edinburgh.

The most important result of his studies in Scotland was the completion of his work on Mackenzie and his times, published in 1931 by the Oxford University Press with the title *A Scottish Man of Feeling: Some Account of Henry Mackenzie, Esq., of Edinburgh, and of the Golden Age of Burns and Scott*. This was a pioneering work. *The London Times Literary Supplement* hailed it as more than a biography, as "a book that no critic of modern letters can afford to leave unread."

The book established Thompson's reputation as an authority on eighteenth-century literature. Many a scholar would have remained content to plow further in that field; he was not. After 1931 he increasingly became absorbed in American literature and folklore. His audience as a folklorist grew beyond State College; beginning in 1932 he taught every summer huge courses in the Cornell Summer Session. In 1935 he instituted a radio program on

folklore over Station WGY. No teacher in the East was so successful in interesting students in the legends and history of their communities, in tracking down stories and ballads, tall tales and epitaphs, unpublished manuscripts and broadside ballads. Many of his students turned up material that might otherwise have been irretrievably lost. Such, for instance, was the manuscript of Robert Coffin's adventures in the South Pacific, which Thompson edited and published in 1941 under the title *The Last of the "Logan."*

In time his filing cases bulged with lore he and his students had collected. Much of the material for his big, bursting book on New York State folklore, *Body, Boots and Britches* (1939), came from those files, but the book was no mere compilation; it bears throughout the impress of his own personality and his love for his subject. He enjoyed doing the book, and others have enjoyed reading it ever since.

Thompson joined the Cornell Faculty as Professor of English in 1940. The transplanting from State College, though late, was eminently successful. He quickly became one of the most popular professors in the University. Students flocked to his courses in American literature and folklore. He was in constant demand as a speaker to student and other groups, some years delivering as many as fifty addresses in and outside the University. In the crowded postwar Cornell he sometimes taught more than five hundred students a term. In his nineteen years at Cornell he directed over a hundred dissertations of candidates for advanced degrees. Many of his students have made important contributions to the knowledge of both American literature and folklore. Thompson continued vigorously his own work in folklore; he was president of the American Folklore Society (1942) and of the New York Folklore Society (1943-1949); he was a member of the Council of the Pennsylvania Society and founded (1945) the *New York Folklore Quarterly*, which he edited from 1950 to 1955.

He was at the height of his busy career when in 1950 he suffered what at first threatened to be a crippling stroke. With courage and patience he faced bravely the much more restricted life he henceforth had to lead. He by no means shelved himself, however; Cornell recognized that by appointing him Goldwin Smith Professor of English in 1951. He continued to teach, until his retirement in 1959, his ever-popular course "American Folklore" and a series of advanced courses in American literature. He had to relinquish the column on ecclesiastical music that he had conducted for *The Diapason* since 1918, but he did not give up other writing. In 1958 Cornell University Press published his edition of *A Pioneer Songster*, and he completed a volume of autobiographical recollections which is as yet unpublished.

Over the years he acquired a number of honors and distinctions in addition to those already mentioned: honorary degrees, Doctor of Music (Hamilton College), and Doctor of Humane Letters (Union College); election as a trustee of Hamilton, 1937-1941. He was at one point Dean of the American Guild of Organists. He was a member of the Modern Language Association, the Scottish History Society, the New York State Historical Association, the St. Andrews Society of Albany, and the Savage Club.

In 1916 he married Jean Alma Saunders; they had a son, Arthur, and a daughter, Katherine (De Porte), who was graduated from Cornell in 1943. In 1942, he married Marion Chesebrough (Ph.D., Cornell, 1953), who is a Professor of English at the State College in Cortland. The year after his retirement, he moved to Cortland. He died in that city on February 21, 1964, after a prolonged illness.

His friends and students at Cornell, honoring him for his distinguished career as teacher and scholar, will also long remember him as a man—a man of intense loyalties, a friendly colleague, a generous supporter of many good causes, a genial host and raconteur, a wise and kindly friend and adviser of students. He always gave of himself without stint, and the lives of many are richer because of what he gave.

Harry Caplan, Walter H. French, Francis E. Mineka

Homer Columbus Thompson

January 5, 1885 — April 12, 1976

Professor H. C. Thompson was the leading vegetable scientist in the world for many years.

He was raised on a farm near Gaithersburg, Maryland, and attended the one-room school when farm work allowed. At the age of sixteen he left the farm and obtained work as a student assistant for the U.S. Department of Agriculture in Washington, D.C. Encouraged by his supervisors to get more education he took some night school courses and, in 1904, entered the two-year course in agriculture at Ohio State University since it did not require high school training. Before the end of the first year his professors suggested that he transfer to the four-year course in spite of the fact that he had only about one-fourth of the entrance requirements. He transferred to the four-year degree program and fulfilled the entrance requirements by examination, the last one shortly before receiving the B.S. in 1909.

During his college years, he continued working for the U.S. Department of Agriculture during summers and a full year in 1905-6, when he took time off from his college work. After graduating he served as assistant professor of horticulture at Mississippi A & M College for one year and as associate professor of horticulture at Clemson College the next year before rejoining the U.S. Department of Agriculture as project leader in truck crop production investigations.

During the First World War increased food production had first priority in agricultural research. Dr. Thompson's research had demonstrated that about one-third of the sweet potato crop was lost after harvest. He studied successful storage houses and combined the good features in some demonstration storage houses at several locations. The success of these demonstrations led to hundreds of storage houses being built throughout the South. His interest in sweet potatoes never lagged, and in 1929 he wrote the book *Sweet Potato Production and Handling*.

His career at Cornell began in 1918 when he was appointed professor in the Department of Farm Crops to work with vegetables. In 1921 he became head of the new Department of Vegetable Gardening (the Department of Vegetable Crops after 1931) after serving two years as acting head of the Department of Farm Crops. After coming to Cornell he began graduate work at Ohio State and by utilizing a three-month leave each year and part of a sabbatical leave, he received his M.S. in 1923 and his Ph.D. in 1926.

His study of the premature seeding of celery is a classic of horticultural research. He discovered that flowering of celery was controlled by temperature, and he devised growing techniques that prevented flowering of celery when grown for market and that accelerated flowering when desired for seed production.

Widely known for his training of graduate students, at the time of his retirement, he had trained more than half the men in the country with advanced degrees in vegetable crops. Some of his graduate students continued his work on flowering of biennial crops including celery, cabbage, beets, onions, and carrots. They also studied the importance of shallow cultivation of vegetable crops and did research on handling and storage of vegetables. He tried to pass to his students a research philosophy that one does not spend a lot of time finding out why something happened without first making sure that it does happen. His doctoral dissertation on cultivation illustrated the point. His objective approach to the problem showed that many previously held assumptions were not true, and much time had been wasted trying to explain these false assumptions.

He was not impressed by elaborate equipment or elaborate explanations. Asking the right questions and using the simplest possible experiments to answer them was preferable to using a lot of sophisticated equipment without knowing how the results would help solve the problem at hand. He urged his students to undertake some research that would yield quick results for the benefit of farmers, as well as longer term research of a more fundamental nature.

Author of *Vegetable Crops*, a standard textbook used in most agricultural colleges in the country and in many parts of the world since its first publication in 1923, Professor Thompson published the fifth revised edition of this book in 1957, with Professor William C. Kelly as coauthor. The textbook set a new standard of excellence when it was published in 1923. It was one of the first agricultural texts to utilize and cite the results of experiments. He also wrote the book *Asparagus Production*, and many articles and bulletins on vegetable growing and handling.

He was not an easy taskmaster, but students came to him in large numbers because they knew he was fair and what he asked of them was for their own good. He retained the respect and loyalty of his graduate students and kept in close touch with them wherever they went. Even the ones who didn't obtain a Ph.D. degree and assistant professors who didn't get promoted to tenure felt the same way about him as the more successful ones, because they knew that he had treated them all fairly.

One of his less tangible but equally real contributions was the feeling of belonging he created in his department. Part of it was due to the warmth and hospitality of both Professor and Mrs. Thompson. Part of it was the daily

operation of the department in which everyone was made to feel that he or she had an important role to play, whether as stenographer, field helper, laboratory technician, or professor.

For three years following his retirement in 1951, Professor Thompson was head of the Plant Industry Department and director of research and education of the Inter-American Institute of Agricultural Sciences at Turrialba, Costa Rica.

In 1957, as president of the Ithaca Rotary Club, he attended the Rotary International meeting in Switzerland and visited a number of former students in Europe. In 1961, he was invited to Egypt by the minister of agriculture, a former student, where he counseled with agricultural and government specialists and visited other nearby countries before returning home.

Professor Thompson was named Vegetable Man of the Year in 1960 by the Vegetable Growers Association of America, and in 1965 he was elected a fellow of the American Society for Horticultural Science, of which he was president in 1925. He was also a fellow of the American Association for the Advancement of Science.

Dr. Thompson is survived by his wife, Clara Smith Thompson; two sons, John and David; nine grandchildren; and two great-grandchildren. Dr. John F. Thompson is plant physiologist with the U.S.D.A.'s Plant, Soil and Nutrition Laboratory on the Cornell campus. Dr. David D. Thompson is director of the New York Hospital, part of the Cornell Medical College complex in New York City.

H. C. Thompson's influence extended far beyond the circle of those who were privileged to know him personally. The impact of his life and work extends wherever vegetables are grown and will be a lasting memorial to him.

Robert D. Sweet, Henry M. Munger, William C. Kelly

Raymond Gerald Thorpe

January 20, 1921 — September 6, 2005

Professor Thorpe was known simply as “Ray” by his colleagues and friends, and as “Uncle Ray” by the more than 50 classes of Cornell students for which he was a teacher, mentor, advisor, coach, confidant, counselor, and good friend.

His early years in the Navy, during World War II, did much to shape his outlook and to make him the man he was. He was born in Utica, New York, but grew up in Herkimer, New York. Upon graduation from high school in 1938, he enrolled in the chemical engineering program at Rensselaer Polytechnic Institute. In 1941, at the end of his junior year, he joined the Navy, and was commissioned as an Ensign, but after brief training, he was released from active duty to complete his studies at RPI. In December of that year, Pearl Harbor was attacked, plunging the U.S. into World War II, and in May 1942, immediately after receiving his BChE degree, he returned to active duty at the Brooklyn Navy Yard, where he quickly advanced to the post of Ordnance Ships Superintendent.

Unwilling to be confined to a stateside appointment, Ray requested combat duty. After a brief stint on a destroyer escort in the Atlantic, he was assigned as Assistant Gunnery Officer on the USS Bennington, a newly commissioned Essex Class Carrier bound for the Pacific. By May of 1943, he had been promoted to the rank of Lieutenant JG. While on leave in the spring of 1944, he married Eleanor Livingston Crofts in Cortland, New York, and days later was promoted to the rank of Lt (equivalent to Captain in the Army). He held that rank until his discharge nearly two years later.

Over the first six months of 1945, the Bennington saw heavy action in the campaigns at Iwo Jima and Okinawa, two of the most intense battles in the Pacific. Eleven U.S. aircraft carriers were sunk in the Pacific War, and although The Bennington was repeatedly attacked, it never suffered serious damage. Ray and his gun crews were proud of that record. Ray was formally discharged from active service in February 1946, at the age of 25. He served in the Naval Reserve until 1955.

Ray Thorpe was a true American Hero. His military experience strengthened his commitments to integrity, to honor, and to caring for his fellow man. To this he added his own deep sense of compassion, his common sense approach to everything in life, and his ability to inspire and motivate others. It was these characteristics that made him so successful and so well loved for the next 59 years of his life, most of which were devoted to Cornell. Had he remained in the Navy, he would surely have risen to the highest ranks.

But he chose another path. In March 1946, a month after his release from active duty, he enrolled in Chemical Engineering at Cornell, and was awarded the degree of Master of Chemical Engineering in September 1947.

After a brief period as a process engineer at Monsanto, he returned to Cornell in 1949 as a research investigator, and in 1951 was appointed Assistant Professor of Chemical Engineering. Three years later, he was appointed to the rank of Associate Professor with tenure.

From time to time over the years, he taught or assisted in the teaching of almost all the undergraduate courses in Chemical Engineering. His specialty, though, was the sophomore introductory course required for entry into the program. Here the students learned how to think, not just to regurgitate facts; how to marshal information already gained from chemistry and physics to solve practical problems; and how to quantify the performance of flow processes for solids, liquids and gases as these undergo chemical and physical changes. In all of his teaching, Ray demanded rigor, but he also stood eager to help those who struggled. His success as a teacher for 39 years, his remarkable rapport with students, and his ability to motivate and inspire them is the stuff of legend. Students who were overwhelmed by academic pressures and personal problems, were often invited to spend a few days at Ray's home, where he helped them through a difficult period. When they had serious financial difficulties, he would sometimes write a check to bail them out.

The teaching awards he won illustrate the extent of Ray's influence on his students. He twice won the Tau Beta Pi Award for excellence in teaching—in 1974 and in 1983. The student honor society selects the winner of that award. At that time, it was one of a small number of teaching awards, and was the most prestigious in the Engineering College. At the time of his retirement in 1988, he was one of only two faculty members who had won that award twice. In 1982, the School of Chemical Engineering awarded him the title of "Master Teacher." In 1984, the University inaugurated the Merrill Scholars Program, a program under which the top students from the graduating class are screened and 35 are chosen as Merrill Scholars. Typically about six of these are from Engineering. Merrill Scholars are asked to identify the high school teacher and the Cornell Professor who contributed most to their success. In the first four years of that program, there were four Merrill Scholars from Chemical Engineering, and they all identified Ray as the Cornell faculty member who had contributed the most to their success. No other faculty member in the University came close to that accomplishment during that time. The Chemical Engineering Alumni have further honored Ray by endowing the Thorpe Lectureship, which annually brings to campus outstanding leaders from industry, many of whom are his former students.

A few other brief notes about Ray's career: he was on the staff of the University Division of Unclassified Students from 1973-79, and he was its Director from 1979 until his retirement in 1988. DUS was a kind of "purgatory" where students seeking to transfer to another college were assigned until they met the requirements for transfer. There is a letter in Ray's Cornell files from the Vice Provost for Undergraduate Education, pointing out that before he took over, many of the Deans wanted DUS shut down because it was ineffective, but with Ray's leadership it became highly successful. It gave him the opportunity to help students all across the university.

In 1984, he was appointed to the rank of full Professor, after 30 years as an Associate Professor—a promotion that many recognized as 25 years overdue!

Ray retired at the end of 1988 to care for his wife, Eleanor, who was seriously ill. She died in 1990.

The final chapter in Ray's Cornell career began in 1991 when the Dean of Engineering asked him to return to Cornell to work in the Engineering College Advising Office. He readily agreed, and he worked there continuously until a few weeks before he died. He also taught part time in Chemical Engineering. With his guidance and leadership, he and his colleagues made the Advising Office more effective and successful than it had ever been. He was back in his element, and he loved it.

Outside Cornell, one of Ray's major interests was the civic affairs of Cortlandville, New York, the community where he lived most of his life. He served for many years on the Town Board and as Town Supervisor. A colleague there captured one of his outstanding qualities with the observation, "Ray had a ton of common sense."

Ray is fondly remembered by his colleagues, particularly the eclectic group of professors with whom he lunched regularly at the Statler over the years. That motley gathering at times represented economics, physics, education, and mathematics, in addition to various branches of engineering. Ray's contributions to the discussions were frequent and forceful. He is sorely missed.

His daughter, Kimberly T. Knight; his son, Mark L. Thorpe; and two grandsons, Garrett and Wyatt Thorpe, survive Ray.

Robert K. Finn, Ferdinand Rodriguez, William B. Streett

William Crooks Thro

May 1, 1875 — April 6, 1939

Dr. William Crooks Thro was intimately associated with Cornell University for nearly forty years. Born in Elmira, New York, on May 1, 1875, he received his preliminary education in the public schools of that city, entered Cornell in 1896, and earned the B.S.A. degree in 1900 and the M.A. degree a year later. During the next four years he served as instructor in Histology and Embryology and began his medical studies, receiving his M.D. degree in 1907. After an interval of three years as interne in Bellevue Hospital, bacteriologist in the research laboratories of the New York City Department of Health, and instructor in Bacteriology at University and Bellevue Medical College, he returned to Cornell as assistant professor of Clinical Pathology. He was appointed professor of Clinical Pathology in 1918 and associate professor of Medicine in 1932. In December, 1936, he retired from active service because of ill health; his death occurred on April 6, 1939.

Dr. Thro will best be remembered by his associates at Cornell as a teacher of medicine. His approach was always practical, never didactic. There was a friendly informality in all his contacts with students and he had a natural gift for arousing and holding their interest by the simple clarity with which his subject was presented. His textbook on *Clinical Laboratory Methods* owed its popularity to the same qualities that characterized his work in the classroom and laboratory. Like every great teacher he took a keen interest in the personal problems of his students and gave freely of advice, sympathy, and even more material help when needed. His laboratory and his services were always available to anyone who wished to do serious work in his field.

During his service as assistant to Gage, Comstock, and others in his early collegiate years, Dr. Thro was privileged to see scientific research at its best. The field of investigation had a strong appeal for him and his studies on poliomyelitis, on the streptococci, and on blood dyscrasias were worthy contributions to medical literature. His bibliography, while not voluminous, is select and shows his ever present sense of the practical.

And now this genial, kindly person is gone. His friends will never forget nor cease to miss him. His college will never have a more loyal or devoted servant. Cornell is different, somehow, without Bill Thro.

Robert Henry Thurston

Director of Sibley College and Professor of Mechanical Engineering

— *October 25, 1903*

The Faculty and Instructing Staff of Cornell University, wishing to give voice to the sentiments evoked by the death of their colleague and friend, Professor Robert Henry Thurston, Director of Sibley College, have directed the following to be entered upon the records of the University Faculty and communicated to his family :

Professor Thurston came among us in 1885 when the University had barely entered upon its present era of development, and the college over which he came to preside was still small in numbers and poor in equipment. During the eighteen years of his labors he witnessed the progress of the University in all of its departments and the remarkable growth of Sibley College. His own contribution to this splendid result can hardly be overestimated. To his wise and farsighted policy and his tactful and efficient administration is due, in greatest measure, the development of Sibley College, which now constitutes the largest unit of our University organization and holds an assured place among the foremost technical schools of the world.

In all his relations to general University problems he exhibited the spirit of the scholar and the wisdom of the man of affairs. Serene in temper, sound in judgment, swift and certain in action, he justly exercised a weighty influence in all our counsels.

As a colleague he exhibited an interest in all good learning that bespoke the true scholar and the generous fellow-worker.

As a friend and companion he manifested a cordial sympathy that attracted all who knew him and held them in the bonds of increasing affection.

In all the relations of life he moved upon the higher levels and shewed forth the better qualities of our nature.

His loss falls heavily upon us, his colleagues and friends, upon the College whose head he was, and upon the University in whose history he has borne a distinguished part. It falls most heavily upon his family, whose grief we share and to whom we desire to express our profound and sincere sympathy.

Committee: T. F. Crane, E. W. Huffcut, W. F. Durand

Moses Coit Tiler

Professor of American Constitutional History

— *Dec. 28, 1899*

The special committee appointed at the last meeting to draft resolutions on the death of Professor Moses Coit Tyler reported the following resolution:

“On Friday, the 28th of December, in the last week of the closing century, it pleased God to take from among us our revered colleague, Professor Moses Coit Tyler. To his family, to society, to scholarship and to literature, the loss is heavy. It falls with peculiar weight on this University and on its Faculty. For nearly twenty years his place among us was unique. He came to us, in 1881, ripe, not alone with the training of the scholar, but with a rare social and literary experience. To a wide acquaintance with men of letters on both sides of the sea he added freshly-won prestige of an epoch-making book. Thus from the first he brought to our deliberations and activities the dignity of a matured character and the poise of an assured eminence. In our debates we deferred to his broad knowledge of academic life and to his singular union of a wise conservatism with openness of mind. In the social circle we found him ever courtly of presence, genial of manner, austere of conviction yet buoyant of temper, fertile in thought and in anecdote, delicate in fancy, affluent and happy in diction bubbling with playful humor, yet wielding at need a trenchant irony. In daily life he proved himself a thoughtful neighbor, a tender and loyal friend, sensitive to his own rights but not less quick to recognize those of others. We were proud of what we learned of his work in the class room and in the study; yet, though he was our model in the rigor of his devotion to the tasks of his pen, we knew that he was not less scrupulous in the maintenance of the highest physical vigor, and those of us so happy as sometimes to share with him his walks or his rides knew, too, what a love of nature and of common life, what a boyish glee in out-of-doors, were his to the end. Above all, and at the heart of all, we felt him a man of reverence and of faith, broad yet earnest, tolerant yet devout ; and the graces of his personality drew their best charm from the deeper sanctities of his character. Such a man we do well to mourn.”

Source: Records, p. 141, February 8, 1901

John Neal Tilton

June 16, 1891 — May 29, 1970

Professor John Neal Tilton came to Cornell in 1909 from Chicago, where he had been born and reared, to study architecture. In 1913 he received the degree of Bachelor of Architecture and a year later that of Master of Architecture.

He then returned to Chicago, and, with the exception of two years as an officer in the U. S. Army Air Corps during World War I, worked as an architectural designer for Marshall and Fox, Architects, until 1926. At that time he formed a partnership under the name of Armstrong, Furst, and Tilton, practicing in Chicago.

In 1932 he left Chicago and joined the faculty of the College of Architecture at Cornell as an assistant professor, becoming professor in 1936. In 1937-38 he served as acting dean of the College, from 1938-40 as assistant dean, and from 1940-45 as secretary. In 1959, after twenty-seven years of dedicated service, he became professor of architecture, emeritus. During his tenure at Cornell, Professor Tilton retained his partnership in Chicago on a part-time basis.

Professor Tilton taught with distinction and great devotion and served well generations of Cornell students. His special fields of interest were in the area of working drawings, specifications, and mechanical equipment of buildings. In addition to his teaching responsibilities he served on a number of University committees, including the University Aptitude Committee, the Executive Committee on Student War Service, and the University Scholarship Committee. He also served terms as chairman of the Student Conduct Committee and the Committee on Student Activities.

He was active in many professional organizations. He was a long-standing member of the American Institute of Architects, and at one time was secretary of the Central New York Chapter. He was also a member of the honorary societies Tau Beta Pi, Gargoyle, and L'Ogive. In recognition of his dedication to his teaching and to his students, the Association of Collegiate Schools of Architecture awarded Professor Tilton its "Citation for Excellence in Teaching" in 1958.

In addition to serving the University, John Tilton also served his community in many ways. He was one of the most faithful and beloved members of St. John's Episcopal Church, to which he gave freely of his professional

talents, especially in its building and redecorating program and as a member of its vestry. He was also a dedicated member of Rotary International, and was an honorary member of the Ithaca Rotary Club at the time of his death.

In 1940 John Tilton married Hazel Davidson of La Grange, Illinois, who died in 1967.

Professor Tilton died at the age of 78 at the Lakeside Nursing Home, Ithaca, where he had been a resident for two years.

He is survived by a brother, Brigadier General Rolland L. Tilton of Hampton, Virginia, and three nieces.

Stuart M. Barnette, Thomas H. Canfield, Francis W. Saul

Edward Bradford Titchener

Sage Professor of Psychology in the Graduate School

1867 — August 3, 1927

In 1892, just a year after the establishment of the Sage School of Philosophy, Edward Bradford Titchener was appointed to the Chair of Psychology, as assistant professor, and with various changes of title he continued in that office until his sudden death on August 3d, 1927. Trained in the humanistic disciplines and in biology at Oxford, and rigorously schooled in laboratory methods at Leipzig under Wilhelm Wundt, he came here with unusual equipment for scientific investigation and writing: he had buoyant health, astonishing industry and energy, exact and exacting respect for facts, a rare gift for the systematization of knowledge, and the power of clear and precise expression. Long before his death he became the acknowledged “dean of experimental psychology in America.”

Professor Titchener was a man who read swiftly, a man of varied scientific and human interests. His vocational reading included anthropology, biology, polite letters, numismatics, music: and in the last named subjects his discernment and range of knowledge awakened the admiration of experts. As a personality he arrested immediate attention. He was ruggedly and picturesquely individual, straightforward and fearless in argument, and to young and aspiring minds he extended a genial hospitality. He had delightful and illuminating powers of conversation, which few colleagues enjoyed, owing to his self-imposed isolation.

As a teacher of graduate and undergraduate students few professors in the history of the University have achieved his brilliant success. His course of lectures delivered year after year in Goldwin Smith Hall will long be remembered by many generations of students as an undergraduate classic. As scholar, writer, and colleague, his work and example will be deeply and affectionately cherished by his associates.

N. Arnold Tolles

September 21, 1903 — April 10, 1973

Only a few individuals ever approximate as closely as did Arnold Tolles the ideal of devotion to teaching and scholarship combined with public service. His unexpected death on April 10, 1973, while he was teaching a class, followed the announcement only a few days earlier of Arnold's intention to stand for election to the Tompkins County Board of Representatives. He did not distinguish between the two spheres, however; in both his political and his academic roles, Arnold was above all an educator.

Professor Tolles was born in New York City in September 1903. At the age of sixteen he enrolled in the School of Commerce, University of Chicago, which three years later conferred on him the B. Phil, degree in economics, with high honors. A year later he earned his M.S. at the same institution. At about this time he began to work on his Ph.D. dissertation, a study of the economics of unemployment insurance in Great Britain. Along the way there was a year at Harvard University, which awarded an M.S. degree in 1926, and a further year of study at the London School of Economics. The Ph.D. in economics was conferred by the University of Chicago in 1932. During most of his professional career, Professor Tolles was a member of the American Economic Association, the American Statistical Association, and the Industrial Relations Research Association.

Arnold's career as a college teacher began as instructor and then assistant professor at Mount Holyoke in 1929. For a while he was also a part-time instructor in economics at Smith College, until in 1935 he left the academic world to enter government service. In Washington he joined the U.S. Bureau of Labor Statistics, where he remained until 1945 except for a two-year stint as assistant director and director of research in the U.S. Department of Labor's new Wage-Hour Division. There was also a brief assignment in 1940 to the Labor Division of the U.S. Advisory Commission to the National Defense Council. In the Bureau of Labor Statistics, Arnold concentrated on wage problems, but his intelligence and ability to deal with industrial relations in broad perspective led to a succession of higher administrative appointments, terminating with the position of assistant commissioner in charge of program planning for the Bureau.

Arnold resumed his academic career at the close of World War II, first on the faculty of American University and then, in 1947, as professor at Cornell's newly-established New York State School of Industrial and Labor Relations. He remained in this post until his retirement in July 1969 and was appointed professor emeritus in July 1971.

Experience in government as well as his academic background matched the ILR School's needs, and Arnold was influential in shaping its first curriculum in economics. He was also active in developing the School's extension program in its early days. His research reflected Arnold's continuing effort to relate concept and practice. In 1962, for example, he served as chairman and contributed a working paper to the work of a special committee of the Interstate Conference on Labor Statistics formed to improve the usefulness of area wage statistics. In 1965 he directed a study of the salaries of professional economists for the American Economic Association.

Teaching, however, was Professor Tolles's highest priority. More often than not at his own insistence Arnold carried a course load in excess of the accepted norm. For several years, also, he was the driving force behind an annual conference on the teaching of economics. He was also founder of the New York State Economic Association, which he served as president in 1961. For two years following his retirement, he taught part time at Cornell and, in the second of those years, also taught at the State University College at Geneseo, in its department of economics. There, too, even in the brief tenure before his death, Arnold contributed significantly to the improvement of its teaching program.

Arnold first entered local politics as a candidate for city alderman in 1957, losing by a tie-breaking vote. In 1965, his second attempt for this office was successful, and he served two terms. In 1969, he was defeated by a small margin in his bid to become mayor of Ithaca. At the time of his death he was a member of the Tompkins County Board of Representatives, to which he had been appointed in 1971 to fill a vacant seat. Arnold was throughout his years in Ithaca a faithful and valued member of the local Democratic party.

Arnold's first marriage to Marian Donahue Tolles ended with her untimely death in December 1969. He is survived by his second wife, Martha Tolles, and two daughters, Patricia and Harriet.

Robert H. Ferguson, Vernon H. Jensen, Robert L. Aronson

Frederick Kwai Tuck Tom

September 9, 1920 — June 17, 1993

Frederick K.T. Tom was a master teacher and internationally famous teacher educator. Well-known for his sensitivity to the needs of his students and associates alike, he flourished in the roles of counselor, adviser, and team player. He was a true believer in “learning by doing/” and problem-solving, and used them as approaches to his teaching, learning, and everyday life. His influence as an international educator spanned his entire career.

Born in Honolulu, Hawaii, on September 9, 1920, he graduated from Lahainaluna High School in 1938 and was the Maui recipient of the University of Hawaii Territorial Scholarship. He was graduated in 1942 with a Bachelor’s degree from UH-Manoa, where he was president of his class and the student body. That same year, he married Nancy Yun Wah Wong. During World War II, he was stationed in China as a U.S. Technical Sergeant. Fred served for eight years as a teacher of vocational agriculture at various secondary schools in Hawaii. And, he earned both the M.S. and the Ph.D. degrees at Cornell University.

Fred was a faculty member of the New York State College of Agriculture from 1955-75. As a teacher educator in agriculture, he worked with hundreds of undergraduates preparing to teach agriculture at the high school level, and with scores of graduate students from various parts of the world who were preparing for leadership roles in teacher training, administration and supervision, and earning masters and doctoral degrees in agricultural and occupational education. At Cornell, he became well-known for both his expertise as a master teacher and his research on the improvement of college teaching.

He was co-author of *The Cornell Diagnostic Student Observation and Reporting System for the Improvement of College Teaching*. The research report describing the development of this computerized system was selected for publication in 1975 by the American Vocational Association as one of five model research projects in the field of vocational education. The system has been used by thousands of college teachers to improve their teaching over the past twenty years.

After retiring from Cornell, he became the first dean of the College of Agriculture at the University of Hawaii-Hilo. He was responsible for planning the first buildings. He established the 110-acre agricultural farm laboratory where students translate theory into practice. He hired the initial faculty and assisted them in developing the curriculum.

Throughout his professional life, Fred Tom maintained a strong interest in international agriculture. He served a total of eight years as a consultant, visiting professor, and team leader for various Cornell, USAID, and United Nations projects including: acting dean, Teachers College, University of Liberia, Monrovia, 1963-64; professor, agricultural and extension education, University of the Philippines at Los Banos, 1966-68; principal, South Pacific College of Tropical Agriculture, Western Samoa, 1973; team leader, USAID Project, Feasibility Study, Western Samoa, 1978; consultant, World Bank Evaluation Study of Assam and Bihar Universities, India, 1983; consultant, Food and Agriculture Organization, Papua, New Guinea, 1983; team leader, USAID, South Pacific Regional Agricultural Development Project, 1984-86; and member, USAID Evaluation Committee, University of Peshawar, Pakistan, 1987,

Following his retirement from the University of Hawaii, Fred remained active in people-related activities; teaching reading, helping people prepare income taxes, and leadership in projects of the Chinese community and the United Community Church in Hilo. He developed a spectacular backyard garden, densely planted with both local and exotic fruits, vegetables, and flowers. In 1992, Fred and Nancy celebrated their 50th Wedding Anniversary at a surprise family reunion.

Frederick K.T. Tom died on June 17, 1993, at Queen's Medical Center in Honolulu after a brief illness. He is survived by his wife, Nancy Y.W. Wong Tom; three sons, Stanley Y., Edward W., and William M.; one daughter, Marilyn W.C. O'Riordain; mother, Kalani Ah Kee; three brothers, Richard, Harry, and Lawrence; four sisters, Gloria Hashimoto, Ednette Chandler, Shirley Woo, and Moni Comara; and six grandchildren.

In an interview with the Honolulu Star Bulletin, following Fred's death, his youngest son, William, characterized his father this way:

"Frederick K.T. Tom loved growing things, nurturing his family, his students, and his plants. . . The Tom house was not only full of his family, but he always invited stray students over for holidays, and we always took in at least one foreign student each year."

Harold R. Cushman, William E. Drake

Diran Hagopos Tomboulian

November 1, 1902 — December 7, 1964

The untimely and unexpected death of Diran H. Tomboulian brought to an abrupt end an association with the Department of Physics that had continued for more than thirty years. Professor Tomboulian came to Cornell as a graduate student assistant in 1931 and received his professorship in 1951. His death, at the age of sixty-two, terminated a fruitful and devoted career in both research and undergraduate teaching, the contributions of which have had broad recognition.

Born near Istanbul, Turkey, of Armenian ancestry, he became an ardent American citizen in 1939. Little is known of his youth except that he had hazardous experiences, with scars to attest them, in escaping from the Turks in the difficult years at the end of the First World War. He completed three years' work at Roberts College, Istanbul, before coming to this country in 1924. Working his way by tutoring, he earned the B.A. degree from the University of Rochester in 1927. He graduated second in his class, with work largely in chemistry and mathematics.

It was relatively late in his undergraduate years that his interest in physics was aroused and his profession decided. In 1929, the year he was married, he earned the M.A. degree in physics at the University of Rochester, while holding a position as teaching assistant. Reports of his unusual energies, ability, and enthusiasm for teaching are noted in letters of others dating from his Rochester days, along with the suggestion that "his research will also be noteworthy." And so they were.

He came to Cornell as a teaching assistant in 1931 as he began work for his Ph.D. Thereafter, except for two years during which he held scholarships, he was connected with "Physics for Sophomore Engineers" until his death. Eventually, he directed the entire operation, giving the lectures, holding recitations and laboratories himself, and managing the assistants and innumerable clerical matters associated with such a large course. His last lecture was given an hour or so before he died, and he was in better spirits than usual. But he well knew the frustrations of leading recalcitrants through difficult material, of coping with administrative directives and restraints, with the not-always-so-reliable staff of assistants, and with substandard equipment and quarters. Some nine thousand students going through engineering at Cornell during his tenure knew him as a rigorous teacher who brooked no horseplay, and as a stern, but always fair taskmaster. He had little sympathy with the able boy who frittered away his time, wasting opportunity, or who was negligent in observing the rules of the game; the chap who tried

but could not master the material would, however, find Professor Tombouliau a helpful and willing counselor, generous with his time.

He rebelled at details that subtracted from his effectiveness as a teacher, and he constantly tried to hold strict standards of quality performance against what he felt was a general trend in the opposite direction. His recitations and lecture demonstrations were well prepared. He stayed in command of any situation; on one occasion he was nearly killed during a lecture when he contacted a high-voltage X-ray tube in the darkened lecture room. It jolted him severely and burned through the soles of his shoes, but he went on—carefully—and the audience was not aware of the incident.

Over the years he initiated several changes, both in content and approach, in the physics course for engineers and was engaged at the last in preparing copy for a book at the sophomore level, *Electric and Magnetic Fields*, which has been published posthumously.

Devoted and significant as his teaching was, touching and leaving an imprint on so many students, his own research was not eclipsed. From his Rochester days, his research interest was in spectroscopy. His Ph.D. degree, earned in 1935, was based on study of the spectrum of triply ionized sodium and on the iso-electronic sequence of triply ionized rubidium. His interest then turned to fine details revealed in interferometric spectroscopy, the so-called hyperfine structure in atomic spectra giving information on nuclear spins and quadrupole moments. But his chief contributions were to come later when his interest turned to the spectroscopy of the extreme ultraviolet and soft X-rays.

A steady procession of graduate students went through his laboratory. There were always two or three students quietly working away in his corner of Rockefeller Hall, a corner which he jealously guarded against encroachment. A paper by him and his students were annual events at the winter and spring meetings of the American Physical Society. More than a hundred papers, oral and written, were given by his group. The results were evidenced in the continued improvements and advancing sophistication of his instrumentation, as well as in increasing understanding of atomic and indeed, of solid state physics, although this last area was not his chief interest. With the advent of space astronomy and the desire for investigations at very short wave-lengths with rockets, and with the generation of such radiation as a waste by-product in circular high-energy electron accelerators, he had come to be in demand as a consultant to several major projects, and several of his students also went on to serve in these operations.

His article on soft X-rays in the renowned *Handbuch der Physik* will be the definitive work for people in the field for many years.

In a way, recognition came late to him. He was always fiercely independent, somewhat contemptuous of administrators, something of a lone wolf, and a watchful guardian of what he considered to be his rights. He was disdainful of group activity and, very much the individual, cared little what was thought of him. His standards were high, and his work was good. It was, nonetheless, obviously a source of pleasure and satisfaction to him to have his work recognized for its worth and to be called on by others for his help. A trip by invitation to an international conference in Tokyo late last summer was indeed a happy occasion for him and his wife, and the paper he delivered there provided an easy, informal, yet somehow fitting farewell, not recognized as such at the time. At the 1965 Physical Society meeting in Hawaii, jointly sponsored by American and Japanese societies, a special session on vacuum spectroscopy was arranged in his memory and honor.

Without a doubt, Diran H. Tomboulian was one of those who marched to a different drummer. Difficult though such individualists may be, the University would be a poorer place without their presence. He will be sorely missed by his colleagues and by his family, to whom his devotion was constant. He is survived by his wife, Ruth, and four sons.

Joseph B. Piatt, a teaching assistant with Professor Tomboulian while a graduate student at Cornell and now President of Harvey Mudd College of the Claremont group in California, has, perhaps, penned the most fitting eulogy for Professor Tomboulian: "He had a very real influence on a great many of us, and we are better physicists, better teachers, better people for it. I hope that we in our time are able to pass on to our students some of the high standards, the integrity, and the drive which we learned from him."

Carl W. Gartlein, Paul L. Hartman, Donald F. Holcomb

John Tomkins

May 5, 1918 — December 14, 2004

John Tomkins was born on May 5, 1918 on a dairy farm in western Pennsylvania. He received his B.S. and M.A. degrees from Penn State University before serving in the Army Corps of Engineers in World War II. He then became a Research Associate at the New York State Agricultural Experiment Station at Geneva and received his Ph.D. degree in 1950. Dr. Tomkins then worked for three years at Michigan State University as a berry crops specialist, then for Welch's Grape Juice Cooperative, then back to the experiment station at Geneva. He became a Professor in the Department of Pomology at Ithaca in 1964, dividing his time between extension and teaching.

Dr. Tomkins taught two popular courses: the Essentials of Fruit Growing and Small Fruits. Students who appreciated his enthusiasm, generosity, and stories about his first-hand experiences in fruit production loved him. He was also very actively engaged in extension, visiting growers in each county of the state each year, and logging between 30 and 40,000 miles annually. Many growers, including nursery stock producers who produced small fruits as part of their inventory, considered John to be their friend, as well as their source of research-based information about berry production. Fruit growing was both John's profession and avocation. John took great pride in his very large garden in Dryden where he grew all sorts of fruits and vegetables, and generously shared them with neighbors. It was not unusual for John to unexpectedly show up at one's doorstep with a basket of berries, which, in his words, were specifically for jelly or jam making even though no one in the house knew how to make either. Many of John's innovations for strawberry, raspberry and blueberry production, in particular, could be seen in this garden. Later in his career, John helped to establish the North American Strawberry Growers Association, serving as this organization's executive secretary for many years. John was tall in stature and character, and was respected throughout the country as an authority in strawberries. He retired in 1983 and, with his wife, Gladys, moved to California to be closer to their three children. John passed away on December 14, 2004.

George Good, Marvin Pritts

John Cutler Torrey

April 19, 1876 — October 7, 1946

Dr. John C. Torrey, retired head of the Department of Public Health and Preventive Medicine of Cornell University Medical College, died at the age of 70, at his home in Yonkers, October 7, 1946.

Immediately after obtaining his doctorate at Columbia University in 1903 Dr. Torrey came to Cornell and proceeded to teach and conduct research in his chosen field of bacteriology. He was one of the pioneers in the bacteriology of bacillary dysentery, the bacteriology of milk and of the intestinal tract as influenced by diet, and developed typing of the gonococcus. Perhaps his most notable contribution was his "Studies in Absorption" with B. H. Buxton, in which the roles of the cellular elements in phagocytosis were established.

Even after his retirement in 1941 his activity was undiminished and he completed work on the changes in the flora of the respiratory tract which he had earlier begun. His lively mind engaged new interests and he set out in search of a precipitin test for malaria, which he conducted with great tenacity and success.

Dr. Torrey was for many years editor of the *Journal of Immunology* and a member of several scientific societies.

A descendant of William Torrey who landed at Weymouth Mass. in 1640, Dr. Torrey was born at Burlington, Vt., son of the late Sarah Paine and Henry A. P. Torrey. In 1898 he was graduated from the University of Vermont where his father was Professor of Philosophy and his grandfather had been president.

Dr. Torrey organized at Cornell what is now the Department of Public Health and Preventive Medicine in 1916, and was the active head until 1937 as Professor of Epidemiology. Following his retirement in 1941, he gave his full time unstintingly to research, which he conducted up to the time of his death.

His kindly demeanor was blended with a keen sense of humor. He was at all times an inspiration to his students and members of the faculty, and will be remembered with deep affection by those who knew him.

Morton C. Kahn

Louis A. Toth

January 14, 1893 — July 28, 1977

Louis Toth, professor emeritus, taught hotel accounting in the School of Hotel Administration for thirty-four years, from 1924 to 1958. He died in Florida at the age of eighty-four.

He was born on January 14, 1893, in the village of Nagyszalonta, Hungary, and graduated from the School of Economics of the University of Budapest, where he prepared for a career in foreign commerce and consular service. Shortly after graduation he came to this country and continued his studies at New York University and Columbia University in New York City, majoring in accounting.

After service in the U.S. Army he joined the firm of Horwath and Horwath, certified public accountants nationally recognized as specialists in hotel accounting. In 1925 he sat for the professional licensing examinations given by the American Institute of Accounting, which he passed with honors, and received the Elijah Watt Sells Scholarship Prize for having received the highest mark of any candidate participating in the examinations. Subsequently, he was licensed as certified public accountant in twelve states, including New York. He was admitted as general partner of Horwath and Horwath in 1926.

In 1924, at the request of Professor H. B. Meek, director of the School of Hotel Administration, to Horwath and Horwath, Toth commenced a distinguished career in teaching courses in hotel accounting. In the succeeding twenty-seven years until 1951, Toth commuted between New York City and Ithaca on the Lehigh Valley Railroad once a week for a semester each year. He was appointed a full professor in 1951 and made his home in Ithaca until his retirement in June 1958.

Toth was a brilliant accountant and a dedicated teacher, beloved by generations of hotel students at Cornell. His courses, one on the interpretation of financial statements, the other in advanced accounting, were taken by nearly every hotel student during his thirty-four years of teaching at Cornell. His lectures were an admirable combination of accounting and auditing theory and practical hotel management, sprinkled with some of the best stories in hoteldom.

Toth's Cornell lectures formed the basic material for the publication of *Hotel Accounting*, the definitive treatise on the subject, published by the Ronald Press.

Toth was a member of the American Institute of Accounting, the American Accounting Association, the New York State Society of Certified Public Accountants, and the Hotel Accountants Association in New York City. He took an active part in several revisions of the *Uniform System of Accounts for Hotels*.

He is survived by his wife, Elizabeth, two daughters, and several grandchildren.

Robert A. Beck, Charles E. Cladel, John H. Sherry

Clarence Ellsworth Townsend

April 7, 1882 — May 27, 1967

Professor Clarence Ellsworth Townsend was born in 1882 in the town of Painted Post, New York, near Corning. He was the son of Frederick J. and Viola R. Tibbot Townsend. He attended Painted Post High School and Wyoming Seminary of Kingston, Pennsylvania, then graduated from Cornell University with a degree of Mechanical Engineer in 1907.

He was employed by the Ingersoll-Rand Company in Painted Post and by the International Harvester Company in Auburn as a designer. He started his teaching career at Cornell in 1910 as an instructor in machine design. He was promoted to an Assistant Professor of Machine Design in 1919, working with Professor C. D. Albert. In 1921, he became Assistant Professor of Engineering Drawing.

In 1924, Professor Townsend was promoted to a full professorship and appointed head of the Department of Engineering Drawing. He began a long association with Professor Stephen F. Geary. Together they prepared the textbooks and related instructional materials, *Introductory Mechanical Drawing*, *Questions on Introductory Mechanical Drawing*, and *Machine Layouts for Working Drawing Problems*. The layouts were unique in providing assembly drawings from which detail drawings were prepared by students. A principal layout was for a high-speed woodworking lathe for a production shop, and many hundreds of Cornell engineering students made the drawings.

Although soft-spoken and quiet in many of his ways, “Tommy,” as he was affectionately called by some, was popular with staff and students, and many would inquire about him when they returned to visit Cornell. He enjoyed athletic events, attended football games, and acted as a judge at track meets. After forty years of teaching at Cornell, he retired in 1950 as Professor of Engineering Drawing, Emeritus.

During much of his career, Professor Townsend was interested in the management of a farm in Lake Ridge. He attended classes in agriculture, and he spent much of his extra time at his farm. After his retirement, he specialized in the breeding of purebred Hereford cattle, until his illness in 1960. He was at times a member of the Forest City Grange, the Farm Bureau, and the American Hereford Association.

Professor Townsend was married to Clara Antoinette Davis in 1915. She died in 1943. In 1946, he was married to Florence May Van Iderstine. Living at their Lake Ridge home, Green Meadows, they were well known for their

teas on the Sundays before Christmas, when, in a beautifully decorated house, they entertained faculty friends and townspeople.

Professor Townsend served the Society for the Promotion of Engineering Education (now the American Society for Engineering Education) on a national committee to develop standards for drawings, and drafting room practice. His memberships included the Cornell Society of Engineers, the American Association of University Professors, Phi Kappa Phi, and Lambda Chi Alpha. He was a member of the Masons for more than sixty years, starting with the Painted Post chapter. He was also a member of the Sons of American Revolution, the Eagles club, and the Ithaca Rotary Club.

Professor Townsend died on May 27, 1967, in the Oak Hill Manor nursing home, after a long illness. He is survived by his wife, Florence.

Joseph O. Jeffrey, John R. Moynihan, Arthur H. Burr

Martha Leighton Tracy

July 4, 1901 — March 18, 1981

Though sightless at the time of her death, Martha Leighton Tracy never lived in darkness and was never without friends or humor.

A native of Newbury, Vermont, Martha was graduated from the University of Vermont with a Bachelor of Science degree in home economics in 1923. For the next four years she taught home economics in Burlington and was assistant state 4-H leader at the University of Vermont from 1927 to 1939, at which time she assumed the same position at the Pennsylvania State University. In 1946 she joined the administrative staff of Cooperative Extension at Cornell as assistant professor in extension service and assistant state 4-H Club leader. She became associate professor in 1948 and professor and associate state 4-H Club leader in 1954. She retired on December 31, 1962.

Martha was well known nationally and served three terms as a trustee of the National 4-H Foundation. She was also a member of the National Advisory Committee for the International 4-H Farm Youth Exchange Program, the National 4-H Policy Committee of the National Association of State Land Grant Universities and Colleges, the Steering Committee for the National Research Project on the Developmental Needs of Youth, the National 4-H Health Committee, and the National 4-H Citizenship Committee. She was a longtime member of the extension honorary society, Epsilon Sigma Phi, and in 1956, in recognition of her work with the international programming for youth, she received one of the society's first awards for effective leadership. Before the development of many foreign exchange programs, Martha was responsible for programming young adults from thirty-seven countries in over 250 host families in the state. Simultaneously, 4-H members or 4-H alumni were programmed in six-month visits to thirty-three different countries. This brought to the inhabitants of rural areas and small towns and villages throughout New York in these early post-World War II years an increased understanding of world situations and a recognition of the similarities among all peoples in the world.

Martha was responsible for orientation and in-service education programs for all extension home economists with responsibility for 4-H youth development programs in the state. She had tremendous influence on them and her colleagues at Cornell and elsewhere. She was a goal-oriented person—highly organized, meticulously prepared, and extremely clear and effective in her efforts. Her dignity and propriety made her a legend. But at no time did they overshadow her humor, warmth, understanding, and sincere concern and helpfulness, which she freely extended. Personally and professionally she was a model and a guide for all.

Martha had many hobbies: she was a wood-carver, a photographer, an inveterate bird-watcher, and was heavily involved in enameling, bridge, and travel. She had a large number of domestic and international friends and maintained correspondence with many of them.

Martha enjoyed, and never forgot, her Vermont heritage. She faced issues and problems forthrightly and was usually successful in solving them in their early stages. When she learned that loss of eyesight was a certainty, she sought help from the Association for the Blind and relearned home and living skills so that she could retain her independence and maintain her own home.

Oversize bridge cards, felt tip pens, and practice trips around her home prepared her well for the time when she needed these new skills. The determination, strength of character, and realistic assessment of her strengths and limitations that served her well in her professional life served her equally well in retirement and disability.

As Professor Wilbur Pease said at the time of her retirement, “Her awareness of the needs of youth and her desire to help them develop and make the most of their opportunities have inspired all who have worked with her.”

Martha died in Newington, Connecticut, of cardiac arrest and is survived by her husband, Robert, whom she married in 1972.

Mildred Dunn, Edward A. Schano, George J. Broadwell

Bernard V. Travis

March 29, 1907 — October 12, 1980

Bernard V. Travis, professor of medical entomology emeritus, died at his home on October 12, 1980, after a prolonged illness. He was seventy-three.

Professor Travis was born at Umcompahgre, Colorado, and spent his boyhood on farms in Colorado and Arizona. After attending Phoenix Junior College, he obtained his Bachelor of Science degree at Colorado A & M. He then went to Iowa State University, where he received Master of Science and Doctor of Philosophy degrees. In 1935 he joined the United States Department of Agriculture (USDA) as an assistant entomologist, and a few years later he became interested in what was to become one of his major research areas—mosquito biology focusing on mosquito control measures and repellents.

He became associate entomologist in 1942 and two years later was loaned to the navy in response to its appeal for specialists on insects. At that time the U.S. troops in the Pacific Theatre were suffering more casualties from malaria and other insect-borne diseases than from bombs and bullets. Barney's navy research on insects affecting human health in the Pacific Islands resulted in many publications, especially in the areas of new and improved repellents, in which he made his most notable contributions. There was a spectacular drop in casualties from insect-borne diseases, and the navy's unit of Malaria and Epidemic Control was awarded the unit citation for outstanding service.

Returning to active duty with the USDA in 1946, Dr. Travis assumed temporary charge of the research laboratory at Orlando, Florida, where he remained until he assumed the professorship of medical entomology and parasitology at Cornell in 1949. His unique qualifications also led to field studies in Alaska, where for four summers (1947-50) he directed a research unit of twenty-one scientists investigating the biology and control of biting insects.

While at Cornell, Dr. Travis taught medical entomology and parasitology, served as graduate committee chairman for thirty students, and expanded his own research and publishing to include studies of other insects of medical importance. One of his most important contributions, which gives impressive evidence of his library research, is a valuable set of reference works of worldwide coverage on insects, mites, and ticks that irritate people or transmit diseases. With a volume for each continent, *Arthropods of Medical Importance* brings together essential data on the biology, seasonality, geographic distribution, and ecology (including disease organisms transmitted) of each pest species, and cites the original sources for these data. This huge compilation was prepared by a multilingual

group of more than forty persons from eight countries, working under Professor Travis's direction over a period of fourteen years.

Duties off the Cornell campus also received his time and attention. During 1957-59 the Travises spent two years in the Philippines at the University of the Philippines College of Agriculture at Los Baños. As a follow-up he returned for three months in 1963 to assist in the planning of a graduate school facility in the animal sciences. In 1968-69 he spent a sabbatical leave in Costa Rica doing field research on the biology of black flies. He has been a member of the advisory committee of Gorgas Memorial Laboratory (Panama), the U.S. Quartermaster Technical Committee on Repellents and Insect Control, and a study section of the National Institutes of Health.

Dr. Travis's twenty-three years of distinguished service culminated in his chairmanship of the Department of Entomology for three years. Barney often said he came to Cornell to escape administrative work, but he accepted the call of his colleagues at a critical time for the department. He retired from the University on October 31, 1972.

Dr. Travis is survived by his wife of fifty years, Esther Lanchester Travis, and three children: Ruth Ellen Knutson, Robert Victor Travis, and Vesta Ann Hill; fifteen grandchildren; and a host of friends at Cornell and across the nation.

Clifford O. Berg, George G. Gyrisco, James E. Dewey

Joseph Ellis Trevor

October 11, 1864 — May 4, 1941

Early Sunday morning, May 4, 1941, the death of Joseph Ellis Trevor bereft the University community of one of its notable members. Born at Lockport, New York, in 1864, and trained in the schools of that city, Trevor began a business career with brilliant success, but abandoned it at the age of twenty-four to enter Cornell. On his graduation, at which time occurred his marriage to Mary Tuft Guild of Lockport, he went abroad to continue his studies; as a pupil of Ostwald he received the doctorate from Leipsic in 1892. He returned at once to Cornell as assistant professor of chemistry; his title was changed in 1894 to assistant professor of general and physical chemistry; he became professor of the same subjects in 1900, of physical chemistry in 1903, and of thermodynamics in 1908; he retired as professor emeritus in 1934.

It was not in the nature of Trevor to seek wide popularity for his courses. He much preferred teaching and personally guiding a few exceptionally gifted men. Several of these personal disciples, now occupying important positions in the academic world, have spoken of his influence with an admiration approaching reverence.

His introductory lectures on thermodynamics found their way into his book *The General Theory of Thermodynamics* in 1927; the much more extensive material of his lectures on advanced theory and applications has not been published in book form. He contributed about thirty papers to various American, British, and German periodicals in the fields of chemistry, physics, and mathematics. Together with W. D. Bancroft he founded the *Journal of Physical Chemistry* in 1896 and served as co-editor until 1909.

Trevor was extraordinarily broad in his range of interests. Deeply grounded in his special fields of chemistry and physics, he possessed also a good background and great keenness of thought in mathematics. He was an enthusiastic musical amateur, a violinist of considerable ability and a strong supporter of the musical interests and enterprises of the community. Languages and literatures also fascinated him; he was widely read, and was a close observer of the origins, relations, and functions of words.

The outstanding feature of his personality was his attitude of active friendliness. He could not be moved to the utterance of censorious remarks except by some instance of flagrant hypocrisy, charlatanism, or unfairness. He found genuine happiness in giving pleasure to others. Directly or indirectly he frequently made it possible for needy students to continue their work.

Trevor is survived by his widow, four children, and four grandchildren. To them we extend our sympathy; and for ourselves we place on record our appreciation of the privilege of having known as our associate this kindly soul, this distinguished scholar, this student and supporter of the sciences and the fine arts.

Harrison Miller Trice

May 25, 1920 — December 5, 1994

Harrison Miller Trice was Professor Emeritus in the Department of Organizational Behavior at the School of Industrial and Labor Relations, Cornell University, where he had been a member of the faculty since 1955. Professor Trice's major contribution to his discipline has been the integration of the study of alcohol and drugs with the study of the workplace. More than any other social scientist, he was responsible for integrating occupational and organizational sociology with the study of alcohol and drugs. For example, his book with Janice Beyer, *Implementing Change: Alcohol Policy in Work Organizations*, which was published by the Free Press in 1978, was an important addition to alcohol studies and continues to be a major contribution to the theory of social change in organizational sociology. His other books include such classics as *Alcoholism in America*, published by McGraw Hill in 1966, and *Spirits and Demons at Work: Alcohol and Other Drugs On the Job*, which was first published by the ILR Press in 1972 (co-authored with Paul Roman). In addition, he was the author of numerous monographs, book chapters, and articles on the relationship between work and substance abuse. In 1984, for example, he received the Mark Keller Award from Rutgers University's Center of Alcohol Studies for his outstanding article, "Work-Related Outcomes of the Constructive Confrontation Strategy in a Job Based Alcoholism Program" *Journal of Studies on Alcohol*.

In addition to his many scholarly contributions, Professor Trice also led an active life of public service. He held numerous professional offices, which included chairman of the Committee on Drinking Behavior of the Society for the Study of Social Problems and of the Section on Occupational and Industrial Programs of the Alcohol and Drug Problems Association. He served on many editorial boards including the publications committee of the Society for the Study of Social Problems, the *International Journal of Addictions*, *Sociological Forum*, and the *Journal of Drug Issues*. His many public service activities included serving as member of the Board of Trustees of Alcoholics Anonymous, the New York State Governor's Task Force on Alcohol and Drug Problems, and the Initial Review Group for the National Institute of Alcohol Abuse and Alcoholism.

Professor Trice was also a popular teacher. His courses on occupational culture, deviance in the workplace, and employee assistance programs were always popular. Until his retirement, he conducted a large course in which each student was required to carry out a specific field study. Among the most popular of these studies were those concerned with alcohol and drugs. While committed to research and public policy, Harrison Trice was also committed to teaching.

Prior to his retirement from teaching in 1991, Professor Trice also played the pivotal role in securing an endowment to establish Cornell's R. Brinkley Smithers Institute for Alcohol-Related Workplace Studies at the School of Industrial and Labor Relations. After his retirement, he kept up an active research program, completing two books in 1993 on organizational culture— *The Cultures of Work Organizations*, co-authored with Professor Janice Beyer, and *Occupational Subcultures in the Workplace*. Both books have received great acclaim from reviewers. At the time of his death, he and Professor Paul Roman were revising *Spirits and Demons at Work: Alcohol and Drugs on the Job*, and he was co-editing with Professor Paul Steele a special issue of the *Journal of Drug Issues* on workplace programs for the prevention and treatment of alcohol and other drug problems.

In 1994, Professor Trice was the recipient of two awards which recognized his lifetime contributions to the field of alcohol and drug studies. In August, he received the Distinguished Career Award from the American Sociological Association's Drinking and Drugs Section. In November, he received an award from New York State's Office of Alcoholism and Substance Abuse Services for his many contributions to the area of employee assistance programs, particularly his efforts to deliver rigorous training and education programs to practitioners.

Professor Harrison Trice touched many lives, and without qualification, it may be said that he had great impact on legitimating the social scientific study of alcohol and drugs. He was a sociologist who changed both his discipline and the specific area of his research concern.

Samuel B. Bacharach, Pamela Tolbert, William J. Sonnenstuhl

George William Trimberger

December 8, 1909 — October 9, 2004

George Trimberger was teacher, mentor and friend to hundreds of Cornell students from dairy farms in New York state and elsewhere. He held a special place in the hearts of purebred dairy cattle breeders, many of who meticulously adhered to his methods and advice on matters of breeding and management. His success over the years in developing and coaching Cornell dairy cattle judging teams that competed in national intercollegiate contests is legendary and almost unparalleled.

George was born in Neilsville and attended school in Chilton, Wisconsin. Raised on the family farm, he graduated magna cum laude from the College of Agriculture of the University of Wisconsin in 1933. For several years, he served as chief dairy herdsman at the University of Nebraska before undertaking graduate studies in dairy science and zoology at that institution. He earned the M.S. degree in 1942, but interrupted his graduate studies in 1944 to take a position as Instructor at Cornell, completing requirements for the Ph.D. degree from Nebraska in 1948, while on leave from Cornell. His career in teaching and research at Cornell extended over a period of 31 years, as he rose through the ranks to Professor in the Department of Animal Husbandry (now Animal Science), retiring in 1975 with Emeritus status. In 1997, he moved to Charlotte, North Carolina, where he died at age 94.

Early in his career, Trimberger conducted pioneering studies on the duration of estrus, time of ovulation and optimal time of insemination of dairy cattle. Some of the resulting publications are now considered classics in the field. Later he was involved as a team member in studying the effects of stage of growth and methods of harvesting and preserving forages on their feeding value; and in research concerned with the effects of various levels of concentrate feeding on the yield and chemical composition of milk, the economy of production and the reproductive efficiency and health of dairy cows.

For many years, George taught courses in production and management of dairy cattle to students who ultimately became dairy farmers and agricultural leaders in the northeast. In this way, he had a large impact on the dairy industry, especially in New York State. He had a particular interest and expertise in dairy cattle conformation (or type), which gained him national and international stature as an official judge and allowed him to train very successful Cornell dairy cattle judging teams. He was author (and in later editions co-author) of a textbook, *Dairy Cattle Judging Techniques*. His record as a coach in regional and national intercollegiate competitions involving some 24 teams was, until recently, unequalled. He also developed a descriptive type classification system that was

adopted by the Holstein and other breed organizations and is still widely used nationally and internationally as a means of evaluating body conformation. This system de-emphasized the significance of some of the traditional fine points of body conformation and stressed physical traits that he felt would have greater impact on lifetime productivity and profitability.

Trimberger served in 1955-57 as Visiting Professor and leader of the Cornell-Los Baños project, an effort to rebuild and enhance the quality and level of teaching and research competence of the College of Agriculture of the University of the Philippines following World War II. He was involved there once more as Professor and project leader in 1966-67 in a joint UP-Cornell graduate education program. Other foreign assignments took him to Israel, Europe, Cuba and, following his retirement, Nigeria.

George was an active member of the American Dairy Science Association, at various times having served as secretary, vice-chairman and chairman of the production section, chairman of the program committee and secretary, vice-president and president of the eastern division. He was also active in several other professional organizations, including particularly the Dairy Shrine Club, where he was a founding member and served as director and president. He was the recipient of many honors and in 2001, 26 years after his retirement, was recognized by the alumni of the College of Agriculture and Life Sciences with an "Outstanding Faculty" award.

Those colleagues who knew George best will long remember his demanding work ethic, stubborn determination, amiable disposition, hearty laugh, lengthy written communications, eternal optimism and heavy foot on the accelerator. He was a charming host and loyal friend to many. He enjoyed a good argument, held strong positions on some issues, and was always a formidable and persistent exponent of his point of view.

His wife, Eleanor, whom he had married in 1938, died in 1998. He is survived by three children: Dr. Ellen Kay Trimberger of Berkeley, California; George M. (Mickey) Trimberger of Charlotte, North Carolina; and Pamela Trimberger Castro of Westtown, New York; and by six grandchildren. George is also survived by four of his six siblings.

David M. Galton, Douglas E. Hogue, J. Murray Elliot

Barbara Troxell

September 10, 1916 — September 23, 1984

On September 23, 1984, Cornell University lost a valued member of its artistic community. Professor Barbara Troxell, a distinguished singer and teacher and a member of the faculty for twenty-three years, died at Tompkins Community Hospital of a heart attack.

Barbara was born in Easton, Pennsylvania, the only child of Edgar and Eleanor Troxell. Her early education was in Nazareth, Pennsylvania, where she studied the piano and sang in her school and church. Her scholastic achievement in high school won for her a four-year Senatorial Scholarship to attend Pennsylvania State University, from which she received the Bachelor of Science and Master of Music Education degrees. With strong support and encouragement from Professor Willa Taylor, with whom she had struck up a close friendship since her freshman year, she decided to pursue a career as a singer.

In 1939 she was accepted as a scholarship student to study with the world-renowned soprano Elisabeth Schumann at the Curtis Institute of Music in Philadelphia, where she remained until her graduation in 1942. There followed a decade of concertizing and additional work with Mme. Schumann and illustrious vocal coaches such as Paul Ulanowsky, Tibor Kozma, and Fausto Cleva. Important events in those years included a debut in 1943 with the Philadelphia Orchestra, conducted by Eugene Ormandy; an appearance in the role of Pamina in the *Magic Flute*, under the baton of Sir Thomas Beecham, with performances in Mexico City and Montreal in 1944; a role as soprano soloist in Bach's B-Minor Mass, under Leopold Stokowski, in 1945; the role of the Marschallin in a New York Concert performance of the *Rosenkavalier*, conducted by Leonard Bernstein, in 1946; a New York Town Hall debut in 1947; a role as soloist in Mozart's C-Minor Mass and Bach's *St. Matthew Passion* with the Cathedral Choral in the Washington Cathedral in 1948 and 1949 respectively; and a role as soloist in the *St. Matthew Passion* with the Cantata Singers in New York, Arthur Mendel conducting, in 1950. She made her Metropolitan Opera debut in 1950 and remained with the company for two years. During the 1953-54 season, while on a concert tour in West Germany with the Mozart Trio, sponsored by the United States Information Service, she was invited to join the Flensburg Opera as a leading soprano. She stayed in Germany as an operatic singer for seven years, first in Flensburg and then in Wurzburg, Ulm, and Wiesbaden, until her appointment at Cornell in 1961.

Thus Barbara joined the Cornell music faculty after having gained recognition as a soloist in operas and concerts. Her vocal artistry was then at its height, and in the decade that followed she gave numerous exquisite

performances at Cornell. Among them were song recitals in collaboration with faculty pianists and with the University's performing organizations in works such as, in 1962, Fauré's *Requiem*, conducted by Nadia Boulanger; in 1963, the premiere of Maximilian Albrecht's *Requiem*, conducted by Thomas Sokol; and, in 1965, Beethoven's *Missa Solemnis*, performed in Ithaca and at Lincoln Center in New York City, conducted by Karel Husa as part of Cornell's centennial celebration. Most memorable was her singing of lieder by Wolf, Schumann, Schubert, and other German composers. But her interest and knowledge extended beyond the standard repertoire of great operas, cantatas, oratorios, and lieder. The music of Schoenberg, Webern, Berg, and other twentieth-century composers interested her more than most of her friends and students might have supposed. When some of Webern's early songs were published for the first time in the 1960s, she studied them patiently, chose a few that suited her best, and performed them wonderfully, in a program that included solo songs by Poulenc and Finzi, framed by arias of Mozart. Works by Charles Ives, Elliot Carter, and other American composers were also part of her large repertoire. For her accomplishments Barbara won the "New Voices" and the "Town Hall Presents" contests in New York City in 1944 and 1945 respectively; the American Federation of Music Clubs contest in Pennsylvania and the Lucius Pryor Award in 1945; and the Pennsylvania State University Woman of the Year Award in 1962.

Barbara made the transition from professional singer to university professor with aplomb. This transition meant devoting less time to performing while concentrating on the teaching of Cornell voice students. She inherited a vocal program developed by her distinguished predecessors, Sir Keith Falkner and the late Dame Isobel Baillie, which she molded into Cornell's modern singing program based on her unique and keen analytic insight into the vocal process. She dedicated her energy and expertise to her students, who were drawn from across the University. They included novices as well as advanced singers. She was able to bring forth the best from all her students, whether they were eager preprofessionals, enthusiastic choristers, or budding actors learning to project their voices. But Barbara's teaching was not limited to giving voice lessons. With her vast experience and knowledge of opera, she quickly became the keystone of opera production in Ithaca. At Cornell, under her guidance, students in her opera workshop gave exciting performances of operas such as Mozart's *Così fan tutte* and Bernstein's *Trouble in Tahiti*. In 1973 she became artistic director of the Ithaca Opera and with this group provided Ithaca with its semiannual gala operatic performances.

Many at Cornell learned from Barbara through her elucidation of different aspects of opera. A favorite role that Barbara had sung and enacted many times in Germany was that of Tchaikovsky's heroine Tatiana in *Eugene Onegin*. Hundreds of students through the 1970s heard her sing phrases of Tatiana's music to illustrate her talk

about Tatiana's growing up from the trusting girl of act one to the wise and complicated woman of act two. Even if some of those students supposed that they would never be interested in opera, Barbara won their respect for the possible depths of operatic characters and for the craftsmanship of singing actors. Those listeners could all turn to Tchaikovsky's symphonies and chamber music with more helpful contexts for understanding than they would have possessed without her expert instruction.

Barbara's contribution to Cornell was not limited to music. Her astuteness, common sense, and forthrightness could be counted upon in the deliberation over departmental affairs. She also took part in college and University affairs, serving on the admissions committee of the College of Arts and Sciences from 1975 to 1978 and as a member of the Faculty Council of Representatives from 1978 to 1981.

Barbara's death leaves us unable to replace her in her whole array of activities, but we are grateful to have had her as a friend and colleague for twenty-three years.

William W. Austin, Thomas A. Sokol, John Hsu

Hugh Charles Troy

May 2, 1867 — January 29, 1961

Hugh C. Troy was born in a log cabin on a farm in Tioga County, New York. Ten years later his family purchased another farm two and one-half miles south of Ithaca, where they lived on what is now known as “Troy Road.”

His elementary education was obtained in the country district school, the Parochial School in Ithaca, and the Ithaca High School. He was captain of the high school football team, and he was chosen to present an oration at the high school commencement.

During the summer preceding his senior year in high school, Troy worked on the construction of the Cornell University Library building. He helped to install the iron book stacks, the gratings over the lower windows across the front of the building, and the iron stairs in the tower.

Hugh Troy entered Cornell in the fall of 1891. He was captain of the freshman crew as well as a member of his class football team. The next year he was president of his class. He rowed on the Cornell crew each year after his freshman year, and he was captain and stroke of the Cornell crew that competed in the first intercollegiate regatta at Poughkeepsie—that was in 1895, the year he graduated from Cornell University. He was so interested in boating, and so skillful as a teacher, that he successfully coached the Cascadilla Preparatory School crew from 1897 to 1925.

In the fall of 1896 Troy registered in the Graduate School of Cornell University. On May 1, 1897, he began work as a New York State chemist. This position did not at first require all his time, so he accepted an assistantship in the Animal Industry and Dairy Department. Fortunately, the chemistry laboratory of the New York State Department of Agriculture was in the dairy building, thus making it convenient for him to hold these two positions. In 1912 he resigned as State Chemist and became Professor of Dairy Industry at Cornell University.

About this time Professor Troy developed the Troy Salt Test, the Cornell Cheese Moisture Test, and the Troy-Wagner Milk Test Bottle, which later was patented. In after years he was responsible for the Lactic Acid Test. He was co-author of the books: *Questions and Answers on Milk and Milk Testing*, *A Dairy Laboratory Guide*, and *The Technical Control of Dairy Products*. He also wrote several bulletins and papers on milk and milk products.

Professor Troy was a member of Quill and Dagger, Sigma Xi, Knights of Columbus, and the Catholic Church. He was a member of the executive committee of Cornell United Religious Work, Ithaca Social Service League, the Ithaca chapter of Red Cross, and the Ithaca Community Chest. During World War I, Professor Troy served

two summers as a dairy expert with the Federal Bureau of Animal Industry, Dairy Division, assisting in the conservation of dairy products.

Surviving are his children, Mrs. John Rice of Mountain Lake, New Jersey; Hugh of Washington, D.C.; and Francis B., of Orinda, California; and his niece, Mrs. Alexander Zeissig of Mountainside, New Jersey.

Hugh Troy was a thoughtful researcher and a skillful instructor. His sparkling outlook on life and his overflowing humor helped to create in him an inspiring teacher. He remained vigorous in mind until the last, at the age of 93.

E. S. Guthrie, H. E. Ross, B. L. Herrington

Virginia True

February 7, 1900 — January 4, 1989

Virginia True began her career at Cornell University as a part-time instructor in the College of Architecture. She became an assistant professor in the College of Home Economics in 1942. Her local and national leadership in the areas of housing and design were instrumental in bringing the College of Home Economics to the forefront of housing and design issues in the U.S.

As head of the Department of Housing and Design, now Design and Environmental Analysis, she expanded the design courses into a strong undergraduate curriculum; she helped develop the Cornell University Housing Research Center; she took leadership in establishing a very vital housing program in the Cooperative Extension Service to address housing issues, and to complement earlier established work in home furnishings and interior design; and on a national level, Professor True helped to plan and participate in national conferences concerned with the improvement of the teaching of housing in land-grant universities, and with art in the home economics curricula. The fourth Conference of Housing was held at Cornell University under her aegis in 1960.

As a teacher and administrator, Virginia True took a personal and sensitive interest in her students and faculty and their accomplishments. At the same time, she received numerous awards for her paintings, and exhibited widely throughout the United States in both juried and one-woman shows in galleries, museums and universities. Her mural entitled "Home Economics," which hangs in the Martha Van Rensselaer Amphitheater, is well known to students and faculty of the college. She also designed the wood relief carving in Mann Library, which designates the Martha Van Rensselaer Collection of books by and about women. She was also an enthusiastic leader in the arts at Cornell. For example, she established the Art Gallery in Martha Van Renssalaer Hall, a first on campus, bringing art works of foremost artists and designers to the college and community.

Professor True retired in 1965 and was appointed professor emeritus at that time. After retirement, she established residency on Cape Cod, Massachusetts, and also in Del Ray, Florida. She died in Gillett, Pennsylvania, on January 4, 1989, and is interred at Hannibal, Missouri.

Virginia Utermohlen, Clark Garner

Ethel Marie Tschida

December 9, 1914 — November 28, 1966

Miss Ethel M. Tschida, Assistant Professor of Outpatient Nursing (Pediatrics) at Cornell University-New York Hospital School of Nursing, died November 28, 1966, at the age of fifty-one.

Miss Tschida was born at South Bend, Indiana, the daughter of Moudelle and the late Frank Tschida. She attended schools in South Bend and graduated from the Mercy Hospital School of Nursing, Chicago, Illinois. She earned her Bachelor of Science degree in Nursing at St. Mary's College, Holy Cross, Indiana, in 1944. Subsequently, she received a diploma in Public Health Nursing from the University of Minnesota.

In 1958, she earned her degree of Master of Arts at Teachers College, Columbia University. This same year St. Mary's College conferred the honorary degree of Doctor of Laws upon Miss Tschida for her work as nursing director of the program of institutes in the care of the premature infant at The New York Hospital.

Miss Tschida spent her last seventeen years in active nursing at the New York Hospital—Cornell Medical Center. In 1949, she became instructor-supervisor in the Premature Infant Unit of the Pediatric Nursing Department where she was involved in teaching nursing students. She was instrumental in the organization of the country's first premature infant institutes for doctors and nurses, under the auspices of the Children's Bureau and the New York State Department of Health. In 1955, she transferred to the Pediatric Clinic of the Outpatient Department where she remained as a member of the faculty and nursing service.

Being a person of vision, she directed much of her energy toward maintaining standards and practices of nursing in keeping with the general health and welfare trends. Among her publications were several articles which appeared in professional journals, as well as a syllabus, "The Management of Premature Infants."

Miss Tschida's membership in various organizations reflected her major interest. These included the National League for Nursing, the American Nurses Association, the International Federation of Catholic Alumnae, and the St. Mary's Notre Dame Club of New York.

She is survived by her mother and a brother.

Muriel R. Carbery

Sho-Chieh Tsiang

June 27, 1918 — October 21, 1993

Professor Sho-Chieh Tsiang, a world renowned authority in macro-economics, monetary theory and international finance, joined the Economics Department in 1969 and taught until 1985 when he was elected an emeritus professor on retirement.

Born in Shanghai, China, he studied at Keio University, Japan, until the war intervened. He then enrolled in the London School of Economics where he received the B.Sc. (1941) and Ph.D. (1945) degrees. Even as a graduate student of 24, his critique of Keynes (*Economica*, 1942) marked the beginning of a stream of influential contributions which have spanned half a century. His dissertation under Hayek won him the Hutchinson Medal, awarded to authors of the best thesis at L.S.E. in a two-year period.

While he offered many criticisms against the imperfections of the Keynesian theory which foreshadowed many of the recent developments, his principal concern was the harm which may be caused to developing economies by the unqualified acceptance of the views of Keynes in inappropriate contexts.

He taught at the National Peking University, 1946-48 and the National Taiwan University, 1949. Interestingly, his proposal of indexed saving bonds made at the Peking University was not implemented by the Nationalist government but adopted after the Communist takeover.

He served as an economist at the International Monetary Fund. While at the Fund, he established himself in a series of articles as a major participant of the debates in macro-economics and international finance. It was also during this period that he and the late Professor T.C. Liu formulated the proposal for reform of the exchange rate and interest rate policies for the economy of Taiwan, China. The adoption of that proposal in 1958 and its full implementation in the next two years made possible the economic miracle of Taiwan.

He then accepted a professorship at the University of Rochester in 1960 before he was induced to join Cornell by T.C. Liu in 1969. In his visits to Taiwan, he helped Liu in setting up the tax reform in Taiwan. This provided the finance for the expanded education system. He further utilized his prestige in public policy debates. Under his leadership, the interest groups were prevented from appropriating the development gains in Taiwan for private benefit. As an acknowledged leader in development policy, he was invited to Chile, Mexico, Switzerland, Japan, Korea, and China to discuss his views.

He was a principal force in promoting the education and research in economics in Taiwan. By his prestige, influence and personal leadership, he played a major role in the founding of the Graduate Institute of Economics of the National Taiwan University, and the Institute of Economics in Academia Sinica, and he was the founding President of both the Taiwan Institute of Economic Research and the Chung Hua Institution of Economic Research.

He was the author of one book and more than fifty scholarly articles in his field. During his illustrious career, he was a Visiting Lecturer at Johns Hopkins University; member, Academia Sinica; the Rockefeller Visiting Professor of the University of the Philippines; Visiting Fellow, Nuffield College, Oxford University; and Visiting Lecturer of Keio University. He served on the Editorial Board of the *American Economic Review*, 1974-76; and was a Guggenheim Foundation Fellow, 1966-67.

Japan Mitra, Erik Thorbecke, Henry Y. Wan, Jr.

Kenneth L. Turk

July 14, 1908 — December 16, 1990

Farm animals lost a friend and his multitude of students, colleagues and employees lost a mentor and skilled associate. Dr. Kenneth L. Turk died December 16, 1990 after participating in the Cornell community for fifty-three years as a graduate student, instructor, professor, department head, director, and professor emeritus.

Born on a livestock and grain farm in the shadow of the Ozarks on July 14, 1908, Ken received a B.S. degree in dairy and animal husbandry from the University of Missouri in 1930, and M.S. and Ph.D. degrees from Cornell in animal husbandry in 1931 and 1934 respectively. He began his career as an extension specialist in dairy husbandry at Cornell in 1934. During that year he married Bernice Francis Stockier who had been an undergraduate at Missouri and a graduate student at Cornell. (Mrs. Turk died on October 20, 1988.) In 1938, he moved to the University of Maryland, later to become department head. He returned to Cornell in 1944 and was head of the Department of Animal Husbandry from 1945 to 1963. During his tenure the faculty expanded from 28 to 35, including 23, whom he hired; the budget increased nine-fold; the internationally recognized Cornell-Los Banos Philippine project evolved; and Morrison Hall came into being. For many of those years he taught an undergraduate course in dairy husbandry. In 1987 he completed a remarkably and characteristically well documented, illustrated book, *Animal Husbandry at Cornell: A History and Record of Development From 1868 to 1963*.

Ken left the Department of Animal Science in 1963 to become the Director of International Agricultural Development at Cornell, the first such position in the country. The program grew from a fledgling effort in a number of departments to a unified and vital cog in the total program of the College of Agriculture and Life Sciences including professorships established in many departments. He laid the foundation and set an example for many of today's international agricultural programs worldwide.

He wrote profusely, authoring or co-authoring 70 scientific publications and over 300 articles for the popular press. He was associated with a number of scientific societies, and served as president of the American Dairy Science Association and the Association of U.S. University Directors of International Agriculture Programs. He received honors and awards from these organizations as well as from the American Society of Animal Science and the University of Missouri for his significant contributions to the field of dairy husbandry and international agriculture.

Dr. Turk's leadership of the Los-Banos Cornell Philippine Project is legend. The College of Agriculture at Los-Banos had been decimated during World War n and Cornell was called to restore it to productivity. Ken led the project. He went with a cadre of the best qualified Cornell personnel available. The project flourished and stands today. Dr. Turk summarized this effort in the book, *The Cornell-Los Banos Story*, published in 1974.

He was frequently in demand as an agricultural consultant and served on the boards and panels of the Rockefeller Foundation, Latin America Science Board of the National Academy of Sciences, FAO, National Livestock Centre for Africa, Agricultural Research for the US-USSR Joint Commission on Science and Technical Cooperation, and the U.S. Agency for International Development. In retirement he accepted a number of international consultancy assignments in Latin America, Africa, Asia, Southeast Asia and the Middle East.

Ken and his wife Bernice were a kind and caring team. No one knows how many babies they acknowledged in their own inimitable fashion; no one knows how many flowers appeared at hospitals, along with visits; no one knows how many brunches or dinners they supervised or how many students, foreign visitors, faculty or friends came under their spell. An invitation to the Turks was a trip to a never-never land which no one ever forgot. To the young folks they were an inspiration that the fantasy of living "happily ever after" could be a reality, that marriage could be team work. Their home was a veritable oasis of refreshment, relaxation, and *joie de vivre*.

Ken and Bernice's dedication to students, to the Department of Animal Science, and to International Agriculture is reflected by their generous legacy to the College of Agriculture and Life Sciences and the College of Veterinary Medicine which will be used to support Animal Science graduate students with an interest in international agriculture and for visiting foreign academicians.

In recognition of his accomplishments, Cornell University, the College of Agriculture and Life Sciences, and the Department of Animal Science dedicated the Kenneth L. Turk Seminar Room in Morrison Hall in 1986. A paraphrase of part of that dedication statement says, "With all his manifold contributions to teaching, research, extension and administration, we suspect Ken relished as much as anything the recognition that he was a darn good cow man".

Robert H. Foote, William G. Merrill, Richard G. Warner

Clesson Nathan Turner

September 17, 1908 — October 27, 2001

Clesson Turner was a major force in the field of Agricultural Engineering for more than 33 years. From 1931-68, he contributed to many areas of engineering and technology in agriculture in New York State and beyond.

Clesson Nathan Turner was born in Sodus, New York on September 17, 1908. Following graduation from Sodus High School in 1927, he attended the University of Rochester for two years, and obtained a B.S. degree from Cornell University in 1931. After serving as Extension Agricultural Engineer in Maine for four years, Clesson joined the Cornell Agricultural Engineering staff in November 1935 as an Assistant Professor.

During his first four years at Cornell, he took the time to study for his Master of Science degree that he received from Ohio State University in 1939. His thesis project was the study of erosive wear of stray nozzles discs. His work resulted in a manufacturer redesigning a spray discs that gave better performance and an increased life of five times.

He was Extension Project Leader for Agricultural Engineering from 1939-44. At this time, he was the key person responsible for the War Emergency Farm Machinery Repair Program (World War II). He was also active in establishing, equipping and directing the operation of custom potato spray rigs during the war. As Extension Specialist, he was called upon to use his broad knowledge to conduct many types of programs and “schools” such as tractor and field machinery repair and adjustment, potato and fruit sprayer maintenance and use, electric wiring, and dairy barn and poultry house ventilation.

Clesson Turner was instrumental in organizing the New York State Farm Electrification Council in 1943, supported almost entirely by investor-owned electric companies in the state. He was appointed its first Project Leader and served as Project Leader for 20 years until 1964. In this capacity, he made numerous research and extension contributions to the application of electricity to agriculture. Clesson was appointed Associate Professor in July 1945, and Professor in July 1950.

Clesson’s research studies and investigations led to better design and means of operating adjustments of potato diggers to minimize bruising in digging, design of barn hay driers, electric water heaters, and standby generators for emergency service on farms. In the early 1950s, he studied and tested various designs of bulk milk coolers that would replace milk can coolers on dairy farms. These studies were influential in future designs of bulk milk

coolers. He was also instrumental in developing recommendations for sizing and type used, and specification for adequate controls for the coolers.

In 1959, Paul Sturges and Professor Turner started the development of the equipment to recover waste heat from the refrigeration system on milk coolers and use that heat to preheat water in the milk house. Clesson conducted some of this investigation in the early 1960s at the National Institute for Research in Dairying at the University of Reading. This process was a forerunner to today's heat pump; removing heat from milk and using that heat to warm water. Today this process is common in agriculture, industry and in some residences.

Clesson Turner may be best known among his colleagues in Agricultural Engineering at home and abroad, and by the people of New York State, for his life-long work on Cornell's environmental control system for livestock housing. The work of Professors Turner and William Millier, dealing with negative pressure ventilation systems and the slot-inlet, led to revolutionary changes in the ventilation of livestock housing.

Most of his research studies and contributions over 20 years were documented in the Annual Progress Report of the Farm Electrification Council. Two booklets authored by Clesson, *Farm Electric Equipment Handbook* and *Wiring Specifications for Electrical Farm Equipment*, were used by power companies, electric equipment manufacturers and vocational schools. His contributions also appeared in over 250 technical and research articles, leaflets, bulletins and popular articles. While on leave from Cornell in 1961-62, he was adviser to the United States delegation to the United Nations Rural Electrification Conference in Geneva, Switzerland.

An avid collector of antique clocks, Clesson was a member of the National Association of Watch and Clock Collectors. After retirement in December 1968, when he was named Professor Emeritus, his interest in old clocks continued—owning some 40 Ithaca Calendar (perpetual) and Poole clocks. He was a charter member of Chapter 55 of the National Association of Watch and Clock Collectors. He also had an interest in cars having five Hondas, two Toyotas, and a MG midget.

Clesson and his wife, the former Elizabeth Dukes, of Denver, Indiana, were married in 1934. They had two daughters, Ann and Jean. After retirement, Clesson and Elizabeth lived in Interlaken until 1992 when they moved to Gig Harbor, Washington. Clesson and Elizabeth had been married 65 years when Elizabeth died in August 1999. Clesson Turner passed away October 27, 2001.

Robert Lorenzen, David Ludington

Kenneth Bertrand Turner

Assistant Professor of Hydraulics

July 19, 1882 — October 21, 1918

The death of Assistant Professor Kenneth Bertrand Turner on October 21, 1918, has deprived the instructing staff of Cornell University of one of its most able and conscientious teachers.

Entering the University in September 1899 as a student in Civil Engineering he pursued that course with credit and enthusiasm, receiving the degree of Civil Engineer in 1903 and the degree of M.C.C. in 1905. For a year, following the completion of his work for the Master's degree, he served as Recorder with the United States Lake Survey. In the autumn of 1906, he returned to the University as an instructor in Civil Engineering and two years later was made Assistant Professor of Hydraulics.

From the autumn of 1906 until his death he literally devoted his entire time and energy, with the exception of a sabbatic leave during the first term of 1915–16, to the work of his chosen college. Endowed with a physique which refused to recognize fatigue, thoroughly conversant with the many details of his work, ever actuated by the spirit of the investigator, and possessed of a genial and cheerful personality, he combined in an enviable manner those qualities which mark the progressive, virile teacher, and which gained for him the respect and the confidence of his associates and of the students who passed under his influence. Though he had published but little, he spent many hours in research both of a commercial and of a theoretical character, and a mass of as yet unpublished data on the flow of water over weirs secured by the Department of Hydraulic Engineering bears mute testimony of his cooperation and ceaseless activity.

Be it resolved—that this faculty deeply deplores the early cessation of his labors; that it enter upon its records this appreciation of his faithful and zealous application to his University duties; and that a copy of this resolution be sent to the bereaved family.

Source: Fac. Rec, p. 1013 Resolution Adopted By The Faculty of Cornell University on The Eleventh Day of December, 1918.

Herbert Tuttle

Professor of Modern European History

— *June 21, 1894*

On the morning of Commencement Day, June the 21st, 1894, there passed from earth our colleague, Professor Herbert Tuttle. In resuming without him the duties in which he was so long our associate, it is fitting that we put upon record our deep sense of his worth and of our loss.

From his entrance into this Faculty in the autumn of 1881, Professor Tuttle took an active and efficient part in the conduct of the University. The keenness of his mind, the vigor and courage of his convictions, his invincible independence, his experience of affairs, his power of exact and cogent statement, gave at all times weight to his counsels. To the work of his class-room he brought the same wealth of research, the same maturity of judgment, the same precision of diction, the same grace of literary expression, which give just eminence to his published writings. In all his University relations, the uncompromising honesty of his nature, impatient of pretense and equivocation, his humor, keen and often caustic, his sensitive and aggressive temper, his outrightness and downrightness, stamped with the force of a positive individuality whatever he said or did. By all who knew him well and not least by his colleagues in this Faculty, he must ever be sorely missed and sincerely mourned.

The Committee recommends that this expression of our grief be made a part of the records of the Faculty and communicated to the relatives of our late colleague.

Charles Mellen Tyler

— *May 15, 1918*

The following resolutions on the death of Professor Charles Mellen Tyler were prepared (during the summer vacation) by a committee appointed by the President and consisting of Professors E. L. Nichols, W. Strunk, Jr., and E. Albee, Chairman, a committee appointed with power:

The University Faculty of Cornell University desire to express their deep sorrow at the death of their honored and beloved colleague, the Reverend Charles Mellen Tyler, D.D., Professor Emeritus of the History and Philosophy of Religion and of Christian Ethics, and to record their appreciation of him as a scholar and as a man.

After distinguished service in the church, in the General Court of Massachusetts, and as chaplain in the field in the arduous campaign of the Wilderness, Dr. Tyler came in 1872 to Ithaca, where his unusual gifts of mind and character made him a valued member of the community, in his office of clergyman and in civic and social life. After serving the University for five years as Trustee, he became in 1891 a member of the original faculty of the Sage School of Philosophy. He served for twelve years as professor, until his retirement in 1903, when he became Professor Emeritus and Lecturer. Since 1907 he has continued with Cornell University as a member of the Board of Trustees.

As Professor, Dr. Tyler is remembered with affection and gratitude, alike by his colleagues and by his students. His personal charm and his unfailing courtesy endeared him not only to his friends of long standing, but to the latest comers and the most diffident, while his openness of mind and aptness for lucid exposition made the work of his class-room attractive and stimulating. No one did more to make us realize that, as members of the University, in spite of all differences in our methods of approaching the truth, we are spiritually one body, and that our interests are not confined to the material and to the temporal. At a time of thoroughgoing and even radical reconstruction in many fields of investigation and speculation, Dr. Tyler was never unprogressive or intolerant, for he never forsook the essentially humane point of view. Always ready to welcome the accredited results of modern scientific thought, his faith was even more in the future than in the past. More than usually endowed with sympathy and imagination, Dr. Tyler was not only keenly susceptible to all suggestions of beauty in nature and art, but in his daily walk and conversation he unconsciously exemplified the beautiful as well as the fearlessly true and the humanely good. And his military figure, erect to the last, looked always forward.

We hereby express our sorrow and extend our sympathy to the family of our late colleague and friend.

Howard Styring Tyler

February 24, 1910 — May 20, 1980

Howard Styring Tyler died suddenly on May 20, 1980, at his home, Peruville Road, Groton, New York. He served thirty-seven years as graduate assistant, instructor, and professor with the New York State College of Agriculture and Life Sciences. In January 1972 he was named professor emeritus by the Cornell University Board of Trustees.

Professor Tyler, born February 24, 1910, grew up on a farm in Plainville, Connecticut. He received the Bachelor of Science degree from the Connecticut Agricultural College, now University of Connecticut, in June 1932. Before coming to Cornell in July 1934, he worked as a farm manager in North Haven, Connecticut, in advanced registry testing of dairy cattle, and as farm manager and agricultural instructor at Connecticut Junior Republic in Litchfield.

At Cornell he was a graduate assistant in agricultural economics while working for his doctorate, which he received in 1938. He was an instructor in the Department of Agricultural Economics for two years before his appointment in October 1940 as assistant professor in personnel administration in the Office of Resident Instruction. He was appointed associate professor in July 1944 and professor in July 1948.

Dr. Tyler's life was devoted to helping people. For more than thirty years, while in charge of vocational guidance and placement, his talents were focused on making the college a place where students would have opportunities to find academic success and satisfying careers. His educational philosophy emphasized freedom of choice and individual responsibility with a minimum of regulations and required courses.

As a member of the admissions committee, his attention to detail made him adept at recognizing potential for success. His students in the orientation course came away with an appreciation of the history and traditions of a great educational institution, as well as a knowledge of how to choose a specialization and a career.

Howard's ability as a moderator and chairperson guided many committees and groups with divergent ideas to reach consensus. His committee and faculty minutes were cogent, clear, and concise as was all of his writing.

Because of his reputation as a counselor, students with problems came to him from all parts of the college and University for help in organizing what they knew of their abilities, interests, and values into a self-concept which they then used in selecting a specialization and eventually a career. Dr. Tyler personally advised hundreds of young men and women in general agriculture as they explored the varied offerings of the University.

Each year he scheduled interviews with all graduating seniors. Those who wanted assistance developed a personal profile and resume and were put in touch with appropriate employers. His letters of recommendation were classic examples of objective analysis of potential, achievements, and demonstrated abilities, but did not overlook weaknesses. The student and his adviser always received a copy of these letters.

As part of his duties Dr. Tyler supervised the preparation of promotional booklets explaining the college to prospective students. Each year he compiled a report on the starting occupations and beginning salaries of the June graduating class. In 1954 he made the first of four studies of the occupational status of alumni. Eventually data was compiled on the career progress of graduates in 1949, 1954, 1959, and 1964.

Professor Tyler maintained a strong interest in farmers and farming until his death and was secretary-treasurer of the Owasco Valley Milk Producers Cooperative from the time of its organization until 1979. In addition to his academic work he operated a small dairy farm from 1941 to 1958.

He was a member of Sigma Xi, Phi Kappa Phi, and Alpha Zeta honorary societies. Active in community organizations, he was president of the Groton Central School Board of Education and a thirty-year member of the Groton Rotary Club. He served as chairman of the Tompkins County Board of Health and the County Social Planning Council and vice chairman of the County Comprehensive Health Planning Council, and he was a member of the Executive Board of the local council of the Boy Scouts of America. He served as moderator of the Groton Community Church of the United Church of Christ and after retirement became lay associate pastor assisting the minister of the church. In religious affairs he was a strong advocate of ecumenism and served for many years on the board of Area Congregations Together.

He is survived by his wife of forty-five years, Margaret Smith Tyler, three sons, two grandsons, and four granddaughters.

Richard A. Church, Herbert L Everett, John P. Hertel

Leon John Tyler

September 28, 1902 — May 27, 1988

Leon John Tyler had thirty-four years of professional association with Cornell University, from his appointment as a research instructor in plant pathology in the College of Agriculture in 1934, to the award of professor of plant pathology, emeritus, in 1968. His early work was with the Dutch Elm Disease, in a cooperative research laboratory at the Boyce Thompson Institute for Plant Research, then located at Yonkers, New York. His efforts helped in development of a control program to reduce the spread of that disease.

Leon J. Tyler came to Cornell from the University of Minnesota, highly recommended by Dr. E.C. Stakman, one of the world's foremost plant pathologists and humanitarians. Dr. Tyler was born in Iowa, attended high school in Minnesota, and received the B.S. and M.S. degrees in agriculture at South Dakota State University. In 1930-31 he became instructor in botany at Louisiana State University and was highly lauded by Dr. C.W. Edgerton, chairman of that department. He entered the University of Minnesota in 1931 and was awarded a Ph.D. in plant pathology in 1934. During that period he carried out research on hybridization of corn smut fungi, and conducted field work during three summer months as leader in a state supported program for eradication of the common barberry, an alternate host plant for the dreaded wheat stem rust fungus. Immediately upon graduation, Tyler reported for work at the United States Forestry Laboratory in Milwaukee, Wisconsin, where he helped with a research program on White Pine Blister Rust in the Lake states.

Association with Cornell University began in the fall of 1934, in cooperation with the Boyce Thompson Institute in Yonkers, but by 1939 Dr. Tyler had become an assistant professor on the Ithaca campus, and gradually worked into a leadership role in the teaching of core courses in Control of Plant Diseases. Most students majoring in plant pathology over the period of 1939-1968 were in classes organized and presented by Professor Tyler. Early graduates remember the smell of rotten eggs in the halls as they prepared lime-sulfur in the laboratory, and the detective work necessary to find the unknown pathogens in samples of cereal seeds. Later students recall the studies of antibiotics and the de-emphasis of chemical protectants as cure-alls, as plant disease control moved into the latter half of the 1950s. All students remember Dr. Tyler's meticulous attention to detail in lectures and laboratories, and his insistence that they master the principles of plant disease control and learn to think with the facts which they accumulated. Candidates for advanced degrees under his direction were particularly appreciative of the friendly and patient guidance which he gave them.

Dr. Tyler contributed much to the research knowledge of small grains, working in collaboration with the Plant Breeding Department in the development of disease-resistant oat and wheat cultivars. He is credited with the discovery of three new diseases of wheat: dwarf bunt, foot rot, and stripe. Detailed studies of the etiology of these diseases led to new recommendations for control. In 1960 Dr. Tyler spent a sabbatic leave in Great Britain, Germany, and Greece, exchanging information and studying small grain diseases in those countries. His many publications attest to his vigorous approach to “practice what you preach.” His research and teaching activities were supplemented by participation on many scientific committees and by membership in many national honor societies.

After retirement in 1968 Dr. Tyler maintained an office in plant pathology and became the coordinator of news of the department via the departmental newsletter, *Phytopathology*, and local news media. Many alumni wrote to him regularly, and were obviously pleased with the tremendous job that he did in keeping them up to date with Cornell and the Department of Plant Pathology through an annual newsletter.

Dr. Tyler is survived by his wife, Iphigenia J. Tyler of Ithaca; a son, Dennis H. Tyler, of New Jersey; two stepchildren, James Atsedes, of Freeville, New York, and Sandra DiGiacomo of Ohio; a sister, Mrs. William Lind of Sarasota, Florida; and nine grandchildren.

Edward D. Jones, Arden F. Sherf, Carl W. Boothroyd

Denny Hammond Udall

February 9, 1874 — September 8, 1955

Denny H. Udall was born of New England farm folk, at Craftsbury, Vermont, on February 9, 1874, and died at Ithaca, New York, on September 8, 1955. At an early age Dr. Udall had a keen desire for an education and was graduated with the B.S.A. degree from the University of Vermont in 1898. In the fall of that year, he entered Cornell University to study veterinary medicine. The D.V.M. degree was conferred upon him in 1901. As evidence of his application to his work as a veterinary student, Dr. H. Udall was the “Demonstrator in Anatomy” in 1900-01, his senior year.

After two years (1901-03) in general practice at Saint Johnsbury, Vermont, Dr. Udall was appointed assistant professor of surgery at the Veterinary College at The Ohio State University, in which capacity he served until 1908, when he was called to Cornell as Professor and Head of the Department of Veterinary Medicine. In 1914 Dr. Udall became director of the Ambulatory Clinic. He continued in this dual capacity until his retirement from active administrative work in 1942, when he became Professor Emeritus.

Under Dr. Udall’s able leadership for thirty-four years, the Department of Veterinary Medicine developed rapidly. The Ambulatory Clinic, an integral part of the Department, became the envy of every educator in this field who visited Cornell. Dr. Udall did not subscribe to the modern thesis that eight-o’clock classes and undergraduate teaching are for the young instructors and assistants; he met eight-o’clock classes five days a week, two terms a year. He usually walked to class, was there on time, and always had an acid remark for the sleepy-eyed student who came late. Dr. Udall’s teaching was characterized by the fact that he led the bright student and incessantly prodded the dullard. Those individuals who were wont to slide along with little effort were frequently the target of his biting sarcasm and often found themselves going home with an armful of reference books so that they would not be caught napping again.

While it might be said that Dr. Udall was not particularly close to his students, those who had contact with him respected and honored him. He was absolutely fair and honest. He never hesitated to speak for what he believed to be right, regardless of the consequences.

It is recognized that the Veterinary College at Cornell University enjoys an enviable reputation. Frequently it has been said that *The Cornell Veterinarian* has contributed more to that reputation than any other single factor. For thirty years *The Cornell Veterinarian* and Dr. Udall’s name were synonymous. When travelling in Europe, Dr.

Udall was once introduced to a distinguished veterinarian as the “Head of the Department of Veterinary Medicine at Cornell University.” That remark made no impression; but later, when this gentleman was further informed that Dr. Udall was the Editor of *The Cornell Veterinarian*, the response was dramatic.

On the first issue of *The Cornell Veterinarian* (June 1911), Dr. Udall was an Alumni Editor. From 1915 through 1917 he was the publisher, and from 1918 through 1938 the editor and publisher. During that time, the publication grew from 97 pages to a 350-page volume. In 1935, Merillat and Campbell in “Veterinary Military History of the United States” stated: “In no other veterinary magazine in this country has the average quality of the articles published been as high as those published in *The Cornell Veterinarian*, nor have the contents of any other American veterinary magazine been so generally abstracted in continental European veterinary literature.” Throughout the years, Dr. Udall spent uncounted hours as editor, secretary, business manager, and “news hawk,” in the interests of *The Cornell Veterinarian*.

While Dr. Udall was always active as a writer, being the author of at least sixty-one scientific papers and books, his greatest contribution to veterinary medicine may very well have been “The Practice of Veterinary Medicine,” the first edition of which appeared in 1933 and which is in its sixth revised edition (1954). Typical of the author’s thinking, the book is complete, concise, exact, and free from superfluous or extraneous material.

Dr. Udall was proud of his military record. He was a private in the First Vermont Volunteers of the Spanish-American War. During World War I he was a Major, Veterinary Corps; Division Veterinarian of the 86th Division; Commander, Veterinary Hospitals Nos. 7 and 18 in France. He was a teacher of the American Expeditionary Forces at the University of Beaune in France. Those who served under him in France were quick to point out the thoroughness and vigor with which he dispatched his duties. He never compromised with the truth or with efficiency.

Whether or not they know it, the large animal practitioners had an able champion in the person of Dr. Udall. He fought long, hard, and successfully to give the general practitioners a place in the eradication program of infectious diseases—particularly tuberculosis and brucellosis. There were some who would have placed these programs entirely in the hands of regulatory officials, but were unsuccessful so long as Dr. Udall lived to oppose them. Time has vindicated his conviction. Earlier he had pioneered in research on the clinical diagnosis of open cases of bovine tuberculosis. In later years, when the attention of the profession was focused on the control of mastitis, some believed that control could be effective only in the hands of a corps of technicians with a well-equipped laboratory. Dr. Udall believed that the disease could be diagnosed, controlled, and treated in the barn by

the practicing veterinarian. Time and again those beliefs have been justified. Today any system of control of the disease is based upon the fundamental work done by him twenty to twenty-five years ago.

In 1937 he was the first recipient of the Twelfth International Veterinary Congress Award, given to the veterinarian whose work was most outstanding and noteworthy during the year. In addition to his earlier collegiate degrees, Dr. Udall received in 1938 the honorary degree of Doctor of Science from the University of Vermont. He was a member of the Southern Tier Veterinary Medical Society, the New York State Veterinary Medical Society (a past president), the American Veterinary Medical Society, Phi Kappa Phi, Sigma Xi, Phi Zeta, Alpha Psi, Sigma Nu, and the Congregational Church.

He is survived by his wife, Mary Taylor Udall, and by three children, all graduates of Cornell University, Mrs. James Earl Ash of Bethesda, Maryland, John Taylor Udall of Ithaca, and Dr. Robert Hovey Udall of Fort Collins, Colorado, and two grandchildren.

Dr. Udall's tenacity of purpose, his straightforwardness and diligence have blazoned in the history of veterinary medicine an epoch that will be long remembered. His colleagues and former students will not soon forget the forceful man who met his appointments, worked hard and long each day, and expected others to do the same.

A. G. Danks, M. G. Fincher, S. J. Roberts

Lowell Dohner Uhler

May 10, 1914 — July 3, 1986

The untimely death of Lowell D. Uhler, professor of biology emeritus, was a great shock to his many friends. Several of us had coffee together the morning of July 3, 1986, after which Lowell took his customary swim at Teagle. When a hurried call came from Gadabout, in need of a substitute driver, Lowell typically obliged and, just before departing with his riders, collapsed over the wheel. Thus suddenly ended the life of one of Cornell's most devoted and dedicated teachers, the son of the late Joseph M. and Naomi D. Uhler.

Lowell received his bachelor of science degree from Indiana State Teachers College, Indiana, Pennsylvania, and came to Cornell in 1939 for graduate study in entomology. He received his master's degree in 1941, but further graduate work was interrupted by appointments in 1942-44 as medical entomologist for the Douglas Aircraft Company in Gura, Eritrea, East Africa, and in 1944-46 as malariologist in the U.S. Navy with headquarters in Greece. On his return to Cornell in 1946 Lowell continued his graduate work and received his doctorate in 1948. His dissertation, "Biology and Ecology of the Goldenrod Gall Fly, *Eurosta solidaginis* (Fitch)," was published as Memoir 300 by the Cornell University Agricultural Experiment Station and was followed by a paper detailing mortality factors in more than seventeen thousand specimens of goldenrod galls collected over a fourteen-year period. This work continues to be widely cited as a foundation for many contemporary studies. The goldenrods and their associated fauna have become model systems for ecological and evolutionary investigations.

In September 1948 Lowell was appointed assistant professor of biology at Cornell to develop his celebrated course "Laboratory Methods in Biology." Cornell graduate students knew that that course was the only one in which they could learn how to stain and clear whole vertebrates, how to prepare study skins of birds and mammals, how to make tissue sections, how to stain vertebrate blood, and so on. Many of the course members were science teachers in training or experienced classroom teachers who wanted to improve their laboratory programs. They departed with a veritable suitcase full of prepared teaching materials and the know-how to produce more of them. Lowell's impact through the teaching of this course was catalytic. Those he taught continue to inspire an appreciation of biology in a wide audience.

Advancement to the rank of associate professor in 1952 and of professor in 1958 followed, and when the new Division of Biological Sciences was established, Lowell Uhler became a member of the Section of Ecology and Systematics in 1965. The following year he served as a visiting professor at the University of the Philippines at

Laguna, returning to Cornell in 1968. In June 1977 Lowell retired from Cornell University with the rank of professor emeritus.

Lowell Uhler was one of those illustrious teachers and biologists in the tradition of Comstock and Needham, men who did so much to make Cornell preeminent in the natural sciences. His concern for those he taught is reflected in the following statement from one of his former students:

I remember clearly my meeting with Lowell Uhler the day I arrived in Ithaca. It was my first encounter with a Cornell professor, and I was a bit nervous. His smile and his spontaneous warmth and interest immediately put me at ease. He showed me the laboratories and then described the course of study I would follow: Biological Techniques, Field Natural History, Nature Writing, and others. My thesis could be on any aspect of biology or biology education. The techniques course would require insect and vertebrate collections, plant collections, and on and on. I remember tingling with excitement. Lowell emphasized how important good technique was and how important it was for biology teachers to know how to prepare all types of specimens and teaching materials. This wasn't the way I had pictured graduate school. Lowell, in his serious but always gentle manner, had begun to shape my approach to biology. He taught us and showed us that it's good to get your fingernails dirty, to try things, to experiment, to do it yourself. He showed us that biology is "out there, not in texts alone."

Lowell Uhler held membership in the American Institute of Biological Sciences, the Ecological Society of America, the Philippine Association of Entomologists, and the Society of Sigma Xi and was a Fellow of the American Association for the Advancement of Sciences.

He is survived by his wife, Iona P. Uhler of Ithaca; his two daughters, Karen U. Cushman of Loveland, Colorado, and Rae U. Wion of North East, Pennsylvania; five grandchildren; his sister, Helen U. Zimmerman of Oneonta, New York; and his brother, Ray C. Uhler of Bradford, Pennsylvania.

Thomas Eisner, Richard Root, Perry W. Gilbert

Paul Halladay Underwood

December 29, 1881 — March 17, 1963

Professor Underwood passed away March 17, 1963, at the home of his son in Nashville, Tennessee. He was eighty-two years old and had been Professor Emeritus of Civil Engineering since 1949. Professor Underwood's death closed a full lifetime of service to Cornell University. He was born in the near-by town of Ludlowville, and most of his childhood and adolescent years were spent in the environs of Ithaca. He entered Cornell as a student of civil engineering, receiving the C.E. degree in 1907. Upon graduation he was immediately employed as an instructor, which started his career of forty-two years at Cornell as an engineering educator. He rose through all the faculty ranks and became a full Professor in 1922, Professor Emeritus in 1949.

Basically he was a modest, kind, home-loving man, and a dedicated scholar. The book shelves of his office and home were crammed with books, magazines, and papers that he used to keep abreast of his educational field and the social and political events from day to day. Broad, selected reading made him a man of wisdom and sound judgment, to whom the faculty members and students alike would turn for sympathetic advice and moral counsel. He never sought public office, but because of these fundamental qualities he was asked to serve successively as Deacon and Elder of the First Presbyterian Church of Ithaca, and the high regard of his educational associates was manifested when he was asked to serve as acting director of the School of Civil Engineering during the years 1937-1938 and once again in 1945.

For many years he served as head of the Department of Surveying and Mapping of the School of Civil Engineering, but his former students and faculty associates have their fondest recollections of him in his capacity as director of the Cornell Summer Surveying Camp during the period 1917 to 1948. The surveying camp was the oldest in the United States and a large and important part of civil engineering training in the days of railroad, highway, and waterway expansion, when Professor Underwood first took up his duties as an engineering educator. Each year a new campsite was selected, and progressively topographic maps were prepared for the Cayuga, Seneca, and other Finger Lakes areas. Many of these camps were big—more than a hundred students might attend. Work of professional quality was insisted upon and was so well done that the United States Geological Survey accepted it as a basis for their topographic maps. Both students and faculty took pride in the work, and, since graduation, many an alumnus at reunion time has recalled the strenuous but pleasant experience of the survey camp projects. The maps produced have become collector's items to the riparian owners on the shores of the Finger Lakes.

Professor Underwood was generous in his service to the societies in his profession; for many years he was a member of the American Society of Civil Engineers and once acted as president of the Ithaca Section. For several years he was chairman of the Committee on Surveying and Mapping for the American Society of Engineering Education. He was vice president of the Geodesy Section of the American Geophysical Union and an active member of the American Society of Photogrammetry and the American Association for the Advancement of Science.

Professor Underwood became widely known for his work as an engineer when employed by the Isthmian Canal Commission in Culebra, Panama. Most of his extra collegiate services, however, were given without charge, commanding the respect of his colleagues, his profession, his church, and his community.

Professor Underwood is survived by his wife, Frances Humphreys Underwood, A.B., Class of 1903, Cornell; a son, Robert H. Underwood, A.B., Class of 1942, Cornell; and three grandsons.

N. A. Christensen, S. C. Hollister, John E. Perry, George B. Lyon

George Burr Upton

October 16, 1882 — October 29, 1942

In the sudden passing of George Burr Upton, Cornell University lost not only one of her most distinguished scientists, but also one of her most inspiring teachers.

Professor Upton was born in Newark Valley, New York, on October 16, 1882. He attended high school in Denver, Colorado, and in Ithaca before entering the Sibley School of Mechanical Engineering in 1900. Four years later he received his Mechanical Engineering degree, and was awarded a University Fellowship. Following the completion of his graduate work in 1905, he received the degree of Master of Mechanical Engineering, and was appointed an instructor on the staff in Experimental Engineering. Five years later he became Assistant Professor, and in 1919 was named Professor of Experimental Engineering. Although he was unquestionably one of the most versatile scientists in the College of Engineering, Professor Upton's primary interests in engineering were in the field of materials, and in the internal combustion engine and its application to the automobile. He became an outstanding authority on automotive engineering, and the courses with which he had pioneered in that field became so popular that in 1936 the Department of Automotive Engineering was organized with Professor Upton as department head.

Along with his university work, Professor Upton was frequently called upon by industry to act as a consultant. He was particularly valuable as an expert witness, especially in patent suits. During the period of World War I, he was associated with the Bureau of Ordnance in the development of shell case manufacture, and also with the National Advisory Committee for Aeronautics on airplane power plants. In addition, he served as a consultant for the Curtiss Airplane Company at that time.

Early in his career, Professor Upton made a profound study of engineering materials and metallography, and was responsible for many advances and developments in the technique of testing materials, and in the improvement of the physical and mechanical properties of materials through careful metallurgical analysis. He invented and patented, with George W. Lewis, the Upton-Lewis Fatigue Testing Machine. He was the author of the widely known and popular book *Materials of Engineering*, which was in a large measure responsible for the rapid development of the testing and utilization of engineering materials industrially, and for the progress in the study of this subject in engineering schools and colleges. Professor Upton contributed extensively to the writing of a text book on *Experimental Engineering* by Carpenter and Diederichs; was the author of many technical papers which appeared in the current publications in the fields of engineering materials and internal combustion engines.

Besides being a licensed Professional Engineer, Professor Upton was a member of the American Society for Testing Materials, the Society of Automotive Engineers, the American Society of Mechanical Engineers and the American Society for Metals. He was further honored by election to the honorary societies of Sigma Xi, Tau Beta Pi, and Phi Kappa Phi.

Although Professor Upton was most widely known for his work and writings in the field of engineering, his studies and research covered every branch of science. "G. B.," as he was affectionately known to his friends, was a person to whom they could take any scientific problem and be assured of an enthusiastic reception with a just criticism and a sound analysis of the problem and its solution. He had a most retentive memory and a keen analytical mind. G. B. was regarded by all who knew him as an unexcelled source of reliable information, and as a person who was able, not only to inform accurately and fearlessly, but who could also exercise sound judgment and offer wise counsel. He was so modest that he rarely took the credit he deserved for the ideas and inspiration he instilled in those who sought his advice. His ability to combine the fundamental principles of chemistry, physics, and mathematics in the solution of practical engineering problems was so boundless that it at times amazed even his most intimate friends who were already aware of his brilliance and the broad scope of his knowledge.

Professor Upton's lectures, like his conversation, were always stimulating and challenging; he taught with enthusiasm and understanding. He expected in his students the same high and exacting standards as those which he set for himself. His lectures were in a constant state of revision, as he added to them the results of his critical and extensive reading and the information gleaned from his experiences in the solution of practical engineering problems. Graduate students and his colleagues on the faculty revisited his lectures year after year to broaden their knowledge and to be stimulated with his uncanny knack of arriving at logical solutions for seemingly impossible problems.

While Professor Upton was widely known as an eminent engineer and teacher, it was only his most intimate friends who knew that this modest man was early a student of birds, an author of a paper on plant breeding, and a collector of reptiles. As a member of a transcontinental entomological expedition in 1917 and again on a cross-country trip with botanists in 1920, he was ever ready with unique and ingenious devices for collecting small animals and for drying plants.

To his colleagues, Professor Upton was more than a brilliant scientist and engineer. He was a fine and loyal friend, sympathetic and helpful at all times. It is by them that his loss will be most keenly felt. Although he has now passed on, the inspiration and high ideals he has instilled in them, and their admiration and affection for their departed friend and teacher, will keep him alive in their memory forever.

Ernest Van Alstine

April 15, 1882 — September 12, 1977

Professor Ernest Van Alstine retired and was appointed professor of soil technology emeritus on June 30, 1950, after nineteen years of service to Cornell and the farmers of New York State. As extension professor of agronomy from 1931 to 1932 and professor of soil technology from 1932 to 1950, he served as extension specialist for the entire area of agronomic subject matter but concentrated on soil fertility and liming. He shared responsibility for outlying agronomic field experiments during his first ten years at Cornell. He introduced field methods for determining lime needs of soils, which were used by county agents on fifteen thousand samples a year by the time he retired. He saw the use of lime on New York farms triple to 300,000 tons a year during his tenure. He also supervised the extension phases of a program of rapid soil testing for fertility diagnosis during its formative years, in the 1940s. Immediately after World War II he concentrated on the potential of the newly developed selective chemical herbicides for weed control on New York farms. He was extension project leader for agronomy from 1947 until his retirement.

Professor Van Alstine was reared on a farm near Grand Ledge, Michigan. He graduated from Lansing High School in Michigan and was awarded the Bachelor of Science degree by Michigan Agricultural College (now Michigan State University) in 1907. He was especially interested in chemistry and on graduation served for eleven years as chemist in the soil laboratory of the Illinois Agricultural Experiment Station. Methods of determining lime and fertilizer needs of soils became a major interest during this period.

Professor Van Alstine was awarded the Master of Science degree by the University of Illinois in 1917 and completed the Doctor of Philosophy degree at Rutgers University in 1920. During the following year he worked on commercial production and evaluation of new fertilizer materials in Baltimore.

In 1921 Professor Van Alstine began a career in agricultural extension, which he followed until his retirement in 1950. During the first ten years, 1921 to 1931, he served successively as assistant professor, associate professor, and professor of agronomy at the University of Vermont, with resident teaching responsibilities in addition to his extension activities. It was there that he acquired the dry sense of humor characteristic of rural Vermont people, which served him well in his work with New York farmers from 1931 onward. His good nature, practical outlook, and ready wit, combined with his genuine concern for people's welfare, made Professor Van Alstine highly effective with farmers.

After retiring from Cornell in 1950, Professor Van Alstine operated a custom chemical weed control service for farmers of the Ithaca area until 1957. He and Mrs. Van Alstine, the former Adah M. Stowell of Lowell, Michigan, have lived in Clearwater, Florida, since that date. He held life membership in the American Association for the Advancement of Science and maintained his interests in science during retirement. Space science, especially, intrigued him during his later years. He maintained his interest in the natural sciences through reading and culture of the fruit and ornamental plants at his Florida home.

Professor Van Alstine is survived by his wife, Adah; a daughter, Mary Lou Andersen of Boulder, Colorado; a sister, Mrs. Etta Holton of Mulliken, Michigan; and nieces and nephews.

Harry A. MacDonald, Gerald W. Olson, Marlin G. Cline

Ferdinand Hinchley Butt Van Cleve

August 5, 1899 — December 11, 1993

Professor Emeritus Ferdinand Hinchley Butt Van Cleve died at home in Friday Harbor, Washington on December 11, 1993 of natural causes. He was predeceased by his wife, Gladys, who died on December 20, 1992. He is survived by a brother, Dr. Donald Van Cleve of Voorheesville, New York. He was appointed an Instructor in Entomology in 1930; promoted to Assistant Professor of Insect Morphology, October 1, 1944; Associate Professor, July 1, 1948; and Professor on July 1, 1959. He became an Emeritus Professor of Entomology, August 16, 1959.

He was born on August 5, 1899 in Spokane, Washington; Ferd and his brother grew up in the Seattle area and developed an early love for boats. No boat advertised for sale was too expensive to inspect. Ferd's philosophy was that if one is just looking, price is no object. He brought his love of boats to Ithaca where he soon acquired a handsome sailing auxiliary vessel. But, upon retiring to Friday Harbor in 1959, he went back to power boats.

He received his B.A. degree from the University of Washington, Seattle, Washington in 1923; his M.A. degree from the same school in 1925 and his Ph.D. degree from Cornell in 1934.

Ferd and Gladys acquired the John McGraw home in Dryden located at 8 Library Street; the house was built in 1835. John McGraw was an early benefactor of Cornell University and the donor of McGraw Hall. After they had studied the history of the house, they renovated it in its original style. They frequently entertained their colleagues and students; there were Sunday teas and picnics. If new guests found the house interesting, Ferd was delighted to take them on a tour and demonstrate its interesting features.

He taught courses in insect morphology and embryology. A number of graduate students worked with him and produced theses under his direction. Ferd's lectures in entomology were informal, pleasant but often accompanied by difficult quizzes. The lectures were stimulating and his fine sense of humor was always present. He inspired students to perform beyond their expectations in making scientific pen and ink drawings. He was co-author and illustrator of *Embryology of Insects and Myriapods*, written with O.A. Johannsen and he was author of a number of articles on the morphology of insects. He was author of a booklet entitled, *Friday Harbor Then and Now*. It is profusely illustrated with his sketches of scenes of Friday Harbor.

Ferd was ever the optimist. At the age of 77 and having two major health problems, he was planning on putting into book form more than 100 eight by ten inch photographs of well-known old sailing vessels, "sometime in the

next ten years". His greatest concern at this time was his inability to take his guests on a cruise in Puget Sound on his thirty-six foot diesel cruiser because he had broken a leg due to a fall and could not fit the immobilized leg behind the pilot wheel. He and Gladys were planning yet another trip to the Orient via freighter the following year; a trip which they subsequently made.

George Eickwort, Dick Pendleton, John G. Franclemont

Gladys Loraine Peterson Butt Van Cleve

November 23, 1896 — December 20, 1992

Professor Emerita Gladys Loraine Peterson Butt Van Cleve died at home in Friday Harbor, Washington, on December 20, 1992. She is survived by her husband, Professor Emeritus Ferdinand H. Butt Van Cleve, and by a sister, Ruth Windsor of Friday Harbor, and numerous nieces and nephews. An associate professor in the Department of Textiles and Clothing of the New York State College of Home Economics, she retired in 1959. She and her husband moved to Washington State to be near to their families in Seattle, adopting the name Van Cleve, Professor Butt's Mother's family name.

Born in 1896 in Wadena, Minnesota, Gladys grew up on a farm, a member of a family of nine brothers and sisters, several of whom went to college, making it necessary for her to earn her way. She did this by selling encyclopedias in the backwoods and rural areas of Washington and Oregon. She was treated well by farm families who frequently took her in out of concern because she was so tiny and so young. But life to Gladys was an adventure. It wasn't so much what happened to you that mattered, it was what you did about it that counted—a philosophy which she shared with students, colleagues, homemakers, community groups, friends and family throughout her life. Most of these can tell stories of her solutions to problems— some hilarious, but all both imaginative and pragmatic.

Gladys graduated from the University of Washington, Seattle, in 1928, one of the three top students in the University. She earned a Bachelor of Science degree in home economics, with a strong background in chemistry, which she later put to practical use at Cornell with the emergence of synthetic fibers. Her M.S. degree was from Columbia University in 1945 with a major in philosophy of education.

As a newly married couple, Mr. and Mrs. Butt came from Washington State to Cornell University in 1928, where Ferd became a candidate for the Ph.D. degree in the College of Agriculture (Entomology) and Gladys was appointed clothing specialist in Cooperative Extension. They arrived on campus in the depths of the Depression. No one had ever heard of "Welfare" and most families had little money and were "making do". Gladys's assignment in Cooperative Extension was "to extend the resources of the Department of Textiles and Clothing to the people of New York State." Extension at that time was organized into community groups of homemakers by the county home economists. The latter identified needs of families by interaction with them. In those Depression days, American women sought to lift themselves by their bootstraps, and Gladys was equipped to help. Through her bulletins and her demonstrations she taught them how to use what they had. Her Cornell Extension bulletins

were classics. *Keeping Clothes Wearable*, #536, and #984, *Home Methods of Stain Removal* could not keep up with demand, and long after her retirement the College was still receiving requests from Alaska for #838, *Make Your Furs Wear Longer*. Our present day concepts of health and fitness were low on the scale of conscious concerns of these Depression families, but Professor Butt saw the need to lift spirits by introducing lessons in posture, in fitness, and in ways to become physically more attractive, especially for candidates for jobs outside the home. In these days of women's magazines and of women's liberation, it is difficult for us to imagine how innovative these programs were. But the women knew, and they blocked the corridors of Martha Van Rensselaer Hall during "Farm and Home Week" hoping that she would repeat her lectures to the overflow crowds.

In 1937, Mrs. Butt was appointed assistant professor for the resident undergraduate program in the College of Home Economics. She was one faculty member who really knew the families of her students. She had first hand understanding of those who sacrificed to send their daughters to Cornell University when there was little financial aid and few scholarships. These students sought Mrs. Butt's counsel in managing wardrobe problems and personal appearance standards. Most of all, through her teaching, based frequently on her knowledge of chemistry, and her involvement with honorary societies such as Omicron Nu and Iota Sigma Phi, she encouraged scholastic achievement. In addition to courses in textiles and in apparel design, she taught the departmental core course required of all students in the College. Attentive students were treated to a cultural richness and a joy in learning and living. She was responsible for a well-equipped textile laboratory.

In 1938, Gladys and Ferd purchased the historical home of John McGraw on 8 Library Street in Dryden, about ten miles from the campus. Built in 1835, this Greek Revival style house had a two story central core with one story sections flanking the north and south sides and beautiful grounds. John McGraw, the donor of McGraw Hall at Cornell, was the father of Jennie McGraw Fiske, who gave Cornell its first set of chimes now in Library Tower, also the Southworth Library in Dryden in memory of her Mother, Rhoda Southworth. Ferd and Gladys were always active supporters of this library, Ferd serving on the Board and keeping the clock wound. Together they studied the history of their home which looked out on the Library. They renovated it in the original style. They opened its doors to colleagues and to their students who absorbed the hospitality, the perfection of the Greek proportions inside and out, the carefully selected library, the art, music, pottery shop in the barn, and the Franklin stove in the kitchen so often the center of lively conversations. A treasured memory is Cinnamon the cat picking his way among colored glasses in the dining room window. Some of these glasses dated back to Rembrandt's time, and were hand carried from the Netherlands in one of Gladys and Ferd's frequent travels.

The interest in travel to Europe and Asia continued into retirement. Boats were a life-long passion, including ocean liners, tramp steamers, sailboats and power boats on Lake Cayuga and in the San Juan Islands where Ferd's historical investigations and sketching and Gladys's pottery making could continue. Winters were frequently spent on the island of Penang in Malasia.

Among the many contributions of Professor Gladys Butt to New York State and to Cornell University, it should be noted that Professor Butt's pursuit of science and textiles provided a base for the future of those areas of specialization in what is now the reorganized Department of Textiles and Apparel in the New York State College of Human Ecology.

Natalie Crowe, Elsie Frost McMurry, Vivian White

Frans van Coetsem

April 14, 1919 — February 11, 2002

Frans van Coetsem was born on April 14, 1919 in Geraardsbergen, Belgium. Frans was the quintessential linguist, for languages and linguistics was his consuming interest and focus of his life from his earliest years until his final period as Professor Emeritus of Linguistics at Cornell University. Frans' home situation made it natural that a boy with a bent for language and a consuming interest in how language works should be drawn to a career as a linguist. His hometown is situated in the Flemish-speaking area close to the linguistic boundary with French. Also, it so happened that the home dialect of Flemish in Geraardsbergen differs strongly from standard Dutch, so that as soon as Frans entered school, he had to learn to work in a new language. Shortly thereafter, he was orphaned, losing father, mother and younger brother in quick succession. He was sent to live with an unmarried aunt who had little notion of how to handle a young boy and sent him off to a nearby French-language boarding school. The experience colored his life and may explain two opposite traits in his personality: his self-sufficiency—that is, ability to work and produce in total isolation, and the strong need to form warm and strong bonds with his wife and children. Certainly switching to a school with a new language was traumatic, but it gave Frans an excellent start toward becoming a polyglot. He went on to write books and articles in no less than five languages: German, French, Dutch, English, and there is at least one article in Frisian. It was the childhood in three languages and the multi-lingual nature of the community in which he grew up that piqued his interest in linguistics and led him to study Germanic linguistics and philology at the Catholic University of Leuven (Louvain). His studies were interrupted by the German invasion when he joined the Belgian army. In the last months of the war, Frans was assigned as translator for the British Army during the invasion of Germany. Evidently, he had managed to obtain a solid enough knowledge of English and German to translate between them, although both of them were foreign to him. After the war, he returned to his studies in Leuven, where he earned his licentiate in 1946 and his Ph.D. degree in 1952, writing a dissertation on the dialect of his hometown, Geraardsbergen. While still doing graduate studies, Frans was offered a position with the Institute of Netherlands Lexicography, Leiden, Netherlands, as a lexicographer and later as editor of the great Dutch dictionary, the *Woordenboek der Nederlandsche Taal*. While working in the Institute, he published his first really important work, a study of the strong verbs in Germanic (1956). On the basis of this work, he received the degree of “geaggregeerde van het hoger onderwijs”, the post-Ph.D. degree that in Europe qualifies a scholar to receive a professorial appointment, and in 1957, he was called to Leuven as the successor of Professor Grootaers, his former advisor. At the same time, he continued with the

Lexicographic Institute as corresponding editor. He was also the editor-in-chief of the journal *Leuvense Bijdragen* from 1958-62. In 1963, he was called to Leiden University, where he was made Chairman of the Department of Historical Germanic Linguistics, continuing at the same time with his professorial duties in Leuven. In 1968, Frans decided to leave Europe and accept an offer from Cornell's Department of Modern Languages and Linguistics. It was a difficult decision for Frans and his family, for Frans was happy as a professor in Leiden, and it was hard to move far from family and friends to a new land. However, Frans was also attracted to the academic atmosphere in American universities and particularly at Cornell. The relatively more egalitarian relationship between professor and graduate students and the degree to which that fostered a more active intellectual dialogue was an important impetus for the decision to make the move.

At Cornell, Frans chaired the committees of seven Ph.D. students, all of whom have become outstanding scholars in their own right. But this is hardly the total story of his contribution, for he was an extremely engaging, inspiring and supportive mentor for his students in general linguistics and especially Germanic linguistics and was often chosen as a member of a student committee until well after retirement in 1989. Throughout his years, Frans gave popular and highly regarded courses.

His influential 1956 monograph on the vocalism of the Germanic verb placed Frans among the very top scholars in his field, and in 1970, he was inducted as a Member of the Royal Netherlands Academy of Arts and Sciences. In 1990, Frans was singled out for honor by the Meertens Institute in Amsterdam, where he gave the keynote address at a colloquium on dialect and standard language organized by the Royal Academy. Throughout his career, Frans published influential and widely quoted articles on various aspects of historical Germanic phonology and morphology, but it was in his years after retirement that he was most prolific and produced his most definitive work. 1994 saw the publication of *The Vocalism of the Germanic Parent Language*, a work which is important not only for its innovative solutions to some of the most difficult problems of Germanic historical phonology, but for the insights it provided based on Frans' wider perspective on the nature of Germanic phonology and morphology.

Although Frans is best known as a Germanist, he had an abiding interest in issues of general linguistics that enabled him to explore questions of Germanic linguistics in broader contexts. In 1996, he published a widely admired work of general linguistic importance, *Towards a Typology of Lexical Accent*. His life experiences of growing up in a multilingual community and later in life moving with his family to an English-speaking community, led him to think seriously about issues of language contact. It is in this area that Frans produced what may ultimately come to be regarded as his most important contribution to the field of linguistics—that is, his theory of the two

transfer types and their relationship to the stability gradient of linguistic structures and linguistic behavior of the bilingual. His book of 1988, *Loan Phonology and the Two Transfer Types in Language Contact*, was a leap forward in the study of bilingualism from the point of view of human cognitive abilities and was regarded in Europe as a truly groundbreaking work. In the United States, it did not receive similar appreciation and failed to affect the framework in which language contact was investigated to the extent that Frans had hoped. He thus continued to restate his position more clearly and rework his theoretical framework, producing his impressive work, *A General and Unified Theory of the Transmission Process in Language Contact* (2000). Upon his death, he left behind a completed manuscript on the same subject, *Topics in Contact Linguistics*.

After his retirement, Frans withdrew from public life to an ever-increasing degree. He did, however, continue to help his old students and worked informally with new Cornell students who sought his help. In addition to his remarkable academic publications in Germanic and general linguistics, Frans spent a considerable amount of time researching and writing about a topic outside his main fields of study, namely, that of human consciousness. None of this has become public at this point, but we can be sure it is, like other instances of Frans' life work, the product of a clear-thinking and imaginative mind.

In 1947, Frans married his childhood sweetheart, Juliette DeBodt, with whom he enjoyed a long and happy marriage until her death in 1993. The couple was inseparable, and after her passing, Frans lived in the certainty that she was still in communication with him. Frans and Juliette left two children, Paul van Coetsem of Cortland, New York, and Mieke Gouwerok-van Coetsem of Seattle. They have two grandsons, Arick and Lars Gouwerok, whom Frans and Juliette adored.

Frans was an intensely private person and preferred to socialize little outside of the circle of close friends and family. He was, however, open and hospitable to his students and often had them over. His students recall afternoon get-togethers over excellent wines and hors d'oeuvres and lively interaction with the whole family. Frans remained a European in much of his personal life and inclination, but he chose to become an American citizen in recognition that America was his new home and in loyalty to the new land, which had given him so much.

Anthony Buccini, James Gair, Wayne Harbert, John Wolff

Martha Van Rensselaer

Director of the College of Home Economics

— *May 26, 1931*

A long service of peculiar significance in Cornell University was brought to a close by the death of Director Martha Van Rensselaer on May 26, 1931. It was she who made the earliest beginnings in home economics education in the University, first in extension work among the women of the State, and later in resident instruction. Every step in the entire development of the work in home economics, organized first as a department in the College of Agriculture, then as a school, and finally as one of the constituent colleges of the University, was taken under her guidance, and every activity of this large enterprise had, to the day of her death, her closest scrutiny.

Miss Van Rensselaer was called to Cornell University in 1900 to set up an educational service for women living on the farms of the State. The type of work thus begun has grown into a highly organized and effective movement permeating the entire State, still receiving leadership and technical assistance from the College of Home Economics, but firmly established in the interest and activity of organized groups of women in all parts of the State. This phase of the work remained throughout as Miss Van Rensselaer's direct and chief responsibility.

Together with Miss Flora Rose, who became her associate in directing the development of home economics at Cornell University, Miss Van Rensselaer initiated in 1907 the instruction of resident students, taking an active part herself in the teaching relating to the family, the widening interests of women, and household management. The work of resident instruction has grown steadily, outstripping the successive material provisions for it.

It is Director Van Rensselaer's distinction that she accomplished these pioneer efforts and, because of her own growth, maintained an effective and stimulating leadership in her field throughout her thirty-two years of service. It is a record that discloses wisdom in planning, vigor in carrying through, fortitude under many discouragements, and capacity for long-sustained, hard work. In all of her activities, official and personal, she emanated a spirit of joy in her work, of genuineness, of simplicity, and of warm and generous understanding.

Miss Van Rensselaer's leadership in home economics was widely recognized and great demands were made upon it. During the World War she was called upon to take charge of the Division of Home Conservation in the United States Food Administration. Death came to her as she was recording the findings of the White House Conference on Child Health and Protection, and of the President's Conference on Home Building and Home Ownership, to each of which undertakings she had been summoned for active leadership.

The memory of Miss Van Rensselaer's personality and of her fruitful activities, together with her ideals of home economics education, which grew with the years, will be a lasting heritage for the University and especially for the College which she administered; and the College, in turn, will ever be a great memorial, in the University, of her devoted service.

Source: Fac. Rec, pps. 1737, 1745 Resolutions of the Trustees and Faculty of Cornell University, November, Nineteen Hundred And Thirty-Two

André Gerard van Veen

March 13, 1903 — December 7, 1986

André Gerard van Veen, Cornell's first professor of international nutrition, died in Ithaca on December 7, 1986, at the age of eighty-three. He was born in Medemblik, the Netherlands, and spent his early years in that country. He studied at the University of Utrecht, where he majored in plant physiology and biochemistry and obtained his master's degree (1926) and Ph.D. degree (1928), both cum laude.

In 1929 Dr. van Veen was selected to succeed Professor B. C. P. Jansen at the Eijkman Institute in Batavia, Netherlands East Indies (now Jakarta, Indonesia). He went there in 1930. Initially he worked on the purification of the B vitamin, thiamin, which Jansen had been the first to isolate. In 1935 he became chief of the institute's Biochemical Division. He was also deputy director of the Nutrition Research Institute, which he had helped to create in 1934. The Eijkman was a medical institute; its Biochemical Division included nutrition work, mostly of a laboratory nature. The Nutrition Research Institute was concerned mainly with fieldwork. Together the two institutes were well equipped to handle both practical nutrition problems and nutrition research. Prior to the Second World War the two institutes carried out about thirty-five food and nutrition surveys, mainly on Java and Sumatra. Those surveys included food consumption studies and clinical and biochemical studies, as well as agricultural and economic assessments. It was during those surveys that Dr. van Veen's interest and attention were first drawn to endemic outbreaks of poisoning that he discovered were due to natural food toxins. He studied several of these toxins in his laboratory. He found that the so-called bongkreng poisonings of Central Java were caused by a bacterium, *Pseudomonas cocovenenans*, that produced two toxins, tonoflavin and bongkreng acid. In localities where the poisoning occurred he found that it was associated with the eating of a fermented soybean cake containing pressed coconut.

In 1938 Dr. van Veen became professor of biochemistry in the medical school of what is now the University of Indonesia, and he was instrumental in establishing an agricultural faculty at that university. In 1936 he became secretary of the Indonesian Science Council and in 1940 president of the Royal Society of Natural Sciences. He was chairman of the Round Table Conference on Nutrition of the Far Eastern Association of Tropical Medicine held in Hanoi, Vietnam, in 1938.

From 1942 to 1946 Dr. van Veen was a prisoner of war during the Japanese occupation of Indonesia. During that time his knowledge of the nutritional properties of local plants helped to save the lives of many who were interned

with him, because he was able to demonstrate how they could be used to supplement the meager prison diet. Following the war he was awarded the Order of Officer of Orange—Nassau.

In 1948 Dr. van Veen returned to his native country to become professor of biochemistry at the Technical University in Delft. He returned to Indonesia on behalf of the Food and Agriculture Organization of the United Nations (FAO) in 1951, 1953, and 1969-70. The first two visits were concerned with helping to rehabilitate the Nutrition Research Institute and to draw up a national nutrition plan; in 1969-70 the purpose was to lay down the basis of a national food and nutrition policy in the five-year development plan of the country.

While on leave of absence from the Dutch government in 1947, Dr. van Veen helped to organize the newly created Nutrition Division of FAO, which at that time had its headquarters in Washington, D.C. The director of its Nutrition Division was the eminent nutritionist Dr. Wallace R. Aykroyd. That year Dr. van Veen was also instrumental in preparing *Rice and Rice Diets*, the first of FAO's Nutritional Studies Publications. He returned to FAO headquarters as a permanent staff member of the Nutrition Division in 1950; in 1951 FAO headquarters were moved to Rome, Italy. Dr. van Veen was initially senior supervisory officer of the Nutrition Division and later chief of its Food Science and Technology Branch. Significant undertakings included the initiation of work on food additives, which was done in close cooperation with the World Health Organization (WHO) and which led, among other things, to the establishment of the Codex Alimentarius Commission, which today plays a very important role in many countries throughout the world in protecting consumers from health hazards in food. Also of significance was work on protein-rich foods for use in child-feeding programs in developing countries where surveys were revealing that protein malnutrition among young children was a very widespread and serious problem. That work was done in close cooperation with WHO and the United Nations International Children's Emergency Fund.

In 1952 he married Marjorie Scott in Rome, a Canadian who had joined the Nutrition Division of FAO in 1946. Their ensuing time in Rome together was both professionally productive and personally rewarding. Both grew to be very fond of Rome and of things Italian.

In 1962 Dr. van Veen was appointed professor of international nutrition in what was at that time the Graduate School of Nutrition at Cornell University. In the following six years he built up an impressive program focusing on problems of food and nutrition in developing countries. It evolved into the Program in International Nutrition, and he was its first director. Research work carried out at Cornell under his guidance included study of the nutritive value and wholesomeness of a number of fermented foods consumed in the Far East, Near East, and Latin

America. He was also Cornell's pioneer in the area of aflatoxin research. In collaboration with social scientists at Cornell he was the first to develop ways of applying social science research methods to the study of food and nutrition problems. He supervised field studies of graduate students in a number of countries in Latin America and the Caribbean. He worked closely with Professor Frank Young in rural sociology, Professor Kathleen Rhodes in community service education, and Professor Keith Steinkraus at the Geneva experiment station. He retired from Cornell in 1968. Since that time Cornell's Program in International Nutrition has expanded greatly and become the preeminent program of its kind in the United States if not in the world.

Dr. van Veen was a frequent consultant to the U.S. Interdepartmental Committee on Nutrition for National Defense (ICNND) in connection with national nutrition surveys, and he participated in the ICNND survey in East Pakistan (now Bangladesh) in 1964. In 1972-73 he served as a consultant to the U.S. Agency for International Development (AID) in connection with vitamin A problems in developing countries and prepared one of three status reports published by AID in 1973. Dr. van Veen's publications throughout his varied career number more than 165. He was on the editorial advisory board of *Ecology of Food and Nutrition—an International Journal* and of the Dutch *Voeding*.

In 1970 Dr. van Veen received the Eijkman Award at a ceremony in Rotterdam, the Netherlands. The award is for scientists who have made significant contributions to tropical medicine and health in their broadest sense. The first recipient in 1927 was a nutritionist, Professor B. C. P. Jansen, for his work on thiamin. Dr. van Veen was the second nutritionist to have his work thus recognized. In 1983 he was elected a Fellow of the American Institute of Nutrition.

Dre, as he was fondly known by his friends and relatives, was a warm and understanding person, a humorous raconteur, and a good friend to many people, and he devoted much of his life to serving humanity. He will be greatly missed. He is survived by his wife, Marjorie; a son by his first wife; two grandchildren; and a sister.

Daphne A. Roe, Diva Sanjur, Michael C. Latham

Noland Leroy VanDemark

July 6, 1919 — December 16, 2001

Dr. Noland L. VanDemark, Professor Emeritus of Animal Science, died peacefully on December 16, 2001 at the age of 82.

His early years were spent busily growing up on a general farm in Columbus Grove, Ohio. As was typical of rural America in those days, he attended a small high school in Columbus Grove. Also, as was typical of Vandy, the person, he graduated as valedictorian of his high school class. He was an all-around student, participating in football, basketball, and baseball, while holding offices in the Future Farmers of America and in the 4-H Club. He was a member of the orchestra and drama clubs, as well as active in the youth programs of his church. What did he do in his spare time? Remember, he grew up on a family farm.

With this background of experience and energy, he moved swiftly through a Master's degree program in 1942 at Ohio State University after receiving a B.S. degree at the same institution in 1941, majoring in Animal Husbandry. During his college years, he held various scholarships and assistantships, and cared for a research colony of rats to help defray his educational expenses. He continued work toward a Ph.D. degree at Cornell University in 1942. This program was interrupted by service in the army in World War II, followed by a term as a Livestock Specialist in Austria for one year. He returned to Cornell and completed his Ph.D. degree in 1948.

His next move was to the Department of Dairy Science at the University of Illinois. From 1948-64, he rose through the ranks from Assistant Professor to full Professor where he headed the physiology group in the department. In 1960, he received the Outstanding Agricultural Teaching Award at the University of Illinois. His next challenge came when his undergraduate alma mater asked him to chair the Department of Dairy Science at Ohio State University, which he did until 1974. At this juncture in his career, Cornell University called, and Dr. VanDemark served as Director of the Cornell University Agricultural Experiment Station and Director of the Office of Research at the New York State College of Agriculture and Life Sciences until 1981. In 1981, he returned to the Department of Animal Science and instigated a new course on "Nurturing Scientific Creativity". In 1983, he retired and was appointed Professor Emeritus.

During his 40 years in the academic arena, he established a superb reputation as a researcher, teacher, and administrator. He served on over 80 M.S. and Ph.D. committees. His classic studies on perfused testes contributed greatly to the understanding of testis physiology. Research on factors affecting sperm transport in the cow

contributed to practical procedures for developing optimal insemination techniques. He used results of other research in his broad program on semen collection and sperm metabolism to improve bull management and semen preservation. He was a member of seven major scientific societies, holding important positions in several. He was in demand to give major addresses on his research at national and international meetings. In 1956, at the 3rd International Congress on Animal Reproduction held in Cambridge, England, he presented a major invited paper on "Quantitative Aspects of Semen Production in Bulls". He presented invited papers in the physiology sections of the annual meetings of the American Dairy Science Association and the American Society of Animal Science, as well as at the national Biennial Symposium on Animal Reproduction. He was chair in 1959-61 of the group that organized the biennial symposia.

He was honored for his research with the Borden Award for Research in Reproductive Physiology in 1959. In 1964, he received the Gold Medal for outstanding research in animal reproduction at the International Congress on Animal Reproductions in Italy. These are examples of several prestigious research awards during his career. He published over 200 research papers, was co-author with Dr. G.W. Salisbury of the classic text on the physiology of reproduction in dairy cattle, and co-editor with A.D. Johnson and W.R. Gomes of three standard reference volumes on the testis. The excitement of this research was transferred to the classroom where well-organized and critical lectures challenged undergraduates and graduate students to think.

He was noted for his concern and compassion for his colleagues and support he gave for their advancement. Many of his graduate students became leading researchers in the field of reproductive biology, and several moved to high administrative positions. He served on the National Research Council Agricultural Research Board, and was President as well as a Director of the Society for the Study of Reproduction. At the same time, he served the national research community by accepting an appointment to the National Institute of Health Reproductive Biology Study Section.

The appointments, committees, and service on planning boards within his college and university at both the University of Illinois and at Ohio State University, are too numerous to mention. His track record did not escape the attention of Cornell University, looking for a proven administrator who could stimulate researcher-teachers to perform at the highest research levels without neglecting the classroom. In the Experiment Station at Cornell University, he established a competitive awards program, gave additional attention to social and environmental sciences, and developed faculty leadership programs. During this time, he also served in national leadership positions. These included chairing the Division of Agriculture Committee studying the "Establishment of a

National Center for Leadership Development for Selected Land Grant College Administrators”, and chairing a national committee preparing monographs on the “Impact of Agricultural Research and Education Endeavors on Social Contributions to Society”.

In retirement, he was a Distinguished Bicentennial Professor at the University of Georgia. In 1991, he published the book, *Breaking the Barriers to Everyday Creativity: A Practical Guide to Expanding Your Creative Horizons*. This book reflects much of Vandy’s personal creed. A synopsis of this work, describing the “whole scientist, and the scientist’s place in society” had been published previously in a symposium in 1978. He had a great deal of faith in a supreme power. This faith was reflected in leadership positions in his church wherever he was called to serve.

Family togetherness, scouting, fishing, and other outdoor activities were celebrated with his wife, Beda, for 61 years, along with their son, Gary, daughters, Judy and Linda, and their families. While his personal friendship, serious-minded good humor, and leadership will be missed, his legacy of high scholarship, superb teaching, quality research, and exemplary concern for others, will live on as emulated by those who follow.

Theodore L. Hullar, Richard G. Warner, Robert H. Foote

Paul J. VanDemark

June 17, 1923 — June 27, 1988

Professor Paul J. VanDemark retired from Cornell University on March 1, 1988 and was appointed professor emeritus. As the result of a rather sudden, totally unexpected illness, he passed away on June 27, 1988. In a sense, he had reached the apex of his professional career, which started at Cornell in 1950. In 1986, as senior co-author, he had published a textbook for beginning students of microbiology entitled, *The Microbes: An Introduction to Their Nature and Importance*, and was preparing as co-author the fourth edition of a widely recognized laboratory manual entitled, *Microbes in Action*.

His contributions as a teacher of microbiology to undergraduate students were publicly acknowledged in March of 1987 when the American Society for Microbiology, the largest, single discipline, scientific society in the world with approximately 35,000 members, selected him to receive the Carski Foundation Distinguished Teaching Award. The purpose of the Carski Award is to provide recognition of a mature individual for his or her distinguished teaching of microbiology to undergraduate students and for encouraging such students to further achievement. It can be given to no more than one person per year. The award committee stated that, in their opinion, Paul VanDemark represented “the epitome of a Carski Award winner.”

In June of 1987, New York State also honored Paul VanDemark for his many years of teaching by presenting him with the New York State Chancellors Award for Excellence in Teaching.

While a member of the faculty at Cornell, Paul VanDemark developed a nationally recognized research program concerning the physiology and metabolism of the bacterial genus known as *Streptococcus*. A number of graduate students received the Ph.D. under his supervision and most went on to have successful careers of their own as microbiologists.

Paul received a B.S. degree from Cornell in 1947, an M.S. degree in 1948 and a Ph.D. in 1950. He began his thesis research under the direction of Professor Wayne Umbreit (who later left Cornell) and finished his research under the supervision of Professor James Sherman. After receiving the Ph.D., he was appointed to the faculty as an assistant professor of bacteriology in the Department of Dairy Industry and taught the introductory microbiology lecture course (290) and was in charge of its laboratory component (291).

He was promoted to associate professor in 1954 and professor in 1958. As a result of organizational changes in the college, he became, sequentially, a member of the Department of Food Science, the Section of Microbiology of the Division of Biological Sciences, and the Department of Microbiology, this last formed in 1977.

In recent years, after increasing enrollment required the introductory course to be taught every semester, Paul took responsibility for the course during the spring semesters when enrollment was the highest. He taught this course for thirty-eight years. The enrollment steadily rose during this period of time, reaching 362 students in the spring semester of 1985. He also taught the summer session of the course (without extra compensation) for many years, and always had other teaching responsibilities in more advanced microbiology courses, involving both lectures and laboratories.

Paul always put extra effort into his teaching. As enrollment in the introductory course grew larger he developed the concept of the “prefecture”. This consisted of a three-to-four minute commentary on some current topic of microbiology before every lecture period to hold the students’ attention while late arrivals found seating. He voluntarily divided the lecture of the spring session into two sections (offering it at 9:05 a.m. and 11:15 a.m.). In doing this, he doubled the number of lectures he offered, but was also able to maintain enrollment for each section under two hundred for the benefit of the students. He also initiated introductory microbiology autotutorial group sessions (292)—one-hour, one-credit, weekly meetings where students from the large lecture sessions met in small classes to explore, in depth, specialized areas of microbiology. These discussion sections used guest lecturers, field trips, films, and other teaching aids to explore the relevance of microbiology as a science.

Microbiology has grown rapidly, thus increasing the enormous amount of basic material. To present this in a reasonable fashion, Paul abandoned the “old-fashioned” method of writing extensively on the blackboard while talking. Instead, he prepared copies of condensed lecture material in outline form (updated yearly) containing page references in the textbook for expanded coverage. A copy was available to each student at the start of each lecture.

Another major feature of Paul’s presentation was the use of slides and projection equipment. He felt that good slides—labeled photographs, diagrams, etc.—made a powerful impression on the observer and permitted an increased pace of presentation. He collected and prepared hundreds of slides, many from authors of recent publications, carefully selecting those useful in a given lecture. By using a microphone and projection equipment he reached his large classes effectively.

When Paul left Stocking Hall late in the afternoon, his professional day was not over. A special room in his home was filled with reference books, journals and projection material. Although he thoroughly enjoyed social gatherings, he was reluctant to attend one on an evening prior to a lecture.

Paul functioned as an advisor to undergraduate students since 1954, working with and advising well over 500 students. Since 1974 he served as the program coordinator for all of the undergraduate majors in microbiology at Cornell. He also arranged and supervised a clinical microbiology program where undergraduate students majoring in microbiology spent their senior year in the Microbiology Department of the Cornell Medical College in New York City, obtaining practical experience in clinical microbiology.

In collaboration with the Career Center Education Committee of Cornell, Paul interviewed premedical students. His recorded impressions were used to supplement the students' applications to medical schools.

Paul participated in many activities of the American Society for Microbiology, serving on national committees, faithfully supporting the local Central New York Branch, and serving as its president. He also played roles in the complex university community, at times as representative of the Graduate Field of Microbiology, as a member of the Faculty Council of Representatives and as a member of university, college and departmental committees too numerous to mention.

Paul's scientific process was recognized by a Fulbright Award in 1985. He was a veteran of World War II, serving in the European Theater. By nature, he was a highly competitive individual. He was keenly interested in professional and college sports, specifically baseball, football, hockey and lacrosse. He was a communicant of St. James the Apostle Church in Trumansburg and was past president of the church council.

Paul was devoted to his family and found moments of relaxed enjoyment at his cottage on Seneca Lake. Fishing was a favorite pastime. He enjoyed various chores — masonry, carpentry and plumbing — and took pride in the maintenance and improvement of his properties.

Of his immediate family, Paul is survived by his wife Eileen, five sons and eight grandchildren.

Eugene A. Delwiche, Robert P. Mortlock, Harry W. Seeley, Jr.

Ethel Landau Vatter

October 22, 1909 — June 1, 1996

Professor Emerita Ethel Landau Vatter was a dedicated social scientist in the broadest sense of the term. Her professional interests spanned economics, research design and statistics. She combined technical competence with a strong commitment to helping the disadvantaged.

Born and brought up in Ohio, Professor Vatter left for Washington, DC in search of a job. Growing up in the depression gave her an enduring concern for economic and social issues. While in Washington, she began to attend part-time courses at George Washington University.

Professor Vatter did not obtain her first academic degree until she was in her thirties. Her academic career began in 1947 when she became an Instructor in economics at Oregon State University. She subsequently returned to the University of California at Berkeley where she had earned her bachelor's degree and completed her Master's program in 1952. She returned to Oregon State, serving not only as an Instructor, but also as a Researcher and Editor in the Department of Agricultural Economics. She resigned her faculty position there in the late 1950s to pursue a Ph.D. program at the University of Iowa. She obtained her doctorate in economics from that institution in 1962.

Professor Vatter joined the Department of Household Economics and Management at Cornell in 1962. At Cornell, she initially had a three-way appointment in teaching, research and extension. She became an Associate Professor in 1966 and a full Professor in 1970. From 1966-69, she was Coordinator of Research for the College and Assistant Director of the Cornell Agricultural Experiment Station. In 1969, she was named Associate Dean for Graduate Education and Research for the College and served in that role until 1971. She was named Professor Emerita in 1974.

Within the College, Ethel Vatter was noted for bringing the insights of the various social science disciplines to bear on humanitarian issues. Her strong personal commitment to achieving justice and concern for the disadvantaged led to her research interests on poverty and to service on numerous college committees dealing with social issues. She was a member of the Executive Committee on Operation Hitchhike, a pilot effort of the three Statutory Colleges at Cornell and the U.S. Department of Labor on rural manpower development. She was active in the development of women's studies on campus.

One of Ethel Vatter's major contributions to the College was her work with both graduate and undergraduate students. Professor Vatter was an excellent teacher presenting material clearly and challenging her students to take on individual projects. She gained the confidence of graduate students and was strongly supportive in their professional activities. Her concern for their personal welfare led her to interact with her students both socially and professionally.

Professor Vatter made significant contributions to the study of family income, including work on private pension plans, the allocation of family resources and the economic status of women in the world of work. Her publications included *Women in the World of Work*, *The Affiliated Family: A Device for Integrating Old and Young*, *Income Maintenance in the 1970s*, and *Experiment and Evaluation in Reaching Those in Poverty*. While on sabbatical leave in 1970, Professor Vatter was a Visiting Professor at Temple University. Her work there led to the publication of joint research with Sylvia Claven and Joseph Kennedy.

In 1972, Professor Vatter was diagnosed with a massive brain tumor which was surgically removed. The physicians were amazed at her stamina and recovery. The following year she returned to teaching having made a remarkable recovery. Her courage during this period was inspiring to her colleagues.

Professor Vatter was active in several professional societies. She was a member of the American Economics Association, American Home Economics Association, American Council on Consumer Interest, American Association of University Women, American Association of University Professors and the Grove Conference on Marriage and the Family.

Professor Vatter will be remembered for her concern for the less fortunate. It influenced her research and her teaching. Her generous gift to the college in 1987 supports mature students who experience financial stress. She had encountered difficulties while pursuing her own education and hoped to smooth the way for students similarly situated. She also demonstrated her concern for others through participation in activities in the community. She was a person of strong convictions, determination and courage; she also had an unusual tolerance for all points of view and was particularly effective in chairing committees and mediating conflicting views.

Professor Vatter married Harold G. Vatter in 1944; they were later divorced. They had two daughters: Theresa Vatter, now a high school mathematics teacher in Ithaca; and Rita Vatter Jett, an attorney in Portland, Oregon. Professor Vatter died on June 1, 1996 at the age of 86. In addition to her two daughters, she is survived by three grandchildren.

Gwen J. Bymers, Marjorie Galenson, Jean R. Robinson

Michael Gerard Villani

February 7, 1953 — May 15, 2001

Professor Mike Villani was revered by fellow scientists throughout the world, adored by his many undergraduate and graduate students, and loved and respected by all. He was the consummate teacher, advisor, and mentor. He unselfishly devoted his time in questioning, cajoling, and inspiring others to think creatively and to develop their potential. He always shared the success of his highly acclaimed program on turf insects with his staff and with other scientists around the country. His management style was to encourage freethinking and independence among those who worked both with him and for him. He was the acknowledged master of the win-win situation. Villani rarely thought of himself and he gave far more than he got in return. Mike epitomized the best in all of us in both his professional and personal life. He will be greatly missed for the unique perspectives he brought to the science of soil insect ecology, the probing questions he asked that often made those associated with this area of research question long held beliefs about soil arthropod behavior, and the engaging and gentle manner in which he did so.

Villani died at home after a lengthy illness with pancreatic cancer. Mike died in a manner consistent with how he lived. He showed dignity, compassion for his family, a sense of humor that never waned, and a commitment to giving each day his best effort. Villani is survived by his wife, Connie; two daughters, Sara and Kate; his parents, Salvatore and Concetta Villani; a sister, Susan; and two brothers, Thomas and John.

He was born in San Antonio, Texas and graduated from East Meadow High School, East Meadow, New York in June 1971. Villani was awarded his Bachelor of Arts degree from the State University of New York, Stony Brook, magna cum laude in 1979 and his Doctorate degree in Entomology in 1984 from North Carolina State University, Raleigh. He also attended Hobart College for two years as an undergraduate and was active in its lacrosse program.

Villani came to the Geneva Experiment Station in 1985 as an Assistant Professor of Entomology. He was promoted to Associate Professor in 1991 and to full Professor in 1999. His specialty was soil and turf insect ecology.

Mike's principal professional interests scientifically were in the area of the interrelationships between turfgrass insects and the soil environment. His projects on soil insects placed Geneva in the worldwide limelight as the center of excellence for this type research. His research included the impact of soil heterogeneity on insect behavioral patterns. This included the study of predatory/prey and pathogen/host interactions with the soil. Among these strategies were the impact of soil physical properties on chemical and microbial insecticides, use of pheromones in

grub monitoring and management, use of fungal pathogens, and the use of nematodes to help control turf insects. His research has been of immediate and significant benefit to researchers and pest management practitioners worldwide. His program was featured in a television segment produced by the BBC.

Villani served as co-author with Dr. Haruo Tashiro, Professor Emeritus of Entomology at Geneva, and Patricia J. Vittum, Associate Professor of Entomology at the University of Massachusetts, on a revision of a book originally written by Tashiro, *Turfgrass Insects of the United States and Canada*. This book is considered “the bible” of the turfgrass industry and is the manual of choice among golf courses across the country. He was also a co-editor with Rick Brandenburg, Professor of Entomology at North Carolina State University, of the *Handbook of Turfgrass Insect Pests* which has become a best seller in the handbook series published by the Entomological Society of America.

During his career, this distinguished scientist received numerous awards and honors. He received a Citation of Merit (their highest award) from the New York State Turfgrass Association in 1999; the National Recognition Award in Urban Entomology from the Entomological Society of America in 1997; the Distinguished Achievement Award in Urban Entomology from the Eastern Branch of the Entomological Society; and several others. In January 2001, Villani received the Outstanding Service Award of the Turfgrass Council of North Carolina.

He was a member of the Entomological Society of America and the International Turfgrass Society; and served on the scientific and technical advisory boards of *Earthgro Composting and Turfgrass Trends Digest*. He was co-editor of *Environmental Entomology* and served on numerous committees both within the College of Agriculture and Life Sciences at Cornell University and nationally.

Rick L. Brandenburg, Paul S. Robbins, Frank F. Rossi, Wendell L. Roelofs

Kathryn Elizabeth O'Malley Visneyi

December 3, 1916 — December 23, 1991

Professor Emerita Kathryn Elizabeth O'Malley Visneyi died December 23, 1991 in Naperville, Illinois. She was born in Perry, Iowa, on December 3, 1916. She and her husband, Dr. George Visneyi, lived in Ithaca until May, 1991.

A graduate of Iowa State University, Professor Visneyi completed a dietetic internship at University Hospitals, Western Reserve University, Cleveland, Ohio. Then she worked at the University of Chicago Clinics and Cook County Hospital in Chicago and subsequently was director of dining services and instructor in dietetics at St. Joseph's Hospital and the College of St. Francis respectively, in Joliet, Illinois. Her M.S. degree in institutional management was earned at Cornell in 1966.

Professor Visneyi had a long and productive association with Cornell, beginning in 1942 as assistant manager of Martha Van Rensselaer cafeteria. She took time off from campus life to rear a son and daughter. She rejoined Cornell as an extension specialist in the Department of Institutional Management in 1963. After completion of the M.S. Degree, she was appointed assistant professor in 1966. Professor Visneyi became associate professor in 1971 and retired from the Division of Nutritional Sciences in 1978.

Professor Visneyi was instrumental in the smooth integration of the Institutional Management Department into the Human Nutrition and Food Department when the College of Home Economics was reorganized and became the College of Human Ecology. She spent many hours as a member of the committee that planned the reorganization of the curriculum and helped establish the undergraduate program in the new department. When departmental councils became operative with reorganization, she was elected repeatedly to serve on the council. There she was a valuable and contributing member, one whose ideas were well received by student representatives and other faculty. Professor Visneyi also served on the newly established committee for Public Service and Continuing Education and was chairperson in 1969 and 1970.

Her professional career centered on administrative dietetics. This emphasis included the interpretation and translation of new state and federal legislation concerned with delivery of dietary services to vulnerable population groups. In particular, her efforts focused on the elderly in nursing homes and other long-term health care facilities as well as on children in school lunch, Head Start, day care and camp settings. In 1971, David Knapp, Dean of the College of Human Ecology, wrote in promotion documents that Professor Visneyi "provided a remarkably active

leadership in the program of administrative dietetics as it related to public needs. Most especially, she has worked assiduously in developing programs which related to a number of vulnerable population groups and in these efforts has done much to implement recent directions of the college.”

Professor Visnyei was frequently called upon to speak before professionals on topics related to dietetics and institutional management and to write articles for professional and lay publications. In her writings, she contributed numerous articles concerning solutions to food service operational problems, as well as articles on layout and design of dietary departments. As an editor of the *Bulletin of the New York State Dietetic Association*, her many articles and writings provided authoritative, practical information to all health care institutions in New York State.

With extension and public service as her major focus, Professor Visnyei developed and carried out workshops for administrators of nursing homes and health related facilities throughout New York state. She frequently presented off-campus courses on sanitation in food service to dietary personnel in health care facilities, school lunch programs, day care centers, camps and Head Start Centers. These efforts were reinforced by her editorship of *Highlights*, a quarterly publication sent to nursing home and health care facilities throughout the state.

Professor Visnyei served as director of the annual Cornell Institutes of Administrators of Nursing Homes and Health Related Facilities. She brought to this role not only a broad understanding of administrative dietetics but also her expert knowledge of the complex interrelationships among administration, governmental health care regulations, and patient problems. In addition, she provided leadership in curriculum development for the training of food service supervisors and consulting dietitians working in nursing homes and health care facilities. Off-campus, Professor Visnyei was for many years a member of the Education Committee of the New York Association of Long Term Health Care Administrators and also served on the Health Code Committee of the New York State Health Department, which revises the dietary section of the State Hospital Code.

Professor Visnyei held membership in the American Dietetic Association, the New York State Dietetic Association, the New York State Nutrition Council, and the Association of Schools of Allied Health Professions. She was also a member of the Honorary Society, Psi Chi.

Both in her private and professional life, Professor Visnyei exhibited profound interest and concern for other people. Graduate students and her children’s friends were “adopted” as part of the Visnyei family. In her quiet, unassuming way, Professor Visnyei enhanced individual growth through her genuine respect, careful listening, and generous support.

Friends and colleagues remember Professor Visnyei as a gracious hostess and a caring, fun-loving person. Early jazz music, travel, and sports were among her special interests. As an avid sports fan, she kept abreast of winners and losers and thoroughly enjoyed “replaying the games” with family and friends. Professor Visnyei’s broad interests, keen wit and dry sense of humor always added zest to the lively discussions she stimulated and enjoyed. Her personal and professional contributions to the lives of others are appreciated and cherished.

Professor Visnyei is survived by her husband Dr. George Visnyei (B.A. ‘36) DDS, formerly of Ithaca and now of Naperville, Illinois; a daughter and son-in-law Margaret (M.B.A. ‘80) and Jerry Burton of Naperville; a son and daughter-in-law, George (M.B.A. ‘76) and Ellen Visnyei of Redding, Connecticut; and three grandchildren, Catherine, Douglas, and Benjamin Visnyei, all of Redding. She was predeceased by two brothers and one sister.

Marjorie M. Devine, Marcia H. Pimentel, Jerry M. Rivers

Robert Lee Von Berg

June 14, 1918 — August 11, 2006

Born in Wheeling, West Virginia, Bob attended schools there before entering West Virginia University from which he received a B.S. and M.S. degrees in Chemical Engineering with a minor in Electrical Engineering in 1941. He served in the National Guard from 1937-41. Next, Bob went on to Massachusetts Institute of Technology where his work was sponsored by the National Defense Research Council. He graduated with the Sc.D. degree in 1944, again majoring in Chemical Engineering. From MIT, he joined the Industrial Engineering Department of DuPont in Wilmington, Delaware. There he worked on process design and development until 1946 when he accepted an offer to join the faculty of Chemical and Metallurgical Engineering at Cornell. Three years later, he was promoted to Associate Professor and in 1958, to Professor of Chemical Engineering.

Early on, Bob developed an interest in nuclear engineering and spent six summers at Oak Ridge and Brookhaven National Laboratories working on reactor design as well as one summer at DuPont's Savannah River plant working on nuclear fuel processing. He was a visiting professor at the Los Alamos National Laboratory cryogenic engineering division. At Cornell, he was primarily responsible for the design of the Gamma Radiation Facility. He served as a consultant to other faculty who made use of the facility, often as a member of a graduate student's special committee. For many years he served on Cornell's Reactor Safety Committee.

Other one-year leaves were spent working on process development at Dow in Midland, Michigan and at the Delft Technical Institute in the Netherlands where he held a NATO fellowship. Visiting professorships in New Zealand and Australia further enriched his international background. All of his varied experiences with research and development enriched his teaching and research at Cornell. He and his graduate students studied the design and analysis of chemical processes and equipment design especially in the areas of liquid-liquid extraction and the use of gamma radiation to promote chemical reactions such as ammonia synthesis. Atomic Energy Commission Fellowships supported several of his students. He also collaborated with another Chemical Engineering faculty member, Herb Wiegandt, on the desalination of seawater using a direct contact freezing process.

Over the years, Bob taught courses in thermodynamics, reaction kinetics, nuclear engineering and plant design. It was especially plant and process design that continued to be his interests even to the years following his nominal retirement in 1988. He served on faculty panels that critiqued teams of chemical engineering seniors who were

required to design chemical plants in the “capstone” design course. Bob was patient and thorough in his questioning, but he always maintained an even disposition and good humor that elicited positive responses from the students.

Other products of Bob’s overseas study periods were the people he contacted. Some of them returned the favor by spending time at Cornell in a teaching capacity.

Second only to his devotion to teaching and research was his abiding interest in music. As a graduate student, he was the student leader of the MIT Classical Orchestra. Over the years, he played the clarinet in the Cornell Orchestra and the Ithaca Concert Band. In addition, he played as part of the informal groups that entertained at numerous Chemical Engineering functions, especially at the annual departmental Christmas parties. During his sabbatic leaves, he invariably found a local group with which to play.

Bob was an elder and long-standing member of the First Presbyterian Church of Ithaca. He was a founding member and volunteer of the Cayuga Heights Fire Department in 1955, and he served as a Trustee of the Village of Cayuga Heights. At various local and university track and field events such as the Heptagonals, he often officiated as a timer and in other capacities. For some of his colleagues, he is especially remembered as a member of an informal Statler Club luncheon group that included faculty from various disciplines. He participated and enjoyed the animated discussions that ranged over politics, science and technology, and the state of the University.

Bob married Kate Hopkins in 1947. Surviving him are Kate and their four children: Eric, Gretchen, Karl and Karin, their spouses and twelve grandchildren; and also his sister, Gloria Luikart; and three nephews.

Ferdinand Rodriguez, Chair; Robert K. Finn, Julian C. Smith

Oskar Dietrich von Engeln

July 3, 1880 — January 25, 1965

Oskar Dietrich von Engeln, since 1948 Professor Emeritus of Geology, was born in Dayton, Ohio, the son of German-born parents, Dietrich and Elizabeth (Adam) von Engeln. Prior to entering Cornell in 1904, his formal education had ended with the eighth grade. In the ten years between leaving elementary school and entering Cornell he worked as an office boy, factory hand, shipping clerk, and salesman.

During that decade, however, his lively intellect did not lie fallow. His reminiscences of these years sketch an appealing picture of an alert and resourceful youngster. He read assiduously, to good purpose, and with such effect upon his own style that at twenty, and before entering college, he was able to sell to *The Outlook* his essay "On Spring Flowers as They Grow." Two years later *The Outlook* printed another of his essays, "On Being Abroad in Winter," both stemming from excursions into the field made with a group of high school teachers with whom he had become acquainted. He became expert in photography, too.

Enterprising as he was, he entered a contest, conducted by a shoe polish company whose product he was selling, to estimate the receipts of the Cincinnati post office for a given month and captured the third prize of \$250—no contemptible sum in those days.

Toward the close of this period, he prepared himself for the College Entrance Board examinations by independent study and by being tutored in Latin and mathematics. He passed all the subjects required for entrance to Cornell except algebra and geometry, and in 1904 he was admitted with conditions in these two subjects.

His career as an undergraduate was notable even for a student more mature than the average. With an essay entitled "Shakespeare as an Observer of Nature," he won the Barnes prize as a freshman. The same essay later won the Walter Natural History prize offered by the Boston Society of Natural History, and it was subsequently published in *Popular Science*. Dr. von Engeln was naturally proud of these, and all his life he strove to improve his style. He also maintained his interest in photography, and his talents won him the photographic editorship of the 1908 *Cornellian*.

As a freshman at Cornell he had attracted the attention of Professor Ralph S. Tarr, in whose course in physical geography he had enrolled. The very next year, 1905, Tarr secured his appointment as an assistant instructor in dynamic geology. And so it was as a sophomore that Oskar von Engeln's long and successful career as a teacher at

Cornell began. He was only a junior when he was made an instructor in physical geography. He received the A.B. degree in 1908 and the Ph.D. in 1911. He was promoted to Assistant Professor in 1919 and became a full Professor in 1921. From 1944 to 1947 he was chairman of Department of Geology and Geography.

Dr. von Engel's interest in good writing had a salutary effect on the graduate students he trained, for they soon discovered that only well-organized and carefully composed writing would secure his approval. Dr. von Engel continued writing himself, and among his favorite subjects were Cornell and its natural environment. In 1909, only a year after graduation, he published *At Cornell*, and eight years later followed this with the more comprehensive *Concerning Cornell*. Both books were designed to orient and instruct the student in the history of the University and its unique setting, and both exercised a wide influence, attracting to Cornell many who might have turned elsewhere. His life-long interest in the geology and topography of Cornell's locale culminated in his last book, *The Finger Lakes Region: Its Origin and Nature*, summarizing the development of the scenery of south central New York. It was published by Cornell University Press in 1961 when he was eighty-one, and it is as fresh and vivid a treatment of the theme as any man in his prime might write.

Of his several books, *Geomorphology*, published in 1942, was his outstanding contribution to geology. *Geology*, an elementary textbook written with Kenneth E. Caster, was characteristically well written and well illustrated, and was revolutionary in that it proceeded from modern times backward into geologic past.

Learned though he was as a geomorphologist, only about half of his books and papers deal with glacial and geomorphic geology; the remainder are concerned with geography. He was particularly interested in the social implications geography and regarded them as his special province. That interest is attested by his insistence on being listed, in later editions of *American Men of Science*, the volume dealing with the social sciences. His interest in geography's social impact is evident, too, in his *Inheriting the Earth*, published in 1922. This is remarkable work so far in advance of its day that it failed to attract the attention it deserved. In it he developed with rare skill and erudition the theme that the rise, development, and destiny of nations, and the well-being of its peoples are inevitably and inextricably tied to the place they occupy on the face of the earth. His *General Geography for Colleges*, written with Bruce C. Netschert and published in 1952, was his last textbook; it was well received and widely used.

Dr. von Engel's skill as a photographer was of great assistance in preparing illustrations for his publications, and some of his photographs, particularly those of the campus, were works of art. One, "In College Precincts," taken

as early as 1906, showed two freshmen passing McGraw Hall in the rain on their way to the library. It was used as the frontispiece of his *At Cornell* and was widely admired, as it seemed to catch the very spirit of the place.

He communicated his enthusiastic appreciation of the beauties of the Ithaca region to his students not only during the academic year, but even more successfully in the course which he so much enjoyed giving in the summer sessions and to which he devoted a large amount of his time and energy. This summer course was for him the highlight of the year; for his many students it was a profitable, enjoyable, and even thrilling experience.

Professor von Engeln's field work outside the Ithaca region was confined to expeditions to Alaska. These expeditions were conducted in 1906 and 1909 by Professor Ralph S. Tarr, primarily for the study of glaciers. Von Engeln enjoyed the difficulties of these surveys and delighted in recounting his experiences and in contrasting the conditions under which the work was done with those prevailing at present.

He was a fellow of the Association of American Geographers, of the Geological Society of America, and of the American Association for the Advancement of Science. He was a member of Sigma Xi, Sigma Gamma Epsilon (honorary), and Sigma Phi Epsilon. In 1930 he was a delegate to the Centennial of the Geological Society of France, and in 1934, to the International Geological Congress at Warsaw, Poland. In 1937 he was made a member of the International Committee on Snow. He was invited to give the Bonnocker Lectures in geology at Ohio State University in 1943.

On September 7, 1910, he married Maude G. Hewitt, Cornell '09, of Margaretville. She was a gracious and vivacious person, known affectionately to her wide circle of friends as "Buzzie." The von Engeln's had no children, but their home was always open to the children of neighbors and to groups of students, many of whom recall long evenings of stimulating discussion before a blazing fire in their living room.

Mrs. von Engeln died suddenly of a heart attack on March 25, 1962. The loss of her companionship, her sympathy, understanding, advice, and solicitude for his well-being affected him profoundly, and those close to him immediately saw his hitherto valiant spirit falter and his will to go forward ebb.

He enjoyed unusually good health all his life and, although partially incapacitated by arthritis during his last years, he had never been confined to a hospital before his terminal illness beginning in the early summer of 1964. After a few weeks in the hospital and a subsequent brief period at home, he returned to the hospital in early December and remained there until his death on January 25, 1965. He is survived by a sister, Miss Bessie E. von Engeln of Fort Lauderdale, Florida.

Honest, open, forthright and foursquare, “Von,” as he was known to his many friends, never left the slightest doubt about where he stood on any question, however much he consequently sometimes nettled the pussyfooter. His sense of humor was well developed. He loved debate, and to stimulate it he would often prod—”stirring up the animals,” he used to call it. He was a good companion and a good mixer; he enjoyed to the full his association with his colleagues, particularly his daily encounters with his friends at lunch in Willard Straight Hall, and later on, at the Statler Club. Only some unavoidable contingency kept him away and he is painfully missed by those who were of his company.

He lived a long life and a full one. His contributions to Cornell and the Ithaca Community endure, and in his passing we have lost a human landmark of rare qualities.

J. Dabney Burfoot, Jr., W. Storrs Cole, Howard B. Adelman

Frederick O. Waage

October 7, 1906 — January 28, 1985

Throughout much of Fred Waage's long and notable career on the Cornell faculty, he served the University in two separate though related roles, in classics and in the history of art, combining the two harmoniously and fulfilling both with great distinction. His initial appointment at Cornell, in 1935, was as an instructor in classical archaeology in the Department of Classics, and he continued to serve as a professor of classical archaeology until his retirement. In 1938 he was appointed assistant professor of the history of art and archaeology and was the founder, in 1939, of the Department of Fine Arts, which became, in 1962, the Department of the History of Art. Fred Waage served as chairman of that department for twenty-two years and was successively an associate professor (1941) and a professor (1945) of the history of art and archaeology until his retirement in 1972, when he was appointed professor emeritus.

Born in Philadelphia, he received his primary and secondary education in El Paso, Texas, and Bethlehem, Pennsylvania. He attended Muhlenberg College and the University of Pennsylvania, where he graduated, with the degree of A.B. with honors and as a member of Phi Beta Kappa, in 1928. After earning an M.A. at Princeton he was appointed a Special Fellow of the American School of Classical Studies in Athens, where he was one of that eminent group of American archaeologists who were active in what is generally regarded as the most celebrated and significant excavation of a classical site by American archaeologists, the Agora of ancient Athens. He also participated in several campaigns (1933, 1937-39) of the Princeton excavation of Antioch on the Orontes, serving as recorder for these campaigns. After returning to Princeton as a Jacobus Fellow for a second master's degree, (M.F.A. with honors, 1935), he came to Cornell, where he remained on the faculty for the rest of his career. His Princeton Ph.D. degree in art and archaeology was conferred in 1943.

While his early experience was in archaeology and he continued an active interest in this field all his life, his great contribution to Cornell was undoubtedly his work in the Department of the History of Art, to which he contributed both superb leadership and great energy. At its outset, the department had a faculty of two offering nine courses; at his retirement it had grown to a department of eleven faculty members offering forty courses with a total enrollment of about sixteen hundred students. Along with his manifold activities as a dedicated and skillful administrator, Fred never ceased to be a devoted and very successful teacher, both in his large and highly regarded lecture courses (his course Fine Arts 101-102, a survey of the history of art, was one of the most popular courses in the college) and in his advanced courses in such special fields as numismatics and Greek pottery.

Along with his demanding program of teaching, administration, and scholarly productivity at Cornell, he served for twenty years as a visiting lecturer at other institutions: at Elmira College from 1952 to 1958 as a lecturer in art and at Ithaca College from 1958 to 1972 as a visiting professor of art. He served a term as chairman of the Advisory Committee of the Andrew Dickson White Museum of Art and was a member of the Managing Committee of the American School of Classical Studies in Athens.

Waage's publications reveal a breadth of talents and interests paralleling his career as a teacher. His early work consisted of a number of detailed and specialized articles resulting from his field experience in excavations in Greece and the Near East. These studies were principally devoted to art objects discovered in the excavations; one of the chief among these is his 1935 monograph *Greek Bronze Coins from a Well at Megara*. He was coeditor of several volumes of a major archaeological publication, the six-volume series recording the excavation of Antioch on the Orontes, which was issued in the 1930s and 1940s. Waage contributed several studies in the series and was the principal editor of *Ceramics and Islamic Coins*, which constituted part one of volume six, published in 1948. In a totally different sphere is his *Prehistoric Art*, published in 1967. This book was designed to meet the needs of a general survey course in the complex and varied subject of the art of prehistoric cultures. It was the fruit of many years of experience and of Waage's career-long concern as a teacher to achieve breadth of coverage and yet to avoid superficiality of treatment. He had, moreover, a strong conviction of the serious educational value of the study of the history of art. As he puts it in the preface to this book, "The aim of the history of art in education is primarily to enlarge one's knowledge of man and not merely to supply examples of his works for 'appreciation.'" The wide acceptance of this book testifies to his success in achieving his aim.

Soon after his retirement from teaching at Cornell, in 1972, he settled in Pittsboro, North Carolina, near Chapel Hill, where he was able to enjoy to the full his beloved hobby of gardening. He also remained active in his profession and was a visiting professor of art at Warren Wilson College, North Carolina, from 1973 to 1975. He is survived by his wife, Dorothy, who shared Fred's professional interests and is herself an archaeologist and a major contributor to the Antioch series. He is survived also by his son, Frederick, of Johnson City, Tennessee; two grandchildren; and a brother, Karl, of New Haven, Connecticut.

Those who knew Fred Waage well were conscious of the close and harmonious family relations he enjoyed. By a wide circle of friends in the Cornell community as well as by his more immediate colleagues he was held in high esteem and much affection as a person ready to enjoy conversation on just about any topic. Though by nature of a reserved and dignified manner, he was generous with advice and help, when they were wanted, for his students

and his colleagues alike. A man of firmly though quietly held convictions, he was also a man of great courtesy, a cooperative colleague, and a sympathetic friend.

Knight Biggerstaff, Albert S. Roe, John W. Wells, Gordon M. Kirkwood

Robert Jeffrey Wagenet

August 10, 1950 — July 31, 1997

Robert Jeffrey “Jeff” Wagenet was born in Pittsburgh, California, on August 10, 1950. Following graduation from the University of California at Davis (1971) with a Bachelor of Science degree in Soil Science, he continued his education at the University of Oklahoma where he earned a Master of Science degree in Environmental Health in 1972. He returned to UC Davis for graduate studies and completed his Ph.D. degree in Soil Science in 1975. In 1976, he accepted a position at Utah State University, where he obtained the rank of professor within six years. Twice at Utah he was named Professor of the Year in the College of Agriculture. In 1982, Jeff and his family moved to Cornell University, where he began as Associate Professor and was soon promoted to full Professor in the Department of Agronomy.

Jeff Wagenet was recognized internationally for his work on the fate and transport of chemicals in soil, especially the transport and transformation of nitrogen fertilizers under irrigated conditions, the displacement and chemical reactions of inorganic salts in saline soils, and the movement of pesticides through soil. He cooperated in the development of analytical and numerical mathematical models describing these processes. He and his friend and collaborator, J.L. Hutson, developed a family of comprehensive numerical models with the acronym LEACHM that describe the fate and transfer of nitrogen fertilizers, inorganic salts, pesticides, and organic manure in soil. LEACHM has been used by numerous research and regulatory groups both within the U.S. and internationally. The models also have been extended for use with geographic information systems, soil survey databases and for climatological data to estimate pesticide leaching at a larger geographic scale. He published over 100 refereed papers and six book chapters. He was a member of the National Research Council’s Committee on Long-Range Soil and Water Conservation. During the course of his career, he was appointed visiting professor at Ecole Polytechnique Federale de Lausanne (Switzerland), Katholieke Universiteit (Leuven, Belgium), Department of Land, Air and Water Resources at University of California at Davis, Institute for Soil, Water and Climate (Pretoria, South Africa), and the Institute of Soil and Water of the Volcani Center (Bet Dagan, Israel).

Perhaps Jeff’s greatest contribution to Cornell was through his role as department chair from 1987 through 1995. Jeff was well respected by both his colleagues and CALS administrators for the open, organized and efficient manner in which he chaired the department. During his tenure as chair, Jeff oversaw a broadening of the scope of the department to include environmental concerns and modern information technology. As part of this change, the

Department of Agronomy was renamed the Department of Soil, Crop and Atmospheric Sciences. At the same time, Jeff will be remembered for his commitment to upgrading the department's agronomic research infrastructure, including major improvements to the Musgrave Farm at Aurora, New York. In addition, he successfully steered the department through a difficult financial period for the college.

Jeff was a great teacher and mentor. While at Cornell, he taught undergraduate and graduate courses on transfer processes in soils, as well as an interdisciplinary course of the fate of chemicals in soil. He was major professor to 17 M.S. and 10 Ph.D. students.

Jeff was a fellow of the American Society of Agronomy and the Soil Science Society of America. He received the Honor Award of the Soil and Water Conservation Society. He was Editor of the *Journal of Environmental Quality* (JEQ) from 1990-95. During this time, the journal was expanded from four to six issues per year and it became one of the premier environmental journals in the world. Jeff helped to broaden the journal's scope by implementing publication of papers under subject matter categories, which greatly increased the visibility of various environmentally related topics in the journal.

In addition to his professional work, Jeff was a merit badge counselor for Troop 4 Boy Scouts of America, served on the Science Center Board, and attended the First Congregational Church of Ithaca. He was a loving husband and father and good friend.

Jeff died peacefully at home on July 31, 1997 at the age of 46 after a seven-year struggle with brain cancer. He leaves behind his wife of 26 years, Linda; his son, T.R.; and his daughter, Kylie.

Susan Ernst, Gary Fick, John Hutson, Harold VanEs, Linda Wagenet, Susan Riha

Harold Raoul Wainerdi

1911 — August 18, 1965

Dr. Harold Raoul Wainerdi, Clinical Assistant Professor of Medicine, Cornell Medical College, Physician to Out-Patients of The New York Hospital, and Assistant Attending Physician at the Hospital for Special Surgery, died on August 18, 1965, at the age of fifty-four.

Dr. Wainerdi was appointed to the staff of the Hospital for Special Surgery as a resident in Medicine in 1949. Here he served as a member of the staff until his death. He was graduated from Tufts Medical School, served as a rotating intern at Staten Island Hospital in 1947-48, and was a resident in medicine and cardiology at Sea View Hospital in 1948 and 1949. His activities in the Hospital for Special Surgery were chiefly in the field of rheumatic diseases, in which department he regularly attended rheumatic disease clinics, administering chiefly to the patients with arthritis. He became very much interested in multiple sclerosis, served as a medical director for the Multiple Sclerosis Society and established a clinic for demyelinating diseases in the Hospital for Special Surgery. The clinic was under his direction from the time of its origin. He was on the staff of The New York Hospital, the Jewish Chronic Disease Hospital, and was chief of the Rheumatology Division of Sea View Hospital on Staten Island, where he also was a member of the Medical Board and of its executive committee. He edited the *Sea View Hospital Quarterly Bulletin*.

Dr. Wainerdi was a Fellow of the American Medical Association, a member of the American Rheumatism Association, the History of Science Society, New York Academy of Science, World Medical Association, American Association of the History of Medicine, American Association for the Advancement of Science, International Auxiliary Languages Association, and the Clinical Society of Sea View Hospital.

Dr. Wainerdi will be sorely missed by his many patients and associates on the staff of the various hospitals where he was very popular and very much admired.

David D. Thompson

Lucien Augustus Wait

— Sept. 6, 1913

“We, the members of the University Faculty, desire to place on record an expression of appreciation of the life and services of Lucien Augustus Wait, a detailed report of which was placed on our record on the occasion of his retirement in 1910 (President’s Report, 1909-10, Appendix II, pages VIII and IX.)

“Upon his return from a two years’ journey around the world, he renewed his keen interest in the affairs of the University, in particular of the Department of Mathematics, in the progress it was making in research, and in the welfare of its members. We shall all miss his kindly sympathy and helpful encouragement. We express our sorrow and extend our sympathy to the bereaved family of our late associate and friend.”

G. P. Bristol, E. L. Nichols, V. Snyder

Source: Records, p. 609, October 15, 1913

RETIREMENT STATEMENT

On the retirement of Professor Lucien Augustus Wait from active teaching after a long and successful career, his colleagues in the University Faculty desire to place on record their high estimate of his services to the cause of education and sound learning.

Called in 1870 to an Assistant Professorship in the Department of Mathematics in the third year of its history, fresh from study at Harvard, he bore an important part in shaping the policy of the Department, and in establishing its well-known high standards. His unusual ability as a teacher and organizer led to his promotion in 1877 to the Associate Headship of the Department, relieving Professor Oliver of much of the administrative work ; and he became sole head at Professor Oliver’s death in 1895.

His administration has always been notable for efficiency, harmony, and devotion to high ideals of scholarship. In planning the mathematical instruction, he has kept steadily in view its various aims and purposes, including intellectual discipline, preparation for the scientific professions or for work in pure science, and the training of teachers and investigators. How well he has succeeded in the difficult task of holding an even balance among the diverse interests is well-known to all who have had any personal concern in the matter. On the disciplinary side, he has been careful to have the instruction of every grade placed upon a sound logical basis; on the scientific side, while keeping in close touch with the related departments in the College of Arts and Sciences, he has also studied

the needs of the various professional Colleges; and in the interests of prospective teachers he has always given due prominence to the pedagogical side of the work.

A notable feature of his administration is the encouragement he has given to the research work of his younger colleagues and of the graduate students. He has always planned that each instructor, after his initiatory period, should take some share in the graduate work, and should not be so overburdened as to leave him no time for his private investigations. Professor Wait has also encouraged the preparation of suitable text-books, being ever eager to adopt progressive methods of presentation and instruction, and has himself set an example of thoroughness and effectiveness in the class-room.

While firm in enforcing the rules and standards of the Department, his unfailing courtesy is proverbial; and his qualities as a teacher and a man have gained him the warm regard of a long line of Cornell alumni, and of the Faculty and Trustees, many of whom are numbered among his former students.

A man of ripe and varied culture, Professor Wait has taken a deep interest in all the educational problems which have come up before the Faculty, and his accustomed attitude has exhibited a fine blending of the progressive and the conservative. We shall miss his genial presence from our meetings, but we hope he may long remain a member of our University community.

Source: Records, p. 494, June 10, 1910

Marvin Waldman

February 15, 1920 — November 9, 1977

Marvin Waldman, associate professor of clinical psychology at the Gannett Medical Clinic, died November 9, 1977, at the age of fifty-seven, after an extended illness, during most of which he continued to work actively.

Dr. Waldman was born in Chicago, Illinois, on February 15, 1920, and received his Bachelor of Arts degree in 1942 at Roosevelt College, majoring in psychology. In January 1943 he enrolled in the doctoral program at the University of Chicago, receiving his Doctor of Philosophy degree in 1956. After service as a member of the Psychological Research Unit in the United States Air Force from 1942 to 1945, he interned in clinical psychology at the Worcester State Hospital in Massachusetts from August 1947 to September 1948. Such were his contributions that he was asked to continue there from September 1948 until March 1950, as a staff psychologist involved in therapy and research. Marvin was then asked to assume the position of research psychologist from March 1950 until August 1951, designing and conducting applied studies in psychopathology and participating in the educational program. As chief psychologist from August 1951 until September 1956, he actively directed the student training program; then after a year as psychologist in the Los Angeles Psychiatric Service he joined the staff of the Laboratory of Psychology, National Institute of Mental Health, Bethesda, Maryland, where he coordinated their psychodiagnostic program.

Dr. Waldman joined the Mental Health Section of the Department of University Health Services in October 1958 as associate professor in order to engage in his main interest, the practice of psychotherapy. Early in his career in Worcester he was actively involved in public speaking to community groups and as a psychological consultant to the Family Service Organization agency. Dr. Waldman continued these interests while a member of the Cornell faculty, being active in the organization and training of volunteers for the Suicide Prevention and Crisis Service and serving as a consultant to and president of the board of directors of the Family and Children's Service, as well as a board member of the Tompkins County Mental Health Association.

Marvin was a welcome speaker and teacher at innumerable campus meetings and discussion groups. He emphasized a strong interest in the preventive aspect of mental health and was always ready to participate in discussions and conferences with groups of students regarding general problems of mental health, instead of confining his efforts to one-to-one psychotherapy. Marvin was known to many students over the years as an

informal, friendly, supportive therapist who was genuinely interested in their lives. He had many friends and will long be remembered about campus as a result of his unusual kindness and consuming interest in others.

Dr. Waldman was a diplomate of the American Board of Examiners in Professional Psychology and a member of several learned and professional societies. He is survived by his wife, Marjorie, and two sons, Mark and John.

Christopher Bull, William C. White, Jr.

Charles Leopold Walker

July 1, 1879 — January 15, 1975

Charles L. Walker, emeritus professor of sanitary engineering, was born and grew up in North Evans, Erie County, New York. After graduation from the Buffalo Center High School in 1900, he enrolled in the Cornell College of Civil Engineering and received the degree of Civil Engineer in 1904. He worked with the United States Lake Survey before returning to Cornell as an instructor in civil engineering in 1905. He married Maude Coleman in 1910 at Piermont, New York. There were no children. Professor Walker's association with Cornell, as student and teacher, spanned a half century, the last thirty years as a professor of sanitary engineering. He retired in 1948 but was called back to teach, retiring a second time in 1952.

Charles Walker will be remembered for his impact both on his students and on the engineering profession. As one of the early researchers in what has come to be known as environmental engineering, he recognized the necessary relationship between researching or understanding practical environmental problems and solving them. He was among the first to bring an academic approach to bear on some of the practical problems that faced a still young sanitary engineering profession. An inquiring mind, an inclination toward research methodology, and research "know-how" enabled Professor Walker to carry out some of the pioneering field studies on such industrial wastes as paper wastes, milk wastes, and meat wastes in Florida, Maine, and Virginia. This early experience with field problems led Professor Walker to graduate student research that not only produced a series of published articles on the treatment of sewage sludges and industrial wastes but, more importantly, helped to develop a next generation of sanitary engineers who carried on Professor Walker's approach to applied research. This research resulted in his receiving the Kenneth Allen Memorial Award from the New York State Sewage Works Association in 1937.

Generations of students remember Professor Walker for his complete dedication to their education, as a painstaking teacher who worked tirelessly with and for them and as one who felt personal concern for each of them, as well as for their education and their careers. His teaching reflected his intense desire to develop professional engineers in whom he had instilled both intellectual integrity and a respect for detail. His profound interest in students as individuals generated loyalties that led to correspondence and visits to his home that continued until the end.

Somehow Professor Walker found time to serve the community, particularly the young people, through his Congregational Church, Masonic, and YMCA affiliations. Very active in the latter two, he rose to the presidency of the YMCA and became commander of the St. Augustine Commandery in the Masonic Lodge.

Always cognizant of his obligations to his colleagues and to Cornell, Charles Walker served the faculties of both the College of Engineering and the School of Civil Engineering as secretary, with the same conscientious attention to detail that characterized his teaching and research.

Colleagues and friends remember Charlie Walker as a person whose complete devotion to his students, total commitment to Cornell University, and continuing concern for young people benefited all three.

S. C. Hollister, G. B. Lyon, C. D. Gates

Kathryn E. Walker

February 9, 1917 — November 18, 2002

Dr. Kathryn E. Walker, Professor Emerita of the College of Human Ecology, died November 18, 2002 at her residence in Kendal at Ithaca. Born to Roy M. Walker and Helen Klinger Walker of Lemont, Pennsylvania, in 1917, Katy earned both Bachelor's and Master's degrees in Home Economics from Pennsylvania State University in 1938 and 1945 respectively. During the intervening years, she taught high school home economics in Alexandria and Damascus, Pennsylvania. Upon completing her Master's degree, she taught at the Laboratory High School at Slippery Rock State College, Pennsylvania. While at Slippery Rock State College, Katy took summer courses at both Pennsylvania State University and Cornell for several years. She commenced Ph.D. studies in the Department of Economics of the Household and Household Management, Cornell University, in 1953. Upon completing her Ph.D. degree in Home Economics in 1955, Katy joined the faculty of the Department of Household Economics and Home Management as an Assistant Professor and spent the rest of her career teaching and doing research here at Cornell. She retired in 1978.

Katy will be remembered as a pioneer in the collection and analysis of the way people use time when not employed for pay. While time diaries have been used since the 1920s, Katy perfected the use of the 24 hour diary as the most accurate means of recording what people do with their time during the day, when they do it, for how long, with whom, and what else they might be doing at the same time. Her initial and abiding interest was not with time use per se, but with the efficiency with which people performed the welter of housework activities. Absent good measures of household output, a deficiency that continues to plague the field, she used the time spent on housework as a proxy and worked tirelessly to improve its measurement. She hoped that through her research, housework would be recognized as important as work in the labor market and that the work could be made more efficient, relieving some of the burden shouldered by housewives and others who do it.

In addition to the many M.S. theses and Ph.D. dissertations she directed on time use and home management topics, three of her research contributions stand out as most important: the 1967 time use study of families in Onondaga County, New York, published in 1976 by the Center for the Family, American Home Economics Association as a book co-authored by Margaret Woods entitled, *Time Use: A Measure of Household Production of Family Goods and Services*; a 1980 monograph co-authored by William Gauger entitled, *The Dollar Value of Household Work*, as College of Human Ecology Information Bulletin No. 60; and her leadership in organizing and directing the

NE-113, *The 11-State Time Use Study*, a time use study conducted by Agricultural Experiment Station researchers in 11 states.

The publication of *Time Use: A Measure of Household Production of Family Goods and Services* in 1976, along with several journal articles published earlier, established Katy as a leader and innovator in the field of time use research. She consulted with researchers at the Survey Research Center, University of Michigan, as they devised the 1975 Time Use in Economic and Social Accounts Survey and the subsequent re-interview survey as well as with a wide array of international time use researchers. As a result, Cornell became the place where international researchers from Scandinavia, Germany, The Netherlands, Japan, Korea all came to become more familiar with diary survey techniques she pioneered.

The Gauger and Walker monograph, *The Dollar Value of Household Work*, surveyed and analyzed the techniques by which unpaid housework might be valued. As such, it became the standard used and cited by lawyers and expert witnesses in arguing wrongful death and injury and divorce cases in every state of the union.

Through her organizing skills, her tenacity, and her vision, NE-113, *The 11-State Time Use Survey* was financed by regional research funds from the USDA and conducted in 11 states in 1977-78. More than anything else, this endeavor trained a generation of home economics researchers in the time use diary survey technique and provided them with the data to answer a host of questions about the variability and determinants of the time married women and men spend doing housework. Without Katy Walker's leadership and tenacity, this would not have happened.

Throughout Katy Walker's career, only sporadic, piecemeal, and very infrequent national surveys of time use were conducted and not all of those employed the kind of detailed time diary techniques Katy developed and promoted. Only on the eve of her death has the Bureau of Labor Statistics and the U.S. Bureau of the Census developed a national survey of time use that will be conducted at regular intervals. While Katy did not live to see a continuing national time use survey, her work influenced its design. Such a national survey would not have come to pass without Katy's influence and that of a host of other time-use researchers.

While Katy's research interests were always clearly focused on time use research, she played an important role as an educator, especially at the graduate level. Scholars who completed their M.S. and Ph.D. degrees under Katy include people from university faculties across the country and in many foreign countries. Their own accomplishments in teaching, research and extension have reflected back on Cornell and have helped make it the premier College

of Human Ecology in the world. Her accomplishments were recognized in a symposium organized by the College of Human Ecology in 1992, which honored both Katy and her major professor, Jean Warren. Scholars from the United States and Canada came to celebrate their work on time use.

One of Katy's contributions is shared by her great good friends, Gwen Bymers and Mary Woods, both faculty in the department. Jointly they owned "Walk-By-Wood," a cottage on Cayuga Lake. There they entertained several generations of faculty, graduate students, international visitors, and friends. Through the gatherings at the cottage, scholarly relationships were established and fostered that extended throughout the United States and around the world and continue on into the present. "Walk-By-Wood" continues its work even though its owners have all passed away because Gwen Bymers, Katy Walker and Mary Woods donated the land and cottage to the College of Human Ecology in 1990. Sold, it funds a graduate assistantship that each year is awarded to a graduate student in the department.

Pioneering researcher, staunch supporter of her department, college and of Cornell, the final word, perhaps, should be from a former Ph.D. student who, upon learning of her death, said: "Katy will be fondly remembered for the moral and material support she offered. She was small in stature but the influence on her students' lives was large."

W. Keith Bryant, Jean Robinson, E. Scott Maynes

Robert John Walker

May 5, 1909 — November 25, 1992

Robert John Walker, professor of mathematics emeritus, died November 25, 1992 at St. Clair's Hospital in Pittsburgh, Pennsylvania. He was born May 5, 1909, in Pittsburgh, a son, with three elder sisters. He attended Duquesne University High School and then obtained a bachelor of science degree from Carnegie Institute of Technology in 1930. Robert Walker held fellowships at Princeton University from 1931-33 after which he was a part-time instructor at Princeton from 1933-35. He was awarded a Ph.D. degree in 1934 with a dissertation, "Reduction of the Singularities of an Algebraic Surface".

In the summer of 1935, Bob traveled to Europe returning as an instructor at Cornell University starting September 26, 1935. He was assistant professor from 1938-46, associate professor from 1946-48, and professor from 1948-74, when he retired. World War II intervened, but Bob was classified 1B because of defective eyesight. He obtained occupational deferment and was assigned to doing rocket research at Aberdeen Proving Ground in Maryland from 1942-45. In August 1945 Bob wrote Chairman Agnew "I would not object to a couple of months vacation—the first in three years..." Agnew wrote back saying o.k., noting the fall term ran from November 2, 1945 to February 23, 1946.

In 1950 Agnew had been chairman for ten years. Bob became the next chairman and served two terms from 1950-60 broken by a sabbatical leave from 1954-55. During this leave Barkley Rosser acted as chairman. In retrospect Bob felt being chairman for two terms was the wrong decision.

Barkley Rosser succeeded Bob as chairman but resigned in 1962. Then Bob acted as chairman until Paul Olum was appointed.

Bob's dissertation was an important contribution to the subject of algebraic curves. He had a number of conversations with S. Lefschetz of Princeton University about material for a book. In March 1946, Lefschetz offered Bob a lectureship at Princeton during 1946-47 to help him finish the book. *Algebraic Curves* was published by Princeton University in 1950 and remains in print today. It showed how to compute things about algebraic curves and this subject has become important in design considerations in computer science today.

By the early 1960s Bob had lost interest in his original subject of algebraic geometry. A colleague recently offered the opinion that Bob was at heart a geometer and as the subject became more algebraic and less geometric, he

lost interest. Emerging was a deep growing interest in computers. He had studied aerodynamics and had worked in the Ballistic Research Laboratory at Aberdeen. Part of the sabbatical in 1954 was spent at UCLA working with SWAC (Southwestern Automatic Computer). A newspaper clipping says “SWAC...is rigged to play Seventeenth Century musical games in the interest of solving mathematical problems.” Bob had programmed SWAC to play sequences of changes over the speaker wired into the SWAC circuits. Early in the 1960s he was involved in the decision to purchase a Control Data mainframe for Cornell. The computer was located in Rand Hall. The time was ripe for a computer science department and Robert Walker, Richard Conway, and Anil Nerode helped found the Computer Science Department and persuaded Juris Hartmanis to leave General Electric and become head of the new department. Bob held a half-time appointment in the new Computer Science Department until 1968.

Bob was a member of the Mathematics Association of America Committee on the Undergraduate Program in Mathematics. In 1960 the NSF granted \$350,000 to the Mathematics Association “to wipe out a . . . lag in American mathematics teaching.” In pursuit of his interest in computers, numerical analysis, and the teaching of mathematics, Bob took two sabbatical leaves to Florida State University, first in 1961-62, the second in 1968-69, to “study and research in the role of computers and computer science in the undergraduate curriculum. . .” In 1964 Barkley Rosser, now at the University of Wisconsin, offered Bob a professorship in the new department of computer science, but he refused. The second leave resulted in the book, *Calculus — A Computer Oriented Presentation*, 1968, under the sponsorship of CRICISAM. The book was used several years at Cornell but the methods did not seem successful enough to continue to use.

Bob had always been interested in puzzles, games and problem solving. This fascination extended to combinatorial questions and resulted in papers in 1960 and 1963. The 1963 paper “Determination of Division Algebras with 32 Elements” required a computer to enumerate all possible structures, which was a major computation at that time.

Bob was a great friend to colleagues and their children. His office door was always open. He became godfather to two Rosser children who have fond memories of their fun with him, as does the Agnews’ son, who, after working many years for IBM now teaches computer science at Binghamton University. He was “Uncle Bob” to these children who prized his friendship and good-natured jokes with them. Unmarried, Bob and his sisters Clara and Francis really enjoyed each other and were great friends. Bob anchored a bachelor table evenings at the Statler Club which was a convivial meal for those who were single as well as for parents with children who treasured this pleasant relief on a busy day. Periodically he was a breakfast chef who served wonderful pancakes to these families and

friends in his apartment. Many enjoyed eating there to the powerful roar of water in Cascadilla Gorge, watching his birds come to his feeders and just enjoying the calm, well-organized style of his place.

He spent hours studying how best to attract and photograph birds and designed excellent feeders to avoid squirrels. Birding with Bob was great fun and after he retired he took trips to Big Bend and Utah, to the Galapagos Islands and to Africa showing enormous stamina for sunrise-to-sunset trips in the field. Many of his photographs went to the Audubon Society in Pittsburgh. Others became the picture of the yearly Christmas card that so many remember receiving.

He had a very select library likely to contain excellent books on subjects of special interest. Included were guides to Africa and important places to bird in North America. These books provided the foundation for a number of self-directed tours that Bob took with friends. Bob knew and recommended the best detective fiction and enjoyed discussing it in detail.

A large retirement party was held on May 11, 1974 at the Big Red Barn on campus—informal but beautifully arranged. The department secretary, Madelyn Keady, was also retiring after serving from 1928 to 1974. In the early years Madelyn was jointly the department secretary and librarian. The department was small and relationships often were very close, no longer true in a department four times its earlier size, which saddened Bob a bit.

After retirement Bob moved to Pittsburgh and shared a house with his sisters, Clara and Francis. The elder sister Martha lived in Florida, which inspired great birding trips and much good-natured joking. Clara typed braille and had contact with the blind. Bob read difficult science texts onto magnetic tape for blind students which was organized through a church in Pittsburgh. Subjects included economics, pharmacology, organic chemistry, finance, etc., each with its peculiar problems about verbalizing diagrams, pictures and equations, each text worked out in close consultation with the blind reader. Bob excelled at this type of problem solving and continued this humanitarian work until his health began to fail. His heart was in helping people to enjoy living intelligently.

Those of us who knew him well miss his spirit, intellect, wit, directness, honesty and lively interest in his friends of all ages and in the world about him.

Richard Conway, Juris Hartmanis, Roger Farrell

Donald Howard Wallace

June 27, 1926 — April 19, 2002

Donald Howard Wallace, Professor of Plant Breeding and Vegetable Crops, Emeritus, who died on April 19, 2002 in Ithaca after a brief illness, was a dedicated writer and teacher of the genetics and breeding of several vegetable crops. His activities involved consultation and research not only for New York but also in many countries world wide, primarily with the food grain legume crops.

Wallace's early years were in Idaho and Utah. He was born in Driggs, Idaho, and grew to manhood on an irrigated farm in the Teton Valley, a beautiful part of the western slope of the Teton mountain range. After graduating from high school in 1944, he served for two years in the United States Navy after which he went on a mission to Eastern Canada with the Church of Jesus Christ of Latter-day Saints. He returned to attend Utah State College of Agriculture in Logan, Utah, where he received the baccalaureate degree in 1953. His interest in horticulture and plant breeding was heightened by summer employment at the college in vegetable breeding.

He applied for graduate study in the Department of Plant Breeding at Cornell University with Professor Henry M. Munger. He received a research assistantship and was awarded special fellowships. Joining Munger on his graduate committee were F.C. Steward, plant physiology, and E.B. Oyer, vegetable crop production. In this experience, Wallace developed a deep interest in the physiology of plant growth and a goal to develop superior varieties for all mankind. The latter interest was stimulated by his interactions with Munger and Oyer, who had much national and international experience.

Wallace's graduate studies, initiated in 1953, were curtailed in 1955-57 when he was appointed Acting Assistant Professor on the vegetable breeding project in place of Thomas L. York, Associate Professor of Plant Breeding and Vegetable Crops, who was on leave to serve in that capacity with the Cornell-Los Banos contract in the Philippines. Upon Professor York's return, Wallace resumed graduate studies and received the Ph.D. degree in 1958. He again was named to an Assistant Professorship, which became available by the untimely death of York in 1957. Don was promoted to Associate Professor in 1965, Professor in 1971, and Professor Emeritus in 1992.

Don was the mentor and chairman for thirteen masters and fourteen doctoral students; at least half were from other countries. Most were concerned with the genetics and breeding of grain legumes, vital food crops. He continued interaction with many of these students and cooperated with scientists at several of the international research centers; in particular, CIAT in Columbia, South America, and ICRISAT in India. In recent years, he developed

an International Plant Breeding Newsletter in cooperation with Food and Agricultural Organization (FAO) in Rome, Italy on the World Wide Web, whereby interested scientists could exchange ideas and information on plant genetics and breeding. Another scholarly contribution in this area was the publication in 1997 of a comprehensive book entitled, *Plant Breeding and Whole-System Crop Physiology: Improving Crop Maturity, Adaptation and Yield*, in collaboration with Weikai Yan, a Visiting Scholar from China.

Early in his career, Don concentrated on the physiological genetics of crop yield in dry beans and hybrid varieties of cabbage. Today, from his research, inbred lines of cabbage are used by private companies and several varieties of dry beans are used widely. The American Society of Horticultural Science recognized him with the Campbell award in 1979, and the Asgrow award in 1981.

He was very dedicated to his science and his students. In his quiet, almost retiring manner, he was a leader and his advice often sought. He served one to three month consultations in Guatemala, Ecuador, Michigan State University, CIAT and ICRISAT. These activities were much of his life until a mild stroke curtailed them a few weeks before his death.

Wallace was married to Naomi Parrish in 1949. They had three daughters and three sons.

Donald E. Halseth, Bruce Rich, Royse P. Murphy

Jeremiah J. Wanderstock

April 28, 1920 — June 6, 1972

Jeremiah J. Wanderstock, professor of hotel administration, died suddenly while on a business trip to New York.

He was born in New York City on April 28, 1920, and came to Cornell in 1937. He matriculated in the College of Agriculture, where he received the B.S. degree in 1941 and the M.S. in 1942. After taking his Ph.D. in animal husbandry in 1945 he joined the faculty of the College of Agriculture as an instructor. He became an associate professor in 1953 when he transferred to the Hotel School, where he was made full professor in 1961.

Professor Wanderstock was recognized worldwide as an authority in meat science, management, and menu planning. In 1969 he was named the first recipient of the Distinguished Educator's Award given by the National Association of Meat Purveyors.

He was the author of numerous technical papers and was the coauthor with the late C. A. Reitz of a two-volume work concerning the selection and cooking of foods.

He was a fellow of the American Association for the Advancement of Science, a founder and charter member of the American Meat Science Association, and was listed in *American Men of Science*, *Who's Who in the East*, *Leaders in American Science*, *Who's Who in American Education*, and *Who's Who in Food and Lodging*.

He was a member of the Cornell University Senate, and he served through the years as a member of many University committees and as chairman of some. At the time of his death, he was faculty adviser to three University groups and was secretary of the Ithaca Chapter of the Cornell Society of Hotelmen.

Among his many community activities, he was a founder and active member of the Cayuga Heights Fire Company and president of the Ballet Guild of Ithaca, and he had been an executive in the Boy Scout Council.

Jerry Wanderstock was a gifted professor, a warm, humane person, and a gracious gentleman who was respected and admired by all who knew him. He will always be remembered for his cheery disposition, his warm and firm handclasp, his pleasant manner, his bright smile, his sincere interest in his students, his love of sport — particularly his enthusiasm for Cornell swimming — his attention to duty, his love of family, and devotion to his wife and children. He was a respected and admired teacher of international renown in his field, one who carried the name of Cornell all over the world. He will long be remembered for his dedicated service to Cornell and to the Ithaca community.

He is survived by his wife, Edith Poummit Wanderstock; two sons, James and Jonathan; and three daughters, Helen and twins Janet and Joni Wanderstock, all of Ithaca.

Myrtle H. Ericson, John H. Sherry, Paul R. Broten

Hsien-Chung Wang

April 18, 1918 — June 25, 1978

Hsien-chung Wang had been a professor of mathematics at Cornell since 1966. He was a scholar with a high international reputation and a colleague of outstanding integrity, modesty, and helpfulness. The University suffered a sad loss through his death.

He was born in Peking. His family, from Shantung Province, had produced distinguished scholars for several generations. After a school career that included achievements in the high jump and basketball along with high academic performance, he became a student of mathematics at Tsing Hua University. He was enrolled there when the university made its dramatic move from Peking to western China. After completing his undergraduate work in mathematics, he won a national scholarship that enabled him to do graduate work in Great Britain. The competition for these scholarships was fierce, and only students of exceptional merit could obtain them. He received the Doctor of Philosophy degree from Manchester University in 1948 and then came to the United States.

His first appointment was to the position of lecturer at Louisiana State University. Despite a heavy teaching load, H.C. remained active and successful in research. His achievement was recognized by a visiting membership of the Institute of Advanced Study at Princeton in 1951-52. He was highly esteemed by the faculty of the institute and was invited back in 1954-55, 1961-62, and 1965. His work became widely known and appreciated in the early 1950s. He held positions at the Alabama Polytechnic Institute, the University of Washington, Columbia University, and Northwestern University. In 1966 he accepted a professorship at Cornell and was one of the most respected and distinguished members of the Cornell faculty until his sudden death from leukemia.

He was an excellent and devoted teacher. Students frequently asked to be switched to the section of a course taught by him. He was a source of inspiration, especially to his graduate students, in whom he took a deep interest.

H. C. Wang's scientific work dealt with differential geometry, Lie groups, and discrete subgroups of such groups. He was an internationally known authority in his field, and his work was widely used by others. His eminence as a scholar led to an invitation to address the International Congress of Mathematicians in Edinburgh in 1958 and to the award of a Guggenheim fellowship in 1960. He was a participant in several international scientific conferences both in the United States and abroad.

No one who came into contact with H.C. could fail to be impressed by his generosity and his modesty. In the best sense he was a gentleman, always ready and anxious to help others, never asking the least thing for himself. If one did him the slightest favor, he showed gratitude for it ever after; if one asked anything from him, he acted instantly and seemed to think nothing of it. He had wide interests outside mathematics, in literature, the Classics, Chinese history, and the games of chess, bridge, and go. He was a private person. His love of his family was intense. One of his great joys during the last years was that he could visit his four brothers and his sister in China after a separation of more than twenty years.

He is survived by his wife, Lucy, and their three daughters, Angela, Louise, and Clara.

Alex Z. Rosenberg, Oscar S. Rothaus, Wolfgang H. Fuchs

George Gray Ward

August 15, 1868 — December 20, 1950

Dr. George Gray Ward, the son of George Gray and Marianne Smith Ward, was born in London, England, on August 15, 1868. At about one year of age he was taken by his parents to St. Pierre and Miquelon, small French islands off the south coast of Newfoundland. When he was six years of age the family moved back to London and later in the same year came to the United States. They lived for one year at Rye Beach, New Hampshire and settled permanently in New York City in 1875. These frequent changes in residency by his family are explained by the fact that his father acquired the reputation in his day of being the leading international expert on telegraphic communications, and especially on installation and operation of submarine cables. He held positions of great responsibility with the French Atlantic and Direct United States Cable Companies, and eventually became vice president and general manager of the Commercial Cable and Postal Telegraph Companies. He had a leading role in the laying and operation of the first and second cables across the Atlantic Ocean.

Dr. Ward was graduated from the Brooklyn Collegiate and Polytechnic Institute and from the Holbrook Military Academy in Briarcliff, New York, in 1885, at seventeen years of age. The following summer was spent on the “Mackay Bennett” a ship which was being used to locate a break in one of the Atlantic cables. On this ship he reached London, but returned soon to New York and spent three years in business with his father.

Through his friendship with Henry Wallace, the son of a physician, and a student at the Long Island College Hospital, he became interested in the study of medicine in 1888 and his father arranged for Dr. Alexander J. G. Skene to be his preceptor. After his graduation from the Long Island College of Medicine in 1891, he spent one year as intern at the Long Island College Hospital and another year at postgraduate studies in Berlin, London and Paris. He began the practice of medicine in New York in 1893 at twenty-five years of age. His career as teacher of obstetrics and gynecology began also in 1893 and continued without interruption until 1934, that is, for forty-one years. Within this time he held teaching appointments at the Long Island College of Medicine, the New York Postgraduate Medical School, and the Cornell University Medical College. At the Cornell University Medical College his appointments included: Instructor in Obstetrics 1898-1906; Instructor in Gynecology 1902-1916; Assistant Professor of Gynecology 1916; Professor of Obstetrics and Gynecology 1916-1934; and Professor of Obstetrics and Gynecology Emeritus 1934-1950.

He was Chief Surgeon at the Woman's Hospital in the State of New York from 1918 to 1938; Chief Surgeon Emeritus at the Woman's Hospital from 1938 to 1950; and a Professor of Clinical Obstetrics and Gynecology at Columbia University from 1937 to 1946. He was an Honorary Fellow of the Royal College of Obstetricians and Gynecologists of England; an Honorary Fellow of the Edinburgh Obstetrical Society; and Honorary Member of the British Congress of Obstetrics and Gynecology and a Corresponding Member of the Royal Budapest Medical Society. At the time of his death he held appointments as Consultant in Obstetrics and Gynecology at the New York Hospital and as Consultant in Gynecology to the New York Postgraduate Hospital, Booth Memorial Hospital, Lawrence Hospital (Bronxville, N. Y.), St. Barnabas Hospital for Chronic Diseases and the Monmouth Memorial Hospital (Long Branch, N. J.)

Throughout all of his career he took an active part in the affairs of our local and national scientific societies. He was a member and ex-president of the New York County Medical Society, the New York Obstetrical Society, the American Gynecological Society, the American Gynecological Club and the Hospital Graduates Club. He was a member of the New York State Medical Society, the American Medical Association and ex-chairman of its section of Obstetrics, Gynecology and Abdominal Surgery; a fellow of the New York Academy of Medicine, a fellow and founder of the American College of Surgeons, and a Diplomate of the American Board of Obstetrics and Gynecology. He was also a member of Phi Alpha Sigma and Alpha Omega Alpha fraternities. On May 7, 1947, he was awarded a certificate by the New York State Medical Society for having completed 50 years of active practice. At the 90th Commencement of the Long Island College of Medicine the alumni medallion, designed by Dr. Robert L. Dickinson, was awarded "to Dr. George Gray Ward of the class of 1891 for distinguished service to American medicine". His contributions to medical literature included over one hundred articles on subjects related to obstetrics and gynecology. They dealt especially with gynecological operative techniques, irradiation for benign and malignant diseases of the pelvic organs and certain phases of hospital organization. He contributed chapters to Johnson's "Operative Therapeutics" 1915, Kelly's "Gynecology" 1928, Lesis' "Practice of Surgery" 1928, Curtis' "Obstetrics and Gynecology" 1933, and Davis' "Gynecology and Obstetrics" 1933.

For eight years he was a member of the 7th Regiment of the National Guard of New York, a captain and Assistant Surgeon of the 12th Regiment from 1895 to 1898, a Surgeon Major from 1898 to 1902 and a Surgeon Major, 12th Regiment Infantry New York Volunteers, U. S. A., in the Spanish American War. He was a member of the military Order of Foreign Wars, the Naval and Military Order of the Spanish American War and the Army and Navy Club.

He was a member of the Union Club, the Century Association, the Pilgrims of the United States and a Life member of St. George's Society of New York. He was an Episcopalian and a member of the St. Thomas's Church in New York.

On June 23, 1889, he was married at Chattanooga, Tennessee, to Edith Wigham of New York. He is survived by his wife, Edith Wigham Ward, a brother Sidney F. Ward and a sister, Mrs. Henry H. Hough.

From good English stock, Dr. Ward inherited a sturdy physique and enjoyed excellent health until near the end of his life on December 20, 1950, at 82 years of age. It is probably fair to state that he made the practice of medicine for 57 years his hobby as well as his life's work. During this time he attained great distinction as both a teacher and clinician. He was always an excellent teacher and nothing brought him more genuine satisfaction than the success of physicians whom he had helped to train.

Throughout his long professional career, Dr. Ward was fortunate in having means which made it possible for him to travel extensively in this country and abroad. He spent much time visiting clinics in England, Scotland, the Scandinavian countries and on the continent as well as in this country. He counted among his personal friends many of the outstanding clinicians and teachers here and abroad. He was always on the alert for new ideas to improve results in the treatment of obstetrical and gynecological patients.

In all his scientific work he set high standards for himself and for those who worked under his direction. He had little patience with any members of a hospital personnel who failed to put forth their best efforts in the performance of their duties. He was at times a rather severe taskmaster but had capacity to show appreciation for work which was well done.

R. Gordon Douglas

William B. Ward

July 16, 1917 — April 27, 2008

William B. Ward came to Cornell as a full professor and department head in 1945 at age 28—after serving as an information specialist in the U.S. Department of Agriculture and War Food Administration during war years 1941-45. He earned a Bachelor's degree from Utah State University and a Master's degree from the University of Wisconsin in 1941. He taught in the College of Agriculture and Life Sciences for 56 years from 1945 to 2001. He died at age 90 on Sunday, April 27, 2008.

Bill was invited to Cornell to organize and develop a new department that would combine communication production, teaching, extension, and research functions in the newly emerging field of communication for both the College of Agriculture and the College of Home Economics. He mobilized resources to offer courses in agricultural journalism and public speaking and to establish divisions within the new department for the production of publications, visual aids, news services, and radio, television and film. He shifted the scope of the department from one that was originally named Extension Teaching and Information to the more comprehensive Department of Communication Arts (which later became the Department of Communication). During his 26-year tenure as head of the department, Bill assembled a staff of faculty and communication specialists who had a significant impact on the field of agricultural and extension communication in the U.S. Land-grant University system. During his tenure as head of the department (1945-71), the department won more national awards for excellence than any other land-grant university. The department frequently achieved distinction for the exhibits it produced for the New York State Fair. In 1998, he was recognized for these contributions with an Award of Excellence from the internationally recognized organization Agricultural Communicators in Education—the award noting his

“substantial and creative contributions to the communication/information technology profession and leadership involvement over many years in international activities.”

Early in his Cornell career, Bill served as President of the American Association of Agricultural Editors.

Bill's fostering of a strong academic base for the study and practice of communication paved the way for the department to add a new applied graduate degree to its B.S. degree. This was a Master of Professional Studies (Communication) program that was the first of its kind in the country. It was the forerunner and foundation of an expanded graduate program that in later years was to include M.S. and Ph.D. degrees.

Magazine Writing was one of Bill Ward's most popular courses. Often the opening class of the year had more students enrolled than chairs in the classroom, and he would early on whittle the class size down by the rigorous demand of writing for specific publications. In his graduate course on Communication Planning and Strategy, he required students to write case analyses in three pages or fewer to encourage them to concentrate on the essentials in a problem. Much of his writing dealt with practical matters in which transparent communication was essential. His teaching reached beyond the Ithaca campus with the publication of his textbook, *Reporting Agriculture*, which was widely used in the U.S. and abroad. In addition, more than 400 of his articles have been published in national and regional agricultural magazines.

Bill was an early pioneer of Cornell's use of television for educational purposes. In 1962, he participated in the effort to obtain support for a TV Film Center and in 1970 the new Educational TV Center became a reality in the College of Human Ecology, with modern studios and equipment capable of delivering full-color taped programs to a network of 19 television stations. The studios also became a laboratory for the teaching of television production.

In addition to being a teacher and administrator, Bill was a noted professional communicator. After the Japanese attack on Pearl Harbor and while he was attached to the U.S. Department of Agriculture, he was assigned to report on available food supplies for Hawaii in case of a blockade of Hawaii. Later, he was a member of the press corps covering a trade mission to South America led by Ezra Taft Benson, the Secretary of Agriculture. His "Washington Connection" continued into the 1970s when he received a USDA grant to plan, write and design media materials for all 50 states to improve the public understanding and image of American agriculture.

Bill was a leader in many projects abroad. When Cornell was deeply involved in institution building in the Philippines during the 1950s, he helped establish a new Department of Agricultural Journalism at the College of Agriculture, University of the Philippines at Los Baños. He subsequently did consulting work on communications and publications at the nearby International Rice Research Institute during its earliest days. During a sabbatical leave in the early 1960s, Bill developed a communication program for Instituto Nacional de Tecnologia Agropecuaria, a nationwide agricultural research and extension agency in Argentina. In the late 1960s, he planned and helped create communication centers at two agricultural universities in India as a part-time consultant for the Ford Foundation. These centers continue to thrive today. In 1972, he became Chief of Party for the University of Tennessee agricultural development program in India sponsored by the U.S. Agency for International Development. He had the distinction of being one of those forced out of India when Indira Gandhi became unhappy with U.S. Government presence in that country. In India, he also responded to a request by the Director General of the

International Crops Research Institute for the Semi-Arid Tropics (ICRISAT) to plan a communication division for the organization.

In Africa, Bill served as a visiting scientist at the International Institute of Tropical Agriculture in Ibadan, Nigeria. During half-time retirement from 1977-89, he was a communication consultant for IITA for three months each year. One of his special talents was compiling and editing research reports. He carried this skill over into a long-term relationship with the International Agricultural Development Service in Indonesia where he was a communication consultant. He prepared five-year research reports for the country's Agency for Agricultural Research and Development that were published and widely distributed. Bill's involvement with international agricultural research centers also included many months over a five-year period during the 1980s at the International Center for Agricultural Research for the Dry Areas (ICARDA) in Aleppo, Syria. Bill's other overseas assignments also took him to Guatemala, Honduras, Taiwan, and Bangladesh.

Bill Ward was a member of the University Faculty during the tenures of seven Cornell presidents. He was appointed Professor Emeritus in 1988, served as Vice President of the Cornell Association of Professors Emeriti, and represented CAPE in the Cornell University Faculty Senate. Soon after the new Kennedy Hall became the home of the Communication Department, a room in the building was named in his honor. Since 1999, there has been a William B. Ward Communication Scholarship for undergraduate students majoring in Communication.

Royal D. Colle, Chairperson; Ronald E. Ostman, Donald F. Schwartz

Ethel Bushnell Waring

January 9, 1887 — December 18, 1972

Ethel Bushnell Waring, professor of child development and family relationships, emeritus, was a member of the staff of the New York State College of Home Economics (now the College of Human Ecology) from 1927 until her retirement in 1955. Her appointment as professor of home economics in what was then the department of Family Life marked the beginning of the formal study of child development, behavior, and guidance in the young College. The small department grew vigorously. In 1945 it became Child Development and Family Relationships. (Currently it is Human Development and Family Studies.) During her twenty-eight years in the College, Dr. Waring made outstanding contributions in teaching and research. For many years she directed the departmental research program; during 1940-41 and 1943-44, she served as acting head.

The A.B. degree was awarded to her at the University of Illinois in 1908, where she was the class valedictorian. Pursuing an interest in work with young children, she studied for the next year at the Chicago Kindergarten Institute. The year provided valuable experiences and brought her in touch with the laboratory school Dr. John Dewey had established at the University of Chicago some years earlier. She was stimulated by his educational theories and was to know him well later in her years of study at Columbia University.

She received her teacher's diploma in 1909 and studied with Dr. Lewis Terman at Stanford University for the Master's degree, receiving it in 1917. She was awarded the Ph.D. by Columbia University in 1927.

Dr. Waring was a member of many honor societies, including Phi Beta Kappa, Sigma Xi, and Pi Lambda Theta, and in 1957 she was elected an honorary member of Omicron Nu.

Prior to her appointment at Cornell Dr. Waring worked with young children of various ages, backgrounds, and ability, developing methods of teaching and guidance that were creative, progressive, highly successful, and far-reaching.

She married Clarence Waring in 1914. While living in Oakland she assisted Dr. Terman, at Stanford, who was developing psychological tests for children between birth and preschool age. When her husband died in the flu epidemic of 1918, their son was a year old.

The next few years presented opportunities to teach young children of primary-school age in San Francisco, and to work with exceptional children (many with learning problems) in the public schools of Los Angeles. As a creative

young teacher she had already begun to develop the methods for self-directive learning experiences and the self-corrective materials for which she became well known. Her teaching of young children continued at Columbia University, where she held assistantships with Dr. Patty Smith Hill and Dr. Helen Wooley from 1923 to 1926.

The child study movement in America was then in its infancy. Nursery schools were just beginning. The young Ph.D. candidate studied under the chairmanship of Dr. William H. Kilpatrick, Dr. Dewey's close friend. As her work progressed it attracted the attention of leaders in the field of child study and childhood education.

In 1926 Dr. Waring accepted a position at the University of Iowa with Dr. Bird Baldwin in the Institute for Child Welfare Research. Here she became acquainted with Dr. Amy Daniels, the child nutritionist, who sought her help with emotionally disturbed children in the university hospital and was impressed with the positive results of her advice and methods. So Dr. Daniels recommended Mrs. Waring when Miss Flora Rose asked her to suggest "a human psychologist" — a teacher whose wisdom was "practical as well as theoretical — for the new program in child development at Cornell.

Laura Spelman Rockefeller grants were then making possible initiation of child study and childhood education programs in a number of state universities. The College of Home Economics at Cornell had received a generous five-year grant in 1924. It was unique among the institutions receiving grants, for it centered the new program in a department of Family Life. This was an important consideration for Dr. Waring, who wished to work both with preschool children and with their parents.

Professor Marie Fowler, also appointed in 1927, was to be head of the department of Family Life. A laboratory nursery school was already being organized. Further additions to staff resulted from the Laura Spelman Rockefeller funds, and extension programs in child development and family life were soon launched. Dr. Waring, in addition to her college teaching, directed the research program, while Professor Fowler carried the department's administration until her retirement in 1943.

Dr. Waring's creative educational methods in teaching young children had early attracted attention in California. "Self-directive learning experiences" permitted the child to choose among several learning tasks. "Self-corrective materials" were designed to lead him to find the right combination to achieve success. Her classroom organization resembled that of the open class-rooms of today. The promotion of self-teaching, the development of individual strengths, and an emphasis on positive direction (do this rather than don't do that) were fundamental concepts in Dr. Waring's teaching and writing. In 1929 she was invited to present her methods and materials at a conference

on progressive education in Denmark. In this same summer both Dr. Ovide Decroly and Dr. Jean Piaget invited her to prepare articles for publication in French. She also consulted with Dr. Jessie MacKinder in England.

Mrs. Waring spent several weeks of that summer in Berlin, reviewing movie-filmed studies of child behavior being conducted by Dr. Kurt Lewin. A few years later Dr. Lewin left Nazi Germany and came to Cornell, where he worked with Dr. Waring from 1933 to 1935, making movie films of child guidance and child behavior in the nursery school. These were accompanied by stenographic notes of observation. The films are preserved in the Department of Manuscripts and University Archives at Cornell, where they are available to scholars today.

Dr. Waring's research, and her teaching of both undergraduate and graduate courses, always utilized observation of child guidance, behavior, and learning. Students observed for five-minute periods, rested five minutes while editing notes, and then returned to observation.

Help for parents was a continuing concern to her. Dr. Waring was a consulting editor for *Parents' Magazine* from the time of its first issue in 1925.

Several books, a number of Cornell extension bulletins, and numerous articles for professional and other magazines were written by her: *The Behavior of Young Children*, coauthored with Dr. Marguerite Wilker, is a text published in three volumes. *Helps to Learning, a Progressive Series of Worthwhile Games together with Workbook*, was a set of self-directive, self-corrective materials published by the Children's Institute and distributed to purchasers of *The Book of Knowledge* for use by parents. Her bulletin, *Principles for Child Guidance*, first published in 1939, was reissued in 1970 with a foreword stating: "This bulletin, substantially unchanged in its content since the 1930's, now stands as a classic. Its usefulness to its readers is the test of its endurance." Using four basic principles — that adult affection gives the child security, respect encourages self-respect, help stimulates his abilities, and approval fosters values — it is brief, clearly written, and timeless as a help to parents, teachers, and counselors working with people of any age.

Dr. Waring considered the Ethel B. Waring Fellowship one of her greatest honors. At her retirement dinner in 1955 one of her graduate students started the fund, expressing the hope that her contribution would lead to "a chain of giving," reflecting Mrs. Waring's philosophy that a kindness received should be passed on to others. Generous and substantial gifts followed. The Fellowship, now active, is designated for graduate study in fields that contribute to "the improvement of family living in other countries and societies." Since Mrs. Waring's death, many memorial

gifts have come in, with accompanying letters of appreciation for the guidance in times of trouble and the sharing in times of joy given by this greatly beloved teacher.

Mrs. Waring was a small dynamic person. She said that her size was helpful in dealing with nursery school children. She knew what she believed in and was a leader and pioneer in the field of early childhood education. Although she taught large classes, she seemed always to know and to be interested in each student.

People were important to Dr. Waring. Many of her former students found their way to her door in her retirement years, and many others wrote to her. Annually she sent out her “newsletter” of notes about fellow alumni to a list that ran into the hundreds. Her former students hold positions of leadership today not only in the United States but also in many other countries. Her last sabbatic leave was spent in Lebanon and Egypt, where she visited several former students and worked with them in their programs of research and teaching.

Dr. Waring’s retirement years were spent with her son Dana and his family in Connecticut. Her apartment in a wing of their house was home base for her comings and goings. She enjoyed being part of the family and watching her four grandchildren as they grew, graduated from school and college, married, and established homes of their own. These years were active and busy. Until her final illness she was preparing and refining manuscripts for publication and serving as a consultant in universities and school systems where her former students were establishing new programs in child development.

Helen Bayer, Esther Stocks, Jean Warren

Annette Warner

January 18, 1860 — November 10, 1949

Annette Warner, a teacher and administrator in the field of housing and design at Cornell University for sixteen of the formative years of home economics educational work, died in Santa Barbara, California, November 10, 1949.

Professor Warner was born in Granby, Massachusetts, on January 18, 1860, the daughter of Eli and Samantha Cornelia Warner, whose forebears had settled in Massachusetts in 1632. Ingrained in her character were the values forged in this New England setting. Her resulting interest in civic affairs endured throughout her lifetime and found expression in participation in many public projects.

In the spirit of the times, her precocious bent in childhood was recorded in her reading of Latin and Greek at an early age. As she grew older and her interest in art began to be defined, she sought out, with courage for a young woman of that day, some of the best teachers in the country under whom to study. She received diplomas or certificates from the Normal and Training School at St. Cloud, Minnesota, the Cowles Art School in Boston, the Massachusetts Normal Art School—the first school in this country to train teachers of art—the New York School of Fine and Applied Art, summer schools at Harvard University, and the Arthur Dow Summer School. She worked in the studios of William M. Chase, Denman W. Ross, Charles Hubert Woodbury, and other artists of note. She also took advantage of lecture series by such educators as G. Stanley Hall and George Herbert Palmer. Her active professional years included three periods of foreign travel and study in England, France, Italy, and Greece.

Before coming to Cornell University, Miss Warner had become an outstanding figure in art education in the State of Massachusetts, which then held the position of leadership in developing art education in the public schools. She had been Supervisor of Drawing in the city schools of Pittsfield, and Director of Arts at the State Normal and Training Schools in Fitchburg. In addition, she had been Director of Drawing and Manual Arts at the Normal and Training School in St. Cloud, Minnesota, and Principal of the John Herron Art School in Indianapolis, Indiana. At Cornell University she was appointed Assistant Professor of Home Economics in 1913, Professor in 1920 and head of the Division of Housing and Design as it was then designated in the School of Home Economics, Head of the Department of Household Art when the College of Home Economics was created in 1925, and Professor Emeritus upon retirement in 1929.

Miss Warner was a charter member of the Eastern Arts Association, and long a member of the American Federation of Arts and of the College Art Association of America. She was appointed a member of the American Committee to

attend the International Art Congress at Prague in 1928. She was a member of the National Education Association and of the American Home Economics Association. She was active in the Campus Club and the University Club of Cornell University, contributing generously of her talent in the furnishing of the University Club of that time. Aside from these professional affiliations, she had the honor of being at one time President of the Fitchburg Woman's Club.

While at Cornell, she was the author of several bulletins widely used in resident and extension teaching—*Artistry in Dress*, *The Decorative Use of Flowers*, and *Economics of Good Furnishing*. A manuscript for a book on design in dress unfortunately remained unfinished.

In her teaching, her public and professional commissions, her dress, and her writing, she was a perfectionist, lavishing labor, talent, and time upon each undertaking.

For a host of students and friends, Professor Warner opened up a lifelong appreciation of the elements of beauty. She had the gift of helping others to strive to create beauty in their surroundings with even the simplest materials. Her philosophy of the contribution of art to the wholeness of life made its lasting impression on all who worked with her.

Cornelius Betten, Helen Canon, Dora Erway

Richard (Dick) Griswold Warner

November 1, 1922 — May 10, 2002

Richard (Dick) Griswold Warner died on May 10, 2002. His colleagues, friends, and former students at Cornell will long miss Dick, with his effervescent personality, friendliness, and concern for all people.

He was born on November 1, 1922 in Washington, D.C. He graduated from McKinley Technical High School where he was a member of the Cadet Corps and the Boys Glee Club, and was an Eagle Scout. After high school, Dick enrolled at Ohio State University and graduated summa cum laude, in 1947, interrupted by three years for military duty in the U.S. Field Artillery (1945-46). He continued his studies at Ohio State, receiving an M.S. degree in Animal Nutrition in 1948, and then enrolled at Cornell and completed a Ph.D. degree in Animal Nutrition in 1951. This started his long tenure at Cornell from Assistant Professor (1951-55), Associate Professor (1955-63), and Professor of Animal Nutrition (1963-89). As Professor Emeritus, he also served as Cornell University Ombudsman from March 1994 to December 1997.

While he tackled his varied activities in teaching, research, and extension with vigor and enthusiasm, many of his colleagues felt that teaching undergraduate students was his most enjoyable responsibility. He taught at least one course every year but one, primarily handling the “Introductory Livestock Nutrition” course. He also taught a graduate level course in laboratory methods in animal nutrition. For a number of years, he represented the department on animal care issues and helped initiate a course in “Ethics and Animal Science”. His extension activities generally followed his research efforts, getting those results into the field.

Dick supervised over 40 graduate students in animal nutrition and published in both the scientific literature and the popular agriculture press. His research involved a number of farm and laboratory species, with special interest in the nutrition of the young dairy calf. His research on the development of the ruminant stomach in the dairy calf is indeed classical. Before this research, it was common to say, “the darkest place in the world is inside of a cow’s stomach”, and he did as much as anyone to turn on the lights in the rumen. Most importantly, he and his students showed that the primary stimuli for the papillary development of the rumen of the calf are the products of rumen fermentation, the volatile fatty acids (acetic, propionic, and butyric) produced by the rumen microorganisms, with butyric the strongest stimulus. Over the years, several graduate students worked on this project, including W.P. Flatt, now Dean Emeritus of the College of Agriculture at the University of Georgia, and E.G. Sander, now Dean of Agriculture at the University of Arizona. His other research activities included experiments on milk

replacers, antibiotics, factors affecting voluntary feed intake, and an array of nutritional subjects with varied species including the rat, the mink, and sheep.

Cornell recognized Dick's teaching skills with the Professor of Merit Award (voted by the senior class); an award for teaching by Gamma Sigma Delta, and the Agriculture College's Edgerton Career Teaching Award. He also received the Ralston Purina Teaching Award from the American Society of Animal Science and an Outstanding Alumni Award from Cornell's College of Agriculture and Life Sciences Alumni Association, and was admitted to the Animal Husbandry Hall of Fame of Ohio State University.

During his career, Dick was a Visiting Scientist in Canada, Sweden, and Brazil, and often spoke in the international arena. He frequently served on national committees dealing with animal nutrition, and on many departmental, college, and university committees. He was active as an alumnus in the affairs of the Cornell Chapter of Alpha Zeta.

His community activities included the First Presbyterian Church, the Ellis Hollow Community Center, and the Ithaca-Cayuga Rotary Club, of which he was a past president. His hobbies included reading, gardening, and travel.

His family and friends will best remember him for his sense of humor, his joy of teaching, his love of people, and his propensity to write poetry for birthdays and anniversaries or to honor retirees and friends at farewell parties.

He is survived by a loving family: his wife of 53 years, Barbara "Bibs" Dean Warner; four daughters, Patricia Kurent, Sherry Warner, Candace Herring, and Tamara Ause; six granddaughters, Ayla and Kira Cline, Megan and Angela Herring, and Emily and Erica Ause; two brothers, Philip F. Warner, and William A. Warner, and many in-laws, nieces, nephews, and friends who were an intricate part of his life.

J. Murray Elliot, Douglas E. Hogue, Harold F. Hintz

Ernest Neal Warren

November 10, 1907 — November 6, 1986

Ernest N. Warren was born in Troy, New York, on November 10, 1907, and remained a resident of New York until his death on November 6, 1986, just a few days before his seventy-ninth birthday.

Ernie was graduated from Hamilton College in 1928. He then entered the Cornell Law School and received his law degree in 1931. For the next eighteen years he engaged in private practice, first in Utica with the firm of Miller, Hubbell, and Evans and then in Carthage with Smith, Warren, and Roberts. In 1949 he joined the faculty of the Cornell Law School, and here he remained until his retirement in 1974 as the William G. McRoberts Professor in Administration of the Law.

Ernie was an outstanding classroom teacher. He was always thoroughly prepared, and he drew on his rich practical experience to help his students understand the relationship between the law in books and the law in action. The breadth of his interests is indicated by the diversity of the courses he taught at one time or another. These included personal property, evidence, domestic relations, admiralty, and torts. The subject of practice and procedure, however, was Ernie's first love, and generations of Cornell lawyers throughout the country are living testimony to his unmatched expertise in this field.

Over the judge's bench in the Moot Court Room of Myron Taylor Hall are Roscoe Pound's words: "Law must be stable and yet it can not stand still." These words capture so well Ernest Warren's own philosophy of law. He had great respect for the past and for precedent and stability in the law. At the same time, however, he keenly believed that law must be flexible and able to change and adjust to meet new problems and challenges.

In 1960 the senior class dedicated its yearbook, *The Barrister*, to Ernest Warren. The words of dedication make clear the warmth and affection that law students generally felt toward Ernie Warren. This is what they said:

Rarely has a professor assumed so unique a relationship to his students as Professor Ernest N. Warren has to the class of 1960... Few will ever forget those wonderful moments of relaxation when, with glasses to the light and that distant look in his eyes, "Uncle Ernie" infused his warm, personal philosophy and experience into the discussion of a perplexing legal problem.

He has given to us more than the full measure of his time and energy. We remember the review classes, not required but offered for our benefit; his office door always open and inviting; and his charming presence at our social gatherings.

The class of 1960 is proud to dedicate this edition of *The Barrister* to a man who has endowed his students, Cornell Law School, and indeed the entire legal profession with not only the letter but the true spirit of the law.

From 1964 until 1973 Ernie Warren served as associate dean of the Cornell Law School. He had earlier acted as director of placement. In those positions he contributed his impressive administrative skills to the ongoing life of the school. In addition to his involvement in teaching and academic administration, Ernie had a strong interest in law reform. In that connection, in his capacity as a research consultant to the New York State Law Revision Commission, he conducted a number of important studies designed to improve the existing legal system. A reference to some of the subjects on which he wrote is instructive as an indication of the broad range of his inquiries. The list includes "Liability for Street and Sidewalk Defects"; "Authentication Required to Establish Validity of Foreign Record or Judgment"; "Historical Background on Article 7 of the Uniform Commercial Code: The Law of Documents of Title"; and "Rights of Joint Tortfeasors on Appeal after Joint Judgment." In 1957-58, while on sabbatic leave from Cornell, he served as special attorney in the U.S. Department of Justice in Washington.

Following his retirement from Cornell, Ernie accepted an appointment as senior clerk to New York State Supreme Court Justice Frederick B. Bryant of Ithaca. His ten years of postretirement service in that position were happy and productive ones. His encyclopedic knowledge of New York practice and procedure was available not only to Justice Bryant but also to the many lawyers, including former students, who sought his advice and counsel.

The Tompkins County Bar Association, of which Ernie was a former president, passed a resolution that noted that "his death has removed from our midst a lawyer and teacher who was professionally of inestimable value to both bench and bar; who was patient and who generously shared his wisdom and his experience without condescension and offered counsel with compassion." Further recognition of Ernie's significant contributions to our system of law and justice was given by the Tompkins County Board of Representatives when, on December 16, 1986, it provided that the law library located in the Tompkins County Courthouse should henceforth be known as the Ernest N. Warren Library.

There were many facets to the outstanding life of Ernest Warren: the love and affection he held for his family; his years of lay leadership in the Baptist Church; his exemplary community service as a member of the Ithaca Board of Education, including serving as president of the board in 1960-61, during the building of the new high school; his love of the outdoors, particularly at his summer home on Lake Bonaparte; the wide circle of those who valued

his friendship; his postretirement years of service with Justice Bryant; his total commitment to the law; and his unmatched place in the life of the Cornell Law School.

Ernest Warren was a very special man. Remarkable indeed were his good-natured patience, his unselfishness, his modesty, his devotion to high ideals, and, above all, his good judgment. He had many talents, but his genius was in his relations with people. Ernie was a great teacher, and he taught by example. He lived life as we all should live it, in a way that gives meaning to life and inspiration to those still living. It is a better world because there was an Ernie Warren.

A memorial service for Ernie was held on November 29, 1986, on the Cornell campus in the moot court room of Myron Taylor Hall.

Ernie's survivors include his wife, Dorothy Failing Warren of Ithaca; two daughters, Delight Warren Sticker of Middleport, New York, and Valerie Warren Vrana of Athens, Georgia; two sons, Herbert Lee Warren of Louisville, Kentucky, and David Scott Warren of Ithaca; and eleven grandchildren.

W. Ray Forrester, Harrop A. Freeman, W. David Curtiss

George Frederick Warren

February 16, 1874 — May 24, 1938

The death of Professor Warren on May 24, 1938, brought to its close the notable career of one of the most widely known and most eminent members of the Faculty of Cornell University.

George Frederick Warren was born, the son of a farm family, near Harvard, Nebraska, on February 16, 1874. Graduating from the University of Nebraska in 1897, where his special interest had been mathematics, he devoted himself during the next five years to teaching in the high schools of his native State. In 1902 he resigned his position as superintendent of schools in Minden, Nebraska, and came to Cornell University to study under Professor L. H. Bailey. He received the degree of bachelor of science in agriculture in 1903 and was appointed to a fellowship for the next year, in the course of which he earned the degree of master of science in agriculture. In 1905 Cornell University conferred upon him the doctorate of philosophy, and he left the University to become horticulturist of the New Jersey Agricultural Experiment Station.

Returning to this University in 1906 as assistant professor of Agronomy, his promotion kept pace with the development, under Dean Bailey, of the rapidly expanding New York State College of Agriculture. While still an assistant professor he was, in 1907, made head of the newly organized department of Farm Crops. With unusual vision and untiring effort he undertook the development of research and teaching in the then but little explored field of Farm Management. In 1909 his accomplishments in this field were recognized by his promotion to a full professorship as the head of an expanded department of Farm Crops and Farm Management. With a reorganization of departments in the college in 1911, he became professor of Farm Management and head of that department. Again pioneering, he undertook investigations into the broader aspects of the farmer's economic problems, with the result that in 1919 his contributions in this direction were recognized in the establishment of the department of Agricultural Economics and Farm Management, of whose staff he remained the head and the inspiring leader until his untimely death.

Professor Warren inherited to a marked degree the pioneering spirit of his forefathers. This spirit found expression through his leadership in the initiation and development of the largest and most outstanding department of agricultural economics and farm management in the agricultural institutions of this country. No one man has wielded greater influence than he in the development of this field or has made more important and lasting contributions to the basic principles of economics as applied to agricultural problems. His renown in this phase

of modern agricultural thought and practice is world-wide. He was a great teacher, as witness the host of able and brilliant young men who have gone forth moulded and inspired by his teaching to take positions of great importance and responsibility. They are to be found today in universities, in governmental organizations, and in other public services not only throughout the United States but also in nearly every country in the world.

Born and raised a farmer, he ever sensed and understood the problems and point of view of the American landsman. Through the eyes of a farmer he saw the economic problems of the American farm people. With keen insight, with unbiased judgment, and with untiring devotion to their welfare, he sought to solve their problems and lead them along the road of safety and success. No member of this faculty commanded a larger or more devoted audience when he arose to speak in public; no teacher was more respected and loved by his students.

In the death of George Frederick Warren this Faculty recognizes an irreparable loss. The most eminent agricultural economist of his time, a teacher of rare ability and great influence, a pioneer in agricultural science and teaching, a noted citizen, a loved and respected colleague, we record our heartfelt tribute to his memory.

Jean Warren

April 17, 1909 — July 19, 1990

Professor Emerita Jean Warren died July 19, 1990. She received a B.S. degree from the College of Home Economics at Cornell University in 1929 and the M.S. and Ph.D. degrees from Cornell University in 1935 and 1938. Her professional career included service as a home demonstration agent in New York and Maine and faculty positions at the University of California, Davis, from 1938 to 1951, and at the College of Home Economics, Cornell University, from 1951 to 1965. After her retirement, she served as a visiting faculty member at the University of New Mexico, Oregon State University, University of Hawaii, Iowa State University and University of Guelph, Ontario, Canada.

Professor Warren was a leader in the field of family economics and financial management. As a productive scholar and director of graduate student programs, she had a profound influence on developments in both of these fields. Her major contribution was in research in the use of time and the value of household work; in this she carried on the original research of Helen Canon which has led ultimately to estimates of the value of household work as a component of the Gross National Product.

Professor Warren was recognized for her excellence in teaching, both at the undergraduate and graduate level. Her classes were popular, stimulating and demanding. In recognition of her work with undergraduates, she was designated Professor of Merit in 1955. She brought out the best in graduate students by her questions, demands, sharp-edged or chiding humor and infectious laugh.

Jean Warren played an important role in the international aspects of resource management and family economics. Her service included stays in Argentina, Uruguay, Mexico, Guatemala, Yugoslavia, Malaysia and El Salvador. Her fluency in Spanish facilitated her presentations of workshops in Latin America. She was sought as a consultant on consumer credit counseling, financial decision making in marriage, life insurance needs, financial requirements in retirement and the specific problems of low income women.

Dr. Warren's close working relationships with Professor Mabel Rollins, Chair of the Department of Household Economics and Management, were filled with respect and widely different approaches to most every topic and issue. The complementary effect was beneficial to faculty and graduate students.

She was a member of many honorary associations including Sigma Xi, Pi Lambda Theta, Phi Kappa Phi and Omicron Nu and such professional organizations as the American Council on Consumer Interests, American Statistical Association, the American Home Economics Association and the Joint Council on Economic Education.

She carried her interest in family resource management into community service with the Family and Children's Service and the Day Care and Child Development Council in Ithaca and similar organizations in the communities in which she has lived since retirement.

Gwen Bymers, Kathryn Walker, Francille M. Firebaugh

Stanley W. Warren

April 30, 1907 — January 10, 1994

Dr. Stanley W. Warren, who lived to be 86, was one of Cornell's most outstanding and visible professors. A native of Ithaca, he retired in 1972 after forty consecutive years of classroom teaching. His primary work at Cornell was teaching the basic course in farm business management to students who intended to work in agriculture as farmers, bankers and in agribusiness. Renowned for his teaching skills and his rapport with students, he received the first "Professor of Merit" award presented by the seniors in the College of Agriculture and Life Sciences in 1948.

He received his bachelor's degree in 1927 and his doctorate in 1931, both from Cornell. On completion of his graduate work, he went to Nanking, China where he served as statistician for studies of Chinese agriculture at Nanking University. He joined the Department of Agricultural Economics in 1933.

Awarded a Distinguished Life Membership in the Northeastern Agricultural Economics Council in 1973, he was cited for his continuing commitment to farming. Among the many honors he received were Honorary Life Membership in the Association of Teachers of Agriculture of New York (1967), the Distinguished Undergraduate Teacher Award from the American Farm Economics Association (1967), the Distinguished Service to Agriculture Award from the New York Farm Bureau (1969) and the Distinguished Service Citation of the New York State Agricultural Society (1970).

For seventeen years (1945-61), he served as Scoutmaster of Ithaca's Boy Scout Troup 4 and was instrumental in restoring the Eight Square School (on Hanshaw Road) during the bicentennial year. His purpose was to use the one-room building as a place to teach about early rural and school life. He was also the treasurer of the Alumni Association, College of Agriculture and Life Sciences, a director of Citizens Savings Bank and a Village of Cayuga Heights Trustee.

He touched many lives with his down to earth, homespun philosophy of management and life. His sense of humor and sense of purpose was always evident in everything he did. Stan shaped the careers of thousands of undergraduate and graduate students. He was a plain spoken, humorous, approachable man, loved by his students. He was devoted to them and taught his courses in a unique manner featuring field trips.

At his home on Warren Road, he kept a small museum behind the house that was quite an eye opener to anyone who had not grown up on a farm. He also loved to tend his garden.

He was a guiding light to thousands of students. He kept in touch with his students long after they graduated from Cornell. He kept a permanent file on every student he taught and devoted all his professional energies to teaching. In forty years, he missed only one scheduled class. Over those years, he taught more than 9,000 students farm management and farm real estate appraisal.

On the wall of his room was a painting of the Eight Square School, a drawing of a Scout leader given him by his scouts in 1955, a farm scene and a painting of him holding a grandchild and this summed up his good life.

At a tribute to Dr. Warren on Saturday, June 11, 1994, his former students and several of his children commented on various phases of his life.

He is survived by seven children, 16 grandchildren, 10 great grandchildren, two sisters and two brothers.

Wayne A. Knoblauch, Robert S. Smith, George J. Conneman

Thomas Cobb Watkins

October 1, 1909 — October 27, 1995

Dr. Thomas Cobb Watkins, a man of many talents, served Cornell well as research scientist, teacher, and administrator. He died after an extended period of ill health.

Tom was born in Calhoun, Missouri, to the Rev. Thomas Henry and Fannie Burton Watkins. During Tom's early years, Rev. Watkins' ministry took the family to several church locations in the Arkansas area. After Rev. Watkins' death, the family moved to Davidson, North Carolina where Tom enrolled in Davidson College. He graduated at the early age of 18 receiving a B.S. degree in biology in 1928.

Tom continued his education at the University of North Carolina, Chapel Hill, receiving a Master's degree in 1930. From 1930-33, he was Instructor of Biology at Washington and Lee University. The years 1933-36 were spent as teacher, coach, and principal at the high school in Dilwyn, Virginia.

Upon the advice and urging of a former colleague on the faculty of Washington and Lee, Tom came to Cornell in 1936 to continue graduate study. He was appointed to a joint research assistantship in the Departments of Entomology and Plant Pathology. He was assigned to research a problem that threatened the production of seed potatoes in New York State. A virus disease, potato yellow dwarf, transmitted by the clover leafhopper, was the culprit. Tom conducted an extensive study of the insect vector and devised methods to control the insect, thereby controlling the disease.

After receiving his doctorate in 1939, Tom joined the faculty of the Department of Entomology as a Research Instructor rising through the ranks to Professor.

From 1939-48, Tom was in charge of research projects dealing with insect pests of vegetable crops grown on the organic soils of the State. The results of his investigations were communicated to growers through Tom's extension activities. The field experience gave him a much needed acquaintance with agriculture. His contacts with farmers, farm organizations, and farm related business broadened his perspective of the importance of agriculture as an industry. These experiences would serve him well in his later work as a teacher and as an administrator.

In 1948, Tom changed direction in his career devoting full time to resident instruction. He taught the introductory course in entomology and two applied entomology courses. These courses became very popular. His skill as a teacher was acknowledged by the college faculty and the student body. Tom's dedication to excellence in teaching

was recognized by his election to the Petitions Committee and the Educational Policy Committee. In time, he chaired both committees. He was appointed to an ad hoc committee charged with evaluating resident instruction in the college. The committee made an exhaustive study of all aspects of teaching and recommended improvement for more effective programs. A well deserved honor was bestowed upon Tom by the College senior class of 1957; the award of Professor of Merit.

Tom moved to college administration in 1960 becoming Director of Resident Instruction, a post he held until his retirement in 1965. His wisdom and influence served to energize the college faculty to review instructional practices and make changes and innovations. As an administrator, he was highly regarded and praised for his attention to detail, and his wisdom and clarity of vision. He championed teaching as a catalytic and vital function of the College.

Through his leadership, Tom instituted a mutually gainful liaison with community colleges and agricultural and technical institutes to bring well qualified students to Cornell for further education. Reaching out to these two-year units contributed to a much needed working relationship for the transfer of students.

Tom's service to teaching reached beyond the campus. He was secretary and also chairman of the Northeast Region Deans and Directors of Resident Instruction and a member of several committees of the national organization. In 1964, he served on a review panel established by the National Academy of Sciences – the National Research Council to study curricula and organization of education in selected colleges of agriculture in the United States.

Tom took time off from his campus duties for two sabbatical leaves. The first sabbatical was spent at a research station of the University of Florida. He studied insect problems troubling the citrus industry. Later, he went further afield on a sabbatical to the Rome headquarters of the Food and Agriculture Organization of the United Nations as a technical officer. He was project leader for entomological work in the countries of the Mediterranean area. On assignments, he visited various countries of the region.

Tom held memberships in Phi Kappa Phi, Sigma Xi, Alpha Zeta, Entomological Society of America and the American Phytopathological Society.

In the community, Tom was a member of the First Presbyterian Church and served terms as deacon and elder. He was co-leader of the Boy Scout Troop in the East Hill Neighborhood for a few years.

Tom retired for health reasons in 1965, moving to a home in Fort Lauderdale, Florida, where he and his wife, Paige, resided for some years. They later moved to Warsaw, Virginia, Paige's hometown. She died in 1982. Tom remarried

to Margaret Wright Starr who survives. Surviving are a son, Thomas H., a Professor of History at Western Illinois University, and a daughter-in-law, Sharon; and granddaughter, Beth.

Tom leaves an enduring imprint as a leading educator in the halls of learning at Cornell. His civility and generosity of spirit, his work ethic and moral values, were hallmarks of his character.

Whether serving the farmer in the field, the student in the classroom, or shaping the college instructional program, his commitment was to the development of human potential through education. The University, the College, his colleagues, and family have been enriched by his unique combination of intellectual and personal qualities.

James E. Dewey, John C. Franclemont, W. Arthur Rawlins

Edgar Raymond Watt

April 13, 1897 — July 9, 1951

Edgar Raymond Watt, Assistant Professor of Heat-Power Engineering, died suddenly on July 9, 1951 at the age of 54. The son of James E. and Clarissa Goff Watt, he was born in Brooklyn, New York where he received his public school education. In 1918, he received his degree in Mechanical Engineering at Cornell University, after which he spent the next 25 years in industry.

He was employed as an engineer by the Chicago Pneumatic Tool Company, the National Aniline Company, and finally, by Russell and Watson Inc. in Buffalo, New York, manufacturers of food-service equipment.

In September, 1942 Professor Watt returned to Cornell as an instructor in Engineering Drawing where he also taught descriptive geometry. Then in 1944 he was transferred to the Heat-Power Department in the Sibley School of Mechanical Engineering where he taught until his untimely death. Granted an Edgar Meyer Fellowship in 1946, he completed his work for the degree of Master of Mechanical Engineering at Cornell in 1947, at which time he was promoted to an Assistant Professorship.

His main interests in Heat-Power Engineering were in the Steam Power Plant field and to further his knowledge of this subject he was employed summers by the Babcock and Wilcox Company.

Professor Watt discharged his duties as a teacher and student adviser in a most conscientious and enlightened manner. A thorough gentleman, he was well liked by both his students and his colleagues.

“Ray”, as he was known to his associates, was an ardent sportsman, and his major hobbies were bowling and golf which he pursued with a truly competitive spirit. He was a member of the American Society of Engineering Education, and was active both in his Church and Masonry.

He is survived by his mother, Mrs. Clarissa Watt of Ithaca and a sister, Mrs. Mildred Haff of Burlington, North Carolina.

Raymond Watt was a retiring, kindly type of person, most observing, and ever generous of his time when he could be of help to others. His consideration for, and devotion to his mother was an outstanding characteristic of the man. His family, colleagues, and wide circle of acquaintances realize they have lost a staunch friend.

N. R. Gay, D. G. Shepherd, B. P. Young

Leland Eugene Weaver

October 16, 1888 — March 7, 1974

Lee Weaver was a native New Yorker — born at Findley Lake, New York. He received his B.S. degree in Agriculture at Cornell in 1918.

After receiving his degree from Cornell, Lee taught vocational agriculture at Greensville, Kentucky, from 1918 to 1920. While in Kentucky he also managed the Kentucky Hatchery at Lexington.

In 1920 Lee returned to Cornell as instructor in Poultry Extension. He was later appointed assistant and then associate professor of poultry husbandry in 1945 and held this position until his retirement in 1951, at which time he was made professor emeritus. Professor Weaver obtained a Master of Science degree in genetics from the University of Wisconsin.

Lee Weaver was a member of the poultry extension staff at Cornell for thirty years. He was a kind and considerate individual with a warm spot in his heart for the small flock owner. Farm flocks of limited size, often housed in a variety of farm buildings that had been renovated to accommodate chickens, received his support and enthusiasm. His down-to-earth approach was also characteristic of his contribution at the “Farm and Home Week” programs at Cornell, at regional trade shows and fairs, as well as in his many contacts at poultry meetings throughout the state. His contact with graduate students always evolved around his basic interest in the chicken as an agricultural animal.

Those who knew Lee, even briefly, remember his ruddy checks, twinkling eye, constantly moderate disposition, and contagious warmth and kindness.

In 1945 Lee was appointed supervisor of the Western New York Egg Laying Test at Stafford, New York. He continued as supervisor of this test until his retirement in 1951.

Lee was chairman of the Chicken of Tomorrow contest in New York State in 1948. This was a program that was very instrumental in developing the broiler as we know it today.

After his retirement in 1951, Weaver accepted a federal appointment supervising the Point Five Program in Egypt to develop the poultry industry in that country. This was a personal highlight of his career because of his strong feeling for the family-type operation and helping the natives develop the poultry industry.

Included in Professor Weaver's many activities were the operation of the 300-acre Lick Brook poultry and vegetable farm in Inlet Valley with his brother; service as poultry editor of the American Agriculturist; work as coordinator of the Northeastern Poultry Producers Baby Chick Show; and membership in the American Poultry Science Association.

While on sabbatic leave in Hawaii he arranged for a shipment of rare native East Indies jungle fowl to Cornell University. Descendants of these birds are still being used in genetic research.

Lee never married.

He passed away Thursday, March 7, 1974, near Phoenix, Arizona.

Edward A. Schano, Randall K. Cole, Charles E. Ostrander

Paul John Weaver

July 8, 1889 — October 14, 1946

The musical life of the University and of the community has sustained a grievous loss in the death of Paul John Weaver. Born in 1889 at Reedsburg, Wisconsin, Professor Weaver in 1911 was graduated from the University of Wisconsin. After a brief period as director of music in Racine College, he continued his own studies in voice, piano, and organ with private teachers. Called to St. Louis in 1915, he served for four years as First Assistant Supervisor of Music in the Public Schools of that city. In 1919 he accepted the post of professor and head of the Department of Music in the University of North Carolina. Ten years later, he was called to Cornell University as Professor of Music and Chairman of the Department. While he gave his attention to, and brought his knowledge and training to bear on, various aspects of musical education in colleges and schools, his own special interest was from the first directed to choral singing and the training of choirs. He directed many choral organizations, and his extensive experience in this and other branches of music teaching was widely recognized throughout the country. Thus he became member of various advisory boards on music; he organized and was first president of the Southern Conference on Musical Education; and from 1928 on, he served as the American Chairman of the International Musical Conference.

When Professor Weaver came to Cornell University, the Department of Music was small and the regular Chair of Music in the University had been vacant for two years. His fifteen-year tenure of the departmental Chairmanship was distinguished by far-sighted and constructive ideas, most of which he lived to see carried into effect, and was a notable achievement. The enlargement of the Department by the addition of several more teachers made possible a great increase in courses for graduate and undergraduate students; and, with the establishment of a major in Music in the College of Arts and Sciences, music took its legitimate place by the side of the other Fine Arts. The gradual reorganization and enlargement of existing musical organizations and the creation of new instrumental and choral groups, a great increase in the number of subscription concerts and the institution of almost weekly free recitals, the building-up of a fine departmental library of music and especially of recordings to which the students had untrammelled access—these were some of the means by which a love and understanding of music in the student body have been aroused and fostered in recent years. This development, astonishing to those old enough to contrast it with the slight interest in music and things musical manifested two decades ago by a majority of the undergraduates, is perhaps one of the most significant contributions that Professor Weaver brought to the musical life of the community.

Nor must the enlargement of Sage Chapel, the rebuilding of its organ, and the addition of new bells to the University Chime be forgotten, since these improvements were effected largely as the result of his initiative.

Those who had the privilege of knowing him in private life will mourn the loss of a charming and kindly friend. The University and the many musical organizations throughout the country to which he gave his time and energies unstintingly will deeply regret the passing of a keen and dynamic personality, who strove consistently and with no little success to further the study and appreciation of that art to which he had devoted his life.

D. J. Grout, M. L. W. Laistner, Laurence Pumpelly

Dwight A. Webster

February 2, 1919 — November 9, 1986

The lake's quiet water is spackled with oranges and reds from a setting sun. In the dark shadows cast by surrounding spruce, a mayfly emerges on the surface. It pauses to launch into the air for its mating flight. Before it can do so, a large, streamlined shape flashes to the surface and with popping jaws engulfs the mayfly. The fish turns on its side. A pattern of gleaming olive, gold, and crimson is visible for a fleeting instant. The knowledgeable observer knows that a brook trout has begun its evening feeding.

This scene, repeated many times on more and more lakes, owes much to Dwight A. Webster, professor emeritus in the Department of Natural Resources, who died on November 10, 1986. His career was dedicated to studying the biology and management of salmonid fishes, especially the brook trout, a native species of eastern North America highly prized by anglers and admired by all who know its distinctive beauty.

Recently Dwight's colleagues were discussing plans for a comprehensive research program on recreational fisheries in the Adirondacks. One offered an insightful comment: "When Doc began his studies on brook trout in the mid-1950s, fishing was so poor he could experimentally manipulate a body of water and its fish community virtually any way he wanted to. Now, however, fishing's so good there would be strong resistance to any kind of study that threatened to alter an existing fishery, albeit temporarily!" This marked change-about is a great tribute both to Dwight Webster's research and to his dedicated interest in having findings applied in new management practices.

To those of us who were fortunate enough to work directly with Dwight Webster, his most impressive characteristics were an unwavering interest in his beloved salmonids and the meticulousness with which he applied the tools of his science to understanding them better. He was a scholar in the fullest sense. Dwight worked under a long-term plan that brought fish genetics and modern fish culture together with needs to conserve rare native strains, improve angling, and even meet the crisis of populations threatened with extirpation by atmospheric pollution. At any time he could explain where his work stood with respect to long-term goals.

Dwight's contributions to fishery science began with his studies of rainbow trout strains, the smallmouth bass fishery, and lake trout population dynamics in New York's Finger Lakes. Focusing principally on Cayuga Lake, he achieved noteworthy success in reestablishing a lake trout fishery here through a carefully thought out, closely monitored program of stocking. This reliance on fish culture was necessary in Cayuga Lake because the traditional spawning grounds of lake trout were destroyed early in the century by siltation.

During the latter thirty or so years of his career the focus of Professor Webster's scientific interest was the brook trout. The ubiquity and dominance of this fish in Adirondack waters ensured its role as both indicator and principal victim of lake and stream acidification, an insidious form of pollution first identified as a problem for North American waters by Carl Schofield, now senior research associate in natural resources, who at that time was one of Dwight's graduate students. As more and more brook trout habitat became degraded by this phenomenon, Dwight's expertise came to the fore in seeking understanding of what was happening and in the search for solutions. As an active researcher working on communities in the affected ecosystems, he was able to shift critical aspects of his studies to embrace objectives that served acidification-related questions. The research he initiated and inspired continues and represents a splendid example of scholarly research put to use in coping with an environmental crisis.

Dwight was a natural scientist in every sense. He knew this state's geology, its plants and its animals, and especially how they related to lakes and streams and the communities they contained. He observed and thought about the multitudinous interactions of fish, zooplankton, and insects that comprise aquatic communities. His research and teaching were based on the questions he developed and the conclusions he reached from direct experience with the lakes and streams he loved so much. Indeed, he developed special interest in the recolonization of fishes in Adirondack waters following glaciation, and, to better equip himself for his inquiry, took courses in glacial geology.

Many of Dwight's friends and colleagues will be frequently reminded of him through his legacy of artistic works. These include both black-and-white and color photographs, the trout flies he tied so professionally, and hand-painted mounts of fish that convey strength, motion, and beauty. As with so many truly gifted people, he combined scientific knowledge and acute powers of observation with a talent for artistic expression.

Dwight Webster was a Cornellian in every sense. His education included a bachelor's (1940) and a doctoral (1943) degree from this university. In 1942 he began his career as a teacher with a post in entomology as an instructor of limnology. By 1946 he was an assistant professor of fisheries, still in entomology, where he resided until our Department of Conservation (now the Department of Natural Resources) formed in 1948. Rapid promotion to associate professor in 1949, and full professor in 1957, followed. He was awarded emeritus status subsequent to his retirement in January 1986.

Throughout his nearly fifty-year association with Cornell Dwight played a full role as a member of the faculty and as a member of the fishery science profession. From 1967 to 1972 he served as chairman for the Department

of Natural Resources and in 1979 was selected to receive the Outstanding Teaching Award from the College of Agriculture and Life Sciences. We had special esteem for his high academic standards. Professorial recognition included the Trout Conservation Award (1965) from Trout Unlimited and a Professional Award of Merit (1979) from the Northeast Division of the American Fisheries Society, a group of colleagues he served in several capacities. He was a member of Sigma Xi and Phi Kappa Phi.

Offices and appointments Dwight held also attest to the respect accorded by his peers. He was a member of the Scientific Advisory Committee to the Great Lakes Fishery Commission; symposium coordinator for a landmark international symposium, "River Ecology and Man"; and a counselor on the management of many privately owned fishing waters in the Adirondacks. The Adirondack League Club at Old Forge, which was one of his principal research sites, granted him honorary membership.

Professor Webster published some seventy-five technical and popular articles during the course of his career. Most notable were those dealing with his research describing the development of in-strain hybrids of brook trout and several scholarly works recounting and analyzing observations on New York's fish and fisheries made by some of this state's earliest explorers and men of learning, such as, for example, Dewitt Clinton.

He also wrote extensively for widely read semitechnical publications such as *The Conservationist* to communicate his research to a broad audience of those who care and use the resources he studied. He collaborated closely with New York State's cadre of fishery biologists over the years and in effect maintained important sectors of salmonid investigation cooperatively with our state resource agency.

Many of Dwight's former students attained positions of prominence in their profession and have substantively affected the development of fishery science and management. Their careers reflect the influence of a mentor who demanded much and who shared both his knowledge of, and dedication to, the goal of scientific fishery management.

About a year before his death Dwight Webster organized an endowment at Cornell, the Adirondack Fishery Research Fund, to insure support for continued research leading to improved scientific management of fisheries in that region. Former students, colleagues, and especially the anglers with whom he worked have shown the esteem they felt for Dwight and the respect they had for his dream through their generous contributions to this fund.

Harlan B. Brumsted, William D. Youngs, Raymond T. Oglesby

Sydney Weintraub

January 20, 1895 — March 24, 1956

Dr. Sydney Weintraub died in The New York Hospital on March 24, 1956 following a brief illness. He was sixty-one years of age and had been associated with Cornell Medical College and The New York Hospital for thirty-eight years. His unexpected and untimely death came as a great shock to his host of friends and admirers.

Sydney Weintraub was born in New York City and educated in its schools. He received his medical education at Columbia University's College of Physicians and Surgeons, from which he was graduated in 1918. Following Graduation he served a one-year internship on the First Medical Division of The New York Hospital. Next followed a nine-month period of service as resident physician of the Hudson Street Hospital, which in the year 1919 was being used as a naval base hospital. Further residency training in medicine was received at Mount Sinai Hospital, New York City. To this was added a brief period of training in obstetrics at The New York Lying-in Hospital. In 1921 appointment as Physician in the Department of Gastroenterology of the Cornell Clinic began a long, distinguished and devoted service to Cornell Medical College and The New York Hospital.

In 1932 when the newly formed New York Hospital—Cornell Medical Center moved into its present buildings, Dr. Weintraub held the position of Assistant Radiologist to The New York Hospital and Assistant Professor of Clinical Radiology in Cornell Medical College. In addition to his hospital and teaching appointments, he was engaged in the private practice of Gastroenterology, sharing offices at 16 Park Avenue with the late Dr. Douglas Palmer.

For the next ten years he combined an active teaching career with private practice. This was interrupted in 1942 by World War II when at the age of forty-seven he volunteered for military service. He was commissioned a major in the medical corps of the Army of the United States and was assigned to the Ninth General Hospital, which had recently been activated and was being staffed with New York Hospital personnel. Dr. Weintraub was placed in charge of the section of Gastroenterology. The professional complement of the Ninth General Hospital comprised the most promising young members of the faculty of this Center. It contained many of the future leaders in American medicine. Sydney Weintraub as a member of this talented company played an important, prominent role and contributed significantly to the distinguished war record established by this unit.

The Ninth General Hospital received its initial military training at Fort Andrews, Boston, Massachusetts, and during this onerous period no one displayed more admirable fortitude, nor accepted with better grace or good-natured understanding the difficult adjustment from civilian life to the particular demands of a military community

than did Major Weintraub. His innate courtesy, consideration of others, sincerity of purpose and devotion to duty won him the admiration and respect of his associates and he was known affectionately to all as "Syd."

In July of 1943 the Ninth General Hospital was sent to the Southwest Pacific area to support the military effort in this combat zone. During this overseas service he was made Assistant Chief of the Hospital's medical service; an assignment he discharged with distinction.

Soon after the successful conclusion of the war in the Pacific and the completion of the hospital's mission, he was rotated home and received a medical discharge because of symptoms of coronary artery disease. He was separated from the service with the rank of a Lieutenant Colonel in the Army Medical Corps. Following his release from military duty, he returned to the New York Hospital as a full-time member of the radiology staff. In the immediate postwar period the Department of Radiology faced serious problems in its own internal organization as well as in its relation with the other clinical departments. During this difficult period Dr. Weintraub's wise counsel, loyal and faithful conduct was a stabilizing influence on the entire Department.

Perhaps the most outstanding of his many fine qualities was his intense desire to be of service to the attending physician and thus to the patient. His door was always open to those who sought his advice. No effort was too great and no problem too small for his attention. Dr. Weintraub combined with technical aspects of his work a rich clinical experience which accentuated his radiological acumen. He was a keen observer.

His observation that a drink of cold water immediately following the ingestion of barium would hurry the meal through the small intestines led to the development of a technique for the rapid x-ray examination of the small bowel. This technique gained wide acceptance and made practical routine barium studies of the small intestines. His contributions to the literature, while not large in number, were substantial and represented the analysis of a large amount of data. He was engaged at the time of his death in the preparation of a textbook for medical students on gastrointestinal radiology.

His kindly manner, sense of humor, humility in his work, patient and paternal handling of young men in training endeared him to his students and associates and made it a privilege and pleasure to work with him. At the time of his death he was Attending Radiologist to The New York Hospital and Professor of Clinical Radiology, Cornell University Medical College. In his passing our Medical Center has lost a dedicated physician, faithful servant, effective teacher and warm friend.

He is survived by his devoted wife Dorothy, and loving sisters Lillian Hormel and Clara Ehrens.

John Evans

Richard William Weires, Jr.

February 3, 1944 — November 20, 1990

Professor Richard Weires served as an entomologist studying the biology and management of insects and mites on tree fruit from 1974 until 1990 in Cornell's Hudson Valley Laboratory at Highland, New York. In addition to his skills and experience as a fruit entomologist, he had diverse interests in horticulture and was dedicated to the advancement and improvement of the fruit industry in Eastern New York. He enjoyed interacting with fruit growers individually and collectively at meetings and conferences, and worked tirelessly to ensure that the results from his research program were widely used by the fruit industry in New York and elsewhere in the Eastern United States.

Rick was born in Faribault, Minnesota. As a youth he maintained a large insect collection. He later became interested in agricultural entomology while he was employed as an inspector in a vegetable cannery in his home town. He earned a B.A. degree in political science at Bowling Green State University in 1966 and continued in this institution until obtaining an M.A. degree in 1968. He completed a Ph.D. degree in entomology under Dr. H. Chaing at the University of Minnesota in 1972, and subsequently conducted post-doctoral work as a research fellow investigating the ecology of arthropods in alfalfa planting systems.

He came to the Hudson Valley Laboratory in 1974 as a research associate with a joint assignment in research and extension. The general focus of his work was to study the biology and ecology of insects and mites attacking fruit crops in the Hudson Valley and to develop improved management programs that could be utilized by growers in the region. He was promoted to associate professor in 1981 and became a professor in October of 1990.

During his seventeen-year career at Cornell, Rick faced unique professional challenges because of the geographical isolation of the Hudson Valley Laboratory from both the Cornell campus and the New York State Agricultural Experiment Station at Geneva and the mandate of the laboratory to work closely with the fruit industry in Eastern New York. He was able to overcome these constraints and to develop an integrated research and extension program that was not only relevant to the fruit industry in Eastern New York, but became known throughout the other major fruit-growing regions in the United States and Canada.

In addition to his general studies of the biology and ecology of arthropod pests and important parasites and predators, he excelled in conducting large-scale research trials on arthropod control and management in commercial apple orchards. He was particularly adept at designing these trials so that the results were particularly useful to fruit

growers. One of his earliest contributions to the apple industry in Eastern New York was to develop an improved management program for two leafminer species that had become serious pests in apple orchards in the Hudson Valley because they had become resistant to commonly used insecticides. He initially conducted laboratory tests to formally confirm this resistance and followed this discovery with additional laboratory and field tests to identify insecticides that could be used to effectively control this pest. He was also involved in basic ecological studies to compare the biology and damage caused by the two species and worked cooperatively with other scientists in the Northeastern United States to map the geographical distribution of the two species in major apple production areas within the region. Finally, he worked cooperatively with other scientists to develop sampling and monitoring techniques that could be used to detect the pest in commercial orchards and to define damage levels of this foliar pest that would require treatment to prevent economic damage. Because of his pioneering research efforts, apple growers in the Hudson Valley were able to effectively manage this pest and prevent serious losses of their crop during the late 1970s. Subsequently, as insecticide-resistant populations of these leafminer species were detected in other apple-growing regions, the results from his pioneering research efforts were widely used by other tree fruit entomologists to develop improved management programs for this pest in other parts of New York State and in many apple growing regions throughout the Eastern United States.

Another of his most important research contributions was the study of economics of insect damage on the packout of fruit from commercial apple orchards. He was one of the first scientists to set up large-scale management trials against multiple species of insects damaging fruit and he examined the economic impact of different levels of this pest damage on the percentage of fruit that is acceptably marketed as fresh fruit. Such information is vital to the development of realistic treatment threshold levels for insect pests that directly damage apple fruit. Because of his early work in this research area, many other fruit research and extension personnel throughout the United States have recognized the importance of economic studies of pest damage on fruit packout and have also conducted similar studies on other pest species.

He was recognized as a world authority on the various kinds of leafrollers that damage fruit. He organized and hosted several regional conferences on this important group of insect pests. He also tested the mass release of sex attractants to prevent the mating and reproduction of leafrollers in orchards. This novel control technique could be used to reduce the use of conventional toxic insecticides.

In 1990, he completed a chapter on the biology and management of leafroller pests in orchards in the Eastern United States for a current book on the biology and management of the World's leafroller pests of fruit.

Rick worked tirelessly in his extension program to educate growers about the biology and management of insects and to communicate the results of his research in extension meetings and through various extension publications. He was always willing to take time to answer individual grower's questions over the telephone and make personal visits to diagnose problems in orchards in Eastern New York. Because of his warm sense of humor and ability to simplify results from complex research trials, he was probably asked to speak at grower meetings throughout the Eastern United States and Canada more frequently than any other tree fruit entomologist within the region. Certainly, this popularity at grower meetings resulted from his proficiency in communication, his attitude toward extension, and the importance of his research and extension activities to fruit growers within the state and elsewhere throughout the region.

He had a warm, outgoing personality and enjoyed interacting with all different types of people. His sense of humor was legendary and he could always be counted on to provide several good jokes at any gathering. He was very active in community affairs and particularly enjoyed working with youth. For many years he coached little league baseball teams and also coached basketball teams for the Catholic Youth Organization and the New Paltz Middle School. He loved fishing; enjoyed running and downhill skiing.

He is survived by his widow, Diane; and two sons, Rhett, a 1991 graduate of Cornell University, and Nathan, who will enter Cornell in the fall of 1991.

Richard W. Straub, Harvey Reissig, Wendell L. Roelofs

Lionel Weiss

September 5, 1923 — May 23, 2000

Lionel Weiss, Professor Emeritus in Cornell's School of Operations Research and Industrial Engineering, died suddenly on May 23. He was 76 years old. His death is a huge loss and comes as a shock because Lionel always seemed to have twice as much energy and vitality as anyone else.

Lionel grew up in New York City and received his Bachelor's, Master's and Doctoral degrees at Columbia University. While teaching at the University of Virginia, he spent the 1952-53 academic year as a Cornell Visiting Professor and 4 years later returned as a permanent faculty member. Weiss' arrival came during a period when Cornell Statistics took a leap forward in prominence and influence with the hiring of four from Columbia University: Lionel, Bob Bechhofer, Jack Kiefer and Jack Wolfowitz. Kiefer, Bechhofer and Weiss had all studied under Jack Wolfowitz.

Kiefer and Wolfowitz joined the Math faculty. Weiss and Bechhofer both joined Industrial Engineering. They were brought to what became the School of Operations Research and Industrial Engineering as key components of a vision to shape industrial engineering into a broader discipline, more sophisticated mathematically, and better suited to the rapidly evolving needs of industry for decision-making tools. Weiss and Bechhofer mentored many generations of graduate students in statistical research, and provided training in modern statistical methodologies to many future leaders who graduated from the College of Engineering.

Lionel was prolific and profound in his research contributions. He wrote more than 100 papers and published the text, *Statistical Decision Theory*, in 1961, making that subject accessible to both students and practitioners. His work with Jack Wolfowitz on maximum probability estimators was both ingenious and important in overcoming deficiencies in the maximum likelihood theory introduced by Fisher, and developed further by Wald and Cramer. He did substantial work on asymptotic properties of order statistics, which produced "Weiss-type" point estimators, and on goodness-of-fit tests, where the "Weiss test" for independence of variables uses order statistics to overcome difficulties in how variables are grouped in a chi-squared goodness-of-fit test.

Lionel's devotion to the School of ORIE and to Cornell was unsurpassed. He served as ORIE's Associate Director for Undergraduate Studies from 1986-95. In addition, it was not unusual for him to teach an overload. He was a dedicated and extremely effective teacher and was the winner of multiple teaching awards (1973, 1980, 1983, and 1988). He was always anxious to be of service right up to the time that he assumed the title Professor Emeritus

in 1994. In fact, the spirit of service continued well beyond retirement and he continued to serve as Associate Director on a special appointment during the 1994-95 academic year.

Lionel was certainly an intellectual leader of the statistics group in ORIE, but the most colorful Weiss anecdotes center around his high octane teaching style which combined great enthusiasm, clarity and expenditure of energy. When Lionel's students reminisce about his classes, nine of 10 use the word "speed" repeatedly. The others use variations such as "warp-speed", "lightspeed", "quicksilver," and "fastest chalk in the East". They remember him as someone who could think faster than anyone they have ever met, and who could also walk, talk, write and erase faster than anyone. Lionel's chalkboard style was legendary and students enthuse with tongue in cheek about his ability to simultaneously write with one hand while erasing with the other, both at dazzling speed. Students always responded to him with affection, admiration and respect.

As a colleague in a technically oriented discipline at a high-pressure university, Lionel brought a special blend of devotion, kindness, charm, grace, common sense and broad scholarship to our school and to Cornell. His literary allusions and gentle wit elevated discussions and deliberations, and occasionally maintained calm in a discussion headed in the wrong direction. He was humble, humorous, self-effacing and impossible not to like. He was a devoted family man who seemed to have no trouble deciding on the priorities of life.

A major attraction of working at a great university like Cornell is to contribute to an evolving excellence of enduring value and to have contact with the great intellects and personalities of an era. Lionel will be remembered as a distinguished and honorable contributor to his school, his university and his profession and we will miss one of our giants.

Robert Bland, Sidney Resnick

Donald Stuart Welch

March 12, 1894 — January 27, 1972

Professor Donald S. Welch taught the science and practice of plant pathology for thirty-seven of the fifty years of his association with Cornell. He was a nationally recognized and widely sought authority on arboriculture and diseases of shade and forest trees.

Dr. Welch's birth and early experiences in the lumber-oriented town of Norway, Maine, led to his sustained interest in forestry and tree diseases. Cornell had a highly regarded program for the training of professional foresters when he was appointed assistant professor of plant pathology in 1925, and he soon developed a course in forest pathology. He also taught the introductory course in plant pathology and the course in plant disease control for several years.

The Dutch elm disease arrived in New York State in the mid-1930s, the third lethal tree disease of foreign origin to spread widely in North America from a point of introduction in New York. This disease was to be a major focus of his attention for the next thirty-five years, for his position involved resident teaching, research and extension work on diseases of forest, shade and ornamental trees and shrubs. Annually he diagnosed hundreds of diseased tree and shrub specimens that came to his laboratory from foresters, arborists, horticulturists, nursery inspectors, woodlot owners, and rural and urban residents. He authored the Cornell recommendations for disease control on trees and shrubs as well as many research and extension publications on tree diseases.

In 1934 he was chosen to direct a joint research project on Dutch elm disease involving Cornell's Departments of Plant Pathology and Entomology and Limnology, and the Boyce Thompson Institute for Plant Research. The resulting information on the biology of the fungal pathogen and its vectors still forms the basis of municipal programs for control of the disease.

Professor Welch was largely self-taught in forestry and arboriculture. His formal education, at a time when plant pathology was predominantly concerned with diseases caused by fungi, emphasized botany and mycology. He received the Bachelor of Science degree from the University of Maine in 1917, the Master of Arts degree from Harvard University in 1921, and the Doctor of Philosophy degree from Cornell in 1925.

Before entering Cornell for graduate work he was a scientific aide for two years at the Station for Experimental Evolution, Carnegie Institution of Washington. In 1933-34 he served as technical adviser on emergency conservation

work with the U.S. Division of Forest Pathology. He was advanced to associate professor in 1939 and to professor in 1941. In 1947, supported in part by a grant from the School of Forestry, University of Idaho, he served as collaborator with the U.S. Forest Service in research on the pole blight disease of western white pine in the Coeur d'Alene National Forest in Idaho. From 1954 until the late 1960s he served as consultant on forest pathology for the Maine Forest Service. After retiring in June 1962, he spent two years as consultant with the U.S. Forest Service, Division of State and Private Forestry, developing problem analyses for use in suppression of disease losses in northern hardwood forests. He also advised municipalities on problems related to the suppression of Dutch elm disease and the management of shade tree resources. He served as technical adviser to the Elm Research Institute in 1970-71.

Former students, especially those who were advised by Dr. Welch during graduate studies, recall that he gave them great latitude to work out research problems. A quiet, gentle person, given more to listening than to talking, he preferred to serve as a source of advice rather than as director of a student's research project.

Professor Welch was a past president of the International Shade Tree Conference and a former member of the Board of Governors of Region 2 of that organization, a member and then honorary member of the Northeastern Forest Pest Council, a former member of the Council of the American Phytopathological Society, and a fellow of the American Association for the Advancement of Science. He was also a member of the Society of American Foresters, the Mycological Society of America, the American Institute of Biological Sciences, the New York State Arborists Association, the Association of New York State Bird Clubs, Sigma Xi, Phi Kappa Phi, Alpha Zeta, and Phi Sigma.

Professor Welch married Catherine Graham of Guelph, Ontario, in 1925. He is survived by Mrs. Welch, their daughter Catherine and their son James.

Richard P. Korf, George C. Kent, Wayne A. Sinclair

Gene Armour Welch

May 18, 1930 — December 11, 1969

Gene Armour Welch was born in Parkersburg, West Virginia, on May 18, 1930, and was brought up in the small town of Belpre, Ohio, as an only son. While in high school he was active in athletics, especially basketball. He was also an active participant in Boy Scout programs, rising to the rank of Eagle Scout. This interest in scouting was carried over into later years, when he served as an active member of the executive board of the Tiotomca area. His activity in providing medical coverage for area activities of the Boy Scouts will be remembered with appreciation.

Dr. Welch continued his education at Marietta College in Marietta, Ohio, where he received the A.B. degree in 1950. He later attended McGill University in Montreal, where he studied medicine and was graduated with distinction. He was honored by election as senior class president, McGill University Faculty of Medicine, and as president of the Osier Society. Following graduation he served an internship at the Cincinnati General Hospital.

At the completion of his training Dr. Welch served for two years (August 1957 to August 1959) as an officer in the U. S. Air Force, stationed in Turkey. He left the service in 1959 with the rank of captain, U.S.A.F.(M.C).

Following his discharge from the service, Dr. Welch came to Ithaca and entered the general practice of medicine in 1959. He continued his private practice until 1962, at which time he joined the staff of the Cornell University Health Services. He will be remembered by his colleagues as a dedicated physician, devoted to the welfare of his patients. He will be remembered by Cornell students as an understanding doctor and friend. He will be remembered by the hockey players as an enthusiastic backer and team doctor.

Gene Welch was far more than a conscientious physician, however. He had an inquiring mind and was interested in many fields in addition to medicine. He loved good music and would listen to his favorite symphonies for hours. He had an excellent ear for music and memory for dominant themes. He delighted in talking with his friends in the Music Department.

His musical ear was also a help to him in identifying bird songs and sounds. He had an interest in ornithology and was frequently seen taking his eldest son on the weekly bird walks at Stewart Park. He was a concerned and devoted father.

Dr. Welch was also an ardent student of history and an avid reader. He particularly enjoyed reading about the period of the Civil War and he delighted in telling small anecdotes about the various leaders. This interest in history tied

in with various other fields—he knew much about railroading in this country. We can recall a pleasant summer afternoon listening to a record on his stereophonic system entitled, “The Sounds of Steam.” These fading, soon-to-be-forgotten sounds brought back memories from childhood—the sounds of mighty locomotives switching back and forth, or rushing along the rails, or emitting a lonely whistle in the night.

His friends will remember Gene Welch as a good friend and delightful companion. He had a gift for gay, light-hearted conversation. At the same time he was an interested, helpful friend. He was a good listener and had a very sincere feeling for the emotional state of others. His empathy for the feelings of young people rendered his services in the medical clinic invaluable.

Raymond Haringa, M.D., Alexius Rachun, M.D., Paul H. Darsie, M.D.

Harry Porter Weld

September 22, 1877 — October 2, 1970

Harry Porter Weld, professor of psychology, emeritus, was born in LaGrange, Arkansas, September 22, 1877, and died in Bradenton, Florida, October 2, 1970. He joined the Cornell faculty in 1912 and served the University continuously until his retirement in 1945.

After receiving the Ph.B. from Ohio State University in 1900, he devoted the next ten years to music, as professor of music at George Peabody College and as a professional singer taking part as soloist in many concerts and oratorios. He became interested in the psychological aspects of music and decided to study psychology at Clark University under G. Stanley Hall and J. W. Baird. There he was a fellow in psychology for the year 1909-10 and remained as assistant until taking the Ph.D. in 1911. His dissertation, "An Experimental Study of Musical Enjoyment" applied both physiological measurement and introspective analysis to the musical experience. In later years, while his personal interest in music remained active and was reflected in his participation in the University Committee on Concerts, his professional interests in psychology covered a wide range of topics.

After a year as instructor at Clark, Professor Weld was brought to Cornell by E. B. Titchener in 1912 to replace Madison Bentley, who had moved to Illinois. Dr. Weld served as assistant professor of psychology from 1912 to 1919, as professor from 1919 to 1945, and as chairman of the Department of Psychology from 1938 to 1945.

For many years Professor Weld was well known to undergraduates as lecturer in the second course in psychology, which surveyed the various branches and fields of the application of psychology. His polished and interesting lectures attracted many students into further studies in the department. Out of this course grew his book, *Psychology as Science* (1928), which investigated the relationships between science and technology in a way which is still relevant to the problems of present-day psychology. While he accepted the dominant emphasis at Cornell on psychology as a "pure" science, he also showed respect and appreciation for the application of psychology to practical problems.

During his career, Professor Weld taught many of the advanced courses in the Department, and many generations of graduate students owed a large portion of their training to him. He became the departmental specialist in the history of psychology, which was considered an essential part of graduate training. He also pioneered in teaching social psychology, developing the first course to be given at Cornell and probably one of the earliest to be given

anywhere. He also became interested in the psychology of law, developing a course and initiating research in this area, again at a time when the field was in its infancy.

In the mid-thirties, Professor Weld conceived of a new approach to the teaching of introductory psychology and a new type of textbook. Until that time, introductory texts supported a particular theory or “system” of psychology, so that students at different universities received quite different views of the field. It seemed to Dr. Weld that psychology had progressed to the point where the basic facts of the discipline could be presented in a neutral fashion without reference to a particular theory. Theories could be left to upper-level teaching, after the student had learned about psychology as an empirical science. He enlisted the collaboration of E. G. Boring of Harvard and H. S. Langfeld of Princeton in developing a book in which each chapter was written by an authority in the field, with the editors carefully fostering theoretical neutrality. The result was *Psychology: A Factual Textbook* (1935), familiarly known as “BLW” in a large number of colleges. In fact the main limitation on its usage was that it demanded better students than some institutions had. The book became the standard textbook in the field and set a trend in the teaching of introductory psychology which still continues. Two more editions, the last in 1948, involved such complete revision that they became new books and occupied much of the time of the editors for several years.

Graduate students knew Professor Weld not only as an enthusiastic and interesting classroom teacher, but as a friend who was readily available for informal discussion of specific problems or of general trends in the development of the field and its relations to the other sciences. His enjoyment of these discussions was so obvious that the student never felt that he was imposing or taking up too much time. This informal teaching went on continuously throughout the day, and the graduate students of the time could fully appreciate why the Cornell Graduate School emphasized the concept of residence rather than course credits. These conversations gave a vivid sense of the informal side of the history of psychology, emphasizing individual intellectual influences and development but not the personal scandals.

R. B. Macleod, T. A. Ryan

George Harvey Wellington

September 19, 1915 — September 20, 2004

George Harvey Wellington, Professor of Animal Science and Food Science, Emeritus, died in Weslaco, Texas on September 20, 2004 at the age of 89.

Born in Springport, Michigan, George was raised on a general livestock and dairy farm. He graduated with a B.S. degree from Michigan State University in 1937. For one year he was an Instructor in Vocational Agriculture in Holly, Michigan. He continued his studies at Kansas State University, receiving the M.S. degree in 1940. He served as officer in the Remount Service in the U.S. Army from 1941-45, during which time his rank on duty rose from Second Lieutenant to Major. After being discharged from the Army in 1945, he served as an Assistant Agricultural Agent in Charlotte, Michigan for two years. In 1947, he accepted a position as Cornell Extension Meats Specialist with the rank of Assistant Professor. In 1949, he was promoted to the rank of Associate Professor. In 1952, his responsibilities were changed to resident instruction and research in the Department of Animal Science. He received his Ph.D. degree in Animal Science from Michigan State University in 1954 and he was promoted to Professor of Animal Science at Cornell University in 1957. George also had a joint appointment as Professor of Food Science. He retired as Professor Emeritus of Animal Science and Food Science in 1978.

For 24 years, he was in charge of the meat plant operation in the Department of Animal Science. He was involved in teaching five undergraduate and graduate courses dealing with Meat Science and he was very active in graduate training programs. He served as chairman of the graduate committees for four M.S. and nine Ph.D. students. George has contributed greatly to scientific knowledge through his research activities as evidenced by the thirty-six scientific papers, which have been published. Each paper resulted from research planned carefully and executed with great detail and precision. Professor Wellington's major research included pioneering studies on the effect of steroid hormones on meat production and quality, humane slaughter of animals, and the development of techniques for live animal and carcass evaluation. In the carcass studies in collaboration with Professor J.T. Reid, the interrelationships among concentrations of the chemical components of various meat-producing animals were found to be quite specific within species irrespective of breed, sex, and level of nutrition. Long-term studies with cattle were concerned with the influence of energy input, sex, body type, age, and body size on carcass composition and quality. Tenderness, cookability, and acceptance of meat products were measured. An interesting observation was that beef of higher fat content was not tenderer than leaner beef if produced by animals of the same age. He devoted substantial time to agricultural development and study in other countries.

In 1962, he was consultant to the Ford Foundation on agricultural programs in the Syrian Department of Agriculture, Damascus, Syria and Visiting Professor at the University of Aleppo, College of Agriculture, Aleppo, Syria in 1965-66. George studied the meat research programs in England and Ireland in 1975.

Professor Wellington was a charter member of the Reciprocal Meat Conference and was its chairman in 1960. He helped form the American Meat Science Association and was awarded the Signal Service Award in 1966 and served as the president of that organization in 1970. George was a member of the American Society of Animal Science and the Institute of Food Technologists. He received the 1975 Distinguished Service Award, Northeast Section, from the American Society of Animal Science. He continued his international involvement after retiring with assignments to: the Federal University of Minas Geras, Belo Horizonte, Brazil in 1978; he represented the American Soybean Association as a delegate to the Soviet Union in 1979; he made on site recommendations of Animal Science related research activities in Botswana and reviewed the agricultural research programs in Malawi in 1982.

Professor Wellington's community activities included St. Paul's Methodist Church, Ithaca, New York; First United Methodist Church, Weslaco, Texas; and the Ithaca-Cayuga Rotary Club. His hobbies included organized programmed exercise, including jogging, and he was an avid golfer. The construction of dry stone walls and splitting wood supply for home heating provided him with much pleasure and satisfaction.

His wife of 65 years, Gladys Brown Wellington died on March 6, 2005. He is survived by three children: Earl C. (Myra) Wellington of Harlingen, Texas; a daughter, Mary W. (Richard) Daly of Tucson, Arizona; a daughter, Ann W. (Louis-Henri) Marguet of Glen Ridge, New Jersey; and by seven grandchildren and two great-grandchildren.

Robert H. Foote, Douglas E. Hogue, James R. Stouffer

Richard Wellington

October 10, 1884 — June 15, 1975

Richard Wellington, professor emeritus of pomology at Cornell University's New York State Agricultural Experiment Station, Geneva, New York, died at the age of ninety. For forty-seven years he served the station in horticultural research, twenty-four of these years as department head. Under his leadership, seventy new fruit varieties were introduced, and the department gained worldwide recognition for its accomplishments.

Professor Wellington was born and grew up in Waltham, Massachusetts, on a traditional New England dairy farm with its usual fruit and vegetable sidelines. He obtained his B.S. degree from Massachusetts Agricultural College, Amherst, in 1906. That same year, at the age of twenty-two, he came to the New York State Agricultural Experiment Station, Geneva, as assistant horticulturist to work with U. P. Hedrick. He was the third horticulturist to be hired by the station which, then, was less than a quarter of a century old. In 1911 he earned his master's degree in genetics at the Bussey Institute of Harvard University, after which he was promoted to associate horticulturist at the station.

In 1913 he went to the Minnesota Agricultural Experiment Station as pomologist. Six years later, he was appointed professor of vegetable gardening at the University of Maryland and Vegetable Breeder at the Maryland Experiment Station. In 1920 he returned to Geneva to become associate horticulturist; and in 1929 he was made professor of pomology and head of the division of pomology. He guided the departmental program until his retirement in 1952. He also served as collaborator with the United States Department of Agriculture on fruit breeding projects.

For over thirty years, he served as secretary-treasurer of the New York State Fruit Testing Cooperative Association, which works closely with the Geneva Station in propagating and distributing new fruit varieties originating in the station's breeding programs. He was more influential in developing this association and shaping its policies than any other person.

Richard Wellington was a fruit breeder in the old tradition. However, his very detailed knowledge of varieties and his keen insight into the inheritance of qualities useful for developing improved fruits were excellent substitutes for the modern punch cards and computers. The long list of new fruits that he introduced testifies to the success of his approach.

While working with vegetable crops in his early years, Professor Wellington was the first to demonstrate the hybrid vigor and increased yields attainable by crossing tomatoes and was also the originator of several varieties of hothouse melons. Later he was instrumental in the development of twenty-one apple varieties including Macoun, Lodi, Early McIntosh, and Kendall; the Gorham pear; Newburgh and Taylor red raspberries; the Bristol black raspberry; the Fredonia gooseberry; the Catskill strawberry; the Stanley prune; the Gil Peck sweet cherry; and thirteen grape varieties, including Buffalo, Steuben, and Keuka. The Stanley prune is the plum most widely grown in the world. The Wellington apple, developed at the Geneva Station, was named after this distinguished scientist. After retirement, he maintained an active interest in plant breeding and introduced the outstanding Cardinal crabapple from his backyard breeding program.

Dick Wellington had the unique ability to carry on a lively conversation with the janitors as well as distinguished scientists and administrators. Alert, yet soft-spoken and courtly in the traditions of another age too fast gone by, he readily expounded on subjects ranging from history to the birth of a new kind of grape or apple. He was keenly interested in genealogy. He was a very kind person who was interested in young and old alike.

Professionally, he gained the highest recognition in his field. He was a fellow of the American Association for the Advancement of Science and a member of the American Society for Horticultural Science and the American Pomological Society. He was elected to Sigma Xi and Kappa Sigma. Special recognition for his accomplishments in fruit breeding was made on two occasions by the Massachusetts Horticultural Society, once in 1937 when he was given the society's gold medal, and again in 1949 when he received the coveted Jackson Dawson Medal for outstanding fruit hybridization.

Of the honors bestowed upon Mr. Wellington, perhaps the most appropriate were the Wilder Medals. This medal, established in 1873 by the American Pomological Society, is given to individuals and organizations who have rendered outstanding service to pomology, especially for the origination and introduction of meritorious varieties of fruit. The experiment station was awarded the medal in 1947 to recognize its fruit breeding programs. In 1954, Professor Wellington himself was given the medal and, in 1959, the New York State Fruit Testing Association was cited. All three honored the man and his work.

He wrote numerous scientific articles, experiment station publications, and contributions in popular horticultural magazines. Along with U. P. Hedrick and others, he wrote the famous fruit books of New York: *The Grapes of New York*, 1908; *The Plums of New York*, 1911; and *The Cherries of New York*, 1915.

In 1927, he attended the International Genetics Congress in Berlin and spent several months visiting horticultural institutions on the continent and in England. While on a sabbatical in 1941 visiting horticultural research stations in the United States, he helped to select the Idared apple in Idaho, now a prominent, widely grown variety.

During his tenure, the New York State Agricultural Experiment Station at Geneva became known worldwide for its contributions to fruit breeding and cultural aspects of pomology.

Edward H. Glass, Roger D. Way, John Einset

Albert Edward Wells

December 18, 1870 — May 12, 1954

Albert Edward Wells, Sibley Professor of Mechanic Arts, passed away in Ithaca Memorial Hospital, May 12, 1954, after some months of declining health. He was born in Sherbrooke, Canada, of American parents on December 18, 1870.

His formal education was received at Sherbrooke. Early in his teens he began his industrial career. His wide experience and keen interest in the processing of materials resulted eventually in his employment as Superintendent of the Switchboard Department of the Stanley Electric and Manufacturing Company Pittsfield, Massachusetts. While there he invented a high-voltage, non-arcing switch. It was also there he came to know Dexter S. Kimball Sr. who was Works Manager of the Company. When Kimball left the Company in 1904 to become Professor of Machine Design at Sibley College, Cornell University, Mr. Wells came with him to be Foreman of the Sibley Machine Shop. From 1905 to 1912 he was Superintendent of all the shops of Sibley College. In 1912 he was made Assistant Professor of Machine Construction. This date coincides with the dedication of Rand Hall which was to house the laboratories for Machine Tool and Pattern Work instruction. In 1916 he became Professor of Machine Construction, and in 1920 he was awarded the Sibley Professorship of Mechanic Arts. This post he held until his retirement in 1939.

During his tenure at Sibley College, Professor Wells was very active in planning exercises and courses of instruction for the students in the Pattern, Forge, Foundry, and Machine Shops. This work resulted in a very considerable improvement in the courses for which he will long be remembered. His judgment as to the content and real purpose of the courses was always sound. Besides giving the courses in the processing of materials, he gave an elective course of lectures on Safety Engineering. He was also responsible for developing much laboratory equipment. An outstanding project was the development and manufacture of the first pieces of apparatus for the testing of foundry sands. This work was in collaboration with Dr. Heinrich Ries of the Department of Geology.

Two World Wars were fought while Professor Wells was connected with the University. In both wars he worked diligently to train personnel in the specialized techniques of materials processing.

Professor Wells was a Mason and an active member of the Episcopal Church. He was active also in civic affairs and instrumental in the development of the East Lawn Cemetery tract. His mechanical ingenuity was expended in many ways. The Reconstruction Home benefited often from his unique devices that improved the therapeutic

treatments of the patients. Professor Wells originated a series of charts and a system of folding Red Cross bandages that greatly increased the quantity and quality of production. He was an avid gardener, taking great pride in his vegetable and floral layouts, which adjoined the lower entrance to Cascadilla Gorge.

He is survived by his wife Lillian Stevens Wells of Ithaca and a daughter Mrs. Mary Wells Wilson of Newfield. His many friends and former students regret his passing and will remember him as a friendly, helpful, and admirable man who contributed significantly to the upbuilding of Sibley College.

C. D. Albert, W. C. Andrae, R. L. Geer

Frederick Morris Wells

November 2, 1902 — July 18, 1983

Frederick Morris Wells was born on November 2, 1902. He came from a tobacco-farming family in Baldwinsville, New York. Wells graduated from Cornell in 1927 with a degree in architecture, in a class that included such prominent architects as Nathaniel A. Owings. After a tour of Europe he practiced architecture for twelve years in New York City, in such firms as John Russell Pope, Charles Platt, and Madigan and Hyland, and for five years on his own. He was a senior architectural engineer with the navy for two years in World War II and worked on the naval hospital at Saint Albans, on Long Island. In 1945 Dean Gilmore Clarke brought Wells to Cornell, where he was given tenure in 1946, made a professor in 1948, and made the Andrew Dickson White Professor of Architecture and the head of architectural design in the college in 1950, positions he held until 1968, when, after a reorganization of the college, he became the first chairman of the newly formed Department of Architecture. He retired the following year.

During his twenty years as head of the architectural design faculty, Wells proved himself a skilled administrator. He kept the college's fractious, creative designers—so typical of architecture schools—going by means of a generous serving of his good-humored wit and his careful attention to overall planning and scheduling, resulting in a balanced program and a minimum of friction. Among his personal concerns were a hardheaded course in professional practice and a special design course to prepare students for their major individual architecture project, the thesis.

Two important contributions to education were associated with Wells's tenure. Working with Dean Thomas Mackesey to broaden the experience of the students and mitigate the isolation of Ithaca, Wells instituted a program that brought visiting architectural critics to Ithaca for periods of from two weeks to a full term. Many of these critics subsequently became the most prominent professionals in their field, in this country and abroad. They included Franco Albini, Fello Atkinson, William Caudill, Charles Eames, Kenneth Frampton, Buckminster Fuller, Aldo Giurgola, Philip Johnson, Dan Kiley, Paul Rudolpy, Hideo Sasaki, Stanley Tigerman, and Henry Wright. To have such a range of critics in class, and free access to them after class in the college's Heller House, was an invaluable asset of Cornell's program, and Wells made it work.

Wells's second major contribution was to that basic tool of design education, the Architecture, Art, and Planning Slide Library. A talented architectural photographer, he firmly believed in the importance of using visual material

in the teaching of architecture and in the establishment of a visual archive. For years he spent summers and time during his retirement traveling throughout Europe, adding to the college's slide collection. Recognizing the importance of his work, the American Institute of Architects awarded Wells its 1951-52 Langley Fellowship.

Wells's general services to Cornell included terms of membership on the Administrative Board of the Cornell Council, the Architecture and Engineering Advisory Board, and the Committee on Educational Environment. He was chairman of the Board on Physical Education and Athletics. Also, he served as consultant to the University of Puerto Rico in connection with the establishment of its first school of architecture. For many years during his tenure at the college, he and Thomas Canfield conducted a private architectural practice, building many houses in the Ithaca area.

Wells was a man of many talents. He loved good stories and excelled at telling them. He was a master of the shell game, never caught out. He was a wonderful traveling companion. And he made the best dry martini in Ithaca. He was devoted to his wife, Ruth, who died in 1980, and a warm father to the two daughters who survive him: Mrs. Marga McLeod of San Anselmo, California, and Mrs. Deborah Macomber of Indianapolis, Indiana. Wells died in Marbella, Spain, on July 18, 1983.

Alexander Kira, John Reps, Burnham Kelly

John West Wells

July 15, 1907 — January 12, 1994

Professor Emeritus of Geological Sciences, John W. Wells, died at his home on Brook Lane on January 12, 1994. His loving wife, Elizabeth (Pie), died at their summer home at Sheldrake Point on July 1, 1990. John is survived by his daughter, Ellen Baker Wells of Alexandria, Virginia; two granddaughters, Diane Elizabeth Hull and Linda Ann Wilson (both of San Luis Obispo, California); and two great grandchildren, Alan Scott Hull and Elizabeth Darlene Hull (also of San Luis Obispo).

John was born on July 15, 1907 in Philadelphia, but grew up in Homer, New York until he entered college. John did not do his undergraduate major in geology. He started as a pre-med student at the University of Pittsburgh, and then switched to chemistry, but he also took some geology courses with two professors who had studied at Cornell—Ransom E. Somers (Ph.D. '15) and Henry Leighton (A.B. '06, GRAD '06-'08). John became so interested in geology that he ended up with more courses in that subject than in his major. His is one of many examples of future Cornell faculty members who were influenced, early in their careers, by more senior Cornellians.

Leighton suggested that if John was interested in paleontology, as he seemed to be, he should study some biology. This John did during two summers at Cornell. Then he obtained an assistantship with Professor Gilbert Harris—it covered living expenses plus \$75 per term for tuition—and began working toward his master's degree, which he received in 1930. He completed the Ph.D. degree in 1933 from Cornell.

Almost from the beginning, John began specializing in corals, both living and fossil. His interest in corals led him to an instructorship (1929-31) at the University of Texas, where he published several papers on the fossil corals of central Texas. During 1933 and 1934, he was a National Research Council Fellow, studying at the British Museum in London, the Museum National d'Histoire Naturelle in Paris, and the Humboldt Museum in Berlin. From 1935-37, he worked with the noted coral taxonomist, T. Wayland Vaughan, in Washington, D.C. After one year (1937-38) at the State Normal School at Fredonia, New York, he joined the faculty at Ohio State University, where by the time he left for Cornell nine years later in 1948, he held the rank of professor. During World War II, he served in Europe as a geographer in the Office of Strategic Services, providing assessments of war damage and searching for looted library and art collections. One reason for John's return to Cornell was his interest in the paleontology and stratigraphy of the Devonian System in upstate New York.

From 1946 until well past his retirement, John, with his colleague, the late Professor W.S. Cole, was associated with the U.S. Geological Survey, working on various aspects of the Bikini Atoll Atomic Bomb Project. John also took part in the Pacific Science Board's expedition to Arno Atoll. Part of these studies involved examining cores from holes that were drilled completely through the coral cap of Bikini and Eniwetok to the underlying basalt. Some forty of his 173 publications concerned the Recent and Tertiary corals collected from these and other Pacific islands.

For most of his career, John was accepted worldwide as the authority on coral taxonomy. Hardly a week passed that he did not receive a parcel of specimens for identification. By his recollection, in 1971 alone, he identified over a thousand Red Sea coral specimens for Tel Aviv University in Israel.

In 1954, John was a Fulbright lecturer at Queensland University in Australia, and while there he took the opportunity to make an extensive coral collection from the Barrier Reef for the National Museum in Washington. His work with corals led to the publication of a small paper in *Nature* ("Coral Growth and Geochronometry", 1963, v. 197, pp. 948-50) that received major attention. He had discovered that, with careful observation, he could count very fine ridges (about 50 microns wide) between the coarser ridges on the outer surface of Palaeozoic corals that were believed to represent annual growth increments, and he interpreted these thin ridges as daily growth rings, suggesting that the number of fine lines between the coarse annual ridges indicated the number of days in the year at the time the fossil coral was alive. Allowing for a few cloudy days, the mid-Devonian year seemed to have been about four hundred days long, indicating that the earth was rotating much faster then. A slowing down of the Earth's rotational speed had been postulated for years, but this was the first actual evidence that the calculations and predictions were correct. At a time when huge sums of money were being spent for fundamental research, the British scholar, J.B.S. Haldane, commented in a *New York Times* article that major scientific advances could still be made with a simple hand lens and careful observation. It was this work, and the ensuing explosion of studies on daily, monthly, and season growth bands in fossils that followed, that led to current calculations of the changes in the orbital patterns of the Earth and moon over geologic time, and new evaluations of the chronology of cyclical deposition of sedimentary rocks and of climatic variability.

John was a private person but generous and loyal to his friends. A newly appointed professor of prior acquaintance was invited to occupy John's house, empty because John's summer residence was at Sheldrake, until the delayed furniture arrived for the professor's house. The invitation was supported by a bottle of champagne in John's refrigerator.

John was a delightful conversationalist and for many years enjoyed luncheon with a variety of free-speaking colleagues in the small alcove at the side of the Rathskeller, the old Faculty Club on the lower floor of the Statler Building. On Monday there was always *inter alia*, a review of the facility with which the Sunday *N.Y. Times* crossword puzzle had been completed. On each Thursday, he joined the more formally organized Wilcox Luncheon Group in a private dining room. He chaired that venerable group in later years.

John's interests were many and varied and frequently astonishing. He was a collector who generously passed on to his colleagues items which he found while searching for his interests. For example, he located a statement in 1877 by a British scientist about currents and jets of water at Niagara Falls which are no longer visible, but are important to the understanding of the retreat of the Falls. He was a collector of rare books with fine bindings, including all editions of Lyell's classic textbook of geology. He found oriental rugs worth collecting, and the walls of his house in Ithaca were covered with beautiful paintings of the scenic Finger Lakes landscape, many by his father-in-law, Professor W.C. Baker. A collection of more than 300 chamber-pot lids adorned the walls of his early 20th century cottage at Sheldrake. John was an extraordinarily interesting and delightful fellow.

John retired from Cornell in 1973 after twenty-five years of teaching. He received much recognition for his professional achievements and leadership; he was a Fellow of the Geological Society of America, and served as president of the Paleontological Society. He was president of the Paleontological Research Institute (1961-62) that was founded by his mentor, Cornell Professor Harris. He was honored by election to the National Academy of Sciences in 1968. He was awarded the Paleontological Society Medal in 1974, and the James Hall Medal of the New York State Geological Survey in 1987.

What do accolades like this mean on a personal level? One day, shortly after John had received notice of his election to the National Academy, he took a student along with him on an elevator ride to the fourth floor of McGraw Hall. John had picked up his mail and was looking through it during the slow ascent. Just as the elevator reached the top, the student heard him mutter, on opening an impressive-looking envelope, "Oh, dinner at the White House. The wife will like that."

William R. Brice, Shatter S. Philbrick, Arthur L. Bloom

Anthony Seth Werner

December 1, 1933 — January 2, 1968

It is with great sadness that we record the untimely death of Dr. Anthony Seth Werner, Assistant Professor of Medicine, Cornell University Medical College*

Dr. Werner was born in New York City. He received a Bachelor of Arts degree from Yale University in 1955 and the degree of Doctor of Medicine from Yale University School of Medicine in 1959.

After an internship in medicine at the Johns Hopkins Hospital-Osier Service, he entered the United States Navy where he served on active duty for two years. Following his tour of duty he became an Assistant Resident in medicine at the Johns Hopkins Hospital-Osier Service from 1962 through 1964. During the residency program in 1964, Dr. Werner spent four months at the Johns Hopkins Center for Medical Research and Training, Cholera Study Unit, in Calcutta, India.

In July of 1964, he became a Fellow in medicine at Cornell University Medical College in the Division of Allergy and Infectious Diseases. In 1965 he was appointed Instructor in Medicine and Physician to Outpatients at the New York Hospital. In 1966 he was promoted to Assistant Professor of Medicine at Cornell University Medical College and Assistant Attending Physician at The New York Hospital, positions he held until his death.

Dr. Werner contributed original research on infectious diseases which was published in some of the leading medical journals, and at the time of his death he was involved in important research.

He participated actively in the teaching of medical students, house staff, and fellows, and was a consultant in infectious diseases for patients hospitalized at the New York Hospital.

Dr. Werner was respected for his profound knowledge of medicine and his ability for original thinking. In addition he was well liked by everyone for his humor, love of argument, and compassion. In him the medical students, house staff, faculty, and patients had a true friend. In addition to his extensive knowledge of medicine, he had a deep interest in the arts.

He was a devoted husband, father, and son, a loyal Yale alumnus, and a proud member of the Cornell faculty.

Anthony Werner was a man of wide-ranging knowledge and interest whose sparkling wit, enthusiasm, and intellectual honesty will be missed by all of his many friends and associates. If his career had not been terminated so early, there are no limits to the contributions he could have made to science.

Dr. Werner is survived by his widow, Mrs. Evelyn Werner; a daughter Kathleen, four years old; a son Anthony, Jr., two years old; his parents, Dr. and Mrs. Aaron Werner; a brother Dr. Edward C. Werner; and a sister Mrs. Joseph McManus.

Donald Kaye, M.D.

Barbara Mayer Wertheimer

November 7, 1925 — September 20, 1983

Barbara Mayer Wertheimer, professor of industrial relations in the School of Industrial and Labor Relations Extension Division, died on September 20, 1983. She is survived by two children, David and Ellen. A graduate of Oberlin College and New York University, she joined the Cornell faculty as a senior extension associate in 1966, was appointed an associate professor in 1977, and was promoted to professor of labor history in 1983.

Before joining the Cornell faculty she was employed by the Amalgamated Clothing Workers of America, first as a national representative and, from 1947 to 1958, as associate national education director of that union. From 1961 to 1966 she served as a community service consultant to the New York State Division of Housing and Community Renewal.

Professor Wertheimer's teaching and research interests centered on the role of women at work and in the trade union movement. She was appointed the director (with Anne Nelson) of Cornell's Institute for Women and Work in 1977. Under their leadership the institute developed credit and certificate programs in trade union women's studies, public service women's studies, and career development for clerical employees, and a large number of conferences and workshops on topics of interest to working women. The institute grew to provide technical assistance to other organizations here and abroad. It maintains a specialized library.

Professor Wertheimer was founder of the Trade Union Women's Summer Schools, sponsored by the University and College Labor Education Association and conducted annually on university campuses throughout the United States. She was a founding member of the Coalition of Labor Union Women.

Among her many publications were the books *Labor Education for Women Workers* (1981), *We Were There: The Story of Working Women in America* (1977), and *Trade Union Women: A Study of Their Participation in New York City Locals* (co-authored with Anne Nelson, 1975). At the time of her death she was working on the second volume of the study of working women in America. Her research papers for this volume are housed at the ILR library. A prolific writer, she also published numerous articles and book chapters dealing with issues affecting women at the workplace and in unions. She served on several boards and committees. Among her services in these areas were as member of the editorial board of *Labor History*, commissioner of the National Commission on Working Women, and member of the Board of Overseers, Wellesley College Center for Research on Women. She was the appointed

arbitrator for the contract between the Service Employees International Union and the 9 to 5 National Association of Working Women. At Cornell she served a term on the Provost's Advisory Committee on the Status of Women. Highly regarded not only by her colleagues at Cornell but by those involved in the women's and trade union movements, Professor Wertheimer's work was recognized by the several honors she received. Among them were the Creative Programming Award from the National University Extension Association, in 1969; the Innovative Programming Award from the American College Testing Program, in 1963; and a study grant from the Ford Foundation, in 1982. Program grants were received from the Carnegie Corporation, the Rockefeller Family Fund, the Ford Foundation, the New York State Council of the Arts, the Muskiwinni Foundation, and the German Marshall Fund.

Faculty colleagues and former students cherished Barbara Wertheimer's friendship. She is remembered by students for her commitment to developing their full abilities and by colleagues for her creative application of high principles to practical purposes. Her memory is honored by the New York State Labor History Association by the establishment of the Barbara Wertheimer Undergraduate Prize in Labor History and by creation of the Cornell—Barbara Wertheimer Memorial Fund, which will provide funding for women's labor programs.

Alice Cook, Lois Gray, Robert Doherty

Philip Henry Wessels

March 16, 1880 — November 30, 1950

Philip Henry Wessels, Emeritus Professor of Vegetable Crops, passed away November 30, 1950.

Professor Wessels was born at Flint, Michigan, March 16, 1880. He graduated from Michigan State College with Bachelor of Science degree in 1905. He obtained the Master of Science degree from the University of Wisconsin in 1910 and for the next two years he held a fellowship in the same institution. From 1905 to 1909 he was Assistant Chemist at the Rhode Island Agricultural Experiment Station and from 1912 to 1922 he was Associate Chemist at the same station. In 1922 he was appointed Research Professor of Vegetable Gardening, to take general charge of the research work on the Long Island Vegetable Research Farm, Riverhead, New York, which position he held until his retirement from active service on March 31, 1947. He was made Professor Emeritus April 1, 1947.

Professor Wessels was a member of the American Association for the Advancement of Science, American Chemical Society, American Society of Agronomy, American Society for Horticultural Science, and the Potato Association of America. He was active in the Grange for many years, serving as Lecturer of the State Grange of Rhode Island and as Master of the Kingston, Rhode Island, and the Sound Avenue (Riverhead, Long Island) granges. He was active in church work and in Rotary, serving as President of the Riverhead Rotary Club.

Trained as a chemist and devoting many years to work in this field, Professor Wessels spent a large part of the last twenty-five years of active service in applying his chemical knowledge to the solution of problems of soil fertility, soil reaction, and other soil-management problems. His most notable research was on the relation of soil reaction to the growth of vegetable crop plants. While his research was conducted primarily to solve problems confronting farmers on Long Island, the results have wide application and have contributed to general knowledge of soil management. Few scientists have had the results of their research so readily and so fully put into practice. He gave liberally of his time to farmers and others who came to consult him on some special problem and he was never too busy to discuss the problem and to offer suggestions and advice.

In addition to his work as a scientist, Professor Wessels made other contributions that have enriched the life of thousands of rural people. His travel lectures and recitations of whimsical poetry of his own composition have entertained hundreds of audiences. To his colleagues and other friends he will be remembered for his genial disposition, his sincerity and his great capacity for friendship.

He is survived by his wife Grace Felker Wessels.

His death at the age of seventy brings sorrow to all who knew him.

Richard Bradfield, H. C. Thompson, L. A. Maynard

Michael Dennis Whalen

May 6, 1950 — December 27, 1985

In his short lifetime Michael Dennis Whalen lived fully. He established a fruitful and promising academic career, and his genuine interests in others and the happenings about him gave richness to his life.

Michael was born in Cedar Rapids, Iowa, but spent the greater part of his childhood in Texas, where his wide-ranging and insatiable curiosity introduced him to subjects as diverse as astronomy and philosophy. In 1968 he entered the University of Texas at Austin as an anthropology major. Following an interlude of one semester at the University of Montana and a shift of interest from anthropology to botany, he received his B.S. degree from Texas in 1972. He remained at the University of Texas for his doctoral studies and was awarded the Ph.D. degree in 1977.

In the fall of that year, Michael joined the faculty of the L. H. Bailey Hortorium with a joint appointment in the Section of Ecology and Systematics. His appointment was of particular significance, for the hortorium was in the midst of change from a unit of relatively narrow research to one of more-typical academic nature. His arrival was a signal of change and revitalization.

A true academic, Mike focused his energies on teaching and scholarly research. He revitalized the introductory taxonomy course, combining the field experiences that had always characterized the course with a modern view of systematics. In a similar way the advanced course in systematics and evolution responded to his touch, as did a new course in biogeography. His infectious smile, sense of humor, gentleness, and easy manner, coupled with remarkable knowledge and a true interest in students, made him more than popular with both undergraduates and graduates. They found in Michael a teacher of extraordinary ability.

None would deny, however, that, for Michael, the plant genus *Solanum* was the focal point of his academic life. From it all other activities radiated and returned. Innovative approaches, involving both classical and modern techniques, are amply evident in his work. His publications are models of clarity, and representative of his incisive and imaginative thinking. He was widely recognized among others involved with this very large and economically important genus as its leading student. His studies of the basic biology and evolution of the *Solanum* species, which include the potato, eggplant, naranjilla, and, by some thinking, the tomato, promised to cast light on relationships within the genus and lead to improvement in humanity's store of basic crops. In the acknowledgments of his last major publication, which dealt with one segment of *Solanum*, Michael revealed a bit of himself and his fascination with this group of plants. "My first thanks go to the prickly solanums of the world. Their diversity was my principal

inspiration.” He was unfailingly generous with time and knowledge and brought all who worked with him into the heart of his research program.

Michael participated conscientiously and effectively in hortorium and university activities. He was particularly concerned with the future of the university’s natural areas, which he used so extensively in his teaching. Through his membership on the Cornell Plantations Committee he worked to strengthen that aspect of university resources. Yet, above all else, Michael was his own person. He was at his best following his own inclinations and pursuing his own intellectual goals. He plunged into new interests with abandon, being consumed by them until he felt he had mastered that which they could give him. In his final illness he displayed unimaginable courage and self-awareness and in his own strength reached out to help others.

He is survived by his wife, Elizabeth Lawson Whalen; their two children, John, ever known as Jack, and Charlotte; his parents, John M. and Jean Knight Whalen; and three brothers and a sister.

David M. Bates, Peter L. Marks, David A. Young

Ralph Hicks Wheeler

September 11, 1883 — March 20, 1962

Ralph Hicks Wheeler was born in East Bloomfield, New York, the son of George A. and Mary Belle (Hicks) Wheeler.

After graduating from Canandaigua Academy in 1904, he began his long association with Cornell in 1905 as a special student in the College of Agriculture.

In 1908 he returned to his home farm near East Bloomfield, expecting to remain a farmer. Extension teaching from the College of Agriculture was gathering momentum at that time, and in 1909 he was invited to assist Charles Tuck, who in 1906 had been appointed to head the extension work. A small staff was carrying a heavy load in a period of rapid growth, but Instructor Wheeler found time and energy to complete his interrupted college work and took his Bachelor's degree in 1912. He was immediately appointed an Assistant Professor in the College of Agriculture. Full professorship came in 1917.

The functions of the old "Extension Department" in the College of Agriculture included courses in public speaking; the Reading Courses and the Nature Study program; publication of the Rural School Leaflets; distribution of experiment station bulletins, promotion and organization of Farmers' Institutes and Extension Schools; lectures and demonstrations; fair exhibits; and other activities that laid the groundwork for the development of the county extension work in agriculture and home economics. Professor Wheeler participated in all these activities. In 1908 he had been a member of the student committee that assisted in planning the first Farm and Home Week, which grew out of the college-sponsored "Experimenters' League." He continued to direct that annual event for the next thirty years, while it grew to nationally known stature.

During the period of Professor Wheeler's service to Cornell, the College of Agriculture grew from a small and not-too-highly regarded academic unit in the University to a position of pre-eminence both at home and abroad. In shaping the policies and molding the structure of the institution Professor Wheeler played a most important role.

During these earlier years of the University's work in agriculture and home economics, he earned the reputation among his colleagues for sound judgment, reasonable conservatism, and absolutely dependable integrity in safeguarding the expenditure of public funds. It was recognition of these qualities that resulted in Professor Wheeler's being appointed October 1, 1932, to the newly created position of assistant treasurer of the university

in charge of the finances of the New York State Colleges and Experiment Stations under the administration of Cornell University.

Professor Wheeler was admirably qualified for the added responsibilities given him. He had served in an administrative capacity in the Extension Service; he had seen all the buildings of the State Colleges erected with the exception of James Law Hall; he was personally acquainted with most, if not all, of the staff members of these institutions; and he was familiar with all the lands used by the State Colleges as well as experienced in the use of both state and federal appropriations and the restrictions on their use.

Although Professor Wheeler's original appointment of assistant treasurer covered only the balance of the fiscal year 1932-1933, he continued in that capacity until his retirement in 1951. During the nineteen years that he held the office, he was faced with many complex problems arising first from the Depression years, then from World War II, and later from the postwar period of expansion and adjustment. Under his supervision, there was established a central business office for all of the State Colleges, which by 1951 included thirty-one staff members and handled annual budgets in excess of thirteen million dollars.

Among the more outstanding accomplishments of those years of expansion in which Professor Wheeler had an active part was the creation of the new School of Industrial and Labor Relations, the establishment of a salary classification system, and the beginning of construction of the new Albert R. Mann Library.

For many years Professor Wheeler taught resident courses in public speaking and parliamentary law and procedure in the College of Agriculture. Because of his proficiency in those fields and his courteous and friendly personality, his services were in great demand for presiding at meetings and as judge or moderator of oratorical stages and debates. Many persons who had got themselves into a tough parliamentary tangle while presiding at a meeting were rescued when they saw Ralph Wheeler in the audience and asked him what to do next.

Professor Wheeler was a true public servant. His continuous ambition was to make sure that the taxpayers of New York State received full value for every dollar invested in resident teaching, research, and extension at the State Colleges and Experiment Stations under Cornell administration. The restriction of appropriations or emergency situations frequently forced him to turn down requests for the expenditure of funds. But when that happened, all concerned could be confident that the funds denied would be used for a more urgent need.

Professor Wheeler's sound judgment and his high professional and personal integrity won for him at Cornell, Albany, and Washington the respect and admiration of all with whom he worked. His interests in resident teaching,

research, and extension, and his desire to see all three equitably supported kept him above criticism, even by those whose proposed activities were restricted by allocation of funds that Professor Wheeler handled.

Professor Wheeler was a trustee of the Ithaca Savings Bank and for several years after he retired from Cornell served that bank as an active officer. He was a member of the Ithaca Rotary Club, Senior Citizens, Alpha Gamma Rho fraternity, and Forest Home Chapel; he was a charter member of the Cornell chapter of the honorary extension fraternity Epsilon Sigma Phi.

Ralph Wheeler was a friend and adviser to deans, students, professors, janitors, bankers, neighbors, farmers, clerks, and tradesmen—all were welcome at any time in his office or his home. His counsel on academic, business, and personal problems will be long remembered by all who were fortunate enough to receive it.

Death came to him on March 20, 1962, at 119 Forest Home Drive where he and Mrs. Wheeler, the former Jessie Elizabeth Hart, who predeceased him by several years, had made their home since he started work with the College of Agriculture.

He is survived by a daughter, Mrs. Richard C. Crosby of Birmingham, Alabama; two sons, Kenneth E., of Olean, New York, and Ralph, Jr., of Libya; two sisters, Mrs. Percy Pettit of Canandaigua and Mrs. Stanley Freeman of Rochester, New York; six grandchildren, and several nieces and nephews.

A. W. Gibson, Arthur H. Peterson, Van B. Hart

Herbert Hice Whetzel

September 5, 1877 — November 30, 1944

Herbert Hice Whetzel died on November 30, 1944, after 42 years of distinguished service in the University. In failing health for more than ten years, and especially throughout the last five years when his daily life was increasingly fraught with pain and discomfort, he carried on in good cheer and amazing fortitude until the end. With his death the University lost one of the most widely known and eminent members of its faculty.

Professor Whetzel was born on September 5, 1877 on a farm near Avilla, Indiana where he spent his boyhood. He was graduated from Wabash College in June, 1902. In college he did his major work in botany and zoology, coming under the influence of Professor M. B. Thomas, an inspiring and altogether remarkable teacher. He came to Cornell University immediately on graduation and entered the Graduate School that autumn. Holding an appointment for four years under another great botanist, Professor G. F. Atkinson, who was both Head of the Department of Botany (then in the College of Arts and Science) and Botanist of the Cornell University Agricultural Experiment Station, Professor Whetzel assisted with the Station work on plant diseases. In 1906, shortly before he expected to complete the requirements for the doctorate he was appointed Assistant Professor and Head of the Department of Botany in the newly organized New York State College of Agriculture. In 1907, at his urgent request, his title was changed to that of Assistant Professor of Plant Pathology. Thus he held the first Professorship of Plant Pathology in the United States. He was advanced to a full professorship in 1909 and continued as head of the department until 1922 when he resigned as head to devote full time to teaching and research.

Professor Whetzel was well qualified for the task of establishing phytopathology as a distinct branch of biological science and of building a department of plant pathology at Cornell. He was exceedingly active and possessed exceptional leadership. He was convinced of the necessity for, and the practicability of, plant disease control and lost no opportunity to impress this conviction not only on his students but also on growers and on industrial and business concerns connected with agriculture. His enthusiasm for his work and for every project which he sponsored was contagious. A large number of able young men fired by his enthusiasm have gone forth into positions of importance and responsibility.

Though definitely emphasizing the practical aspects of plant pathology Professor Whetzel maintained at all times a deep interest in the taxonomy of the fungi. He became interested in plants and animals while a boy on the farm and

made many collections of both, and of fossils as well. At the time of his death he possessed a herbarium which he had prepared while in high school, and treasured it highly. Wherever he traveled he collected fungi. The collection he began when he came to Ithaca became, through gift, the beginning of the departmental collection of fungi and diseased material, now consisting of some 26,000 specimens. Ever working for its betterment, the contribution made by Professor Whetzel to the building and maintenance of this valuable herbarium was very substantial.

A collecting trip to Puerto Rico in 1916, followed by two later trips, and a year in Bermuda in 1920-21 whence he returned with 500 specimens, marked the beginning of one of the largest collections of tropical American fungi in the world. Recent contributions have come particularly from a number of mycologists, mostly former students, in Puerto Rico, Brazil, Venezuela and Colombia, who have responded to the encouragement and enthusiasm of Professor Whetzel by collecting and sending him material. Even during his illness he continued to give time and effort to the identification of specimens and otherwise furthering these collections.

Professor Whetzel was an outstanding teacher and it is as such that he will doubtless be longest remembered. No phase of his work in the University interested him as much or profited more from his remarkable vigor. He could instill in students a considerable degree of his own abounding enthusiasm for the study of the fungi and plant diseases and their control. He had an intense interest in young people and gave much of his time and effort to helping them with their problems. He introduced several innovations in teaching procedures, was always refreshingly original with a bit of showmanship, saw problems through the eyes of the students, and was unusually successful in getting his students to assume responsibility and initiative. He contributed much to the organization of material and to the terminology used in courses in plant pathology in institutions throughout this country.

Although teaching was his principal interest, Professor Whetzel was productive in research. Early in his career he became interested in sclerotium-producing fungi, especially those in the genera *Botrytis* and *Sclerotinia*. Throughout the last thirty years of his life he worked on a monograph of genera of fungi in the family Sclerotiniaceae, publishing a number of important papers. Perhaps his most important contribution to this monographic work was the organization of the study based on his extensive collections and cultures, and the encouragement of active interest on the part of graduate students whose work he guided.

Professor Whetzel's non-professional life was simple, with gardening a hobby that he skillfully furthered with much of the same drive that he put into his vocational activities. How varied his interests were was manifest in his garden where one could find fruits, shrubs, vegetables and flowers; native wild plants and horticultural creations rarely found; plants, carefully maintained, that were prized because they carried the symptoms of some interesting

disease; an exceptionally fine collection of sedums; and a rock garden that received much of his attention in recent years. Arrangement was simple and was secondary to the plants themselves.

Professor Whetzel was a man of action, in a positive, constructive manner. He often ignored obstacles and disregarded conventions— and seemed to get satisfaction out of so doing. He quickly grasped the substance of an issue and reached decisions rapidly. He was impatient with delay and mediocrity but at the same time was generous and fair in his appraisal of men and motives. Those who were associated with him in one way or another, will remember him for his intense enthusiasm for whatever came to occupy his attention; for his amazing drive in furthering his purposes; and for his general optimism and progressiveness. A pioneer in agricultural science and teaching, he exercised a substantial and sound influence at a time when the future of practices, ideals and objectives was being shaped. His contribution to the development of plant pathology and mycology in this country was notable; all workers in the field of biological science are indebted to him.

Stephen Emerson Whicher

June 16, 1915 — November 13, 1961

Stephen Emerson Whicher, Professor of English at Cornell, died at his home on November 13, 1961.

Professor Whicher was born June 16, 1915, the son of parents distinguished in the profession, the late Professor George Frisbie Whicher of Amherst College and Professor Harriet Fox Whicher of Mount Holyoke College. He attended Amherst High School and Exeter Academy and was awarded his Bachelor's degree *summa cum laude* from Amherst College (1936), after earning some dozen prizes for scholarship, public speaking, and work in English and classics. He received a Master's degree in philosophy at Columbia University (1937) and the Ph.D. in English at Harvard University (1942). While a graduate student at Harvard, he won two prizes, including the Bowdoin prize, for chapters from his thesis on Ralph Waldo Emerson. He married Elizabeth Trickey of Boston, Massachusetts, in 1940; the couple had four children, Wendy, Nancy, Stephen, and John.

During the war, 1943-1946, he served in the U.S. Navy as Ensign and Lieutenant (j.g.) and was stationed in the Pacific as a night fighter director. He earned combat stars at Iwo Jima and Tokyo in 1945.

Professor Whicher had a broad and varied academic experience before coming to Cornell in 1957. He had been a teaching fellow at Harvard (1938-1942), an instructor at the University of Rochester (1942-1943) and at Harvard (1946), and a member of the English Department at Swarthmore (Assistant Professor, 1947-1952; Associate Professor, 1952-1957). He had also taught summers at Pennsylvania State University (1948) and New York University (1954-1955). A specialist in American literature, he was also interested in modern drama, and had read widely in Latin, Greek, French, German, Norwegian, Danish, and Swedish literature. He had held a Rockefeller Post-War Fellowship, 1946-1947; a Ford Fellowship, 1952-1953; and two Fulbright lectureships—in Norway, 1952-1953, and Sweden, 1955-1956. He was on the board of editors of the periodicals *Studies in Romanticism* and *American Literature*. In 1961 he was honored by his alma mater with the degree of Doctor of Humane Letters.

His principal publications were important ones. *Freedom and Fate: an Inner Life of Ralph Waldo Emerson* (1953) is generally recognized to be the most illuminating of commentaries on Emerson's thought. "Emerson's Tragic Sense" (*American Scholar*, 1953) is definitive. The critical introductions in *Twelve American Poets* (co-edited with Lars Ahnebrink for Swedish readers, but recently reprinted in the United States for American students) transcend the limits of routine anthologies to make an independent contribution to the appreciation of American poetry; and his edition of selections from Emerson (intended as a classroom text) is a model of creative editing which

broadens our understanding of Emerson both as man and as man of letters. “Whitman’s Awakening to Death” (*Studies in Romanticism*, 1961) is a superbly perceptive reading of “Out of the Cradle Endlessly Rocking.” The series of *Early Lectures of Ralph Waldo Emerson*, co-edited with Professor Robert E. Spiller, was to be, as the first volume demonstrated in 1959, an edition no less readable than it was authoritative and critical.

Professor Whicher was not only outstanding in print; he was what Emerson might properly have named Man Teaching, a combination of “the scholar” and what Emerson called “character,” “a reserved force, which acts directly by presence and without means.” Colleagues responded to him with respect and affection. Students found in him a model of intellectual and moral integrity, and were led by him to find in themselves capacities for work and original thought they had not known before. They remembered as characteristic his saying, “The purpose of a literature course is not to cover, but to uncover.”

Professor Whicher died just as he was coming into the full mead of scholarly recognition and honors. During the last months of his life, however, he was increasingly troubled about the crisis confronted by mankind. Indifference by others bespoke human failure; concern too often revealed merely helplessness. Yet for Professor Whicher the failure was not a personal one, but generally human. He was aware, as he himself wrote, how necessary it is for the individual in America to “break decisively with the whole extremist Emersonian pattern and find some means to face this world without either transcendence or despair.”

R. H. Elias, W. R. Keast, M. H. Abrams

Andrew D. White

— *Nov. 4, 1918*

The following resolutions on the death of Ex-President White were prepared by a committee consisting of President Schurman, chairman, Professors Burr, Bennett, and Hammond, and although not read to the Faculty, they were approved for purpose of record:

Ripe in years and in honors, at his home on our Campus on the eve of his eighty-sixth birthday, President White quietly entered into rest. A half-century has passed since first on that Campus the Faculty of Cornell gathered about its young President; a third of a century since he laid the presidency down. Of the original Faculty not one is still in active service; of those who during his presidency joined the teaching corps there are left in it but one or two. But what he has meant to Cornell is known to us all. The University was his thought. Her fundamental documents—the charter, the plan of organization, the earliest announcements—were mainly or wholly his work. Whatever the share of others in her material foundation or in broadening the scope of her beneficence, it was he who planned her curriculum, chose her teachers, shaped her educational policies. To him she owes her breadth, her democracy, her guarantees of intellectual freedom. From his own purse he eked out her resources, enriched her library, added grace and color to her sober beginnings. All our life here has breathed the atmosphere of his thought, of his taste, and in his own person he has been to us the embodiment and interpretation of Cornell.

But Dr. White has been to us much more than a reminder of the past. Though he refused an honorary presidency, and consented to act only as a Trustee, his place in our academic life has been unique. His exceptional relation to the university, his catholic hospitality, his interest in everything and everybody pertaining to Cornell, have opened the door to acquaintance. His home, overrunning with books, abounding in art, rich with the treasure-trove of wide and life-long travel, has remained a center and inspiration to our social life. There, in his study or about his table, we have come into touch with the broader world of men and affairs; and, with his every return from the high public duties to which he has been called, he has brought back to us a riper experience, a wider acquaintance, a fresh wealth of books and of beauty. Best of all, he has brought to us himself—his charm of manner, his quiet refinement, his breadth of information, his vast store of anecdote, his zest and alertness of interest in all things human, his wide sweet outlook over men and things, his kindliness of judgment, his wise and gentle courtesy, his loftiness of soul. Few men like him have known how to be rich without waste or ostentation, learned without eruditeness, dignified without arrogance, fastidious without censoriousness, democratic without a trace of vulgarity, cosmopolitan without loss of patriotism or public spirit.

To our students, as to us, he has been an exemplar. If less than we they heard his voice or shared his acquaintance, they have read to pieces his books, memorized his public addresses, lived again under the guidance of his writings the vicissitudes of early Cornell; and this liberalizing, emancipating influence has been quickened and deepened by their glimpses of the revered figure so long a center for our loyalties.

He is gone; and with his going there ends for us an era. No record can replace that living presence. But his memory will be to us a perpetual benediction.

Retired: June, 1885. Fac. Rec. B. pps. 112, ...

Edward Albert White

May 23, 1872 — May 13, 1943

Edward Albert White, Professor of Floriculture, Emeritus, Head of the Department of Floriculture and Ornamental Horticulture from the time of its inception, died on May 13, 1943. He was born at West Townsend, Massachusetts, on May 23, 1872, of New England ancestry and was educated in the public schools of his native village. When ready for his higher education he chose to attend the Massachusetts Agricultural College. His training there was in botany and allied sciences and during his college career he acquired an extraordinary love for ornamental plants and an appreciation of their place in human enjoyment. He had a highly developed sense of the beauty of plants which expressed itself in his work in flower arrangement, an art in which he later became nationally known.

The positions which Professor White held during his career were numerous and important. He was assistant horticulturist at the Massachusetts Agricultural College from 1895 to 1897 and horticulturist at the Baron de Hirsch School, Woodbine, New Jersey, from 1897 to 1899. He served as assistant professor of horticulture at the Agricultural and Mechanical College of Texas from 1899 to 1902; and as professor of botany, forestry, and landscape gardening at the Connecticut Agricultural College from 1902 to 1907. In 1907 he was called back to his alma mater to organize there a department of floriculture. This was the first department of its kind in the United States and its successful development won him international recognition.

On July 1, 1913, Professor White accepted the invitation given him by Dean Liberty Hyde Bailey to organize a department of floriculture at Cornell University and he remained as head of that department until his retirement on June 30, 1939. During these twenty-six years the department grew extensively under his direction and is now recognized as the outstanding organization of its kind in the United States. The work in plant materials previously organized in the Department of Landscape Art was added to the floricultural work in 1922 and the name of the department was then changed to Floriculture and Ornamental Horticulture.

The study of orchids was Professor White's particular interest and while head of the department he traveled in Central and South America to study and collect these plants. After retirement he continued his work with unabated interest, visiting India and Burma and many of the islands of the Pacific to study orchids growing under natural conditions.

Professor White was the author of many bulletins and magazine articles valued in scientific, commercial, or amateur circles. He published several books which were well received: *American Orchid Culture*, *The Florist*

Business, Principles of Floriculture, Chrysanthemum Culture, and Principles of Flower Arrangement, the first of these was brought out in a beautiful revised edition after Professor White returned from his trip to the South Pacific.

Students trained under Professor White are scattered throughout the world in professional and commercial work. With but few exceptions the work in floriculture at other colleges in the United States is being carried on by men trained by him or in his department. This is a most unusual record.

Professor White was very active in many of the commercial and amateur organizations in the field of floriculture as well as in college teaching and research. He served as secretary of the American Rose Society, was chairman of the Committee on Horticultural Education of the Society of American Florists and Ornamental Horticulturists, and secretary of the Federation of Horticultural Societies of New York State. The recognition and support received by the Department at Cornell University was due in no small part to his helpful contact with commercial interests.

Recognized as an authority on orchids, Professor White was called upon to address many organizations in the United States and in 1939 he gave a series of lectures at the University of Hawaii. He was a member of the American Association for the Advancement of Science, the Royal Horticultural Society, and honorary member of the New York Florists' Club, the American Rose Society, and the American Orchid Society. He was a member of Kappa Sigma, of the honorary society Phi Kappa Phi, and the first member of the Alpha Chapter of the honorary floricultural society, Pi Alpha Xi. In 1938 the Massachusetts Horticultural Society awarded him its gold medal for outstanding achievement as a teacher, and the silver medal of the New York State Federation of Garden Clubs for achievement as a teacher and writer was presented to him in 1939.

A kindly, considerate, and unassuming man, Professor White valued above all the friendship and esteem of his associates and acquaintances. He was a tremendous force in the floricultural education of his day and a man who will be long and kindly remembered by those privileged to know him.

Professor White is survived by three children, Emerson Edward, Kendall Crittenden, and Barbara Crittenden. Mrs. White, formerly Cora Crittenden of Tyringham, Massachusetts, died on May 16, 1938.

Richard N. White

December 21, 1933 — October 3, 2009

Richard “Dick” N. White, the James A. Friend Family Distinguished Professor of Engineering Emeritus of the School of Civil and Environmental Engineering (CEE), died at the age of 75. He was born in Chetek, Wisconsin and grew up on several different dairy farms in Wisconsin. His father alternated farm ownership with operation of a small contracting firm. Work on the farms, helping his father in construction, and his classroom interests made civil engineering his clear choice while still in high school.

Dick pursued his civil engineering education at the University of Wisconsin, Madison, earning a B.S. in 1956 and an M.S. in 1957. He and his wife, Margaret “Marge” C. Howell, met while they were undergraduates and were married in December 1957. After 6-months of active duty in the U.S. Army Corps of Engineers, he returned to Madison to work as a structural designer for a firm of consulting engineers. He continued this work part time when he re-enrolled at UW-Madison for study leading to his Ph.D. in structures, awarded in 1961. While still a graduate student, he began to develop his famously effective teaching skills by serving as an Instructor with full responsibility for several undergraduate courses.

He joined the CEE faculty in 1961 and rapidly developed a versatile research program to complement his teaching of undergraduate and graduate courses. Although his research interests spanned all the traditional areas of structural engineering – experimental, analytical and computer approaches to concrete, steel and timber structures – he held a special love for topics in concrete and for structural model studies. In support of the last, he led the creation and use of a structural models lab for both instruction and research that was one of the finest in the nation. Among his many publications, he was the senior author (with faculty colleagues Peter Gergely and Robert Sexsmith) of a remarkably successful set of textbooks, *Structural Engineering*, a three-volume series that integrated aspects of mechanics, analysis, behavior, materials and design – and also disseminated widely the essence of the Cornell CEE undergraduate curriculum in structures.

Among his numerous appointments and positions at Cornell, he most notably served as Director of the School of Civil and Environmental Engineering (1978-84). Among his proudest accomplishments as Director was the fundraising, planning, construction and dedication for a 5,000-sq.ft. addition to Hollister Hall to house the Joseph H. DeFrees Hydraulics Laboratory. He served the College as Associate Dean for Undergraduate Programs (1987-90), and he was named the James A. Friend Family Distinguished Professor of Engineering in 1988. Dick retired

from Cornell in 1999 but remained active in the School until illness overtook him in 2005. Thanks to the financial support of alumni and friends, the Richard N. White Instructional Laboratory was dedicated in 2004 within the newly refurbished Bovay Laboratory Complex of CEE. Posthumously, a fund drive has been launched to endow the continued maintenance and upgrading of this lab as well as the other instructional labs in the School of CEE.

Throughout his 39 years at Cornell, Dick also maintained a part-time consulting practice for dozens of clients, including leading companies, national laboratories, government agencies, publishers and universities. This consulting involved structural analysis, design and development work; structural investigations, reviews and evaluations; structural research and development oversight; preparation of design aids; and editorial development work.

During the course of his career, he received two teaching awards from Cornell's College of Engineering (1965 and 1996), three "Professor of the Year" honors from the Cornell chapter of the civil engineering honorary society Chi Epsilon (1972, 1987 and 1996), the University of Wisconsin Distinguished Service Citation (1993), and the Collingwood Prize of the American Society of Civil Engineers (ASCE) in 1967. He was elected to the National Academy of Engineers in 1992 and was also named an Honorary Member of the ASCE in 2001.

An American Concrete Institute (ACI) member since the late 1950s, Dick was elected ACI Vice President in 1995, served as ACI President from 1997 to 1998, and was Chair of the Standards Board from 2002 to 2005. He was a member of the Technical Activities Committee for 8 years and served as its Chair from 1991 to 1994. He also served a 3-year term on the ACI Board of Direction. White was a member of numerous ACI committees; and he was the first Chair of ACI Committees 335: Composite and Hybrid Structures, and 444: Experimental Analysis for Concrete Structures. White received the ACI Joe W. Kelly Award in 1992 and was the co-recipient of the ACI Wason Medal for Most Meritorious Paper and the ACI Structural Research Award in 1993 and 1994, respectively. He was named an ACI Fellow in 1974 and was elevated to ACI Honorary Membership in 2006.

During his sabbatical leaves from Cornell, he was a staff associate at Gulf General Atomic (1967-1968) and a visiting professor at the University of California at Berkeley (1974-75), the University of Puerto Rico at Mayaguez (1982), Southwestern Jiaotong University in China (1982), and Durham University in England (1990).

Through his mentoring of many international graduate students and his duties as ACI President, he was able to enjoy travel to a great many places in the world: Egypt, Saudi Arabia, the United Arab Emirates, Qatar, Puerto Rico, Costa Rica, Colombia, Chile and Brazil, to name a few. He also lectured in many places, including an

extended stint in China in the early 1980s that included Beijing, Hong Kong, Shanghai, Wuhan, Xian, and Chendu. Of course, he always carried his favorite camera, recording his trips, the scenery, the people, the foods, and life wherever he was.

Photography was a major pastime for Dick. He enjoyed taking pictures of people, birds, animals, flowers, and all the things around him. He later entered many photographic exhibitions, and had numerous one-man shows of his various works, both locally in Ithaca and a major show in eastern Massachusetts. He also recorded the growing years of his daughter, Barbara, and son, David.

Dick was very proud of his years at Cornell University and of the colleagues and students who were an integral part of his career and life. He enjoyed his many friends and neighbors through his Ithaca years, as well as his beloved schnauzers. He is survived by his wife, Marge, one daughter and one son and their spouses, a sister, and several grandchildren, nieces and nephews.

Dick's personal and professional accomplishments were outstanding as shown, in part, by the array of distinguished awards and recognitions that were presented to him throughout his career. But in addition, we would be remiss if we did not acknowledge the statesmanlike and humane role he performed as a distinguished member of the Cornell University Faculty – a role that infused and yet transcended his specific area of research and which demonstrated his personal warmth, knowledge, compassion and commitment to students, staff and faculty in Civil and Environmental Engineering and in every aspect of the University in which he participated. Dick was uniformly admired and respected and will be long remembered for the many roles he fulfilled as a Cornell faculty member.

John Abel, Chair; Kenneth Hover, Walter Lynn, William McGuire, Arnim Meyburg

Horace Eugene Whiteside

June 5, 1891 — June 9, 1956

In the closing days of the academic year, the long teaching career of Horace Eugene Whiteside, J. DuPratt White Professor of Law in the Cornell Law School, came to an end with his death June 9, 1956, four days after his 65th birthday. His association with the Law School began in the fall of 1919 when he enrolled as a student. He became a member of the Law Faculty in 1922 and had thus completed 34 years of eminent teaching in the Law School.

The fall term of 1955-'56 he spent on sabbatic leave in Jamaica, British West Indies. Although seriously ill when he returned for the spring term, he insisted on giving his courses in Trusts and Future Interests. By gallant and super-human effort he continued to meet his classes to within a month of his death. In his passing the Law School lost one of the great teachers of law.

Direct descendant of John Morton a signer of the Declaration of Independence, Horace Whiteside was born June 5, 1891 on a farm near the village of Bell Buckle in Eastern Tennessee, the youngest of seven children. All of the family had a veritable passion for higher education. Fortunately, there was then developing in the village the Webb School, founded and taught in part by two Webb brothers, whose graduates were thoroughly trained in the classics. In contrast to our modern educational institutions, the buildings and equipment were simple, almost primitive, but no expense was spared in assembling good teachers and a strong library. "The books cost more than all the buildings combined", say members of the family. Here were taught with inspiration the great truths of the scriptures and the best in ancient and modern literature. The atmosphere of the school inculcated the American ideal that hard work and character were the keys to success, which became his fundamental philosophy.

He entered the University of Chicago without examinations, having received a scholarship in Latin, and because of his excellent preparation was able to maintain a very good record and at the same time play varsity football. There he became an outstanding guard on famous football teams coached by Amos Alonzo Stagg, whom he always considered one of his great teachers.

Upon graduating from the University of Chicago in 1912, he successfully taught and coached at the East Waterloo, Iowa, High School for two years, advancing to athletic director and instructor of Greek at Earlham College. Then came World War I when he went overseas as Captain in the 67th Artillery, Coast Artillery Corps, later attaining the rank of Major.

Returning from the war, he entered the Cornell Law School. While pursuing his law course he coached intramural athletics and freshman basketball at Cornell. In spite of this, he graduated from the law school with a higher than straight A average, by reason of several double 'A's—an achievement still unequalled. He was elected Book Review Editor of the *Cornell Law Quarterly* and his editorial notes are models. During the year 1926-1927 he was Ezra Ripley Thayer Teaching Fellow at Harvard Law School where he received the degree of Doctor of Juridical Science.

Brilliant and effective teacher, he was nonetheless a strong advocate of the value of active professional practice in law teaching. Therefore, he became associated in 1939 on a part time basis with the Wall Street law firm of Whitman, Ransom, Coulson and Goetz. This led to his participation in the reorganization of the Western Pacific Railway Corporation and in the leading case of *Ecker v. Western Pacific Railroad Corporation*, 318 U.S. 448 (1943), which did much to settle the relative powers of the Interstate Commerce Commission and the courts with respect to railroad reorganizations. After 1951, however, he limited his outside practice to consultant in the law of Trusts, Wills and Estates.

His classical background made Professor Whiteside a perfectionist in his professional work and in his teaching, yet he possessed the rare trait of not being intolerant with those less ably blessed; he taught the whole class, not merely the top ten percent. Often would he remark on the value of the middle-of-the-class student who not infrequently developed into a fine lawyer, making a distinct contribution to his community and to the reputation of the law school. For the student who was really trying he possessed a patience and gentleness in class which might not have been suspected of one with his great physique and mental power. This deep sense of compassion endeared him to his students.

Indeed, his abiding interest in his students was evidenced not only in the attention which he gave to them in Myron Taylor Hall, but by the fact that groups of law students often came to his home for round-table discussions. The loyalty, affection and respect of his students was made manifest by returning alumni of the Law School. Through the years, eminent lawyers and members of the Judiciary, as well as many of lesser distinction, visited his home to enjoy the hospitality that was extended and to profit from words of wisdom of their former teacher or the friend learned in the law.

Among his colleagues he won both admiration and affection. He was generous in shifting courses or in taking on extra work to help a fellow teacher in time of illness or for a sabbatic leave. On one occasion he gave up a field of law in the curriculum to which he had a legitimate claim so that a colleague who had a unique opportunity in that field might take advantage of it to the benefit of the law school.

His writings brought recognition to the Cornell Law School as well as to himself. He edited *Huffcut's Cases on Agency* (3rd Ed. 1926) and *Kales' Cases on Future Interests* (2nd Ed. 1936). Several of his monograph studies for the New York State Law Revision Commission won wide acclaim. He also prepared the New York Annotations to the American Law Institute's Restate-prepared the New York Annotations to the American Law Institute's Reinstatement of the Law of Contracts. In the fields of Trusts and Estates his writings were also outstanding, culminating in his becoming one of the contributing authors on those subjects to the recent American Law of Property Series.

Professor Whiteside is survived by his widow, Mrs. Ruth Kinyon Whiteside to whom he was married in 1951, and by a daughter of a former marriage, Mrs. Ann W. Wynd of Kenmore, N. Y. His first wife, Mrs. Esther Vesey Whiteside, and a son, Horace, Jr., died in 1950 and 1954 respectively.

Lewis Knudson, J. W. MacDonald, G. J. Thompson

Frederick Whiting

February 4, 1861 — March 12, 1946

Dr. Frederick Whiting was born on February 4, 1861 in Brooklyn, New York, the son of Murray Whiting and Mary Elizabeth Ferris Whiting. He was a descendant of William Whiting, the first treasurer of the Colony in Connecticut (1634) and Nathaniel Whiting, Colonel in the British Army at the siege of Louisberg.

Dr. Whiting received an A. B. degree in 1882 and an M. A. degree in 1885 from Amherst College. He studied medicine at the Long Island College Hospital and graduated in 1885. Following an internship at the New York Eye and Ear Infirmary, he pursued post graduate studies at Heidelberg and at the University of Vienna from 1888 to 1890 with the view of filling the position of pathologist at the New York Eye and Ear Infirmary. However, upon his return to the United States, he became associated with Dr. Gorham Bacon in Otology and began private practice of this specialty at that time. His association with the New York Eye and Ear Infirmary continued through 1927.

Dr. Whiting practiced inconspicuously until he undertook the care of a case of lateral sinus thrombosis, the mortality rate of which was then very high. In collaboration with Dr. Gibson, he worked out a new method of dealing with this serious condition and thereby made a notable contribution to surgery. His success in accomplishing a surgical cure for lateral sinus thrombosis accorded Dr. Whiting great prominence as an aural surgeon. In 1904, Dr. Whiting was appointed Professor of Clinical Surgery in Otology at Cornell University and continued active until 1928 when he was appointed Emeritus Professor. Between the years 1907 and 1920, Dr. Whiting was associated with the New York Polyclinic and Mt. Sinai Hospitals and for a time served as Director of the New York Eye and Ear Infirmary. He was a Fellow of the American College of Surgeons and a member of the American Otological Society, the New York Otological Society and the New York Academy of Medicine. Dr. Whiting was a member of numerous clubs, among others the New York Athletic Club, Clove Valley Rod and Gun Club, the Century Association and the Society of Cincinnati in the State of Connecticut. He was a collector of paintings of American artists, medallion art and porcelains.

In 1905, Dr. Whiting published his book, "Modern Mastoid Operation." He also contributed many articles on Otology to medical literature.

As a surgeon Dr. Whiting was distinguished particularly for his painstaking thoroughness rather than his brilliance. His mastoidectomies were performed so completely that rarely did his patients have any recurrence of infection. This same characteristic was evidenced in his writings and he once told an associate that he had spent two weeks

on a single paragraph. The illustrations in his book on mastoid surgery still stand out as the best illustrations existing in this particular field.

Dr. Whiting's character was exceptional. He despised all petty politics in medicine and showed a friendly helpfulness to those who were associated with him. He believed in advancing his associates according to their merits alone.

Dr. Whiting's great interest in the Department of Otology at Cornell University Medical College continued up to the time of his death. He gave two prizes each year for the two students of the graduating class making the best records in Otology. He also donated a very valuable collection of instruments and specimens to the Medical College.

Dr. Whiting died of cerebral hemorrhage at the age of 85, on March 12, 1946.

Dr. Arthur Palmer

John Hendrick Whitlock

September 10, 1913 — May 22, 1994

John Whitlock served the Veterinary College for fifty years (1944-94) in the role of parasitologist extraordinaire. He liked to quote Asa Chandler who compared a parasitologist to an orchid. “He requires long and careful nurturing, he develops slowly, and he is himself a parasite in that he is dependent on many other sciences for material aid. But when he comes to flower, he is a rare and beautiful object, scientifically speaking, and is usually slow in going to seed. He may not always smell like an orchid, but that might be a blessing in some circles/7

He also served the University as a Faculty Trustee (1971-76), a role of which he was very proud. He declared that the Board had treated both the University and himself with kindness and wisdom and upon his retirement, made over to the Board the choicest of his collection of verbal brickbats “The Academic Cynic’s Anthology”. One of his personal favorites came from Burns’, ‘To a Louse’.

Oh wad some Powr the giftie gie us To see oursels as others see us! It wad frae monie a blunder free us, An’ foolish notion:”

Laudable as this plea might be, it does present a grave temptation to the chroniclers of this complex and, by design, controversial genius.

John Whitlock received a D.V.M. degree from Iowa State University in 1934 and a Master of Science degree in Zoology from Kansas State University in 1935. His dual interests in the relative confines of veterinary medicine and the broad vistas of zoology characterized his academic life where his many writings (over a hundred journal articles and at least three textbooks) covered topics as narrow as “The administration of phenothiazine to sheep” and as expansive as “Parasitology, ecology and biometry” contained in four pages of the *British Veterinary Journal!* Throughout his career, he was unconcerned about fashion in science and pursued with equal vigor diverse topics which interested him, ‘Inherited eye defects in the guinea pig,’ “Feeder lamb loss in Genesee County”. He studiously committed to paper facts which he felt would be of value to other disciplines. His notation on new uses for oesophageal intubation for baby lambs (1954) was “rediscovered” in the 1970s and has become the universal method of administering emergency treatment to hypothermic lambs.

John Whitlock was a scientific prophet well before his time and he thoroughly enjoyed relating his works to homely origins. Thus his early (1958) study on the inheritance of resistance to trichostrongyloidosis in sheep was based on observations made in Ellis Hollow and involved a ram named, characteristically, “Violet”. This too was a landmark study in genetic resistance to intestinal worms.

Throughout it all, he enjoyed the company of distinguished scientists. He shared his parasitological studies with J.R. Georgi, J.V. Evans, L.Z. Saunders, P. Kennedy, S.J. Roberts, H.D. Crofton, J.O. Slocombe and his biometric calculations with M.R. Lynn, L.H. Ratcliffe, H.M. Taylor, W.T. Federer and D.S. Robson—he even diverted some of his efforts into those lesser parasites, the bacteria, in a paper with Julius Fabricant on the use of *Clostridium welchii* anaeroculture for the prevention of overeating disease in sheep. Given the catholic nature of his interests and published works, it is hardly surprising that one of John's later papers (1978) reflected his own career and interests "How to Live and Die with Ecologists".

In the Veterinary College of the times where teaching was didactic, authoritative and highly structured, John's instructional efforts were unorthodox, unusual and sometimes rambling. In lectures, he was somewhat less than organized in his approach and expansive in his content—none of your "Give us the facts, diagnosis and treatment", but rather a sporadic and ecological approach to the world of parasitism and certainly not confined to domesticated animals. Students in the practicum had their questions answered with a question in rebuttal. While generations of students flinched under this unusual tack, the Class of '53 invited John Whitlock to address their 25th class reunion as the professor who, in their experience, had taken an unusual and expansive ecological approach to the world of veterinary parasitology.

There was a cultivated Jekyll and Hyde aspect to John Whitlock's life—from humble beginnings on the Canadian prairie to Cornell Trustee. John kept his origins to himself and quietly enjoyed the contrast. In his extracurricular roles, he was an autocratic, outspoken Speaker of the University Assembly declaring that "the American University is a prototypic, organized anarchy where decision-making is a random activity". As a leader in the restructuring of Cornell to include a greater measure of student input, John was fond of quoting the *New York Times*, "Restructuring the self-governance of the University achieves, the same order of stewardship as the rearrangement of deck chairs on the Titanic".

In contrast, John Whitlock was a quiet and private supporter of many of the evolving and not necessarily popular movements of his time; student governance; women's rights and access of minorities to higher education. He declared during the troubles of the sixties "There is a weird modern idea that the University has somehow escaped standing in loco parentis to the students." He never subscribed to this "weird modern idea" and quietly pressed for many issues advantageous to our students; better nutrition, access to athletic facilities and better commonroom facilities. Most importantly, perhaps, he championed individual students whom he perceived were at a temporary disadvantage in our academic community. His support was not limited to well-intentioned advice but best

estimates suggest that a score of now veterinarians received from him financial support in time of dire need. This allowed them to finish on time and in good order. It is not surprising that his tangible legacy to the University is The Cornell Women in Science Fund to provide financial assistance to help women students improve the quality of their lives while at Cornell.

During his student days, John was an active thespian and a devotee of classical music. He was a competent double bass player and performed in the Cornell Symphony under Karel Husa. Later in life he was an ardent fisher and power boat captain. He was supported in it all by Pauline, his wife, and they reared two successful sons, Ward and John, in a rambling old house, formerly an inn, across the Ellis Hollow valley from his self-designed sheep barns. John was one of the founders of the Ellis Hollow Community Center, and supervised the rehabilitation of the old school house at the corner of Ellis Hollow and Turkey Hill Roads, the first home of the Center. For years he was the stentorian auctioneer at the Ellis Hollow Country Fair. John and Pauline liked big cars. They acquired President Day's used Lincoln Continental, which John proudly parked behind the postmortem room of Moore Lab. The Lincoln suffered a large dent when an ailing horse staggered over and fell on the prized car, much to the amusement of envious colleagues.

Following his retirement, Dr. Whitlock continued to bring his beagle, //Pelly,,/ to the Small Animal Clinic for weekly baths and routine health care. Receptionists and technicians became his friends and he enjoyed immensely meeting veterinary students and was moved by their attentive interactions with him. He told and retold familiar stories about his life in the profession, his favorites being hoary Cornell veterinary chestnuts. Often he shared candy with his listeners and he would leave, Pelly on lead, with a promise to revisit next week.

John Whitlock strolled through life, nattily dressed, possessed of a keen mind and a fine sense of humor. Mostly he chose to be outrageous rather than ordinary. He enjoyed wrestling with the large and small issues of ecology and university governance and left notable contributions thereto. A self-styled "academic cynic" he was, in fact a bellicose romantic engaged in a life-long courtship of Cornell and its contents. He had a notable weakness for the underdog and provided intangible and tangible support for same, an aspect of his life which he carefully downplayed but which will be a major legacy. He walked with intellectual kings and enjoyed the jaunt. His oldest friend and mentor at Cornell, a man of sparse words summarized it all. "John was smart and had some wild ideas." A worthy definition and epitaph for any academic. John Whitlock was indeed smart and many of his original ideas and ideals have already come to fruition.

Dwight D. Bowman, William E. Hornbuckle, S. Gordon Campbell

Robert H. Whittaker

December 21, 1920 — October 20, 1980

Robert H. Whittaker was recruited to Cornell in 1968. He had already gained a position of prestige for his landmark studies in plant ecology, and the newly formed Division of Biological Sciences hoped to use his leadership to shape its Section of Ecology and Systematics. His influence pervaded faculty recruitment and the shaping of several academic programs at Cornell. His vigorous research program served as an example for his colleagues and attracted superior students and numerous distinguished visitors to Cornell, helping to build the ecology program into the strongest in the world. This program and the careers of its faculty and students remain a principal legacy of this man.

Bob was born in Wichita, Kansas. Following graduation from Washburn Municipal University in 1942, he joined the Army Air Corps. At the end of World War II he resumed his education at the University of Illinois. His interest in insect communities led him to the Smoky Mountains of Tennessee, but he quickly realized that plants would provide a better test of his theories of community structure. While he retained an active interest in insects throughout his life, his doctoral research converted him to a career in botany. He obtained his Doctor of Philosophy degree in zoology in 1948 and took a position at Washington State College at Pullman. At the nearby Hanford Laboratories in Richland, Washington, he conducted pioneering studies of model ecosystems using radioisotopic tracers. He moved to Brooklyn College in 1954, and in 1966 to the newly created University of California at Irvine.

Bob was actively involved with a number of professional organizations. He served as editor for *Ecology*, *Vegetatio*, and *Paleobiology* as well as consultant for the National Science Foundation. He was elected vice president of the Ecological Society of America (1971) and was president of the American Society of Naturalists at the time of his death. In 1966 he was presented the Mercer Award for the most outstanding publication in ecology of that year; the award was for a paper on the vegetation of the Santa Catalina Mountains in Arizona. He was elected to the National Academy of Sciences in 1975, to the American Academy of Arts and Sciences in 1979, and was an honorary member of the British Ecological Society and of the Swedish Phytogeographical Society.

Bob Whittaker was recognized as an intellectual leader in ecology on an international scale and as the world's foremost authority on plant communities. His numerous studies on vegetation of the United States and several other countries led to major technical and conceptual advances in his field, and were the starting points for uncountable works by other scientists. But in addition to his contributions to basic science, he was also capable

of broad synthesis. He produced benchmark publications in diverse areas of biology, ranging from community ordination to niche theory to chemical ecology to phylogeny. His talents in research transferred admirably to his teaching. He was widely noted for his profound erudition and scholarship, and for the new insights he could provide. He was a master of the English language, serving up his ideas on a fully adorned platter of well-crafted sentences and memorable metaphors.

Although he earned distinction as a scientist, Bob will be most remembered by his friends and colleagues for his strength of character. He took special interest in young scientists. No one on the faculty of Ecology and Systematics took more of a personal interest in the welfare of the graduate students, and his devotion to them began before their arrival at Cornell. Despite his busy life, he always had time to discuss a problem, scientific or personal, and obviously relished his interactions with younger colleagues and students. He was particularly attentive to the plight of oppressed and underprivileged scientists in other countries, answering inquiries from individuals from underdeveloped countries and from behind the Iron Curtain with extreme courtesy and almost paternal interest. He gave freely of his energies as a protector and teacher, and had friends throughout the world because of it. The scientific community will surely miss Bob Whittaker's intellect; but a loss of no less magnitude was his warmth and humanity, which was not well disguised beneath his formal exterior.

Simon A. Levin, Gene E. Likens, Brian F. Chabot

William Foote Whyte

June 27, 1914 — July 16, 2000

William Foote Whyte began his academic career at Swarthmore College. After graduating in 1936, he went on to four years at Harvard as a member of the Society of Fellows, followed by three years at the University of Chicago where he received a Ph.D. in Sociology with a minor in Social Anthropology. With that degree in hand, Bill went to the University of Oklahoma where in one year he was both Assistant Professor of Sociology and Acting Chairman of the Department of Anthropology. He returned to Chicago as Assistant and then Associate Professor of Sociology. This appointment lasted from 1944-48, when Bill accepted an offer to teach at the then three-year old New York State School of Industrial and Labor Relations (ILR) at Cornell.

The appointment at ILR gave Bill a chance to teach and research in the field then called “human relations,” but throughout his career, he continued to write and edit in sociology and anthropology. Bill often remarked that in the early days, the distances between the disciplines were not nearly so clear. He vacillated between sociology and anthropology but always felt comfortable in both camps. It is indicative of both his scholarship and his dedication to ideas rather than camps that during his life, he was elected to and served as President of the Industrial Relations Research Association, the Society for Applied Anthropology, and the American Sociological Association.

What stands out more prominently than any disciplinary affiliation was Bill’s choice to link his social research to liberal social reform. In later years, he spoke nostalgically of the “triple-threat professor” expectation at the ILR School—a professor engaged in teaching, research, and extension work.

From the beginning as a triple-threat professor, Bill engaged in industrial projects in New York cities such as Corning and Rochester, always bringing along graduate students for the research and experience. In the mid-1950s, his interest in discovering whether “good human relations” practices were universal had led him to take a sabbatical in Venezuela. The experience in Latin America led eventually to an extensive period of time in Peru and a role in the development of the Institute of Peruvian Studies at Cornell. The Institute reflected his ambition to provide field training for both Peruvian and American students. His concern over academic imperialism was evident in his insistence that all publications from the work of the Institute be published first in Spanish.

From 1956-61, Bill served as Director of the Cornell Social Science Research Center. In 1969, in response to the social unrest on campus, Bill joined faculty from other colleges and formed the Human Affairs Program, designed specifically to link the university and the community. The program remained viable for four years; with its final

claim to success an alternative secondary school in Ithaca that by the time of Bill's death had reached national acclaim.

The last chapter in Bill's relationship to Cornell ILR was, upon retirement in 1980, to move physically into the ILR Extension complex, where he soon established an action and research group, Programs for Employment and Workplace Systems (PEWS), dedicated to providing technical assistance to labor and management collaborative work. While he continued for several years to teach one graduate seminar in strategies for labor-management cooperation, his real contribution to PEWS was his intellectual interest in the role of labor-management in organizational improvement. His writing (see below) and leadership in PEWS provided early footing for the Cornell Participatory Action Research Network, an on-campus group of faculty and students who are known world-wide via the Web and the connection to William Foote Whyte's name.

Street Corner Society was his best-known book. Published in 1943, it was still in print at his death and had been translated into many different languages. The book was as vital in 2000 as when it first appeared; it influenced countless social researchers and community leaders over the generations. It is as close to a bestseller as social science writing gets. Key to that book is the linking of rich urban ethnography of a particular community with the study of organizational behavior among the street corner boys. Bill's ability to focus on processes in context, particularly leadership in organizations, was already fully visible in 1943, marking a major difference between his writing and other urban community studies of that period.

Taking *Street Corner Society* as the pivot, we see a wide variety of threads moving outward from it. His work on the restaurant industry and other industrial settings and his studies of organizational dynamics became both influential and his trademark in industrial and labor relations. (See *Human Relations in the Restaurant Industry* (1948); *Pattern for Industrial Peace* (1950); *Man and Organization* (1959); *Money and Motivation* (1955); *Men at Work* (1965); *Action Research for Management* (1965); *Organizational Behavior: Theory and Application* (1969); *Worker Participation and Ownership* (1983); and *Social Theory of Action* (1991)).

At the same time, he pursued a continuing interest in larger-scale issues of community development, both domestically and internationally, leading to both highly contextualized ethnographic/historical studies of communities in the Andes and breakthrough work on unlocking human potential in development work. (See *Toward an Integrated Theory of Development* (1969); *Dominación y cambios en el Perú rural* (1969); *Power, Politics and Progress: Social Change in Rural Peru* (1976); and *Higher Yielding Human Systems for Agriculture* (1983)). This double focus on the human factor and the potency of history was a theme throughout his whole career.

Long after other people have rested on their laurels, Bill moved into a new arena which he called “participatory action research,” leading to major collections of essays on the topic of collaborative research with local stakeholders (*Participatory Action Research* (1990) and *Industrial Democracy* (1985)) and one of the most important historical, ethnographic, and organizational studies of the famous Mondragón cooperatives ever done (*Making Mondragón: the Growth and Dynamics of the Worker Cooperative Complex* (1988, with Kathleen King Whyte)). This work caused a great many people to encounter Bill for the first time and begin to learn from his concept of “social inventions.” He focused attention on socially desirable innovations made in one context that could be learned from and applied elsewhere.

In the final phase of his career, he turned back to reflect on his own learning and developed a uniquely effective way to share his learning, first in a book on the role of the field experience in learning about social inventions and the promise of fieldwork for future generations (*Learning from the Field* (1984)); and finally in much more personal reflections on his itinerary, choices, and reasons for doing what he did (*Participant Observer, An Autobiography* (1994), and *Creative Solutions to Field Problems: Reflections on a Career* (1997)).

Few people have been more intellectually ambitious, more diverse in the topics and methods of their work, or more consistently committed to linking the academy to societal improvement than Bill Whyte. We scan the horizon in fear that there will never be another to replace him.

Davydd J. Greenwood, Ann W. Martin, Lawrence K. Williams

Herbert August Wichelns

December 29, 1894 — March 4, 1973

With a brilliant record attained at Boys' High School in Brooklyn, New York, Herbert August Wichelns enrolled in 1912 at Cornell University, where he continued a career of high achievement, was awarded the A.B. degree in 1916 and the Ph.D. in 1922. (His dissertation: "Burke's Essay *On the Sublime and Beautiful*: A Critical Edition.") As an undergraduate he was active in the life of the University, joining several of the literary and social clubs, and making his mark as an orator and debater. In 1916 he was appointed assistant instructor in public speaking, and the next year instructor. During World War I he served as a second lieutenant in the Army of the United States.

In 1920-21 he taught as instructor at Dartmouth College, in the following year at New York University, and in 1923-24 as assistant professor at the University of Pittsburgh. Then he returned to Cornell, where he held the rank of assistant professor until 1931, when he was promoted to a full professorship. From 1940 to 1948, with exceptional merit, he performed the duties of chairman of the Department of Speech and Drama; in this capacity he provided strong support to both the Speech and Theatre sections and received the loyal cooperation of his colleagues in both wings. He retired from teaching in 1962.

As a member of the staff, Wichelns served on a number of important academic committees of the College of Arts and Sciences, of the University, and of the Speech Association of America (e.g., as chairman of the Association's Committee on Research), in addition to his functions as faculty adviser to the Cornell Debate Association and to Delta Sigma Rho, and as supervisor of the annual oratorical contests. He was president of the Cornell Chapters of Phi Beta Kappa in 1935 and Phi Kappa Phi in 1937, of the Eastern Public Speaking Conference in 1930, and of the National Association of Teachers of Speech in 1937. He lectured at Yale University, Louisiana State University, and the University of Illinois, and, as visiting professor, taught at the University of Wisconsin in the summer of 1929 and at Columbia University in the summer of 1938.

Of the various studies published by Wichelns, the following should be especially noted: "Burke's Essay *On the Sublime* and its Reviewers" (in the *Journal of English and Germanic Philology* XXI, 1922); "The Literary Criticism of Oratory" (in *Studies in Rhetoric and Oratory*, honoring J. A. Winans, ed. A. M. Drummond, 1925; reprinted in *The Rhetorical Idiom*, and a section of it, in *Historical Studies of Rhetoric and Rhetoricians*, honoring E. L. Hunt, ed. R. F. Howes, 1961), which has justly been hailed as one of the most fruitful and influential studies produced in our day in the field of Speech; "Analysis and Synthesis in Argumentation" (*The Quarterly Journal of Speech*, vol. 11,

1925); “Public Speaking and the Dramatic Arts” (in *On Going to College*, Oxford, 1959); A History of the Speech Association of the Eastern States, 1959; and “Ralph Waldo Emerson” (in *History and Criticism of American Public Address*, vol. II, ed. W. N. Brigrance, 1960). Further, in 1944, Wichelns was chairman of the Committee of Editors of *Studies in Speech and Drama* (honoring A. M. Drummond). And reference should also here be made to his many excellent reviews that appeared over the years, most of them in *The Quarterly Journal of Speech*.

In 1958 a volume of sixteen articles was dedicated to him, *The Rhetorical Idiom* (ed. D. C. Bryant), introduced by E. L. Hunt’s cordial tribute, “Herbert A. Wichelns and the Cornell Tradition of Rhetoric as a Humane Study,” which testifies to the significant part Wichelns played in establishing the Cornell group among the leading departments in the field. The contributions to this Festschrift help to illustrate what Isocrates avers of the importance of speech in society: “The art of discourse. . .of all the faculties abiding in human nature, is the productive source of most of our blessings” (*Antidosis* 253).

In his scholarship Wichelns was a master in the field of modern rhetorical theory and criticism. And, as a teacher, he trained a goodly number of students who became prominent scholars and teachers in the field, among them editors of *The Quarterly Journal of Speech* and presidents of the Speech Association. His students extolled him as a gifted teacher, and prized their association with him. His classes were provocative and stimulating educational experience; he elicited the active participation of his students, and, with his incisive mind, moved promptly to the heart of the subject under discussion, cutting through immaterial and irrelevant considerations, and expressing his conclusions with remarkable clarity and effectiveness. Genuinely interested in the welfare of his students, he was never too busy to see the many who sought his advice and assistance, and in return, he won their deep respect and warm affection. Emphasized among the qualities praised by them and his colleagues and friends were his broad culture, his integrity, his quiet dignity, his kind and generous disposition, his fairmindedness (firm in his convictions, he yet was tolerant of the views of others), his dry and gently ironic sense of humor, and his sage counsel. He was a true *vir humanus* — and an impressive exemplar of the art he taught with such eminent success.

W. David Curtiss, Walter H. Stainton, Harry Caplan

Elizabeth “Betsy” Wiegand

August 26, 1916 — July 30, 1995

Professor Elizabeth Wiegand was a lifelong Cornellian. After her high school education at Cascadilla Preparatory School, Ithaca, and Westtown School, Westtown, Pennsylvania, Betsy enrolled at Cornell in the College of Home Economics. Her curriculum included a semester of study at the prestigious Merrill Palmer School in Detroit. She graduated Class of 1938, worked several years as a Home Demonstration Agent in county extension programs in New York State, and returned to Cornell for graduate work in Economics of the Household and Household Management, receiving her Master’s degree (1949) and Ph.D. degree (1953). Her doctoral dissertation on the use of time by New York State homemakers provided not only descriptive data but the basis for quantifying their work contributions with current data.

Professor Wiegand’s career was primarily dedicated to extension, although she was involved in teaching and research at Michigan State University for three years following completion of her Ph.D. degree. Upon her return to Cornell, she moved through the ranks of Assistant Professor (1957) to Professor (1964) as an extension specialist in family economics and home management. She was named Professor Emerita in 1981.

Professor Wiegand’s professional career focused on serving the needs of people—from her early work as an Extension Agent in Cayuga County to her work as a specialist in economic problems of families. Betsy was dedicated to the Extension philosophy of helping people help themselves. She prepared educational materials, taught county Extension agents and lay leaders, and provided them with information and tools that families could readily use in planning and conducting their business affairs. For example, she and Professor C. Arthur Bratton in Agricultural Economics, collaborated on the preparation of the Cornell publication, “Do You Know Your Valuable Papers.” It has been used by New York State families for more than forty years and is still in use.

Betsy’s work was always carefully and thoroughly done. She was meticulous about details and accuracy. One of her guiding principles was to make material as simple as possible, easily understood, and generally useful. She was skilled in interpreting economic research findings and translating research results into forms that could be used by the general public.

Betsy had a quiet sense of humor and always enjoyed a good joke. She set her priorities and was focused in working toward her goals. She was thorough in developing ideas and had a strong determination for seeing them through. Although her colleagues considered her single-minded, she thought through a problem and would come to a

conclusion based on facts. She perplexed others by rarely revealing how she arrived at her conclusions. Throughout her professional career, Professor Wiegand was active in the American Home Economics Association. She was elected to the Home Economics honor society, Omicron Nu, and to the Extension honor society, Epsilon Sigma Phi. From the latter she received an award for excellence in her work in Cornell Cooperative Extension.

Betsy developed a great loyalty to Cornell and a life-long interest in trees, shrubs, flowers, birds, animals, conservation and ecology from her parents, Professor Karl McKay Wiegand and Maude Cipperly Wiegand, both botanists and Cornellians, and their next door neighbors and friends, Professor Albert H. Wright and Anna Allen Wright. After her retirement, Betsy continued to live in the Wiegand home and delighted in caring for the grounds and gardens.

Service to others was a basic part of her personal life as well as her career. After retirement, she participated in FISH (Friends In Service Here), a volunteer organization to provide transportation for those who needed it. She served as FISH treasurer for many years. She also was active in Nature Conservancy and enjoyed Monday night seminars at the Laboratory of Ornithology.

A private person, few colleagues knew much about her family and how she cared for various members. For many years, Betsy researched her genealogy, carefully documenting facts and organizing materials. Betsy is survived by two sisters, Anna Mae Van Deman Bacon and Catherine Van Deman Eastman; and several nieces and nephews and their children. She was predeceased by three brothers and a sister.

Betsy's loyalty to Cornell was exemplified by her bequest to the College of Human Ecology to be divided among three scholarship funds. In discussing her interest in a bequest, she indicated no need to have her name attached to the funds, but a desire to honor her mentors, Helen Canon, Mabel Rollins, and Jean Warren.

C. Arthur Bratton, Rose E. Steidl, Francille M. Firebaugh

Karl McKay Wiegand

June 2, 1873 — March 12, 1942

Professor Karl McKay Wiegand, for many years Professor of Botany and Head of the Department of Botany, died on March 12, 1942. He had retired from active service on August 15, 1941, but was continuing research at the university and service on non-academic committees. He is survived by his wife and one daughter.

Professor Wiegand was born at Truxton, New York, on June 2, 1873 and grew up in this small town in the beautiful Tioughnioga Valley. The son of a pharmacist, he early became interested in the flora of that region, and the family's atlas of Cortland County has notations of the hills, valleys, and swamps he visited on his early expeditions. As a boy of fifteen he was already demonstrating interest and ability in the solution of problems in taxonomy.

He came to Ithaca High School to prepare for entrance to Cornell University and for training in his father's profession. The course in pharmacy was, however, abolished just before he entered the university and his interest turned to botany in which he eventually majored. His senior thesis was in seed anatomy and the quality of his investigation was such that it gained for him election to Sigma Xi.

After graduation in 1894 with the B.S. degree, he became assistant in the Department of Botany and continued study as a graduate student. In 1898 he received the degree of Ph.D. and the following year was promoted to the rank of instructor, a position which he held until 1908 when he went to Wellesley College as Associate Professor of Botany.

During the early years at Cornell his interests were diverse and included physiology and anatomy and morphology. His doctorate thesis was in physiology and at the time of its preparation he intended to continue study in that field.

In 1900 he began teaching in taxonomy and from that time his attention turned permanently to taxonomy as his major field of work. At Wellesley College he taught elementary botany and taxonomy until 1913 when he returned to Cornell as Professor of Botany in the College of Agriculture. At this time Dr. Liberty Hyde Bailey, then dean of this college, organized a new Department of Botany and placed Dr. Wiegand at its head. Within a few years this new department absorbed the Department of Botany of the College of Arts and Sciences.

Dr. Wiegand continued as head of the new department for twenty-eight years until his retirement. During this long period he wisely guided it and was in large measure responsible for its high reputation.

Despite the pressure of administrative duties, he taught large classes both in the laboratory and in the field and found time for research. He also built up from the beginning a herbarium of about 250,000 specimens and gave liberally of his time to the identification of plants for botanists from all over the country. Through his contagious enthusiasm for his subject and for the teaching of it, he developed in many students an interest in plants and an appreciation of the value of taxonomic studies in their practical and cultural aspects. When it was realized that Dr. Wiegand was soon to retire his courses became filled to capacity.

Dr. Wiegand always found time for research and published more than one hundred papers. His intensive studies of the plants of the Cayuga Lake region led to the publication of the "Cayuga Lake Flora" which he, as senior author, prepared in association with Dr. A. J. Eames. The excellence of this work has resulted in its general acceptance as a model of its kind. He made a notable contribution to horticulture by preparing for Bailey's "Standard Cyclopaedia of Horticulture" the extensive and technical "Synopsis of the Vegetable Kingdom" and assisted with the general introductory key—an important contribution of taxonomy to horticulture. He was recognized as one of the leading taxonomists of the world.

In 1933 he was Vice-President of Section G of the American Association for Advancement of Science and in 1939 President of the Botanical Society of America.

He has served the University on many important committees, notably the Arboretum Committee, the Committee on Campus Trees and the Committee on the Bailey Hortorium. He was chairman of the last two committees for several years, and to the work of all of these committees he gave much time and thought.

In 1923, in view of the large attendance of summer students in the biological fields and the richness of the Ithaca region in biological material, a Summer School of Biology was established under the auspices of the Summer School of the University and the Summer School of the New York State College of Agriculture. Dr. Wiegand was in large measure responsible for the initiation of this new school and directed the school throughout the eleven years of its existence.

Dr. Wiegand was a very modest man, unselfish in high degree. He viewed his administrative problems, as he did his research problems, objectively. He was always ready to forsake his own views when convinced of the validity of the concepts of others. His research was conducted with the utmost patience and marked by the most careful and intelligent procedure based on exact knowledge.

His quiet cheerfulness, his high ideals, and his thoughtful consideration of others endeared him to his students, to

all members of the department, to his colleagues, and to all who were associated with him. To work with him was an inspiration to all.

Roy Glen Wiggans

May 12, 1891 — August 19, 1971

Roy Glen Wiggans, professor of plant breeding, emeritus, died on August 19, 1971, bringing to a close more than fifty-six years of association with Cornell University. He was born in Mercer County, Missouri, in 1891, and after receiving his B.S. degree in agronomy from the University of Missouri in 1914, he came to Cornell to do graduate work. He received the M.S. degree in 1915 and the Ph.D. in 1919, both in the field of plant breeding at Cornell. Except for one year in 1916-17, when he was assistant professor in agronomy at Ohio State University, he spent his entire professional career at Cornell. He was promoted to assistant professor in 1919 and to professor in 1934. He retired in 1958.

The early work of Professor Wiggans was concerned with strain testing and seed sources of alfalfa and clovers. His research clearly established the superiority of local clover seed sources and the variegated types of alfalfa. Use of these adapted legumes did much to increase farm yield and reduce seeding failures with clover and alfalfa. Wiggans added soybean breeding and variety testing to his program in the late 1920s. The variety Cayuga, released in 1934, was the first of several early maturing grain soybean varieties he developed for use in New York.

Professor Wiggans was one of the early hybrid corn breeders. Though far removed from the Corn Belt and its intensive corn breeding research, the New York farmer has enjoyed the full benefit of corn hybridization because of the scope and success of Dr. Wiggans's efforts. His early concern was with improved quality of corn silage. He showed that early hybrids with relatively well-matured ears produced better quality silage and as much tonnage of dry weight as the tall, late-maturing open-pollinated varieties then popular among farmers.

As dairymen became more interested in corn for grain, Wiggans developed varieties that would mature under New York conditions. He tested his first successful hybrid, Cornell 29-3, in 1929 and released the earliest maturing Cornell hybrid, NE310, just weeks before his retirement in 1958. Several other hybrids developed by Professor Wiggans have been widely used by farmers in the Northeast and have served as pace-setters for hybrids introduced from other breeding programs.

Dr. Wiggans taught, conducted research, and trained young scientists at the University of Nanking in 1927 and 1930 as a part of the Cornell-Nanking Wheat Improvement project sponsored by those universities with aid from the International Education Board.

Professor Wiggans was a member of the American Association for the Advancement of Science, American Genetics Association, American Society of Agronomy, and the Rotary Club of Ithaca. He was treasurer of the Westminster Foundation of New York and director of the Ithaca Westminster Foundation. He had served as an elder of the First Presbyterian Church of Ithaca since 1932.

His late wife was Edna Landon Wiggans, with whom he observed a golden wedding anniversary in 1967. He is survived by a son Robert, eleven grandchildren, and three great-grandchildren.

The work of a plant breeder lives on indefinitely after active research has been completed. Superior corn genes identified and isolated in inbred lines will reappear time and again in new and even better varieties yet to be developed. Likewise, training imparted to younger men will reappear and bear fruit. Each will be a lasting monument to the long and fruitful career of Professor Roy Wiggans.

Neal F. Jensen, Henry M. Munger, Ronald E. Anderson

Henry Booth Wightman

August 8, 1901 — February 2, 1980

Dr. Henry B. “Pete” Wightman was born in Auburn, New York. The son of a Presbyterian minister, he moved to the University Heights section of the Bronx, New York, when his father was called to a church there. He attended the Horace Mann School and continued his undergraduate education at Williams College, of which he was a loyal alumnus. He attended the Cornell University Medical College from which he obtained his Doctor of Medicine degree in 1927. It was in medical school that he met a classmate, Jocelyn Woodman, who later became his wife.

Following medical school he served a two-year internship at the Bellevue Hospital in New York and a period of several months at the Manhattan Maternity Hospital. He specialized in pediatrics and entered private practice in New Rochelle, New York, in 1930. Early in his medical career he developed an interest in allergy and obtained training from some of the pioneers in that field, including Dr. Robert A. Cooke. During the period from 1930 to 1942 he held appointments as attending pediatrician at the New Rochelle and Grasslands Hospitals and at the Vanderbilt Clinic. He also was on the staff of the children’s allergy clinic at the Bellevue Hospital and of the allergy clinic of the Roosevelt Hospital. He was certified by the American Board of Pediatrics and was a member of the American Academy of Allergy and of the Society for the Study of Asthma and Allied Conditions.

As years passed Dr. Wightman became aware of a preference for clinic work as opposed to private practice and of a desire to work with young people. In 1940 he began contacting leaders in the field of student health, including a former schoolmate, Dr. Norman S. Moore, who had recently become director of that department at Cornell. Their correspondence led to Dr. Wightman’s appointment in 1942 as assistant professor and attending physician at the clinic and infirmary.

He arrived at a particularly busy time, since the health service was caring for both civilian and military students on the campus. During the early forties he collaborated with Doctor Norman S. Moore and Doctor Edward C. Showacre in a study of the radiographic patterns of primary atypical pneumonia. He continued his interest in allergy and held allergy clinics until several years following his formal retirement. In 1949 he Published a study of clinical and pathological findings in 258 cases of appendicitis observed at the Cornell Infirmary over an eight-year period.

In 1950 Dr. Wightman was appointed assistant to the clinical director, a position he held for ten years. He played an active part in education within the student health department. He also participated in the education of medical

residents during the years when the health service collaborated with the Tompkins County Hospital in conducting a residency program in internal medicine. He contributed articles on a variety of clinical topics to *Student Medicine*, official organ of the American College Health Association. For two years he served on the Faculty Committee on Student Conduct. He was a member of the American Medical Association and of the New York State and Tompkins County Medical Societies.

Pete Wightman had a wide variety of community and social interests. He was a member of the board of trustees of the First Presbyterian Church and served as its chairman. He was a member of the City Club, the Rotary Club, the Country Club of Ithaca, and the Statler Club. He was a member of the American Cancer Society and served on the board of directors of the Y.M.C.A. and of the Family and Children's Service. He was president of the Sons of the American Revolution and a trustee of McGraw House. He had considerable skill and a lasting interest in fine woodworking. Summer vacations usually found him at one of the family cottages on Bailey Island, Maine, or at Big Moose Lake, New York. He enjoyed golf, fishing, and tying flies.

Dr. Wightman retired in 1969 and was granted the title of professor emeritus. His retirement was saddened in 1970 by the death of his wife, Jocelyn. He continued to work part-time as allergist at the Gannett Clinic until 1974. In 1974 he married an acquaintance and friend of long standing, Ms. Elizabeth Stocking. He was brightened by this new period of companionship and maintained the jovial personality and good humor which made him so well liked by those who knew him.

One of his unfinished projects as part of the Retired Senior Volunteer Program was a study of early physicians and medical care in Tompkins County. Physical infirmities ultimately took a heavy toll, particularly after a stroke in April, 1979. He died following a protracted illness in February, 1980. He is survived by his wife, Elizabeth Stocking Wightman; two sons: Henry B. Wightman of Syracuse and Frederick Wightman of Chicago, Illinois; a daughter, Winifred Webster of Boston, Massachusetts; seven grandchildren; three sisters: Katherine Hadden of Bronxville, Elizabeth Selander of Naples, Florida, and Edith Kreitler of Philadelphia, Pennsylvania.

Paul H. Darsie, Alexius Rachun, Raymond Haringa

Burt Green Wilder

Professor of Neurology and Vertebrate Zoology

1841 — January 21, 1925

By the death on January 21, 1925, of Dr. Burt Green Wilder, Cornell University loses almost the last member of her original faculty. The pupil of Oliver Wendell Holmes, of Jeffries Wyman, of Asa Gray, of Louis Agassiz, and attached to these great teachers by an almost religious affection, he brought to our chair of zoology notable traditions. Since 1866 he had been Agassiz's assistant and it was Agassiz who, backed by Asa Gray, named him for the new institution, in whose fortunes both were deeply interested. Appointed among the very first of its professors in September of 1867, more than a year before our doors were opened to students, Dr. Wilder was of great help in the gathering of our equipment; and for more than forty years, till his retirement from teaching in 1910 and his return in 1911 to the Massachusetts home of his boyhood, he served this university with a singular fidelity,

Born at Boston in 1841, he was a precocious lover of nature and his studies were from the first chiefly devoted to natural science; but at his issue from Harvard in 1862 the country's call took him into the hospitals of the civil war and to the front as a surgeon, and on his return in 1865 a further year was given to the completion of his medical studies. Then, however, he turned to the career of the scholar. At Cornell he showed himself from the start a teacher of rare powers. He was a master of exposition. The charm of his diction and the lucid grace of his style made him captivating alike by voice and pen. His lecture room was always crowded and his articles found welcome in our best magazines. But he was, before all, the patient and conscientious leader of research. Working quietly but tirelessly in the midst of his students, and ever ready to interrupt his investigation to listen to a question or to share with those about him some fascinating discovery, his laboratory was a fruitful nursery of budding scholarship. Nor was his interest in his students confined to class room and laboratory. Many bear in lifelong memory the kindly word or thoughtful act that showed his sympathy in their personal haps and mishaps,

As did few others Dr. Wilder shared the unconventional ideals of the young university, and to the end he was their champion. For his personal convictions, too, he was always ready to do battle, and it never dismayed him if his cause was unpopular. For the simplified spelling of English, for a better nomenclature in anatomy, for temperance rather than abstinence in the use of alcoholics, against tobacco, against secret societies, against intercollegiate athletics, he stood with uncompromising frankness, regardless of opposition and of ridicule. Discrimination because of race or sex found always in him a zealous foe. This ruggedness of personality has given him large place in student legend as well as in the memory of his colleagues. In the faculty he was often a minority of one; but

he held his ground, and the music of his diction, coupled with his unwavering courtesy, made him always gladly heard.

From the poverty of Cornell's early years none perhaps suffered more than Dr. Wilder and his work; but he bore its burdens and deprivations with exemplary patience, and through it all, despite the weight of his duties, he was a prolific contributor to the literature of science. His published papers number many scores. But he welcomed with joy the growing prosperity which enabled him to turn over division after division of his biological teaching to new and soon independent departments and permitted his larger attention to those neurological studies which were ever the center of his interest. If even in this best loved field he leaves behind him no work of long breath, it is due not less to his sacrifice of self to his teaching and to the public spirit which spurred him to a share in righting every wrong than to his unbounded conscientiousness and his all too scrupulous concern for the details of method. Both as teacher and as investigator he leaves a name not soon to be forgotten.

William Henderson Wilder

July 19, 1914 — November 3, 1948

Stricken while attending the Cornell-Columbia football game in New York City the preceding weekend, William Henderson Wilder, Assistant Professor of Electrical Engineering, died on November 3, 1948. Thus, death ended a promising career which was really just beginning.

Born on July 19, 1914 at Rochester, New York, Professor Wilder registered in the School of Electrical Engineering at Cornell in 1931. Dissatisfied with his progress, he took a leave of absence in 1934 and entered the employ of the Paragon-Revolute Corporation, Rochester, New York. Anxious to continue his formal education, Professor Wilder relinquished his position as Production Manager with this company, and reentered Cornell in 1944. He received the degree of Bachelor of Electrical Engineering in 1946. During the latter period as an undergraduate, Professor Wilder worked on a Navy-sponsored research project in the Physics Department. He entered the Graduate School and received the degree of Master of Electrical Engineering in June 1948.

While carrying on his graduate work, Professor Wilder was an instructor in the School of Electrical Engineering. His performance and interest in teaching were of such nature that he was appointed an Assistant Professor in Electrical Engineering on July 1, 1948.

While performing well all of the duties required of him as a graduate student and instructor, Professor Wilder prepared himself for the examinations for the Professional Engineer's License. Ironically, the notice of the successful completion of the examinations and granting of a license arrived on November, 2, 1948, the day before Professor Wilder's death.

In addition to his registration as a Professional Engineer in New York State, Professor Wilder was a member of the Rochester Engineering Society, the American Institute of Electrical Engineers, the Institute of Radio Engineers, Tau Beta Pi, Eta Kappa Nu, and Sigma Xi.

On April 24, 1943 he married Olive W. Smith who survives him.

W. H. Erickson, W. E. Meserve, H. F. Newhall

Mabel Wilkerson

August 22, 1885 — November 20, 1969

Miss Mabel Wilkerson came to Cornell University as assistant professor of house furnishings in the Department of Household Art, College of Home Economics, in 1943 and was promoted to associate professor of housing and design in 1948 (the same department with a change of name). She retired from Cornell in June 1953.

Miss Wilkerson was born in Tuscarora, Nevada. She received preparatory education at the University of Nevada at Reno, a diploma from the University of Arizona at Tucson, and a Ph. B. in science and arts from Arizona in 1909. She studied food and nutrition at the University of Berkeley, California, but the focus and direction of her professional life began at Simmons College, Boston, Massachusetts, where she specialized in clothing and house furnishings. Next, she studied art at the Sacker School of Art in Boston for one year, and then continued her study at the New York School of Fine and Applied Art in New York City for two years, completing work in interior design in the Paris branch of that school in 1926. At Columbia and New York Universities in New York City she added work in psychology and education. Later, she also studied the history of art at the Louvre, in Paris.

Her early positions were as instructor of clothing, textiles and dress design at Simmons College, 1915-1917, and instructor of clothing and house furnishings in the extension program at the University of Illinois, Urbana, Illinois, where she was the first specialist in house furnishings. There she worked with Dean Isabel Bevier, a pioneer in home economics, who felt the home environment was very important to the quality of family life. She served as assistant state leader of Illinois from 1921-23. She resigned from that position, first to study and then to teach in the New York School of Fine and Applied Art (Parsons School of Design) in New York City. After teaching there one year, Mr. Parsons appointed her associate director of the Parsons School in Paris, and she held this position from 1927-33. During this time she also spent her summers as a lecturer at sessions conducted by the school in Italy.

In 1934 Miss Wilkerson became owner-director of the Montreal School of Design in Montreal, Canada. The school was highly successful and attracted students not only from Canada but also from the United States and other countries as well. Each summer she took selected, advanced students from the school to study abroad and experience at first hand the historic architectural monuments and art treasures of the museums, galleries, palaces and towns, focusing especially on historic interiors, though also noting design of all kinds. Unfortunately, the war took almost all of the male students from her school and in 1942 she was forced to close the school “for the

duration.” It was during this period, (the ‘30s and ‘40s), that she practiced the profession of interior design, chiefly in Paris but also in New York City and Montreal, and became well known in the field.

Thus, when she came to Cornell, her exceptionally fine background and experience enabled Miss Wilkerson to develop the type of course work in interior design needed for the department as it was evolving into the Department of Housing and Design. Her influence with colleagues and students was constructive and helpful. She demonstrated intellectual integrity and uncompromising scholarship, and was a constant stimulus toward the improvement of the work of the department. As a member of the graduate faculty, she guided students to strive towards the highest possible academic accomplishment, insisting that they extend themselves intellectually, creatively.

During her Cornell career, Miss Wilkerson executed numerous professional commissions. In 1943 she was in charge of the redecoration of the dean’s office, the auditorium, and the faculty lounge in Martha Van Rensselaer Hall. When the Statler Inn and the Hotel School facilities were being planned in Statler Hall, she was invited to be the designer in charge of all interiors and furnishings. She declined because of the time involved in such a program. Other campus jobs were as a consultant on plans for Anabel Taylor Hall, and for several offices, including one in the Industrial and Labor Relations School. When Dean Sarah Blanding left Cornell to become president of Vassar College in 1947, she asked Miss Wilkerson if she would accept the commission to redesign the interior of the president’s house. She did and, a year later, also designed the Student Recreation Rooms there.

Known affectionately as “Peg” to her friends, her wit and sparkle as a raconteur made her a lively and interesting companion to all who knew her. After her retirement from Cornell in 1953, she continued to live in Ithaca. She was visiting a niece, Mrs. Leo R. Collins, in Mentor, Ohio, when she died unexpectedly, November 20, 1969.

The quality of a University lies in great measure in its faculty, and although Mabel Wilkerson was at Cornell just ten years, she contributed to the University very considerably and with verve, as a scholar and as a professor concerned with environment in her specialized area of interior design, historic and contemporary; as a practicing professional designer; and in personal contacts with colleagues and students.

Virginia True, Ruby Loper, Helen J. Cady

Bruce Tabor Wilkins, Sr.

June 21, 1931 — June 30, 2007

Dr. Bruce Tabor Wilkins, Sr., was born in Greenport, New York and grew up in Queens. He graduated from Stuyvesant High School in New York City. He enrolled in 1948 in Cornell's newly created Department of Conservation (now Natural Resources) and received his B.S. degree, specializing in wildlife management, with its first graduating class in 1952. As an undergraduate, Bruce was a member of the Reserve Officer Training Corps, Scabbard and Blade, captain of the rifle team and played #150 football.

After graduation, Bruce served with the U.S. Army in Korea, training at Camp Drum in 1953 and then serving as an Artillery Lieutenant in the 84th Field Artillery Battalion in Seoul during 1953 and 1954. Following his discharge, he completed his M.S. degree at Montana State University in 1956, specializing in wildlife management and botany. While serving as a Laboratory Teaching Assistant at Montana State in 1954, he met his future wife, Sandra Enevoldsen. Bruce and Sandra were married in 1956. Bruce worked as a wildlife and range research biologist for the Montana Fish and Game Department until moving to New York in 1959 to assume a Cooperative Extension agent position in Broome County, whose focus was working with non-farm rural residents.

Bruce returned to Cornell University in Ithaca in 1963 as an Extension Specialist in the Department of Conservation. His responsibilities included Extension programming in wildlife habitat improvement, fish pond management, and commercial recreation enterprises. Simultaneously, he worked on his Ph.D. degree, which he completed in 1967. He received his doctorate and a faculty appointment in Conservation in 1967, with a focus in outdoor recreation.

Dr. Wilkins' early teaching included courses in conservation perspectives and outdoor recreation. His early research interests included hunting and fishing trends and factors associated with these trends, and campground business management, the latter also being important to his Extension programming. He began a research program in outdoor recreation that included staff as well as graduate students. This program later evolved into the Human Dimensions Research Unit.

In 1972, Dr. Wilkins became the Associate Director and Extension Director of the newly formed New York Sea Grant Institute, a position he held for much of the rest of his career. In this position, he led the most diverse Sea Grant Extension program in the nation, with offices, staff, and programs in marine, estuarine, and freshwater locations on Long Island, the lower Hudson River, and Great Lakes. During those years, the New York Sea Grant program had the reputation of being annually ranked first or second among the leading programs in the nation.

Dr. Wilkins' calls for applied research, the translation of the research results into Extension programs useful to marine trades clientele, and his emphasis on program evaluation were major factors contributing to the success of New York's Sea Grant program.

Dr. Wilkins maintained a faculty appointment in the Department of Natural Resources during his tenure with Sea Grant and was promoted to Associate Professor and later to Professor. He worked actively with the Resource Management and Policy section of the department, leading efforts to establish more rigor in the curriculum and formalize the administration of this academic concentration. He taught courses in natural resource policy and marine fisheries and later in his career developed an interest in fisheries management in developing countries. He taught hundreds of students, had many undergraduate advisees, and perhaps a score of graduate students. Sabbatical leaves and consulting opportunities gave him the chance to spend extended periods of time in Canada, Ghana, Kenya, Tanzania, Zimbabwe, New Zealand, Australia, China and Taiwan, Chili, and Cambodia. In 2002, he was awarded the Outstanding Faculty Award from the Alumni Association of the College of Agriculture and Life Sciences at Cornell University. In 1997, he was named Professor Emeritus. In 1998, he received the William O. Wick Leadership Award from the Assembly of Sea Grant Extension Program Leaders.

Dr. Wilkins was very active professionally, with memberships in the Ecological Society of America, American Fisheries Society, and The Wildlife Society. He participated frequently in national and international conferences of these organizations as well as the North American Wildlife and Natural Resources Conference, national Extension conferences, and regional and national Sea Grant conferences.

Dr. Wilkins was also active in community service in Ithaca. In 1972, he was part of a group who organized the Tompkins County Girls Ice Hockey Association, probably the first in New York State. In 2002, the group held a 30th Reunion, honoring the founders and thanking them for "bringing into being" an organization that meant so much to them. He was a member of First Presbyterian Church of Ithaca, New York where he had served as Elder and on many committees.

Dr. Wilkins is survived by his wife, Sandra Enevoldsen Wilkins of Solomons, Maryland; by his sons, Bruce Tabor Wilkins, Jr. of Seattle, Washington, Gregory Wilkins and his wife, Marcy Feathers Wilkins of Sudbury, Massachusetts; and his daughter, Sheryl Wilkins Pardo and her husband, Jaime Pardo of Alexandria, Virginia; also by five grandchildren, Andrew, Christopher and Nicholas Wilkins, Sebastian and Amanda Pardo.

Tommy L. Brown, Chair; Barbara A. Knuth, Richard J. McNeil

Robert Elzworth Wilkinson

July 27, 1916 — February 13, 2003

Robert Elzworth (Bob) Wilkinson began his association with Cornell University in 1940, when he entered the Graduate School to study plant pathology. He joined the faculty of the Department of Plant Pathology in 1948, and remained active in the departmental program until several years after his official retirement in 1987. His area of expertise was pathology of vegetable crops and management of vegetable crop diseases.

Bob was born in the farming community of Mt. Ayr, Iowa, where he grew up on the farm owned by his parents, Clara Long Wilkinson and George Roy Wilkinson. He attended a one-room elementary school and later Mt. Ayr High School, and then moved on to the University of Northern Iowa at Cedar Falls, where he received the B.S. degree in 1938. His involvement with plant pathology began in that year, when he entered Iowa State College at Ames and worked as a Research Fellow while studying corn smut disease. His M.S. degree in Plant Pathology was completed in 1940.

He enrolled in a doctoral program at Cornell in 1940 and there worked as a Research Assistant with F.M. Blodgett in the Department of Plant Pathology studying diseases of potatoes. His doctoral study, like that of many others in his academic generation, was interrupted in 1942 by military service. He served in the U.S. Army Air Corps as a communications officer with the rank of First Lieutenant, and while overseas was stationed in England, Northern Ireland, and Scotland. On returning to Ithaca after military discharge in 1946, he resumed research on the X-virus of potatoes, which was one of the principal viral causes of yield depression. His Ph.D. degree was awarded in 1948; his dissertation title was “Studies on the X-virus of potatoes with special attention to a local lesion host.”

Bob remained at Cornell. In 1940, he was appointed Assistant Professor with responsibility for research on disease resistance in vegetables, an assignment that continued until his retirement. His emphasis was on onions, cucumbers and beans, the major effort being development of root disease resistance in beans. He was promoted to Associate Professor in 1952, and was elected Professor Emeritus upon retirement. He collaborated extensively with plant breeders. A colleague in Africa reported that a disease-resistant bean from the Cornell program had been important in countering a food shortage in Africa. Bob was author or co-author of over 40 articles dealing with viral and fungal diseases of vegetables and development of disease resistant varieties. These appeared in both scientific and trade journals as well as conference proceedings.

Bob's sabbaticals were sponsored by USAID and FAO. In 1955-56, he spent 18 months in Israel helping to set up a research program on virus diseases. In 1963, he spent a year in Egypt, helping to develop a program on onion diseases, and he returned to Egypt at intervals over the next six years as an advisor. In 1971-72, he was Visiting Professor at Viçosa University, Brazil, where he advised on a research program on bean diseases.

In 1943, Bob married Antoinette Miele, a union that lasted 60 years. They remained in Ithaca after retirement. Bob died of complications from a fall. Antoinette (Toni) and their three children survived him. Antoinette has since passed away.

Gary C. Bergstrom, Thomas A. Zitter, Wayne A. Sinclair

Bertram Francis Willcox

July 11, 1895 — April 30, 1987

Bertram F. Willcox was born in Cascadilla Hall on the Cornell campus, July 11, 1895. He died in Ithaca at his home at 111 Kelvin Place, April 30, 1987, shortly before his ninety-second birthday.

Bert was the son of Professor Walter F. Willcox, a distinguished long-time member of Cornell's Department of Economics, and Alice E. Work Willcox. Following secondary schooling in Ithaca and at the Hill School, Pottstown, Pennsylvania, he entered Cornell in the fall of 1913. His college activities and honors included serving as editor-in-chief of the *Cornell Era*, and membership in Psi Upsilon Fraternity, Sphinx Head and Phi Beta Kappa. His A.B. degree was awarded *in absentia* in 1917, following his assignment to France for war service.

Bert had promptly responded to the American Declaration of War on Germany in early 1917 by volunteering for military service, only to find that his eyesight did not measure up to minimum American military requirements. He was, however, accepted by the American Field Service and joined the ambulance corps. In mid-April he sailed for France on a submarine-infested transatlantic crossing that involved, as he wrote to his father, "just enough risk to add zest". His initial assignment was for six months in the Ardennes Forest Sector near Verdun as an ambulance driver and "sou-chef" for his unit. This was followed by an additional six months of service as a Red Cross Captain, headquartered in Paris.

In the late spring of 1918 after French manpower needs led to a reduction in the physical standards for enlistment, he was accepted by the French army through the French Foreign Legion, and assigned to an artillery officers candidate school for three months of training. He was then posted to the 13th Regiment of the French Light Artillery as a junior officer ("Aspirant") and had several months of combat service that ended with the Armistice. Following his French Army discharge, he joined the Paris staff of the American Secretariat to Negotiate The Peace.

Upon his return to the United States, Bert decided to pursue a legal career. From 1919 to 1922 he attended the Harvard Law School, graduating *cum laude* and serving as president of the *Harvard Law Review*. There followed twenty years of law practice in New York City. From 1923 to 1928, he was an associate with the law firm of Hughes, Rounds, Schurman & Dwight, and its successors. He then organized his own Wall Street firm, Schurman, Wiley & Willcox, with two of his law school classmates and fellow associates in the Hughes firm. They were Jacob Gould Schurman, Jr., son of Cornell's third president, and Alexander Wiley, who was to become his brother-in-law. In 1943 Bert transferred from private practice to government service, becoming a public member of the Appeals

Committee for the National War Labor Board. His Labor Board assignment involved arbitrating appeals from regional boards throughout the country, many of which concerned wartime wage controls.

In the spring of 1946, Bert happily and enthusiastically accepted an invitation to return to Ithaca as a member of the Cornell Law School faculty, teaching primarily in the fields of labor law and commercial transactions. He also served concurrently as a faculty member of Cornell's New York State School of Industrial and Labor Relations. He won rapid promotion to the rank of professor of law in 1948. He was the author of two editions of the widely used *Cases and Materials on Commercial Transactions*, published in 1951 in collaboration with Professor Robert E. Sutherland, and in 1953 with Professor Robert Baucher as an additional collaborator. In 1952 he was at the London School of Economics under a Fulbright grant and conducted research in labor relations in the nationalized gas industry. He was co-editor for two editions of *Labor Relations and the Law*, published in 1953 and 1960. He also actively participated as an arbitrator of labor-management disputes, serving on arbitration panels of federal and state agencies and as a member of the National Academy of Arbitrators.

In 1954, Bert was appointed as the first holder of the newly established William G. McRoberts Research Professorship in the Administration of the Law. As McRoberts Professor, he made a number of notable contributions toward improving the administration of justice. His study of problems besetting indigents accused of crime resulted in two important articles, each written in collaboration with Edward J. Bloustein (now President of Rutgers University): *The Griffin Case – Poverty and the Fourteenth Amendment*, and *A Field Study in a Rural Area of the Representation of Indigents Accused of Crime*. In 1960, he became staff director of a pioneer interdisciplinary study of the law applicable to the admission and discharge of patients in New York State mental institutions. This study, sponsored by the Association of the Bar of the City of New York in cooperation with the Cornell Law School, culminated in 1962 in a volume entitled *Mental Illness and Due Process*. Many of the recommendations proposed in this report were incorporated in a subsequent legislative revision of the New York laws governing the hospitalization of the mentally ill. For this important contribution, the Association for Improvement of Mental Health awarded Bert its Adolf Meyer award for distinguished service in behalf of improved care and treatment of the mentally ill.

Bert retired from active teaching at Cornell in 1963, becoming McRoberts Professor Emeritus. He spent the next four years in India on a challenging project sponsored by the Ford Foundation that permitted him to continue teaching and research in the areas of labor law and labor relations. From 1963 to 1967, he served as visiting professor of law at the Indian Law Institute in New Delhi, and concurrently in 1966 and 1967 as a member of the law faculty at Banaras Hindu University at Varanasi. At the Indian Law Institute he worked in collaboration with a

group of Indian legal scholars in preparing a pioneer Indian Case Book entitled *Labour Law and Labour Relations*, published in 1968.

Bert was an unusually conscientious faculty colleague, cheerfully undertaking more than his share of time-consuming committee and administrative assignments. His balanced good judgment and manifested institutional loyalty contributed greatly to his effectiveness in faculty deliberations, as did his patience and skill in bringing together individuals with diverse interests and views. He was always gentle, amiable and urbane, winning the respect, affection and esteem of colleagues, students and all who knew him.

Bert's interests and contributions spanned a broad spectrum, covering both private and public law. In dedicating the 1963 fall issue of *Law in Transition* to Bert, the editors wrote: "To each of these segments of the law he has brought incisive analysis and high-minded principle. Achievement of sound public policy in defense of the weak or the humble is as much a part of his work on commercial transactions as on problems of public law." Bert's final Cornell sabbatic was spent in Europe studying the problems of world federalism and the legal and practical problems involved in attaining international peace. He was also a dedicated civil libertarian, courageously maintaining his membership in the National Lawyers Guild during the difficult years when that organization was the object of bitter McCarthyist attack. He was, however, never doctrinaire. In expressing his opinions on difficult and controversial issues, he would do so in a way that showed respect for the sincerely held views of others, even when he was unable to accept their conclusions.

Having lived as a boy and young man on the campus, in the days when there were faculty homes on areas now occupied by the College of Engineering, Statler Hall, and other university buildings, Bert had a great store of personal memories of Cornell as it was in the first decades of the century. He related anecdotes, however, only when they were relevant to the topic under discussion. He had a keen sense of propriety and could never, even in his last years, be accused of "anecdoteage".

Bert was a devoted family member. He met his wife-to-be, Katherine Webster Leckie of Hamilton, Ontario, on a trip to Bermuda in 1930. Kay and Bert were married in 1934, and were happily destined to share forty-nine years of close married companionship until Kay's death in 1983. They were blessed with three children: David born in 1935, Alice in 1938, and Mary in 1944. Bert and Kay had many interests in common. They both loved hiking, mountain climbing and the out-of-doors, enthusiasms they shared with their children. Furthermore during World War II, Bert and Kay opened their home to two English children who remained here throughout most of the War, safe from the threat of bombing at home.

During Bert's seventeen years of active Cornell teaching, his father Walter F. Willcox was still active as an emeritus professor at Cornell. When Bert joined him in the ranks of the emeriti, a classic picture of the two emeritus professors Willcox appeared in papers throughout the country, with a report stating that this was the only known case of a father and son contemporaneously holding emeritus rank at the same university.

W. David Curtiss, Milton R. Konvitz, Gray Thoron

Walter Francis Willcox

March 22, 1861 — October 30, 1964

Walter Francis Willcox died at his home, after a brief illness, October 30, 1964. On March 22 he had celebrated his one hundred and third birthday. At the time of his death he was the oldest living alumnus of Phillips Andover Academy, of Amherst College, from which he received degrees of A.B., A.M. and LL.D., and (it was believed) of Columbia University, from which he received the LL.B. and Ph.D. He was also the oldest Professor Emeritus of Cornell and the only one known to have a son also a Professor Emeritus of the same institution.

Born in Reading, Massachusetts, in 1861, he was the son of a Congregational clergyman. Both his mother and father hoped that he, too, would enter the ministry but, after a passing interest in Greek, he turned instead to philosophy. Even before completing his graduate work, however, he found his attention drawn to those human and social problems that were to be his principal concern for the rest of his life. Although he came to Cornell in 1891 on a temporary appointment as an instructor of philosophy, the following year he accepted a position in the Department of Economics, rapidly making statistics his special field and himself a recognized authority and important innovator in that subject.

In 1899 he was asked to serve as chief statistician of the Twelfth Census of the United States, a post that took him to Washington until 1901. Part of his assignment consisted in preparing the new apportionment tables for the Congress; this brought to his attention the alarming rate at which the House had been growing as new seats were added to provide representation for the country's expanding population, and the unsound method by which seats were apportioned. The House, he felt, could never realize its potentialities as a constructive political institution unless it were reduced to a manageable size—he considered three hundred the optimum number; but he also recognized the virtually insuperable obstacles in the way of any revision that would require incumbent representatives to vote some of their own seats out of existence. He did think, however, that it should be feasible to stem the previously unchecked growth of the body by a law fixing its existing size and providing for automatic reapportionment following each census. He even hoped that this technique might be used to reduce the size of the House by ten seats with each successive census. That proved too Utopian but in 1931, after a very long campaign, Congress finally did fix the size of the House at its existing 435 seats and also provided for regular reapportionment according to a plan Dr. Willcox himself had derived from the principle of “major fractions” originally formulated by Daniel Webster. Walter Willcox' contribution to this achievement received unprecedented tribute from Senator

Arthur Vandenberg, the sponsor of the bill, in a letter to Cornell President Jacob Gould Schurman. Some of Dr. Willcox' personal satisfaction in this accomplishment was diminished, however, when a group of Harvard mathematicians persuaded Congress to adopt a rival statistical formula for reapportionment. Never convinced of the validity of the "Harvard method," he continued throughout the remainder of his life to perfect and advocate his own system, and to urge to apparently hopeless cause of reducing the size of the House. His last appearance before a Senate judiciary subcommittee hearing on this subject was in 1959 when he was ninety-eight.

The role Walter Willcox played in national and international organizations can only suggest the nature and extent of his influence in the developing field of statistics. In 1892 he joined the American Statistical Association, becoming its president in 1912 and a fellow in 1917. In addition, he was instrumental in bringing the United States into effective membership in the International Statistical Institute, which he himself had joined in 1899. He served as the United States delegate to its session in Berlin in 1903, and to most of its subsequent biennial meetings in various capitals throughout the world until his final appearance at Paris in 1961. Having been a vice president of the Institute since 1923, he took the lead in reviving it after World War II, and served as its president at the first post war meeting, held in Washington, D.C., in 1947. From that time until his death he held the title of honorary president. In addition, he was a fellow of the Royal Statistical Society and an honorary member of the Statistical Society of Hungary, the Czechoslovakian Statistical Society, and the Mexican Society for Geography and Statistics. He served as a member or adviser of innumerable statistical commissions and boards, the Census Advisory Commission, the New York State Board of Health, the International Congress of Hygiene and Demography (1912), and the World Statistical Congress.

Although each of his four books—*The Divorce Problem, A Study in Statistics, Supplementary Analysis, 1897; Derivative Tables, Twelfth Census, 1906; Introduction to the Vital Statistics of the United States 1900-1930, 1933; and Studies in American Demography, 1940*—made a significant contribution, it was through his innumerable articles, letters to the editor, and personal written and oral communications that he exerted his surprising influence, not only in the fields of statistics and economics but in the general affairs of the nation. If his attention was habitually attracted by the "facts," he had an extraordinary instinct for the right facts and great persistence in calling them and the problems and injustices they represented to the attention of his fellow citizens. Characteristically he was one of the very first to study the economic and social conditions of our Negro citizens; and it has been widely recognized that the recent Supreme Court decision establishing the principle of equal representation in state as well as national government reflects his efforts and influence. Both the problems of world government and the

United Nations and the affairs of Ithaca and New York State were for him serious preoccupations. When on the occasion of his one hundredth birthday he was asked to comment on his life, he astonished his audience by saying, “If I were to start all over again I think I would go into politics. I don’t think I would have been so successful at that profession, but I would have enjoyed it more.”

In spite of his extensive professional interests and accomplishments and wide travels, the focus of his life, at least next to his family, was surely the University. Having come early enough to know most of the great personalities in Cornell’s early history and notably, all of its presidents from Andrew D. White to James A. Perkins, he had an insatiable interest in anything that pertained to the history, growth, or welfare of Cornell. From 1902-1907 he was Dean of the Faculty of Arts and Sciences, from 1916 to 1920 faculty representative on the Board of Trustees, and from 1931 Professor Emeritus.

An inveterate attender of faculty meetings, he also sought and made informal occasions for faculty discussion. He took a major part in reviving the Faculty Club after World War II, serving as its first president and making a substantial donation to its library. It was in one of the club’s small dining rooms, most fittingly named the Willcox Room, that he met regularly twice a week with luncheon groups. He himself had founded one of these groups nearly forty years ago, and modeled it after a “round table” which he had been invited to attend at the Library of Congress during his stay in Washington at the turn of the century. Although he always referred to it as the Becker luncheon group because, as he explained, he had begun it to serve as an occasion for Carl Becker’s conversation, it has long since been known to others as the Willcox group. Its members have included many of Cornell’s most distinguished citizens from Carl Becker to Liberty Hyde Bailey, Dexter Kimball, and Miss Francis Perkins, to mention a very few. We all, guests and new members, came to appreciate the unobtrusive skill with which the quiet figure of Walter Willcox drew out and directed the conversation.

Walter Willcox was throughout his long life not merely a distinguished economist and citizen; he was a model of a nineteenth-century gentleman and scholar concerned with the fate of his fellow man. He managed the rare feat of keeping his interest up to date without relinquishing his hold on his original values. As nearly as any one man could, he seemed to embody the ideal around which Ezra Cornell and Andrew White had established the University.

Mario Einaudi, Felix Reichmann, Edward W. Fox

Harold H. Williams

August 29, 1907 — February 25, 1991

Harold H. Williams was appointed professor of biochemistry in Cornell's Graduate School of Nutrition and the Department of Biochemistry and Nutrition in 1945, one year after the department was established. He served as department head from 1955 to 1964, He retired as professor emeritus in 1973. During these years, he made a significant contribution to the excellence of biochemistry on this campus.

Professor Williams was born in Blanchard, Pennsylvania in 1907 and received a B.S. degree in agricultural biochemistry in 1929 from Pennsylvania State College. He was an undergraduate research assistant in their Institute of Animal Nutrition. He received a Ph.D. degree from Cornell in 1933 in animal nutrition, biochemistry and physiology. During his years as a graduate student, he served as a graduate research assistant in the Laboratory of Animal Nutrition. Following completion of his Ph.D. degree, he studied for two years as a Sterling Fellow at Yale University School of Medicine under Lafayette R. Mendel, one of the great pioneers in nutrition and biochemistry.

Immediately prior to his return to Cornell, Harold Williams spent four years in the research laboratory of the Children's Fund of Michigan, first as a research associate, then as assistant director and finally as associate director. Here he studied the nutrition of growing children. This organization has established standards of nutrition for normal children and has studied the vitamin and mineral composition of human milk and the nutritional problems of children afflicted with leukemia, anemia, nephrosis and diarrhea. While with this project in Detroit, Professor Williams was also a special chemistry instructor at Wayne University and at the Children's Hospital of the Medical School at Wayne.

At the same time, Dr. Williams and Dr. Icie Macy Hoobler, director of the research laboratory, also wrote *Hidden Hunger*, which was published just before Dr. Williams came to Cornell. This book, prompted by the worldwide nutrition problems pointed up by World War n, is a semi-popular text describing human food and nutrition problems.

Another project of Professor Williams while he was in Detroit during wartime dealt with the treatment of burns. As a civilian with the Office of Scientific Research and Development, he worked with Dr. John Hirshfeld, a surgeon who has since come to Ithaca, to determine the hitherto unknown connection between burns and human metabolism.

At Cornell, Professor Williams continued to study human nutritional requirements and explored various aspects of nitrogen and amino acid metabolism, the biochemistry of the digestive processes of ruminants, milk synthesis in man and animals, and the biological activity of selenium in microorganisms. He published more than 140 scientific papers on these subjects. In 1953, he was honored by being given the Borden Award of the American Institute of Nutrition for his studies on milk production. He was elected a Fellow of the American Institute of Nutrition in 1983.

During his tenure at the State College of Agriculture and Life Sciences, Cornell, Professor Williams served on numerous university and government committees including the Nutrition Research Advisory Committee of the U.S. Department of Agriculture; the Food and Nutrition Board of the National Academy of Sciences-National Research Council; the Nutrition Study Section of the National Institutes of Health; and the United Nation's Food and Agricultural Organization Expert Panel on Milk Quality. In 1971, as an authority in nutritional biochemistry, he gave expert testimony to the Senate Subcommittee on Labor, Health, Education and Welfare Appropriations. The objective was to urge the committee, by its support, to continue and enhance the international leadership of the United States in the life and health sciences. He also served on the editorial board of the *Journal of Nutrition* and as an overseas correspondent of "Nutrition Abstracts and Reviews". While in Detroit, Professor Williams was chairman of the Detroit section of the American Chemical Society, and in 1951 he was chairman of the Cornell section. He was also a fellow of the American Association for the Advancement of Science, a member of the American Institute of Nutrition, the American Society of Biological Chemists, the Society of Experimental Medicine and Biology, Sigma Xi, Phi Kappa Phi, Phi Lambda Upsilon, and Alpha Zeta.

As head of the Department of Biochemistry, Dr. Williams was very interested in the teaching program, encouraging the staff to attempt new courses and methods of presentation.

Professor Williams was married in 1935 to Agnes T. Gainey, a Cornellian and Ithacan. After he retired, he and his wife were on the golf course early on many a morning from the time that the snow had departed until cold weather came again. They were constant companions, sharing an interest in sporting events, concerts, other university functions and travel. Dr. Williams was extremely proud of his three daughters who were all Cornell graduates. After retirement, he and his wife enjoyed a family reunion each summer in the West.

He is survived by his wife, Agnes Gainey Williams of Ithaca, and daughters Patricia of Washington, D.C, Margaret of Encinitas, California, and Kathleen of Denver, Colorado.

Louise J. Daniel, Leon A. Heppel

Henry Shaler Williams

— *July 31, 1918*

The death of Professor Henry Shaler Williams having occurred in the last summer vacation when the University was not in session and the Faculty had no opportunity to adopt resolutions, it was voted to concur in the following resolutions of the Board of Trustees adopted August 3, 1918, and to record the same in the minutes of this Faculty:

The Trustees of Cornell University learn with great sorrow of the death of Professor Henry Shaler Williams, Emeritus Professor of Geology in this University.

It is now nearly forty years since Professor Williams became a member of the teaching staff of this institution. During the long period of his services as teacher, from which he retired in 1912, he endeared himself to his students by his unselfish devotion to them; and during the longer period of his association with his colleagues in the Faculty and with members of the Board of Trustees he won their affection and respect by his sterling qualities as a man and his attainments as a scholar.

As a teacher he was very conscientious; he was especially strong as a teacher in his laboratory, where his close personal attention and his constructive criticism gave his students a training of incalculable value.

As an investigator he attained a very high rank. His studies of Devonian paleontology, of the geological history of organisms, and of the evolution and geographical and geological modification of the fossil faunas stand out as important contributions to the literature of these subjects. He was honored by election to the more important American and foreign geological societies.

Although his devotion to his students and his attainments as an investigator gave him eminence, yet to those of us associated with him he will be remembered especially because of his personality. His sweetness and gentleness of character and his thoughtfulness of others won him the love of all who were so happy as to know him. We mourn the loss to the world of a teacher and a scholar and our loss of a friend.

Herbert Howard Williams

May 28, 1903 — September 29, 1969

Herbert Howard Williams, registrar emeritus and former director of admissions, died September 29, 1969, while on vacation at Wappoissett, Cape Cod. He was born in Brooklyn, N. Y., on May 28, 1903, the son of Herbert Howard Williams, Cornell '94, and Mabel Shaw Williams, and grew up in Ithaca.

Mr. Williams was a member of the Class of 1925 and received the degree of civil engineer in February 1926. As an engineer with the Port of New York Authority, he worked on the Goethals Bridge from Elizabeth, N. J., to Staten Island, the Bayonne Bridge, and the George Washington Bridge.

In 1933 he returned to Ithaca to become the first director of the Cornell student placement bureau.

From 1943 to 1945 he also served as assistant to Dean S. C. Hollister of the College of Engineering. In this position he worked with secondary schools and was chairman of the McMullen Scholarship Committee.

After World War II, Mr. Williams was appointed Cornell's first director of admissions. This department was created at that time to handle the large number of returning veterans applying for admission. During his seventeen-year tenure in that position, Mr. Williams instituted numerous innovations, such as the guidance counselor conferences, national school visitation programs, and a unified freshman scholarship program.

In 1962, he was appointed University registrar and to this area of University administration he brought new techniques for storing and retrieving students' academic records.

To each of these assignments, Mr. Williams gave a great deal of himself. His colleagues remember his unusual devotion to Cornell in each of these endeavors, as well as the smile with which he always greeted them.

In all his years at Cornell, Mr. Williams worked with students and, as he himself said, it was work he loved. He enjoyed "working with people" and he gave of his time to students far beyond the confines of his job. He and Mrs. Williams established in their home the Sunday morning coffee hours which are fondly remembered by many alumni.

Mr. Williams served as president of the Middle States Association of Collegiate Registrars and Officers of Admission in 1959 and served on the College Entrance Examination Board in several committee capacities. He was a member of the Eastern College Personnel Officers Association from 1950 to 1962. He was a former member

of the committee on college preparatory curricula of the Association of Colleges and Universities of New York State, and of the New York State Committee on College-High School Relations of the Metropolitan School Study Council.

Mr. Williams held many posts serving the Cornell faculty, among them chairman of the Committee on Registration and Schedules, executive secretary of the University Committee on Academic Integrity, and a member of the National Scholarship Committee, which was formed in 1947.

He was a member of the Rotary Club, at one time of the Chamber of Commerce, a charter member of the Ithaca Yacht Club, an undergraduate member of Psi Upsilon fraternity (and an adviser of the fraternity for thirty years), the Cornell Club of New York, the Cornell Faculty (Statler) Club, which he served as president for one year, and he was a sponsor of Cornell Plantations.

Gardening, sailing, carpentry, and photography were his hobbies. He was especially fond of sailing and he and his wife, Marion, owned with former Provost and Mrs. Arthur Adams a boat named the Four Admirals.

Mr. Williams leaves his wife, Marion Reese Williams, whom he married February 15, 1926, and two sons, Timothy Shaler (1928) and Herbert Howard (1930).

A memorial service was held in Sage Chapel on October 3, 1969. Mr. Williams willed his body to Harvard Medical College.

Robert W. Storandt, R. Peter Jackson, Solomon C. Hollister

Lawrence K. Williams

March 8, 1930 — February 3, 2005

Professor Lawrence K. Williams was a valued faculty member of the School of Industrial and Labor Relations for 45 years. Born in Bellows Falls, Vermont, Larry received his B.S. degree in Psychology from Tufts University in 1952, his M.A. degree from the University of Illinois in 1954, and a Ph.D. degree in Social Psychology from the University of Michigan in 1960. From 1954-56, he served in the U.S. Army as a research psychologist. Larry joined the ILR School as an Assistant Professor in 1961, and was promoted to full Professor in 1969. At the time of his death, he was Professor Emeritus in the Department of Organizational Behavior and had recently completed teaching his popular graduate course on organizational change. For 21 years, from 1969-75 and from 1982 until his retirement in 1997, he also served as the ILR School's Director of Graduate Studies.

As a social psychologist with a capital "P," Larry was recruited to the ILR School by Professor William Foote Whyte, who was then in the process of building the Department of Organizational Behavior and offered him a generous research budget to study white-collar automation in New York State. He subsequently published research on the effect of cultural differences on workers' attitudes, motivational constraints in industrial retraining, and the impact of technological change on individuals and organizations. In the 1960s, he and Professor Whyte were co-directors of a longitudinal and comparative research project, "A Study of Change in Peruvian Villages." Speaking of that project, Larry said that he was most proud of the book that they coauthored, *Toward an Integrated Theory of Development*, which became the basic training manual for the Peace Corps.

Larry was a beloved teacher and his courses were always popular with students. During his long career, he served on the committees of over 250 graduate students and acted as chair for more than 70 of them. As Director of Graduate Studies, he also took a personal interest in every student who entered the MILR Program. Students' remarks on his passing reflect a great affection for Larry as a teacher and mentor. Melissa Siebrecht wrote,

"Professor Williams was one of the kindest, most approachable teachers I've ever known. . . . Thank you for the advice and for posing the thought-provoking questions; especially for helping me to understand myself better when it came to issues of change."

Pete Fisher commented, "I really enjoyed Dr. William's class last semester. . . . I will never forget the fun we had learning about different cultures."

Devan Scott remarked, "As a non-traditional student, I received great support from Professor Williams. . . . I am grateful for the support and continue to see the results today."

Professor David Lipsky described Larry as a “connector,” someone with a special gift for bringing the world together. One way Larry brought us together was through his mentoring of junior faculty, serving as the ILR School’s institutional memory by connecting our past, present, and future. Professor Lipsky remarked,

“When I was an assistant professor, Larry was a kind of tutor. He especially taught me about the mysteries of the ILR School and the University. Larry knew as much about our institution as anyone I’ve ever met.”

Professor Lee Dyer remembers,

“The one thing that struck me about Larry, perhaps more than anything else, was how helpful he tried to be to junior faculty. When I came here the department hadn’t had an assistant professor in a number of years and really didn’t know what to make of me. Larry often ambled down the hall and stepped into that breach by offering a number of helpful hints, especially about time allocation, faculty relations (okay politics) and research. . . . Without question, his efforts helped to make my first few years on the ILR faculty a whole lot easier than they would have been otherwise.”

Janice Guthrie and Jennifer Borel described Larry in ILR Connections (Summer 2002) as

“a frequent source of information on anything ILR related . . . His current, unofficial titles include historian, lexicographer irregular, and quipster. Our motto when the written record proves inadequate is, ‘Ask Larry!’”

As the ILR School’s Director of Graduate Studies, Larry was most proud of being one of the founders and directors of GOALS, a foundation to support under represented minority graduate students in Human Resources and Industrial Relations. Together with representatives from sister programs, Larry designed, raised funds, and managed the foundation.

One of Larry’s hobbies was gardening, and he served as the ILR Gardener for many years. As Martha Smith observed, “When I look at the ILR gardens . . . I’ll think of him and how much he loved life.” His love of life was also reflected in the many organizations he supported with his generous contributions of time and money. These include the Family Reading Partnership, Heifer International Projects, the Sierra Club, Tufts University, and Cornell University. He also was the Past Commodore of the Ithaca Yacht Club, Treasurer of the Condominium Association of the Commodore Club in Naples, Florida, and a Board member of Ithaco.

Larry will be missed for his kindness, sense of humor, and endless array of stories. As Julie Sadler remarked, “He could always make me smile . . . [He] will be sorely missed around the halls of ILR.” Larry was one of those special people who always made you feel better when you talked with him. We looked forward to seeing him at work every day, stopping by each morning to check in, coming to lunch, and telling stories about the ILR School in the old days. He loved to tell jokes, and was an amazing punster. Indeed, almost every conversation with Larry

would start with a joke or story. After he retired, Larry spent the winter in Florida, which left a void in Ives Hall. We looked forward to his annual northern migration, and his showing up in Ithaca on or about May 5, like the swallows returning to Capistrano.

When asked, "How are you today?" Larry's common refrain was always, "Adequate." But Larry was so much more than adequate. He was a generous colleague, supportive mentor to his students, and a kind man to all he met.

His wife, Jean Starliper Williams, and their son, Jeffrey Freeman Williams, predeceased Professor Williams. His cousins, Susan Smith of Williamsburg, Virginia, and Tom Orth of South Mountain, Pennsylvania, as well as his companion and domestic partner, Jeanne Mueller, Professor Emerita, College of Human Ecology, survive him.

George Boyer, Tove Hammer, William Sonnenstuhl

Robin Murphy Williams, Jr.

October 11, 1914 — June 3, 2006

Robin Murphy Williams, Jr., the Henry Scarborough Professor Emeritus of Social Sciences, and a respected and beloved member of the Department of Sociology in the College of Arts and Sciences from 1946 to 2003, died June 3, 2006 in Irvine, California. He was 91 years old. He is survived by his beloved wife and life partner, Marguerite; his daughters, Nancy Elizabeth O'Connor of Santa Fe, New Mexico, and Susan York Williams of Binghamton, New York; his sister, Helen Coble of Mebane, North Carolina; and grandchildren Julia, Tara, Tyler, and Robin O'Connor. His son, Robin M. III, was born in 1942 and died in 1984.

Robin Williams was born October 11, 1914 in Hillsborough, North Carolina, the son of Robin (a farmer) and Mabel (a homemaker) Williams. He earned his B.S. degree at the age of 19 in 1933 from North Carolina State College, his M.S. degree in 1935 from North Carolina State College and the University of North Carolina. He studied at Cornell in the Department of Rural Sociology from 1935-36, and then went to Harvard University for graduate studies in Sociology where he received an M.A. degree in 1939 and a Ph.D. degree in 1943. At Harvard, Williams studied with a talented group of sociologists, including Robert K. Merton, during a formative period of 20th century American sociology led by Talcott Parsons and Pitirim Sorokin.

In 1946, Robin Williams joined the faculty of Cornell University as Associate Professor of Sociology and was promoted to full Professor in 1948. He was appointed the Henry Scarborough Professor of Social Sciences in 1967. He retired in 1985. He continued as an Emeritus faculty member to teach at Cornell in the Department of Sociology for nearly two additional decades until 2003. In 1990, he became affiliated with the University of California at Irvine, where he remained until the time of his death. His distinguished career as a Cornell sociologist was defined by both pioneering scholarly and institutional achievements. His influential monograph published in 1947, *The Reduction of Intergroup Tensions*, was the first systematic sociological study to organize research in race relations by developing a propositional inventory of the field. He was a co-author of the landmark four-volume study, *The American Soldier*, which was published in 1949 based on research conducted by the U.S. Army Information and Education Division during World War II. Robin participated in this study as a soldier-researcher on the front lines in the European Theater of Operations from 1942-46. In 1951, Robin published *American Society: A Sociological Interpretation*, which offered a magisterial interpretation of American institutions from a structural-functionalist framework. The book was reissued in a second edition in 1960 and third edition in 1970, and was acclaimed for its meticulous scholarship in reviews in the *American Sociological Review*, *American Journal of Sociology* and the

Social Forces. During the 1950s, Robin built a remarkably productive empirical research program on race relations (with John Dean and Edward Suchman)—the Cornell Studies in Intergroup Relations—funded by the Rockefeller Foundation. This led to a distinguished series of publications: *Schools in Transition in 1954*, a study of school desegregation co-authored with Margaret Ryan; *What College Students Think in 1960*; and in 1964, *Strangers Next Door*, an influential analysis (with Dean and Suchman) of race relations based on ethnographic interviews and survey research in Elmira and other cities. During the decade of research, many sociology graduate students received their training working with Robin, including Bernard C. Rosen and Melvin Kohn.

Robin M. Williams served as the 48th President of the American Sociological Association. His Presidential Address, “Continuity and Change in Sociological Study,” was delivered at the Association’s 1958 Annual Meeting in Seattle, Washington. He was Fellow of the Center for Advanced Study in the Behavioral Sciences at Stanford from 1961-62 and Visiting Scholar at the Russell Sage Foundation 1968-69.

He played a formative role in shaping the development of Cornell Sociology. From 1949-54, he was the founding Director of the Social Science Research Center at Cornell, an exciting and productive interdisciplinary center, which he led ably. He served as chairman of the then Department of Sociology and Anthropology from 1956-61. The committee he chaired in 1965 on the social sciences led to the construction of Uris Hall, the current location of the Departments of Economics, Sociology and Psychology. He was the founding Editor of the *Sociological Forum*, with Charles Hirschman and Victor Nee as associate editors. Established in the Department of Sociology at Cornell, it became the official journal of the Eastern Sociological Society.

As an Emeritus Professor, Robin continued an active and fruitful research career. He was the co-editor (with Gerald D. Jaynes) of *A Common Destiny: Blacks and American Society* (1989) a book sponsored by the National Research Council’s Committee on the Status of Black Americans. More recently, he published *The Wars Within: Peoples and States in Conflict* (2003). In 1999, Phyllis Moen, Donna Dempster-McClain and Henry A. Walker co-edited a *festschrift* to honor Robin M. Williams entitled *A Nation Divided: Diversity, Inequality and Community in American Society*. The author of more than 150 articles, monographs, and chapters in edited books, he was a member of the American Philosophical Society, the American Academy of Arts and Sciences, the National Academy of Sciences, and the National Research Council. Among other honors, Robin Williams received the Commonwealth Award for Distinguished Service and the American Sociological Association’s Career of Distinguished Scholarship Award. The Eastern Sociological Association established the Robin M. Williams Jr. Distinguished Lectureship Award in 1992 to honor Williams’ many contributions to sociology and the society.

Donna Dempster-McClain, Victor Nee, Phyllis Moen

Samuel Gardner Williams

Professor of the Science and Art of Teaching, Emeritus, and former Professor of Geology.

— *May 19, 1900*

The Committee appointed at the special meeting of May 21st introduced the following resolutions, which were unanimously adopted.

Resolved, that this Faculty has learned with profound regret of the death of their colleague, Samuel Gardner Williams, professor of the Science and Art of Teaching, Emeritus, and former professor of Geology. During an association of more than twenty years, Professor Williams endeared himself to his colleagues by his genial disposition, his public spirit, and his continual readiness to perform his full share of the various duties incumbent upon his office. His long and varied experience as a teacher through all the grades of instruction, from the country school to the University, gave him an admirable equipment for his position, to which he united a wide range of personal acquaintance with the teachers of the state, and great practical familiarity with educational movements and organizations.

This Faculty desires to record its appreciation of the public and private virtues of one whose name is now to be added to the lengthening roll of those who have had a prominent part in the councils of the Faculty, and in the successful development of the University.

Resolved, that we tender to the surviving family of Professor Williams an expression of our sincere sympathy, that these resolutions be spread upon the minutes of this Faculty, and that a copy be delivered to the family of our departed colleague.”

Source: Records, p. 127, June 1, 1900

Walter Long Williams

February 26, 1856 — October 23, 1945

Dr. Walter L. Williams was born February 16, 1856 near the present village of Argentina, Illinois. His early education was obtained in a country school followed by a year in the Presbyterian Seminary at Mt. Zion. After a year of school teaching, he entered the Illinois Industrial University, now the University of Illinois. Spending two years there, he became intensely interested in the subject which was to become his life's work. He continued his veterinary studies in the Montreal Veterinary College where he attended classes conducted by the great Dr. William Osier, graduating as honor student in the class of 1879.

Following graduation, he established a private veterinary practice in Illinois and became Assistant State Veterinarian. In 1891, ill health compelled him to enter a less strenuous field. For two years he served as professor of Veterinary Science at Purdue University following which he accepted a professorship in the Montana Agricultural College, Bozeman.

When plans were announced in the American Veterinary Review regarding the establishment of a College of Veterinary Medicine at Cornell, Dr. Williams wrote to Dr. Law and later came to Ithaca for an interview with President Schurman and Dean Law. He received the appointment of Professor of Veterinary Surgery, Obstetrics, Zootechnics and Jurisprudence and began his work in 1896, one of the original faculty of the New York State Veterinary College. He served in this capacity until 1915 when he was appointed Professor of Veterinary Obstetrics and Research Professor in diseases of breeding cattle. In 1911 he became a Professor Emeritus.

Dr. Williams was an inspiring teacher. He brought nearly twenty-five years experience as a practitioner in an extensive equine practice to his students. He was a thorough believer in learning by doing. Through his zeal, the clinics which are now an integral part of veterinary training were founded at Cornell. He was also the first to establish a course in Surgical Exercises. The training received from his clinics was invaluable.

During a sabbatical leave in 1910, Dr. Williams acted as veterinarian on the Parker ranch, the largest cattle ranch in the Hawaiian Islands. Later in 1919-1930, he spent a year on this estate where, as usual, he was wide awake to opportunity—here on a vast scale—for research and advancement of knowledge pertaining to disease in breeding animals.

The experience of sixty-five years in the veterinary profession added to intellectual curiosity and authority of leadership in his chosen field resulted in an impressive wealth of internationally recognized articles and books.

Of his books, his "Veterinary Obstetrics" and "Diseases of the Genital Organs of Domestic Animals" are used in many of our colleges as well as in those of other English speaking countries. Their translation into Spanish have spread their influence to South American schools as well as to Continental Spanish speaking colleges. "Veterinary Obstetrics" also has found its way into Italian instruction through an Italian translation.

Among Dr. Williams' contributions to veterinary science are the following:

The diagnosis in 1885 during his practice in Bloomington, Illinois of *dourine*. This was the first diagnosis of the disease in America.

The development of the roaring operation which was demonstrated to the English in London in 1909.

The poll evil operation.

The production of a surgical operating table for large animals which was duplicated in leading schools as well as in the U. S. Remount Station and adopted by prominent veterinarians.

The studies in genital disease.

Dr. Williams was an Associate Editor of the American Veterinary Review between 1890 and 1911; Editor for the United States of the Veterinary Journal of London between 1906 and 1908; President of the Illinois State Veterinary Medical Association from 1889 to 1900, the American Veterinary Medical Association in 1893, the New York State Veterinary Medical Society in 1906-07; an honorary member of the Iowa Veterinary Medical Association, a foreign corresponding member of the Society Centrale De Medicine Veterinaire of France; an honorary member of the Central Veterinary Society of England, and the Veterinary Society of Sweden.

Until his final illness, Dr. Williams was a frequent visitor at the College Clinics, always alert and interested. In January at the 1945 Veterinary Conference, when almost eight-nine years of age, he presented a paper, "Recollections of, and Reflections Upon Sixty-five Years in the Veterinary Profession."

At the time of his retirement in 1921, the faculty and alumni of the Veterinary College gave a testimonial dinner for Dr. Williams in Prudence Risley Hall. The large attendance, the speeches, the letters, and telegrams attested to the high regard in which the honor guest was held.

Again on the occasion of his eightieth birthday, the Veterinary faculty with some of the former assistants in his department gathered in Balch Recreation Room in honor of Dr. Williams' anniversary. It was a pleasant affair, an

evening of friendly good will of the kind one experienced in the cordial atmosphere of Dr. and Mrs. Williams' home.

A living likeness of Dr. Williams, painted by Olaf M. Brauner in 1911, was presented to the University by the Veterinary Alumni and may be viewed in the Flower Library.

J. N. Frost, H. J. Milks, Earl Sunderville

William Robert Williams

June 13, 1867 — November 17, 1940

Dr. William R. Williams, Professor of Clinical Medicine in the Cornell University Medical College, and consulting physician in the New York Hospital, died in the Hospital on November 17, 1940, after a long illness.

Dr. Williams was born in Watertown, Wisconsin, on June 13, 1867, the son of Evan Thomas and Anne Robert Williams. Later, the family moved to St. Paul, Minnesota, and his preliminary education was received in the public schools of that city. After graduation from high school, he entered Williams College, where he was graduated in 1889 with the degree Bachelor of Arts, and where, three years later, he received the degree Master of Arts. He returned to St. Paul after his graduation from college, and for two years he taught physics in the high school there. A keen interest in music, which was an outstanding characteristic throughout his life, was evident at that time, and he organized and led an orchestra in the school. During that time also a group of men from the railroad shops in St. Paul asked the Superintendent of Schools to provide for them instruction in electricity, which was then being installed in the shops. Dr. Williams volunteered to hold evening classes for this instruction. He often had in one class as many as sixty men, who were thus enabled to keep their jobs.

In the fall of 1891, Dr. Williams entered the College of Physicians and Surgeons in New York, from which he was graduated in June, 1895. He then had a year's training as interne at the Nursery and Child's Hospital in New York, and during 1896 and 1897 had a medical internship at the New York Hospital. This was followed by a year's residency at the Sloane Maternity Hospital in New York.

Dr. Williams' teaching experience was wide. His first appointment was as demonstrator in histology at the College of Physicians and Surgeons in 1897. In 1904, he became instructor in the Department of Materia Medica and Therapeutics. In 1908 he was advanced to the rank of adjunct professor, and later to that of assistant professor in the same department. In 1914 he was appointed Associate Professor of Clinical Medicine.

In 1899 his long connection with the Cornell University Medical College began with his appointment as lecturer on hygiene. In 1903 he was made instructor in medicine, and in 1932, when the Medical College was affiliated with the New York Hospital, he became Professor of Clinical Medicine.

During the early period of his medical career, Dr. Williams devoted part of his time to the General Memorial Hospital where he served as assistant pathologist from 1902 to 1904. He was also connected with the French Hospital as pathologist from 1902 to 1908 and as consulting pathologist from 1908 to 1916.

In 1905 he was appointed assistant attending physician at the City Hospital, New York, where he served until 1910. In that year he was made associate attending physician at the New York Hospital, and two years later he became attending physician. In 1932 he was made consulting physician, a position which he held at the time of his death. He was also consulting physician at the New York Infirmary for Women and Children, the Elizabeth Horton Memorial Hospital in Middletown, and St. John's Riverside Hospital in Yonkers.

From this record of his connections it is evident that Dr. Williams' chief interest was the practice of medicine. As he often said, his only thought was the care of sick people, and in his devotion to and his care of his patients he was unsurpassed. A large part of his time was devoted to his hospital work, and his contribution to medicine was chiefly in the clinical field. In his earlier years he published several articles in the current medical journals, and he was always intensely interested in and kept well abreast of all developments in medicine. For a number of years he held a clinic at the New York Hospital for the neighborhood doctors, presenting a discussion of interesting cases in his division. These clinics were always well attended and extremely interesting, and through them a close association between the hospital and the doctors of the neighborhood was maintained. His opinion as a consultant was frequently sought and highly valued, and among his patients he numbered many members of his own profession.

Dr. Williams was a member of the Century Association, the Williams College Club, and the Hospital Graduates' Club. He is survived by a widow and two sons.

Shortly after Dr. Williams' death a number of his patients and friends decided to raise a memorial fund with which to endow a bed in his name at the New York Hospital. It was felt that such a memorial would be in keeping with his own wishes, carrying on the help which he gave in such abundance to the sick during his lifetime. This fund was completed in a very short time, an indication of the high esteem and affection in which he was held. It will form a lasting memorial to a devoted and beloved physician.

Charles Edward Williamson

May 29, 1915 — May 30, 1996

Charles Edward Williamson, Professor Emeritus of Plant Pathology, died on May 30, 1996.

Professor Williamson was born in Newport, Indiana on May 29, 1915. He came to Cornell from Wabash College, an institution at which many young men had studied earlier under the tutelage of the illustrious Professor of Botany, Mason B. Thomas, and found their way into plant pathology at Cornell University. His undergraduate education culminated in the A.B. degree at Wabash College in 1937, and he then began graduate work at Cornell University. As a graduate student he was very helpful to other graduate students, particularly beginning students. He also was a good athlete and participated in many graduate student activities. Ed was a member of the Plant Pathology Volley Ball Team in 1941, which were champions of the Cornell Graduate League.

He was awarded the Ph.D. degree in 1949; the award delayed by service in the United States Armed Services from July 1942 to August 1946. Ed attained the rank of Captain and served as a meteorologist during the war. He lost much of his Ph.D. thesis material in a fire on Long Island, but when he returned from serving in World War II, he went to work and completed his Ph.D. degree in spite of this serious loss.

His assignment to the Cornell Department of Plant Pathology was made in October 1948, and Professor Williamson assumed duties in extension and research on ornamentals at the New York State Ornamentals Laboratory at Farmingdale, New York. Ed's early work was impressive as he demonstrated the relationship between ethylene production by leaf-spotting pathogen-host complexes and defoliation of affected leaves. He extended this work to show the practical importance of ethylene production by diseased plant tissues as it affects the keeping quality of flowers in storage or in transit.

Following this early work, was a series of contributions to the florist industry of New York State in the form of basic research for solution of specific grower problems, talks to audiences all over New York State and to many florists out of state at special schools and conferences, guidance to growers in outlining and carrying through successful cropping programs, and in many publications on control of diseases of florist crops. His work was concerned with soil sterilization and fumigation, nematode control, and the nature and control of numerous plant diseases affecting anemones, carnations, chrysanthemums, geraniums, roses, and snapdragons, among other flowers. Ed had a close relationship with growers, gaining their confidence and respect as he helped them with their many

cropping problems. He was particularly competent in diagnosis, and devoted many hours in the greenhouses and nurseries, helping growers to understand what was wrong, and then following through on his recommendations with them until the problem was solved. Ed's most recent work has been with control of foliar nematode disease of chrysanthemums, root rot of poinsettias, and geranium rust.

Aside from his professional accomplishments, Ed enjoyed square dancing, and he also worked with the Boy Scouts of America.

Ed is survived by his wife, Mildred Jane; two sons, Robert Bruce and David Lee; and a daughter, Judith Williamson Matthews.

Carl W. Boothroyd, William Mai, H. David Thurston

Hervey Clock Williamson

June 9, 1887 — February 1, 1951

Hervey Clock Williamson was born in 1887, at Islip, Long Island, the son of Gilbert and Isabel Clock Williamson. His forbears were of English and Dutch stock who established their homes in eastern Long Island and were among the early settlers of America. His father died during the first year of his life. He attended the Islip Grade and High Schools and with a firm resolve and initiative he managed successfully to finance his medical education and subsequently graduated in 1908 from the New York University and Bellevue Medical School. Under competitive examination he won a two year internship ending as house physician on the Third Division at Bellevue Hospital. By virtue of his industrious and faithful application to the study and care of his patients on the medical wards he developed a keen diagnostic acumen and perspective which made him a good doctor prior to entering his chosen specialty. He was then appointed on the Resident staff of the Manhattan Maternity Hospital and served in that capacity for two years.

In 1916, the late Dr. William E. Studdiford, Sr. became director of the reorganized combined gynecological service at Bellevue and among the six men he chose to work under him was Hervey C. Williamson. In 1917 the late Dr. Clifton Edgar, Director of Obstetrics on the Cornell Division and Professor of Obstetrics at Cornell University Medical College, appointed him as Instructor of Obstetrics at Cornell University Medical College and as Adjunct Assistant Attending Surgeon on the Second Division (the Cornell Obstetrical Division) at Bellevue Hospital. During the year 1918 he was appointed to the Junior Attending Staff at the Manhattan Maternity Hospital. He also served for a time as Assistant in Gynecology at the Memorial Hospital, as well as Attending Obstetrician at the John E. Berwind Free Maternity Clinic. Later, he received an appointment as Assistant Attending Surgeon at the New York Nursery and Child Hospital, becoming a full Attending Surgeon in charge of a service in that institution in the latter years of its existence. During the years 1928 to 1932, he served as Director of the Obstetrical Service on the Cornell Division at Bellevue Hospital, resigning in 1932 when Cornell terminated its service at Bellevue. Since 1932 he has held the title of Attending Obstetrician and Gynecologist at the New York Hospital.

Dr. Williamson held the following faculty appointments at Cornell University Medical College: Instructor in Obstetrics, 1917 to 1927; Assistant Professor of Obstetrics and Gynecology, 1927 to 1932. During the period from 1928 to 1932, under the Chairmanship of Dr. George Gray Ward, he acted as Director of Obstetrics at the Medical College until Dr. Henricus J. Stander assumed the Chair in 1932. From 1932 to 1941 his appointment was that of

Assistant Professor of Clinical Obstetrics and Gynecology, being promoted to Associate Professor in 1941 and, finally, in 1950, to that of Professor of Clinical Obstetrics and Gynecology.

Upon the organization in 1935 of an obstetrical service at French Hospital he became an Associate Attending Surgeon in Obstetrics and Gynecology under the late Dr. Frederick C. Holden. Upon the latter's death in 1944 he was chosen to succeed him as Director. In 1948 he was promoted to Attending Surgeon in charge of Obstetrics and Gynecology at that institution.

Dr. Williamson held appointments as Consultant in Obstetrics and Gynecology to Bellevue, the Margaret Hague Maternity, the New York Infirmity, the Beth David and Mary Immaculate Hospitals. He was a member of the New York County and State Medical Societies, the American Medical Association, a Fellow of the New York Academy of Medicine, the American College of Surgeons and the New York Obstetrical Society. He was a member of the Society of Alumni at Bellevue Hospital and a Diplomate of the American Board of Obstetrics and Gynecology. At one time he served as a member of the Medical Advisory Board of the Maternity Center Association. He was awarded recognition by being selected to hold the highest offices in several distinguished societies. He served as Chairman of the Section of Obstetrics and Gynecology of the New York Academy of Medicine; President of the New York Obstetrical Society, 1936-1937; President for two terms of the Medical Alumni of the New York University College of Medicine, 1944 to 1946 and President of the Society of the Alumni of Bellevue Hospital, 1947 to 1948.

In conjunction with the late Dr. Harold Bailey, Dr. Williamson developed an obstetrical forceps, subsequently named the Bailey-Williamson forceps, which is in extensive use today. He was the author, for the Oxford Outline Series, of a volume on obstetrics. He contributed numerous papers on various obstetrical subjects. Among those published may be found articles on cesarean section under local anesthesia, maternal and infant mortality, management of breech presentation, the obstetrical forceps, the extraperitoneal cesarean section, and the management of placenta previa.

Dr. Williamson possessed a sincere faith in mankind and an unselfish will to do good for others. He had a high sense of intellectual honesty which far superseded any thoughts of personal gain. In the practice of his specialty he did not hesitate to request consultation and help if he thought there was any possibility of increased benefit to the patient. He was a great man and a great leader without resort to showmanship or politics. His professional responsibilities always came first and for this reason he had little time to devote to his hobbies, such as sailing, fishing and photography.

Dr. Williamson was found to have an advanced neoplastic process which was in a sense held in check, allowing him to carry on in full activity with apparent cheerfulness and great faith in the future. His death on February 1, 1951, at the age of 63, was relatively sudden and was due to a cerebral hemorrhage from which he never recovered consciousness.

Dr. Williamson married Miss Lilly White who survives him as well as a son, John Hervey, whose profession is engineering and a daughter, Susan, an able obstetrician and gynecologist in this city who is a graduate of Cornell University Medical College.

In the death of Hervey C. Williamson this institution has lost a devoted, conscientious and valuable medical adviser as well as a staunch friend, greatly beloved by our fellow members.

R. Gordon Douglas

Lucille Williamson

December 12, 1893 — November 8, 1990

Cornell Professor Emerita Lucille Williamson died in Long Beach, California, on November 8, 1990, at the age of 96. She had been a member of the faculty of the New York State College of Home Economics for 28 years prior to her retirement in 1960. Professor Williamson held positions in resident teaching, research and extension service in household economics and management.

Professor Williamson received her Bachelors and Master's degrees from the University of Oklahoma and a Ph.D. degree in chemistry from Columbia University in 1923. She was a member of the faculty at the University of California from 1923 to 1928. She came to Ithaca when her husband, Professor Paul Williamson, began graduate work in agricultural economics.

When first in Ithaca, she participated in a study being conducted by Flora Rose of several thousand Belgian schoolchildren who had suffered from malnutrition during WWI. This study was initiated at the behest of President Herbert Hoover who had been recognized for his relief efforts in post World War I Europe.

Professor Williamson also helped to develop nutritious and economical cereals, particularly for use in New York City, to stave off malnutrition among poor families during the depression. The cereals contained a high proportion of skim milk mixed with/oats, wheat or corn. Eleanor Roosevelt sampled the cereal during a Farm and Home Week demonstration and later served the cereals at the White House to promote their adoption.

Professor Williamson's later work focussed on the performance and durability of household equipment. Her research provided the basis for extension publications which were widely used in programs throughout the United States. Professor Williamson directed many graduate students, including a significant number of foreign students, who remember her breadth of knowledge, her skill in directing research and also her genuine hospitality. Upon her retirement she spent several months in Europe and received a warm welcome from many of her former students.

Her home on Oak Hill Road was the favorite gathering place for faculty and graduate students in household economics and management. The good food, relaxed atmosphere and stimulating conversation were much appreciated.

She was a member of several professional organizations, including the American Standards Association, American Home Economics Association, Sigma Xi and Sigma Delta Epsilon. In Ithaca she was active in scouting, the PTA, League of Women Voters and the local chapter of her sorority, Alpha Phi.

Her husband, Professor Paul Williamson, a member of the faculty in agricultural economics, died in 1943. She is survived by her two children, James Williamson and Mrs. Barbara Ann Timmer; and three grandchildren.

Alice Davey, Rose Steidl, Jean Robinson

Paul Stuart Williamson

November 20, 1900 — April 18, 1943

The death of Professor Williamson on April 18, 1943, brought to a close a career at Cornell University that was brief in years but full in service and in the respect of his associates.

Paul Stuart Williamson was born November 20, 1900, in Fairfield, Iowa. Throughout his youth he lived in rural districts in Iowa, Idaho, and California. His future work was influenced by those rural surroundings and by his father's occupation as teacher, principal, and superintendent in public schools. In 1923 he was graduated from the University of California with a major in horticulture, after earning most of the expenses for his college education.

During the following seven years of county extension work in California, his curiosity led him into two minor research projects that sharpened his appetite for training in agricultural economics. Of his own initiative he started and carried through to completion farm management studies of apple farms and of prune farms. These studies were conducted without any special training for the job, yet the final reports showed his ability to analyze data and present results clearly, which continued to be characteristic of his work. Those studies were carried out while serving five years as assistant farm adviser in Santa Cruz County, and two years as farm adviser in San Benito County.

This interest in agricultural economics and a desire to study under the late Dr. George F. Warren were merged into the four years of study at Cornell leading to the degree of Doctor of Philosophy in 1934. His doctorate thesis reported a farm management study of fruit farms in the Hudson Valley. From then until his death, except for leaves of absence, he continued to serve Cornell University, and for the last eight years was in charge of teaching and research in farm cost accounts. In the summer of 1936 he went abroad for travel and attendance at the International Conference of Agricultural Economists. In the summer of 1939 he was engaged by the Colonial Government of Bermuda to supervise a study of the agriculture of that island, the report of which was made privately to that Government. During 1941-42, while on sabbatic leave, he served at the University of Louisiana as an exchange professor.

Professor Williamson's work was always marked by a high degree of initiative and originality. He developed, for instance, a loose-leaf system of records which facilitated the keeping of farm cost accounts, and he greatly speeded the work of analysis and publication of results.

Outstanding among the qualities by which Professor Williamson will be remembered by those who knew him should be mentioned his energy and mental initiative, a tremendous breadth of interests combined with exceptional ability to work carefully with details, ability to organize his work effectively, a rare open-mindedness of a type that did not prevent his arriving at a conclusion, absolute mental honesty and fearlessness in his search for truth, and a sincere liking of people. The longer and better one came to know him, the more one recognized these admirable qualities.

In the death of Professor Williamson, this Faculty recognizes a serious loss. His death at the age of forty-two cut short a career, the fruitfulness of which was assured by his ability, and by his habits of mind and work.

Scott H. Williamson

May 15, 1975 — March 14, 2008

Dr. Scott Williamson, Assistant Professor of Biological Statistics and Computational Biology, passed away on Friday, March 14, 2008 after a year-long battle with glioblastoma. A rising star in the field of population genetics, Scott was best known for his work on using diffusion models for inference of natural selection and demographic history from genetic data. He will be fondly remembered by all who worked with him for his brilliance, humble nature, and kindness of spirit.

Scott was born in Lawrence, Kansas, the son of Brad and Carol Williamson. He was a natural athlete and scholar and seemed to excel effortlessly in whatever academic field or sport he tried. From an early age, his parents and grandparents instilled in him a love of the natural world, and along with his sister, Erica, spent an idyllic youth hiking and camping in his native state. His fondness and encyclopedic knowledge of natural history was reminiscent of the founders of the field of evolutionary biology and provided exceptional training for his career as an academic biologist.

A gifted mathematician, Scott excelled as an undergraduate and graduate student at the University of Kansas, where he worked with Maria Orive, John Kelly, and Richard Prum, among others. His Ph.D. thesis under Orive, focused on developing novel approaches for rigorous inference of evolutionary forces from DNA sequence data. His breadth of study was quite remarkable and ranged from mathematical modeling of bird feather formation and pigmentation to inference of Human Immunodeficiency Virus (HIV) population dynamics to identifying signatures of natural selection from DNA sequence data.

In 2003, he joined the newly formed Department of Biological Statistics and Computational Biology at Cornell as a post-doctoral researcher working with Carlos D. Bustamante and Rasmus Nielsen. Here, Scott found an invigorating and collaborative environment that allowed him to blossom into one of the most productive young evolutionary geneticists of his generation. He worked tirelessly to tackle difficult problems including modeling the joint impact of natural selection and population size change on patterns of genetic diversity, developing population genetic theories of domestication, and scouring the human genome for statistical signatures of recent adaptive evolution in our species. In 2006, he chose to stay at Cornell as an Assistant Professor after fielding job offers from throughout the country. During his graduate career and time at Cornell, he authored and co-authored nearly 20 scholarly articles including papers in *Nature*, *Proceedings of the National Academy of Sciences (USA)*, *Proceedings*

of the Royal Society B, Genetics, Molecular Biology and Evolution, and the Public Library of Sciences – Genetics. Scott's work also caught the imagination of the popular press, and his research was featured in both *Discover* magazine (Top 100 Science Stories of the Year 2007) and the *New York Times*. Tragically, during his first year as a faculty member, he was diagnosed with an inoperable brain tumor that would ultimately take his life. Scott fought bravely and strongly making frequent trips to Rochester and Duke University where he was treated.

Although many of us knew Scott as a scientist and educator, he considered his most important role that of a husband and father. A doting partner and parent, Scott adored his wife, Shannon, and two young daughters, Emma and Claire. The Williamsons lived in Trumansburg, and loved their small village on Lake Cayuga. In the tradition of his parents, Scott and Shannon spent many hours with their daughters enjoying the natural beauty of the region, and traveled to the mountains and seas of the East coast.

Scott Williamson was a scholar, a father, a husband, and a great friend. He will be missed by all who knew him, and remembered fondly for having made our lives better.

Carlos D. Bustamante, Chairperson; Charles F. Aquadro, Andrew Clark

Elias Root Beadle Willis

— *November 22, 1959*

Elias Root Beadle Willis, Associate Librarian, Emeritus, of Cornell University, died on November 22, 1959. Mr. Willis was graduated from the University of Pennsylvania in 1901 with the degree of Bachelor of Arts. He became a secondary school teacher, and in 1913 he enrolled as a graduate student at Cornell where he studied classics and won the degree of Master of Arts in 1915. He was instructor in Greek at Cornell during the academic years 1918-1919 and 1920-1921; later he maintained this connection with teaching and research through membership in Phi Beta Kappa and the American Philological Association.

When Mr. Willis had completed his work for the Master's degree in 1915 he became superintendent of readers' services in the University Library, and here, in the Library, he lived out a long and useful professional life. He became assistant librarian in 1923 and associate librarian in 1930. When the affairs of the Library were managed by an administrative committee from 1929 to 1930, he had the most responsibility for oversight and direction of daily routine; and for a short period in 1946 he was acting librarian. He retired in 1947 and was granted the title Associate Librarian Emeritus.

During the long, busy period of his service to the Library he concerned himself as much with books and their contents as with the large, ever-changing staff—mostly students working part-time—who under his direction brought books from the recesses of the Library to the main desk for distribution to readers. He was a learned man who understood the scholar's problems and talked with authority not only about the merits of different editions and translations of a book but about by-ways of scholarship relating to the classics, literature, and history, studies in which he maintained a lively interest. He was a close friend of the late Professor Carl Becker, who at times sought his advice on questions concerning ancient Greece and Rome and who always put a high value on his judgment. Also he helped Liberty Hyde Bailey by creating the exact and official Latin names appropriate to new varieties of palms discovered by the eminent botanist.

To a whole generation of Cornellians, faculty and students alike, Mr. Willis personified the Library. On entering the main reading room one saw him at a raised desk to the right, sitting by himself, at first sight, as it seemed, an austere and reserved man, his body held erect, his face impassive. To enter the stacks one passed his desk, a busy man's desk, full of slips and notes, call-cards and the time sheets of his student workers. But he was never too

busy to answer a question or help in the search for a book. A question dissolved his austerity. He gave information exactly and generously and with the assurance of one who knew the resources of the Library to be rich and varied. His manner was somewhat withdrawn but self-reliant, his humor dry. He enjoyed conversation not only on points of scholarship, which occupied him most, but on contemporary affairs and even on the annual football game between his own Pennsylvania and Cornell. Nor was his interest in physical recreation merely that of an onlooker; during much of his life he took his exercise by rowing, sometimes journeying stage by stage around Cayuga Lake. In the summer months Mrs. Willis and he established their home on the West Shore of the lake, rowing the mile or so each morning and evening.

He was, until the last years of his life, a trim, vigorous man. In appearance and manner he changed but little. And so it was with his interests. His administrative work he performed quickly, quietly, and efficiently. He and his staff provided readers with the books they needed. Yet he was more than an able administrator. At all times he was in touch with the intellectual life of the University and made his own informal contribution to it. He was a steady, loyal, and warm-hearted companion. By his death our community has lost a man of much knowledge and wisdom, a scholar-librarian.

F. G. Marcham, F. B. Hutt, G. F. Sabine

Harold A. Willman

September 1, 1903 — July 14, 1999

Harold A. Willman was Mr. 4-H in New York State for over 50 years. He probably had a greater impact on the agricultural youth in this state than any other individual during the 20th century. Even now, years after his retirement at many meetings of livestock or dairy producers, someone will frequently inquire about Harold and reflect on the influence he had on them in their youth, or their parents, or even their grandparents; and how they remembered how he puffed his pipe and asked them about their calf or lamb or horse and indirectly about them and their future. We will never know exactly how many farm youth chose to become students at Cornell and then leaders throughout the state and nation because of Harold.

Harold was born on a farm in McKean County, Pennsylvania on September 1, 1903. After high school, he studied at Clarion State Teachers College and taught country school for 2 years before entering Pennsylvania State University where he received a B.S. degree in 1927 followed by a M.S. degree at the University of Minnesota. He worked as a county agent in Pennsylvania for a year before accepting a position at Cornell in 1929 as Extension Instructor of Animal Husbandry at an annual salary of \$2,600. From then until his retirement in 1964, he gave major attention to the youth phase (4-H) of livestock and dairy educational programs in New York State. His 4-H judging teams won national contests several times. He judged many of the livestock and dairy shows himself and usually selected the animals and youth that could participate in the State Fair. He also directed the youth livestock activities at the New York State Fair; but actually directed the youths themselves, more than their animals or their activities. He set high standards for all involved in the 4-H program.

His leadership in developing 4-H County extension agents and local leaders for the 4-H Club boys and girls was outstanding. The growing numbers of 4-H members necessitated the development of teaching methods and aids that could be used by the leaders. His well written bulletins, mimeos and 4-H Club manuals were widely used. His book entitled, *The 4-H Club Handbook*, received national acceptance and acclaim.

With his fantastic memory for both people and animals, it was not uncommon for him to recognize a 4-H boy or girl and tie this individual directly to their parents or even grandparents, and then remember the animal the grandmother had exhibited many years ago.

Professor Willman was honored for his meritorious service by many county and New York State organizations. These included the State Fair Board of Directors, the State Farm Bureau Association, the Dairy Cattle Breed Associations and the Empire Chapter of the Future Farmers of America. In addition, many county 4-H clubs gave him special recognition.

He was a member of Epsilon Sigma Phi, honorary extension fraternity, as well as Alpha Zeta and Alpha Gamma Rho.

Following his retirement in 1964, he was very active in the New York State 4-H Foundation and continued activities at the State Fair. He prepared teaching aids for youth group leaders. A main activity was a horse judging series that is used across the country and internationally.

Harold was also an avid sports fan and seldom missed a Cornell football or basketball game. His interest in the Animal Science Department continued long after his retirement, as he continued to attend department functions. He also continued to follow his alma mater, Penn State, throughout the years. He was especially pleased with former 4-H club members who became active members on Cornell sports teams.

Harold and his family established the Willman 4-H Fund in 1981, to support both the Department of Animal Science and the New York 4-H Foundation to enhance the development of youth through animal science projects and project activities. A small portion of the fund's income is also contributed to the Cornell Athletic Department.

Harold is survived by his wife of 65 years, Louise, living in Columbia, Missouri; and daughters, Jean Scott and Nancy Burton; grandchildren and one great-grandchild.

Robert H. Foote, Douglas E. Hogue, Harold F. Hintz

John Peter Willman

October 30, 1900 — September 8, 1963

John Peter Willman came to Cornell in 1925 as a staff member in Animal Husbandry Extension in charge of the 4-H livestock and dairy programs. Following excellent success in this work he joined the Animal Husbandry resident teaching and research staff in 1929 in charge of the Sheep and Swine Divisions. He served in this capacity until he retired in 1957 because of illness. His dedicated service of more than thirty years to students in the College of Agriculture and to the livestock farmers of New York was widely recognized and respected.

Professor Willman was a native of Kane, Pennsylvania, where he was born October 30, 1900. He obtained the B.S. degree from Pennsylvania State University in 1924. The Master's degree was earned at Kansas State University in 1925 just prior to his employment at Cornell. His Ph.D. degree from Cornell University was obtained in 1933 while he was employed in the Department of Animal Husbandry.

His wife, Anna Rogers Willman, a graduate of Cornell, served for a number of years as Home Economics Foods Specialist in various extension and research programs. Their children, Mrs. J. C. Showacre of Ithaca; Mrs. Philip Bartlett, Nantucket, Massachusetts; and James R. Willman, Frederick, Maryland, obtained all, or part, of their college education at Cornell.

Professor Willman was a member of Alpha Zeta, Sigma Xi and the American Society of Animal Science. He was also active in various livestock associations in New York.

Professor Willman was uniquely successful in maintaining strong interests in the three fields of teaching, research, and extension. In his teaching he stressed a practical approach to educational and agricultural problems, giving strong emphasis to the art as well as the science of livestock production. He especially enjoyed helping with the problems of individual students or farmers, and there are many who benefited from this help. He also enjoyed visiting livestock farms as well as conducting students and farmers on a tour of the College sheep and swine barns. He attended as many fairs, sales, and other livestock activities as time permitted.

His concern for students was appropriately recognized in 1951 when he was given the Professor of Merit Award. He was a faculty adviser to the Round-Up Club for many years and national president of the Block and Bridle Club in 1940-1941.

His research projects generally were directed toward the solution of practical problems of current concern to sheep and swine producers. One such problem was the “stiff-lamb” disease. He worked on this problem throughout his career, aided by various associates in the Department of Animal Husbandry and in the Veterinary College. The many experiments contributed notably toward a solution of this problem. In 1953, Professor Willman received the New York Farmers’ Award for achievements in livestock production.

Professor Willman’s many writings on sheep and swine subjects and his close contacts with livestock producers resulted in a host of acquaintances among farmers. This relationship brought him much pleasure and satisfaction. He would note the accomplishments of such farmers and stress any direct or indirect aid that might have been contributed by Cornell.

His colleagues gave “J. P.” deserved respect for his dedication and thoroughness. These traits plus his droll humor and complete loyalty to Cornell University were trademarks of his personality.

M. D. Lacy, G. H. Wellington, J. I. Miller

Benjamin Dunbar Wilson

October 14, 1889 — September 5, 1940

On September 5, 1940, occurred the untimely death of Benjamin Dunbar Wilson, Professor of Soil Technology, from injuries received four days before in an automobile accident at Warren, Ohio. Dr. Wilson was at the full tide of his career and in his passing Cornell University loses a most valuable member from her staff of research. His wide circle of friends attests his kindly nature and whole-hearted friendliness, while his scientific publications are a partial measure of his industry and ability.

Benjamin Dunbar Wilson was born on October 14, 1889, in Lexington, Kentucky, of ancestry that can be traced to the sturdy colonial stock of Virginia and South Carolina. He was educated in the secondary schools of Lexington and in 1906 entered the University of Kentucky where he specialized in chemistry. Graduating in 1909 with the degree of Bachelor of Science, he accepted a position as assistant chemist in the Kentucky Agricultural Experiment Station, at the same time pursuing graduate work in chemistry at the University. In 1914 his alma mater awarded him the degree Master of Science.

In September 1914 Professor Wilson came to Cornell University as an assistant and graduate student in the Department of Agronomy, and after three years he was granted the degree Doctor of Philosophy. By this time his ability was so manifest that he was offered an instructorship at Cornell, and two years later was made an assistant professor. During these years Dr. Wilson worked on various research projects and in close association with Professor Thomas Lyttleton Lyon. In 1934 he was made Professor of Soil Technology, a recognition of his research ability and his efforts in his chosen line of endeavor. His value in a more general way must not be overlooked, as he took a keen interest in university affairs and gave his time fully and freely to those activities that round out a faculty member's contribution to the administration and intellectual life of the institution of which he is a member.

Benjamin Dunbar Wilson was a modest, friendly man who gave Cornell University twenty-three years of unstinted service. His scientific contributions to the chemistry of soils are noteworthy especially in respect to the peat deposits of New York and their successful utilization. Not only this, but he had the knack of encouraging other people. Many faculty members and especially graduate students will long remember his kindly interest in their progress and his solicitude for their welfare and advancement. No written words can fully record the grateful memories he left in the hearts of his friends and associates.

Hugh M. Wilson

December 13, 1903 — January 29, 1984

Hugh Wilson will be remembered by his colleagues and friends throughout the state for his outstanding ability as a teacher. He could season a complicated, sometimes boring, soil-and-water-related subject with appropriate humor and demonstrations and thereby make the subject interesting and informative. He was born near Hancock, New York. Shortly thereafter the Wilson family moved to Steuben County, where Hugh worked on the farm and later managed the two-hundred-acre dairy operation. He was educated in the public school system of Steuben County and graduated in 1924 from the New York School of Agriculture at Alfred University.

His recognition of the need for erosion control and better land use stemmed from his early farm experiences and continued to his last days. The lean years of the Great Depression induced him to leave the farm in 1935 and enter the recently organized U. S. Soil Conservation Service as a trainee.

In six years he was promoted through various levels of responsibility to district soil conservationist, in charge of organizing and directing the work in Wyoming, Erie, and Livingston soil conservation districts.

Hugh's area of influence expanded when, in 1943, he was invited to join the New York State College of Agriculture as extension soil conservationist. During the next ten years he was instrumental in organizing more than thirty soil conservation districts throughout the state and in establishing the fundamental principles upon which they operate today.

Later in his academic career Hugh was appointed associate professor of conservation in the Department of Agronomy. In that capacity he further demonstrated his ability as an effective communicator, seizing every opportunity to work with other specialists in related fields, with county agricultural agents, with students and skeptics. If the door seemed to be ajar, Hugh Wilson was there to open it to the conservation cause.

A few examples illustrate the scope of his efforts and the techniques that he used as a teacher:

Hugh organized and conducted land-judging demonstrations for youth groups to give them a hands-on experience in identifying soil differences.

Sometimes referred to as "the gadgeteer with a purpose," Hugh built a portable "rain maker," which he set up for field demonstrations to simulate the effects of rainfall on erosion under various soil, slope, and cover conditions.

Oversized dice (possibly loaded) were used to illustrate the daily gamble farmers take with respect to weather conditions. Another gadget, dubbed the “one-armed bandit” was a cross between a slot machine and a roulette wheel. It was “programmed” to demonstrate land-use capabilities and “safe” cropping practices. Two pieces of equipment that were usually demonstrated together were the soil penetrometer and the infiltrometer. The penetrometer measured and recorded the force required to push a probe into the soil to a depth of twelve inches or more. The infiltrometer measured the rate at which a known depth of water was absorbed into various soil layers. Together they were an effective demonstration of how tillage practices affect soil physical characteristics.

Hugh Wilson authored several agricultural extension bulletins on erosion control, tillage, and drainage. He was a regular contributor to the County Extension News Service. He is also remembered as “the old curmudgeon” in the *American Agriculturalist*. In 1959 the honorary extension fraternity, Epsilon Sigma Phi, cited Hugh for “excellence in written materials—for his able manner in creating clear work pictures, based on proven practices in the field of soil conservation, and especially the work with county agricultural agents in creating and promoting agronomy workshops in New York State.”

While in retirement he wrote several books: one was titled *Hard Facts and Soft Sell, A Little Nonsense Now and Then is Welcomed by the Best of Men* and another, *Living Long Ago—No Runs, No Hits, Some Errors*. These and other publications reveal a philosophy and dedication that will be remembered by his many friends as well as his family.

Surviving family members include his wife, Margaret, of Bath, New York; two daughters, Lois Wilson of Albany, New York, and Mrs. James Klepeis (Elizabeth) of Reading, Massachusetts; and a son, Edward, of Brentwood, Missouri.

Paul Zwerman, Harry Kerr, Carl Winkelblech

James Kenneth Wilson

August 5, 1881 — July 28, 1948

James Kenneth Wilson, Professor of Soil Technology at Cornell University, passed away Wednesday, July 28, in the Waterbury Hospital, Waterbury, Connecticut. His decease was a great shock to his friends and acquaintances as during the summer he outwardly appeared to be in the best of spirits and health.

Professor Wilson is well known in this and other countries for his research in microbiology as he has published an unusually large number of valuable papers covering a wide range of subjects. Moreover, he has to his credit many graduate students who keenly regret his passing. As a teacher and director of research, he was enthusiastic, helpful and unusually patient. And his perseverance and industry were phenomenal. Few men possessed a more winning and likable personality—cheerful, friendly and cooperative.

While Dr. Wilson has explored many phases of microbiology, three lines of research, during his thirty-six years at Cornell University, have claimed his major attention. These, in order of the intensity of their investigation, were: (1) the nodule organisms of legumes and their cross-inoculation peculiarities and capacities, (2) methods of preservation of grass and legume silages especially in respect to keeping properties and quality, and (3) the presence of nitrates and nitrites in the plant foods of humans and domestic animals and their nutritional significance. His publications regarding these phases have won him wide recognition both at home and abroad.

Professor Wilson was born August 5, 1881 in Maryville, Missouri, and passed his boyhood days on a ranch in Oklahoma. Here he received his early education and here he acquired a love for and a curiosity in respect to plant and animal life. Conditions were hard in those days on the plains of Oklahoma, but, in his quest for a higher education, he was able to attend the Oklahoma Agricultural and Mechanical College from which he received the degree of Bachelor of Science in 1906. His scholarship and promise were such that he immediately was offered a position at the New York State Agricultural Experiment Station at Geneva, New York. Here, as assistant bacteriologist, young Wilson did his first real research, spending six productive years at this institution. It was during this period, from 1906 to 1912, that he finally decided in what particular field his life work was to lie.

Realizing the need of further scientific training, James Kenneth Wilson came to Cornell University in 1912 as an assistant in Plant Physiology and a candidate for a Ph.D. This degree was granted in 1914. Because of his excellent record he was offered forthwith and accepted an assistant professorship in Soil Technology at Cornell University, to pursue research and teaching in the field of Soil Microbiology. In 1919, Dr. Wilson was raised to a

full professorship, a position he ably occupied until his death. Professor Wilson was a member of Sigma Xi, the American Association for the Advancement of Science, the American Society of Agronomy, and the Society of American Bacteriologists.

Although a man of strong personality and intense enthusiasm, Professor Wilson never forced his ideas upon other people nor did he advertise his achievements. In fact, he was most modest and unassuming. His heart was in his work and advancement in material ways was a secondary consideration. He was a man of strong imagination and projected his ideas far ahead, yet he was not led afield thereby. Dr. Wilson, in spite of his 67 years, was still at the peak of scientific production. His passing, therefore, is not merely regrettable, it is a tragic loss to microbiological science.

H. O. Buckman C. N. Stark J. B. Sumner

Lyman Perl Wilson

January 21, 1883 — April 20, 1951

In his sixty-ninth year, about to become Professor Emeritus as of July 1951, but still committed to continue his instruction in Torts and Choice of Remedies during the academic year 1951-52, Professor Lyman P. Wilson was permitted, while engaged in the early morning preparation for the class-room, to end his work unexpectedly and peacefully.

Lyman Wilson was born in Leslie, Iowa, January 21, 1883. He received the B. S. degree from Knox College in 1904, and J.D. from Chicago University Law School in 1907. Knox awarded him an honorary LL.D. in 1924.

When he came to Cornell in 1921, as Professor of Law, he brought with him a wealth of experience as private practitioner and city attorney in Galesburg, Illinois, and as a teacher of law at Idaho, Oklahoma and George Washington Universities. At those institutions and later at Cornell and in summer sessions at Columbia and Chicago Universities, he taught nearly every subject in a law school curriculum. With that background, he was always found ready and willing to adapt his own program to accommodate situations resulting from changes in faculty personnel or to fill emergency gaps caused by illness. At Cornell, his chief study and instruction was in the law of torts and it was in that field that he wrote law review articles and published his case book, the third edition of which was in preparation at the time of his death. He had unique ability and extraordinary success in the conduct of a Practice Court. His students annually testified with enthusiasm to the benefits derived from practice before that court.

He could always find time, in his office or at his home, to give a hearty welcome and patient counselling to students who sought advice upon their personal or academic problems. They took his friendship with them into their careers and returned it with warmth and reverence.

In the faculty team, he was always a wheel horse, willing to pull more than his share of the load, cheerfully receptive to committee assignments and contributing good judgment and dispatch to the committees' deliberations and conclusions.

His temperament and good fellowship, his reputation for straight-forward expression tinged with humor and for sound reasoning bound by understanding and unselfishness inevitably attracted his impressment into service of the University and the community. He was almost continuously on duty with some important university committee,

such as the Committee on Inter-Faculty Relations and the Committee on Student Conduct. Off campus, he was an ardent Rotarian and president of the local Rotary Club in 1930-31; on the budget committee and vice-president of the Community Chest; three times president of the Council of Social Agencies between 1925 and 1935, and director of the Tompkins County Community Fund during the second World War.

Many will miss his community wide interest in people, his willingness to give unstintingly of himself as a speaker and adviser to many diverse groups both off and on the campus. His was a life of action, encouragement to others, and cordiality.

In the law school world, he had a host of friends, was a regular attendant at the annual meetings of the American Law School Association, participated in its round tables, served on its committees and was elected its president for the year 1943-44.

Professor Wilson was concluding his thirtieth year of devoted service to the Cornell Law School. He added to its distinction and contributed to the spirit of good fellowship between faculty and students. The liveliness of his personality will keep the memory of him vivid.

J. W. MacDonald, R. S. Stevens, B. P. Young

May G. Wilson

July 1, 1891 — June 14, 1971

Dr. May G. Wilson, age 80, professor of clinical pediatrics, emeritus, at Cornell University Medical College and consultant in pediatrics at the New York Hospital, died June 14, 1971, in Falmouth, Massachusetts.

To the thousands who were patients in Dr. Wilson's clinic at the New York Nursery and Child's Hospital and the New York Hospital during the Years 1916 to 1964, and to those interested physicians and students both in the United States and abroad, her name will be forever synonymous with rheumatic fever and rheumatic heart disease.

She was fortunate in having continued good health until the last few months of her life; her quiet and deep enjoyment of a lovely home and garden in Woods Hole, Massachusetts, was enhanced by affection for and from friends and family.

As a native New Yorker, she was educated at Hunter College and Cornell University Medical College and interned at Syracuse Memorial Hospital. After an initial period of about five years in general pediatrics, Dr. Wilson dedicated her career to the care of children who were afflicted with rheumatic fever or rheumatic heart disease.

She observed that this disease often occurred in more than one child in the same family. With unusual foresight and imagination, she organized a unique clinic for long-term follow-up of these patients and their families. The Commonwealth Fund and the Helen Hay Whitney Foundation enabled her to carry out her long-term projects. During almost half a century of devoted service and investigation, she made the following major contributions:

A. The importance of heredity in the etiology of rheumatic fever. Recognition of early stage of rheumatic carditis. Initiated the early short-term corticosteroid therapy to prevent or minimize the damage to the heart. Understanding of the natural history of the disease.

B. Author of two books on rheumatic fever and heart disease, which are being used as reference texts in most major medical centers around the world, and numerous publications on the subjects in various medical journals.

C. Challenging and dynamic teacher.

She was a member of many distinguished medical societies including the American Academy of Sciences, American Heart Association, American Rheumatism Association, American Pediatric Society, Society for Pediatric Research, and the Harvey Society.

Dr. Wilson's death has deprived the medical profession of a courageous and original investigator and a superb clinician.

W. W. McCrory, M.D.

Philip Duncan Wilson

April 5, 1886 — May 7, 1969

Medicine in general and orthopedic surgery in particular have lost one of their outstanding teachers, leaders, and colorful personalities in the death of Philip D. Wilson.

Educated at Harvard College, he graduated cum laude from the Medical School in 1912. At the outbreak of World War I, he joined Harvey Cushing in the American ambulance (Harvard) unit, in France and then was with the American Expeditionary Force until 1919. It was during 1916 that he met and married Germaine Porel, a volunteer French nurse.

Having been inspired by Robert Osgood and Sir Robert Jones, Dr. Wilson entered practice in Boston and began an academic career in association with Harvard Medical School.

In 1934 he was brought to The Hospital for the Relief of the Ruptured and Crippled as director and the following year was made surgeon-in-chief, which position he held until 1955. Several of the outstanding events which took place under his guidance follow: (1) The changing of the name of the oldest bone and joint hospital in this country to The Hospital for Special Surgery. (2) The building up and strengthening of the Residency Training Program to be known as one of the best in the world. (3) The establishment of a fellowship program in which foreign-trained orthopedic surgeons could come to The Hospital for Special Surgery for a year or two of special training. (4) Arranging the details and setting in motion the affiliation of The Hospital for Special Surgery with New York Hospital-Cornell University Medical College so that the Hospital would no longer be an isolated unit on Forty-second Street but a vital part of a large academic center, thereby insuring better patient care, teaching, and research.

The move to the present building in 1955 had hardly taken place before Dr. Wilson had raised enough money to erect the Caspary Research Building for basic and clinical research in orthopaedics and rheumatic diseases. Following his retirement as surgeon-in-chief, he served as director of research until 1962.

These are but a few of the many activities of Philip D. Wilson. He again went to the aid of our Allies in 1940 and established the American Hospital in Britain.

He considered his clinical professorship of surgery (orthopedics) at Cornell University Medical College one of his most appreciated distinctions. He held this professorship from 1951 to 1955, when he became emeritus clinical professor.

Dr. Wilson was an indefatigable worker not only in orthopedic surgery but also in play as well. He was an expert sailor, a good huntsman, a good golfer, and an ardent croquet expert. He never entered any of these sports without the desire to play his best and to win. A great sense of humor and a vast knowledge of human beings made him an ideal companion and friend of all of his residents and fellows.

In spite of his innumerable duties, Dr. Wilson was the author of a great number of articles on various aspects of orthopedic surgery, and of several books.

Following are the medical societies to which he belonged: The New England Surgical Society, New York County Medical Society, New York Academy of Medicine, American Medical Association, American College of Surgeons (regent), American Academy of Orthopaedic Surgeons (past president), American Orthopaedic Association, International Orthopaedic Society and Traumatology (SICOT), president, Ninth Congress, 1963, Pan-American Medical Association, Robert Jones Orthopaedic Club, American Board of Orthopaedic Surgery, American Rheumatism Association, Australian Orthopaedic Association, New York Surgical Society, Orthopaedic Research Society (past president), Royal Academy of Medicine (England, honorary), Cuban Surgical Society, Scandinavian Orthopaedic Society (honorary), Italian Orthopaedic Society (honorary), Hispano Orthopaedic Society (honorary), Peruvian Orthopaedic Society (honorary), and Royal College of Surgeons (Edinburgh, honorary fellow, 1965).

Honors conferred on Dr. Wilson include the Chevalier, Legion of Honor (France) 1947; Kings Medal, England, 1947; Honorary Commander Order of the British Empire, 1948; and Doctor *Honoris Causae*, University of Paris, 1966.

We shall all miss this great man of medicine, his foresightedness, his strength, and his love for his fellow man. Our sympathies are with his wife, Mrs. Germaine Wilson; his daughter, Mrs. George Finckel; and his two sons, Dr. Philip °. Wilson, Jr., and Mr. Paul Wilson.

Robert Lee Patterson, Jr., M.D.

Robert Rathbun Wilson

March 4, 1914 — January 16, 2000

Robert Wilson was a central figure in the flowering of high-energy physics in the last fifty years. He was the driving force in the creation of two of the four world class high energy physics laboratories in the United States; the Laboratory of Nuclear Studies at Cornell and the Fermi National Accelerator Laboratory (Fermilab) in Batavia, Illinois. His insistence on bolder, more economical design, seen clearly in the accelerators he built at Cornell, influenced the design of most modern accelerators. At Fermilab, first he built the world's highest energy accelerator, the 500 Gev (billion electron-volts) proton synchrotron, and later initiated the doubling of the energy by replacing the conventional magnets with super-conducting magnets. The latter technique made possible, both technically and financially, very high-energy accelerators. All subsequent and planned high-energy synchrotrons have used super-conducting magnets.

Wilson was born March 4, 1914, in Frontier Wyoming. He studied physics under E.O. Lawrence at the University of California at Berkeley, receiving a Ph.D. degree in 1940. He published his first paper while still an undergraduate, and as a graduate student, he published the first theoretical analysis of the stability of cyclotron orbits, and verified his analysis experimentally.

In 1940, he married Jane Inez Scheyer of San Francisco. They had three sons, Daniel R., Jonathon H., and Rand E. Wilson. In 1941, he accepted appointment as an Instructor at Princeton and was promoted the following year to Assistant Professor. In 1943, Wilson, together with his research group, joined the new Laboratory being set up at Los Alamos for the development of the "atomic" bomb. In 1944, he was chosen head of the Physics Research Division, which was responsible for the experimental nuclear physics research, and later for nuclear measurements that were made during the test of the first atomic bomb. Appalled by the destructive power of the bomb, Wilson worked effectively toward the end of World War II for civilian control of atomic energy. He was a leader in the formation of the Federation of Atomic Scientists, becoming its chairman in 1946.

After spending two years as an Associate Professor at Harvard University, Wilson moved, in 1947, to Cornell University, where he spent the next 20 years as the Director of the university's Laboratory of Nuclear Studies. At Cornell, he oversaw the construction of four successively more energetic electron synchrotrons. The second of these accelerators, a 1.2 GeV strong focussing synchrotron, was the first operating accelerator of this type. The following quotation from Wilson's 1953 report to the Office of Naval Research (ONR), describing the new project,

tells us much about Bob as an accelerator builder:

“The Laboratory has indulged itself in some high adventure. A new synchrotron has been designed which is to give over a billion electron volts of energy. The design is highly controversial in that the new machine is exceedingly small and cheap for what it will do, hence there is considerable risk that it may not work at all. On the other hand, if we are successful, we shall have the largest electron accelerator in the world and new areas of research will be opened to us.”

And it was a great adventure. Despite Bob’s warning to the ONR, the 1.2 GeV machine was very successful. Not only did it produce important physics, but its design paved the way to more compact, less expensive accelerators. What is also revealing is the candor of Bob’s proposal to the ONR. There was no guarantee of success, only the guarantee of a scientifically exciting project worth the risk involved.

The Cornell facility, alone among university facilities, has endured as an important center of experimental high-energy research in this age of giant national or international laboratories because it has always had an accelerator with some unique physics capabilities, built for a modest price. Wilson insisted on this during his tenure as director. His inspiring leadership, inventiveness, can-do attitude and commitment to keeping the Lab at the forefront have carried through to the faculty, students, and staff to the present day. The three subsequent directors were colleagues or students of his.

During his 20 years at Cornell, Wilson remained deeply embedded in the physics program, as both mentor and experimentalist. He performed extensive measurements of kaon and pion photo-production in which he made the first observation of a new state of the nucleon, N(1440). In a series of elastic electron-nucleon scattering experiments, he extended the work of Robert Hofstadter on the structure of the nucleon.

In 1967, after completing the 10 GeV Cornell Synchrotron, the fourth machine, Wilson left Ithaca to assume the directorship of Fermilab. Starting on a virgin site with no staff, he began the job of building the most ambitious accelerator project ever undertaken up to that time. In addition to the challenge of building a cascade of large accelerators in less than five years, Wilson promised to double the 200 GeV energy of the originally proposed accelerator, a promise that he fulfilled, making it the highest-energy facility in the world. He accomplished that feat primarily by designing magnets that had a smaller aperture and higher magnetic fields, thereby increasing the energy of the protons, which could be circulating in the same-sized tunnel. The achievement of higher energy at the same cost was a hallmark of Wilson’s career.

In 1980, the accelerator’s capability was more than doubled again to reach 1000 GeV by adding a super-conducting magnet ring in the same tunnel. (With characteristic foresight, Wilson had the original tunnel built with space

to spare.) Called the Tevatron, the accelerator was activated in 1980 and continues today to be the world's most energetic proton accelerator.

The Tevatron undertaking was vintage Wilson. To guide its circulating beams, the accelerator required about 1000 very accurate and reliable super-conducting magnets, which in turn, required an enormous leap forward in super-conducting technology. Wilson provided the project's vision and leadership and was devotedly and personally involved in the difficult R&D required to establish the mass production technology for bringing the project to a successful and low-cost conclusion. Without the technology, the capital and operating costs required for multi-TeV accelerators such as the Tevatron would be prohibitive.

Wilson built accelerators because they were the best instruments for doing the physics he wanted to do. He had very clear ideas of what the important physics problems were and these ideas had a strong impact on the experimental program. So far, the two most important physics results at Fermilab have been the discovery of the bottom quark (in 1977) and the top quark (in 1995). It was the redesign of the accelerator from 200 GeV to 400 GeV that made it possible to observe the bottom quark and the full energy of the Tevatron was necessary for the discovery of the much heavier top quark. The third and heaviest family of quarks "belongs" to Fermilab and to Bob Wilson.

Fermilab was an architectural, as well as scientific, triumph. With Wilson's involvement, the campus was designed with a grace and beauty rare in such facilities. The striking and memorable main building revealed another side of Wilson: the artist who believed that art and science should blend to form a harmonious whole. Wilson eloquently expressed this philosophy to Senator John Pastore on April 16, 1969 in testimony before the Joint Committee on Atomic Energy of the U.S. Congress:

Senator John Pastore: "Is there anything connected with the hopes of this accelerator that in any way involves the security of the country?"

Robert Wilson: "No sir, I don't believe so."

Pastore: "Nothing at all?"

Wilson: "Nothing at all."

Pastore: "It has no value in that respect?"

Wilson: "Only from a long-range point of view, of a developing technology. Otherwise, it has only to do with the respect with which we regard one another, the dignity of men, our love of culture. Otherwise, it has to do with are we good painters, good sculptors, great poets? I mean all the things we really venerate in our country and are patriotic about. It has nothing to do directly with defending our country except to make it worth defending."

In 1946, noting that protons deposit most of their energy near the end of their path, Wilson proposed using proton beams for cancer therapy. By controlling its energy, most of the beam's energy could be deposited in a cancerous tumor inside the body with little damage to healthy cells. At his suggestion, the Harvard cyclotron was used for cancer therapy—the first successful demonstration of the technique. In recent years, the use of proton therapy has grown rapidly in many different cancer treatment centers around the world.

Wilson was awarded the National Medal of Science in 1973 and the Enrico Fermi Award in 1984. In 1995, the Andrew Gemant Award was given to Wilson for “his outstanding work linking physics to the arts and humanities”. He was elected to the National Academy of Sciences, the American Academy of Science, and the American Philosophical Society. In 1985, he was elected to the presidency of the American Physical Society.

Wilson's effervescent personality came through in everything he did. He was a man filled with exciting ideas, inventions, and an array of interests in art, humanities, nature, and moral principles. These interests resulted in the restoration of the grasses of the Great Plains and the buffalo herds to the Fermilab site; his artistic stamp on the architecture at Fermilab; his personal sculptures at the laboratory, at other institutions, and in his own home; his civil rights efforts at Fermilab; his commitment to the Federation of Atomic Scientists (now the Federation of American Scientists) and American Physical Society; and his long-time work toward proton therapy.

Wilson's legacy to high-energy physics and the laboratories he built survives his death. This feeling was eloquently expressed by Judy Jackson, Director of Public Affairs at Fermilab, in a letter to Jonathon and Ann Wilson. She wrote:

“...it is probably impossible to overstate his (Bob's) influence on Fermilab. I think most of the time institutional memories are rather short: even people who play important roles are forgotten surprisingly quickly. That is emphatically not the case for Fermilab and your father. One cannot spend a day or an hour in the Laboratory without feeling his presence, in the architecture, the prairie, the accelerators and the attitude. For once, it is no cliché to say he lives on; he really does.”

And so he does, also at Cornell.

Karl Berkelman, Boyce McDaniel, Albert Silverman

Wilford Murry Wilson

January 24, 1860 — January 23, 1943

Of Wilford Murry Wilson, Professor of Meteorology, Emeritus, much may be said in honor of his long, loyal and distinguished service at Cornell University. Of forty years in the Weather Service, nineteen were at the station in Roberts Hall of the College of Agriculture.

Dr. Wilson was born in Espyville, Pennsylvania, on January 24, 1860. He attended Allegheny College at Meadville, Pennsylvania, from 1881 to 1885 and then was appointed as assistant observer of the Signal Corps of the United States Army, before its meteorological work was transferred to the Weather Bureau of the Department of Agriculture.

After five years at various stations he was put in charge of the station at Memphis, Tennessee, where in the six years of his assignment, he studied at and was graduated from the Memphis Hospital Medical College with the degree of Doctor of Medicine.

From Memphis, Dr. Wilson went to Detroit, Michigan, and was in charge of the Weather Bureau Station there for ten years. In 1906 he was transferred to the Station at Ithaca. Almost immediately he began to expand his services to include lecturing on meteorology to the undergraduates in the College of Agriculture. Within five years he became Cornell's first Professor of Meteorology, and had organized the first department of meteorology in any land-grant college.

His teaching service covered eighteen years of undergraduate instruction; during seven of those years graduate students also worked under his direction. In his years at Cornell he aided the agricultural extension program with special forecasts aimed directly at farm operations, such as successful haying, spraying, and harvesting, that depend upon a fore-knowledge of the weather. His development and maintenance of these specialized services through radio, and immediate telephone messages relayed from farm to farm, constituted a pioneer service.

Genial and kindly in all personal relations, he endeared himself to his colleagues in the College of Agriculture and Cornell University.

William Dexter Wilson

Professor of Moral and Intellectual Philosophy

— July 30, 1900

The special Committee appointed at the last meeting to draft resolutions on the death of the Reverend Doctor Wilson, reported the following resolutions :

Resolved, The Faculty of Cornell University having learned of the death of the Reverend Doctor William Dexter Wilson, for eighteen years Professor of Moral and Intellectual Philosophy and Registrar, and since 1886 Professor Emeritus, desire to express and put upon record their appreciation of his personal qualities and of his services to the University. Appointed at the very beginning of the University to the important positions he so long filled, he was one of the few professors who already possessed an extensive experience in collegiate administration and instruction. This experience was in those early years of great benefit to the University and was accompanied by the most unselfish devotion to its interests. His duties as Professor and Registrar gave him an intimate acquaintance with the whole body of students, to whom he endeared himself by his ready sympathy and tireless devotion to their advancement. His wide range of knowledge and ripe scholarship contributed to the progress of liberal studies, while his pure and consistent Christian life was a potent factor in moulding the character of the students of the University.

To his colleagues he was a loyal, unselfish friend, ever willing, when called upon, to impart the counsels of his rich experience, and whose influence was always exerted for peace and harmony.

Resolved, That these resolutions be accepted as expressing the sentiments of the Faculty and that a copy be sent to the family of the late Dr. Wilson.”

Source: Records, p. 136, November 2, 1900

William Abell Wimsatt

July 28, 1917 — January 9, 1985

William Abell Wimsatt died at his home in Ithaca, New York, after a courageous fight against cancer. He was born in Washington, D.C., the oldest of three sons of Alma Cheyney and William Church Wimsatt. After his father's early death Bill spent his summers on Chesapeake Bay and his winters in Tarpon Springs, Florida. Both environments inspired him with an enduring love of the out-of-doors. He developed such a keen interest in birds, especially birds of prey, that he trained several hawks for falconry and retained a lifelong interest in the sport.

When Bill was a student at St. John's Preparatory School in Washington, D.C., he attended a lecture by Professor Arthur A. Allen, the colorful Cornell ornithologist who triggered his strong desire to study at Cornell. His mother's serious illness prevented his coming to Ithaca for a time, but after her death he transferred from Catholic University in Washington to the College of Arts and Sciences at Cornell, where he spent his senior year. After graduation Bill became one of "Doc" Allen's graduate students in ornithology and soon published five communications on birds.

In 1940 Bill married Ruth Claire Peterson, a fellow student in Allen's ornithology class. Of their six children, Bill, Jr., Ph.D.; Michael, M.D.; John, A.A.S.; Mary, M. A.; Jeffrey, D.V.M.; and Ruth, B.S., five followed in their parents' footsteps in receiving degrees from Cornell.

When Bill took a course given by the distinguished embryologist Howard B. Adelman, he was inspired to broaden his interests and changed his major to anatomy and embryology with Dr. Adelman as his doctoral committee chairman. Bill was pleased that through Adelman he could trace his scientific lineage to the great seventeenth-century anatomist Marcello Malpighi. His sense of history, however, never hindered Bill in exploring new ideas and new methods, whether in research, teaching, or social relationships.

In 1943, after Bill had received his doctorate at Cornell, he became an instructor of anatomy at Harvard Medical School. In 1945 he returned to Cornell as an assistant professor of zoology; in 1947 he became an associate professor; in 1951, a professor of zoology, a title he proudly held until his death. He was an active member of the Section of Genetics, Development, and Physiology in the Division of Biological Sciences, and from 1945 until 1960 he also taught histology and embryology to students in the College of Veterinary Medicine.

One of Bill's outstanding traits was his absolute loyalty to family, friends, and the institutions he loved. It was this loyalty that made him accept onerous tasks willingly, knowing full well they would consume much of his time, his

energy, and his patience. Prior to the complete reorganization of the field of biology at Cornell, Bill was chairman of the Department of Zoology. During the planning of the shuffle it became clear that the Department of Zoology would be dissolved and that none of the new sections would even have the term *zoology* in their names. Bill was the vigorous and vociferous advocate of zoology, but once the die was cast, he called the chairman of the committee planning the reorganization and asked, "How can I help to make it work?" This loyalty to Cornell and its best interests had its counterpart in the loyalty his family, friends, and students felt for him.

It was inspiring to see Bill in the laboratory engaged in animated discussion with his undergraduates and graduate student assistants. In his inimitable way he impressed them with his ability boldly to integrate structure and function. No student who took his course ever forgot this experience.

In addition to serving Cornell on innumerable committees and as a faculty trustee (1960-65) Bill was the recipient of many richly deserved honors. He authored more than eighty-five publications for professional journals and served as the organizer and editor of a widely acclaimed multivolume series on the biology of bats, which was published by Academic Press. At the time of his death, volume four of *Biology of Bats* was in preparation. Bill was devoted to his professional societies, attended meetings as frequently as time permitted, and served as an associate editor of the *American Journal of Anatomy* for eleven years.

The imagination and attention to detail that characterized his research was evident in his cabinet making. He was a superb craftsman in whatever he built, whether it was miniature ships or chests of drawers.

One of his most prized possessions was a log cabin on a large tract of land in the Danby hills. Slowly and laboriously he added a Great Room with a fireplace that burned five-foot logs, and here he and Ruth graciously entertained graduate students, colleagues, and friends. It is on this land that Bill's ashes were scattered and that Bill became a part of the environment he loved so dearly.

Howard E. Evans, Ari van Tienhoven, Perry W. Gilbert

Fred E. Winch

June 16, 1914 — May 17, 2008

Remembering a Maple and Natural Resource Pioneer

From November 1943 to November 1975, Fred E. Winch was a pioneer of maple research and education in New York State. He led the way in maple producer education through establishing annual maple schools at over 15 sites around the state. His dedication to natural resource research and extension was very broad and included such topic areas as forest planning, forest taxation, tree plantation spacing, installing windbreaks, recreation, and wood use as fuel. Fred broke new ground in maple and woodlot research through assisting with the establishment of two research extension facilities in New York that still are active today, including the Uihlein Sugar Maple Research and Extension Field Station in Lake Placid and the maple program at the Arnot Forest. The benefits of these pioneer efforts are still helping maple producers and forest owners today.

Mr. Winch was born in Framingham, Massachusetts on June 16, 1914. He graduated from the University of Maine at Orono with a B.S. degree and received his Master's Degree in Forestry in 1937 from Cornell University. He was an Assistant and Associate Professor at Cornell University and served as the Extension Forester from 1943-75. He was Professor Emeritus at Cornell University since 1975. Fred became widely known for his knowledge of maple syrup production and marketing. He was an experienced forester specializing in the management of farm woodlots. He worked extensively with maple producers, woodlot owners and Christmas tree growers throughout New York State. At Cornell, he held a number of responsible positions including Director of Arnot Forest; Associate Director of NYS Cooperative Extension; Acting Chair of the Department of Natural Resources and Department Extension Leader. Fred provided significant support and leadership to organize the North American Maple Syrup Council and later to form a National Maple Research Council. He wrote extensively about the production and marketing of maple syrup including Extension Bulletins such as *Know Your Trees*, *Production of Maple Syrup and Other Maple Products*, *Planting Forest Trees in Rural Areas*, and *Judging Maple Products*. He assisted in producing the publication, *The Maple Syrup Producers Manual*. He was especially well known for his commitment to young people through his work with 4-H and Future Farmers of America.

In May of 1977, Mr. Winch was the first inductee into the American Maple Museum's Hall of Fame displayed at the American Maple Museum in Croghan, New York. In 1995, he received the Outstanding Alumni Award from the

Alumni Association of the College of Agriculture and Life Sciences at Cornell University. In 2004, the College of Agriculture and Life Sciences named Mr. Winch a Charter Member of the Liberty Hyde Bailey Leadership Society.

Mr. Winch continued to show his dedication to his community in retirement as a member of The First Baptist Church of Bradford, New Hampshire, serving as chairman of the Board of Trustees. He was a member and treasurer of the Bradford Historical Society and the Bradford Conservation Commission. Mr. Winch was a founding member of the Bradford Voters Coalition and was on the Bradford Town Facilities Committee of the Board of Selectman. He was a Director of the New Hampshire Timberland Owners Association from 1977-85 and was a member of the New Hampshire State Tree Farm Committee, the New Hampshire Forestry Communications Council, and a member of the University of New Hampshire Cooperative Extension Advisory Committee for Merrimack County.

Fred passed away Saturday, May 17, 2008 at the age of 93. His pioneering spirit is still remembered by many maple producers and forest owners throughout the world and many more continue to benefit from his foresight, dedication and hard work.

Stephen Childs, Chairperson; Tommy L. Brown, Mike Richmond

Charles Calvert Winding

August 12, 1908 — March 17, 1986

Charles C. (Chuck) Winding died on March 17, 1986, after a lifetime of dedicated teaching and service to Cornell. With Fred H. (“Dusty”) Rhodes he was a founder of the School of Chemical Engineering, and over a fifty-year period he saw it prosper, grow, and change. For thirteen of those years he was the director of the school, leading it successfully through some very difficult times.

Chuck was born in Minneapolis and received his B.S. and Ph.D. degrees from the University of Minnesota. In 1935 Dusty Rhodes asked him to join, with the rank of instructor, in the development of chemical engineering at Cornell. Chuck accepted and moved to Ithaca, where he spent the rest of his life. In 1936 he married Katharine (Kay) Cudworth, who survives him; he had met her at the University of Minnesota. In 1938 he was appointed assistant professor of chemical engineering. He became an associate professor in 1941, a professor in 1948, and the Herbert Fisk Johnson Professor of Industrial Chemistry in 1957. That year he also became the director of the School of Chemical Engineering, a position he held until 1970.

Professionally Chuck’s first love was teaching. Always friendly and helpful to students, he nonetheless demanded hard work, correct answers, and an appreciation of the breadth and diversity of chemical engineering practice. His weekly quizzes, graded 0 or 10, created near panic among fifth-year students in the 1940s. “An engineering answer has to be right,” he said. “A bridge that’s *almost* long enough isn’t worth anything.” He taught courses in chemical process design and organized several more in the developing field of polymer technology. Shortly before he retired, he restructured and modernized the undergraduate process design course and continued teaching it, on a part-time basis, for three years after he became a professor emeritus.

He was a strong proponent of the five-year bachelor’s degree program in engineering, believing that four years was not sufficient to give students adequate preparation for professional practice. But when the college abandoned the five-year program in 1965, he adapted well to the situation and saw to it that the strength and vitality of the chemical engineering program was not lost in the new curriculum. He had previously developed a professional engineering program in chemical engineering at the master’s level, which in large measure replaced the fifth year of the old program.

Chuck carried a heavy teaching load, especially early in his career, when he and Dusty Rhodes taught most of the courses in chemical engineering. In 1940-42, while Rhodes was occupied with the construction of Olin Hall,

Chuck taught nearly all the courses by himself while still contributing to the plans for the new building. During the war years his load increased still further, for under the accelerated schedule there were three terms each year and all courses were given each term. There were no vacations. When asked about that he merely said dryly, “I was glad when it was over.”

As a researcher, he was meticulous and thorough, skilled in asking the right questions and in devising experimental techniques to answer them. He never spared himself time or effort in his research work and was equally demanding of his graduate students. His fundamental studies of heat transfer featured truly innovative techniques, and in polymer studies, starting with his Ph.D. thesis on cellulose acetate, he was one of the pioneers. During World War II his group studied non-Newtonian flow and degradation of rubber latexes and solutions. The course he offered in synthetic plastics, beginning in 1943, was one of the first courses on polymers given in a chemical engineering school. For years he wrote the annual review of polymerization for *Industrial and Engineering Chemistry*. He also wrote two books on polymer technology—one with Leonard Hasche of Tennessee Eastman (1947), the other with Gordon Hiatt of Eastman Kodak (1961). His biographical profile was included recently in “Polymer Pioneers” in *Polymer News*.

In 1957 he became the director of the school, following Dusty Rhodes’s colorful career. He was more conservative than his predecessor but maintained Rhodes’s policies of concern for the professional development of his students. He did not favor the growing emphasis on research in the engineering college, despite his own prowess in research, since he believed it would inevitably reduce the attention paid to undergraduate education. Chuck led the school through the turbulent 1960s. He battled successfully against the forces that would have significantly reduced the amount of chemistry in the chemical engineering curriculum, modified and shortened the bachelor’s program from five to four years, and held everything together during the student disruptions of 1968-70. During that difficult period he established several new and much-needed options in the chemical engineering curriculum.

For almost twenty years he wrote the *Olin Hall News*, a newsletter to the alumni. He knew virtually all of the graduates personally and kept in close touch with many of them through the newsletter and at annual meetings of various technical societies. He was a fellow of the American Institute of Chemical Engineers and a distinguished member of the Society of Plastics Engineers. In 1983 he was named Educator of the Year by that society, and a few days before he died he received a certificate celebrating fifty years of membership in the American Chemical Society.

During World War II Chuck was a consultant to the Office of the Rubber Reserve. Later he consulted with Rome Cable and a number of other companies. For many years he was a director of the Cowles Company of Skaneateles. He was an avid sailor, competing with great success in meets and regattas on Seneca and Cayuga lakes. His sailboat, a Thistle, was appropriately named *Poly-Mer*. He was a past commodore of the Ithaca Yacht Club, a longtime member of the Seneca Yacht Club, and for many years secretary-treasurer of the Central New York Yacht Racing Association.

Chuck was a dedicated, sincere, conscientious, and caring gentleman with a host of friends. In 1973 a dinner organized by chemical engineering alumni was held in Philadelphia to recognize his many contributions to the School of Chemical Engineering and to the education and welfare of his students. Announced at that dinner was the establishment of the Charles C. Winding Scholarship Fund, made possible by contributions from alumni and friends. Over the years additional gifts have swelled this fund considerably. It will continue to keep his memory alive as it supports graduate students in the program he liked best of all—the professional master's degree program in chemical engineering.

Ferdinand Rodriguez, Raymond G. Thorpe, Robert L. Von Berg, Julian C. Smith

John P. Windmuller

December 4, 1923 — December 2, 2003

The passing of John Windmuller brings a special opportunity for reflection to those of us who shared many years on the faculty with him. Within a few years of joining ILR, this devoted son, brother, husband, and father—this master of Western European languages, piano, chess board, and the carpentry bench—by virtue of his love of teaching, administrative skill, imagination, discipline, and rigorous scholarship, added luster and developed profound institutional loyalty to Cornell.

John Windmuller was a model of modesty. Unless asked directly about his experiences in wartime France, he usually would not reveal his heroic leadership of other Jewish children seeking shelter in a French orphanage. Indeed, in his public life few would have guessed that before coming to the United States, John's immediate family had personally experienced Kristallnacht, the Dachau concentration camp, the voyage of the St. Louis, the dangers of being Jewish refugees on the run in Nazi Europe, and the tribulations of adjusting to Midwestern American life. Few knew that John was a World War II veteran or that he was active in postwar relief work for children in Europe.

By his own account, John's interest in the field of work and labor came from his experience in personnel administration in the U.S. Army during World War II and from courses taught by Emmett McNatt at the University of Illinois, where he earned a B.A. degree in 1948. He was also influenced by an uncle who, as an attorney, believed the ILR area was an up and coming field. John came to Cornell in January 1948 and wrote his dissertation on the influence of labor unions on American foreign policy, a subject that remained of interest to him throughout his life.

John received his Ph.D. degree from the ILR School in 1951 and joined its faculty that very year. He quickly assumed a central and prominent position in the School and in the field. As a member of the faculty, he was modest and did not seek the limelight. He was quiet and reserved and spoke softly. But, when he spoke, others listened—in part because he thought carefully and deeply about any and all issues, and in part because he was known as a person of unusual sincerity and integrity.

John's leadership was manifest especially in areas of scholarship and teaching. He was a creative, forward-looking scholar who understood the central importance of international/comparative relations in the field. He almost single-handedly made this a central feature of students' education from the early 1950s on. He created the first course on International and Comparative Labor Relations in 1951; when the School established its first

International Institute of Industrial and Labor Relations in the early 1950s, Dean Catherwood appointed him its Director. Directly or indirectly, John bears substantial responsibility for the range of international opportunities offered to our students over the last fifty years. John Windmuller remains “Mr. International” in the history of the ILR School and the field.

In his scholarly career, John Windmuller became the world’s leading expert on comparative labor relations. His work shaped the field and he received many accolades, including a silver medal from the government of the Netherlands for his work in that country. He also played an important role in expanding international work across the university, having been a member of the first Executive Committee of the Cornell Center for International Studies, headed by Mario Einaudi. In acknowledgement of his distinguished scholarship, he was awarded the first Martin P. Catherwood Professorship in the ILR School in 1983.

John’s dedication to scholarship and to the life of the mind was unsurpassed. He was brilliant, rigorous, and analytical. He demonstrated to generations of students and faculty that it was possible to be qualitative and institutional and yet rigorously analytical. He was a disciplined scholar and teacher, who seemed to read everything in the field and take notes on all that he read. John was an old-fashioned scholar: demanding, meticulous, methodical, a bit austere, and a bit severe. But just behind that facade was a warm, generous, and gracious human being, who was unfailingly helpful to young faculty members, and older ones too.

Those of us who joined the faculty after John had become a leading luminary in the ILR School learned three very valuable lessons by watching him on a day-to-day basis. The first is that John was a very active teacher and researcher until his retirement. We learned the importance of remaining professionally active and vital throughout one’s career. Second, when John retired from active teaching and became Professor Emeritus, we were able to benefit from his continued teaching one semester a year for the next several years. John eased gracefully into phased retirement. In that too, he served as a model for us to follow. And third, throughout the years we knew him, John always conducted himself with dignity and grace. He was a model of personal comportment.

When John transitioned from Professor to Professor Emeritus, we missed his daily presence at the School. Later, when he retired fully and could come to campus less and less because of his declining health, we missed him more and more. We continue to miss him today.

Gerd Korman, Edward Lawler, David Lipsky, Gary Fields

Henry Hiram Wing

Professor of Animal Husbandry

November 29, 1859 — Nov. 21, 1936

In the death of Professor Wing, Cornell University has lost one of the founders of her College of Agriculture, one of her ablest teachers and administrators, and New York State has lost one of her soundest, conservative agricultural leaders.

Henry Hiram Wing was born in New York City on November 29, 1859 but only the first four months of his life were spent there. His love for agriculture, his choice of an education, and his lifelong service in this field were largely determined by his early life and training on a farm in Dutchess County, New York. He entered Cornell in 1877, graduated with his class, and was honored by election to the office of class secretary for life. Soon after graduation he became Assistant Director of the New York Agricultural Experiment Station at Geneva, and two years later he went to the Nebraska Experiment Station where he served as instructor in agriculture and superintendent of the University farm, and as editor of *The Nebraska Farmer*. In 1888 he was called to Cornell to begin forty years' service, ending in his retirement in 1928. He first served as deputy director and secretary of the Experiment Station. In addition to these duties, he served for many years as Secretary of the College and, as well, as Professor of Animal Husbandry. Along with Roberts, Law, Caldwell, Comstock, Prentiss, Williams, and Bailey, Professor Wing was truly one of the founders of the College of Agriculture.

No higher compliment can be paid to a teacher than that his students wish to honor him. The work that Professor Wing did in tirelessly training students with meager equipment and few facilities is shown today by the great improvement in the Guernsey and Holstein breeds brought about by some of his former students. Through the efforts of a group of his old students, he was honored by having the coliseum at the New York State Fair named Wing Coliseum in 1934. It is fitting that this building should be so named. It typifies the fact that he trained some of the greatest judges and teachers of the art of livestock production and breeding in the United States.

Professor Wing believed in research and was a quiet, hard-working investigator. His many bulletins, especially those on the effect of feed on milk and fat production, and his development of the famous Glista family of Holstein-Friesian cattle are evidence of his painstaking thought and active mind. He envisioned the importance of records of production of milk and fat in breeding dairy cattle. As secretary of the Alpha Chapter of Sigma Xi for many years he was active in his relations with his colleagues in research. His book, *Milk and Its Products*, has long been a standard text.

New York State is the mother state in the development of the greatest of our breeds of dairy cattle, the Holstein-Friesian breed. Professor Wing early identified himself with this breed and much of the success of the early breeders is due to his retentive memory and attention to minute detail. His integrity and leadership gave just the right balance and security to the production records made in this breed in the early days. His fellow breeders later honored him by electing him President of the Holstein-Friesian Association of America.

In the years 1910 to 1920 in New York came a development in the cooperative purchase of farm supplies. As a staunch member of the New York State Grange, as President of the New York State Dairymen's Association, and as a life member of the New York State Agricultural Society, Professor Wing watched the interest in cooperation grow and he served well in the beginning by helping form the New York State Grange Exchange. Later he served as its president. From this modest beginning in cooperative enterprise has grown Ithaca's largest business enterprise, the Cooperative Grange League Federation Exchange, that now serves more than 75,000 patrons and purchases for them many millions of dollars worth of farm supplies each year. Thus, through the foresight, judgment, and business ability of Professor Wing, has the influence of Cornell been extended in a helpful, material way among the farmers of New York.

Professor Wing was loved by his students and by his friends in the University and outside. He has been remembered and honored by them. His fellow citizens showed their belief in his ability and straight thinking by electing him as one of the members of Ithaca's first Common Council in the years 1905-1909, where his knowledge of the city's financial problems made itself felt. But there was another side of his nature that must not be forgotten. He was loved in his church and found time to serve her, too. Here the prominent side of his character, the trust his fellowmen had in him, was manifest in his long service as treasurer of the Ithaca Congregational Church.

By this brief review of a quiet, many-sided, useful life as lived by Professor Wing, we are again reminded how beautiful and well ordered a man's life may be when he serves his University, his state, his church, his community, and his family, quietly and to the best of his ability. He died at Little Falls, New York on November 21, 1936.

Retired: June 1928 Fac. Rec., p. 1565

Lucius Arthur Wing

August 28, 1882 — February 17, 1946

Lucius Arthur Wing, Associate Professor of Clinical Obstetrics and Gynecology died at his farm in Southfield, Massachusetts on February 17, 1946. He was born in Columbus, Ohio on August 28, 1882. After graduating from Ohio State University in 1903, he studied medicine in Columbus for two years, then entered Cornell University Medical College in New York and received the degree of Doctor of Medicine in June 1907.

Doctor Wing served as Surgical Intern and House Surgeon in the New York Hospital from 1907 to 1909. He then served as Intern in St. Mary's Hospital until January 1910. He returned there as Assistant Surgeon 1914-1917, Associate Surgeon 1917-1934 and Attending Surgeon thereafter. He traveled in Europe in 1910 and 1911 and filled the position of House Surgeon in the American Hospital in Paris for several months.

When Doctor Wing returned to New York late in 1911, he decided to devote all of his efforts to the practice of Obstetrics and Gynecology. He joined the staff of the New York Lying-in Hospital in 1912 and served as Attending Surgeon until 1932. When the Lying-In Hospital became a part of the New York Hospital-Cornell Medical College Association in 1932, Dr. Wing was appointed Associate Attending Obstetrician and Gynecologist and Associate Professor of Obstetrics and Gynecology in the College. He was consulting Obstetrician to the Margaret Hague Maternity Hospital in Jersey City and the Nassau Hospital in Mineola.

Early in Dr. Wing's career it became evident that he was destined to be more than just a competent practitioner of his chosen specialty. His keen intellect, his broad and thorough scientific training and his inquiring mind, kept him constantly on the watch for improvements in technique, for new methods that could be applied to the practice of obstetrics to minimize the hazards of childbearing to reduce maternal and infant mortality. Among the many problems in clinical research to which he devoted himself, the study of pelvic roentgenography was one of the most important. In collaboration with Steele and McLane, he published a clinical evaluation of this procedure in 1938. Since that time x-ray pelvimitry has become standard practice in Obstetrics.

Because of his unusual technical skill and his strict adherence to the best principles of Obstetrical practice, Doctor Wing was an excellent teacher. His students were always impressed by his practical approach to the subject with which he was dealing. His discourse was simple and direct, his clinical demonstrations were presented with such clarity and completeness that the lessons learned were long remembered. He enjoyed informal discussions with

his students on all matters pertaining to their medical studies and they soon came to realize that he was not only a fine instructor but a good friend and counselor as well.

Doctor Wing was a man of great personal charm. His patients, his friends and all of his associates respected him for his high ideals and loved him for his friendliness, his unfailing good nature and his willingness to stand by them whenever they needed his help.

Lucius Wing is no longer here, but the place he left is not vacant; it is filled with pleasant memories.

Dr. G. W. Wheeler

Carl Seymore Winkelblech

June 28, 1918 — October 30, 1995

Professor Emeritus Carl Seymore Winkelblech, 77, died at his home on Graham Road in Ithaca, New York, October 30, 1995, after a courageous struggle with cancer. Born June 28, 1918, in Aaronsburg, Pennsylvania, he was a son of the late Paul M. and Ollie Treaster Winkelblech.

Carl received the B.S. degree in agricultural engineering from Pennsylvania State University in 1939 and the M.S. degree in agricultural engineering from Ohio State University in 1961.

Before joining the faculty at Cornell, Carl spent one year in the Engineering Department of the Oliver Corporation at South Bend, Indiana and 13 years with the USDA Soil Conservation Service where he was responsible for the design and construction of many large group drainage projects. He also designed hundreds of water storage structures. In 1953 and 1954, he served as a Niagara County Extension Agent where he helped establish the County Soil Conservation District. He also developed an overall county drainage plan with priorities based on land use capabilities. Carl was appointed an Extension Assistant Professor in August 1954 with principal responsibility for conducting educational programs in soil and water engineering and tillage machinery. He was promoted to Associate Professor in July 1959 and to full Professor in July 1967.

Professor Winkelblech's background and experience permitted him to develop outstanding educational materials in drainage, water supply, soil conservation and management, water resource development, and tillage. He was one of the early innovators in the development of equipment and techniques for minimum tillage. He built one of the first plow-plant machines. Carl worked extensively with growers to minimize compaction and soil management problems through proper tillage practices. As an example of his practical approach to farmers' problems, he developed equipment for ridge planting on muck soils that was enthusiastically accepted by growers. He also designed a strawberry runner cutter to implement a new technique in strawberry culture.

Professor Winkelblech provided leadership in the development of the Land Improvement Contractors' Association and was instrumental in inaugurating a highly successful training program for New York State land improvement contractors. He also worked extensively with golf course operators on drainage and compaction problems. Professor Winkelblech was a consultant on the technical staff of the "Temporary State Commission on Irrigation" during the summers of 1956, 1957 and 1958. He and Professor Hugh Wilson conducted a study for the Commission to

determine the feasibility of developing water supplies and the legislative requirements to distribute irrigation water to important agricultural areas of the state.

He organized and conducted many county and state plowing contests. He developed the criteria and rules for the conduct of these contests and used these principles as effective tools to teach good plowing and plow adjustment. He served as a judge at several national and world plowing contests.

His outstanding extension program in machinery management received national recognition from his peers by being awarded four Blue Ribbons in the American Society of Agricultural Engineers' Competition for TV short courses, movies, demonstrations and publications. He was a prolific writer, contributing over one hundred articles to *Extension County News* and farm magazines. He also authored three excellent college bulletins: "Basic Principles of Tillage", "Farm Pond Construction", and "Drainage Around the Home".

Carl worked closely with farm machinery distributors in New York State providing leadership in the New York State Tractor Club, and the New York Farm Equipment Dealers' Association. For many years, Carl was an integral part of Empire Farm Days, a major agricultural machinery exhibition.

As an authority on rural water supply and treatment, Carl developed and disseminated information that has aided countless New York State farmers and homeowners.

Professor Winkelblech retired on July 31, 1975, after 21 years of continuous service to the Department of Agricultural Engineering in the New York State College of Agriculture and Life Sciences at Cornell University. In October 1975, he was awarded the title of Professor of Agricultural Engineering, Emeritus.

He continued to utilize his knowledge and expertise in drainage after retiring. He aided many golf courses throughout the state in solving their drainage problems. He took particular interest in improving the drainage on the Robert Trent Jones Golf Course at Cornell University. "Wink", as he was known by his friends, became an avid golfer after being given a set of golf clubs for his work on drainage at the Cornell course. His most recent contribution was locating and designing a holding pond, between holes #1 and #6, for the anticipated course irrigation system. Wink played golf every day the weather permitted and frequently arrived at the course as soon as it opened. He looked forward to joining other Cornell retirees for a round of golf. Before his death, he was awarded a lifetime membership at the Robert Trent Jones golf course at Cornell. After retirement, Carl and Olive spent the winter months in Florida where he played golf and became an excellent surf fisherman. He supplied fresh fish to all his Cornell associates in the area.

Carl was a very kind and caring person who dedicated his life to helping others. He would do anything to help someone and never asked for anything in return. His family and grandchildren were most important in his life and they respected and loved him in return. Carl dedicated his life to educating, invigorating, improving and serving agriculture.

Professor Winkelblech is survived by his wife, Olive of Ithaca, New York; daughter and son-in-law, Mary Ann and John Beno of Freeville, New York; three sons and daughter-in-laws, Kermit and Sandra of Palos Park, Illinois; Dean and Kathy of Andover, Massachusetts; David and Helen of Hawley, Pennsylvania; eleven grandchildren; two great grandchildren; and a sister, Mary Stover of Aaronsburg, Pennsylvania.

Wesley W. Gunkel, Everett D. Markwardt, William F. Millier

Andrew Leon Winsor

October 30, 1890 — December 26, 1965

Andrew Leon Winsor was born in St. George, Utah. He received his A.B. degree from the University of Utah in 1920 and his A.M. from the same institution in 1921. He began his professional career as an instructor and director of teacher training at Weber College in Ogden, Utah where he served on the faculty from 1921 to 1926. This term of service was interrupted by a short period of study at Stanford University in 1924. He held an instructorship at Cornell University from 1927 to 1930 and completed all requirements and was awarded the Ph.D. degree in 1929. He was an Assistant Professor of Rural Education and Hotel Administration from 1930 to 1936, when he became a Professor in the Department of Rural Education. During the First World War he served as a private in the United States Army, and during World War II directed research for aviation pilots. From 1946 to 1955 he was head of the department of Rural Education and director of the School of Education. Professor Winsor became the first Dean of the School in 1955. He took leave from his responsibility in 1956 to become director of a Comparative Extension Education Project supported by a grant from the Ford Foundation. In preparation for this Project he visited a number of European and Asian countries in 1955. In 1957 he studied extension programs in several countries of Latin America. Although he retired in 1958, he continued to serve the Comparative Extension Education Project as its director until the summer of 1961. He returned to teach in his home state of Utah for several short periods, most recently during the summers of 1964 and 1965.

Andrew Leon Winsor will be remembered as a warm friend whose counsel many persons sought, whose company was enjoyed, whose achievements were admired, whose steadfastness in support of worthy educational developments were appreciated, and whose character was a model that many were challenged to emulate. Both in his many committee activities and in the classroom he was adept at bringing purposes into clear focus and in securing wide participation to achieve them. In all his teaching and leadership work, he was characterized by great personal modesty. By word and deed he expressed confidence in his associates and thus challenged them to strive for a high level of achievement. His willingness to serve and to accept responsibility for leadership was especially notable, even when the situations were new and fraught with difficulties. His ability to organize, to work well with others, to apply both common sense and high intelligence, brought uncommonly good results. He fully merited the high regard and warm friendship which he attained wherever he served.

Dr. Winsor had a strong research orientation based on his own studies in physiological psychology where he concentrated on the effects of caffeine and alcohol on human responses. He was one of the early researchers in this area to quantitatively measure reactions. The search for solutions to problems related to education caused him to be sought as a consultant by many school systems as well as by industrial organizations. He saw the significance of psychology in many aspects of life, and he became a leader in the applications of psychology to hotel administration. He taught in the School of Hotel Administration over many years and also carried forward research studies related to this area.

The need for help in underdeveloped countries caused him to plan and win approval for the Comparative Extension Education Project which brought extension leaders from many developing countries to Cornell for special studies. While working on this program he developed strong ties with individual students who were preparing for important leadership roles in their home countries. In relation to this Project he journeyed to many nations in Europe, Asia, and Latin America to observe and to study the social, economic, occupational and educational problems at first hand. The professional esteem and warm friendship growing out of this work brought many students to Cornell for advanced studies. His influence is perhaps best noted in Pakistan where an institution is named the Winsor School. The Winsor home in Ithaca was the place for friendship, understanding, and congeniality on the frequent occasions when the students from abroad were guests. Dr. Winsor came to be regarded as a world authority in extension education, and his influence on developments toward greater self sufficiency in many nations of the world was great and will continue far into the future.

Dr. Winsor was also concerned about conditions in his home community. He served for many years as director of the Ithaca South Side Community Center, was a member of the Ithaca Board of Zoning Appeals and the Ithaca Rotary Club, and served as the president of the latter in 1943. His loyalty to his church was well known. However, it was the Cornell community that demanded much of his thought and attention. Included in his activities were: chairman of the Board of Physical Education and Athletics, chairman of the Student Activities Committee, and director of the Cornell Veterans' Advisement and Guidance Center. Closer to his professional responsibilities were: representative of the Field of Education in the Graduate School, membership on the General Committee of the Graduate School, and services on many committees of the New York State College of Agriculture.

Among the scientific and professional organizations to which he belonged were: Sigma Xi, Phi Kappa Phi, Phi Delta Kappa, the American Psychological Association, and the American Association for the Advancement of Science.

One of Dr. Winsor's professional hopes for Cornell was the establishment of a College of Education with the Department of Rural Education as the core and with a professional staff drawn from several units of the University. He envisioned a Graduate School of Education to serve the leadership needs of the State of New York. This School he envisioned as having an independent state budget but also resources from the University. He stated his official hope in the following words, "My last official hope is that the interest of education for the young people of the state will outweigh political purposes and institutional rivalry, and that the best education for teachers we know how to provide, will be available at Cornell."

Leon, as he was known to many persons, demonstrated his belief in the importance of the individual in his many professional and community activities. He saw in every individual he knew, something of worth and promise. He was as free from prejudice and bias as any person could be. His daily life, as he lived it in association with others, was a testimonial to his religious and spiritual convictions. One of the little known facts about Leon was his long series of visits to the home of an infirm and aged friend who was otherwise cut off from the world. It was this type of dedication which illuminates the real character of the man. Thus he gave of himself to many responsibilities of life with distinction and fidelity. These included also his role as husband, father, and grandfather. He will be sorely missed by his colleagues and by his family, to whom he showed constant devotion. He is survived by his wife Ina, two daughters, and three grandchildren.

Robert A. Polson, Frederick H. Stutz, Philip G. Johnson

George Winter

April 1, 1907 — November 3, 1982

George Winter, Class of 1912 Professor of Engineering Emeritus, was born and raised in Vienna during a time of great cultural and intellectual activity. During his early childhood he developed his lifelong interests in music, art, literature, and the theater, as well as his enduring love for the outdoors and mountain climbing. After studying engineering for a year in Vienna, he moved first to Stuttgart and then to Munich, where he received his engineering degree from the Technical University in 1930. His first job was working on the construction of the first skyscraper in Vienna, an apartment building that still stands. In early 1931 he and Anne were married, and in April 1932 they journeyed to Russia, where George had secured a position in structural design and construction. Russia provided many opportunities for a young engineer in those days, and in addition to his engineering work, George had a teaching assignment at the mining institute in Swerdlowsk.

Their son, Peter, was born in August 1934. The increasing tensions of life in Russia in the mid-1930s convinced the Winters that they should return to Austria, which they did in early 1938. Soon after, they decided to come to the United States, and they arrived in Ithaca in August 1938. George enrolled at Cornell as a doctoral student in structural engineering and embarked on the first leg of his remarkable career in research, teaching, and professional practice.

George's entry into research on steel structures is an intriguing example of the right man being at the right place at the right time. By the late 1930s an expanding market for structures made of thin steel had created a demand for rational standards of design, and Dean Solomon Cady Hollister had obtained support from industry to conduct the required research. George Winter had the ideal educational background for the task, and his many years in engineering practice gave him precisely the right perspective for this design-oriented research program. He received his Ph.D. degree in 1940 and joined the faculty of the School of Civil Engineering immediately. His research led to the publication in 1946 of the first edition of the American Iron and Steel Institute Specification for the Design of Cold-Formed Steel Structural Members. Most of the research and the writing of this code, and of many subsequent editions, can be attributed to George Winter. It soon became the world-recognized standard for this type of construction and has been published abroad in many languages. Another result of this early work has been continuous steel industry support of Cornell structural engineering research since 1940, under George's direction until he retired in 1975 and since then under one of his former graduate students now on the Cornell faculty.

As an outgrowth of his work in thin steel structures, George Winter also became deeply involved in the writing of standards for heavier steel construction, serving for many years as a leading member of the committee responsible for the specification used in the design of most steel buildings in the United States. He also served as chairman of the Column Research Council, an organization that establishes directions for research in the stability of structures and provides guidance for incorporating research results into practice.

While most structural engineers in academia concentrate their research and teaching efforts in only one of the several common building materials, George Winter was an international expert in all three major modern materials—cold-formed steel, structural steel, and concrete. His interest in reinforced concrete structures spanned his entire professional career. His early work as a consulting engineer in Austria and Russia provided him with an appreciation for both theory and practical design and led directly to later research and publications on a wide variety of topics, including his pioneering paper on concrete folded plate roofs, a form of construction he introduced to the United States in 1947.

George devoted much time and energy to the revision and improvement of the Building Code of the American Concrete Institute (ACI), a document that not only governs the design of all reinforced concrete buildings in the United States but also serves as the model for numerous foreign specifications as well. His leadership in the ACI Code Committee led directly to an improved method of design for reinforced concrete structures. It was through his further efforts that a rational approach to structural safety, involving load and resistance factors based on probability theory, was introduced into the code.

George's influence on the development of reinforced concrete was further extended through his efforts as coauthor of the fifth through ninth editions of the book *Design of Concrete Structures*. This unique volume has been a standard reference work and textbook for almost sixty years, serving the needs of many generations of students and practicing engineers.

Although George Winter had a vast influence on many aspects of structural engineering research and practice, perhaps his greatest impact was in the role of teacher. As stated by Professor Floyd Slate in the preface to a commemorative volume published at the time of George's retirement in 1975, "The atmosphere which he consistently created in the classroom was exhilarating: the clarity, the stimulation, the thought-provoking questions, the personal interactions, the sincerity, the dedication—all of these things and more made his teaching both a challenge and an excitement." This same commitment to excellence and to nurturing the ability to think critically extended to the thesis advising of his many graduate students. He taught hundreds of engineers who have

gone on to become leaders in the structural engineering profession, including many Ph.D. students who are now faculty members at institutions all over the world.

George Winter became chairman of the Department of Structural Engineering in 1948 and served twenty-two years, during which time he brought international distinction to himself, to the department, and to Cornell University. He was named the Class of 1912 Professor of Engineering in 1963.

His presence was felt far beyond the College of Engineering; it extended to many Cornell community activities and to other national and international arenas outside engineering. He was a strong supporter of music, who took an active interest in the musical well-being of the Cornell community. He served on the Faculty Music Committee in the early fifties and was its chairman in 1954-55. For the last seventeen years he was chairman of the Friends of Music at Cornell (a group of local music lovers whose generosity has provided much-needed bursaries for many Cornell music students). George's great enthusiasm for intimate chamber music was the decisive factor in the maintaining and planning of the Friends' annual series of chamber music concerts at the A.D. White House. He was also a familiar figure at the many other concerts given on campus. His abiding love and deep appreciation of music and his warmth and loyalty endeared him to many musicians.

But music was only a part of George's broad interest in the humanities and the arts. He also cared deeply for the museum and the library and was a longtime member of the Andrew D. White and Herbert F. Johnson Museums and the Cornell Library Associates. He also served on the University Lectures Committee from 1966 to 1970. Prehistoric archaeology was another interest pursued by George Winter for many years. He was an avid member of the American Archaeological Institute and participated in the Smithsonian archaeological expedition to Egypt in 1966.

George Winter was elected to membership in the National Academy of Engineering and the American Academy of Arts and Sciences. He was also named an honorary member of the American Society of Civil Engineers and of the American Concrete Institute. He received three national awards from the American Concrete Institute: the Wason Research Medal in 1965, the Henry C. Turner Medal in 1972, and the Joe W. Kelly Award in 1979, as well as three national awards from the American Society of Civil Engineers: the Moisseiff Award in 1948, the Croes Medal in 1961, and the E.E. Howard Award in 1981. In September 1982 he received the coveted International Award of Merit in Structural Engineering from the International Association for Bridge and Structural Engineering "in appreciation of his outstanding contributions in research and teaching of structural engineering."

He was the author or coauthor of nearly one hundred technical papers and contributed to the *Encyclopaedia Britannica*, the *Structural Engineering Handbook*, and the *Building Structural Design Handbook*. He was awarded an honorary doctorate from his undergraduate university, the Technical University of Munich, and held a Guggenheim fellowship. He served as visiting professor at the California Institute of Technology; the University of California, Berkeley; and the University of Liege. He was a member of many technical societies and did extensive consulting in structural engineering.

George Winter was unique in being able to excel in so many roles: first and foremost, as a teacher who nurtured critical thinking, but also as an adviser, lecturer, researcher, colleague, author, member of professional committees, consultant to industry, developer of building codes, and leader of both engineering education and campus cultural life. He greatly enriched and expanded the horizons of his students, colleagues, and friends, and we all rejoice in having been part of his remarkable life.

His professional accomplishments were many, but his first love was for his family. He particularly treasured his summers in Maine with Anne. He took great pride in his son, Peter, and daughter-in-law, Madge, and he cherished his role as grandfather to Karin Anne and Christopher George.

John T. Hsu, William McGuire, Arthur H. Nilson, Richard N. White

William B. Wolf

June 9, 1920 – June 13, 2009

Bill Wolf joined the faculty of the ILR School in what was then the Manpower Studies Department in 1969, for one year as a visiting professor and subsequently as a resident member. He continued with the department through many, sometimes tumultuous, changes, several of which he initiated and championed both as chair and informal leader, until 1982, when he retired to Emeritus status. To say that Bill served the department, school and university with distinction is indeed an understatement. He is remembered as a dedicated scholar and teacher and somewhat of a renaissance man who had an amazingly wide range of academic and other interests.

Bill received his B.A. degree in Economics with highest honors from the University of California-Berkeley in 1942 (where he was, paradoxically but characteristically, both Phi Beta Kappa and captain of the wrestling team). He received his M.B.A. degree from Northwestern University in 1945 and his Ph.D. degree from the University of Chicago in 1954. Prior to coming to Cornell, Bill served on the faculties of the University of Washington (1954-58) and the University of Southern California (1958-69). After retiring from Cornell, he held visiting appointments at the Norwegian School of Management, Kyoto University, University of New South Wales, University of Hawaii, and the University of California-Irvine, among several others.

Throughout his distinguished career, Bill was a dedicated student of management. Initially, his focus was on personnel management (as it was then called). During this period, he wrote two specialized books on merit rating and wage incentives and then a widely used textbook, *Management of Personnel* (1961), accompanied by a teaching supplement of cases and exercises (1962). In the early sixties, Bill's attention turned to the development of contemporary management thought, an interest he retained until his death. Much of his work in this vein focused on legendary management thinkers, including Kurt Lewin, James O. McKinsey, and Peter Drucker. To this day, Bill is recognized as the world's leading authority on Chester I. Barnard whose amazing life and work he chronicled in three influential books: *Conversations with Chester I. Barnard* (1972), *The Basic Barnard: An Introduction to Chester I. Barnard and His Theories of Organizations and Management* (1974), and *Philosophy for Managers: Selected Papers of Chester I. Barnard* (1986). As an entirely fitting tribute to Bill's long and influential career, in 1984 he was the unanimous choice to edit *The Golden Book of Management*, a classic chronicle of leading edge thought and thinkers in the field.

Bill's dedication to research and writing naturally complemented his devotion to teaching and to students. While at the ILR School, he dedicated his efforts to updating both the name and focus of the Manpower Studies Department. The name became Personnel and Human Resource Management, which had a decidedly more contemporary and less sexist ring and, more important, better reflected Bill's desire to develop the department's curriculum into a "full-service menu" of leading-edge courses for future generations of managers. To this end, Bill not only introduced a number of new courses himself—most notably on organizational development and change—but also took the lead in assuring that every new hire into the department brought additional dimensions to fulfill the vision. In addition, Bill was tireless in his dedication to the development of his Ph.D. students, many of whom went on to have distinguished careers of their own. And notably, he was fond of putting his organizational development expertise to good use by orchestrating numerous informal get-togethers and other events surreptitiously designed to build camaraderie among the group he had assembled.

Bill was elected President of the Academy of Management in 1970, following many years of dedicated service to the organization. At the time, the Academy had 1,500 or so members and was growing slowly. As President, Bill introduced several major changes to the organization, most notably the formation of a divisional structure that served both to open up many more opportunities for participation in governance and to bring in new members with new interests. Under Bill's leadership, the Academy took on a new life and Bill's successor as President attributed much of this "to the stimulus of the new professional divisions". The Academy is currently the world's largest and best professional organization for scholars interested in organizations and management. It has 18,000 members representing 109 countries who participate in two-dozen divisions and interest groups. It is not an overstatement to say, as a recent tribute did, that, "The emergence of the Academy in its present-day form is Bill Wolf's legacy"

Bill leaves behind three sons—Peter, Steve, and Richard—as well as a legion of colleagues and friends who will miss him greatly. He also leaves behind a generation or more of managers and employees who may not know or remember his name, but whose professional lives have been profoundly influenced for the better as a result of his many contributions to the study and practice of management.

Lee Dyer, Chairperson; Samuel Bacharach, David Lipsky

Harold G. Wolff

May 26, 1898 — February 21, 1962

Dr. Harold G. Wolff, Anne Parrish Titzel Professor of Medicine (Neurology) at Cornell University Medical College and Attending Physician and Psychiatrist at the New York Hospital, died February 21, 1962, at the age of 63. Death occurred at the Clinical Center of the National Institutes of Health; he had been a patient there since suffering a cerebral thrombosis one week previously while attending a scientific meeting in Washington, D.C. He is survived by his widow, Isabel Bishop Wolff, and by his son, Remson N. Wolff.

Dr. Wolff was born in New York City, May 26, 1898, and was the only son of Louis and Emma Wolff. He was a graduate of the College of the City of New York in 1918 and of Harvard Medical School in 1923. He had been associated with the New York Hospital-Cornell Medical Center since its establishment in 1932, serving as head of the Neurological Service throughout that period. Dr. Wolff was also director of the Study Program in Human Health and the Ecology of Man at that Medical Center, and was consultant in neurology to the Manhattan Veterans Administration Hospital and the Franklin Delano Roosevelt Veterans Administration Hospital.

Following his graduation from medical college, Dr. Wolff was associated with the Cornell Clinic Department of Neurology and Bellevue Hospital 1923-1926, and with Harvard Medical College and Boston City Hospital 1926-1928. He was assistant in the Department of Psychiatry, John Hopkins Hospital, 1929-1931. After a year of foreign study, including work with the eminent Russian physiologist, Pavlov, he joined the New York Hospital-Cornell Medical Center, where he remained for the duration of his career.

Dr. Wolff was a leading authority on headache and on the circulation of the brain, an outstanding contributor to the understanding of the nature of pain, and an author of more than five hundred scientific papers and fourteen books in the field of neurology and neurological diseases.

He was perhaps best known for his studies of the participation of the central nervous system in human disease. His investigations of "life stress and bodily disease" profoundly influenced the modern concept of the nature of such illnesses as peptic ulcer, high blood pressure, and migraine headache. It has been said of him that "during thirty-five years of investigation he filled in the major outlines of the process by which a disturbance of the relation of a man to his fellow man may lead ultimately to the development of irreversible tissue damage and to death."

Early in his career, at a time when he was studying the role of the vessels of the head in headache, he developed the theory that the changes in the function of these vessels, which he found to be the primary source of the pain, were the result of disturbances originated in the brain as a part of the reaction of the headache sufferer to his "life situation." From that time forward he conducted a series of experimental investigations into the reactions of men to their life situations and the effect of these on the functions of various internal organs. Out of these investigations he developed the concept of the "adaptive reaction pattern," demonstrating that man's reaction to his environment can appreciably influence the course of disease. Ultimately he concluded that there is no special category of disease that is "psychosomatic" but that all human illness is influenced by adaptive reaction patterns initiated in the higher centers of the brain.

In his later years Dr. Wolff and his colleagues turned to the study of "life stress" and the effect of social and cultural patterns upon health. They produced evidence suggesting that people whose life situations are threatening, demanding, and productive of conflict have illnesses of many types. As an incident in this aspect of his studies Dr. Wolff was a leader among the group of scientists who investigated the methods of interrogation and indoctrination used by the Communist state police, the so-called "brain washing" phenomenon.

Within the past year his studies of a new medication for the prevention of headache helped clarify further the nature of head pain. In perhaps his most brilliant recent contribution, he discovered a substance, named "Neurokinin," apparently liberated at nerve endings, which is associated with pain and inflammation.

Dr. Wolff was, at the time of his death, president of the Human Ecology Fund, editor-in-chief of the *Archives of Neurology*, editor for diseases of the nervous system in the Cecil Loeb textbook of medicine, consultant in research and development to the Department of Defense, and a member of numerous other research committees. During 1960-1961, he was president of the American Neurological Association.

He was a member of the Association of American Physicians, the American Society for Clinical Investigation, the American Physiological Society, the American College of Physicians, the American Neurological Association, the Century Association, and the Harvard Club.

Dr. Wolff was the recipient of many awards, including the Louis Livingston Seaman Award of the Association of Military Surgeons in 1960; an Oxford (England) Honorary Lectureship at the Symposium on Mental Health in 1959; and many other distinctions. He was president in 1942-1943 and again in 1949-1950 of the Association for Research in Nervous and Mental Disease and editor of the "Proceedings on Pain."

To his colleagues and students at the New York Hospital Harold Wolff will be remembered as a dedicated teacher, a brilliant clinician, a professional investigator, and a stimulating friend. His death is recorded with deep regret.

Helen Goodell, Lawrence E. Hinkle, Jr., E. Hugh Luckey

Jacob Wolfowitz

March 19, 1910 — July 16, 1981

Jacob Wolfowitz was born in Warsaw, Poland, and came to the United States when he was ten. His father had immigrated earlier, but the outbreak of World War I left the rest of the family stranded in Poland. They survived under very difficult circumstances during the war years.

Wolfowitz's formal education began in the Brooklyn public schools in 1920. By 1931 he had obtained his Bachelor of Science degree from the College of the City of New York. The Great Depression, responsibilities to his family, and marriage in 1934 forced him to seek employment, partly teaching in a vocational high school and partly as a stock clerk. Nevertheless, he obtained his Master of Arts degree from Columbia University in 1933 and a Doctor of Philosophy degree from New York University in 1942, studying and writing his thesis "on the subway," as he said.

In 1938 Abraham Wald, a refugee from Vienna, came to Columbia to begin a distinguished academic career. He and Wolfowitz met and began a close collaboration that continued until Wald's death in 1950. They published two joint papers in 1939 and 1940, before Wolfowitz obtained his Ph.D., and Wald was also the de facto sponsor of Wolfowitz's thesis.

In 1942 the Statistical Research Group was formed by Harold Hotelling at Columbia University to do war-related research. Wolfowitz left high school teaching and joined Wald and others there until 1945. It was there that Wald discovered and developed sequential analysis, and in 1948 this led to the famous paper written jointly with Wolfowitz, "Optimal Character of the Sequential Probability Ratio Test."

Jacob Wolfowitz's first academic appointment was as associate professor at the University of North Carolina in 1945. He came to the newly formed Department of Mathematical Statistics at Columbia University at Wald's invitation in 1946. The death of Wald in an airplane accident in 1950 was a deeply personal and professional loss, loosening Wolfowitz's ties to Columbia University. At the invitation of Ithaca friends Wolfowitz spent the summer of 1951 at Sheldrake on Cayuga Lake. During the visit, there developed associations with members of the Cornell mathematics faculty that led to an offer of a professorship. Coming to Cornell in 1951, Wolfowitz brought with him, as an assistant professor in the Department of Mathematics, Jack C. Kiefer. They became close collaborators, and Kiefer later attained great distinction here and elsewhere before an untimely death in 1981. In the years that followed, Wolfowitz's presence at Cornell influenced Robert E. Bechhofer, Roger H. Farrell, and Lionel Weiss to come and stay at Cornell.

The Cornell period was marked by an astonishing variety and quantity of innovative work of the highest quality. There were papers (some joint papers with Kiefer) on inventory theory, minimum distance methods, stochastic approximation, theory of queues, estimation of distribution functions, optimal design in regression, and information theory. Here, in 1961, he wrote the first edition of his book *Coding Theorems on Information Theory*. Because of the importance of this subject, research continued, and the third edition appeared in 1978. Here also began the collaboration with Lionel Weiss on maximum likelihood and maximum probability that culminated in 1974 in their book *Maximum Probability Estimation and Related Topics*.

Although Wolfowitz was always somewhat restless, he had much deep personal satisfaction during his nineteen years here. He enjoyed long walks and the relaxed atmosphere. He loved the setting. It was here that his children, whom he loved, grew up, were educated, and graduated from the College of Arts and Sciences with distinguished records, which gave him deep satisfaction.

The 1960s were, however, difficult years in many ways. Wolfowitz was dismayed by what he felt was the betrayal of fundamental values and of academic norms by many students and faculty. At odds with many around him and concerned by the Cornell administration's unwillingness to assure him that he could continue beyond normal retirement at sixty-five, he sought opportunities elsewhere that he had previously rejected. In 1970 he resigned—but with his consent his resignation was changed to a retirement at Diedrich Willers's suggestion—and he took a position in the Department of Mathematics at the University of Illinois. He continued there until mandatory retirement at age sixty-eight. He then went to the University of Southern Florida, where he actively served until his last heart attack three years later.

Those who studied under Wolfowitz or heard him lecture remember him as a great teacher. He transmitted to his audiences his intuition for his subject and his feeling for the inner structure of results with clarity and homely humor, without pretension, yet with enthusiasm and a zest for ideas.

The same sense of curiosity and stewardship that drove Wolfowitz in mathematics was evident in his private life. There was a deep commitment to his family, the Jewish community, his adopted country, and decency everywhere. He read widely and was unusually knowledgeable about the affairs of the world. He was quietly generous with his resources and willing to use his influence in the cause of freedom and fairness.

His honors were many: the Rietz and Wald lecturer of the Institute of Mathematical Statistics, the Shannon lecturer of the Institute of Electrical and Electronic Engineering, as well as many invited special addresses and

international lecture tours, and a Guggenheim Fellowship in 1966-67. He was a fellow of both the Institute of Mathematical Statistics and of the Econometric Society and a member of the International Statistics Institute, a fellow of the American Academy of Arts and Sciences, and a member of the National Academy of Science, to name only some.

He leaves his wife, Lillian, of Tampa, Florida; his daughter, Mrs. Laura Sachs, of Israel (arts '62); and his son, Paul Wolfowitz, of Washington, D.C. (arts '65).

Isadore Blumen, Harry Kesten, Roger H. Farrell

Oliver W. Wolters

June 8, 1915 — December 5, 2000

Oliver W. Wolters, the Goldwin Smith Professor of Southeast Asian History, Emeritus, had been a member of the Cornell faculty since 1964. He played a substantial role in establishing his subject in this country, which, despite its deep engagement in the Philippines, had only limited academic investment in the modern history of the region and almost none in its ancient past.

Both the breadth and the interdisciplinarity of his scholarly interests gave his work a wide audience. He was, in effect, a generalist in what is a formidably difficult and specialized field and he remained a commanding figure in the development of Southeast Asian Studies through a vigorous regime of research and writing into his eighty-fifth year. He was devoted to the University's Southeast Asia Program, participating fully in its activities until a few weeks before his death.

All those who knew him are aware that Oliver disdained self-advertisement—that he was rather reserved and rarely spoke of his personal experience. Before coming to academic life, he spent twenty eventful years in Malaysia as a colonial official. He joined the Malayan Civil Service in 1937 immediately after completing his undergraduate work at Oxford with a First Class Honours degree in History.

Oliver arrived in Singapore in 1938 at a time of gathering international tension. He was immediately selected for intensive study of Cantonese, in which, after two and a half years of study in Singapore, Macau and Hong Kong, he could almost dream. He returned to Singapore in 1941 to assume duties in the Labor Department but was almost immediately caught up in the futile resistance to the Japanese attack in December 1941. He was a civilian internee in Singapore until liberated in August 1945.

During the post-war period, Oliver was swept up in a series of fast-paced and challenging events. First he served as a negotiator in a wave of industrial actions initiated by the Malayan Communist Party (MCP). Subsequently, in 1948, when the MCP switched tactics and launched an armed resistance, his background in Chinese affairs fitted him to play a significant role in the massive resettlement of hundreds of thousands of rural Chinese squatters who were located in areas outside of the reach of governmental administration and on the fringe of the forested areas haunted by the guerrillas who relied upon them for recruits and material assistance. He also served as a District Officer in several postings in Perak.

These years were exciting and full of recognition. He was ambushed twice, escaping without injury, and undertook to travel repeatedly in areas of known insecurity. He was awarded the Order of the British Empire and was also decorated for his service by the Sultan of Perak. It was during this time, in 1955, that he married Euteen Khoo who was Inspector of Schools in Malacca and whose family, on both sides, were notable founding fathers of Kuala Lumpur.

With Malaya's independence clearly in sight, Oliver and Euteen left Malaya in 1957 for England where Oliver was to take up a lectureship in the School of Oriental and African studies, University of London, and where he remained until 1964, when Oliver joined the Cornell faculty as its first Professor of Southeast Asian history.

He had a singular voice, unmistakably his and fully formed in his early writing. It is audible in one of his earliest articles, "China Irredenta: the South", published in 1963 in *The World Today*. He gives a brisk, fluent, tour of China's current policy, as well as the Chinese state's perennial objectives in maritime Southeast Asia. The language he uses might easily be found either in strategic intelligence appreciations or in the subtle weighing of courses of action and assessments of probable outcomes typical of diplomatic correspondence. Yet he also makes a determined effort to make clear that the historical springs of action are still a shaping force in contemporary Chinese state initiatives. From early on, China's rulers always aimed to protect the state's maritime communications to the Indian Ocean and beyond by backing a single dominant Southeast Asian polity, a grand commercial center, which could guarantee the tranquillity of the major sea lanes in a region regarded by these rulers as characterized by unstable competing polities.

This principal power was Srivijaya (7-13th c.); its location, organization, capabilities, and the character of its hinterland was the focus of Oliver's Ph.D. thesis at the University of London. The thesis was published in 1963 as *Early Indonesian Commerce*, and after he joined the Cornell faculty in 1964, it continued to engage his imagination throughout his career. He published a second book on the topic, *The Fall of Srivijaya in Malay History* (1970) and followed this up with a series of papers in the 1980s.

All this effort, drawing on the most varied sources, including botanical evidence, archaeological survey, epigraphy, reminiscences of Chinese travelers and diplomats, and art styles and iconography, established that the present city of Palembang on the Musi River was the location of Srivijaya's capital. His contributions, when surveyed in their entirety, present a picture of the historical past, the physical topography of the landscape, and the metaphorical resonance abroad of a harbor-city whose fame and cosmopolitan glamour would rival that of Alexandria, Venice, or Trieste.

The horizon of Oliver's interests extended far beyond the search for Srivijaya. He crossed borders with impunity, writing important papers on Vietnam, Kampuchea, and Thailand. His work on Vietnam drew him to Sino-Vietnamese poetry and to the study of literary conventions. A new emphasis on "voice" and the close study of the structure of "texts" became evident. At the very end of his life, he was experimenting with presenting history through the flux and swift transition of speech in dialogue. He left unfinished an extensive manuscript on fourteenth and fifteenth-century Vietnamese history written in the fluidity and immediacy of address found in conversation. The stimulus here was Oliver's reading of the Russian literary theorist, Mikhail Bakhtin.

Throughout his years of teaching, and continuing throughout his retirement, Oliver gave encouragement to students, and also to colleagues, both through informal consultations in his office and by frequent lunch invitations. Although he would shrink from the grandiosity of such a formulation, he was pivotal in calling forth an intellectual community where one might otherwise have encountered only a loose aggregate of specialized producers of knowledge. He retained a large and exceptionally devoted circle of former students with whom he exchanged letters and visits long after they left Cornell. This web of exchange helped to keep Oliver in touch with publication, as well as research in progress, in many diverse fields and played a significant role in what may be the achievement for which he will be most widely remembered. This is, of course, his remarkable *History, Culture, and Region in Southeast Asian Perspectives*, originally published in 1982 and reprinted in a second edition in 1999 with the addition of a 138-page "postscript." While there have been many significant works on Southeast Asian history, no one before Oliver has so effectively charted the contours of that discipline in such a way that it can now embark on the process of self-reflection that is a requisite of maturity. No one before him had cast a net so widely across the region or made such a compelling case that the recovery of the wholeness of experience demands the integration of perspectives provided by both the humanities and the social sciences. And, there is no parallel to the richly textured weave of the many short narratives through which he demonstrates patterns of cultural commonalities, ruling tendencies, shared proclivities, which, despite many differences, persist in the region even today and give it an air of family resemblance.

Many of the key themes in the book were developed over many years in his articles: mandala politics; openness to the new; the creative adaptation of Hindu cognitive structures to local realities; febleness of governmental structures; marriage politics and charismatic leadership. At the core of this was a vision of early Southeast Asian politics which he designated as mandalas, but that could be described as unstable compounds, an event in time, fluid in borders, lacking in fixed administrative structures, a momentary constellation of interdependent interests

focused on the radiant presence of a charismatic leader or “man of prowess.” Very few of Oliver’s friends and students will read those last words without feeling that he himself was just such a person.

The appearance of the revised edition of *History, Culture, and Region* was suitably greeted by a two-day seminar at the Australian National University. Oliver received many other honors, including the Distinguished Scholarship Award in 1990, the highest recognition bestowed by the Association of Asian Studies. He was awarded a Guggenheim Fellowship, was a Visiting Fellow of the Australian National University, and a Bellagio Fellow of the Rockefeller Foundation. He was a Trustee of the Breezewood Foundation, and at Cornell, he served as Chairman of the Department of Asian Studies (1970-72).

All of his colleagues and former students will long remember his generosity, his breadth of spirit, and the gentle and honorable quality of his character. He exemplified in his person the very best values of humane learning. We express our deep sympathy to his wife, Euteen; his son and daughter, Nigel and Pamela; and his sister, Gwyneth.

Benedict Anderson, Keith Taylor, Stanley O'Connor

Doris Turnbull Wood

December 23, 1907 — January 27, 1974

Doris Wood was a member of the staff of the Placement Office of the New York State College of Home Economics² for twenty years. Warm in her relationships with students and faculty, a skillful organizer, a loyal and creative co-worker, her abilities were of great value in the development of this service department of the College. First appointed in 1949 as assistant placement secretary with the academic rank of instructor, she became associate director of placement in 1951 with the rank of assistant professor and was made associate professor in 1957. In 1963-64, upon the retirement of the placement director, she became director of the placement office, serving in this capacity until her own retirement September 1, 1969.

Mrs. Wood was born in Ilion, New York. She attended Central High School in Syracuse. In 1929 she received her A.B. degree from Westhampton College, the University of Richmond, Virginia, having majored in Spanish and English. Her graduate study was carried out in personnel and guidance, including vocational guidance, at Teachers College, Columbia University, where she was awarded the M.A. degree in 1942.

From 1931 to 1940 Mrs. Wood was a member of the staff of the Placement Office at Teachers College. She was in charge of the office management, later becoming credentials executive and finally assistant placement executive. From 1940 to 1943 and from 1946 to 1949 she was director of placement at Springfield College, Springfield, Massachusetts, a program which she organized and developed.

Mrs. Wood served in the USNR from 1943 to 1946 with the rank of lieutenant (jg). At the Midshipmen's School, Northampton, Massachusetts, she worked as personnel classification officer, and at the U.S. Naval Hospital in Bainbridge, Maryland, she was educational services officer.

During the years at Cornell, her work in the placement office of the College of Home Economics was concerned primarily with the positions for home economists in business and in institutional food services, two large areas of employment opportunity. She was active on a number of college committees. Several of them are noteworthy examples of the utilization of knowledge of employment opportunity in curriculum development.

From 1956-57 until her retirement she served on the Educational Policies subcommittee concerned with the curriculum for students preparing for professional training in the programs sponsored by the American Dietetic

² A new name, College of Human Ecology, was approved by the faculty in November 1968 and by the University Board of Trustees in January 1969.

Association and was chairman of this committee for a number of years. From 1952 to 1956 she was a member of the Educational Policies subcommittee concerned with the development of the Homemaking Core program. For seven years she served on the Committee on Scholarships.

In 1957 a group of representatives of the New York City Home Economists in Business outlined plans for a vocational information project in the College. Mrs. Wood worked with this committee from 1957 to 1962 and was its chairman during 1961-62. A series of luncheon meetings with speakers was designed and carried out for juniors and seniors planning to enter jobs in business. The series on the campus was followed by a field program in New York City.

Mrs. Wood was an active and often a contributing member of a number of professional organizations. These included the Eastern College Personnel Officers, National Vocational Guidance Association, American Personnel and Guidance Association, New York State Association of Deans and Guidance Personnel, and the American Association of University Women. As a member of the American Home Economics Association she served as publicity chairman for the state convention in 1960 and she took charge of the Job Information Exchange at the national conventions from 1963 to 1973.

Mrs. Wood had varied interests beyond the professional ones. She was a member of the American Camping Association and worked with the Association's placement committee. An ardent figure skater, she was on the executive board of the Cornell Figure Skating Association of the U.S. Figure Skating Association from 1957-58 to 1961-62. In 1963-64 she was secretary of the Cornell Figure Skating Club.

She enjoyed travel. Trips in 1960-61 and 1961-62 included Spain, Mexico, Guatemala, and Peru. In the years following her retirement she visited England, Greece, and Italy. She was a member of the American Institute of Archeology. Plans for subsequent travel to France, Germany, and Switzerland were not accomplished.

During the years following her retirement she made her home in Richmond, Virginia, with her sister, a retired professor of the history of art. This was a subject in which Mrs. Wood found increasing interest. In the new community she quickly found her place and many new friends. She was one who made friends easily and kept them long. In the face of recurrent and progressive illness she was courageous. The words of the prayer at the memorial service which was held in Richmond January 29, 1974, seem especially fitting to those who knew Doris Wood:

“We thank thee O God, for all the goodness and courage which have passed from the life of this thy servant into the lives of others and have left the world richer for her presence — for a life’s task faithfully and honourably discharged; for good humour and gracious affection and kindly generosity; for sadness met without surrender, and weakness endured without defeat; through Jesus Christ our Lord.”

Esther H. Stocks, Jean Failing, Margaret L. Stout

Edgar Harper Wood

August 13, 1872 — May 11, 1961

Edgar Harper Wood was born near Topeka, Kansas, August 13, 1872. While he was yet a boy his father, William H. Wood, became foreman of the wood shop in Sibley College and moved his family to Ithaca.

Edgar Wood entered Sibley College in 1888, received the M.E. degree in 1892, and continuing as a graduate student was awarded the M.M.E. degree in 1893.

After serving in various positions, he was appointed principal of the Manual Training High School in Dayton, Ohio, in which position he served three years.

He returned to Cornell University in 1899 as instructor in mechanical drawing and was promoted to Assistant Professor in Machine Design in 1907. When the Department of Mechanics was instituted as a part of Sibley College in 1910, he was appointed Professor and head of the Department. He held this position until August 1937, when he retired because of poor health and was appointed Professor Emeritus of Mechanical Engineering.

He was the author of *A Textbook of Mechanics* and, with the late Professor John H. Barr, co-author of *Kinematics of Machinery* and *Strength of Materials*. He was a member of Sigma Xi and the Society for the Promotion of Engineering Education.

On July 10, 1907, he married Miss Bertha E. Lucas of Ithaca, with whom he celebrated their Golden Anniversary; she died in 1959 after a long illness. There were no children of this union. Professor Wood survived his wife by less than two years, dying May 11, 1961, in Ithaca.

He was an inspiring teacher, a trusted adviser, and a sound thinker. A hard worker in the interest of the University, he labored mightily in promoting and maintaining Sibley College as one of the important engineering institutions of the country. His mental vigor, always prodigious, remained clear and intact until his death. Modest and self-effacing, he gave to others much of the credit which rightly belonged to him. Never physically robust, he was an invalid during the last few years of his life.

W. C. Andrae, H. D. Perkins, C. E. Townsend

Mary B. Wood

July 31, 1914 — May 24, 2000

Mary B. Wood was born on July 31, 1914, in the town of Butler in Wayne County, New York, and grew up on a dairy and fruit farm. After completing high school at Red Creek High School and attending Cazenovia Seminary, she entered the College of Home Economics at Cornell University, receiving her B.S. degree in 1937. Upon graduation, Professor Wood taught home economics in central schools at Andover and Westport, New York. She returned to Cornell University and obtained her M.S. degree in 1942. Later she had the opportunity to undertake additional study at the University of Iowa and the New School for Social Research.

From 1944-48, Professor Wood served as a staff assistant for recreational activities with the American Red Cross in England, France and Germany and then in Newfoundland and Labrador. Here she developed her interest in international issues and later sought additional opportunities to travel and serve abroad.

When she completed her service with the Red Cross, Professor Wood returned to Ithaca and began her career in the Cornell Cooperative Extension Service. She was appointed an Assistant Professor with responsibilities as an extension home economist in marketing and was instrumental in developing the extension food-marketing program both in New York City and throughout the state. She became an Associate Professor in 1953. Her ability to work cooperatively with others and her patience and good humor contributed to the success of the marketing programs. She has written extensively on home economics and consumer issues, including the *Focus on the Food Market and Food Marketing Highlights*. During a sabbatical leave in 1973, she studied consumer television efforts in selected land grant colleges to expand the outreach for consumer programs in New York State.

For her first sabbatical leave in 1954, Professor Wood pursued her international interests. She received a Faculty Traveling Fellowship and attended the International Conference on Methods of Extension Work at the University of Wageningen in the Netherlands. In 1963, she was a participant in an FAO conference in Rome and the following year, spent four months in Liberia on an AID project to assess the need for home economics education at the University of Liberia. She traveled extensively in Liberia gaining an understanding of the needs for teaching and extension in the countryside. She later took on an international assignment traveling with the Dean of the College to review home economics programs in the Philippines and Japan.

In 1960, Professor Wood was appointed Assistant to the Dean in the College of Human Ecology. This assignment led to further leadership in the College's International and Intercultural Affairs Programs. As chairman of an

international program committee of the American Home Economics Association, she traveled to Iran, Liberia and the Netherlands. She also maintained her international interests through membership in the Society for International Development and the International Federation of Home Economists.

Professor Wood returned full time to the Cornell Cooperative Extension Service in 1966. As an Extension Leader and later as Program Coordinator, she contributed significantly to extension programming by giving leadership for program development, implementation and evaluation. Following Hurricane Agnes in 1972, she coordinated the college's efforts to provide information for flood disaster relief in the affected areas. She retired from her position in Cooperative Extension in 1976 and was named Professor Emerita.

Professor Wood was active in both university and community affairs. She served as president of the Women's Class of the Cornell Alumni Association and of the Cornell Women's Club of Ithaca; she was president of the local chapter of the American Association of University Women. She was a member of the New York State and the American Home Economics Associations. Professor Wood was instrumental in the founding of the Upstairs Gallery and served as chairman of the board. She was an active member of the Unitarian Church.

With Professors Gwen Bymers and Kathryn Walker, Professor Wood owned a cottage on Cayuga Lake, Walk-By-Wood. It was a favorite gathering place during the summer for friends and colleagues. Professor Wood was an avid reader and familiar with the classical literature. In addition, she was a bird watcher and participated in programs at the Bird Sanctuary.

Professor Wood died at her home at Kendal on May 24, 2000. She is survived by a sister, Alice L. Wood, of Ithaca; a nephew, Lincoln J. Wood, of Pasadena, California; and a sister-in-law, Rhoda M. Wood, of Lafayette, Louisiana. A memorial service was held at Kendal at Ithaca on June 1, 2000.

Lucinda A. Noble, Jean R. Robinson, Gwendolyn J. Bymers

Edwin Hamlin Woodruff

September 2, 1862 — July 8, 1941

Edwin Hamlin Woodruff, Professor of Law Emeritus, died in mid-summer 1941, full of years and honors. He was the son of Philo Marion and Aristona Holmes Woodruff, and was born in Ithaca in 1862. He entered Cornell University in 1878 after preparation at the Ithaca High School, and remained in attendance until 1880. Of the next six years he spent four in the service of the Astor Library in New York and of the Cornell University Library. He reentered Cornell as a law student in 1887, and in 1888 received his LL.B. degree as a member of the Law School's first class. He was admitted to the New York bar in the same year.

From 1888 to 1890 Professor Woodruff was an Instructor of English at Cornell. Thereafter he served for a year as Librarian of the Fiske Library in Florence, Italy. His next post was at Stanford University, where he was Librarian from 1891 to 1896 and Acting Professor of Law during the last three years of that period. He returned to Cornell as Professor of Law in 1896, and continued as a member of its Faculty until his death. He was Dean of the Law School from 1916 to 1921, and became Professor Emeritus in 1927.

To the teaching profession and to law students at many institutions other than Cornell, Professor Woodruff was known as the editor of case books on contracts, quasi contracts, domestic relations, and insurance. These collections, first prepared between 1894 and 1905, had a long and extensive popularity, calling for successive editions, a fourth edition of Cases on Contracts in 1925, and a third edition of Quasi Contracts in 1933. They demonstrated his rare scholarship and also his understanding of the practical needs of the student. They marked a departure from the earlier Harvard case books in that Professor Woodruff selected and presented for study the most recent significant American decisions. The importance of the historical development of a doctrine was not ignored, and when that was not expounded in his selection of opinions from recent decisions, he revealed and explained it in his footnotes. Very early in his career Professor Woodruff wrote a masterful essay on "Chancery in Massachusetts," published in Volume V of the Law Quarterly Review, in 1889. In 1898, he published his Introduction to the Study of Law.

His theory of law teaching combined the disciplinary with the informational methods, taking advantage of the best features of each and avoiding the weaknesses of both. Though he attached first importance to the student's need for mental discipline, he was practical and did not hesitate occasionally to substitute the lecture for the discussion, when he felt that certain parts of his courses justified the adoption of the former as a more effective method of widening the horizon of the student's information. Irresistibly and with aptness, drawing upon his extraordinary

erudition in many fields of knowledge, he gave his students a liberal education. His meticulously lucid expositions were lightened with a sparkling wit. His understanding of human nature gave him patience and perseverance in the classroom and instilled a confidence that drew students to his office and to his home for advice. Concerning the role which Professor Woodruff played in general University affairs the late Livingston Farrand, former President of the University, said upon the occasion of Professor Woodruff's retirement from teaching in 1927:

"I came to Cornell with all the welcome that anyone could ask. But I was bewildered. Here was a great, vigorous, active university, a great collection of colleges, charged with their own professional responsibilities and quite different from each other. It is no easy job to familiarize oneself with all the intricate details and problems that these colleges face. And one of the obligations of a new executive is as quickly as possible to find out where are the sources of sound information, and who are the persons who are able, not only to inform accurately, but who can exercise sound judgment and offer sound advice. It was a very short time before, in my survey of this University some six years ago, it was clear to me that one of the clearest sighted, one of the best informed, one of the wisest men, and one of the men whose ideals were absolutely immovable in their soundness, was the man in whose honor we are coming together. His judgment and wisdom were not confined to affairs of this school. He was an integral part of Cornell University."

Professor Woodruff charmed all with the brilliance of his conversation, which was rooted in a culture of exceptional breadth but inevitably punctuated with humor. Modest, and escaping publicity, he thrived on intimate contacts. Of these, he had an over-supply in the local friends and the stream of returning alumni who sought him out, and in an active correspondence with distinguished persons about decisions, politics, and books.

Having devoted his life to Cornell and to his students, he symbolized the Cornell Law School in the minds of those who graduated from it during the period of his service as professor and dean. Few teachers of any time or place have been so richly rewarded with the admiration and the affection of his students and his colleagues as was Professor Woodruff.

William M. Woodward

September 19, 1916 — April 22, 1983

Professor Woodward joined the Cornell faculty as an assistant professor of physics and nuclear studies in February 1948, having come from a similar position at Massachusetts Institute of Technology. He was promoted to associate professor in 1952 and to professor in 1960. He retired from the Faculty on June 30, 1982, and was then granted the status of professor emeritus.

Woodward was born in Hartford, Connecticut. He lived there until his family moved to New York City in 1930 and then to Toms River, New Jersey, in 1931, where he completed his high school education in 1934. He received his undergraduate education at MIT and at Columbia University, from which he graduated in 1938. He did his graduate work at Princeton University and was awarded the Ph.D. degree in 1941, having written a thesis on infrared spectroscopy.

In late 1941 Professor Woodward joined a project at Princeton to develop a method for separating the isotopes of uranium. When that project was completed in March 1943, he joined the Los Alamos Laboratory, where he studied the nuclear properties of the fissile materials that were used to create the atomic bomb.

Immediately after the bombing in Hiroshima and Nagasaki he became involved in the movement of scientists working towards the international control of atomic weapons. He contributed significantly to the effort in Washington to educate members of Congress about these problems and played an important role in the creation of the Federation of Atomic Scientists.

From the time of his arrival at Cornell until the mid-1960s, Woodward applied his considerable talent and understanding to teaching and research and to the affairs of the Department of Physics, the Laboratory of Nuclear Studies, and the University. He taught a wide variety of courses to undergraduates and graduate students. With his students and his colleagues he carried out a research program that was innovative and made important additions to our knowledge of the properties of the elementary particles. He conducted his research at the main facility of the laboratory, the electron synchrotron, and also devised a series of “table-top scale” experiments that were particularly suited to the involvement of students and enriched the program of the laboratory. Woodward served as chairman of the graduate admissions committee of the department and as field representative to the Graduate School. He was an undergraduate adviser and was the chairman of the graduate committees for about ten students.

In the mid-1960s Woodward suffered a series of serious physical ailments that necessarily curtailed his activities. Nonetheless, he continued to contribute to the work of the laboratory and the University under circumstances that would have hopelessly discouraged most people. When the Cornell 10 GeV synchrotron was built in 1965-67, he performed the primary survey for the half-mile magnet ring, a task that required pushing the classical methods of surveying to their limits of precision. He later transferred his intellectual interests to biology. In 1976 he felt that he could no longer carry out an effective program of teaching and research, and he was granted a medical disability leave.

Woodward was a member of the American Physical Society and of Sigma Xi. He was a Guggenheim fellow in 1955-56, when he spent the academic year at Stanford University.

Professor Woodward's research and teaching were noted for their originality and creativity. He was a devoted teacher who inspired his students to produce research of the highest quality. He was exceptionally kind, generous, and thoughtful to all with whom he associated. During his entire career he gave generously of his time and energy to foster a better public understanding of the impact of science on society. He was devoted to science as an intellectual pursuit and as a force for the betterment of life. We who were fortunate to have known and worked with him are grateful for his intellectual stimulation and for the pleasure we derived from his presence.

Kurt Gottfried, Peter C. Stein, John W. DeWire

George Woolsey

May 2, 1861 — July 1, 1950

Dr. George Woolsey, Professor of Clinical Surgery (Emeritus) at Cornell University Medical College, was born in 1861, the son of Theodore Dwight Woolsey, President of Yale from 1846 to 1871, and Sarah Sears Prichard Woolsey. Dr. Woolsey graduated from Yale in 1881 and the following year did graduate work at the Sheffield Scientific School. He received an M. D. degree from the College of Physicians & Surgeons, Columbia University in 1885. His subsequent training for clinical surgery is not completely evident in available accounts of his life, but one year was spent at the Roosevelt Hospital. Between 1885 and 1890 he spent two years in France and Germany, presumably in pathology and anatomy. Following his return to this country, he was appointed Professor of Anatomy and Clinical Surgery at New York University Medical College in 1890. He served in this capacity until 1897 when he became Professor of Anatomy and Clinical Surgery at Cornell University Medical College. In 1908 his title became Professor of Clinical Surgery, a post that he held until he retired in 1926 as Professor of Clinical Surgery (Emeritus).

Dr. Woolsey's hospital appointments included that of Attending Surgeon at Bellevue Hospital from 1890 to 1921 and Consulting Surgeon thereafter. From 1900 to 1914 he was an Associate Surgeon at Presbyterian Hospital. He also held appointments as Consulting Surgeon at Memorial Hospital from about 1914, at the New York Infirmary for Women and Children from 1925, at the Peekskill Hospital from about 1897, and at St. John's Riverside Hospital in Yonkers from about 1914.

He was a member of the American Surgical Association, International Society of Surgery, Society of Clinical Surgery, American College of Surgeons, New York Surgical Society, New York Clinical Society, New York Gastroenterological Society, and the New York Academy of Medicine, as well as the American Medical Association and numerous state and local societies. He was the author of numerous articles on the surgical subjects of current interest, including several on genito-urinary surgery. He was also a contributor to Keen's "Surgery", the outstanding text of that era.

Dr. Woolsey died on July 1, 1950 at New Haven, Connecticut. He is survived by his wife, Mrs. Jean Paul Ellenwood Woolsey, two daughters, Miss Laura Woolsey of New Haven and Mrs. John C. Kittle of Ross, California, and by a sister, Miss Edith Woolsey of New Haven.

Frank Glenn

Paul Work

June 18, 1886 — July 8, 1959

Paul Work, Professor Emeritus of Vegetable Crops, died in Ithaca, July 8, 1959, after an illness of over two months. He was born at Kerrmoor, Pennsylvania, June 18, 1886 and obtained his early education in the public schools of Knoxville, Tennessee. He received the B.A. degree from the University of Tennessee in 1907, the B.S. degree from Pennsylvania State College in 1910, the M.S. degree from Cornell University in 1913, and the Ph.D. degree from the University of Minnesota in 1921.

Professor Work came to Cornell in 1910 as instructor in horticulture and registered in the Graduate School. After obtaining the Master's degree in 1913, he was appointed Superintendent of the Department of Vegetable Gardening, the first such department established in the United States. He was appointed Acting Professor in 1917 and Professor in 1920, holding the latter position until his retirement in 1951. During his active service in Cornell University he taught large numbers of students, many of whom occupy important positions in the vegetable industry and in educational institutions in the United States and in many other countries. He was highly regarded by the students as a personal friend and adviser and was never too busy to counsel with them on their problems. Professor Work's most important research was in the study of vegetable types and varieties, vegetable marketing, and plant nutrition. He was a recognized leader in the study of types and varieties and had a large following among seedsmen and college and experiment station workers. He established the Vegetable Variety Field Days for workers in this field. In 1954 he was granted the All-American Selections Award of Honor "for outstanding achievement in horticulture" by the American Seed Trade Association.

In addition to his work at Cornell, Professor Work spent vacations and sabbatical leaves gaining experience. In 1925 he engaged in vegetable variety research with the Ferry-Morse Seed Company in Michigan; in the summer of 1935 he conducted packaging research for the Kalamazoo Vegetable Parchment Company; in 1939 he taught a course in the College of Agriculture, University of California, and in 1947-1948 he conducted research at the Puerto Rico Agricultural Experiment Station at Rio Piedras. Following his retirement he served twenty-one months as Professor in the College of Agriculture of the University of the Philippines at Los Banos, where he was engaged in teaching new courses and training graduate students in research; as at Cornell this was pioneer work.

Professor Work was a Fellow of the American Association for the Advancement of Science; member of Sigma Xi, Phi Kappa Phi, American Society of Horticultural Science, Vegetable Growers Association of America, New York

State Vegetable Growers Association, and Ithaca Rotary Club. He helped organize and was the first secretary of the New York State Vegetable Growers Association, and in 1951 he was elected an honorary life member of the Association. He was a very active worker in the Presbyterian Church of Ithaca, having served as a teacher and superintendent of the Sunday School, and as an Elder for thirty years. He was secretary and president of the Rural Church Institute, president of the Tompkins County Council of Churches, and vice president of the New York State Council of Churches.

Professor Work was the author of two books, *Vegetable Production and Marketing* and *The Tomato*, and many technical papers. He wrote many popular articles for agricultural papers and for various newspapers. He was associate editor of *Market Growers Journal* 1922-1953, and editor emeritus from 1953 until his death in 1959.

During World War I, Dr. Work served as Private and Second Lieutenant in the Corps of Engineers of the Army, 1917-1919.

On August 9, 1917, Dr. Work married Grace Nicholas, who survives him. He is survived also by a daughter Margaret (Mrs. W. K. Stone) and three sons, Ralph, Richard, and William. We share with his family our deep sense of personal loss and the memory of a gracious friend and colleague.

H. C. Thompson R. D. Sweet R. G. Wiggans

Edmund Louis Worthen

October 5, 1882 — 1965

Edmund L. Worthen was born October 5, 1882, on a farm near Warsaw, Illinois. His grade-school education took place in a one-room country school near by. High school facilities were less convenient and required daily travel of about nine miles on foot or horseback.

At the University of Illinois, Mr. Worthen came under the inspiration of one of the great soil scientists of the time, Dr. Cyril G. Hopkins, whom he was to frequently quote in later years. The B.S. degree was granted in 1904. This was followed by work in the Illinois soil survey. In 1905 he came to Cornell for a year of graduate study. From that time he was successively employed by the United States Department of Agriculture, 1906-09; North Carolina State University, 1909-12; and Pennsylvania State University, 1912-19. Cornell granted him the M.S. in 1908.

In 1919 he returned to Cornell as Professor of Soil Technology and project leader of agronomy extension. Prospects for his success were in no [way] impaired when outstanding individuals at other institutions sought to join his staff and become a part of “the Cornell Tradition.” Among those employed over nearly three decades were one or two rugged individualists who tested Professor Worthen’s administrative skills but never exhausted his infinite patience.

Being somewhat of a perfectionist, Professor Worthen wrote extension project statements in precise language which cautiously delimited even the subprojects. Because of this, his extension program was not noted for flexibility, but no one denied that it was successful. For over a quarter of a century he and his extension associates were a link between the College of Agriculture and the farm population. They evaluated, sometimes researched, and of course disseminated information on crop and soil management, this in the interest of a better livelihood for the farmers of the State.

At the expense of field activities Professor Worthen shouldered more than one man’s quota of farmer correspondence. He could pack more sound practical advice into a one-page letter than any associate.

He had a good radio voice and always did his share of radio programs.

One outstanding feature of the annual Farm and Home Week for more than a decade was the Worthen fertilizer forum. In this he presented timely information concerning “best buys” in commercial fertilizers and forthrightly answered farmers’ questions.

He taught an effective undergraduate course on fertilizers and fertilization until extension activities demanded his full time. Another teaching enterprise was an extension-sponsored correspondence course which was broad enough to include most aspects of soil management. The popularity of this venture ran high as long as he corrected all of the papers.

Professor Worthen wrote a successful vocational-agriculture textbook *Farm Soils* which went through five editions (1927, 1935, 1941, 1948, and 1956). The latter revision brought into authorship Dr. S. R. Aldrich. He was also the author of numerous bulletins and leaflets and hundreds of special articles for farm bureau monthly publications.

He coordinated the efforts of at least six colleagues who carried the responsibility for crop and soil investigations on outlying experimental fields at Alfred, Churchville, and Virgil.

Undoubtedly E. L. Worthen's greatest contribution to New York agriculture was in making possible access to open formula and high analysis fertilizers before the latter became widely accepted. In retrospect this appears as a major step from an unenlightened and empirical fertilizer use to more rational and profitable choice and application of plant nutrients. When the fertilizer industry resisted his pioneering efforts, he wisely persuaded the G.L.F. Exchange (now Agway) to take action. This was the beginning of a relationship between College and Cooperative which was destined to greatly benefit the farm population.

He was a fellow of the American Society of Agronomy, a member of the American Society for the Advancement of Science, Sigma Xi, Epsilon Sigma Phi, Gamma Sigma Delta, and Alpha Zeta.

In 1907 Professor Worthen married Xenia Woolman, who died in 1948. Of their three children, Albert and Rachel Daura (Mrs. Richard Sidenberg) survive, with five grandchildren and four great-grandchildren. Elizabeth Jane had died in 1948.

Professor Worthen retired with the rank of Emeritus Professor in 1948; in 1952 he married Mrs. Clarence Doyle, who survives him.

The persisting image of Professor Worthen in the minds of his host of friends is that of a charming, genial gentleman who contributed much to life and enjoyed it to the fullest.

Stanley W. Warren, Earl L. Stone, Herbert B. Hartwig

Albert Hazen Wright

August 15, 1879 — July 4, 1970

The death of Albert Hazen Wright in his ninetieth year brought to a close more than sixty-five years of dedicated service to Cornell.

Professor Wright was born in Hamlin, Monroe County, New York, and his interest in natural history was evident at an early age. When he was fourteen he met Professor Samuel H. Burnett (veterinary science) who encouraged him to learn to identify the local spring flowers and taught him the derivations of their Latin names. In 1899 he was graduated from Brockport State Normal School, where he worked with the herbarium.

He taught public school for one year before entering Cornell in 1900. At that time he was interested in law, history, library work, and botany. He concentrated on botanical studies for three years before changing his major to zoology during his senior year. He received an A.B. degree in 1904, the M.A. in 1905, and his Ph.D. in 1908. In 1910 he married Anna Allen (Cornell '09) and together they traveled throughout the United States, collecting and photographing every available species of fish, amphibian, and reptile. Many of their twelve thousand photographs of live animals have been used in the five-volume *Handbook of Natural History* (Comstock Press).

Professor Wright was associated for fifty years with the well-known course in vertebrate zoology which was begun by Professor Burt G. Wilder (comparative anatomy) in 1898 upon the recommendation of Professor David Starr Jordan. Professor Wright's course, fondly remembered as "Zoo 8," used a manual written by Jordan and for over half a century served as an introduction to the world's fauna, naturalists, and natural history literature.

Professor Wright was the author of many papers on Revolutionary history, early Cornell, and local genealogy. To each he applied his thorough scholarship and bibliographic research. He was able to recreate the excitement of past discoveries and transmit an appreciation of scholarly monographs to several generations of Cornellians. He published a series of sixteen *Studies in History* dealing with early Cornell, the People's Colleges, and Colonial New York. His reputation as a zoologist rests on such comprehensive works as *North American Anura* (1914), *Life Histories of the Frogs of the Okefinokee Swamp, Georgia* (1931), *Handbook of Frogs and Toads* (1942), and the two-volume *Handbook of Snakes* (1957).

Dr. Wright had many other avocations. He made a collection of 150 varieties of peonies and 300 varieties of dwarf bearded iris and was a member of the Bailey Hortorium board from its inception. His explorations and publications on the Great Okefinokee Swamp of Georgia contributed to its establishment as a national park.

He was named a fellow in several of the twenty biological, historical, and geographical societies to which he belonged. He was a member of the Conservation Committee of the Division of Biology and Agriculture on the National Research Council, a past president of Gamma Alpha Scientific Society, and he served on the editorial board of Ecological Monographs.

Professor Wright was made an honorary member of the American Ornithologists Union, the Herpetologists League, the American Society of Ichthyologists and Herpetologists, and the Academy of Zoology in India. He was named an emeritus professor of zoology at Cornell in 1947.

As one of the great pioneers in the science of ecology, several decades before the term became a household word, he was awarded the title of Eminent Ecologist in 1955 by the Ecological Society of America.

A man of great enthusiasm, he was always regarded warmly by his students. He was an inspiring teacher with an astounding grasp of the entire field of natural history, who gave unstintingly of his time and energy, resulting in an impressive roster of former students and scientists throughout the world.

H. E. Evans, E. C. Raney, W. J. Hamilton, Jr.

Carlton Eugene Wright

May 5, 1911 — May 30, 1997

Professor Wright was raised on a dairy farm in Vermont and graduated from the University of Vermont in 1932. After two years as manager of a fruit farm in Barre, Vermont, he entered the education field as teacher of vocational agriculture in Middlebury, Vermont, where he served for three years. He came to Cornell University in the summer of 1936 to complete his Master's degree, which was awarded in February 1937.

Professor Wright returned to Vermont in February 1937 to work at the University of Vermont as Assistant Trainer and Assistant State Supervisor of Agriculture Teachers. On July 1, 1939, he accepted a position at the University of New Hampshire as Assistant Professor in charge of the Applied Farming course, and as Assistant Teacher Trainer in Agricultural Education. He held this position until June 1941, when he returned to Cornell for advanced study. In February 1943, he received the Doctor of Philosophy degree in Agricultural Education and Agricultural Economics. He became an Instructor in the Department of Agricultural Economics in the College of Agriculture and Life Sciences where he worked on the newly established Food Information Service. This program was designed to cooperate with the war effort in supplying food information to the public through the statewide Cooperative Extension system. He resigned in 1944 to become Director of the New York State Institute of Agriculture and Home Economics, a unit of the State University of New York at Cobleskill. One of his major responsibilities at Cobleskill was to rebuild the program and student body that had been decimated by the war. From the directorship of the institute, Dr. Wright was called to Washington, D.C. in February 1947 to become the first Director of Research and Publications of the American Vocational Association. He returned to New York State to organize a food information effort with consumers in the New York City area on July 1, 1948. This program covered the metropolitan area of New York, New Jersey and Connecticut and was sponsored jointly by Cornell University, Rutgers University and the University of Connecticut in collaboration with the United States Department of Agriculture. This was the beginning of Cornell University's Cooperative Extension programming in the five boroughs of New York City. In 1953, Dr. Wright returned to Ithaca as Associate Professor of Food Information and was leader of the extension programs in food information for consumers throughout the State. In 1955, he worked for three months with the Federal Extension Program to plan a series of three national conferences for consumer marketing employees throughout the United States. He was promoted to full Professor at Cornell University in 1962.

During the two years 1962-64, Professor Wright was Chief of Party of the Cornell Project at the University of Liberia. Upon his return in 1964, he assumed leadership for expansion and implementation of a statewide program of marketing information for consumers. In 1969, he returned to New York City as Controller of the Cornell Extension program to assume fiscal and personnel responsibilities.

Dr. Carlton Wright retired July 1, 1973 after forty years of educational leadership, and was named Professor Emeritus. He is the author of *Food Buying*, published by the Macmillan Co. in 1962. He was a member of Alpha Zeta, Kappa Phi Kappa, Phi Delta Kappa, Phi Kappa Phi, and Epsilon Sigma Phi.

Throughout his career, Professor Wright demonstrated unusual capacity to organize and carry out new programs. His broad experience, professional capacity and even temperament contributed to this ability to perform with excellence in programs cutting across departments and colleges and under unique and complex administrative structures. In retirement, he lived in Vermont and then returned to Ithaca, New York where he was an active member of the First Congregational Church and involved in the Boy Scouts of America, the Friends of the Library and the Cayuga Trails Club serving as president of the Finger Lakes Trail Conference.

He is survived by his wife of 58 years, Lucille Neumann Wright; two sons, Timothy, of Honolulu, Hawaii, and Stephen, of Dansville, New York; and four grandchildren.

Professor Wright will be remembered by his colleagues and friends for his wide range of personal and professional interests. He worked effectively with academicians and politicians, with producers and consumers with the goal in mind of improving our food marketing system.

C. Arthur Bratton, Lucinda A. Noble, Robert P. Story, Carol L. Anderson

Florence E. Wright

1894 — September 29, 1983

The death of Florence E. Wright, at the age of eighty-nine, on September 29, 1983, in Bowling Green, Ohio, closed the long, dedicated career of a professional and pioneer in furniture restoration. Miss Wright is remembered throughout New York State for her warm personality, teaching skill, professionalism, and perfectionism. Through Cornell Cooperative Extension she made an impact upon thousands of families.

Florence, a native of St. Cloud, Minnesota, obtained a diploma in art education in 1917 and received her B.A. and M.F.A. degrees in 1924 and 1927, respectively, from Teachers College, Columbia. She taught school in Minnesota and was a supervisor of art in Ames, Iowa, public schools. Her college teaching included being an instructor at the State Teachers College in St. Cloud and at the School of Art in Minneapolis, Minnesota. She was an assistant professor at the University of Texas in Austin before coming to Cornell University as an associate professor in the New York State College of Home Economics and as a home furnishings specialist for cooperative extension in 1929.

Florence was interested in having people enrich their family life through the home environment. Thus she taught homemakers and extension home economists all facets of interior design. However, she was better known for her work related to furniture restoration, the art of stencilling, and the study of antiques. Since the economy did not permit new furniture acquisitions, she inspired people to appreciate their home furnishings and develop the skills to improve the quality of their possessions. She was a recognized authority in the furniture industry and was able to translate industry's vocabulary and methods to homemakers for use when refurbishing their home furnishings.

Florence, through her teaching, had the ability to instill high standards and aid those with talent to advance their knowledge and skill. She developed a leadership program and criteria for the selection of leaders who, when they had completed the course, taught others. This system of teaching others to teach became a model in other state cooperative extension programs and in other educational programs.

In addition, Florence inspired students to attain standards of excellence in their work. She was actively involved in the establishment of the Esther Stevens Brazer Guild. Many students, inspired by Florence's confidence in them, established thriving businesses focusing on stencilling furniture and restoring and selling antiques. This added to many family incomes during the depression years.

Her bulletin *Three Centuries of Furniture* was a resource for over thirty years for individuals, dealers, and collectors. Very few extension bulletins can boast of a distribution record equal to *Three Centuries of Furniture*. The bulletin *How to Stencil Chairs*, published first in 1949 and then renamed in 1982 as *Stencilling Chairs*, sold ten million copies. It is another well-known resource for people interested in the art of stencilling and in developing this skill.

In 1947 Florence was recognized by Epsilon Sigma Phi and given the Award of Merit for the highest achievement in written materials for advancing the work of cooperative extension. Three years later, in 1950, Florence received the Superior Service Award from the U.S. Department of Agriculture in recognition of her outstanding teaching program in New York. In addition, she wrote articles for many periodicals. Among the best known is the chapter "The Empire Period Produces the Golden Age of Stencilling" in the book *The Ornamental Chair*, published by the New York State Historical Society of Early American Decoration.

Florence, in spite of her heavy teaching and travel schedule, had time for community activities. One of her greatest contributions was at the Southside Community House in Ithaca. She served on the board of directors in the 1930s and was chairperson of the refurbishing committee.

After retirement from Cornell University, in 1951, Florence continued her interest in furniture restoration. She was co-owner of The Workshop in Penn Yan for nine years. From 1951 to 1976 she also responded to requests to teach adult education classes in New York and Michigan because of her desire to interact with people and stimulate their interest in preserving antiques. She was frequently called upon to serve as a speaker, judge, and consultant and also served as a member of various community agency boards of directors and volunteered for church and public health programs.

Florence's interest in contributing her knowledge about early decorated furniture continued until her death. She planned to do a publication on the history of painted furniture and document it with photographs that she had taken. It was her wish that photographs and stencils of designs on early decorated furniture be given to the New York State Society of Early American Decoration if she did not complete her plans. All who came in contact with Florence Wright or her work can appreciate the legacy she leaves for future generations.

Orrilla W. Butts, Ruby Loper, Ethel Samson

Forrest Blythe Wright

October 21, 1896 — June 16, 1991

Forrest Blythe Wright was a member of the faculty of agricultural engineering in the College of Agriculture for nearly 38 years prior to his retirement in 1958. He became interested in Cornell University while stationed on the campus with the Air Wing of the U.S. Army Signal Corps. He graduated from Cornell University in 1922, and was granted the Master of Science degree in 1924. He was the second agricultural engineer in the U.S. to earn a Ph.D. degree which he received in 1933 from Cornell University.

“Doc” Wright assisted Howard W. Riley in teaching Agricultural Engineering I, Gasoline Engines, and later assisted B.B. Robb with Course 10, Household Mechanics. In time and until retirement he assumed sole responsibility for this very popular course taken by nearly 10,000 students. Students in home economics took the course to satisfy their graduation requirements in physics.

In 1934 he developed and taught a course in farm electrification when electricity was just beginning to come to some rural areas and farms. In 1935, he wrote a textbook entitled, *Electricity in the Home and on the Farm*, which became a popular text throughout the country. A third edition was published in 1950.

Another textbook, *Rural Water Supply and Sanitation*, was written in 1939. This also became a popular text. This book was selected by the New York Public Library as one of the 100 most essential technical books in 1957 following a 1956 revision. It was revised again in 1977.

Nine bulletins, such as “The Gasoline Engine on the Farm” together with others on electrification, were written by Doc. He wrote numerous articles for many publications, notable were “Electricity on the Farm” and “Agricultural Engineering”. He won the 1949 American Society of Agricultural Engineers’ paper award honor for one of his contributions.

Doc Wright also had time for research and development. He invented automatic egg handling, washing and drying machines marketed by the then GLF Cooperative. The basic principles of these machines were to be later used in sophisticated egg processing equipment. He also made studies of paint durability and heat transfer from the sun through roofing materials, insulation and siding. Doc developed a new design of chick brooder using an electric lamp and a dehydrator for drying laboratory samples of grain and fruits. He also investigated the feasibility of flame weeding.

Doc was a dedicated teacher, always striving to have his students interested and involved in the subject. He worked diligently and thoroughly to achieve his goal of doing the best he could and to have those around him “catch the spirit” and do the same. He organized and operated an aviation ground school in Elmira and Ithaca in the 1920s. His helpfulness and teaching skills, his popular radio programs on mechanics and care and use of the sewing machine were enjoyed by a wide circle of friends and acquaintances.

Doc Wright was well known in and around Ithaca for his civic activities. From 1923 until long after retirement he was active in the Boy Scouts of America and once served as vice president of the local Council, and received the Silver Beaver Award. He served as leader of young people’s groups and served on the Board of Trustees of the Unitarian church. He served as president of the Improvement Association in the Village of Forest Home where he maintained his residence for 28 years. Here he instigated the installation of a water district and the establishment of a fire district in the area.

He was a charter member of the Kiwanis Club of Ithaca and its third president. He was a member of Rotary International in Ithaca and served on the Board of Directors. He served for a number of years on the Ithaca Community Chest teams. Doc had many hobbies. He was an ardent fisherman. He enjoyed woodworking and painting. Doc and Billie were genial hosts and had many friends. He was a great story teller.

Doc was born in Four Oaks, Kentucky and spent his early life on a farm in Falmouth, Kentucky. In 1917 he entered Transylvania College in Lexington, Kentucky, with two scholarships.

Doc was a member of ASAE, Phi Delta Kappa, Pi Kappa Alpha and Sigma Xi and listed in the *American Men of Science* and *Who Knows Who and What*.

He travelled throughout the North American continent, Hawaii, South America and Europe. After retirement Doc worked for three years in Mexico on the Montana Project to teach Mexicans about irrigation and vastly increasing crop yields.

Doc is survived by his wife Mildred (Billie) of 66 years, of Melbourne Beach, Florida; a son, Paul, of Raleigh, North Carolina; five grandsons; six great grandsons; and Enumerable friends and associates.

During his many years of service to Cornell, Doc became well known and sincerely liked by the entire Cornell family. He was looked up to by former students all over the world who consider Doc as a real friend, advisor and teacher.

His colleagues and friends have initiated a campaign to establish a memorial scholarship in Doc's name to recognize his many accomplishments and contributions to the college and university.

E.S. Shepardson, C.N. Turner, R.B. Furry

Lemuel D. Wright

March 1, 1913 — May 12, 1995

Lemuel D. Wright was born in Nashua, New Hampshire in 1913. He received the B.S. and M.S. degrees in Chemistry in 1935 and 1936 respectively from the University of New Hampshire and a Ph.D. degree in Biochemistry from Oregon State University in 1940. His postdoctoral work was done with R.J. Williams at the University of Texas. He became an Instructor of Biochemistry at the West Virginia School of Medicine after which he worked at Merck, Sharp and Dohme from 1942-56 and became a department head. Between 1956-78, Lem Wright was Professor of Biochemistry in the Section of Biochemistry Molecular & Cell Biology, Division of Biological Sciences, and of Nutrition in the Division of Nutritional Sciences at Cornell University. In 1968, he spent a one-year sabbatic at the Max-Planck Institute at Munich, Germany. In 1978, he became an Emeritus Professor, but he continued to serve the University as the Graduate Faculty Representative for the Field of Nutrition.

Lem Wright was a member of the American Society of Biological Chemists, American Institute of Nutrition, Society for Experimental Biology and Medicine, American Chemical Society, New York Academy of Science, and the American Association for the Advancement of Science. He served on editorial boards of *Analytical Biochemistry*, *Journal of Nutrition* and the *Proceedings of the Society for Experimental Biology and Medicine*. He also served on study sections at the National Institutes of Health in Bethesda, Maryland. In recognition of his research on vitamins and cholesterol metabolism he received the Borden Award in Nutrition (1958) and the Outstanding Achievement Award of the College of Technology at the University of New Hampshire (1970) and was named Career Fellow of the National Institutes of Health (1963).

Lem's scientific career began at the time of the exciting crescendo of discoveries of essential nutrients. First with R.J. Williams and E.E. Snell and later with collaborators at Merck, Sharp and Dohme, Lem worked out methods for the microbiological assay of numerous B-vitamins, including nicotinic acid, folic acid, biotin, and vitamin B-12, coincident with their isolation and characterization. During the same period of time he worked on the renal clearance of essential amino acids, and examined the metabolic interrelationships affected by these vitamins and amino acids in pyrimidine metabolism. He discovered biocytin and studied the interaction of biotin with the egg white protein, avidin. At the time that he came to Cornell, Lem began working on the biosynthesis of cholesterol and discovered the acetate replacing factor, mevalonic acid. This led naturally to studies of mevalonate metabolism and influences on the utilization of mevalonate for cholesterol metabolism. These studies were important in laying

the basis for understanding nutrient effects on cholesterol metabolism prior to the realization of the importance of cholesterol as a risk factor in arterial disease. Lem never lost his love for study of the B-vitamins, however. In collaboration with D.B. McCormick and students at Cornell, he continued work on the metabolism of biotin and of lipoic acid. This work remains the best characterization of the metabolic fate of these essential coenzymes in animals. In addition to publishing more than 155 papers in his scientific career, Dr. Wright edited with D.B. McCormick the six volumes on Vitamins and Coenzymes in the "Methods in Enzymology" series. Throughout his scientific career, Lem Wright combined basic biochemical studies with an interest in nutrition.

Lem was a man of strong quiet integrity. He gave scientific collaborators more than their share of credit, and had a work ethic which nurtured students by example. He combined a quiet demeanor, wry humor, and insistence on high standards. These qualities served the Field of Nutrition well during Lem's second "career" as Graduate Faculty Representative. His personal interest in students and his ability to make even those denied admission to the program feel good about themselves helped to build the reputation of the Cornell Nutrition Program to unparalleled heights.

When not in the lab, Lem loved to sail, climb mountains, and father stray animals. He was an avid ham radio operator. He will be remembered by all as a compassionate person and a productive scholar.

Michael N. Kazarinoff, Donald B. Zilversmit

Theodore P. Wright

May 25, 1895 — August 21, 1970

Theodore P. Wright, retired vice president for research, died in Ithaca on August 21, 1970, after a brief illness. He had been in aeronautics since 1917, when he was graduated from the Massachusetts Institute of Technology, enlisted in the Naval Reserve Flying Corps, and was assigned to the Curtiss plant in Buffalo. Later he became general manager and chief engineer of Curtiss-Wright's airplane division. He was director of the Aircraft Resources Control Board of the War Production Board during World War II and then civil aeronautics administrator from 1944 through 1948.

In 1948 Dr. Wright came to Ithaca as Cornell's vice president for research and president of the Cornell Aeronautical Laboratory. The University had accepted the laboratory at the end of 1945 and in 1948 was facing problems of its organization and purposes and its relationships to industry, government, and the University. He solved these problems with characteristic courage, intelligence, and skill. The laboratory prospered, grew, and achieved an enviable worldwide reputation. As vice president for research, he established Cornell's practices and policies for sponsored research; subsequently, the budget for such research grew from \$9 million to more than \$33 million.

Dr. Wright was also president of the Cornell Research Foundation, chairman of the executive committee of the Cornell-Guggenheim Aviation Safety Center, and chairman of the Cornell Committee for Transportation Safety Research. When he retired from the University in 1960, he continued as chairman of the Board of Directors of the Cornell Aeronautical Laboratory, Inc.

For his contributions to aeronautics, Dr. Wright received almost every honor bestowed in that field: the Wright Brothers Medal of the SAE, the Daniel Guggenheim Medal for Aeronautics, the Medal of Freedom, the Presidential Medal for Merit, and the War Department Medal and Commendation for Exceptional Civilian Service. He was a founder of the Institute of the Aeronautical Sciences in 1938 and delivered the Wilbur Wright Lecture to the Royal Aeronautical Society in 1945.

This recitation of Ted Wright's positions and honors reveals only something of his public figure in the aerospace world and higher education. In professional terms he was, we think, the epitome of what an engineer should be: alert, well-informed, precise, and utterly dependable. He was also warm, compassionate, and tactful. He came to Cornell as an outsider—a famous aeronautical engineer, but one who had little background in either the university world or in the humanities or other nonscientific disciplines. But after a decade at Cornell he was universally

loved, respected, and trusted. For a six-month period he was acting president of Cornell (but eager to return to his duties as V.P./Research).

He had incredible energy. He habitually traveled with the varsity football team and became a confidant and counselor to its young men. (His punting and place-kicking, even as a septuagenarian, will long be legend at Cornell, as was his vigor and skill at tennis up to the age of 70.) He was tolerant in only one way: descendant of abolitionists and of Elizur Wright, who successfully fathered life-insurance reform in America, Ted reacted quickly and vigorously against racial and religious bigotry and any other imposition upon the rights of human beings.

While he was generally recognized as a successful engineer and an accomplished administrator, what was less well known was the intensity of his feeling for the natural environment and the plants and animals populating it. His activities as chairman of the Cornell Plantations Committee (1962-68) were generally recognized as being responsible for the remarkable Plantations development during that period.

A. W. Gibson, D. W. Malott, W. R. Sears

William J. Wright

June 6, 1881 — March 19, 1986

William J. Wright died on Wednesday, March 19, 1986, at the age of 104, in Acton, Massachusetts.

Mr. Wright was appointed professor of rural education and state leader of junior extension work in the Department of Rural Education on November 1, 1918. Building on the principles already established in the Cornell Junior Naturalist Clubs by Liberty Hyde Bailey and Anna Botsford Comstock and the work of his predecessors, Martha Van Rensselaer and F. L. Griffin, he established junior extension clubs in fifteen counties within a year of his appointment. During his tenure at Cornell the name 4-H was adopted, and the program's scope and depth and the number of participating counties increased steadily.

In addition, his achievements include the formation of county 4-H program advisory committees and the employment of full-time county 4-H agents. For the first time extension specialists were employed by the College of Agriculture and the College of Home Economics to design programs for 4-H and to provide in-service education and support for 4-H club agents.

When, in 1930, the state Department of Education withdrew its financial support of 4-H club work, Mr. Wright continued his commitment to youth. The state club leader office at Cornell was moved from the Department of Rural Education and was made an administrative division of cooperative extension administration. The move led to revisions of the constitutions of the County Farm and Home Bureau Associations to include a 4-H department. Mr. Wright's leadership role in implementing those organizational changes was invaluable.

Mr. Wright provided dependable, stable leadership throughout the years. He earned the title of "Mr. 4-H" for his commitment to the development of youth through experiences designed to help them become useful citizens and involved community leaders.

Mr. Wright was a charter member of Lambda chapter of Epsilon Sigma Phi, the extension honorary fraternity. In addition, he served on many college and statewide committees.

On retirement in 1942, Mr. Wright returned to Stockbridge, Michigan, where he was elected supervisor for Stockbridge Township. He enjoyed writing, and among his works there was a history of the area. He is also the author of a book entitled *Greenhouse Construction*.

His interest in the 4-H program of Cornell cooperative extension continued in retirement. He enjoyed reading about the advancement of the 4-H program, keeping in contact with 4-H staff members, and remaining vitally interested in Cornell cooperative extension and Cornell University. William Wright was a respected leader, had an outgoing personality, and made friends readily.

Mr. Wright received a B.S. degree at Michigan State University in 1904 and a master's degree from Pennsylvania State University in 1912. He was employed as the assistant to the president at Michigan Agricultural College from 1907 to 1909, as an assistant professor of horticulture at Pennsylvania State University from 1909 to 1912, and as the director of the New York State School of Agriculture at Alfred from 1912 to 1918. While living in Alfred, Mr. Wright was responsible for the direction of 4-H clubs in Allegany and Steuben counties.

He is survived by a son, J. Richard of Carlisle, Massachusetts, and a daughter, Mary Gundry of Pinehurst, North Carolina.

Maurice Bond, Mary Lou Brewer, George Broadwell, Ethel W. Samson

Ray J. Wu

August 14, 1928 — February 10, 2008

Ray J. Wu, Professor in the Department of Molecular Biology and Genetics died in Ithaca on February 10, 2008. He was 79.

Ray was born in Beijing, China in 1928, one of five children. His parents, Hsien Wu and Daisy Yen Wu, were biochemists whose collaboration resulted in China's first nutrition textbook, which was still in print as late as the 1990s. Hsien Wu also was recognized as the co-developer of the first blood test (Folin-Wu reagent) for sugar. Ray's parents helped instill in him values that he kept his whole life, including the importance of education. He attended Yenching University in Beijing for two years. In 1949, the family moved to Birmingham, Alabama, where Ray's father became chair of the Biochemistry Department at the University of Alabama, and where all five children completed their undergraduate education. Ray received his B.S. degree in Chemistry there in 1950, and then went on to earn his Ph.D. degree in Biochemistry at the University of Pennsylvania in 1955.

As a Damon Runyon Postdoctoral Fellow working under Efraim Racker, then at the Public Health Research Institute of the City of New York, Ray studied regulatory mechanisms in carbohydrate metabolism in mammalian cells. It was during these years that he married Christina Chan, and they had their son and daughter, Albert and Alice.

After Efraim Racker came to Cornell to become chair of the Section of Biochemistry under the Division of Biological Sciences, Ray followed in 1966 to join the Cornell faculty as an Associate Professor of Biochemistry and Molecular Biology. He was promoted to Professor in 1972. He served as Chairman of the Section of Biochemistry, Molecular and Cell Biology from 1976-78. Ray received numerous awards over his lifetime, most recently the Frank Annunzio Award (2002), which recognizes innovative research of Americans who devote their careers to improving the lives of humankind through their work in science and technology, and the Outstanding Faculty/Staff Award in the College of Agriculture and Life Sciences (2005). In 2004, he was named the Liberty Hyde Bailey Professor of Molecular Biology and Genetics. Ray's work had lasting international impact in three areas—developing recombinant DNA technology, creating transgenic plants, and furthering graduate student exchanges with China. He was the first scientist to sequence DNA, and the tools he and his coworkers developed underlie many of the techniques used in science and medicine today. His laboratory created transgenic rice strains that

could be grown in hostile climates, a step that will boost food production in areas of the world where it is needed most. He spearheaded the creation of a system to bring promising students from his native China to the United States for training, thus fostering collaborations and influencing generations of researchers.

The technology to determine nucleotide sequence of genomes is one of the most important breakthroughs in modern biology because it allows the possibility of understanding the genetic blueprints of life at the nucleotide level. Ray made significant contributions to this front. In 1970, he developed the first method for determining the nucleotide sequence of DNA using DNA polymerase, which has the ability to add nucleotides one at a time to a preexisting chain by reading off a template. This enzymatic method was adopted and made more efficient by Frederick Sanger, who received the 1980 Nobel Prize in Chemistry for his efforts. Even today, as the next generation of sequencing technologies is being developed, DNA polymerase remains the centerpiece of these new high throughput sequencing strategies. The DNA sequence determination of the entire genomes of rice and human, among other organisms has revolutionized basic and applied modern biology.

When he was in his 50s, Ray turned his attention to world hunger, specifically the problem that much of the world's climate and soils are too hostile to grow rice and other food staples. His first step was to develop efficient transformation systems for rice. In the mid-1990s, Wu and his group genetically engineered and successfully field-tested pest-resistant rice plants, marking the first time that useful genes could be successfully transferred from a dicotyledonous potato plant to a monocotyledonous rice plant. The potato gene in rice plants produces a protein that interferes with the digestive system of the pests. As a result, the stunted growth of insects such as the pink stem borer minimized plant damage. Using a similar approach, a barley gene conferring salt- and drought-resistance turned rice plants into hardy strains in saline and drought conditions.

In 2002, Wu and colleagues made another advance by bolstering yields of genetically engineered rice tolerant of drought, salt and temperature stresses. This feat was achieved by introducing the genes for trehalose (sugar) synthesis into Indica rice varieties, which represent 80 percent of rice grown worldwide including the widely consumed basmati rice. This strategy could apply to Japonica rice varieties and other crops, including corn, wheat, millet, soybeans and sugar cane.

In addition to his own lab work, Ray Wu was also a longtime scientific adviser to governments both in China and Taiwan. He was instrumental in establishing the Institute of Molecular Biology and the Institute of Bioagricultural Sciences at the Academia Sinica in Taiwan, and the National Institute of Biological Sciences in Beijing. He also served as an honorary professor at Peking University and a dozen other Chinese universities.

In the early 1980s, Ray devised a process to identify promising Chinese college students who wanted to continue in graduate school to study advanced molecular biology. Over eight years, the program he founded (China-United States Biochemistry and Molecular Biology Examination and Application, or CUSBEA) brought more than 400 top Chinese students to the United States for graduate training, 100 of who are now faculty members in major universities. These scientists, with colleagues from the Chinese Academy of Sciences, formed the Ray Wu society (now called Chinese Biological Investigators Society), which meets annually to promote advancements in the frontiers of life sciences. A scientific symposium to honor Ray Wu and the CUSBEA students who received graduate education in the U.S. was held in October 2008 at Cornell.

Ray Wu co-authored more than 300 scientific articles and held five patents. The volumes on Recombinant DNA that he edited in the series called *Methods in Enzymology* were classics. Until a few weeks before his death, Ray continued to be active in research, still working full-time at Cornell, running his lab, submitting grant proposals, and flying to various countries to present papers and serve on scientific advisory committees.

Ray believed in organization and planning, setting goals for himself for each year and phase of his life. In addition, he had great personal discipline. Yet, as hard as he worked, he always kept his life in balance, taking breaks to enjoy family, friends, music and photography. He was generous with his time, devoting many hours to advising colleagues, friends and family. He is remembered for his kindness, thoughtful advice and even-handed judgments. Colleagues admired him, as much for his humble, generous nature as for his can-do spirit and many scientific achievements. He was a gentleman and a scholar.

His wife of 51 years, Christina; a son, Albert, '80, M.D. '84; a daughter, Alice, '82, M.S. '86; and four grandchildren survive Ray Wu.

Bik Tye, Chairperson; Maureen Hanson, Volker Vogt

David Kent Wyatt

September 21, 1937 — November 14, 2006

David Kent Wyatt, the John Stambaugh Professor Emeritus of History in Cornell's History Department, died November 14, 2006 at the age of 69 in Ithaca. He was widely regarded as one of the world's foremost living historians of Thailand, and was acknowledged as such not only in the international community of scholars, of which he was a vital part, but in the kingdom of Thailand itself. He spent nearly all of his four decades-long career at Cornell.

A ceremony was held in Ithaca soon after his death, and a memorial Buddhist "sanghadana" was held at Wat Makut Kasatriyaram in Bangkok where many of David's students, colleagues, and friends were present. Also that same day, a memorial seminar was held at the Thai National Archives sponsored by the Association of Thai Archives, the National Archives Office, and the Historical Society under the royal patronage of H.R.H. Crown Princess Maha Chakri Sirindhorn. David was a favorite of Somdet Phra Thep who would make time to attend lectures given by him when he was in Thailand. A David Wyatt fund was also established to promote the study of Siamese history and archives.

David was born in Massachusetts in late 1937, just as the clouds of the Second World War were gathering over Europe. He left his home in Iowa to get a Bachelor's degree in Philosophy at Harvard, and this was where he met his wife, Alene, who was a student at Radcliffe. His lifelong fascination with Gilbert and Sullivan started to become serious at this time. His interest in Thailand, a little-known country on the other side of the world from where most of the globe's main events seemed to be happening, began only after his graduation, when he had reached Ithaca as a graduate student. He eventually became fascinated with Thai history at Cornell, where he was awarded a Ph.D. degree in 1966. Thereafter, he spent several years teaching Southeast Asian History at the University of London in the School for Oriental and African Studies (SOAS), and a further year at the University of Michigan in Ann Arbor.

In 1969, he came back to Cornell, when he was offered and accepted a tenured position in the History Department. From this time onwards, he became extraordinarily active in academia, becoming the Director of the Southeast Asia Program from 1973-76, and the Chair of the History Department (twice) from 1983-87 and then again from 1988-89. He was given a named Chair in 1994 when he became the John Stambaugh Professor, and he eventually served as the President of the Association of Asian Studies as well, the largest grouping of scholars working on Asia anywhere in the world.

From his position at Cornell, he eventually taught and mentored many of the next generation of scholars working on Southeast Asia, so that his impact on the field will be felt for many decades to come. His liveliness in the classroom was legendary, as was the breadth of his knowledge. Though he was a specialist on Thai history, his teaching spanned the region, and he served on dozens of graduate committees that had nothing to do with Thailand per se. Several times in the 1970s he led processions of graduate students to offer ablutions to a concrete traffic marker in front of Uris and Statler Halls, as the marker was in the shape of a *lingam*, a traditional Buddhist phalus as seen in many temples in Southeast Asia. Bemused Cornell students watched as David and his students poured *ghee* (clarified butter) on the pseudo-*lingam*, while chanting Buddhist sutras. He knew how to enliven a centuries-old past for his students in ways that few other professors could emulate.

Taking early Southeast Asia as his specialist field of interest, he learned many languages, often very difficult ones, and he used materials in Thai, Lao, Khmer and Burmese, as well as in Western languages. He was particularly adroit with royal and Buddhist chronicles, a vexing category of sources that many other scholars eschewed, either on genuine intellectual grounds, or—as one suspects—because they are often so difficult to use. David made these chronicles come alive, and though they were written in arcane forms of Thai and other languages, his translations of them were light and eerily beautiful. His sustained use of many of these kinds of sources, some of them called *tamnan* and *phongsawadan*, actually led to vociferous debates in the field as to the validity of such texts as markers of the distant past. David argued eloquently for their inclusion as historical substrate, however, and translations or annotations of many of these sources now make up parts of many normative narratives on the flow of Thai history.

David's work on chronicles started at the beginning of his career and continued up until nearly the very end of it. He co-published an abridged version of a Cambodian chronicle written in Thai (a Thai version of Khmer history, in other words) in 1968, and in 2000 came out with a synoptic translation of the Royal chronicles of Ayutthaya, one of the main dynasties of Thai history. In between, he published translations and annotations of many other chronicles, including political and religious sources on Thai-Cambodian relations (1969), a number of texts from Laos (1972), the Nan Chronicle (1994) and the Chiang Mai Chronicle (1998). Changes in time period, geography, and language in all of these texts show how important this overall achievement really was—there were only a handful of people on the planet who could have comprehensively read, let alone translated into English, all of these texts.

David had a particular fascination with the Thai south in much of his work, too, which was manifested in a number of other publishing projects he undertook over the years. In 1970, he published a version of the *Hikayat*

Patani, and then he followed this up with a book on traditional Thai views of Kelantan (now in north-eastern Malaysia) two years later. His fascination with the multi-racial, multi-religious south culminated, however, in his translation and annotation masterpiece of 1975, on the “Crystal Sands” chronicle of Nakhon Si Thammarat. This book cemented his reputation as an unusually astute student of Thai chronicles, and how they could be used to justify political, economic, religious and social arrangements in a particular time and place.

David’s interests in the second half of his career started to deviate from Thai chronicles. He always remained interested in them and continued to publish on their nature and interpretation for more than thirty years, but his horizons changed as he got older, and he started to look at other sources and questions as well. One presage of this eventual shift was a book he co-edited in the early 1980s on *Moral Order and the Question of Change in Southeast Asia*, which examined intellectual histories of the region via a number of vantages, across Buddhist and Islamic regimes. This was followed up later by a number of important articles, scattered across a variety of journals and a few books as well, charting the intellectual directions of Southeast Asia as the region confronted some wholesale historical changes in the political landscape of the fourteenth to seventeenth centuries. He also eventually was a main mover in the computerization of the Bibliography of Asian Studies, the principle bibliographic resource for scholars of Asia all over the world, and one of seven co-authors of the textbook, *In Search of Southeast Asia*, which came out in three revisions over the course of his long scholarly career.

By the 1990s, David had found another muse: temple murals. He spent a lot of time wandering from wat to wat in Thailand, and in these temples he found murals that excited his imagination and his sense of the outlines of the Thai past. Part of this was because he knew how to look at them. Where many other people would have only seen asparas and heavenly dancers, demons and white elephants, David knew how to interpret these paintings in a manner that few others could. His great knowledge of the chronicles served him here, and though he started off publishing only on a single temple’s designs (those of Wat Phumin, published in 1993), ten years later he penned a beautiful book called *Reading Thai Murals* (2004). This volume is now a must-read for anyone visiting Thailand and its hundreds of beautiful religious buildings: a lifetime of learning is in it, though this is always worn very lightly.

If this is true about David’s book on murals, then it is even more the case on the book that will likely be seen as David’s epitaph to the field, *Thailand: A Short History*, published by Yale University Press now in two printings. David had been asked by Yale to sum up his decades of knowledge on Thailand for a history to be published by the press for both intellectuals and travelers alike. He obliged with the book that will likely be the definitive text of

Thai history for many years to come. David literally waltzes through the centuries in this volume, equally at home discussing old Thai paleography (such as the famous Ramkamhaeng Inscription, and its controversies), the travel itineraries of nineteenth-century Thai kings, and the popular demonstrations that rocked Bangkok twice in the 1970s. And what a waltz it is—full of erudition, snappy language, penetrating insights, and deep learning. Again the panoply of sources utilized really marks out this book as being different—David was interested in *everything* about Thailand, and even the casual reader of this book can instantly see that. David was an intellectual omnivore, and that voracious appetite is evident on nearly every page of this book. Silkworm Press in Thailand will now publish his last book, *Manuscripts, Books and Secrets*, posthumously.

When David finally retired, his love of Cornell and particularly its amazing Southeast Asia Library collection, refused to let him wander far. Though he made several trips to Thailand with his wife Alene, his love for the library proved to be nearly as strong as his love for Thailand itself. The Southeast Asia Program had recently lost its Library Curator and David agreed to take on the position on a caretaker basis for eighteen months. He continued to fortify the library's collections with reams of little-known texts, adding strength to what is already the world's foremost collection of Southeast Asian books on a weekly, if not daily, basis. Graduate students continued to come to see him, and his advice and experience were eagerly sought out by the Southeast Asia program, where he was still a regular at faculty meetings well after his retirement. David had retired from Cornell, but Cornell—very wisely—did not allow David to be too retiring, and kept this great intellectual citizen within its ambit until it was no longer possible to do so on the grounds of ill health.

David Kent Wyatt died on November 14, 2006. He had divested most of his books to Cornell, to other deserving libraries, to his successors in the department, and to other students. These books were his children in some senses too, just like his three sons, who had been a source of great pride and happiness to him during his extraordinary life. His wife, Alene, who had been with him through years of failing health, and who had been quite literally a pillar of strength at his side, was with him in mid-November, and he passed very peacefully. A strange thing happened “at the end,” however. Within a day of his passing, anyone even remotely involved in Southeast Asian Studies anywhere on the planet got email after email reporting the news of his death. Dozens of emails came into Cornell, then scores, and finally the messages stretched into triple figures, all expressing sadness at the passing of the great teacher. Though he had passed, David—like the ancient texts he adored—was breathed into life again momentarily by the glowing testaments of his community. It was a fitting tribute for this giant of a scholar, who also happened to be among the most humble of men.

Eric Tagliacozzo, Chair; Thak Chaloemtiarana, Tamara Loos

Margaret Wylie

December 7, 1889 — October 29, 1964

Margaret Wylie was associated with Cornell University, with the New York State College of Home Economics, and—through the Cooperative Extension Service—with families of New York State for more than thirty years.

During that period she literally *made* an extension program in family life, building the program from nothing to one requiring a staff of four college specialists, and using in the building of it a sturdy academic competence and a remarkable talent for working with people.

Professor Wylie came to the New York State College of Home Economics in the fall of 1925, following the establishment of the College of Home Economics in February of that year. Resident and research programs were then under the direction of Nellie L. Perkins, and Professor Wylie's responsibility was to establish a program in extension. From 1925 to 1927 she initiated intensive institutes and follow-up programs in eight counties of the state. Then for three years (1927-30) Miss Wylie was away from New York, completing her doctorate in psychology at the University of Michigan at Ann Arbor. She spent a year of postdoctoral study at the Illinois Institute of Juvenile Research under the Behavior Research Fund, studying negativistic behavior of preschool children. In the fall of 1930 she returned to Cornell, to remain until the fall of 1957.

She was a scholar—part of the national and international academic world. Her studies took her to Austria, France, Germany, Belgium, and Switzerland. She participated in national and international conferences and organizations. For example, she presented a paper at the International Congress of Psychology, Copenhagen, Denmark; attended the International Progressive Education Association Conference, Nice, France; was representative to two White House Conferences on children and youth, Washington, D.C.; served on the Board of the National Committee on Parent Education; was chairman of the Family Relationships and Child Development Committee of the American Home Economics Association; and was part of the New York State Regents Parent Education Committee, and of the National Film Excerpting Committee of the Joint Council of the American Home Economics Association. She was an active member of and held offices in honorary societies: Phi Beta Kappa, Sigma Xi, Sigma Delta Epsilon, Epsilon Sigma Phi. She was a fellow of the American Association for the Advancement of Science and the American Psychological Association, and belonged to the American Home Economics Association and the International Council of Women Psychologists.

She was recognized for her superior achievements by a national award at a special ceremony in Washington June 1, 1955. Dr. Wylie was presented the Superior Service Award of the U.S. Department of Agriculture, in a presentation made by the then Secretary of Agriculture, Ezra Taft Benson, and was cited “for developing a child development and family relations program that has helped families to become more resourceful in solving their own as well as community problems.” A citation honoring Dr. Wylie when she became Professor Emeritus noted, “Professor Wylie has friends all over New York State that she made in course of her professional activities, and she has been one of our best beloved and most valued faculty members. She has received national recognition for her outstanding work. No one could be more deserving of the honor.”

She was interested in people of all ages. After being graduated from Buffalo Normal School she taught fifth and sixth grades for several years before undertaking undergraduate and graduate work in psychology, sociology, and psychiatry.

During her graduate study, she assisted in experimental laboratories with college students, did psychological testing with men and women, boys and girls. Her early work at Cornell (1925) was with mothers, centered in their interaction with young children. By 1936, the program included teaching youth as well as adults.

She was deeply devoted to families and friends—to her sisters, to her nieces, nephews, grandnieces, and grandnephews; to her professional colleagues; to the families of community leaders with whom she worked.

To all of her activities she brought a priceless gift: the vigor of mature, disciplined intelligence together with childlike freshness of vision and openness to the experience of the moment.

Mary Ford, Orrilla Butts, Helen Bayer

Donald R. Yennie

March 4, 1924 — April 14, 1993

Donald R. Yennie, professor of physics at Cornell University, died on 14 April 1993 at the age of 69. He was an internationally recognized authority on quantum electrodynamics, the fundamental theory of the interaction between matter and electromagnetic radiation. He will be remembered not only as a leader in the most difficult and precise aspects of this field, but also as a beloved teacher and friend to his many students and colleagues.

Don was born in Paterson, New Jersey in 1924. During World War II he served in the Navy, and was an undergraduate at the Stevens Institute of Technology. He graduated in 1945 with an M.A. degree, and was an instructor in physics at Stevens during 1946-47. In 1951, he earned his Ph.D. degree from Columbia University as a student of Hideki Yukawa. He then joined the Institute for Advanced Study in Princeton. From 1952 until 1957, he was first an instructor and then an assistant professor at Stanford University. He then moved to the University of Minnesota, and, in 1964, was recruited by Hans Bethe and the theory group to join the physics faculty at Cornell University. He was an NSF Senior Fellow, a Guggenheim Fellow, and a Fellow of the American Physical Society. He served as a visiting professor at the University of Paris, the University of California (Santa Barbara), Fermilab, and SLAC, and held an Alexander von Humboldt Award at the University of Heidelberg at the time of his death.

Don's work covered a wide range of topics in theoretical physics. He had a strong interest both in fundamental questions about quantum field theory and in applications of field theory to experimental data.

While at Stanford, Don developed much of the theoretical formalism needed to interpret Robert Hofstadter's Nobel-Prize-winning experimental studies of elastic collisions between electrons and nuclei. This work led to important new insights into the internal structure of protons and neutrons. Don's review article, written in 1957 with M.M. Levy and D.G. Ravenhall, was a standard reference in this field for years. At the same time, he pioneered the theoretical analysis of inelastic electron collisions. His paper, with R.H. Dalitz, laid the groundwork for this subject which has since generated hundreds of papers.

One of Don's most influential papers was written in 1961 with S.C. Frautschi and H. Suura. It provided the definitive resolution of the infrared-divergence problem in quantum electrodynamics. This work completed the earlier effort by F. Bloch and A. Nordsieck, putting the analysis on a solid quantum-field-theoretic basis, and providing the technical tools needed to extract meaningful answers from quantum electrodynamics to any order in perturbation theory. It was the final ingredient in the formal development of quantum electrodynamics, a theory, confirmed

by experiment, that is among the foundation stones of modern physics. In recent years, the techniques developed and refined by Don for this problem have been successfully applied in quantum chromodynamics, the theory of subnuclear interactions, to show how long-wavelength contributions factor from short-wavelength contributions in high-energy hadronic amplitudes.

Don's incomparable technical skills, together with his profound understanding of quantum field theory, are well illustrated by his many difficult and precise calculations of the properties of simple atoms in quantum electrodynamics. His analyses, particularly of the Lamb-shift and hyperfine splittings in hydrogen and muonium, remain among the most challenging ever attempted in quantum field theory. They are essential for the experimental verification of quantum electrodynamics, and have provided a starting point for a generation of researchers in this field. Don was still actively involved in such work at the time of his death.

Don was always deeply interested in experimental results, as well as the theory behind the experiments. He often spent hours analyzing data and questioning experimental procedures. This is evident in his extensive work on the interactions of high-energy photons with hadrons. His work led to important clarifications both of the experimental data and of the theoretical formalism needed to understand the data. It resulted in a major review article, written in 1978 with T. Bauer, R.D. Spital, and F.M. Pipkin.

Don was deeply devoted to his graduate students, many of whom became lifelong friends and colleagues. His teaching conveyed the same meticulous intellectual standards that marked his research, and yet it is his unassuming modesty, his warmth and gentle kindness that are most strongly remembered by his students. Don and his wife, Lois, were a constant source of friendship and hospitality.

Don Yennie will be greatly missed by all who knew him. His influence as a physicist and as a human being will remain with everyone.

L. Hand, T. Kinoshita, P. Lepage

Robert York

December 21, 1912 — January 7, 1978

Robert York brought to Cornell a broad and expert background in chemical engineering, derived from earlier academic and industrial experience. For more than twenty years he offered soft-spoken guidance and sensitive encouragement to students, colleagues, and friends in this campus community. A devoted and demanding teacher, Professor York gave his students a broad perspective that combined the technical and theoretical with economic, social, and political practicality. His interest in them was maintained long after graduation; their esteem for him grew with the years. Robert York's associates regarded him not only as an outstanding engineer and teacher but also as a warm friend. To lunch with him was a delightful break in the daily routine. Bob was part of a luncheon group that originated at a table in the Willard Straight Hall Memorial Room long before Statler Hall was built. Later this group occupied a Rathskeller round table. Composed largely of senior faculty from several schools and colleges, this gathering represented a great diversity in points of view and training. Its discussions were sharp, the arguments sometimes hilarious and always enjoyable. Here his comments carried weight because they arose from an incisive intellect that was not confused by peripheral matters. His ability to get to the heart of a problem was well recognized, not only with this group, but elsewhere. While he served on the University Senate, discussions of University affairs became a favorite and often entertaining subject. His subtle humor was well chosen, and he was not above leading on some unwitting person to the amusement of others. As the group decreased in number with the retirement, removal, or death of many of the original members, Bob became as much of a chairman as was needed. His eager participation led to many close friendships; his death has left an emptiness that cannot be filled.

Professor York was modest about his achievements, though he held memberships in well-known scholastic and professional societies and was listed in highly regarded directories. Major corporations sought his counsel, as did friends, associates, and students. He was active on many University and professional committees. His interests and capabilities extended far beyond his field of specialization to include economic and financial matters, patents, applied mathematics, and marketing.

Professor York is survived by his sister, Mrs. Morgan K. Cartwright of San Antonio, Texas; two brothers, Jerome B. York of Kentfield, California, and Philip K. York of Prairie Village, Kansas; and by a multitude of friends in all parts of the world who valued his friendship.

Jay E. Hedrick, Shailer S. Philbrick, Raymond G. Thorpe

Thomas Lenoir York

November 26, 1921 — December 21, 1957

Thomas Lenoir York, Associate Professor of Vegetable Crops and Plant Breeding, died in Ithaca on December 21, 1957 after an illness of several months. His death, at the age of 36, brought to an untimely end a career which was marked by a number of important contributions in research and teaching on the breeding of vegetables and which held ever greater promise for the future. Professor York was born in Waynesville, North Carolina on November 26, 1921 and grew up on a farm there. His undergraduate studies at North Carolina State College were interrupted by service in the Army from April 1943 to October 1945. During this time he spent two years overseas in North Africa, Italy, France, and Germany. Returning to North Carolina he was awarded the Bachelor of Science degree in 1946 and continued studying there for the Master of Science degree. His work for the degree was essentially completed in June, 1947 when he came to Cornell University for further graduate study, but the thesis was presented later and the Master's degree was actually awarded in 1948.

As a graduate student at Cornell, he held an assistantship that involved the breeding of beans for disease resistance. He was awarded the degree of Doctor of Philosophy in 1950 and was immediately appointed Assistant Professor in the Departments of Vegetable Crops and of Plant Breeding, with main responsibility for the breeding of dry and snap beans. He was promoted to Associate Professor in 1953. His research led to the development of a Red Kidney bean with resistance to halo blight, a bacterial disease that has prevented the growing of Red Kidney bean seed in New York State. Field tests in progress indicate that this research will save New York State bean growers many thousands of dollars annually in seed costs. His intensive work on resistance to fusarium root rot of beans led to the finding of a much better source of resistance than was hitherto known. This knowledge shared with other bean breeders has stimulated work at other locations and is expected to lead to a solution of one of the most serious problems in bean production throughout the United States.

In addition to his work on beans, Professor York did the principal work on an early tomato variety, several scab resistant cucumbers, and a hybrid cabbage, all of which are undergoing field tests preliminary to release.

While he did not regularly teach any formal course, Professor York was much sought as an adviser of graduate students. His scholarly and critical approach to their problems earned their respect, and his sympathetic understanding and quiet humor won their affection. He was much interested in foreign students and maintained correspondence with several of them after they left Cornell.

Partly as a result of his interest in foreign students, he held an appointment as Visiting Professor of Vegetable Crops in the Department of Agronomy, College of Agriculture, University of the Philippines. From April, 1955 to January, 1957 he worked to develop the vegetable crops teaching and research program of the College. He quickly recognized that for his impact to be lasting he must develop people and attitudes. The tangible results of his stay are measured in the accomplishments of other people, as they should be, but behind almost every activity of the section was his guiding hand, deliberately inconspicuous but nonetheless real.

In terms of instruction, he taught a graduate course primarily for young faculty members who were working toward advanced degrees. He advised five of these, two of whom remained to strengthen the local institution and three of whom carried his teaching to other colleges, thus spreading his influence. He taught an advanced course for undergraduates, primarily to train local faculty and to develop the course. He gradually shifted responsibility to the local instructors until they carried the course independently. Working with local faculty, he was also instrumental in reorganizing the elementary course in vegetable crops, including development of new laboratory outlines and mimeographed material in order to adapt available texts to Philippine conditions.

For all of his effort to improve the resident teaching and help the young and inexperienced faculty to develop as teachers, his major effort was in the development of sound research and competent researchers. The main projects included evaluation of some 600 vegetable varieties; testing of nutrient amounts, ratios, and placement in fertilizer trials; development of methods of storing seeds in tropical climates; studies of vegetable seed production; breeding of tomatoes, squash, pepper, sweet potatoes, and Irish potatoes for local conditions; studies on curing and storage of vegetables under tropical conditions; and special studies of onion and garlic production and storage. By the time he left, these were all going projects under Filipino staff, most of whom he had a large part in training.

He also stimulated a number of cooperative research projects with farmers and outside agencies, from three of which he was instrumental in obtaining financial support, which was in itself a tribute to the development of the vegetable crops section and its work. Under his guidance a flow of research findings was disseminated through bulletins, the press, and radio.

Quite beyond all this, Professor York and his family were outstanding ambassadors of good will. His sincere devotion to the Filipino people is amply demonstrated in his request that memorials to him be expressed in tangible form to the Church-Among-the Palms.

He is survived by his wife, Barbara Hunt York, whom he married in June 1950. Also surviving are their three children, Stephen, Amy, and Thomas; and his parents, Mr. and Mrs. D. D. York. His friends throughout the United States and in the Philippines share with his family a deep sense of personal loss.

H. M. Munger, M. G. Cline, R. P. Murphy

Benjamin Percy Young

February 27, 1887 — October 10, 1958

Quite probably as he would have elected, had he had a choice, Benjamin Percy Young died at the end of a round of golf at Ithaca, New York. This was on October 10, 1958. Some years earlier, he had had a heart involvement which in a way must have served as a warning to him as it did to his friends. However, no one could think of him as a helpless old man, and his friends will remember him as a man who enjoyed life, and to the fullest extent when he was helping others in some way.

Emeritus Professor Young was born in Kansas City, Kansas, February 27, 1887. In 1908, the University of Kansas awarded him the Bachelor of Science degree, and Cornell University conferred the Doctor of Philosophy degree on him in 1919. In 1928, he carried on some advanced studies at Johns Hopkins University.

For seven years following his graduation, Professor Young served as high school principal and as city school superintendent in Kansas. In 1915, he renewed his university contacts and served until 1917 as instructor in entomology at the University of Kansas. In 1917, he became instructor in entomology at Cornell, and on receipt of his doctorate became Assistant Professor of Zoology. In 1940, he was made Associate Professor of Zoology and in 1952 Emeritus Professor.

Professor Young's academic interests centered largely in invertebrate zoology, with special emphasis on protozoology, helminthology, and parasitism. He made contributions to our understanding of the life history of the spring cankerworm, of the embryology of the honey bee, and more particularly of the attachment of the thorax to the abdomen in the Diptera.

Professor Young had a strong interest in the teaching of zoology to beginning college students. To help him improve his services here, he studied procedures at Johns Hopkins University and at the Wood's Hole Marine Laboratory. Furthering this interest, in 1935, he visited laboratories in Germany, Czechoslovakia, Austria, Italy, France, Belgium, England, and Scotland. Seven years later, in 1942, he extended these studies to the western and southwestern parts of the United States. The year 1950 saw him getting further enrichment in Bermuda and, even after retirement, he continued to broaden his geographic experience by travel in Hawaii. Most of these experiences found expression in revisions and improvement of the laboratory manual which he and the late Professor of Zoology, Hugh Daniel Reed, had developed for use in beginning college classes.

Professional standing in his field was attested by membership in Sigma Xi and in Phi Kappa Phi, in the Society of Parasitology, the American Association of the Advancement of Science, and the American Association of University Professors.

The civic record of Professor Young was justly a matter of considerable satisfaction to him. During his career outside the classroom, he served the community in various positions. He was a trustee of the First Methodist Church of Ithaca, New York. He served in a number of capacities in the local Community Chest. For some time, he was secretary of the Village of Cayuga Heights. From 1927 to 1932, he served on the Cayuga Heights School Board, part of the time as president of that Board. In that capacity, he represented views between those favoring little development and those favoring a more ambitious growth on a site a half mile north of the location of the present school.

The Ithaca Rotary Club elected Professor Young to membership in 1928, and he continued as a member until his death. During the year 1947-1948, he served as president of the club and stimulated it to its first 100 per cent membership in the International Rotary Foundation. This Foundation serves an important role in sponsoring university scholarships on a world basis.

The home life of Professor Young and his wife, the former Nola Ayers, was ideal. A daughter, now Mrs. Mary Elizabeth Oliver, and a son, John Ayers Young, prospered in this atmosphere. The many students who were trained in the classrooms over which Professor Young presided, and the many citizens outside those classrooms who knew the man, as well as the faculty members with whom he worked, must regret the loss of his friendly, helpful personality.

E. L. Palmer, Perry Gilbert, Robert Matheson

Charles Van Patten Young

November 30, 1876 — November 12, 1960

Few Cornellians have been so closely identified with the University as was Charles Van Patten Young.

Professor of Physical Education and Athletics from 1905 until 1944, and Professor Emeritus since then, he died at his home in Ithaca eighteen days before his eighty-fourth birthday.

C. V. P. Young was known and loved by thousands of Cornell undergraduates, who affectionately referred to him as “coat, vest, and pants.” It was his conception that all young men and women were better off with regular exercise and should develop abilities to play games, which could be continued after college. He was a strong advocate of golf, tennis, swimming, skiing, canoeing, and horseshoes, and his influence had much to do with providing facilities for those sports at Cornell.

His interest in Cornell athletics never diminished, and he never hesitated to offer gratuitous advice to the coaches when things did not please him. He was not a cheerful loser, so there were many such opportunities over his sixty years in Ithaca.

He and his great and good friend, Jack Moakley, were constant companions from the time Jack came on the Cornell scene as track and cross country coach in 1899 until Jack’s death in 1955. They took evening walks together and had the happy and comfortable kind of relationship, which permitted occasional vigorous differences of opinion without the loss of a moment’s respect and friendship. And these two vivid personalities had strong opinions on a wide assortment of topics.

“Tar” Young was a lovable cuss and an unforgettable one.

A graduate with the Class of 1899, receiving the A.B. degree, “Tar” was one of Cornell’s greatest athletes, and he maintained a deep interest in intercollegiate and intramural athletics until his death. On the varsity football team he was a brilliant quarterback; in baseball he was an outstanding pitcher and captained the team in his sophomore and junior years. He played major league baseball for one year as a pitcher with the Philadelphia Athletics.

He was instrumental in the development of Upper and Lower Alumni Fields, the Balch Hall athletic fields for women, and the ski slope, named in his honor, in the Caroline Hills eleven miles east of Ithaca. He had much to do with the construction of the old intramural boathouse on the west shore of the Inlet. He originated the Cornell

Outing Club, and Mt. Pleasant Lodge was built under his auspices. For many years he maintained an office in the Old Armory and conducted roller skating sessions in the gymnasium.

He organized the "Continuous Reunion Club," whose members returned to the campus each spring. For years he pitched for the Alumni against the Varsity at the Reunion baseball games and was campus tennis champion. He was a familiar figure at all track meets, where he served as a timer or finish judge.

He was the author of five books: *The Cornell Navy* (1907), *Courtney and Cornell Rowing* (1923), *How Men Have Lived* (1931), *Across the Borderline* (1946), and *Cornell in Pictures, 1868-1954* (1954). In 1951 he was made honorary associate of the University Archives. He assembled and classified thousands of photographs of every phase of the development of the University.

He was permanent secretary of the Class of 1899, a member of Alpha Delta Phi, and alumni adviser and treasurer of Quill and Dagger. The latter honorary society commissioned the portrait of him, which appears in Moakley House.

He was born in Middletown, Ohio. Following graduation from Cornell he attended Dickinson Seminary at Williamsport, Pennsylvania, and was graduated from Princeton Theological Seminary. While at the theological seminary he pitched several games for Princeton University. He preached for a year in Erie, Pennsylvania. Until 1903 he returned to Ithaca each fall to help coach the football team. In 1904 he was appointed Acting Professor of Physical Culture and director of the gymnasium. He was named Professor in 1905. His title was changed to Professor of Physical Education in 1916. In World War I he was director of athletics for the Cornell Student Army Training Corps.

He was a member of the First Presbyterian Church, a charter member of the Ithaca Rotary Club, a former president of the Ithaca Reconstruction Home, and a member of the Cornell Club of Ithaca; he was active in the old Town and Gown Club.

He was the last of five brothers, all Cornellians. They were William '93, Edwin P. '94, John P. '94 and George H. '00. He is survived by his wife, the former Eleanor Mahaffey; a daughter, Mrs. Ralph W. Head of Ithaca; a grandson, and two sisters, Mary and Carrie, Cornell '03, of Williamsport, Pennsylvania.

Robert J. Kane, Erie J. Miller, Jr., Benjamin E. Mintz

Charlotte Marie Young

August 19, 1910 — July 2, 1979

Charlotte Young began her career at Cornell in 1942 as a member of the newly organized School of Nutrition. From that time onwards until her retirement in 1974, she carried a triple appointment in the Graduate School of Nutrition, the New York State College of Home Economics (now Human Ecology), and in the University Health Services. We are indebted to her for the development of a strong program in human nutrition at Cornell. She also provided a nutrition counseling service for students which was a pioneer achievement at the University.

Professor Young obtained her bachelor's degree with high distinction from the University of Minnesota in 1935. Following graduation from a program that provided training in nutrition, she became a dietetic intern at the Indiana University Medical Center. She then proceeded to carry out her graduate work and obtained the Master of Science and Doctor of Philosophy degrees from Iowa State University, receiving her doctoral degree in 1940. From 1940-42 she taught nutrition at Michigan State University. She very soon became recognized for her studies in human nutrition, and it was this early recognition that encouraged the late Professor Leonard A. Maynard to bring her to Cornell.

Her research was in four major areas: dietary methodology, food habit determinants, obesity, and body composition studies. Data from her studies on the body composition of girls and young women have provided national and international standards for normative values. At Cornell she will also be much remembered for her teaching program in public health nutrition, in which she trained future public health nutritionists in a program which, unlike others in the United States, functioned independently of a school of public health. She was also instrumental in obtaining wide national recognition for the Master of Nutritional Sciences (M.N.S.) degree at Cornell.

Charlotte's administrative duties at the University included being the secretary of the Graduate School of Nutrition and secretary of the Graduate Faculty.

She also developed nutrition training programs outside of Cornell and outside of the United States. In 1956 she was invited by the World Health Organization to serve on the technical advisory committee of the Institute of Nutrition of Central America and Panama (INCAP). As a result, she developed the plans for a university-based school of nutrition to be built in Guatemala. In 1966 the first graduating class from that program honored her for her work there. She also served as an Agency for International Development consultant to the Agrarian University,

La Molina, Peru, in 1963 and was successful in the establishment of a department of home economics at that university.

She is particularly well known for the national guidance she provided in the training of dietitians and in the development of their professional society, the American Dietetic Association (ADA). She joined the Executive Board of the ADA in 1962, and subsequently was speaker and delegate-at-large of that organization.

Her public appointments were to the board of directors of the American Board of Nutrition (1962); membership of the Advisory Board of the National Heart and Lung Institute from 1973 onward; and her membership of the United States national committee of the International Union of Nutritional Science (IUNS). She also served as consultant to the United States Department of Agriculture and served on a panel of experts for the Federal Trade Commission.

She was multiply honored for her academic and public service achievements. In 1958 she obtained the Centennial Award from Iowa State University; she also received the Borden Award for research from the American Home Economics Association in 1963; the distinguished achievement citation from Iowa State Alumni Association in 1971; and the Marjorie Hulsizer Copher Award from the American Dietetic Association in 1972. She was the ninth Lena F. Cooper Memorial Lecturer of the American Dietetic Association in 1971, and the seventh Lydia J. Roberts Memorial Lecturer in 1972. In 1973 she was awarded an honorary Doctor of Science degree by Syracuse University.

She was particularly interested in the national honor society Omicron Nu, and served as its president.

Both in Ithaca, and after her retirement, in Minneapolis, she was a prominent lay member of the Protestant Episcopal Church.

Charlotte will be remembered for her many contributions to nutrition and dietetics, but particularly at Cornell for her part in creating a center of excellence in nutrition.

Daphne A. Roe, Norman S. Moore, Lemuel D. Wright

George Young, Jr.

August 24, 1878 — January 15, 1956

George Young, Jr., Emeritus Professor of Architecture and former Dean of the College of Architecture, died at his home in Novato, California, January 15, 1956.

Dean Young was born at Napanoch, New York, August 24, 1878, the son of George and Sarah (Schoonmaker) Young. He was a graduate of Worcester Academy (1896) and of the College of Architecture, Cornell University (1900). In 1902 he married Helen Dorsey Binkerd, his classmate in Architecture who survives him.

As an undergraduate, while maintaining an excellent scholastic record, he also participated to some extent in extracurricula activities, winning his letter in both track and football as well as being vice-president of his class and serving on various committees. Throughout his college and professional life his chief interest was in the structural field of architecture. This interest was perhaps due, in part, to his having been a student under Professors Church and Jacoby. For several years after graduation he was employed as superintendent of construction by different architectural firms in New York and Pittsburgh.

In the fall of 1909 he returned to Cornell as Assistant Professor of Architecture to reorganize and develop the work of that college in the field of structural analysis and design. This he did most effectively. In 1915 he was advanced to a Professorship of Architecture in which post he served with distinction until his retirement. Appointed Dean of the College in 1928, he continued until 1937, when a serious illness, followed by a long period of recuperation, necessitated a sharp curtailment in his physical and professional activities. He withdrew from the deanship but continued to teach with his accustomed zest. Upon retirement in 1946, he removed to California where he passed the remaining years quietly but by no means idly.

Although Dean Young's chief interest and effort were always devoted to sound teaching and in organizing and implementing the curriculum of the college to that end, his restless energy kept him continuously involved with a multitude of other interests. In his early days on the Faculty his special abilities were utilized by the University in the erection or renovation of several campus buildings. During the first World War he served as Captain in the Army Air Service. In the early twenties, together with Dean Bosworth and others, he was prominently identified with several major changes and innovations in the curriculum which were introduced at that time, including the inauguration of the five year program at Cornell, a step which was soon to be followed by most of the leading architectural schools in the country. He was responsible for the beginnings of the City and Regional Planning

program. He was active in university affairs including service as Faculty Representative on the Board of Trustees. He was the senior author of two texts, *Descriptive Geometry* in 1921 and *Mechanics of Materials* in 1927.

Dean Young was a Fellow of the American Institute of Architects and was always actively engaged in the affairs of that organization. He had been president of the Association of Collegiate Schools of Architecture, was a Corresponding Member of the American Society of Landscape Architects, and Panel Editor of the Architectural Forum, one of the leading professional publications. Among his social and professional affiliations were Phi Gamma Delta, Tau Beta Pi and Phi Kappa Phi

In his private life, Professor Young found relaxation in a variety of constructive activities. Besides composing light verse for his own and his friends amusement, and enjoying an excellent library and large collection of recorded music, he loved to work with tools. His home, both outside and within, bore the characteristic marks of his skillful handiwork and flair for design.

Though he discharged his administrative and other duties with competence, Professor Young's chief joy and satisfaction undoubtedly came in his teaching. Intensely interested in his subject and in his students as individuals, he gave time and effort to both without stint. The effectiveness of his stimulating and rigorous presentation of the work, though often achieved with a light touch, brought distinction to the College and the beginnings of understanding and maturity to many an underclassman. The door of his office and that of his home were always open to those who sought his counsel. He knew his students intimately and followed their later careers with friendly interest. The respect and admiration shown for his work and for himself were deeply impressive. Seldom did a former student neglect an opportunity to pay his personal respects, either in Ithaca while Professor Young was still active, or in California after his retirement. His passing is deeply felt by his students, by his colleagues of the faculty and by his professional associates everywhere.

H. E Baxter, D. L. Finlayson, R. M. Ogden

Leroy K. Young

April 25, 1914 — March 2, 2005

Leroy K. Young, M.D., a 45-year resident of Ithaca and Professor, University Health Services, died March 2, 2005 at age 90. Leroy was born in Philadelphia on April 25, 1914. When he entered the University of Pennsylvania in 1931, he was the first Chinese-American from Philadelphia's Chinatown to attend college. After graduating with his B.S. degree in 1934, Leroy enrolled in the University of Pennsylvania Medical School, receiving his M.D. degree there in 1938. He then completed a residency at the Pennsylvania Hospital in Philadelphia, specializing in Internal Medicine.

Leroy took a trip to California in the summer of 1938 to further his studies in Chinese. While visiting friends in Oakland, he met Ruth Chue, whom he subsequently married in April 1942. Leroy and Ruth then moved to Portland, Oregon where Leroy worked for the FBI during World War II. His lifelong interest in foreign languages gave him unique skills in the field of crypto-analysis, and he became a member of the small team that successfully decoded an intercepted message, leading directly to the aerial interception of Admiral Yamamoto over the Solomon Sea in April 1943.

Leroy subsequently joined the U.S. Public Health Service and after three years at USPHS regional headquarters in Savannah, Georgia, he was sent in March 1946 on a "three month" temporary duty assignment to Manila as a USPHS commissioned officer to provide consulting services to the Philippine government in tuberculosis control. The three months lasted for several years and he eventually served as Chief of the Tuberculosis Control Division and was promoted to Lieutenant Colonel, U.S. Army.

In 1951, Leroy established a private practice in Manila, providing medical care to U.S. and Allied citizens, serving the U.S. Embassy and the World Health Organization's Western Pacific Headquarters. On the side, he and Ruth formed the Bach Society of the Philippines and sponsored numerous concerts and performances during their time there.

In 1957, Leroy spent a year in Ithaca, eventually earning his M.B.A. degree in the first graduating class of the Sloan Institute of Hospital Administration in Cornell's School for Business and Public Administration. He returned to the Philippines in 1958 to be the first hospital administrator for St. Luke's Hospital in Quezon City, a brand new state-of-the-art complex sponsored by the Episcopal Church.

In 1961, Leroy received a joint appointment at Cornell University to teach Hospital Administration at Cornell's Business School, and to provide health care to students at the Gannett Clinic. In the mid 1960s, he assumed a full-time position as Assistant Professor of Clinical and Preventive Medicine in Cornell's Department of University Health Services, serving there until his retirement as Professor Emeritus in 1979.

Leroy received numerous awards and honors during his long career as a medical professional and was a long-time member of the Tompkins County Medical Society. In 1995, he was honored as an Outstanding Asian-American with a citation from the Pennsylvania House of Representatives acknowledging "his outstanding lifetime achievements and for setting a standard of excellence in his professional and government service."

Throughout his lifetime, Leroy shared his passion for medicine, travel, opera, classical music, photography, literature and foreign languages with friends, relatives, patients, and colleagues. He had a photographic memory, enabling him to speak and read eleven languages, including French, Swedish, German, Hebrew, Latin, Japanese, Mandarin and Cantonese. Leroy will be remembered for his love and respect for life, which was evidenced by his devotion in caring for his patients, his clever wit in capturing the moment, and his charming ability to engage all who came in contact with him.

Kathleen Crown, James Macmillan, Allyn B. Ley

Roger Grierson Young

December 18, 1920 — August 21, 1994

Roger Grierson Young was born in Moose Jaw, Saskatchewan, Canada, the son of Robert S. and Maryann Young. He received a B.S. degree in 1943 from the University of Alberta. After graduation, Roger was employed as an industrial chemist with the Aluminum Company of Canada in Arvid, Quebec. In 1946, he returned to the University of Alberta where he earned his M.S. degree in 1948. Then Roger entered the University of Oregon as a Teaching Fellow and later as a Research Fellow until the completion of his Ph.D. degree in 1951.

Roger first came to Cornell in 1951, and for two years he was a Rockefeller Postdoctoral Research Fellow in enzyme chemistry working with Nobel Laureate James B. Sumner. Roger continued his postdoctoral studies at Cornell with H.W. Williams studying the biochemistry of the eye. During this study, he received a Geer Research Grant in 1953. From 1953-55, he served as a biochemist with Johnson & Johnson's Ethicon Suture Laboratory in New Brunswick, New Jersey.

In 1955, Roger returned to Cornell as an Assistant Professor of Biochemistry and Toxicology in the Department of Entomology and Limnology. He was naturalized a United States citizen in Ithaca and was promoted to Associate Professor in 1960. Roger was a member of the Cornell Faculty for 28 years and at his retirement in 1983 was granted the rank of Professor Emeritus.

His research dealt with a wide range of subjects, from the biochemistry of the eye to physiological processes in insects and other arthropods. His 32 scientific papers in refereed journals reflect his wide range of research interests. Particularly noteworthy was the leadership that Roger gave to the development of Environmental Toxicology Training at Cornell. He developed a proposal for the training program and NIH funded it in 1965. He served as the first director of the training program. The Environmental Toxicology Training program continues today and the program is now a Field in the Graduate School.

In addition to his extensive research interests, Roger taught graduate-level courses in Insect Biochemistry. He also participated in courses in Veterinary Medicine emphasizing the significance of toxic chemicals, both organic and inorganic, in the environment. In courses he presented, Roger took a deep interest in the progress of his students, offering patience and understanding with the difficult material. His laboratory exercises required particular attention for the inexperienced students because of the small size of the test animals. He was a most supportive instructor.

Roger advised an average of ten undergraduates each year. He also served as major professor or as a graduate special committee member for 26 students. Roger served on the Entomology Graduate Admissions Committee. He was also Entomology Field Representative and Comprehensive Exam Committee member. In addition, he served on the Graduate School's Fulbright Review Committee and was on the Faculty Council of Representatives. Roger was a member of the Society of Sigma Xi, the American Chemical Society, the American Association for the Advancement of Science, and the Entomological Society of America.

During Roger's career at Cornell, he and his family spent sabbatical leaves at the University of Washington, the University of the Philippines, and the University of California (Davis). After his retirement, Roger continued many of his scientific interests. He taught chemistry for a semester at SUNY Cortland and carried out several research projects at the Cornell Toxicology Laboratory. For three semesters he conducted biochemical research at the Huxley College of Environmental Studies, Western Washington University, Bellingham, Washington.

In addition to his professional interests, Roger was an active and loyal member of the First Baptist Church in Ithaca, and for many years, he participated in the Volunteer Fire Company of Varna. He enjoyed golfing with friends at the Robert Trent Jones Cornell Golf Course. His lifelong enthusiasm for camping, learned early in his youth, extended to countless camping adventures with his family. Roger's interest in life around him was reflected in a variety of hobbies. He built and sailed a boat, a product of his interests in woodworking and water-related activities. He was an avid reader and he pursued and maintained active hobbies in genealogy and photography.

Roger Young is survived by his wife of 40 years, Emily V. (Howes), Cornell M.A. '49. His three children are degree holders from Cornell: Roger, B.S. '77; Carolyn, B.S. '80, M.N.S. '84; and Elizabeth, B.A. '84.

Colleagues, students and friends recognized Roger for his scholarship, integrity, helpfulness and genuine kindness. Throughout his life he exhibited a quiet commitment to his family, friends and his professional career.

Arthur A. Muka, David Pimentel, Edgar M. Raffensperger

Stanley William Zimmerman

July 30, 1907 — May 13, 2002

Stanley William Zimmerman was born in Detroit, Michigan on July 30, 1907. After obtaining the B.S. degree in Electrical Engineering and the M.S. degree in Engineering, both from the University of Michigan in 1930, he joined the General Electric Company Test Program in Pittsfield, Massachusetts as an Electrical Engineer with research and development interests in electric-power-system protective devices, transmission and distribution engineering, high-voltage phenomena, and lightning and surge studies. Stanley came to Cornell in 1945 as an Associate Professor of Electrical Engineering and Director of the High Voltage Research Laboratory, attained full professorial rank in 1948, and retired as Emeritus Professor in 1973.

During his 15 years with General Electric Company, Professor Zimmerman made many contributions to the field of high-voltage engineering and related dielectric materials. His work in lightning-arrester research and development that involved studies of thyrite, a nonlinear material used in early arresters, was basic for modern arrester design. Stanley's investigations of high-voltage systems in terms of potential distribution, ionization, corrosion, and impact of environmental conditions, necessitated development of unique experimental techniques. For several years, he was associated with field and laboratory studies of high-power circuit protection and circuit interruption, with particular attention to the design and testing of 287 kV circuit breakers and transformers for the Boulder Dam (now Hoover Dam) installation on the Colorado River. Much of his work was also concerned with the development of lightning measuring instrumentation and the statistics of natural lightning. During World War II, he was engaged in the development of radio noise filters for aircraft and participated in flight tests and field tests of military radio noise-suppression applications.

When Stanley arrived at Cornell in September 1945, he took charge of the high-voltage research laboratory that had been established in 1943. The facility was housed in a large corrugated-steel structure south of the campus on Mitchell Street Extension. The building contained a bank of three 250 kV 60 Hz transformers, a Marx generator that could develop a three-million-volt lightning surge, associated control facilities, a 10-ton crane, and a railroad siding that allowed import of heavy equipment, altogether forming a site that was capable of industrial-standards testing of large electric-power apparatus. Stanley developed two senior courses, High-Voltage Phenomena, and Power Apparatus and Systems, and encouraged use of the laboratory for projects in both disciplines at graduate and senior levels. He also began part-time operation of the laboratory as a testing facility for industry. Due to his familiarity with the electric-power field and through his industrial contacts, he was able to obtain substantial gifts

of equipment to augment the laboratory apparatus already in place. Two 1000 kVA generators and one 3000 kVA machine were among the early major acquisitions. Under his direction, one of the 1000 kVA units was upgraded, tested, and placed in service in the first Cornell Synchrotron facility. The other two machines were prepared for short-circuit studies in the laboratory.

In order to bring the laboratory to the attention of electric utilities as a potential industrial testing service, Stanley established a series of lectures by distinguished visitors, and inaugurated tours of the facility coupled with dramatic demonstrations of the high-voltage equipment. He called one of his favorite displays a “Jacob’s ladder,” a high-voltage arc that would climb up between two copper rods in a vertical “V” formation mounted separately on a block of insulator material. At the top of the V, the discharge would form into a three-foot-long arc that would dissipate, only to form again at the bottom of the V and renew its climb. With the aid of the three-million-volt surge generator and two large copper spheres mounted on insulated posts, Stanley would create a 10-foot-long artificial lightning discharge with associated crackling sound effects. One particular stunt brought him some media attention. He would ask for a volunteer to climb into a “Faraday’s Cage,” a four-foot cube made of copper mesh. After insuring that the occupant was completely enclosed and that the cage was solidly grounded, he would discharge a lightning bolt to the cage from the three-million-volt surge generator.

On February 12, 1948, the high-voltage laboratory was completely destroyed by a spectacular fire that caused an estimated loss of one million dollars. With the aid of insurance and gifts of equipment, Stanley designed and supervised the restoration of the laboratory to its former condition plus improvements that included an upgrade of the 60 Hz high-voltage capability from the original 750 kV to one million volts, and the installation of a 20-ton crane. For several years, Stanley continued to offer his former courses, directed graduate and senior projects, and resumed industrial equipment testing. By the late 1950s, however, large industrial concerns had established their own internal high-voltage testing facilities, student interests moved to other fields, and the laboratory entered a period of limited use. In 1957, the Association of Edison Illuminating Companies (AEIC) authorized a three-year extra-high-voltage underground cable testing program to begin at Cornell in 1960, with the laboratory to be used as a staging area for the test.

In 1959, Stanley recognized that the laboratory would not return to its former use following completion of the cable test. After assisting AEIC engineers in planning the use of the laboratory for the test program, he transferred responsibility for the facility to Professor Joseph L. Rosson, Director of the AEIC testing program, took a sabbatical leave, and upon his return to the campus taught the service courses (electrical engineering for non-electrical

engineers), offered courses in high-voltage phenomena and technical writing, and served as an undergraduate adviser. During the summer months, and for many years after retirement, he consulted as a high-voltage specialist with several industrial concerns, Argonne National Laboratory, and Lawrence Radiation Laboratory.

Throughout his 28-year academic career at Cornell, Stanley, a naturally jovial and energetic man, was an enthusiastic teacher and willingly shared his expertise with his students and colleagues. He was noted for his ability to acquire substantial donations of surplus electric-power equipment, most of which he stored in the Mitchell Street laboratory building. He believed that the material would be useful some day, and indeed on occasion, a faculty member in need of an otherwise expensive device could find it in Stanley's lab. He was a strong proponent of the practical and professional approach to the education of electrical engineers. His courses in high-voltage phenomena always included field trips to generating plants, substations, and large manufacturing plants, and his lectures in all courses were enlivened with examples drawn from his extensive industrial experience. He was a member of the New York State Society of Professional Engineers, and frequently helped students in other branches of engineering prepare for the electrical portion of their professional license examinations. He participated in both national and local activities of the American Institute of Electrical Engineers (AIEE), authored articles and reports in his specialties, and was named a fellow of the AIEE in 1963 "for contributions in the field of high voltage engineering." In 1973, he was named a life fellow of its successor organization, the Institute of Electrical and Electronic Engineers (IEEE). He was also a member of the Conférence Internationale des Grands Réseaux Electriques à Haute Tension, the electrical engineering honor society, Eta Kappa Nu, and the American Society for Engineering Education.

Stanley and Evelyn Raney were married on October 1, 1932 in Detroit, Michigan. Their 40 years of life together, principally in Ithaca, ended when Evelyn died on June 12, 1972. He is survived by his daughter, Dorothy and her husband, Earl Bynack, of Somers, Connecticut; his daughter, Jo Anne and her husband, Stephen Busch, of Fort Collins, Colorado; his son, William S. and his wife, Emelia Maria, of New Hope, Minnesota; and his son, Richard L. and his wife, Phyllis, of Bryan, Texas; seven grandchildren and one great-grandson.

Stanley will be long remembered as an active and innovative investigator in his chosen field, a dedicated teacher and advisor, a respected colleague, and a good friend.

Benjamin Nichols, Norman M. Vrana, Simpson Linke

Paul Joseph Zwerman

April 26, 1911 — December 24, 1985

Paul J. Zwerman, professor emeritus of soil conservation, suffered an aneurysm in the fall of 1985 and died on December 24. His wife, Sara, died in October 1984. They are survived by a son, William LeRoy; two grandchildren; and one great-grandchild.

Paul was a graduate of a one-room country school. When he reached Ohio State University, as a graduate of Sandusky High School, he completed studies for his B.S. degree in agriculture in barely more than three years. Then came a change of pace: he chose to intermingle graduate study with service as a government employee. It was to be seven years before he received his M.S. degree from Ohio State University and eighteen years before he received his Ph.D. degree.

Paul began government service in 1934 as a junior soil scientist with the Soil Erosion Service of the Department of the Interior. As an assistant soil scientist, he was transferred into the Department of Agriculture's Soil Conservation Service when it was created in 1935. He rose to the position of infiltrationist, in charge of that aspect of United States flood-control surveys, but in 1944 he entered the U.S. Navy for two years of service as a lieutenant (gunnery officer) during World War II (in the European theater). He then returned to government service but was given an educational leave to accept a two-year appointment as a research fellow at Ohio State University. He resumed active service as a senior soil scientist, this time in charge of drainage research in Ohio. He concluded this penultimate tour of duty with the government in 1950, when he resigned to join the faculty of Cornell University as an associate professor of soil conservation. In 1976, after twenty-six years at Cornell, he retired as professor emeritus only to re-enter government service for one last time, spending three years with the Bureau of Land Management of the Department of the Interior. In 1979 he and Sara returned to Ithaca, where they settled in a home built for them on Slaterville Road.

Although a soil scientist by profession, Paul was also a practical engineer. Most of his research and much of his teaching were joint ventures with his colleagues in the Department of Agricultural Engineering. His drainage experiment, established near Aurora, New York, was a model of planning and execution on the large scale that is necessary if the results are to carry weight.

His three sabbatical leaves were all spent in the Netherlands, where land drainage is a *sine qua non*. His lectures at the State Agricultural University at Wageningen were instrumental in attracting to Cornell a number of talented

students from the Netherlands who, along with his students from North and South America, have subsequently risen to positions of scientific leadership both in this country and abroad.

There is no record that Paul Zwerman had any formal instruction in German, but his proficiency in the language was such that, in the days when all Cornell graduate students were required to have a good reading knowledge of both German and French, he was one of the examiners appointed by the Graduate School to conduct the German examinations. He could, and did, lecture in Dutch when it was appropriate to do so.

Paul was not a reticent scholar. With a talent for being heard at a distance, he was at his peak when doing his rendition of an irascible professor asking the simple questions that demolish pedantry, while he saved face for all by clever use of his irrepressible sense of humor. Conventional wisdom had no place in his thoughts: to him, innovation was nothing more remarkable than uninhibited common sense. His patience with bureaucracy was minuscule. His patience with nature was infinite.

Paul Zwerman had a vital role in efforts to develop the unrealized potential of New York's north country. Farms on the heavy soils of that region are plagued by excess water and short growing seasons. Paul believed that successful agriculture in the north country depended upon development of proper systems of land drainage, specifically, including elimination of microrelief, which interfered with surface runoff. His experiments and his demonstrations of land smoothing and subtle, but systematic, shaping to promote surface drainage are cornerstones of the programs that have evolved and that have raised the expectations for those who live in the north country. Each year, more and more farmers are adopting the methods he developed. They have increased the productivity of their fields and broadened their management options. Agriculture in the north country owes much to the common sense innovations brought to the scene by Paul Zwerman.

Paul was a member of the Soil Science Society of America, the American Society of Agronomy, the American Society of Agricultural Engineers, and the Soil Conservation Society of America. In 1970 the New York State Conservation Council recognized his contributions with its Soil Conservationist Award. In 1975 he was named a fellow of the American Society of Agronomy. He served as the chairman of the Empire State chapter of the Soil Conservation Society and, in 1972, was a Fulbright fellow in the Netherlands.

David R. Bouldin, Thomas W. Scott, Robert D. Miller
