Although a person of short stature, she was a predecessor of Women's Liberation. Professor Loper was a true pioneer in being able to present realistically her subject matter to all-male audiences in the building-trades. She spoke and wrote with conviction and authority, winning the respect of her audiences. Her efforts assisted many farm families in attaining housing to meet their living requirements. She conducted building technology seminars for building-trades people; assisted county extension associations in planning extension headquarters; and in collaboration with the Department of Institution Management, provided plans for community food-service facilities.

She served on numerous national housing committees and was the author of housing extension bulletins, as well as articles in architectural, engineering, home economics and commercial magazines. In 1955 the Lambda chapter of Epsilon Sigma Phi awarded her a certificate for highest achievement in written material for advancing the work of the Cornell Extension Service. Her many accomplishments were due to her endless energy and dedication to education.

Professor Loper was held in high esteem nationally and statewide for her leadership roles in providing quality housing information and housing programs. She was a charter member of the American Association of Housing

Educators and served on its board of directors. Additionally, she served as a chairman and member of the House Plans and Planning Committee of the Northeast Land-Grant Universities.

After retirement in 1967 Miss Loper remained in Ithaca and resided at the Ramada Inn, where the entire staff became “her family.” She became a benefactor of the College of Human Ecology, formerly Home Economics; and established two department loan-funds for students in financial need and also contributed generously to various college funds and community causes.

She nurtured many continuing and rewarding friendships during her retirement years and continued her love of reading. She surrounded herself with books of many subjects and interests in keeping with the many facets and interests of her personality. Ruby M. Loper, a true friend, a colleague, a person of integrity, humor and protocol, a scholar truly missed.

Bernice Hopkins, Clark E. Garner

Harry Houser Love

March 19, 1880 — April 20, 1966

In the death of Professor Emeritus Harry Houser Love in Ithaca, New York, on April 20, 1966, Cornell University lost a distinguished scientist and educator. He had devoted 41 years of service to Cornell prior to his retirement in 1949.

Professor Love was born at Taylorsville, Illinois, March 19, 1880, received the Bachelor of Science degree from Illinois Wesleyan University in 1904 and the Master of Arts degree from the same institution in 1906. His interest in chemistry and its relation to agriculture led him to the University of Illinois for further graduate work. In the spring of 1906 he was appointed assistant chemist in the Plant Breeding Laboratory of the Agricultural Experiment Station. Later he was appointed as assistant in plant breeding. When the program in plant breeding was organized at Cornell in 1907 Professor Love joined the group as one of the first graduate students in plant breeding. In 1909 Professor Love was granted the degree of Doctor of Philosophy from Cornell. It is worthy of note that Cornell's Department of Plant Breeding was the first such department in the United States, and that Professor Love was associated with it from the beginning. From 1909 to 1911 he was Assistant Professor and from 1911 to his retirement in 1949 he was Professor of Plant Breeding. He was appointed acting head of the Department in 1942 and in 1944 he was made head. In this capacity he worked strenuously to assemble a group of young scientists who could carry on the Cornell tradition of outstanding teaching, research, and extension in plant breeding and genetics. He was eminently successful in obtaining a good staff and increasing facilities for the work of the Department.

Throughout his career, Professor Love had two principal interests: cereal breeding and the application of statistical methods in agricultural research. His contributions in both of these fields have been tremendous. His accomplishments in cereal breeding were notable. He developed varieties for all the major small grain crops grown in New York. For a quarter of a century Wong has been a leading winter barley in the eastern United States; his wheat varieties, notably Yorkwin, Cornell 595, and Genesee, have been grown on millions of acres in the soft white wheat production areas of New York, Michigan and Ontario, Canada. The contribution of Dr. Love's varieties to the agricultural economy has been significant and can only be reckoned in the many millions of dollars of increased income to the growers and users of these crops.

Professor Love contributed significantly to the elucidation and understanding of the genetics of the cereal grains. He was a leader in genetic studies with wheat and, particularly, oats. His papers, and those of his students, constitute

a major part of the early literature on the genetics of oats. Similarly, Professor Love's interest in breeding and statistics led to many studies affecting the procedures and methods used in small grain field trials.

Professor Love's interest in statistical methods was an important corollary to his plant breeding research. This phase of his career is perpetuated in two standard textbooks he wrote. The first, *Application of Statistical Methods to Agricultural Research*, was written in China but found widespread use in this country. His second book, *Experimental Methods in Agricultural Research*, written in Puerto Rico, is used in many institutions as a reference. He pioneered in demonstrating the importance of statistical methods in agricultural research through his books, through formal classroom teaching, seminars, and counseling colleagues, graduate students, and others. He described statistical methods in a manner that could be understood and used by investigators not trained in statistics. In these ways he taught not only the mathematical procedures but also the more difficult technique of learning how to interpret statistical summaries.

In addition to his books Professor Love was author of 22 papers and senior author of 24 other papers on genetics, plant breeding, and statistical methods.

Another important phase of Professor Love's career is his work in foreign countries. He studied first with European geneticists in 1914, but this experience was interrupted by World War I. In 1925 and again in 1929 he served the University of Nanking in China as special consultant in plant breeding. From 1931 to 1934, while on leave from Cornell, he served for three and a half years as adviser in agriculture and crop improvement to the Ministry of Industries of the National Government of China and the provincial departments of Kiangsu and Chekiang. During this period he was also special lecturer at the University of Nanking and the National Central University. In 1939 and in 1940 he was adviser in agricultural research at the University of Puerto Rico.

After retiring in 1949 Professor Love was asked to work with the Joint Commission on Rural Reconstruction of China and spent six months in Taiwan and on the mainland of China, returning to Ithaca in February, 1950. Almost immediately he left for Thailand (March, 1950) where he had accepted an invitation from the Department of Agriculture of Thailand to develop a program for rice improvement. He was rice breeding adviser in Thailand for six years and three months; after July 1, 1952, his program came under the direction of the Economic Cooperation Administration. He and Mrs. Love returned to Ithaca in 1956, after which he devoted much time and thought to the work of Cornell staff members in China. Two publications, written by Professor Love and John H. Reisner describe in considerable detail the work of Cornell staff members in China. This pioneer program had great influence on the development of international agricultural programs.

Professor Love was a Fellow of the American Association for the Advancement of Science, Honorary Fellow American Society of Agronomy, member American Society of Naturalists, American Genetic Association, Sigma Xi, Alpha Zeta, Phi Kappa Phi, and honorary life member of the New York State Seed Association, the third such award given by the Association.

Throughout his career at Cornell, Professor Love contributed freely of his time and efforts to many committees and other special assignments. He assisted with many student activities, particularly the Cosmopolitan Club. He was a member of the Ithaca Rotary Club and was chairman of the International Committee, and he served his church for many years and in many capacities.

In 1904 Professor Love married Anna Barclay, who passed away in Ithaca April 16, 1960. He is survived by a daughter, Mrs. Kenneth R. (Elizabeth) Edwards, Rochester, New York, and three sons: Harry Love, Mexico City, Mexico; Robert Love, Baltimore, Maryland; and Charles Love, Montclair, New Jersey. We share with his family our sense of personal loss and the memory of a gracious friend and colleague.

J. Herbert Bruckner, Neal F. Jensen, Homer C. Thompson

Carl Clifford Lowe

January 1, 1919 — November 29, 1999

Carl C. Lowe, 80, Professor Emeritus, widely known breeder of forage crops, and long-time member of Cornell's Department of Plant Breeding, died suddenly on November 29, 1999. Lowe specialized in breeding forage grasses and legumes. He participated in the development of popular varieties of alfalfa, timothy and birdsfoot trefoil. He also developed refined applications of statistics in experimental design and in plant breeding research.

For 28 years, Lowe taught a popular course in experimental methods for graduate students in the Plant Sciences. He served as advisor for numerous undergraduates and for 14 graduate students. Dr. Lowe's office door was always open to students. Many of his advisees have gone on to distinguished careers of their own.

Lowe worked with seed growers and seed industry leaders in developing programs to bring to farmers the benefits of varieties developed in Cornell plant breeding research. He served as secretary of the NY Seed Improvement Cooperative for 25 years. In this role, he encouraged the adoption of superior varieties by seed growers and farmers.

Lowe was born January 1, 1919, in West Salem, Ohio, the oldest son of Carl and Grace Keener Lowe. His father was an agronomist specializing in sugar beets. The Lowe family soon moved to Twin Falls, Idaho where Carl spent his youth. He attended the University of Idaho in 1938. The family relocated to Fort Collins, Colorado, where his father unexpectedly died. Carl left school and worked for the USDA Agricultural Adjustment Administration from 1940-42.

Carl entered the United States Army in 1942 and served in North Africa, France and Germany as a member of the 899th Tank Destroyer Battalion and the 9th Infantry Division. His unit landed at Utah Beach, Normandy, on D-Day, June 6, 1944, then fought its way across France, and was among the first to cross the Rhine in the invasion of Germany.

After release from active duty he attended Colorado A&M, earning his B.S. degree in 1948. He followed with graduate studies at Cornell, earning his M.S. degree in 1950 and his Ph.D. degree in 1952 in Plant Breeding, under the tutelage of Professors Royse P. Murphy and Walter T. Federer.

Lowe was appointed Assistant Professor of Plant Breeding, at Cornell University in 1952, Associate Professor in 1955, and Professor in 1964. He was named Professor Emeritus in 1983.

Lowe was a member of the American Society of Agronomy, the Crop Science Society of America, Phi Kappa Phi and Sigma Xi. In recognition of his contributions to seed growers and to the seed industry, he was elected an honorary member of the New York State Seed Association.

Dr. Lowe was a pivotal leader in the initiation and development of the Northeast Regional Forage Improvement Project, which continues to coordinate leadership in forage crop breeding and improvement, originally in the Northeast and now nationally. Dr. Lowe also participated in the development and activities of the Northern New York Economic Development Project. He also served as a long-term Consultant to the New York State Fish and Wildlife Service on trout fish breeding and management.

Survivors include his wife and companion of 57 years, Cleo Crane Lowe; one daughter, Ellen Jane Potash, of Franklin, Tennessee; two sons, Donald Lowe, of Ithaca and Cass Lowe, of Seattle, Washington; and two granddaughters, Dru and Carey Potash. Three brothers, three sisters and several nieces and nephews also survive him.

Lowe was an avid outdoorsman, who loved to fish, hunt and garden. The morning sun often found Carl in his boat on Cayuga Lake, luring a lake trout to his line. He died in the woods, suddenly, of natural causes, while hunting deer.

Robert F. Lucey, Royse P. Murphy, William D. Pardee

Robert Francis Lucey

March 13, 1926 — May 7, 2004

In appointing Bob Lucey to a new faculty position in Agronomy, one specifically authorized by the New York State Legislature at the urging of the Farm Bureau and Grange, the College of Agriculture renewed its efforts to raise farm productivity in the six northernmost counties of the state. Four decades later, Bob was recognized throughout that region as the principal architect of the sweeping changes that followed his appointment.

From the outset, he sought the counsel of leaders of the farm community, campus experts in many disciplines, educators, and local institutions as he formulated and later developed a series of diagnostic experiments. The centerpiece of his fieldwork was the “crop-climate” installation. Both farmers and advisers in the North Country had long attributed their difficulties in producing crops to adverse climate. By establishing weather instruments alongside and in the soil beneath plots where various crops were grown under several management systems, Bob demonstrated that there were actually two underlying problems. Slow drainage of water from the topsoil in spring delayed field operations and growth; few of the crop varieties available commercially were adapted to the region’s cool, though reasonably long, growing season.

By employing both traditional and novel practices to drain away water early in the season, he raised the soil temperature and effectively moved the plants south. By buying a four-row planter never before seen in the area, along with other equipment, he accelerated the establishment of large acreages on the newly warmed land. By thus creating a market for adapted seeds, he spurred the introduction of new quick-maturing high-yielding varieties. And by never forgetting that these improvements in crop production were significant only if integrated into dairy and other enterprises, he ensured the practical application of his findings.

The personal demands of the tasks he set for himself were extraordinary. The field work and organizations that dominated his schedule were as much as six nonstop driving hours from Ithaca, and his innumerable trips were rarely nonstop because it was his custom to visit, learn from, and advise a legion of contacts en route. He established agronomic research stations at Canton (SUNY College), Chazy (W.H. Miner institute), and Willsboro (E.V. Baker Farm), and oversaw a major soil management study on a farm near La Fargeville. He formed cordial and supportive relations with educational and advisory bodies throughout the region, becoming over the years the most widely sought counselor for a variety of problems. His continual liaison with state legislators ensured

sustained funding. The donation of the Baker Farm to the college, and the endowment of a Cornell faculty chair by Mr. Baker, testifies to Bob's presence as well as his influence.

On the Cornell campus, recognition of his talents led to a gradual shift in his duties. He had already been an adviser to undergraduates and taught the introductory crop production course, but increasingly became a leader in organizing coordinated research and extension programs across the state. With the Northern New York Agricultural Development Program as a prototype, he contributed greatly to the founding of the statewide PRODAIRY Program. He became chairman of his department, and served in that capacity for eleven years, meanwhile cultivating professional contacts and serving nationally and overseas. He was, for several years, Secretary of the University Faculty.

The Massachusetts family from which Bob came was a source of strength, but for them his venture into higher education was a trailbreaker. He pressed on through Master's and Doctorate degrees, encouraged and supported always by his beloved, Ernestine. The family of eight children they raised was notable for self-reliance, responsibility, and zest.

Bob's unassuming demeanor, friendliness and sincerity, curiosity, patience and optimism were tirelessly directed toward making his part of the world a place that its inhabitants understood more clearly, and used more rewardingly. For these qualities, he was honored during his career, and is remembered with respect and affection.

Robert A. Milligan, R. David Smith, Madison J. Wright

James Douglass Luckett

December 5, 1891 — April 9, 1968

Professor James Douglass Luckett, editor at Cornell University's New York State Agricultural Experiment Station in Geneva for forty years, died unexpectedly April 9, 1968.

Born in Washington, D.C., on December 5, 1891, Professor Luckett completed his secondary and elementary education in the nation's capitol and entered Purdue University. He received his B.S.A. degree in 1916 and his M.S.A. degree in 1919 from that institution.

While an undergraduate at Purdue University, he spent two summers as a scientific assistant in the United States Department of Agriculture's Federal Insecticide Laboratory located in Virginia. During his graduate school days at Purdue University, Professor Luckett worked as an assistant chemist in the Fertilizer Inspection Laboratory.

It was while still in school that his remarkable talent as an editor began to blossom forth, and he was asked to assume editorial responsibility for the Purdue Agricultural Experiment Station *Record*. He served as editor of this publication from 1916-20.

Following completion of his degree work, Professor Luckett joined the staff of the New York State Agricultural Experiment Station in 1920 as editor and librarian. Throughout his illustrious career with the Geneva Station he maintained a very close liaison with the various news media, and his frequent and timely news releases, covering research in a way that was intelligible to the non-scientist, were used widely throughout the world.

During his early years at the Geneva Station, Professor Luckett devoted most of his efforts in editing Station bulletins, and this concern reflected his tireless effort to get the results of both basic and applied research published in its most effective form.

Still not satisfied with the mechanisms used in disseminating research information resulting from Station projects to the general public, Professor Luckett established in 1934 a new publication *Farm Research* that was designed to carry reports of research written in a semi-popular form to mass audiences. This quarterly publication became well known throughout the world, and it was used by almost all other agricultural experiment stations in this country as a model for establishing similar periodicals. In 1943 the Geneva and Ithaca campuses of Cornell University began contributing material to *Farm Research* on a joint basis. Just recently, the publication has been

again broadened in scope to cover all disciplines within the College of Agriculture and has been renamed *New York's Food and Life Sciences*.

Professor Luckett also distinguished himself with extra editorial duties that went beyond the halls of Cornell University and its Geneva Experiment Station. He served as editor of the *Agronomy Journal* from 1928-48, and later as editor of the *Soil Science Society of America Proceedings* from 1938-48. When he relinquished his duties as editor of the *Agronomy Journal*, more than 2,300 papers had passed through his hands for review and publication. Through those years, he never lost the original spark that continued to bring forth new ideas which helped to mold the future objectives of the American Society of Agronomy.

Throughout all of his many activities, Professor Luckett was characterized by his friendly and diplomatic ability to work with all types of people. In his later years with the Geneva Station, the public relations role he assumed with visiting horticultural societies, groups, and individuals was an important factor in giving the full presentation of agricultural research to the public.

Following his retirement in July 1960, he was awarded the title of Professor Emeritus. Even following retirement, Professor Luckett continued to work actively, this time, however, for many community organizations. He was a member of the local YMCA Board of Directors, served on the Board of the Social Service League, was actively engaged in promotional work for the Community Chest, belonged to the University Club and Torch Club, was a member of the Auburn Board of Directors of the Union Theological Seminary, and was former president and member of the publicity staff of Geneva General Hospital.

He was also director of historical records at Prouty-Chew Museum in Geneva and conducted this work for many years on a volunteer basis. Professor Luckett was an elder in the North Presbyterian Church and held various offices in the presbytery during his lifetime in Geneva.

He was a member of the American Society of Agronomy; of Alpha Tau Omega, national college fraternity; of Sigma Xi, national honorary scientific research fraternity; and of the American Association of College Editors.

He is survived by his wife, Lenore, a son Charles, a brother George, two grandchildren, and two nieces.

Paul J. Chapman, Roscoe E. Krauss, Donald W. Barton

Geoffrey Stuart Stephen Ludford

February 2, 1928 — December 11, 1986

Geoffrey S. S. Ludford was professor of applied mathematics in the Department of Theoretical and Applied Mechanics. He developed his deep interest in applied mathematics after he had left the University of Cambridge to work with Richard von Mises at Harvard University. The work resulted in his thesis, “Three Topics in the Mathematical Theory of Compressible Flow,” for which he was awarded a Ph.D. degree from Cambridge. The association with von Mises was extremely stimulating and had a lasting influence on Geof’s approach to mathematics. In 1951, at age twenty-three, he became assistant professor of mathematics in the Department of Mathematics at the University of Maryland. In 1952 his appointment was made joint with the Institute for Fluid Dynamics and Applied Mathematics. The institute provided a fruitful environment for his research. He collaborated extensively with Joseph R. Diaz and with a number of other people, including Monroe H. Martin, the director of the institute. After von Mises’s sudden death in 1953 Geof was invited by Hilda Geiringer (von Mises’s wife) to cooperate with her in completing the book *Mathematical Theory of Compressible Fluid Flow*. Von Mises had written the first three chapters of the book; Geiringer and Ludford added a fourth and fifth chapter, as well as many notes and addenda. Published in 1958, it has become a classic in the field. After serving a year full-time in the Institute for Fluid Dynamics and Applied Mathematics, Geof moved in 1959 to the Department of Aeronautical Engineering of the University of Maryland as a full professor. During the next year he was visiting professor of applied mathematics at Brown University. He came to Cornell in the fall of 1961 as professor of applied mathematics in the Department of Mechanics and Materials (currently the Department of Theoretical and Applied Mechanics). Shortly before his death he was also elected professor in the Department of Mathematics. He was a member of four graduate fields. Soon after his arrival at Cornell Geof established a series of graduate courses that represented his strong convictions on how applied mathematics should be taught. Ever since then those courses have provided a firm mathematical foundation for doctoral students from all over the university.

Besides paying careful attention to teaching, Geof was a prolific and creative researcher. His research interests centered on the application of mathematics to fluid phenomena. These included not only the area of compressible flow but also magnetohydrodynamics and combustion. He became interested in magnetohydrodynamics during a sabbatical year at Harvard University in 1958 working with Sydney Goldstein. Although other areas of interest occupied him during the last ten years, he continued to play an active role in international meetings on the subject. He established a reputation as one of the leading theoreticians in combustion. Of particular importance to the

latter area is his book *Theory of Laminar Flames*, co-authored with his former student John D. Buckmaster and published in 1982. He was the author of more than 160 research papers and four books. He supervised over thirty Ph.D. students, many of whom are now on the faculties of leading universities.

Many awards and honors recognized the value of his work, including a Guggenheim Fellowship, a Fulbright-Hays Fellowship, a Senior U.S. Scientist Award from the Alexander von Humboldt Foundation (Federal Republic of Germany), and a U.K. Science Research Council Visiting Fellowship. In 1982 he was professeur associé at the Université de Provence and the following year at the Université de Paris-Sud. He was a longtime Fellow of the Cambridge Philosophical Society and had been an editor of *Physica D* since 1982. The NATO advanced research workshop “Colloque sur la Modélisation Mathématique en Combustion et ses Applications,” held in Lyon this April, was dedicated to him. Special tributes were paid to the memory of both Geoffrey and Arthur Shercliff at the fifth International Beer Sheva Seminar on MHD Flows and Turbulence in Israel this March.

One of Geof's major achievements was his success in organizing the effort to obtain the five-year grant from the Army Research Office that resulted in the creation of the Mathematical Sciences Institute at Cornell. He was the first director of the institute and was instrumental in setting the basic policies to be followed. In particular he insisted that a large part of the funding be dedicated to the encouragement and support of young mathematicians. The institute currently provides support for eighteen to twenty graduate fellows and ten to twelve postdoctoral fellows, as well as stimulates interaction among mathematical scientists by means of workshops and visiting appointments at Cornell.

Besides excelling professionally, Geof was a world-class athlete. He rowed for Jesus College in Cambridge and was a member of the 1947 Jesus crew that won the Grand Challenge Cup at the Henley Royal Regatta as well as the Scandinavian Championship in Bergen, Norway. He rowed for the winning Cambridge crew in the 1949 Oxford-Cambridge boat race. Geof held a firm conviction that one should not participate in competitive sports after age thirty. However, he maintained his excellent physical condition by a rigorous regimen of exercise and diet. His fitness was remarkable; even when in the hospital during his last illness (he suffered from a brain tumor), his lung capacity exceeded what could be measured by the instrumentation available.

Geof was also an accomplished singer. He always loved to sing, and he joined the Whiton chorale many years ago. He practiced conscientiously to develop his ability further. He was a regular soloist as a tenor in the chorale's performances.

Geof's calm and controlled demeanor gave no hint of the depth of his compassion for those less fortunate than himself. He adopted the causes of Russian refusenik colleagues with committed passion, writing letters of support and encouragement and sending scientific books, reprints, calculators, and money to them (bearing the expenses out of his own pocket). He went to Russia as part of the first large foreign delegation to the famous Moscow Sunday Seminars, a meaningful international expression of solidarity with the intellectually oppressed.

Geof's accomplishments and dedication have served Cornell well. His premature death at the height of his powers is a tragic loss for the university and for the large number of colleagues both at Cornell and around the world who benefited from their relationships with him. Much greater is the loss for his wife, Pamela, and for his daughters, Jennifer and Susan, and their families. Geof actively encouraged all three of them to go as far as possible educationally and was enormously proud that they were able to combine educational endeavors with raising families and activity in other areas.

His was an uncompromisingly high standard of scholarship; precision of thought and expression were central to his life. By his example and teaching, a substantial number of students left Cornell aspiring to develop and maintain these qualities, a legacy in which this university can take pride.

Philip J. Holmes, Sidney Leibovich, P. C. Tobias de Boer

Pamela M. Ludford

October 19, 1928 — July 22, 2001

Pamela M. Ludford (nee Sutcliffe), Emerita Professor in the Department of Horticulture, died at Ithaca's Hospicare of complications arising from lung cancer. Pamela was born in London, England. She was educated at Haberdashers' Aske's (Sutton Court preparatory) School and then attended Westfield College at London University, where in 1950 she obtained a first class honors degree in Botany.

On August 19, 1950, Pamela married Geoffrey S.S. Ludford (deceased 1986). They moved to the United States, where she supported Geoff in his academic career as a Cornell Professor of Applied Mathematics. Pamela became a U.S. citizen in 1970. While in the process of raising two daughters, Pamela decided to pursue graduate studies with Professor F.C. Steward, one of the most eminent plant physiologists of his time.

Pamela received her Ph.D. degree in 1971 from Cornell University and continued to work for an additional two years with Professor Steward as a Research Associate in the Laboratory of Cell Physiology. In 1973, she transferred to a similar position in the Department of Vegetable Crops. She was appointed as Assistant Professor of Vegetable Crops in 1977 and Associate Professor in 1983.

Dr. Ludford's faculty career was devoted to research and teaching in the post harvest physiology of vegetables, with a special interest in the role of plant hormones. She was widely recognized as an authority on this subject, as evidenced by numerous invitations to author book chapters and to perform editorial work. She continued to be active in her profession after retirement (1995), spending many hours in her office and participating in departmental events.

Rigor and attention to detail characterized Dr. Ludford's research, her teaching, and her writing. She was not satisfied with a job until she had given it her best, and she inspired others to do the same.

Dr. Ludford was a member of the American Society of Plant Physiologists, the Plant Growth Regulator Working Group, the American Society for Horticultural Science and its Post Harvest Working Group, the Society for Economic Botany, the American Society of Agronomy, and the Crop Science Society of America. She was also a member of Sigma Xi, including its Admissions Committee, and of Sigma Delta Epsilon. Pamela was Associate Editor for the *Journal of the American Society of Horticultural Science* and was a long-time member of the Horticulture Advisory Board for AVI Publishing Company.

In great demand to serve in campus roles, Dr. Ludford was active as a member of the Faculty Council of Representatives, the Fellowship Board of the Graduate School, and the Provost's Advisory Committee on the Status of Women; and she was a participant on many other university, college, and departmental committees. Dr. Ludford was the first woman to be appointed to the faculty in her department, and one of the first women in any of the production agriculture departments. As such, she served as a role model for female graduate students and faculty, always ready with words of encouragement and acts of kindness. For many years, Dr. Ludford was the Graduate Faculty Representative for Vegetable Crops, in which capacity she went to great lengths to nurture and counsel graduate students.

When she felt it necessary, Dr. Ludford did not hesitate to express her opinions, whether of a graduate student's action or of an administrator's directive. If she thought a decision was wrong, she would tell the person so—with civility and good humor, but without mincing words. Pamela often expressed what others might have liked to have said, but didn't quite dare. Perhaps it was partly her British accent, perhaps it was her head-on approach, and certainly it was her special personality that enabled her to get her point across without causing offense. After Pamela had had her say at a faculty meeting, there would be laughter, a release of tension, and a lightening of mood—but she would have made her point.

Pamela cared for her husband in his final months of life and remained connected to the hospice community for 15 years. The diagnosis of her own terminal illness—which was made only a few months before her death—came as a great shock to her family and friends; but she accepted the prognosis with remarkable equanimity and courage. Characteristically, Pamela's only concern seemed to be the impact on those she loved.

She is survived by her sister, Gillian Bell of Wallingford, England; and two daughters: Jennifer Messing Ludford, married to Seth J. Messing, with children Nicholas, Anna and Timothy Messing; and Susan B. Davidson, married to Charles J. Davidson, with children Jeremy and Christopher.

Pamela loved the color purple, balloons (including hot air balloons), flowers, small children, and her many wonderful friends. She will be remembered as a kind, courageous, generous, and loving woman with an undying *joie de vivre*.

Robin R. Bellinder, Leonard D. Topoleski, Elmer E. Ewing

Edward A. Lutz

July 10, 1910 — October 9, 1987

With the death of Edward A. Lutz at his country home on October 9, 1987, the university and the state lost a respected scholar and a leader in community affairs. His professional life was devoted to the systematic analysis of social problems and to the improvement of schools and local government. He was an educator in the broadest sense and was known throughout the state for his innovative programs to aid local administration. Ed Lutz was characterized at the memorial service as a perceptive, productive and public-minded member of the Cornell faculty and of the Greater Ithaca Community.

Edward A. Lutz grew up in the Catskill mountain town of Prattsville, New York and graduated from the College of Agriculture at Cornell in 1931. He worked for the Farm Credit Administration in Springfield, Massachusetts and Washington, D.C. and obtained an M.B.A. from the Harvard School of Business. In 1937 he returned to Cornell to pursue graduate work in agricultural economics under the direction of Professor M.P. Catherwood. This association was a decisive factor in determining his lifetime career as a specialist in local government and public administration and finance.

From 1940 to his entry into the Navy in 1942, Dr. Lutz was Director of the Bureau of Planning in the New York State Division of Commerce. He served on Admiral Mitscher's Staff in the Pacific Theater during World War II and was selected as a member of a group formed to assist General MacArthur in governing the occupation of Japan.

Ed Lutz joined the Cornell faculty in 1946 as a professor of public administration in the Department of Agricultural Economics and served with distinction in this position for thirty years. He became an emeritus professor in 1976. Professor Lutz focused his efforts on the problems of local and state governments in rural areas. His research, teaching, and extension were aimed to help units of local government provide needed public services efficiently in both rural and urban areas. His insight and dedication gained the respect and admiration of public officials throughout the state and the cooperation and support of other faculty at Cornell.

Throughout his career Professor Lutz was called upon to serve as advisor and consultant to numerous state and local government groups. He was a member of several special commissions including the temporary commission on the constitutional convention, the New York State-New York City fiscal relations commission, the joint legislative commission on school financing, and the state commission on per capita aid. He was instrumental in designing formulas for use in distributing financial aid to schools and local units of government.

His conviction that education was the key to improving government led him to initiate a great many schools designed to inform voters and to train local administrators. Among these were “Citizenship Schools” for training volunteer leaders in the community, the School for Highway Superintendents, and training programs for clerks of the boards and for assessors. Professor Lutz received widespread recognition and numerous awards for his innovative extension programs. In 1976, the New York Institute of Assessing Officers recognized Professor Lutz’s contributions by making him an Honorary Member of the Institute.

Professor Lutz collaborated with others on campus in developing programs. He was a key person in organizing the “Cornell Local Government Program” for training newly elected and appointed local government officials in rural areas. This program was sponsored jointly by the College of Agriculture and Life Sciences and the School of Industrial and Labor Relations. In 1972 Professor Lutz received a national citation from the American Agricultural Economics Association for this distinguished extension program. In cooperation with Professor Harrington in Extension Administration, an educational program known as “Operation Advance” was developed to increase the confidence and competence of local leaders and citizens. This was used in extension programs throughout the rural counties of New York State and was a part of Professor Lutz’s commitment to helping local citizens take a more active role in the governance of their communities.

Professor Lutz participated in a number of programs abroad and gained an international reputation as an expert in his special field. In 1957-58 he and his wife joined the Cornell-Los Baños team in the University of the Philippines where he helped students learn more about citizen involvement in local government. He regularly attracted international graduate students who later became leaders in their home countries. In 1968-69 Professor Lutz received a Fulbright Fellowship to study local government in Norway. In 1978-79 he was leader of a team that assisted with the reorganization of local government in Dominica.

Ed Lutz was a scholar who put his knowledge and skills to practical use in the community in which he lived. Early in his career he was active in the affairs of the Willow Creek one-room school district. Later he served as a member and president of the Ithaca School District Board of Education. He served as chairman of the Town of Ulysses Board of Zoning Appeals, and in 1972 was appointed by the Board of Representatives to serve as chairman of the Tompkins County Reapportionment Committee.

Professor Lutz was active in a number of community organizations. He was a devoted member and president of the Tompkins County Public Library Board. He also was active in the Ithaca Memorial Society, the Ithaca Consumers Society, the Men’s Garden Club, Cornell Plantations, and the Rhodora Club.

Ed Lutz had a keen interest in ornamentals and pursued this as an avocation. The Lutz home was a place of unique beauty with a special collection of azaleas and rhododendrons. He not only cared for these shrubs and enjoyed their beauty but had each properly labelled with its botanical name. He had a lifelong abiding interest and love for the rural areas. Hiking, cross-country skiing, and mountain climbing were among his hobbies. As a friend and hiking companion once remarked, "It seemed that Ed knew every back road and trail in Upstate New York."

It was a pleasure for colleagues to work with Ed Lutz and share his quiet sense of humor and grace with words. He had a subtle and dry wit and was a master of descriptive phrases and short quips. Colleagues valued his editing skills. He fought hard for the demanding principles to which he was committed. Ed Lutz was serious about his work but never took himself seriously. His low-key approach proved to be effective and won him many friends. He was deeply committed to the improvement of the government of New York State and to making Tompkins County a fine place to live. He worked hard and long but seldom was in the limelight.

Ed Lutz is survived by his wife of fifty years, Madeline O'Connell Lutz; a daughter Sarah Saul of Austin, Texas; a granddaughter; three sisters; two brothers; nieces and nephews; and innumerable friends and associates.

Kenneth L. Robinson, Bernard F. Stanton, C. Arthur Bratton

Henry Hamilton Moore Lyle

November 13, 1875 — March 11, 1947

Dr. Henry Hamilton Moore Lyle, Professor of Clinical Surgery in the Cornell University Medical College, died on March 11, 1947. He had been connected with the Medical School since 1919 and from time to time had taught our students at St. Luke's Hospital. This was one of the few institutions used to supplement the clinical facilities of the New York Hospital and it was selected largely on account of Dr. Lyle's ability as a surgeon and as a teacher.

Dr. Lyle, son of the Rev. Samuel Lyle, was born in northern Ireland on November 13, 1875. He was brought to Canada as a boy and he attended Cornell where he took a prominent part in athletics. He graduated from Cornell in 1896 and from the Columbia College of Physicians and Surgeons in 1900. His first wife, Clara Schlemmer of New York, died in 1916, and in 1919 he married Jessie Benson Pickens of New York City who survives him.

From 1913 to 1919 Dr. Lyle was Assistant Professor of Surgery in the College of Physicians and Surgeons, from 1919 to 1931 Assistant Professor of Surgery at Cornell University Medical College and after 1931 Professor of Clinical Surgery. He was Attending Surgeon at St. Luke's Hospital and consultant to many other hospitals in or near the City.

Early in World War I he joined the American Ambulance Hospital B in France. In 1917 as Major in the U. S. Army he organized and took abroad Evacuation Hospital No. 2. Advanced rapidly in rank and responsibilities on the battle front, he was made chief consultant surgeon to the First Army. Among his decorations were the Distinguished Service Medal (U. S.), the British War Medal and British Victory Medal. After the war he and Mrs. Lyle maintained an active interest in work for veterans and a great enthusiasm for military medicine. Dr. Lyle was widely known for his work in supervising the transport of 125,000 sick and wounded during the Meuse-Argonne offensive.

Eugene F. Du Bois

Thomas Lyttleton Lyon

February 17, 1869 — October 7, 1938

The death of Emeritus Professor Thomas Lyttleton Lyon at his home in Ithaca on October 7, 1938, removed from the Faculty of Cornell University one of its most eminent and highly regarded members. In his field of soil science he is known the world over, and his textbooks are used in most American institutions where instruction in pedology and edaphology is offered. His work on the various phases of the nitrogen cycle, his lysimeter studies and his cereal investigations are internationally noteworthy. His published scientific articles and bulletins are many. His career was long, busy, and crowded with successes.

He was born in Allegheny County, Pennsylvania, on February 17, 1869, was prepared for college at the Pittsburgh High School, and graduated from Cornell University in 1891. Later he studied with Professor Tollens at the University of Göttingen and with Professor Caldwell at Cornell. He received his Ph.D. degree from Cornell in 1904.

In 1891 young Lyon accepted an instructorship in Chemistry at the University of Nebraska. Here he served until 1906, having been promoted to a professorship in Agriculture. From 1899 to that date he was also assistant director of the Nebraska Agricultural Experiment Station. While in Nebraska he was married to Bertha L. Clark of Lincoln. Two sons added much to the happiness of his married life.

In 1906 he was called to Cornell University by Dean Bailey to become professor of Experimental Agronomy and in 1912 was made head of the department of Soil Technology, now the department of Agronomy. As head of this department he served the State of New York and Cornell University wisely and well until his retirement on July 1, 1937.

Although Dr. Lyon made several notable scientific contributions while at the University of Nebraska, his most valuable work was done at Cornell. Caldwell Field, named in memory of his former teacher, Professor George Chapman Caldwell, was the site of his lysimeter and plat experimentations and other field studies. Caldwell Field and the chemical laboratories in Caldwell Hall were for years a mecca for persons interested in soil science from all over the world.

Because of his amiable disposition and broad cultural background Dr. Lyon had many loyal friends. As a companion he was genial and delightfully conversant with almost any subject that might be broached. Many still

remember him in his more vigorous days before ill health began to curtail his social activities. His considerate companionship, his quiet, dignified efficiency, his high ideals and the soundness of his scientific research mark a man whom it was good to know.

Thomas Anthony Lyson

January 30, 1948 — December 28, 2006

Thomas Anthony Lyson, the Liberty Hyde Bailey Professor of Development Sociology at Cornell University, died on December 28, 2006 of cancer. He was born in Oak Park, Illinois. His father died when he was eight years old. He and his mother later moved to West Virginia, where he attended high school. He earned his B.A. (1970) and M.S. (1972) degrees in Sociology from West Virginia University (WVU). As a graduate student research assistant at WVU, he traveled the back roads of Appalachia where he saw poverty and privation firsthand. When his major professor was recruited to Michigan State University, Lyson followed him there for his Ph.D. degree (1976). After working for a short time for the Michigan Department of Labor, he took a position in the Department of Agricultural and Applied Economics at Clemson University, where he progressed through the ranks from Assistant Professor to Associate Professor. He came to Cornell in January 1987, and was promoted to Associate Professor in 1989, Professor in 1992, and Liberty Hyde Bailey Professor in February of 2000.

Professor Lyson's career can be divided into four eras, each reflecting with different emphases his concerns about social justice, democracy, and economic opportunity. He began his sociological career with a primary focus on youth, undertaking studies that led to articles on education, migration, career planning and job opportunities among young people of rural backgrounds, as well as gender differences on these topics.

He then turned to a focus on the structure of economic opportunities, especially in rural areas. From this work came numerous journal articles on topics that include the impacts of industrial changes by gender and location, as well as a series of books that include the following titles: *High Tech, Low Tech, No Tech: Recent Occupational and Industrial Changes in the South* [with William Falk, 1988]; *Two Sides to the Sunbelt: The Growing Divergence Between the Rural and Urban South* [1989]; *Rural Sociology and Development: Rural Labor Markets* [edited with W. Falk, 1989]; *Forgotten Places: Uneven Development and the Loss of Opportunity in Rural America* [edited with W. Falk, 1993].

When Professor Lyson joined the Cornell faculty, the changing structure of agriculture and its implications became his central interest. Building on his earlier studies of the public's views on farming and of entry into farming, he turned his attention to topics like how technological changes and sectoral concentration affected both the dairy industry and agricultural sustainability. In addition to numerous journal articles from this work, he edited

two related volumes, *Rural Sociology and Development: Sustainable Agriculture and Rural Communities* [with H. Schwarzweller, 1995] and *Under the Blade: The Conversion of Agricultural Landscapes* [with R. Olson, 1998].

Professor Lyson's fourth era was characterized by the confluence of his interest in economic opportunities and sustainable agriculture. From this emerged his conception of civic agriculture. Here he brought together work from his two previous eras and incorporated the applied work in the Farming Alternatives Program (later renamed the Community, Food, and Agriculture Program). Under his directorship (beginning in the early 1990s), the program shifted its focus from agricultural entrepreneurship to "food and agriculture based community development," i.e., the positive development impacts of independent farms and businesses run by people with an interest in and commitment to their communities. Under Lyson's leadership, the program modeled the Cornell land grant mission, combining research, outreach, and teaching to creatively engage rural needs in an age of globalization. This era yielded co-authored articles with titles like "Local Capitalism, Civic Engagement, and Socioeconomic Well-Being" [1998] and "Civil Society and Agricultural Sustainability" [1998] as well as his last two books: *Civic Agriculture: Reconnecting Farm, Food and Community* [2004] and *Remaking the North American Food System* [edited with C. Hinrichs, forthcoming].

Another era would surely have emerged from Professor Lyson's growing interest in the health implications of food systems and community organization. Papers presented at recent conferences included titles like "Agricultural Chemical Use, Low Birth Weight Babies and Infant Mortality: A Study of Agricultural Counties in the U.S." and a session organized at the 2005 American Sociological Association meeting was titled: "Gentrification, Segregation, and Health: Community Processes for the 21st Century."

Professionally, Professor Lyson was active in the American Sociological Association, the Rural Sociological Society, and the Agriculture, Food and Human Values Society. As editor of *Rural Sociology* from 1996-99, he guided the journal to reflect the increasing range of methodological orientations and topics investigated by the membership of the Rural Sociological Society.

Professor Lyson took his teaching and student mentoring very seriously. His graduate and undergraduate courses were very popular. In his courses and his advising, he challenged students to be "big thinkers." He encouraged theoretical thinking and did this in a way that left students feeling inspired and motivated. He was highly supportive of his graduate students, including actively helping them to generate opportunities to follow their interests and passions, publish papers, and participate in professional meetings.

Though a private person, Professor Lyson's active engagement in public life reflected his sociological interests and passions. He supported grassroots sustainable agriculture groups through generously giving his time and talents as an advisor and a speaker. His "go-for-it" attitude and irrepressible confidence inspired grassroots citizens to act together to realize their dreams and passions. Messages of condolences after his death commonly included comments to the effect that he had helped the writers to accomplish what they themselves wanted to do. In the small village of Freeville, New York, where he lived during his tenure at Cornell, he served the village government in a variety of capacities, including as a member of the zoning board and as Mayor for two terms. He was a leader of a successful campaign to retain the village's elementary school after the school district proposed closing it.

His widow, Loretta Carrillo, daughters, Mercedes and Helena, and numerous current and former graduate students survive Professor Lyson.

Gilbert Gillespie, Chair; Charles Geisler, Philip McMichael
(with acknowledgements to William Falk)

Laurence Howland MacDaniels

October 21, 1888 — June 18, 1986

Dr. Laurence Howland MacDaniels, “Dr. Mac,” as he was known by all, was born in Fremont, Ohio. He earned the Bachelor of Arts degree at Oberlin College in 1912. While he entered Cornell in the fall of 1912 to pursue graduate studies, he had earlier visited the university as a member of Oberlin’s champion football team. He was subsequently elected to the Oberlin College Athletic Hall of Fame for his part in the team’s achievements. In his first year at Cornell he held an assistantship with the farm course in the Department of Entomology and in the next year one in botany. He served as an instructor in botany from 1914 to 1917. He received his doctorate in 1917. The title of his thesis was “*The Histology of the Phloem in Certain Woody Angiosperms.*”

From 1917 to 1919 he worked as a member of the Botanical Raw Products Committee of the National Research Council and for the Bureau of Aircraft Production, where his technical knowledge of wood structure enabled him to provide guidance in the selection of types structurally sound for propellers and other aircraft parts. In 1919 he returned to Cornell as an assistant professor of pomology and in 1923 was promoted to professor. He taught courses in pomology and conducted research on the basic aspects of the pollination of apples, tree wounds, and bracing and on the anatomical aspects of pollination and of flower and fruit abscission. In 1940 he was appointed head of the Department of Floriculture and Ornamental Horticulture, a position he held until his retirement in 1956, at which time he was appointed professor emeritus. During World War II, under Dr. MacDaniels’s leadership, the department focused its efforts on rubber production from American plant species, the use of plant materials for camouflage, and food production through the Victory Garden Program. Dr. MacDaniels was active in organizing the Victory Garden Council of Greater New York and served as the coordinator of the Victory Garden Program for the college.

A colleague of Liberty Hyde Bailey for many years, Dr. MacDaniels greatly admired “the Father of American Horticulture” and spoke often of his conversations and interactions with him. He worked closely with Dr. Bailey on many projects and served on the Bailey Hortorium Advisory Committee in its formative years. He was also a close associate and personal friend of Dr. Bailey’s daughter, Ethel Zoe.

Dr. MacDaniels took leave of the university from 1919 to 1921 and, with Mrs. MacDaniels, did relief work with Armenian refugees in Turkey through the American Committee for Relief in the Near East. During his sabbatical leave of 1926-27 he was associated with the Bishop Museum of Honolulu to make a botanical survey of the

distribution of the fe'i banana as it related to Polynesian migration. In 1949 he continued his survey in newly opened areas such as Caledonia, the New Hebrides, and Canton Island. The herbarium of the Bailey Hortorium was greatly enriched by his plant collections during this period. From 1943 to 1945, once again on leave, he served in the Beka Valley of Syria as director of agricultural extension for the Near East Foundation.

In retirement Dr. MacDaniels continued to be very actively involved in horticulture. From 1957 to 1959 he served as visiting professor of horticulture at the College of Agriculture, University of the Philippines at Los Baños. There he worked to improve fruit, vegetable, and ornamental crops and taught elementary horticulture. In 1960 he became the adviser for nut crops in the Technical Assistance Program for Yugoslavia with the objective of improving the culture of walnuts, filberts, almonds, and chestnuts. He returned to Yugoslavia for six months in 1961-62 as adviser for small-fruits production. There followed in 1964 a four-month assignment as a technical adviser for fruit crops on the Montana State University team at Patzcuao, Michoacan, Mexico, which had the mission of establishing an experimental and demonstration station for temperate-zone fruits. Subsequently Dr. MacDaniels was deeply disappointed when he was informed he could no longer receive foreign assignments because of his age. But he was by no means idle during the next twenty years, as attested by the three-page bibliography of articles appearing in scientific publications reporting on research done primarily on nuts and lilies during this period. During that time he was a pioneer and, until his death, the leading authority in the study of walnut allelopathy.

This chronology identifies only the major involvements of Dr. MacDaniels's long career. In his many capacities and roles he made outstanding, substantive contributions to his profession, to his university, to Ithaca, and, indeed, to the world community as a whole.

He was one of the few all-around horticulturists in the last twenty-five years. Whereas most faculty members, especially researchers, are increasingly specialized in one or so narrow aspects of horticulture, Dr. Mac was knowledgeable in garden flowers, trees and shrubs, turfgrass, weed science, greenhouse crops, fruits, vegetables, nuts, native plants, and taxonomy and in many other fields. He wrote articles in all those areas.

He was a prolific author but probably best known for the book on plant anatomy co-authored with Dr. A. J. Eames, *Introduction to Plant Anatomy*, which was first published in 1925 and completely revised in 1954. It was the standard text and reference book on the subject for many decades and remains a major reference. Dr. Mac's research of 1921-25 led to several classic *Cornell Bulletins* and *Memoirs* based on his studies of the histology of the tree crotch, tree-pruning wounds, effects of spiral ringing on solute translocation, tree bracing, wound treatment,

and related matters. He wrote hundreds of articles in refereed journals, the trade press, and garden magazines. His “A Study of Cultivars in *Bougainvillea* (Nyctaginaceae),” published in *Baileya* in May 1981, when he was ninety-two, is a classic.

In 1940 Dr. MacDaniels was elected president of the American Society for Horticultural Science. His presidential address, “Some Social Implications of the Scientific Method,” should be required reading for all horticulture faculty and graduate students. It is as timely today as it was then, when he wrote about “the sense of responsibility among scientists for the social order.” He emphasized his “belief that the method of science or the scientific approach is useful and effective in interpreting phenomena in all fields of human knowledge and endeavor and will aid in the solution of all problems with which the human race is confronted.” He expounded on the scientific method and wrote in relation to ethics, “The qualities of honesty, loyalty, truth, decency, kindness, unselfishness, and the like are constructive in their effort upon individual and social life and in the long run will make for a better society than their destructive counterparts.” Certainly Dr. MacDaniels’s life exemplified that philosophy.

As an academic administrator, Dr. MacDaniels was highly effective and provided outstanding leadership in program development. He was proud of his role in guiding the transition of floriculture and ornamental horticulture from the status of a gardening art and craft to that of a respected branch of plant science. He recruited new faculty members with strong training in plant physiology and related biological sciences. He introduced courses in horticultural taxonomy and applied plant physiology and worked diligently to garner sufficient funding to support his faculty members with the most modern laboratories and equipment. He developed a strong working relationship with the Bailey Hortorium and sought to achieve optimal interaction among all horticultural departments at Cornell.

Dr. MacDaniels chose to teach the introductory course in floriculture and ornamental horticulture during his entire tenure as department head. He found teaching at that level to be most stimulating and an excellent means of remaining abreast of developments in the field. In his course he stressed horticulture as a science and quickly introduced his students to the scientific method through laboratory experiments and projects that took them into the research literature. He was a warm and understanding teacher, equally able to discuss a complex theory of plant growth and development or to demonstrate a simple garden practice. And he enjoyed as well the lighter side of his relationship with students. Alumni regularly ask if Dr. Mac still played his guitar and sang folk songs and ballads at department get-togethers. Remembered by all were the Sunday evening socials at the MacDaniels’s home, where all were invited to gather to make chocolate candies and to discuss in a most understanding and concerned manner one or more major world concerns. Both Dr. and Mrs. MacDaniels had serious concern for,

and understanding of, students' situations and often made major efforts, using their personal resources, to ease difficulties.

Though he focused his attention on the horticultural sciences, Dr. MacDaniels contributed substantially in many other areas of the university. He was president of the Cornell chapter of the American Association of University Professors and of the Cornell Library Associates. He served on the University Committee on Physical Education and Athletics, chaired the Advisory Committee for the Bailey Hortorium, and served on the Campus Trees Committee. He was involved with the Cornell Plantations in many capacities spanning more than four decades. In 1942 he served as chairman of the Administrative Committee and in subsequent years as member, chairman, and consultant. He was a moving force in the Cornell Plantations Natural Areas Committee's selection and acquisition of ecologically valuable areas. Through his efforts the A. J. Eames Memorial Bog was purchased and given to the Cornell Plantations. In 1973, on the occasion of his eighty-fifth birthday, a fund-raising drive was initiated by friends to obtain a natural area in his honor, to be known as the L. H. MacDaniels Botanical Sanctuary. To that end Allan Hosie and Pauline Bird Treman and Caroline Cooley (the widow of Robert E. Treman) donated property to the university in the Coy Glen Gorge and gave instructions to keep their ninety acres forever wild, managing it only with suitable scientific practices. The area had been used by Dr. MacDaniels and others at the university to study its geological features, mosses, bryophytes, the American hackberry, scarlet oaks, lilies, orchids, and more than 380 other species of plants that are growing in its gorge and that can be found on no other Cornell property. Donations from friends were to help purchase additional adjacent parcels of land to help protect the entire site, but the project has never been fully realized because of reluctance on the part of some private owners to sell or donate their adjacent land. An inveterate plantsman, Dr. Mac greatly enhanced the Cornell Plantations' plant collections through the years, and he was responsible for assembling the Class of 1901 Memorial Cornell Plantations Nut Tree Collection.

Dr. Mac was a member of many honorary and professional societies, including the Cornell chapters of Sigma Xi, Gamma Alpha, Alpha Gamma Rho, Phi Kappa Phi, and Pi Alpha Xi. He was a fellow of the American Association for the Advancement of Science, the American Society for Horticultural Science, and the Royal Horticultural Society of London. He was president of the American Society for Horticultural Science in 1940 as well as a member of the Massachusetts Horticultural Society, the Botanical Society of America, and the American Society of Naturalists. He served as president of the Northern Nut Growers Association in 1951; helped found the North American Lily Society in 1947 and served as its first president from 1947 to 1949 and again from 1955 to 1957; and

was chairman of the Lily Committee of the American Horticultural Society from 1938 to 1946. He was a member of the New York Academy of Sciences.

In 1966 Dr. MacDaniels was the recipient of the Wilder Medal from the American Pomological Society. In 1979 he received the Land Award of the New York Nature Conservancy. On the occasion of his ninetieth birthday, in 1979, the Department of Floriculture and Ornamental Horticulture named its main classroom the L. H. MacDaniels Lecture Room. In 1980 he received the Lytell Lily Cup from the Royal Horticultural Society of London for the significant advancement of knowledge of breeding and cultivation of garden lilies. He was the first Cornellian and the third United States scientist to receive the award since its establishment in 1939.

At home in Ithaca both Dr. and Mrs. MacDaniels played major roles in the community. Mrs. MacDaniels was the first woman to serve on Ithaca's Common Council, initially in 1945 and again in 1948-49. Both were stalwarts of the First Unitarian Church. Dr. MacDaniels was also the chairman of the Council of Social Agencies and active in the Rotary Club, the Ithaca Garden Information Center, and Hospicare of Tompkins County. He was a charter member of the Ithaca Men's Garden Club and was active in founding the Senior Citizens Center, serving as a member of its first board of directors. He served on the Greenbelt Committee, the Circle Greenway Committee, the Area Beautification Council, and the New York Nature Conservancy. He was president of the Cayuga Lake Preservation Association, one of the groups credited with preventing construction of a nuclear power plant along the lake. He also served in an advisory role to many Ithaca officials and groups. In 1967 Dr. and Mrs. MacDaniels donated two acres on West Hill to the city of Ithaca for a park that now bears Mrs. MacDaniels's name.

Dr. MacDaniels's concern for protecting our natural resources led him to spearhead an effort to acquire as many as possible of the one hundred glens along Cayuga Lake for incorporation into the state park system. His concern for world hunger led him to assist in the establishment, in the 1970s, of the Cornell Tree Crops Program, which endeavors to research the feasibility of food production from nut and other tree crops grown on lands otherwise not suitable for agriculture. He donated more than twenty acres of land, along with supporting funds, to Cornell to establish the program.

Horticulture was both his professional and spare-time preoccupation. Gardening was his favorite hobby. His gardens on West Hill represent one of the finest plant collections in Ithaca. Ever generous with his plants, Dr. MacDaniels was the benefactor of many a beginning gardener and swelled mightily the offerings at the annual plant sales of the Ithaca Men's Garden Club. He was also an avid fisherman, pursuing his piscatorial activities in stream, lake, and deep-sea environs. An accomplished musician, he studied at the Conservatory at Oberlin and

sang in the Oberlin College Glee Club. He was a long-standing member of the choir of the First Unitarian Church of Ithaca and one of the most revered song leaders of the Rotary Club of Ithaca, where his direction of the club's members in "My Grandfather's Clock" became a Rotary tradition.

Dr. MacDaniels's colleagues, friends, and students knew him as a concerned and committed scientist, teacher, administrator, and humanist.

His concerns were genuine, his goals sound, his approach scientific, his standards lofty. Blessed with long life, he was able to touch many generations with his wisdom and very special insights. His impact on the university, on Ithaca and its environs, and on the profession and science of horticulture—indeed, on science and education in their broadest contexts—has been profound. Perhaps foremost among his legacies is that of an exemplary philosophy of life rooted in compassion for the human state, understanding of the role and potential impact of scientifically based knowledge, and commitment to take part actively in the issues that swirl in one's own time.

Raymond T. Fox, Robert W. Langhans, Richard M. Lewis, John G. Seeley, Carl E. Gortzig

Harry Alexander MacDonald

June 21, 1910 — November 14, 1993

“Our friend and colleague” as Harry MacDonald was introduced at a dinner honoring his career service to seedgrowers, was an agriculturist of the classical kind. In him were combined scientist, naturalist, historian and philosopher. His was a life of service to constituents spread across New York State, northeastern North America, and overseas.

His early years in rural Nova Scotia inculcated in him the virtues of industry, thrift, and loyalty. As education and experience conducted him into a larger setting, he became known professionally for scholarship, scientific integrity, and insight.

After service with the Canada Department of Agriculture at Nappan, Nova Scotia, he entered McGill University, from which he received a B.S. degree in 1937, and then came to Cornell for graduate study in agronomy under D.B. Johnstone-Wallace, who had been brought from Great Britain to develop a program in pasture management for New York. Harry MacDonald was assigned to investigate an immigrant forage plant called birdsfoot trefoil (*Lotus corniculatus*) that had started to colonize the eastern Catskills. His doctoral dissertation, based on detailed studies both on farms and at the experiment station in Ithaca, became one of the most famous publications of the Cornell University Experiment Station. Memoir 261, “Birdsfoot Trefoil: Its Characteristics and Potentialities as a Forage Legume” stands some half century post-publication as a primary reference source.

The usefulness of trefoil demonstrated in these studies spurred interest in widespread adoption, and MacDonald, after he received the doctorate in 1943, was appointed Assistant Professor of Agronomy in 1944 with duties in both research and extension. His objective was to raise the productivity and nutritive value of pastures on New York farms by introducing trefoil, and by other means.

Enthusiasm for trefoil was tempered by the discovery that the seedling stage of the plant did not compete vigorously, and also by the fact that, because in Europe whence it came, it was an unsown volunteer, there was no source for the quantities of seed that were needed. MacDonald set about selecting better plant types, eventually releasing the first two named varieties in North America, “Empire” and “Viking”. Meanwhile he and his graduate students created a laboratory at Ithaca for the study of the formation, maturation, processing and germination of seeds. With extension agents he undertook to organize growers, land and equipment for commercial-scale production of the new varieties. The production of trefoil seed proved, over the following decades, to be a nearly intractable

problem because the pods, arranged like a bird's foot, fly open spontaneously when fully dry and ready for harvest. At a time when seed production problems were routinely being handed off to specialists in the irrigated West, birdsfoot trefoil was actually rejected by those specialists and the problem was sent back to the area where the seed was needed. Under these difficult circumstances, Harry MacDonald retained the respect and affection of the growers by dedicated effort.

He was promoted to Associate Professor in 1947, and Professor in 1950. Meanwhile he had taken on teaching duties. He taught a course called "Grasslands" for over twenty years. In the mid-1960s he began two new courses, the first (Economic Crops) paralleling a shift in his research and extension duties toward oilseed crops and the second (Tropical Agriculture) responding to student demand for more information about crop production in the tropics. He also offered Special Topics courses from time to time at Cornell, and simultaneously held an appointment at Syracuse University where he taught a course in Range Management to forestry students.

His broad interests made him a natural participant in the program in International Agriculture at Cornell, where he was chosen by more than a dozen graduate students to serve as chair of their special committee. Many others nominated him as a minor member. His hospitality and wisdom made him a popular consultant. There was a year as a member of the Cornell team that assisted the University of the Philippines to establish a graduate studies program at Los Banos, and consultations in several other countries.

Above and beyond the demeanor of its occupant, Mac's office had atmosphere. Its wooded desk and cabinets had sentimental value, but also served as a silent reproach to the administrators for the extravagance of purchasing all new furniture when the Department moved to Bradfield and Emerson Halls in 1968. Photographs of friends and mementoes of many kinds adorned the walls, and the bookshelves displayed an eclectic array of source materials.

Harry MacDonald made and kept friendships by his genuine interest in individuals, by his unselfishness, and by his unfailing courtesy. He would have topped the faculty list if ranked by secretaries and other staff members, and he was gratified at the establishment of an annual Harry A. MacDonald Award for excellence in agronomy. Robust and energetic for most of his career (he was reputed to have used a needle and thread, but no anaesthetic, to sew up a severe cut sustained in the field), he became less so toward the end because of diabetes; typically, he did not complain. He left a period of depression behind him, downplayed his role as critic, basked in the support of family and friends, and left us with the half smile he so often wore himself. And he left us a summer landscape illuminated by the bright yellow blossoms of birdsfoot trefoil.

W. Keith Kennedy, Robert L. Plaisted, Madison /. Wright

John W. MacDonald

March 29, 1905 — March 14, 1981

John Winchester MacDonald was born in Albany, New York, on March 29, 1905. He resided at the time of his death at 15D Strawberry Hill Road, Ithaca, New York. His three earned degrees were from Cornell University: Bachelor of Arts, Master of Arts, and Doctor of Law. He was awarded the Doctor of Laws degree in 1959 by Canisius College and was also a graduate of the Army Industrial College. He was a member of Phi Beta Kappa and the Order of the Coif.

Professor MacDonald married another graduate of the Cornell Law School, Mary Elizabeth Brown, on September 26, 1927, the year after he was admitted to the New York bar. After practicing law in Albany and acting as clerk, New York Court of Claims, he was appointed to the faculty of Cornell Law School in 1930, where he was the Edwin H. Woodruff Professor of Law emeritus at his death.

His principal areas of expertise were legislation, constitutional law, and civil practice, although he wrote and taught on numerous other topics. He was a visiting professor at Columbia University School of Law, New York University School of Law, and St. John's University School of Law. Between 1951 and 1958 he lectured at the St. Lawrence University Institute on Crime and Delinquency.

His many publications include *Cases and Materials on Legislation* and *Materials on Legislation*, as well as numerous legislative studies published over the years by the New York State Law Revision Commission. He was editor for two volumes of the 1938 New York Constitutional Convention Committee Reports and coauthor of *Materials on Introduction of the Study of Law*. In addition he contributed many articles to important legal periodicals.

He served on numerous Cornell University faculty committees over the years and was a faculty member of the Board of Trustees from 1951 to 1955. From 1954 to 1956 he was chairman of the Administrative Committee of the Cornell Law School while the deanship was vacant.

John W. MacDonald also played a prominent role in New York State government. From its inception in 1934, he served the New York State Law Revision Commission as its executive secretary and director of research, then as a member of the commission, and ultimately as its chairman from 1958 to 1973. He became known as Mr. Law Revision Commission over his long period of activity, during which he had an important role in advising other state governments on the law revision concept, and he established contact with similar bodies abroad.

Other public service included that of research associate, New York Commission on the Administration of Justice, 1932-33, special assistant United States attorney general in 1942, delegate to the New York Constitutional Convention in 1967, Board of Visitors, Elmira State Reformatory, 1942 to 1947, and delegate to the New York Joint Conference on Legal Education.

Other interests of Professor MacDonald included service as general counsel and director, Therm, Inc., in Ithaca; acting as director, New York Legislative Service, Inc.; and serving other corporations. He was staff general counsel in the reorganization of the Associated Gas and Electric Corporation in 1942.

Among his many memberships were the Cornell Law Association, of which he was secretary-treasurer from 1932 to 1955; the American Academy of Political and Social Science; Scribes; American Judicature Society; the American, New York State, and Tompkins County bar associations; the Association of the Bar of the City of New York; the American Law Institute, where he was on the permanent editorial board for the Uniform Commercial Code; the American Association of University Professors; the Catholic Commission on Intellectual and Cultural Affairs; the John Henry Newman Society; Delta Sigma Rho; and the Knights of Columbus, Fourth Degree. His clubs included the Cornell Club of New York, the Country Club of Ithaca, and the Ithaca Yacht Club.

Professor MacDonald was a communicant of St. Catherine of Siena Church in Ithaca.

He is survived by his wife; one son, John Winchester MacDonald; and three daughters: Mrs. Catherine Wigsten, Mrs. J. A. Lindseth, and Rita MacDonald. A fourth daughter, Mrs. Mary Jean O'Connell, predeceased him. There are fourteen grandchildren and two great-grandchildren surviving. Two grandchildren predeceased Professor MacDonald.

The crowning honor of his long and distinguished career in the law was the dedication of the John W. MacDonald Moot Courtroom on June 14, 1980, which he attended. A plaque at the entrance of the courtroom in Myron Taylor Hall, home of the Cornell Law School, describes John MacDonald as an "inspiring teacher," a "distinguished scholar," and a "creative law reformer." He was indeed all these and more. A warm and vibrant personality, he played a significant role in the life of Cornell University for over forty years. Professor MacDonald will be remembered with deep affection and respect by his colleagues at the Law School and by the several generations of law students whose lives he enriched by his scholarship and teaching.

W. David Curtiss, Ernest N. Warren, William Tucker Dean

Robert D. MacDougall

September 1, 1940 — May 8, 1987

Robert Duncan (Scotty) MacDougall was an intriguing and enigmatic man. His concern with form and formality—which casual acquaintances misconstrued—was always balanced by his keen sensitivity to the life and energy that animates form. His unusual progress from a bachelor's degree in architecture (Cornell, 1963) to a Ph.D. in anthropology (Cornell, 1971) was quite consonant with his view of the building as an extension of the individual within a culture. His main scholarly preoccupation was the Indian subcontinent, a choice that puzzled people when they first met him, given the obvious contrast between the dapper, precise Scotty and seething, turbulent India. Nor did he restrict his focus to the great works of Indian architecture. He went, as in his exhibition funded by the National Endowment for the Arts in 1980, "Beyond the Taj," in a quest for India's diversity as well as its unity. And his massive dissertation was on *domestic* architecture among the Kandyan Sinhalese, written while he and his wife Bonnie were both hard at work on degrees, trading off duties and responsibilities in a model partnership.

The spiritual structures that men built and inhabited, high religions, raw superstitions, and simple make-believe intrigued him as much as the buildings and artifacts that gave them symbolic form. He was not content to observe from a predictable, scholarly distance but wanted to participate in a ritual as well as to comment on it, to experience it from the inside. As was evident in his famous costumed appearances at the annual Beaux Arts Ball, he possessed an extraordinary ability to let his own energy so animate the form that he adopted that it was hard to believe he was not the being the costume suggested he was. Yet Scotty neither desired—nor imagined it was in his power—to discard his own identity and become assimilated into the world he observed and reproduced. He had what architects call a gifted eye. And perhaps his greatest artistic desire was to share the benefits of that talent with others: to help them participate in a world that he could see but perhaps they could not. He was not just a sympathetic and admiring scholar, determined to be the first Western participant in an age-old ritual. He wanted others to have the chance to see it as he did. So he photographed it.

His obsessive interest was in what the people of different nations took to be central to their lives rather than what a westerner might consider the major monuments of their culture. Although he observed and enjoyed the profundity of Indian and Greek thought and the masterpieces of those cultures' art, as often as not he preferred to offer a less-elegant and fashionable perspective on a culture: its mysterious religious symbols, such as the *omphalos*

at Delphi, or its fear of the evil eye—an understandable preoccupation in one who himself possessed a gifted eye. Similarly he wanted to see a grand sailing vessel from the top of the mast or from the bowsprit, as a sailor sees it, not just from the deck or the shore. His own vision, extended by the camera, yearned to show us the insect's eye or the crow's-nest view of a building, a society, or an idea. His visual intelligence made him a fascinating teacher, a challenging colleague, and a very special parent. For he was dedicated to teaching his own children as well as his students, supporting them, encouraging them, and, above all, training their eyes.

His powers of observation were matched by his skill at reproducing an artistic image of what he saw—with the camera or the study tour, the graphic artist's tools, or the university. He loved observing nature and humankind. He also loved to organize nature into gardens and humans into colleges. And his talents were speedily put to good use by Cornell, which employed him as assistant dean in the College of Architecture, Art, and Planning; as director of the South Asia Program; as guest curator of the Herbert F. Johnson Museum of Art; and, finally, as dean of the Division of Summer Session, Extramural Study, and Related Programs. Under his leadership new programs developed and blossomed. There had always lurked the possibility, indeed the danger, that Scotty's creative talents would be harnessed to institutional rather than personal intellectual goals. His passion for Cornell matched his passion for art. Consequently Cornell's summer brochures became works of art.

Scotty's administrative skills were not tapped only by Cornell. He was intrigued by all the different ways humans in a community gather and express themselves socially. And he participated in many. He served on the boards of directors for the Statler Faculty Club, the Cayuga Heights Community Center, and the Hangar Theatre. Indeed, during the last few years of his life he became progressively more interested in gaining new perspectives on the theater, where human behavior is ritually imitated, mocked, and admired. And his collection of photographs of Greek theaters is a treasure in itself.

The demands of administration, however, sapped the time available for his personal scholarship. As death warned of its approach, he felt he had left far too much unwritten and undone. But his annoyance never lapsed into self-pity. During an early visit to a clinic, he found himself with other cancer patients in their sixties and seventies. Although a university professor in his mid forties usually feels old in comparison with those around him, Scotty felt suddenly and unjustly young. 'I was touched,' he said, "by how frightened some of them were as they faced death, and I noted their reactions. 'I'm not ready to die,' one older man complained bitterly." Neither was Scotty. But he didn't put it that way. His attention shifted almost automatically from himself to others. He maintained that same distance from himself that he had when participating in and photographing a Hindu ritual, seeing and

recording human genius with sympathy and awe, not with a haughty desire to impose his own image on it. In his heart he knew he had accomplished much. He was proud to have completed a pilgrimage to all the holy sites of India. And he met, as he traveled, many old men who were still trying to make all the stops.

George Hascup, Charles Pearman, Frederick Ahl

Duncan MacIntyre

June 2, 1915 — July 24, 2007

Duncan MacIntyre was among the early faculty of the School of Industrial and Labor Relations. His Cornell appointment in 1950 was a natural fit for a teacher and scholar whose interest in social welfare was deep. Duncan's interest in that field could be seen as occupational inheritance. His father served for many years as Commissioner of Public Welfare in Madison County, New York. Duncan often liked to bemuse inquirers by replying that he was raised in the county poor house! His interest in public policy subsequently was reinforced both by academic study and field practice as a welfare worker. Following graduation from Colgate, he attended the University of Berlin in 1935-36. From 1936-39, he attended the University of Chicago in pursuit of his M.A. degree in Social Work Administration. Following service as a cryptographer in World War II, Duncan was employed in various New York communities as social worker, investigator, and veteran's counselor. In 1947, he enrolled as a Ph.D. student at Cornell where he received his degree in Public Administration.

Duncan's mark as an undergraduate teacher was indelible. His stern demeanor at the first meeting of his classes let students know that this was a no-nonsense course. There was substance as well as theater in his performance, of course. Before that meeting, Duncan learned as much as he could about the personal and social backgrounds of each class member. It was information he used for rapport, and often to stimulate their interest by relating subject matter to student's personal experience.

Duncan's interest in students often continued well after their graduation from Cornell and establishment in their careers. A number of letters received both before and after his retirement reflect that interest. Some were from individuals uncertain about their ability to meet the academic standards but, under Duncan's guidance and encouragement, succeeded to go on to rewarding jobs. Appreciation for that support is reflected in such phrases as treating students with "respect and dignity," teaching "analytical thinking," insisting on clarity of expression in their written work. A letter following his death, from a senior vice president for human resources of a major corporation, epitomizes the views of many such students.

"He was a fair, kind man who was a magnificent teacher, a task master who demanded no less than the best you had to give, a man of principle and integrity, whose moral compass never deviated from the correct course and a man who became my friend for almost 40 years."

In 1998, he was honored by the establishment of the MacIntyre Honors Awards Fund to encourage and strengthen teaching in the ILR School.

Duncan's research encompassed almost the entire field of social welfare, and always with a strong emphasis on public policy. His work on health insurance resulted in a number of well-regarded publications, including a monograph, *Voluntary Health Insurance and Rate-Making*, which received the ARIA Eleazar Wright prize. He served several times as consultant to various New York State and Federal legislative committees on welfare issues. He was also instrumental in the creation of the School's resident professorial extension faculty (the Mouse in the Experiment, as he called it), reporting on his experience with the requirement in the ILR School's early years that all faculty members devote a third of their time to its extension program.

Duncan was a brilliant man devoted not only to his field of study but to his interests in gardening, genealogy, the outdoors and, of course, his family. He regarded his success as a teacher as the most important contribution of his career.

His wife of 66 years, Margaret Ryan, and daughters Elizabeth and Rachel survive him.

Robert L. Aronson, Chairperson; James A. Gross, David B. Lipsky

Guilford L. Mack

August 18, 1905 — July 14, 1991

Guilford Leroy Mack, professor emeritus of chemistry died Sunday, July 14, 1991, at Good Samaritan Hospital in Corvallis, Oregon, just a few miles from his birthplace in Bellefountain, Oregon. He received his B.S. degree in chemistry at Oregon State College in 1927, his M.A. degree from Rice Institute in 1929 and his Ph.D. degree at the University of Michigan in 1931. That same year he became an associate in research in chemistry at the New York State Agricultural Experiment Station. Then, except for one year when he returned to the University of Michigan as a Rackham Research Assistant, he has been on the staff of the New York State Agricultural Experiment Station. He became assistant professor of chemistry in 1938 and associate professor in 1952.

Professor Mack was the author or co-author of more than 60 publications covering the results of his research not only on methods of analyzing insecticides and fungicides but also analyzing food products for various components including vitamins, particularly ascorbic acid, and minerals. His publications also include translations from the Alma Alta Research Station in the Soviet Union for the American Chemical Society. His specialty was the field of Analytical Chemistry, especially the development of methods for the analysis of environmental contaminants and agricultural pesticides, particularly soil insecticides and the application of these methods. He was an excellent chemist who was held in high esteem by his colleagues and was a recognized authority in his field. This was demonstrated during his sabbatical leaves when he served as agricultural chemist in the Brazilian Ministry of Agriculture (1949-50), and also when he served as a FAO pesticide consultant to Yugoslavia and India (December 1, 1966-May 31, 1967).

Professor Mack was a member of the American Chemical Society and the Phytopathology Society. He was also a member of two honorary scientific fraternities — Phi Lambda Upsilon and Sigma Xi.

He consistently maintained his career as a bench-chemist. Although he was deeply immersed in his research, he has always been willing and able to collaborate with other members of the faculty and staff and to assist them with solutions for analytical problems. He directed the New York State laboratory for the analysis of official samples of economic poisons, which was a cooperative effort with the New York State Department of Agriculture and Markets.

Although Professor Mack had retired on June 30, 1971, after 40 years of service with the New York State College of Agriculture, New York State Agricultural Experiment Station (Geneva), he maintained an office at the Experiment

Station and continued to improve the Pesticide Register which he had developed. Effective July 1, 1971, he was awarded the title of Professor of Chemistry Emeritus by the Board of Trustees of Cornell University.

Dr. Mack traveled extensively in Central America and Europe, including Bach country in what was then East Germany. He loved classical music, playing violin as a youth and later the viola in the Seneca Symphony in Geneva. He loved hiking and walked the New Hampshire Appalachian Trail while in his seventies and the Canadian Rockies in his eighties. His interest in agriculture followed him in retirement where he continued as Master Gardener raising irises.

Dr. Mack was predeceased by his wife, Dorothy A. Lee, a former bacteriologist for the New York State Agricultural Experiment Station who died in 1974. In 1977 he married Jane Connelly and moved to Ann Arbor, Michigan. She died in 1980 and in 1982 he retired to Samaritan Village in Corvallis, Oregon. He is survived by two children, a daughter, Dorothy Lee, currently of Corvallis, Oregon and a son, Guilford Leroy, Jr. of Geneva, New York; a sister Gladys Hunt of Eugene, Oregon; six grandchildren and four great-grandchildren.

Willard Robinson, Haruo Tashiro, John B. Bourke

Ronald D. Mack

January 30, 1940 — November 26, 1993

Ron Mack was a man of great creative energy, an inspired teacher and storyteller, and a counselor-in-residence for his colleagues in the Department of Psychology during his twenty-two years at Cornell. Before his untimely death after a long fight with cancer, he was taking on the role of departmental patriarch and historian. He leaves in the community his son, Joshua Mack, of his first marriage to Linda Mack, and his wife, Joanne Taormina and their two children, Hannah and Ari. His ebullient personality is missed by everyone whose lives he touched.

He was born in 1940 in Portland, Maine. He attended Brandeis University, where he combined psychology and Near Eastern and Judaic studies, financed in part, he claimed, by summer jobs as a standup comedian. For a time, he explored a career as a rabbi, but later took his Ph.D. in clinical psychology at Columbia University. Proud of his Jewish identity, he explicitly took the role of minority representative and cultural translator, first in Portland, later in Tunisia where he did the research for his thesis, and then in the South where he did his internship. He continued as a different kind of cultural translator in his role as a teacher of clinical psychology to policemen, and finally, to experimental psychologists at Cornell.

Many students who major in psychology are interested in eventual clinical work and wish to take courses that will prepare them for careers in that area. It is difficult to find “real” clinicians who can advise students on possible careers, open doors to clinical practice to them, and yet provide enough academic structure to teach challenging courses. Cornell was looking for such a person, and found Ron Mack in 1971. His extraordinary teaching and organizational skill enabled him not only to develop the academic program in abnormal and clinical psychology, but also to develop fieldwork opportunities for undergraduates. He carried this load, which was not without its intrinsic strains, with great success throughout his career.

His courses were extraordinary, and he won the Clark Distinguished Teaching award in 1988. From a constant stream of testimonials, one will suffice. In 1986, junior and senior psychology majors were asked, “Which psychology courses do you think were most valuable to you and why?”, and more than a third mentioned a course taught by Ron Mack (out of a faculty numbering about 25). His largest, most popular course, “Introductory Psychopathology,” took a developmental, personal and psychodynamic approach to the subject. When Ron began his training, psychodynamic and pharmacological approaches to psychopathology were on an equal footing, but the field progressively medicalized its understanding of both the causes and treatment of mental illness. Ron

insisted on showing his students the person rather than the disorder. Similarly, as a therapist, he asked clients to find the health amidst their symptoms, effectively fighting a progressive depersonalization of this most personal of subjects. He also taught seminars on methods in psychotherapy, an intense experience which students often called “the most influential course in my life”, and he organized a number of fieldwork opportunities which gave students one-on-one experience in helping relationships in the community.

The fieldwork experiences were valuable for both Cornell students and the community. In 1973, he founded Evergreen, a student-run halfway house for mental patients, now a part of Community Living Services of H.O.M.E.S. Inc. They honored him in 1993 with the first presentation of Lifetime Service Award, named for him.

Fieldwork placements were also available in the local elementary schools with emotionally disturbed or learning disabled children, in psychiatric centers and in juvenile correction centers. In addition to his ongoing practice in psychotherapy, Ron Mack also served as a consultant for a large number of these community institutions, and was a leader in mental health issues in this region of New York.

For his colleagues, his role in the department is the greatest loss. Particularly in his first years here, he constantly organized legendary social events—the ongoing Assistant Professors’ Banquets, Polyester Day, the Ron Mack Look-Alike Contest. The last Assistant Professor Banquet, held for Ron a month before his death, brought back former colleagues now spread across the country. Not many academic departments have their own therapist, but the Psychology Department had one. When a major dispute arose in the Department, he was able to counsel every side, help people understand the structure of their points of view and show how differences could be resolved. As a result, a style of problem solving emerged based on openness and directness and consensus, which we hope will be able to survive.

Howard Feinstein, Bruce Halpern, Richard Polenberg, Barbara L. Finlay

Thomas William Mackesey

November 28, 1908 — May 2, 1976

Professor Thomas W. Mackesey, whose contributions to Cornell as a teacher, colleague, and administrator fill the years between 1938 and 1976, died in Ithaca at the age of sixty-seven on Sunday, May 2, 1976. Professor Mackesey is remembered for his inspiring teaching, his brilliant administrative work, his quick good humor and hearty cheer. He will be recalled fondly by his students, his colleagues, and his fellow administrators.

Professor Mackesey was a shaker and a mover who got things done by force of reason, quiet persistence, and principled compromise. He was a builder of institutions and a planner of cities, both here and abroad. At Cornell he left his mark on the campus by creating the conditions under which the best architects of the nation found opportunities to express themselves in buildings reflecting the exciting and sometimes disturbing forms of contemporary America. Tom led the planning, development, and construction of literally tens of millions of dollars of new physical facilities during a period of tremendous University growth and expansion. He did so with keen insight and admirable sensitivity.

Born in Boston in 1908, Professor Mackesey received a professional degree in architecture and, from M.I.T., one of the first graduate professional degrees offered in city planning in the nation. When Tom arrived at Cornell in 1938, the Carnegie Foundation had provided funds for the establishment of a graduate program in city and regional planning. Tom Mackesey worked actively in the development of coursework and the creation of the excellent library collection in planning. The graduate planning program also thrived under his direction, growing from a handful of students in the thirties and forties to over one hundred thirty graduate students.

In addition, Professor Mackesey was from the first active in the administration of the college serving for many years as secretary of the faculty. In 1950 he was appointed acting dean of the College of Architecture and in the following year was named dean. His administration was a period of growth for the college programs in architecture and art as well as planning. He brought to Cornell a number of excellent faculty members and was active in building a better graduate component in all three fields. It was also under his leadership that the visiting critic program, which has proved so valuable a part of the undergraduate curriculum in architecture, was initiated and proved.

Professor Mackesey also had a distinguished career as a professional planner and researcher. He has worked on a number of projects in New York State and abroad. He initiated interdisciplinary research in housing and urban development through the Center for Housing and Environmental Studies in which he led the work of

establishment and recruitment of its first director. Subsequently he was the principal or coinvestigator in a number of major research studies carried out within the center. He was a member of the team working with Professor Belcher advising the Brazilian government on the selection of the site for the new national capital of Brasilia, and he was a principal consultant on campus planning for the National University in Laos.

When Professor Mackesey retired from the deanship of the college in 1960 he planned to return to teaching but after a sabbatic leave during which he served as visiting professor at the Royal Academy in Copenhagen, Denmark, he returned to the campus and was nominated and elected dean of the faculty. In this post he served until 1963 when President James Perkins asked him to serve as vice provost for planning and subsequently vice president for planning. By firmly establishing certain fundamental campus planning processes and principles, he contributed wisely and permanently to the evolution of the unique Cornell environment. As Cornell's master builder in this modern era of campus development, he was often subjected to criticism, which never left him bitter. For as Deane Malott once observed, "Tom has been praised, kidded, prodded, cajoled, vilified, and glorified . . . (because at heart we are all architects and planners) but through it all he has come triumphant, sure of his facts, willing to listen, his humor undaunted, his patience enduring."

Yet it is not only the buildings for which Tom has such a major responsibility that we shall remember him, but for the more important structure that he made of his life. Tom was a gentle man. He cared for the feelings of others, respecting and responding to them with tenderness and understanding.

His personal gentleness, however, did not lead him into soft solutions for tough problems. He possessed the ability and the confidence to make decisions on complex issues. No one ever had to guess how Tom Mackesey stood on controversial matters. He laid down the principles from which he drew his conclusions, stated his position, and argued forcefully and clearly for what he believed. Yet, if a decision was reached contrary to his opinion, he did his utmost to carry it out. He was a modest victor and a graceful loser. Tom bore no grudges. One could disagree with him, even sharply, with the sure knowledge that no part of such conflict would be carried over to other subjects or relationships.

Professor Mackesey always maintained his interest and, to the extent he could, participation in teaching while he served in various administrative capacities. He continued his scholarship particularly in his special interest— the history of city planning and building. Professor Mackesey looked back only to learn from the past. In his popular course on the history of city planning he shared these insights with several generations of appreciative students.

He was a masterful lecturer on this subject, tracing the great accomplishments of city building in ways that gave them fresh meaning and demonstrated how the lessons of history could be applied in modern practice.

Of his teaching ability in other courses, hundreds of alumni can testify to the impact he made on them both personally and intellectually. He took the efforts of students seriously, reacting thoughtfully and conscientiously to the results of their work. He found ways to criticize without wounding, to disagree while finding merit, and to patiently lead the student to reconsider his or her conclusions more carefully. Those fortunate enough to study under Tom thus learned to use their minds for something other than a place to store their instructor's knowledge.

Professor Mackesey wore his many honors lightly and modestly. His elevation to the rank of fellow of the American Institute of Architects could not have failed to gratify him, but it was surely the lively and sentimental party marking his retirement that moved him most. It was an occasion when, as Deane Malott noted in presenting him with three volumes of admiring letters from friends throughout the world, there was affection "in every line and word." His friends' affection remains constant, and our respect grows as his legacy to the University is now acknowledged.

John W. Reps, Ian R. Stewart, Kermit C. Parsons

Charles Osborn Mackey

October 8, 1903 — April 7, 1965

The passing of Charles Osborn Mackey, the John Edson Sweet Professor of Engineering, removed from the Cornell campus a teacher, scholar, and administrator who had devoted a lifetime to Cornell.

Born in Ithaca October 8, 1903, Professor Mackey received his early education in the Ithaca public schools. He received the M.E. degree from the Sibley School of Mechanical Engineering in 1926, where he played the unusual dual role of student and undergraduate instructor from 1924 to 1926 in Experimental Engineering. He continued in Sibley as an instructor after graduation, and his later promotions in the Department of Heat Power Engineering were: Assistant Professor, 1929; Professor, 1936; John Edson Sweet Professor, 1953. He served as head of the Mechanical Laboratory from 1942 to 1947, and of Heat Power and later Thermal Engineering from 1947 to 1962. His honors included Sigma Xi, Tau Beta Pi, Phi Kappa Phi, and Pi Tau Sigma. He had been a member of the Statler Club, the Ithaca Yacht Club, and the Zodiac fraternity.

Professor Mackey was a member of several professional societies including the American Society for Engineering Education and the American Society for Heating, Refrigeration, and Air-Conditioning Engineering, serving some as an officer or chairman. In 1961 he became an ASHRAE fellow and received its distinguished service award in 1963. A few days prior to his death it was announced that Professor Mackey had received the E. K. Campbell Award of Merit from that society.

A licensed professional engineer, he was very much interested in professional engineering and served as a consultant to many well-known commercial firms. He also contributed to engineering literature in the form of many papers and bulletins, and was the author or coauthor of four books in the field of theoretical and engineering thermodynamics: *Graphical Solutions*, *Air Conditioning Principles*, *Engineering Thermodynamics*, and *Thermodynamic Charts*.

His main interest in thermal engineering was air conditioning, in which he was associated with the late Willis H. Carrier. Early in his career he spent a summer with Carrier, living in his house and becoming thoroughly acquainted not only with the technology of a new development, but also with the thinking of a pioneer in the field. It was this experience that led to his subsequent study and contributions in air conditioning, and to his recognition by the ASHRAE for distinguished achievement.

Professor Mackey was very much interested in University affairs and was very active on committees, including the University Policy Committee and the Committee on Tenure and Efficiency. He was a member of the College Policy Committee at the time of his death. He was also much interested in students and student affairs. As a youth he was an outstanding school baseball player and continued his interest in sports in later years, serving for many years as faculty adviser for crew. He was a lucid and articulate lecturer and was greatly respected by two generations of students for his knowledge and experience as a teacher of engineering.

He is survived by his wife, Mrs. Lucy Howell Mackey, and his mother, Mrs. Grace Osborn Mackey.

Those of us who knew "Ob" Mackey intimately recall his great loyalty and interest in Cornell; remember him as a congenial companion with many interests and hobbies, including golf, boating, and fishing; and recollect earlier days of student-faculty relations through the old Atmos Society. He will be greatly missed by all.

J. O. Jeffrey, D. G. Shepherd, J. R. Moynihan

Robert Brodie MacLeod

January 31, 1907 — June 19, 1972

Robert Brodie MacLeod, Susan Linn Sage Professor of Psychology, died on June 19, 1972, less than a month before he was to retire. Only ten days before, colleagues and former students from all over the country had gathered at Cornell for a two-day symposium in his honor. Although already ill, he was able to hear the papers relating to his many interests, to respond to them and to express his appreciation at the closing session. The breadth of his influence and the number of his students who have become prominent psychologists was made very evident at this symposium. A book containing a record of the symposium, a biography, and a bibliography of Professor MacLeod's writings is now being published.

Professor MacLeod was responsible, as much or more than any other American of his generation, for introducing Gestalt psychology into the United States. As a student, he became acquainted with the leaders of this movement. Later, he was able to bring Wolfgang Kohler to Swarthmore. He promoted the establishment of what might be called the Swarthmore-Berkeley axis, the mutual exchange between those two institutions of ideas, of students, and of jobs for psychologists.

He was a true internationalist. He understood and sympathized not only with the Berlin school of Gestalt theorists, but also with David Katz at Stockholm and Albert Michotte at Louvain. These two especially were his friends. Like him, they looked at phenomena and made experiments but never tried to establish a theory or found a school. He was a tolerant thinker. He did not argue against behaviorism; what he argued for was the importance of phenomenal experience and the possibility of a disciplined phenomenology.

He was also an internationalist in that he had an unusual ability to read and speak languages other than English. More particularly, he was a European; he understood the development of European culture and the part that psychology played in it from the Greeks to the present. Of all the courses he taught, the two that interested him most were the psychology of language and the history of psychology.

There are few good historians of psychology, but MacLeod was one of them. So much scholarship is required that it is hard to avoid pedantry, but he was the very opposite of a pedant. He had broad interests outside of scientific psychology. He knew the theatre, and he read philosophy for pleasure. His ability to take the long-term view saved him from the blind alleys of his discipline in the last thirty years. He was not tempted by narrow specialties or by fashionable laboratory technologies. He kept his eye on what he called the persistent problems of psychology.

Professor MacLeod was born January 31, 1907, in Canada, the son of a Presbyterian minister. His early schooling and undergraduate education were in Canada, where he received the B.A. and M.A. from McGill University in 1926 and 1927 respectively. He spent the next two years in Germany on a Morse Travelling Fellowship, studying principally at the University of Berlin. There he became acquainted with the founders of the Gestalt movement and their students, as well as many other European psychologists. This period was undoubtedly of great influence in shaping his later interests. He returned to complete the Ph.D. in 1932 at Columbia University under R. S. Woodworth. While completing his thesis at Columbia, he became an instructor at Cornell from 1930 to 1933. He then took a position at Swarthmore College, where he remained until 1946, with interruptions for government and war service. In 1946 he returned to McGill as professor and chairman of the Department of Psychology. He had been there only two years, however, when Cornell persuaded him to become chairman of the Department of Psychology. He served in this position from 1948 to 1953, when he returned to full-time teaching.

While his teaching and his students at Cornell took first place during this period, he also managed to find time for many other activities during vacations, weekends, or occasional leaves of absence. He was much in demand for committee assignments in the American Psychological Association and was active in the formation of a new division on the History of Psychology. He served on the governing board of the International Congress of Psychology for many years. He made a study trip to East Africa and was strongly interested in African affairs, hoping to return there after his retirement. One sabbatic leave was spent at the University of Michigan in charge of the honors program in psychology, and he was frequently consulted on the development of new honors programs at other colleges. Another leave was spent at the University of Pennsylvania, where he was charged by the president with making a complete study of the College of Arts and Sciences and preparing recommendations for the rehabilitation and improvement of the College.

In the course of his career, he spent a great amount of time as a departmental chairman. He can be said to have built or rebuilt a department first at Swarthmore, then at McGill, and finally at Cornell. Successful as he was in administration, he was above all a superb teacher. He could interest freshmen, he could arouse upperclassmen, and he could stimulate graduate students. He never tired of it and he knew all the ways in which teaching can be done, from having tried them all himself. He encouraged young instructors to try new methods and to experiment with their courses, but he knew that there was no simple formula for success.

There was a special quality about MacLeod as a teacher that reflected his special qualities as a human being. His aim, as he himself put it, was to enable the learner to think in a disciplined way about undisciplined problems. But

the inchoate ideas of his students and younger colleagues were to him more precious than his own. He nurtured them with such patience and gentle probing that the learner believed all the ideas were his own. So did MacLeod. His wisdom became the wisdom of others, for which he claimed no credit. This was the measure of his generosity and greatness as a teacher and as a man. A generation of scholars is indebted to MacLeod for their intellectual identity. The hallmark of their heritage is a humane commitment to thought and teaching about the mind and its way of perceiving reality.

Urie Bronfenbrenner, Thomas A. Ryan, James J. Gibson

Allister M. Macmillan

June 20, 1909 — August 13, 1958

Allister Miles Macmillan, who died on August 13, 1958, of a coronary attack, had been associated with the Stirling County Study of Cornell University since 1950 and with the Yorkville Study of Cornell University Medical College since the fall of 1956. During the latter year, he acted as the chief administrative officer for both projects. In this position he showed his great abilities as a leader in a diversified group of investigators from the fields of social and medical sciences. His grasp of a wide variety of problems and his interest in all aspects of study in the broad field of human behavior made him a valuable member of the Medical College and especially of the Department of Psychiatry.

Dr. Macmillan was born in Boiestown, New Brunswick, on June 20, 1909. After two years at Mount Allison University in Sackville, New Brunswick, he worked for fourteen years in the McLennan Foundry and Machine Works, advancing to the position of manager of the firm's car sales and service department. During World War II he served in the Canadian Army in Nova Scotia and later in North Africa and Italy. He received various promotions and was discharged in April, 1946, in the confirmed rank of lieutenant-colonel, having recovered from his wounds after a year in various hospitals. He then returned to college, receiving his B.A. in psychology in 1947, his B.Ed. degree in 1948, and his M.A. in psychology from Acadia University in 1949. In 1954 he obtained his Ph.D. from Cornell University. In the summer of 1949 he began social research in Digby County and in 1950 became a member of the staff of the Stirling County Study. In 1956 Dr. Macmillan was appointed senior research associate in the Department of Sociology and Anthropology, Cornell University, and in 1957 Associate Professor of Sociology in Psychiatry at Cornell University Medical College.

In 1939, he married Lydia Coral Bigelow, and they had five children whose ages, at the time of his death, ranged from one to seventeen.

His many administrative duties did not give him as much opportunity for research as he would have liked. His publications in the field of social science, especially as they applied to basic knowledge of mental health and social psychiatry, reveal his wide knowledge of his field and his sound attitude toward the new sociological developments in medicine in general and in psychiatry particularly. His cheerfulness, his constant willingness to assume administrative burdens and his ability to understand his colleagues and to work with them soon made him a valuable and greatly esteemed member of the Department of Psychiatry. His loss is deeply felt.

Oskar Diethelm

James Owen Mahoney

October 16, 1907 — October 19, 1987

J.O. Mahoney spent the first twenty-one years of his life in Dallas, Texas, four of them as an art major at Southern Methodist University from which he graduated in 1928. He spent the next three years in New Haven as a graduate student in the prestigious Yale art program where Mahoney was a star pupil of its most influential artist-teacher, Eugene Savage. There he learned a discipline based on the formal and technical practices of the Italian Renaissance, and became a master of the tonal graduations, volumetric modeling and responsible craft of that mode.

In 1932 he won the Prix de Rome and spent three privileged years as a fellow of the American Academy and occupied a studio in the Academy's McKim, Mead & White *palazzo* on the Janiculum. During that time he was overwhelmed by the beauty and the grandeur of Italian art and architecture, and like many another winner of the Rome prize, was marked for life by the experience. He fell in love with all of Italy, and with the culture, and the here and now, of a people and a life that have charmed Americans since before the time of William Dean Howells.

When he returned to New York in 1936, he was ideally prepared to participate in the revival of mural painting in America. He was deluged with mural commissions, including an assignment to paint several panels for the Texas Centennial Exposition, two murals for the New York World's Fair, and murals for private houses in New Haven, San Antonio, New York City, White Plains and Greenwich. In 1939 he won a national competition to paint a third mural at the World's Fair, a 104 by 34 feet painting for the Federal Building. When the vogue for murals later faded, as American artists preempted that scale for use in easel painting, Mahoney continued to produce murals and reverse glass paintings for various buildings in Baltimore, in Atlanta, in Ithaca, and elsewhere. All these works are distinguished by their suitability to site, an Art Deco opulence and by impeccable workmanship.

Mahoney accepted an invitation from Dean Gilmore Clarke to join the faculty of the College of Architecture at Cornell in 1939, and for the next three years commuted between his apartment in New York and his studio in Ithaca. In 1942 he joined the Army Air Corps and after a year of officer training, was sent on detached service to a British post in a country house near Twickenham, where American and English specialists interpreted aerial photographs of enemy territory. During this period, until the end of the War, he enjoyed a kind of English, aristocratic wartime *dolce vita*, living in the setting of some of the Edwardian novels and biographies that he was fond of, and visiting some of the stately homes he had formerly known only from books.

He moved his possessions from New York to the Faculty Club at 1 East Avenue on the Cornell campus in 1946 and renewed his teaching responsibilities. Though he never abandoned the precepts he learned at Yale, he adapted his theory and methods to a form of modified surrealism, combining *trompe l'oeil* elements with real found objects in a style that generated a sense of ambiguity characteristic of much of mid-twentieth century American art.

As a teacher, Mahoney was conscientious and fair. He was not one to motivate students by permissive amiability, but generously offered his sophisticated insights on architecture and art to all those capable of response, and he kept his students on their toes and beguiled them with his witticisms and his exotic eccentricities.

During his term as chairman of the Department of Art, he fostered a program that brought well-known contemporary artists to Cornell to present their views and to participate in critiques of student work. His introductions for the public appearances of these celebrities were often more enlightening than the “lectures” that followed. Throughout his life as artist-teacher Professor Mahoney maintained a bemused detachment from the egocentric passions and professional politics of the art world.

Mahoney had a complex personality of contrary impulses and paradoxical affinities. While actively engaged as a practicing visual artist, he was at the same time an avid reader, with strong literary opinions. His interests ranged from the occult, to aesthetic theory, to the latest fiction. Because he had read so widely and perceptively and because he had a gift for vivid and mordant repartee he found himself at home among a group of tough-skinned members of the English Department. Although he was trained in the grand traditions of the Renaissance, and his own work had an Art Deco flamboyance, he had a surprising regard for the intimate and bucolic images of Samuel Palmer, the neo-primitive work of Henri Rousseau, and the deceptively simple small-scale paintings of Giorgio Morandi. His other visual interests included such diverse manifestations as Chinese wallpaper, high-style furniture, primitive sculpture, and formal gardens. And though his ruthless wit sometimes gave pain to his companions, his good will and good humor endeared him to a large circle of friends in the Cornell community some of whom came to rely upon his Good Samaritan instincts. He was almost Franciscan in his reverential devotion to all animals. He fed both cats and mice; during the winter he bought food for deer and raccoons; and for the last nineteen years of his life he was devoted to a mynah bird, Rover, who lived at large in Mahoney's house.

Of that house, Colin Rowe has written as follows:

“A mynah bird, a superb white porcelain Bavarian Rococo stove, an oversize gilt gesso Chinese Chippendale mirror, which had remained *in situ* in Old Burlington Street, London, until it was acquired by William Randolph Hearst and then by Nina Claiborne of Dallas, Texas: these are among the most prominent

memories of 45 Twin Glens Road; and they all of them served to establish the scale and the distribution of the house.

“In spite of disclaimers, J.O. Mahoney was fundamentally a Texan; but, like so many Texans, a Texan Italianized. Thus, at Twin Glens Road, almost simultaneously, one can feel oneself to be in Lampasas County and in some imagined but undiscovered country to the north of Rome. The long driveway leads through what appears to be a forest of mesquite — tumble weed and live oaks significantly lacking — to what could be called a *cour d’honneur*. Graveled, immense (as a Texas size parking lot should be), it is still of intimate proportions and a completely appropriate prelude to the house which follows — the house looking over a version of the Lago di Bolsena.

“Perhaps it would not be too extreme to suggest that the years J.O. spent as a fellow of the American Academy in Rome were the decisive years of his life. Despite his exposure to other venues, J.O.’s ultimate references were mostly Italian; and the house remains a witness to considered impressions gathered from Frascati, Tivoli, the Villa Chigi-Albani at Soriano, and others.

“Though a very American, and Texan house, in its exploitation of site (like no other house in Ithaca, it magnifies the lake views), in its manipulation of perspectives and levels (both internal and external), in the eclectic assembly of its furniture (including chairs from the ballroom of Andrew White’s Embassy at Berlin), in a peculiar combination of primitiveness and connoisseurship (brick floors and *vermeil* tableware), it is still intended to evoke recollections of hours spent at Caprarola and the Palazzo Rospigliosi-Pallavicini. In other words, it is an American house by which a latter day Henry James might be intrigued.

“Of course, it was never finished. J.O. was far too good a craftsman, with far too many fantasies to allow anything ever to be finished. But by no means was he a craftsman in the ideal sense which John Ruskin and William Morris conceived. No. Any suppositions of truth and sincerity to materials, were completely alien to his temperament. Quite shamelessly, as an Italian craftsman might, he preferred the false, the fake, the simulated to the real; and it was this preference which gave 45 Twin Glens Road its emphatic distinction. The fantasies which the house deployed controlled the conservation.

“Many would say that 45 Twin Glens Road was J.O.’s major achievement and his major act of self-disclosure. An Italianate villa done on a budget, it displayed all those notions of *bella figura* which, in his own person

he was reluctant to advertise. In later years it was kept as private and as secret as he kept himself reclusive; and any suggestions of photographs and publication were vigorously resisted.

“Those who reverence the perceptions of the eye, those who are concerned with the act, and the integrity of ‘making’, will understand what James Owen Mahoney was all about. An obsessive builder, he spent the last years of his life in laboring over a temple or grotto on the east terrace at Twin Glens Road. An Italian fragment seen through the eyes of an Eighteenth-Century English grand tourist! Cold reason would have argued against any undertaking quite so gratuitous. But, in every sense, it turned out to be a doubly extravagant success. J.O. was completely immune from the desolating threats of any, imaginary, Hegelian *Zeitgeist*.”

What gave integrity to his life, his work, and his taste was his consuming pleasure in the aesthetic experience of line, form, and color, his respect for the creative powers of artists and builders, and his lively interest in the history of art. All these humanistic traits were nourished by a humility and a reverence for a deity he often referred to as “Old Gooseberry”. On the day before his sudden death (three days after his eightieth birthday) he entertained a friend at lunch by raising an old topic about man’s need for a reasonable religion — and by explaining why he was so pleased to have discovered that morning a book containing a good photograph of the cast-iron vaulting in the conservatory of Carlton House in London.

Mahoney left his library (about 7500 volumes) to the Cornell University Libraries, all the paintings in his possession to the Herbert F. Johnson Museum, and his house and its furnishings to the Unitarian Church of Ithaca.

Victor Colby, Scott Elledge, Judith Holliday, Colin Rowe, Kenneth Evett

Herbert Mahr

March 25, 1929 — March 10, 1982

Herbert Mahr, professor of physics for twenty years, died at his home after a prolonged illness. He is survived by his wife, Ruth, and three young children: Thomas, Andrea, and Peter. Beyond the loss to his family and the Department of Physics, his Forest Home neighbors lost one of their liveliest participants, and the community at large, one of its active citizens.

“Bib” Mahr was born in Fürth, Germany, and took his Doctor of Philosophy degree in Erlangen. His first teaching position was at the university in Tucumán, Argentina. Two years later, in 1959, he came to Cornell, following the suggestion and seemingly the footsteps of his former classmate R. O. Pohl. He served as a research associate in the Laboratory of Atomic and Solid State Physics and in 1962 was appointed assistant professor of physics.

Mahr’s research activities centered on the use of optics in the experimental investigation of crystalline solids. His work began with optical studies in insulators, using classical sources of ultraviolet radiation, but it then burst ahead vigorously into new problems and new techniques with the advent of the laser in the mid-sixties. The very intense light provided by the laser brought many new properties and processes to the fore. Rather than interacting with photons singly, an atomic site might now interact with two photons simultaneously.

His first laser study was of two-photon absorption in a pure crystal. Soon after, he and his students demonstrated another new phenomenon, spontaneous parametric light scattering, in which one photon turns into two while still conserving energy and momentum. Mahr was also fascinated with very short laser pulses, and he spent much of his career using them to explore ultrafast processes in materials. He was a leader in developing techniques for applying picosecond pulses (pulses a trillionth of a second in duration) to solid-state physics research. Recently he had been working on an elegant but difficult scheme in an attempt to create a vacuum-ultraviolet laser. He spent significant sabbatical years in the general area, working with Nobel laureate C. H. Townes at Berkeley in 1969, trying out a concept to use a laser and nonlinear “up-conversion” to the visible of faint infrared starlight and, in 1976 in London, working on the new and important ultra-violet, excimer lasers.

Mahr was always inquisitive scientifically, seeming continually to have something novel on his mind. Not content to work in established or conventional areas, he was quick to see to the heart of a new idea and to realize how it might be used to explore a new domain of interest. His approach in experiment was simple and direct, and he and

his coworkers were frequently first with influential and suggestive new results. He worked closely with his students and other coworkers in the laboratory and had deep concern for their welfare.

Bib Mahr's enthusiasm and energy carried over into teaching, where he held strong views. He felt that for an experimental science, we do too much lecturing, that students should actually observe and study the phenomena directly. He developed a new course, the modern optics laboratory, where students without formal lectures learned optics in a hands-on way, using experiments he devised from retired equipment and notes that he had developed. The students benefited greatly from his own keen interest and time given unsparingly. For many years he also taught one of the "physics for poets" courses, in which he tried to introduce nonscientists to some of the beauty and utility of physics.

Bib's enthusiasm and strong convictions were expressed in nonacademic ways as well. He had a strong interest in youth, both in recreation and in schooling. Enjoying soccer, he frequently organized games for neighborhood children and adults and was one of the mainstays of the weekly Sunday faculty matches on Upper Alumni Field. He did much to foster community activities and family socializing in Forest Home and was a frequent visitor and vocal participant at Ithaca town meetings. Concerning society at large, he struggled with the dilemma of the need for some kind of social organization and structure on the one hand and the ideal of a genuine democracy in day-to-day life on the other. He was intellectually open and inquiring but also held strong convictions; argument was vigorous and straightforward, be it relative to some national policy, traffic in Forest Home, or a department proposal he felt to be unwise. Even in his illness Bib Mahr was a courageous and caring person. His intellectual vitality and abiding concern for those around him kept him outside of himself. He will be remembered not only as scientist, teacher, and friend, but as an unusually socialized and civilized human being in the very best sense of those terms.

Douglas B. Fitchen, Andreas C. Albrecht, Chung L. Tang, Paul L. Hartman

William F. Mai

July 23, 1916 — August 15, 2007

Dr. Bill Mai was a Liberty Hyde Bailey Professor, Emeritus, in the Department of Plant Pathology at Cornell University in Ithaca, New York. He was born on a farm near Greenwood, Delaware and attended high school in Lewes, Delaware where he played soccer, basketball, and baseball. He obtained his B.S. degree in Agriculture from the University of Delaware in 1939 and started graduate studies in Plant Pathology at Cornell three months later, working with Dr. F.W. Blodgett on diseases of potatoes. While in graduate school at Cornell, Bill married Barbara Lee Morrell in 1941 and had three children: Virginia Austin, William Howard and Elizabeth Hardy. He received his Ph.D. degree with a major in Plant Pathology and minors in Plant Physiology, Plant Breeding and Entomology in 1945. After a brief time in the Navy, he was appointed an Assistant Professor of Plant Pathology at Cornell in 1946 to work on plant diseases caused by plant-parasitic nematodes, particularly the potato cyst nematode. He was promoted to Associate and full Professor in 1949 and 1952, respectively, and officially retired in 1984.

Dr. Mai was recognized as one of the pioneering leaders of Nematology in the United States. During his illustrious and long career at Cornell, he developed outstanding and productive research, teaching and outreach programs. When the potato pathogen known as the “golden nematode” was inadvertently introduced to Long Island in the mid-1900s, his classical research efforts on the biology and management of the potato-cyst nematode provided the needed basic and applied information upon which an effective quarantine program was carried out. The latter not only contributed to the continued viability of potato production on Long Island and throughout New York State, but also most effectively limited the spread of this devastating nematode to other production regions in the United States. His numerous research projects dealt with the etiology and management of the replant disease complex of fruit trees, the ecology and damage of several plant-parasitic nematodes on vegetables, investigations of various interactions between nematodes, soilborne pathogens and general soil microflora, and the integrated management of plant-parasitic nematodes and root diseases of agronomic crops. He was a firm believer that research is not complete unless it is delivered to the appropriate audiences through publication and outreach activities. Bill always enjoyed his collaborations with extension educators and growers in formal and informal settings. He was truly a tireless worker with an enviable record of over 300 publications in academic journals and extension bulletins. In addition, he co-edited a two-volume treatise, *Plant Parasitic Nematodes*, in 1971; co-edited *Nematology Laboratory Manual*, in 1990; chaired a committee for the National Academy of Sciences that produced *Control of Plant-Parasitic Nematodes*, in 1968; and most importantly, co-authored a unique nematode taxonomy aid book, *Pictorial*

Key to Genera of Plant-Parasitic Nematodes, in 1960 (revised in 1962, 1964, 1968, 1975 and 1996). The latter teaching and diagnostic aid has been translated into several languages and is used all over the world as a reference in Nematology teaching and research.

Bill Mai was an excellent teacher and mentor. His success was due to his ability to convey his enthusiasm for Plant Nematology, Plant Pathology and for scholarly research in general to hundreds of students in both formal courses and informal contacts. He developed and taught the first Nematology course at Cornell in 1955 and then taught Introductory Nematology (3 credits), Advanced Nematology (3 credits), and a Current Topic Course in Plant Nematology (1 credit) continuously until his retirement. He was always available to listen to a student discuss any problem, whether it pertained to research or a personal situation. Bill trained over 45 graduate students who went on to become leaders in research, teaching and industry both in the USA and in many foreign countries. He not only inspired and supported all the students who came to work and know him, but he also embraced them as his friends and as part of the extended Mai family while in Ithaca and beyond.

Bill Mai was always an active participant in departmental and university affairs. He was recognized campus-wide for his participation in the Faculty Council of Representatives for CALS, membership in the Campus Council, CALS Library Committee and others. He was a member of ten professional scientific societies and organizations and served on various editorial, administrative or subject matter committees, especially in the Society of Nematologists (SON) and the American Phytopathological Society (APS). He received numerous awards and honors as a measure of the high regard in which he was held by his colleagues including being named Liberty Hyde Bailey Professor, Elected President and later Lifetime Honorary Member of the Society of Nematologists, Fellow of the American Phytopathological Society (APS), Award of Merit from the NE-Division of APS, Venture in Research award from the IX International Congress of Plant Protection, and many others.

As a person, Bill was a true gentleman, generous, courteous and most helpful to all people. He was an exemplary ambassador for the scientific community and brought recognition and honors to the department, the college and Cornell. Bill loved and was proud of his family. His two daughters, Virginia and Elizabeth, and son, William, and their extended families survive him. His wife, Barbara, predeceased him in 2005.

Memorials can be sent to: Graduate School, c/o Sarah Hale (Associate Dean for Student Services), Emergency Loan Fund, Cornell University, 350 Caldwell Hall, Ithaca, NY 14853-2602.

George S. Abawi, Chairperson; George W. Hudler, Richard P. Korf

Norman Malcolm

June 11, 1911 — August 4, 1990

Norman Malcolm was a member of the Sage School of Philosophy for thirty-one years. His intellect, his personality and his character set the tone of philosophical life at Cornell for much of this time, while his writing and inspirational teaching led the Sage School into the ranks of the most distinguished philosophy departments.

Malcolm's wide-ranging work in epistemology and the philosophy of mind consisted, in large part, of the clear and vivid interpretation and ambitious application of the thought of Ludwig Wittgenstein. His association with Wittgenstein (vividly described in his *Ludwig Wittgenstein: A Memoir* (1958)) began when he was a student at Cambridge, on a travelling fellowship from Harvard, from 1938 to 1940. When Wittgenstein visited Malcolm in Ithaca in 1949, their extensive discussions of knowledge and certainty stimulated thinking of Wittgenstein's that led to his last major work, *On Certainty*, and prompted Malcolm's important exploration of knowledge, certainty and justification in *Knowledge and Belief* (1952). When Malcolm's famous review of Wittgenstein's *Philosophical Investigations* appeared in 1954, the book was the subject of much discussion but widespread bafflement. Malcolm's trenchant interpretations of Wittgenstein's remarks on mind, language and the self set the stage for decades of important controversy. In his many articles and several books, Malcolm employed Wittgensteinian strategies to combat the confusions and mystifications that he saw as pervasive in philosophy and psychology.

Malcolm's retirement from Cornell in 1978 was not at all a retirement from philosophical work. He moved to London where he continued to teach at King's College in the University of London, and to write both articles and books. He was vigorously engaged in philosophical work until his final brief hospitalization.

Throughout Norman Malcolm's long and productive life both students and colleagues found him a paradigm of philosophical integrity and commitment. He could seem gruff and bearish, but those who began by fearing him soon found that he was very warm and kind. He lived his life and conducted his intellectual projects with full, guileless and fearless commitment, earning the respect of all who knew him.

Norman Kretzmann, Sydney Shoemaker, Richard Miller

William Lindsay Malcolm

February 2, 1884 — January 18, 1948

The University Community was deeply shocked and saddened by the sudden death of William Lindsay Malcolm, Professor of Civil Engineering and Director of the School of Civil Engineering on January 18, 1948. Thus was brought to a close a career of over forty years of professional practice, teaching, and administrative work. He was born at Mitchell, Ontario, Canada, on February 2, 1884, the son of George and Margaret Malcolm. His father was for a time Vice-principal of the Stratford Collegiate Institute, from which the son graduated and where he won a scholarship for Queens University, Kingston, Ontario. He was graduated from that University in 1905 with the degree of M.A. and after two years of technical training received the degree of B.S. in 1907. He was city engineer of Stratford in 1907 and associate city engineer of Guelph in 1909, 1910, and 1911. His teaching began at his Alma Mater, Queens University, where he was Assistant Professor of Surveying from 1907 to 1909, Assistant Professor of Civil Engineering from 1909 to 1914, and Professor of Municipal Engineering from 1914 to 1938. During the years that he was at Queens he also engaged in engineering practice and contracting and building. He designed and built the University Stadium, hockey rink, and sanitary engineering building at Queens. He also engaged in contracting elsewhere, including the building of a highway from Stratford to Shakespeare.

During the first World War he served overseas from 1914 to 1919 with the Canadian Engineers, holding in succession the ranks of Captain, Major, and Lieutenant Colonel. After the war he was for some twenty years a Lieutenant Colonel in the Canadian Engineers Reserve. While serving overseas he was twice mentioned in dispatches for "gallant and distinguished services in the Field."

For several years he managed by using vacations and taking leave from his teaching, to do graduate work at Cornell University with his major field of study in Sanitary Engineering. He received the degree of M.C.E. in 1934 from the University and the degree of Ph.D. in 1937.

Thus when in 1938 he came to Cornell as Professor of Civil Engineering and Director of the School of Civil Engineering he was no stranger. His occupancy of the directorship for nearly ten years covered a period presenting many problems. The war years with the interruption of student careers and calling of faculty members into service, the various student training programs, and the influx of ex-service men as students after the war all presented many a difficulty involving changing of teaching programs and curriculums. Dr. Malcolm met the various problems as

they arose and worked diligently and effectually in solving them. He impressed the students and faculty by his tireless energy and devotion to duty. He found time not only for administrative work but also for teaching.

Dr. Malcolm's administration of the School of Civil Engineering saw a number of improvements in the laboratory and classroom facilities. The five-year course was inaugurated during his administration and he had much to do with the planning and arranging the five-year curriculum in Civil Engineering.

Throughout his life Professor Malcolm was interested in sports. While a student at Queens he was a member of the football team. Later he coached teams for intercollegiate football. He was also much interested in badminton, being well known in Kingston and in Ontario for his active participation and interest in the sport. He was also interested in tennis and was for some years an officer of the Kingston Tennis Club. After coming to Ithaca Dr. Malcolm played golf. In the early summer of 1945 after an afternoon on the golf links and while attending a banquet of the Chi Epsilon Honorary Society, he suffered a heart attack which necessitated his remaining in bed for several weeks. After recovering from this, although his health was still not the best, he was soon taking on a full burden of work, which he resolutely carried until a second attack of heart trouble resulted in a final illness of but a few days.

He was a friendly man, who impressed those with whom he came in contact with his sincerity. Both students and faculty found in him one to listen sympathetically when they came to him for counsel and advice. No one who knew Lindsay Malcolm either professionally or personally failed to be impressed by his cordiality, his admirable character, the modest and pervasive quality of his friendship; and there is no one who knew him but deeply feels the loss he has sustained in the passing of so good a man.

H. M. Giff, B. J. Monroe, P. H. Underwood

Deane Waldo Malott

July 10, 1898 — September 11, 1996

Cornell's sixth President was born on July 10, 1898 in Abilene, Kansas. He died on September 11, 1996 at his home in Ithaca, survived by a son and two daughters. His father was President of the Abilene Citizen's Bank, founded by his grandfather in 1885. Dwight and Milton Eisenhower, also from Abilene, were family friends.

Mr. Malott graduated from the University of Kansas in 1921, then attended the Harvard Business School. After receiving the M.B.A. degree in 1923, he stayed on as an Assistant Dean and Assistant Professor. In 1925, he married Eleanor Thrum, the daughter of a Hawaiian sugar refinery engineer, whom he had met in 1918 when his father sent him to Hawaii to recover from influenza. Mrs. Malott's death in 1994 ended a marriage they had enjoyed for 68 years.

Mr. Malott left Harvard in 1929 to become a vice president of the Hawaiian Pineapple Company and a personal assistant to James D. Dole, president and founder of the company.

He returned to Harvard in 1934, where he developed courses on agricultural and other western business problems which supplemented the Wall Street concentration characteristic of the school at that time. While becoming an expert on agricultural economic matters, he became friends with influential business leaders, an association that benefited the institutions he later led. His rapid rise to prominence among agricultural business people attracted the attention of the University of Kansas Board of Regents when they were seeking a new Chancellor in 1939. Mr. Malott returned to his home state and to his alma mater as its Chancellor at age 41.

Following 12 years as Chancellor of the University of Kansas, Malott served as Cornell's President for another 12 years, from 1951-63. For American universities, this was a period of reorientation into new areas of study and expansion of facilities following the disruption of World War II.

At Cornell, Hotel Administration, a Department in the College of Home Economics founded by Professor Howard Meek became the School of Hotel Administration early in the Malott era. Education courses in the College of Arts and Sciences, Agriculture and Home Economics were combined into the School of Education. The Engineering College completed its move, begun during the presidency of Edmund Ezra Day, from the north end of the campus to the south end under the combined leadership of Dean S.C. Hollister and President Malott. Construction of Phillips, Upson, Grumman, Carpenter and Hollister Halls provided new facilities for the college.

When the Veterinary College moved from the present site of the School of Industrial and Labor Relations to the east end of the upper campus, ILR moved from temporary buildings at the south end of the campus to the just-vacated location of the old Veterinary College. A new Ives Hall supplemented the ILR facilities.

Alice Statler Auditorium was added to Statler Hall. The School of Business and Public Administration moved from McGraw Hall into a new building, subsequently named for President Malott. The Gannett Clinic was added. The West Campus dormitory group and Donlon Hall expanded student housing. Looking to the future, Mr. Malott purchased the former Ithaca Country Club land, providing space for the later construction of the new North Campus dormitory complex, student union, and playing fields. He moved Cornell to the forefront in quality athletic facilities for women by supporting the construction of Helen Newman Hall.

During this period of major change at Cornell, the enrollment remained relatively stable at about 10,000 students.

The consolidation of the University Library system under the leadership of Stephen McCarthy and the construction of Olin Library were noteworthy Malott accomplishments, as was recataloging the Cornell library collection from the old Harris to the Library of Congress system. Among the academic initiatives of the Malott period, turning an inadequate and outmoded library system into one of the best may have been the most significant.

In this extraordinary reshaping of academic programs and expansion of facilities, Mr. Malott's business experience, his service as a director of major corporations and his membership on the Business Council served Cornell University well. His long-standing friendship with corporate leaders such as Ellis Phillips, Max Upson, Leroy Grumman, John and Spencer Olin, Floyd Newman, Alfred P. Sloan, Mrs. Ellis Statler, Walter Teagle, Frank Gannett, John Collyer, J. Carlton Ward and Herbert Johnson, many of whom were Cornell alumni, gave him ready access to the financial resources he required.

His relations with the Cornell faculty, traditionally difficult for any president, were sometimes strained and seldom easy. An unfortunate passage in his inaugural address contributed to the unease. When the *New Yorker Magazine* identified a statement he had used from a source unknown to him, as a nearly verbatim quote from a speech by the President of Sarah Lawrence College, he apologized to the faculty and offered his resignation to the Cornell Board of Trustees, who promptly refused it.

Further stress between the faculty and the President arose from the shared administrative responsibility for campus affairs. Malott believed that the faculty had not maintained order in student affairs in a way that conformed with

his idea of a university. He arranged to have what had been faculty authority over student affairs transferred to the administration but the tension remained.

To know the faculty better and to understand faculty problems, he presided at most faculty meetings in every college, including the Medical and Nursing faculties in New York City. He interviewed nearly every faculty member proposed for promotion to tenure.

Malott understood academic freedom and the importance of defending it on a university campus. During his presidency, Senator Joseph McCarthy and his political allies sought to rid the government and other American institutions of communists and communist-sympathizers. Faculty members from many universities were called before congressional committees to explain alleged leftist activities. President Malott stepped forward to counter the McCarthy attacks in a guest column in the *New York Herald Tribune* in 1953, under the heading, "Is Professor X Red?" At 1954 class reunions, he called the McCarthy era "a time of widespread hysteria and intolerance of thought, speech and action." Although he had little sympathy for the views expressed by many of those under investigation, he permitted avowed communists, banned on some campuses, to speak at Cornell. In taking this stand, the President set himself apart from most academic leaders and created tensions within his own Board of Trustees; but he remained a staunch defender of freedom of expression.

When Professors Philip Morrison of Physics and Marcus Singer of Zoology were called to testify before congressional committees, Morrison answered the committee's questions and received no sanction from it but Singer was cited for contempt for refusing to testify about his colleagues and friends. President Malott suspended Singer from his teaching duties, but with full salary, until the contempt charge was resolved. When Singer appealed his contempt citation and won his case, after more than three years of suspension from his teaching duties, he was returned to full faculty status.

Professor Morrison, among the first to visit Hiroshima after the use of the atomic bomb and deeply moved by the experience, continued to speak widely on peace issues, often taking stands considered radical by many. When he was recommended for promotion to full professor in 1955, President Malott did not approve the recommendation. He conducted his own investigation of Morrison's activities and when the recommendation was renewed a year later he approved it and forwarded it to the Trustees, where it provoked a long debate. In the end, Morrison was promoted but a Trustee committee investigated his activities. When the committee filed its report, the President refused to read it, stating that he had satisfied himself, that his judgment about the candidate's credentials should

be final and threatened to resign over the affair. Many years after Morrison left Cornell to accept an Institute Professorship at MIT, he wrote President Emeritus Malott:

"I have never made clear to you how much I admire and how often I comment on your fairness and integrity in the bad years of the McCarthy era...your adherence to the fundamentals of human rights and honesty in dispute...was an example of the right conduct for men of responsibility, in a time when too many of them sought the quick expedient."

President Malott sought effective ways to meet students and learn their concerns. He and Mrs. Malott accepted every opportunity possible to dine in dormitories and fraternity and sorority houses. He read the Scriptures at Sage Chapel services nearly every Sunday. He welcomed students in his office. He was disappointed when students threw eggs at his house to protest maintenance of parietal rules specifying curfew hours for women in university dormitories. He attributed this incident to his failure to communicate adequately with students.

After retiring from the Presidency, Mr. Malott traveled widely, including visits to both the north and south polar regions. He joined the International Executive Service Board as a management consultant on higher educational problems, with some assignments lasting several months. On these tasks, he traveled to Iran, Taiwan, Saudi Arabia and Jamaica as well as to other countries. Papers reporting travels with Mrs. Malott reflect clear observation and concise reporting. *Growing Up In Abilene, Kansas*, a small, handsomely published book, records his early years.

Malott was in great demand as a public speaker during and after his presidency. His notable physical presence and direct speaking style complemented a scholarly content based on wide ranging reading that encompassed social, political, economic and scientific matters. Listeners enjoyed the sense of humor in skillfully composed doggerel that was signed, "T. Tolans Enaed." He was up front about his attachment to conservative politics and the Republican Party. "Unless we make known our needs and desires," he declared, "We will have abdicated our position." Yet to the last day of a long life, he enjoyed ideas that challenged his opinions.

Mr. Malott remained a frequent presence at campus events. When Hunter Rawlings was inaugurated in October 1995 as the 10th President of Cornell, half of Cornell's Presidents were on the platform. None enjoyed it more than Mr. Malott.

Deane Waldo Malott's extensive business experience distinguished him from earlier and more recent Cornell presidents. Yet, while he elaborated upon the land grant university idea of service in the public interest by encouraging profit-making businesses to participate in university affairs, President Malott insisted that the university itself is not a business. He remained true to his vision of what a university should be, "a place where all points of view are freely expressed and courteously debated."

Gould Colman, Frank H.T. Rhodes, Alain Seznec, Dale Corson

Michel George Malti

November 7, 1895 — May 8, 1978

Michel George Malti, professor of electrical engineering emeritus, died in Miami, Florida, on May 8, 1978, as the result of a stroke suffered several weeks earlier. He had made his home there since 1962, when he retired from Cornell to assume duties as director of electrical engineering at the University of Miami.

He was born at Deir-ul-Kamar, Lebanon, on November 7, 1895, the son of George Constantin and Mary (Shukri) Malti. After graduating from the University of Beirut, Lebanon, with a Bachelor of Arts degree in 1915, he received his Bachelor of Science in Electrical Engineering degree from Georgia Institute of Technology in 1922. Undertaking graduate studies at Cornell while serving as an instructor, he received his Master of Electrical Engineering degree in 1924 and his Doctor of Philosophy degree with a major in physics and a minor in mathematics in 1927. He became an American citizen in December 1936.

With an active interest in international education he served as visiting professor of the University of Puerto Rico during the spring and fall of 1948, and at Roorkee University, Roorkee, India, during the years 1955 to 1957. He served as a member of the board of directors of the Asia Institute and as faculty adviser for Indian students at Cornell under arrangement with the International Cooperation Authority. He was honored in 1953 by the Syrian-Lebanese Society for his role in these areas. He served as faculty adviser to the Hindustan Association from 1945 to 1955.

Professor Malti's technical interests were in the area of general electric circuit theory and basic sciences. As a licensed professional engineer he served as consultant to the Elliott Company, the General Electric Company, the Westinghouse Company, the U.S. Navy during World War II, and the Cornell Aeronautical Laboratory. Early in his career he was active in research, published numerous papers, and published two textbooks with John Wiley and Sons, becoming editor of a series of texts published by that company as well as of two sections of a general engineering handbook published by McGraw Hill and Company.

A fellow of the American Institute of Electrical Engineers, he served on its Electrophysics Committee from 1948 to 1950 and as vice chairman and later chairman on its Committee on Basic Sciences from 1950 to 1952. From 1936 to 1939 he served as chairman of its subcommittee on definitions and also on its subcommittee on applied mathematics.

Among his other societies and listings are the American Mathematical Society, the American Association of University Professors, Sigma Xi, Eta Kappa Nu, Phi Kappa Phi, Kappa Phi, and Tau Beta Pi. He was also a fellow at the Royal Society of Arts, London.

Devoted parents of a family of six children, he and his wife, Olga, upon his brother's death, adopted two of his brother's younger children, born in Lebanon, and shared with them the devotion they had earlier lavished upon their own children. Always an individual of strong conviction, he was constantly visible in the many issues that involved campus life and as an energetic man was constantly involved in many campus roles. He served as faculty adviser to the Cornell chapter of Eta Kappa Nu, faculty adviser to the Hindustan Association of Cornell, and president of the Cornell chapter of Phi Kappa Phi. He was listed in *American Men of Science* and *Who's Who in America* and its subvolumes. Professor Malti was seldom a passive member of any organization.

Paul D. Ankrum, William H. Erickson, Howard G. Smith

Dean Richmond Marble

1902 — April 17, 1966

After nearly forty years of service to education and to agriculture, Dean R. Marble died following a brief illness on April 17, 1966. He had spent twenty-eight years in academic work, fourteen each at Cornell and at Pennsylvania State University. He was a little more than a year short of an anticipated retirement.

Born on a farm near West Bloomfield, New York, in 1902, Dean Marble's contact with Cornell was as a winter course student in the College of Agriculture. Following that study he was employed at the college poultry farm for a year before enrolling as a freshman in the regular four-year course. He received the B.S., M.S., and Ph.D. degrees at Cornell in 1926, 1928, and 1930. He served as an instructor in Poultry Husbandry from 1926 to 1930. From 1930 to 1944 he was on the staff of the Poultry Department at Pennsylvania State University. From 1944 to 1952 he was geneticist for the Creighton Brothers Farm at Warsaw, Indiana, at that time one of the larger poultry breeders in the country. In 1952 he returned to Cornell as Associate Professor of Poultry Husbandry and was promoted to Professor in 1956. For a time following his return to Cornell he did extension work. For the last ten years he did resident teaching and was in charge of the New York Random Sample Poultry Tests. He had a deep interest in teaching and in students as individuals. His concern for them extended beyond the classroom, and many discussed personal problems with him. His interest included their student organizations, and he served as an adviser to several. He was particularly effective as a student counselor and advisor.

In addition to technical papers, extension publications, and articles and columns for trade publications Professor Marble was co-author of two books. *Judging Poultry for Production*, with two other Cornell authors, Rice and Hall, was widely used as a text. He was senior author of the second, *Commercial Poultry Production*, with Jeffrey, of the University of Massachusetts.

In 1955 he spent several months in Israel on a special assignment for ICA as a consultant to the Israel Ministry of Agriculture in planning poultry breeding programs for use in that country. In 1959 he was U.S. representative to an FAO Conference in Zurich on random sample methods of testing poultry breeding stocks.

Much of Dean Marble's professional effort, both in education and in industry, was spent working with the breeders and hatcherymen responsible for the quality of stock available for production. He had a unique combination of practical and theoretical knowledge of genetics which he used in counseling individuals and groups. He was

influential in improving the methods and procedures of breeding and the methods of testing the performance of the resulting stocks.

He was a member of Phi Kappa Phi, Sigma Xi, Poultry Science Association and the World's Poultry Science Association. From 1942 to 1944 he was editor of the journal *Poultry Science*. He was also a member of Acacia Fraternity, Warsaw Lodge #73 F.&A.M., Warsaw Chapter #48 Royal Arch Masons, and Warsaw Commandery #10 Knights Templar.

A member of the Methodist Church of Jacksonville, New York, Professor Marble was an active worker in affairs of his own and other local and regional church groups. His time and effort were freely used in fraternal and civic activities.

He is survived by his wife, Ann, a son, David, and two daughters, Jean Pearson and Patricia Ward, and by three grandchildren.

Dean Marble's combination of the practical and the theoretical helped achieve a balance between the two in his own work and that of his department. He had an honesty and sincerity of thought and act which inspired an unusual degree of trust and which often acquired consensus without insistence. His quiet, willing counsel was regularly sought by students and co-workers. While his tasks must be assigned to others, none can replace him.

J. Herbert Bruckner, Randall K. Cole, Glenn H. Thacker

Frederick George Marcham

November 2, 1898 — December 16, 1992

Marcham, born in a “Dickensian” quarter of Reading, England, and, in 1987, the first on whom Cornell bestowed its Award of Honor for exceptional service, broke free from his childhood environment when he won a rare scholarship to Christ’s Hospital, followed his father into the Army in the first World War and was awarded an Exhibition in Modern History at St. Edmund Hall, Oxford University, where he met the historian A.B. Emden, a teacher whom he always mentioned with gratitude and affection. After graduating in 1923, he was encouraged to work for a doctorate at Cornell under Wallace Notestein. His thesis, completed in 1926, was on *Sir Edwin Sandys and the growth of opposition in the House of Commons, 1604-1610*. Not long afterwards he was appointed to the Cornell History Department. He specialized in British constitutional history but was happy to lecture in many fields of history. He wrote three textbooks: *A History of England* (1937), *Sources of English Constitutional History; a selection of documents from A.D. 600 to the present* (1937), and *A Constitutional History of Modern England: 1485 to the present* (1960). His *Sources of English Constitutional History* has made his name universally known in the field of English history. The second edition was published in 1972.

In 1941 he became a Goldwin Smith Professor of History. He was a University Trustee from 1946 to 1950 and served twice as department chairman in the disturbed 1960s. At this time his loyalty to the University was especially conspicuous; he played a significant role in quietly helping to mediate and resolve the 1969 crisis on the campus.

Marcham had an extraordinary devotion to his department. The model he set for it seemed to resemble a combination of the Oxford tutorial system and the academic equivalence of smoke-filled-room politics, but politics based on consensus and without needless controversy. His dedication to the department and university also led him to give great emphasis to the central importance of teaching. Nearly all of his scholarly work was stimulated by his teaching interests and his conviction that history should be taught from documents. He preached the obligation of extended office hours and made known his admiration for an earlier generation of teachers, who, as he recalled, chose to remain on the campus during sabbaticals to talk to colleagues and students.

He declared in 1987 that “my religion is the service of the University; my life is to help other persons to learn” Fittingly, a “Marcham Seminar” in the Society for the Humanities was established in his honour and also the Marcham Scholarship for an outstanding senior history major whose other activities and service to the community reflected Marcham’s life-style. When, at the age of seventy, he retired officially, to his immense pride his department

paid him the unprecedented compliment of inviting him to continue in harness. The result was that nearly one third of his teaching career still lay ahead. After his wife's death in 1977, students helped him fill the void in his life, and he increased the time he spent on his tutorials to thirteen hours a week and, during weekends, often invited students to his house for lunch that he himself cooked. As soon as he had recovered from a stroke in 1987, he returned to his students. He was usefully active to the end and became the most venerable figure on the Cornell campus.

Not surprising, during this remarkably long teaching career he developed his own style of teaching and could put to good effect what he probably loved more passionately than anything else, which was the English language. Every reviewer of his *A History of England* praised the felicitous and balanced manner in which he blended literature and history. The very sound of English words moved him, and this affection increasingly influenced his approach to teaching the past. He was always experimenting with literature as a means of kindling his students' interest. He attached the greatest educational value to studying and, he would insist, enjoying the meaning and force of good writing. It has been said that his ideal assignment was a poem's single stanza, to be minutely dissected for its meanings and historical context.

Marcham's range of activities was capacious and rich. For thirty two years he served as the elected mayor of Cayuga Heights Village and is remembered for his ability to guide group discussion to a fruitful and amicable end but also for refusing to shirk tough decisions. When zoning considerations were involved, he never allowed his loyalty to the University to override his loyalty to the Village. He resigned at the age of ninety, and the Village Office was named Marcham Hall. Uniformed veteran officers of the Cayuga Heights Police Department served as ushers at his Memorial service; they called to mind a guard of honour for an old soldier. He sponsored and taught boxing at Cornell. He was the first chairman of the Ivy League athletic eligibility committee. Yet he remained a reserved person and chose to live modestly. Those who knew him well will remember his courtesy, gentle smile, noiseless gait, a teapot in his hand, and how he paid earnest attention to anyone who spoke to him. As he once said of Carl Becker, he could look through you and still like you. He was a mild man but of inflexible integrity. He could be angry with those whom he regarded as "worthless louts".

He was an avid angler and bird watcher. His *Louis Agassiz Fuertes and the Singular Beauty of Birds: paintings, drawings, letters* (1971) is a magnificently illustrated volume. He also published *Thoughts After Reading Izaak Walton's Compleat Angler*. He cultivated vegetables. But the classroom was where he was most at home. He gave his

last class as recently as October, 1992. As his son put it, “when Dad was no longer strong enough to meet students, he was ready to leave us”.

Marcham is survived by a daughter and two sons in the United States and a sister and four nephews in Reading, England. He had five grandchildren and two great-grandchildren.

Paul W. Gates, Walter LaFeber, O.W. Wolters

Clarence Augustine Martin

September 29, 1862 — January 5, 1944

Clarence Augustine Martin, Professor of Architecture, Emeritus, died at Sarasota, Florida, January 5, 1944, being 81 years old.

For thirty-six years he served Cornell University and the College of Architecture, unremittingly and with distinction. As Assistant Professor, Professor and Dean he gave his best and his all. To every associate from janitor to the President of the University he was a faithful and helpful friend, sparing neither his time, his strength nor his material resources.

To many generations of students he was familiarly known as "Pa." As is so often the case this nickname reflected something real and deep-seated. To hundreds he was in fact a father-away-from-home. The standards, academic and ethical, which he set for them were high and sound. His completed record is one of kindness, loyalty, and rugged integrity.

Born in Medina County, Ohio, in 1862, he prepared there for entrance to Cornell University where he was a special student from 1886-1888. This short but rigorous training was then followed by apprenticeship in some of the leading Architects' offices. His early experience included an apprenticeship to the difficult and exacting trade of the wagon builder. This early mastery of tools gave him the foundation on which he built a rare understanding and appreciation of the fine craftsmanship which must underlie accomplishment in Architecture. For years this was the key to his contribution to the College as well as to the development of individual students. He would pass his hand over a finely finished piece of wood and convey more understanding by a gesture than often goes with many words.

During his service, it is now clear, the College was largely formed around his standards and his ideals. Also during those years the College rose to a position of recognition and distinction.

In 1899 he published a volume on "Details of Building Construction" that reflected clearly his high standards of workmanship and sound procedure. For years it was not merely a college textbook but the standard reference book, familiar to draftsmen in hundreds of offices throughout the country. It remains today a sound and useful manual on the subjects covered.

His work was also known and appreciated in the profession at large. He was a Fellow of the American Institute of Architects and one of the founders of the Association of Collegiate Schools of Architecture. He was for a long time

secretary of that Association and an author of its "Standard Minima." In 1918, he was honored by having Colgate University confer on him the degree of Doctor of Science.

He gave of his time, his energy and his resources to all sorts of individuals and institutions. To his church, his fraternity and to the civic life of his community he consistently contributed whatever, at the moment, was most needed.

Throughout his career as a teacher he carried a small amount of professional practice without ever allowing it to take precedence over or to interfere with the needs of the school or the students in his charge.

During World War I, at the age of 57, he not merely held together, almost single handed, the remnants of his College but he played a useful part in a difficult and unprecedented project of building reinforced concrete barges for war use.

When, in the course of time, his retirement from teaching became mandatory, he accomplished that difficult transition gracefully and effectively. Re-establishing himself in Florida, he resumed professional practice to a moderate extent and at the same time continued his contributions to civic and community life in his new environment.

In 1942, at the age of 80, and in the emergency of a new war, he again put on the harness and assumed full time responsibilities in cantonment construction.

Full of years, and of accomplishment to the full, he has passed on. But his kindly view of life and his high professional ideals will live on in the life and work of hundreds of those whose good fortune it was to spend a few of their formative years under his beneficent influence.

Russell Dickinson Martin

September 3, 1917 — May 21, 2003

At the time of his death, Russell Martin had been affiliated with Cornell University for 60 years as an undergraduate, graduate student, Assistant Professor, Associate Professor, Professor, and Professor Emeritus. He touched countless lives through his inspired teaching, advising, counseling, and community services, and achieved distinction in each.

Russ was born in West Henrietta, New York, on September 3, 1917, a son of the late Howard and Alice Dickinson Martin. After graduation from Monroe High School in Rochester, he entered the College of Agriculture at Cornell as a freshman in 1935 and received a Bachelor of Science degree in 1939 and a Master of Science degree in 1941. He then accepted a position in the Central School in Clyde, New York as a teacher of Vocational Agriculture and in 1943 joined the Grange League Federation (GLF), a large cooperative that became Agway. After five years in the agricultural marketing division there, he taught Vocational Agriculture for one year at the Central School in Waterloo, New York.

His teaching career at Cornell started on July 1, 1949, when he received a temporary three-month appointment as Acting Assistant Professor in the Department of Animal Husbandry and then Assistant Professor in the new Department of Extension Teaching and Information. (Later renamed the Department of Communication Arts and the Department of Communication.) In 1954, he was promoted to Associate Professor and in 1970 to Professor.

Upon “partial retirement” in 1983, he became Professor Emeritus. The term “partial retirement” was an appropriate designation because Russ never permanently retired, continuing to maintain contacts with the university on a less formal volunteer basis. For example, he chaired the monthly meetings of the Department of Communication for ten years (1985-95). In a letter to his college dean, he wrote: “To close the door completely, I could never do.” That door remained open until the end of his life.

His teaching schedule included courses in Oral Communication, Parliamentary Procedure, and Effective Listening. He supervised the principal oral communication courses that adopted new innovations, such as video taping student speeches for review. Approximately 1500 students enrolled for these speech courses each academic year, involving eight to ten members of the teaching staff. They stressed a simple rule: have something to say, say it, then stop. His course in Parliamentary Procedure, which started as a one-credit course with only 15 students, gained quick student interest. It was changed to three credits and limited to 100 students in both fall and spring semesters.

For many years, Russ was elected and re-elected as Speaker and Parliamentarian for the Faculty Council of Representatives and its successor, the University Faculty Senate. Also, at the request of Cristen Gardner, Director of the Office of Assemblies, he served during most of the decade of the 1990s as Parliamentarian to help guide members of the Student Assembly through some of their more controversial meetings, many of which lasted until late at night. In her words:

“He will long be remembered for giving freely of his time, and what endeared him to all of us was his wisdom and patience and unparalleled knowledge of parliamentary procedures.”

When Professor Martin first introduced his new course, Effective Listening, in the 1982 spring semester, he had misgivings about student interest. But at enrollment time, he didn't have to worry: 47 signed up. Before he retired, he was teaching more than 100 in four sections, and at one time this course had almost 200 in eight sections. Some students asked him if listening skills were so important why did it take so long for such a course to be offered at Cornell? His reply:

“It was not by intent but by default. We're just becoming aware of the importance of listening in the communication process. Research shows that almost 75 percent of a person's day is spent communicating and 45 percent of that time is spent listening.”

During the early 1970s, he was asked by his department and Extension administration to be Coordinator of Communication for the statewide Cornell Cooperative Extension programs. He and his associates conducted workshops for new personnel to help them improve communication with their clientele.

Cornell athletics held a special interest for Russ, and for 47 years he was faculty advisor for the wrestling team. In the words of John Andrew (Andy) Noel, Cornell's Director of Athletics and Physical Education and former head wrestling coach:

“Russ was the first individual to extend his hand in friendship and support when I arrived in August 1974 to become head wrestling coach. He served my athletes extremely well as faculty advisor, and assisted me immeasurably as a mentor, confidant, and supporter. Furthermore, he helped many a young athlete navigate Cornell University and find his path to graduation and lifetime success in a myriad of careers. Russ was not only liked by them, he was well loved. His broad smile welcomed even the most shy students to his council.”

Before and during retirement, he was an active and dedicated volunteer for numerous organizations, including United Way of Tompkins County. His direct involvement with this agency resulted in a small group of community leaders founding the Livermore Society in 1983. Members of the Society make annual gifts ranging from \$500 to \$10,000. For years and up to the 2003 campaign, he headed an effort to reach retired members of the Cornell community, consisting of approximately 2,000 former faculty, staff, and administrators. He and a few other

volunteers signed letters and personal notes and followed up with telephone calls. This led to increased support among retirees.

Cornell University has had a long tradition in international activities on the campus and around the world. Professor Martin was a part of that tradition. On sabbatical leave in 1964, he served as a consultant for the U.S. Agency for International Development. In that position, he traveled extensively in Nigeria, and reported on the strengths and weaknesses of the communication process in the Extension Service of various regions in that West Africa nation.

On the Cornell campus, he participated in a 15-year Communication Planning and Strategy Program. It started in 1980 and attracted approximately 300 decision-making personnel from 60 countries. The purpose of this international program was to improve participants' abilities to use systematic communication support in development activities, especially those related to agriculture, health, nutrition, family planning, and adult education.

During his career, he received many significant awards, including: Professor of Merit Award in 1960 presented by graduating seniors in the College of Agriculture; Edgerton Career Teaching Award in 1982 in recognition of his outstanding teaching and counseling of students for at least 25 years; Distinguished Community Service Award in 1994 by the Ithaca-Cayuga Rotary Club which included two citations: President of HOMES, Inc., a non-profit agency that provided housing for adults with disabilities and extensive volunteer roles as a 54-year member of the First Presbyterian Church. In July 1991, soon after Kennedy Hall was built on the Cornell campus, the Department of Communication named a conference room there in his honor. The plaque on the wall describes Russ with these words: Teacher, Counselor, Leader, Friend.

Russ was a past master of Hobasco Lodge of the Free and Accepted Masons and a member of the City Club of Ithaca. Among his professional affiliations were the New York State Speech Association and the American Institute of Parliamentarians.

His family was always an important part of his life. He was predeceased by his first wife of 37 years, Esther G. Martin, and a granddaughter, Melissa Peverly. He is survived by his wife of eight years, Margaret (Mig) Kramer Martin; son, Stephen Martin of New Orleans, Louisiana; daughter, Jeanne Prosser of Berthoud, Colorado; four stepchildren, Joseph Gallagher of Michigan, Patrick Gallagher of Syracuse, Maureen Gallagher of Trumansburg and Erin Fennell of Pittsford; a brother, Robert Martin of Rush, New York; 11 grandchildren and five great-grandchildren.

His family and a host of friends and professional colleagues feel that this talented, caring, kind, and gentle man left them much too soon. His passing creates a void not easily filled.

Royal D. Colle, Brian O. Earle, William B. Ward

Gerald A. Marx

March 7, 1930 — November 13, 1988

Gerald A Marx, professor of horticultural sciences at the New York State Agricultural Experiment Station at Geneva was a modest man with high ideals. He was a dedicated scholar, a keen researcher, and a respected faculty colleague. This combination of personal attributes characterized his 29 years on the Cornell faculty and made possible his many accomplishments during his shortened career.

Gerry was born in Wisconsin. He went to the University of Wisconsin, where he received a B.S., an M.A., and the Ph.D. degree in genetics and plant breeding.

He joined the Geneva faculty as an assistant professor of vegetable crops in 1959. Gerry became a world-renowned authority on the breeding and genetics of vegetable crops, including improvements on tomatoes, winter squash, carrots, beets, and peas. It was on peas, however where his greatest attention and devotion were centered, and where he emerged in time as one of only a few scientists in the world with active genetic germplasm collections.

Gerry was one of the founders of the Pisum Genetics Association, a worldwide organization which puts out a newsletter devoted to pea genetics. For about 20 years he was editor of that newsletter and maintained an office at Geneva for that purpose. He was also an active member of the National Pea Improvement Association, composed of university and USDA scientists, as well as representatives from the commercial green- and dry-pea industry, and from major pea processing companies. He was also a regular contributor to their annual workshop.

His contributions in pea genetics were many. Being a strong believer in basic research, he recognized that the identification of individual gene action, their placement on linkage groups, and putting together specific gene combinations would make the pea genetic stocks most useful to both basic and practical science programs. This research became a key source of pea germplasm for researchers from a wide range of scientific disciplines. And more specifically, in later years he became interested in the role of genes in developmental morphology, and authored a comprehensive review of this field of research.

As a plant breeder, he utilized his knowledge of pea genetics to incorporate novel and potentially valuable genes into germplasm lines which were then released to pea seed companies for their use in the release of new varieties. Some examples were: high seed number per pod, incorporation of multiple disease resistance to mildew and

viruses, use of genes which reduce foliage on the plant, high triple podding, and the use of multiple gene action to greatly concentrate the set of flowers and pods.

While Gerry had some disdain for the process of research administration, his devotion to duty to Cornell, along with his personal attributes, made him susceptible to being drafted as acting department chairman. This happened on numerous occasions, from a few days, to a few weeks, to even more than a year's duration. A measure of his success is to be found in the ongoing acceptance of him as an administrator by faculty and staff.

During the last eleven years of his life, Gerry and his wife Mary Lou shared the knowledge that he had a terminal illness with only several very close friends. At the same time, he intensified his attention to his research programs, wanting to get as much accomplished during the time he had left.

In addition to the organizations mentioned above, Gerry was a member of the American Society for Advancement of Science, American Genetic Association, American Institute of Biological Science, American Phytopathological Society, American Society for Horticultural Science, American Society of Agronomy, Botanical Society of America, and Sigma Xi.

The primary legacy left by Gerry Marx is a pea genetic germplasm collection that is probably unequalled in the world. The challenge will be to find a scientist and location that can continue the great works done by this respected scientist.

Michael Dickson, Richard W. Robinson, Donald W. Barton

Clyde Walter Mason

June 17, 1898 — December 8, 1983

Clyde Mason was born in Watertown, South Dakota, in 1898. He went to college in Eugene, Oregon, and received an A.B. degree in chemistry from the University of Oregon in 1919. He stayed on there for a year of graduate study but in 1920 seized an opportunity to combine his interest in chemistry with his love of microscopes and came to Cornell as a Ph.D. candidate under Professor Emile M. Chamot, with a major in chemical microscopy. Microscopy was not his only love, however, for during his first year at Cornell he met and married Elizabeth M. Peterson. For the next sixty-three years Ithaca and Cornell were their home.

In 1924 he received his doctorate and was appointed instructor in chemistry at an annual salary of \$1,200. He was made an assistant professor in 1927 and a professor in 1933. With his colleague and former teacher E. M. Chamot he published the first edition of the classic *Handbook of Chemical Microscopy* in 1930-31. When Olin Hall was completed in 1942, providing new facilities for teaching and research in microscopy, Clyde moved out of Baker Laboratory and became professor of chemical microscopy and metallography in the School of Chemical Engineering. In 1958 he was named the Emile M. Chamot Professor of Chemical Microscopy. He retired from teaching in 1966 but continued working at Olin Hall until a few days before he died. His revised fourth edition of volume 1 of the *Handbook* was published in 1983, when he was eighty-four.

This brief catalog of events, however, does little to convey a sense of his remarkable character. His sometimes prickly independence and self-sufficiency reflected his western origin. He was devoted to learning and to truth, constantly studying, criticizing, and writing with uncompromisingly high standards. His vast knowledge, always up-to-date, made him a true authority in his field. He knew a great many other things, too—most unexpected things. “Ask Clyde,” one would say when a seemingly impossible question arose. “He’ll know.” And he nearly always did.

His great love, however, was teaching. “I knew from the beginning that I was not a great lecturer,” he said, “so I concentrated on becoming a good teacher. I particularly liked the beginner or struggler.” This meant that he liked just about everybody, for all the students in his classes did a lot of struggling. He expected budding engineers to share his passion for accuracy and independent observation. “Don’t tell me what the book says,” he would tell the eye-weary student bent over a microscope. “Tell me what *you* see.” He abhorred the parroting of undigested information. “Don’t take notes on my lecture,” he would say. “Listen to it—*think* about it.” Shocked and dismayed,

most students would take notes anyway, for they had never before been expected to think about lecture material during class. His examinations were equally searching, and he was a tough grader. Nonetheless, he was held in high esteem by his students and was sensitive to their opinions. He especially appreciated the Christmas gift from one of the classes of some notepads inscribed "From the little world of C. W. Mason."

Clyde's world was anything but little. He wrote some forty technical articles on microscopy applied to a wide range of subjects. A series of lectures he presented to the American Society for Metals was published by that society in 1947 as a book entitled *Introductory Physical Metallurgy*. He was a consultant to several industrial firms, the Army Chemical Corps, and the Office of Scientific Research and Development. He was the founder and first chairman of the Division of Analytical and Microchemistry of the American Chemical Society; he was a fellow of the New York Microscopical Society and an active member of several other technical societies. He had a keen interest in libraries, served on library committees, and taught a course in library use. For many years he served on the University Committee on Music.

During the 1960s he drove a 1930 Model A Ford that he had lovingly restored to "historic vehicle" quality; he estimated that he spent three thousand hours on the project. He and his wife loved to dance, and he organized frequent dances for the Alpha Chi Sigma fraternity, of which he was faculty adviser. He was an excellent figure skater and an early member of the Cornell Figure Skating Club. Here he revealed his extreme fondness for children, a characteristic known only to his closest associates. He somehow arranged to be at Lynah Rink whenever he suspected that a chemical engineering faculty child would be at a public skating session. Parents were summarily dismissed; he made sure that blades were properly sharpened, that boots were properly laced, and that the child was not rigidly supported while learning to "use the edges." At age seventy he still had the patience to teach a four-year-old to skate.

Formal honors came to him rather late in life. In 1969 he was cited by the New York Microscopical Society for his contributions, and in 1981 an alumnus of the Class of 1956 established an engineering scholarship in his name. Currently three Master of Engineering degree students are designated as Mason Scholars.

For many years Clyde lived in Cayuga Heights with his wife and two children, George and Phoebe, all of whom survived him. Independent as always, Clyde refused outside assistance, even when, near the end of his days, he was caring for his increasingly incapacitated wife. "We'll manage," he would say. But the day finally came when even he could manage no longer.

Clyde was a gifted, exacting, complex individual. He was a distinguished gentlemen, reserved yet friendly; outwardly brusque yet sensitive and unfailingly generous; demanding of the students yet deeply concerned with their welfare; a recognized authority of enormous learning, yet one who often apologized for his lack of knowledge. There was no pretense in him.

Above all he was a devoted teacher who well understood the learning process and the limitations of our educational system, who sought to awaken in his students a sense of independent thought and critical judgment. Cornell has lost a dedicated servant. It is comforting that he lived to see the establishment of the Mason Engineering Scholarship that will perpetuate his memory.

Robert L. Von Berg, Charles C. Winding, Julian C. Smith

James Frederick Mason

June 25, 1879 — January 9, 1972

James Frederick Mason was born in Portland, Maine, and always proclaimed his loyalty and affection for his state. He took his A.B. at Harvard in 1902, and after studying in France and Germany entered the graduate school of the Johns Hopkins University where he received the Ph.D. in 1911, with a dissertation on the *Melodrama in France from 1791 to 1830*. He came to Cornell in 1909 as an assistant in French, and was promoted to assistant professor in 1912 and to professor in 1914. He retired as professor of Romance languages, emeritus, in June, 1945, and took up residence in New Jersey and later in Florida. He died at his home in Ormond Beach, Florida, in 1972, at the age of 92.

Professor Mason was oppressed by the isolation of college teachers of French in the United States. To give them a common forum, a sense of unity, and some scholarly direction, he founded the *French Review* in 1926 and served as its first editor. Prompted by the same impulses, in 1936 he organized an informal annual meeting of the college teachers of Romance Languages in New York State, outside of the metropolis. This group still meets regularly each fall.

Professor Mason deserves to be called a great teacher. His cynical wit delighted undergraduates, who swarmed into his courses, particularly his Survey of French Literature, which was regarded as an essential for the well-rounded undergraduate in Arts. Graduate students adored him and imitated him, carrying some of his mannerisms afar in the land. And he had a profound influence on a group of young men who would meet for coffee every Monday, Wednesday, and Friday at ten o'clock, to whom he played the role of Socrates.

Proud of his New England background, he enjoyed his reputation of a stern disciplinarian, yet he was at heart a kind and compassionate person.

For a number of years Professor Mason taught a Summer School seminar made up of a devoted group of school teachers and advanced students who vied with each other to see who could read the most books in current literature each winter season. It appeared to be the goal of the disciples to try to read more good books than the master.

Professor Mason's entire teaching career, his active professional life, was given to Cornell. What he gave to Cornell was immeasurable, but it exists in the minds and memories of many an old Comellian.

Blanchard L. Rideout, Morris Bishop

Louis Melville Massey

August 25, 1890 — November 12, 1969

Louis Melville Massey was born in West Point, Iowa, and educated in the public schools of Lima, Ohio. He received his A.B. degree from Wabash College in 1912 where he was one of the many students of Professor M. B. Thomas. He entered the Graduate School at Cornell in 1912 and received the Ph.D. in January 1916. He was appointed instructor in plant pathology in 1914, and assistant professor on July 1, 1917.

Dr. Massey was on leave from Cornell from April 1, 1918, to June 30, 1919, when he served as extension specialist at Rutgers under the War Emergency Program of the U.S.D.A. Returning to Cornell in 1919, he continued his research on diseases of roses, gladioli, and other ornamental crops and initiated an advanced plant pathology course which he taught until 1953.

In 1921 Dr. Massey was appointed acting head of Plant Pathology. In 1922 he became professor and head of Plant Pathology. On July 1, 1950, he relinquished his administrative duties in the department, devoting his efforts to his advanced course for three more years and to his research on roses, which he continued until his retirement on June 30, 1958.

Professor Massey devoted his sabbatic leaves to his research program, serving at Boyce Thompson Institute for Plant Research at Yonkers, New York, in 1925, and on three occasions at the University of California, Berkeley.

Dr. Massey was known throughout the world for his contributions to the culture and disease control of ornamental crops, especially roses. He served for many years as chairman of the research committee of the American Rose Society and conducted extensive studies into the nature and control of rose diseases. His interest in disease control was demonstrated in the 1930s when he was one of the first to experiment with the use of air as a means to conduct liquid spray materials into large plants. Dr. Massey was one of the early leaders in the study of damage to plants by air pollutants and he served as consultant in many of the early disputes in this area.

In 1939, together with Dr. C. E. Palm, then head of Entomology, Dr. Massey set up the Insecticide-Fungicide Conference, which not only cemented relations between the University and industry, but serves as the premier example of such conferences. The conference is now in its thirty-second year.

Professor Massey was a diligent teacher with a firm grasp on the techniques in his field. For thirty-five years his course constituted the formal advanced training in the field. He was a firm taskmaster but a sound teacher.

The least recognized but probably the greatest contribution to his field and his institution was his ability as an administrator. He “took over” the administrative duties at a time when a small staff was split and discouraged. He directed a reunification and vigorous development, the occupation of new and modern quarters within a few years, and “turned over” a staff tripled in size and as harmonious in operation as could be expected. He was respected for his honesty, his judgment, and his keen vision.

Professor Massey devoted his energies to his job but served society in many capacities. He was councilor and vice president of the American Phytopathological Society and vice president and president of the American Rose Society. He was a fellow of the American Association for the Advancement of Science, and a member of several other societies.

Dr. Massey was married in 1921 to Margery Wheldon Leonard, an assistant in Plant Pathology. Mrs. Massey died in 1955. He is survived by a son, a daughter, and five grandchildren.

Professor Massey will be missed by all who knew him for his straightforward nature, the twinkle in his eye, his smile, and his characteristic chuckle, and as a scholar of the highest caliber.

C. E. Palm, D. S. Welch, G. C. Kent

Louis Melville Massey, Jr.

April 28, 1923 — February 2, 1987

Louis Melville Massey, Jr., professor of food science, died on February 2, 1987. Dr. Massey joined the Department of Food Science and Technology at Geneva in 1958 to conduct research on the chemistry and postharvest physiology of fruits and vegetables. For many years his expertise was in the area of food irradiation—the department's six-thousand-curie gamma radiation source was under his administration. In 1968 he received the Joseph Harvey Gourley award from the American Society for Horticultural Science for his research on the effect of ionizing irradiation on the metabolism of Cortland apples. In addition to conducting his research program, he was a member of the executive committee and group research coordinator for the Northeast Regional Committee on postharvest physiology of fruits and was an advisory member of the Perishable Freight Claims Committee of the Association of American Railroads.

Lou's loyalty and affection for Cornell were strong and deep. Born in Ithaca, he was the son of Louis M. Massey, a former head of the Ithaca department of plant pathology. When Lou was appointed to a Cornell assistant professorship, he was pleased to be following in his father's footsteps.

Lou graduated from Oberlin College with a B. A. in 1947, following a break in his education caused by World War II and his service in the navy as a commissioned officer. He then returned to Cornell for his graduate training and obtained his doctorate in 1951 with specializations in biochemistry, plant physiology, and pomology. He was employed as a biochemist in the U.S. Army Biological Laboratory, Crops Research Division, at Fort Detrick for six years before returning to Cornell.

Lou had numerous outside interests. He was a member and treasurer of the Finger Lakes Torch Club for many years. He was an accomplished cabinetmaker, and he enjoyed gardening and auto mechanics. Perhaps he was at his happiest when communing with nature. His cabin in the Maine woods was his Shangri-La. Canoeing on Maine lakes and streams was a favorite pastime. His commitment to activities such as camping with the Boy Scouts and support of the Audubon Society bear witness to his love of nature.

A passage from William Cullen Bryant's *Thanatopsis* well describes Lou's beloved Maine woods, mountains, and lakes.

To him who in love of nature holds communion with her visible forms, she speaks a various language ... The hills, rock-ribbed and ancient as the sun—the vales stretching in pensive quietness between: the venerable woods—rivers that move in majesty, the complaining brooks that make the meadows green: and poured round all, old ocean's grand and melancholy waste—are but the solemn decorations all of the great tomb of man.

Louis Massey and Henry Thoreau had much in common. As Walden was to Thoreau, the Maine cabin was to Lou. Thoreau has been described as a flinty man with a strong moral conscience and a special sense of humor. When he was on his deathbed a friend asked, “Have you made your peace with God?” To which Thoreau replied, “I am not aware that we ever quarreled!”

Dr. Massey leaves his wife, Cynthia; his son, Nathan; his daughter, Deborah; and two grandchildren.

R. C. Lamb, W. B. Robinson, D. F. Splittstoesser

Robert Matheson

December 20, 1881 — December 14, 1958

Robert Matheson, for many years Professor of Entomology at Cornell, died December 14, 1958, in Princeton, New Jersey. A native of West River, Nova Scotia, he came to Cornell in 1902, obtained the degree of Bachelor of Science in agriculture in 1906, the M.S. in 1907, and the Ph.D. in 1911. After a brief tour as instructor in entomology at South Dakota State College, he served Cornell as assistant, instructor, and Assistant Professor in the teaching of biology during the period from 1909 to 1912. For a brief period during 1912 and 1913 he was Professor of Zoology and Entomology at Nova Scotia Agricultural College. He returned to Cornell in 1914 as Assistant Professor of Entomology, became Professor of Entomology in 1922, and served in this capacity until his retirement in 1949.

Although his research, teaching, and publications covered many divisions of the field of entomology, his principal interest was in the field of medical entomology. The many papers and books resulting from his research in this field have been used in classrooms around the world and have contributed significantly to human health and comfort. His stature in medical entomology was widely recognized by physicians and public health authorities, many of whom came to him for advice and assistance. His outstanding investigations on the biology of mosquitoes and their role as transmitters of the Plasmodia causing human malaria led to his appointment as a consultant to the Tennessee Valley Authority. The vast system of lakes created by damming the Tennessee River and its tributaries made an ideal habitat for mosquitoes, and large areas in Tennessee, Alabama, and Kentucky were threatened not only with the mosquito nuisance but with a serious increase in the incidence of malaria. Professor Matheson had a key role in organizing the research, and later the control work, that stopped mosquito breeding in the area and doubtless saved many lives that might have been taken by malaria.

Although his published works will provide an enduring monument, it is probable that Professor Matheson's greatest contribution to the field of medical entomology was in the training of a long succession of graduate students, many of whom became distinguished leaders in medical entomology. He had a talent for selecting students of high potential and held them to an unusually strict discipline, not only in the major field but also in the broad aspects of biology. Several of his students served the Tennessee Valley Authority, and others served with distinction as malaria control officers in the Eastern Theater of Operations during World War II.

His *Handbook of Mosquitoes of North America* probably was the most widely used of his three textbooks. Since it provided means of identifying both larval and adult forms of all known mosquitoes in North America, and in

addition listed such biological information as was known, this little volume was equally useful to the teacher of medical entomology and to the control official. His *Entomology for Introductory Courses*, *Laboratory Guide in Entomology for Introductory Courses*, and *Medical Entomology* were highly regarded by the profession and widely adopted for classroom use.

Titles and contents of the nearly fifty scientific papers that Professor Matheson published show clearly both the breadth and the depth of his interests and abilities in the whole field of entomology. He monographed the North American species of the beetle family Haliplidae and wrote extensive papers on such subjects as plant lice injury to the foliage and fruit of the apple, the insects, fungi, and weeds injurious to farm crops, and the silk glands of *Apanteles glomeratus*.

Professor Matheson was a member of the American Association of Economic Entomologists, the Entomological Society of America, the Ontario Entomological Society, the Society of Parasitologists, and the Society of Tropical Medicine; he was a correspondent of the Philadelphia Academy of Natural Science and a corresponding member of the Sociedad Venezolana de Ciencia and the Academie Chilena de Ciencia.

An intellectual with strong convictions, and capable of forceful and convincing expression, Professor Matheson's voice was heard in any company of which he became a party. If slightly inclined toward pessimism in his appraisal of mankind, it must be admitted that in most respects he was right. His office door was always open to student and staff member alike. Those of us who knew him will always remember the fine counsel and friendly encouragement he gave us so often.

H. H. Schwardt, Henry Deitrich, B. V. Travis

Howard W. Matott

July 13, 1914 — February 24, 2004

Howard W. Matott, 89, was born in Chazy, New York to William and Ethelyn Ashland Matott. He graduated from the Chazy Central Rural School, Plattsburgh State Teachers College, and Cornell University. He did graduate work at Colorado State University and Cornell University.

He married Mary Delaney on June 26, 1939.

Professor Matott was employed as a teacher at York Central School and then as a Cooperative Extension Agent in Chenango County. In 1958, he became an Assistant Professor and a Cooperative Extension Program Leader at Cornell University. He was promoted to Associate Professor in 1966, and retired as Professor Emeritus in 1974.

Survivors include three daughters and two sons-in-law: Anna Hale of Theresa, New York; Sue and Kenneth Green of Georgia; and Mary and Les Niles of Ithaca; as well as six grandchildren, six great-grandchildren, and a brother, Glenn Matott of Fort Collins, Colorado. His wife, Mary, five brothers, five sisters, and a great-grandson predeceased him.

Office of the Dean of Faculty

John George Matthyse

July 30, 1918 — November 8, 1996

Dr. John George Matthyse, 78, Cornell University Professor Emeritus, Department of Entomology, well known for his research in controlling insect and mite pests of livestock and of woody ornamentals and shade trees, died in Kirkland, Washington on November 8, 1996.

George grew up in New York City. Early in his life he showed a love for nature and science. He collected and studied plants and insects in the city and his family still has his journal recording his home chemistry experiments.

He entered the City College of New York, then transferred to Iowa State University where he earned a Bachelor's degree in 1940. He then came to Cornell as a research assistant in the livestock insect project. His doctoral thesis was based on the biology and control of the four species of cattle lice infesting cattle in New York State. His research also included other livestock insect pests such as sheep ticks, cattle grubs and house and stable flies. He received his doctorate in 1943 and was appointed research instructor by Cornell. In 1945, he married Elizabeth Grau, his beloved "Libby", and accepted a position with Geigy Chemical Company where he set up and supervised their lab in Bayonne, New Jersey, then later moved to Baker Chemical Company in Phillipsburg, New Jersey.

In 1947, a new project was established by Cornell's Department of Entomology to investigate and modernize the control of insect pests on woody ornamentals and shade trees. George returned to Cornell as an Assistant Professor in charge of this project and developed good control measures for many pests including very substantial contributions to the control of the insect vectors of Dutch Elm Disease. Several of his graduate students received their advanced degrees during this time. He also was one of the founders of the New York State Arborists' Association bringing together and further educating practicing arborists in identification, life history and control of woody ornamental and shade tree pests.

The untimely death of George's revered major professor, Dr. Herbert H. Schwardt, left the leadership of the livestock insect project vacant and George moved back to the work in which he was the most interested, now called veterinary entomology. He remained in this position, being appointed to Associate Professor then full Professor, until his retirement in 1974. He directed many graduate students who are now located in prestigious universities and other institutions nationally and abroad.

George had a close personal relationship with his graduate students. They were frequently invited to his home where he was a most informal, at times unconventional, host. One of his many graduate students wrote the following statement:

“George Matthyse was an intellectual of the highest order in the age-old tradition of academics. He involved himself in many interests of science and the humanities. Yet, he always had time to patiently guide, instruct, and counsel in order to improve the abilities of those with whom he interacted. He made friends for life, and as a major professor he was instrumental in the training of some of the best qualified scientists who have taken their skills throughout the United States and abroad. He always stayed in contact with his former associates. He was unfailing in his concerned support of others, and I consider myself most fortunate to have been among his friends. I shall forever remember him for his warm mannerisms, exuberant laugh, boundless energy, keen wit, and critical perception.”

Another former graduate student wrote that “All of us loved or hated him at one time or another in varying degrees.” George could be a critical taskmaster.

Throughout his Cornell career, George served on numerous foreign assignments. In 1952, he took a leave of absence to go to Africa to the nation then called Northern Rhodesia, focusing on the control of ticks and tick-borne diseases of livestock. He traveled to many remote villages to set up and demonstrate methods and insecticides used to alleviate the tick and disease problem. He used materials at hand, for example digging a large hole and lining it with a waterproof tarpaulin to substitute for the usual sprayer tank which would have been difficult to transport in the small aircraft often needed to reach the more remote native villages. He and his associates built their sprayers with locally available pumps and small engines, or units which could be powered with Jeep power takeoffs.

On one trip to Africa, George became infected with schistosomiasis—“snail fever”—an often-fatal disease that troubled him for several years. Nevertheless, George and Libby fell in love with Africa and with their family returned several times, working not only on cattle ticks but other pests such as the tsetse fly which transmits “sleeping sickness” making large areas of Africa unfit for human usage.

George was appointed to the University of the Philippines, Los Banos, to advise their Entomology Department on research and teaching methods, and worked with the United Fruit Company in Honduras, Costa Rica and Panama to deal with insect problems on bananas. He was also a member of the USDA-AID (Agency for International Development) team and visited Africa on various projects during the sixties and early seventies.

Among his more than 80 published scientific journal articles, George wrote a book with Murray H. Colbo, *The Ixodid Ticks of Uganda*, published in 1987 by the Entomological Society of America. The book is of great use to tick specialists (acarologists).

John George Matthyse was predeceased by his wife, Elizabeth; and their daughter, Kathryn (Katie).

He is survived by his son, Michael, and daughter-in-law, Margaret and their two children; and his son, John, daughter-in-law, Paula and their four children.

Dr. Matthyse made tremendous contributions to the study of life history and control of insect and mite pests of domestic animals and those of ornamentals and shade trees.

James E. Dewey, Francis H. Fox, Richard F. Pendleton

Leonard Robert Mattick

September 16, 1926 — February 24, 2009

Leonard R. Mattick, Professor Emeritus of Food Chemistry died at his home in Geneva, New York, February 24, 2009. He was born in Plains Township, Pennsylvania. His father was John Mattick and his mother, the former Briska Schweitzer. He attended local schools but left high school in his junior year to serve in the U.S. Navy as Electrician's mate for almost three years. He served in the battles of Sicily, Salerno and Normandy during World War II. He finished the high school requirements using the U.S. Armed Forces Institute courses and was awarded the High School Diploma from Kingston High School in 1944. He was discharged from the Navy in 1946 and entered Pennsylvania State University where he received his B.S. degree in 1950 and M.S. degree in 1951. He went on to the University of Connecticut where he obtained his Ph.D. degree in Chemistry in 1954.

Len worked as a chemist with the USDA Eastern Utilization Research Branch, Dairy Products Section in Washington, D.C. for two years, then as a Post Doctoral Fellow at Pennsylvania State University for two years before joining the Department of Food Science and Technology at the New York State Agricultural Experiment Station campus of Cornell in 1957 as an Assistant Professor. He was promoted to Associate Professor with tenure in 1963, Professor in 1970, and became Emeritus Professor in 1986.

His research activities included the study of analytical methods for the quality control of food and food products, oxidation in mechanically harvested grapes, acids and pigments occurring in grapes and wines, and changes in the composition of wines during and after fermentation. During his career at the Experiment Station, he authored or co-authored more than 120 scientific articles and co-authored several books on instrumentation used in food laboratories.

Besides his work at the Experiment Station, Dr. Mattick was active in community affairs. He was a member of the Geneva School Board for five years, an assistant coach with the Little League Packers football team, a Scoutmaster, a member of the U.S. Coast Guard Auxiliary, the U.S. Power Squadron, and the Geneva Kiwanis Club. He was a member of the Presbyterian Church in Geneva where he served as an Elder. For many years, he was a member of the Seneca Yacht Club. Later in life, he became an avid golfer and joined the Seneca Lake Country Club. He followed sports events enthusiastically in the Penn State tradition. He loved to travel. He was a gourmet cook and maintained a separate kitchen in his home to allow him to indulge in this hobby without interfering with the regular kitchen routine. Len loved to help people, especially in understanding chemistry. He spent countless

hours tutoring high school students in chemistry to help them prepare for college. His thoroughness in this endeavor was legendary. On one occasion, the principal of a local high school telephoned Len at his office to ask, "Is my son ready to come home now?" to which Len replied, "Not yet. There is one more point in chemistry he needs to grasp before I let him go."

Len was an experienced and competent chemist and colleague. He had the unique ability to adapt modern instrumentation for the rapid and sensitive detection and analysis of toxicants and other trace compounds in foods and many other biological materials. He was a thoughtful and devoted researcher, who put in long hours to ensure the accuracy of his determinations. Importantly, he was very enthusiastic about his research. It was a joy to collaborate with him. He contributed much to the field of food science and the training of graduate students. He served as Director to the Graduate Field of Food Science at Cornell for some years.

Len had a special talent for understanding the electronics and mechanics of instruments and how to fix them if not working properly. Any time an instrument in any laboratory was malfunctioning, the first thing one did was ask Len to take a look at it. He would open it up with one of the screwdrivers he always carried with him, examine it, make some adjustments, and the instrument functioned properly again. Faculty and students in other departments in Geneva and Ithaca used his expertise to keep their instruments operating. There were even occasions when he would be in another laboratory visiting a colleague, see an instrument on the bench and casually remark, "that instrument needs some adjustment to work effectively." Then he would remove the screwdriver or small wrench he always carried in his pocket and make the necessary adjustment.

His talent for repairing and adjusting equipment was utilized by his church where the people learned that if any church equipment was malfunctioning, the practical solution was to "call Len" and Len would come and fix it. He was Scientific Advisor to the Buffalo District Laboratory of the U.S. Food and Drug Administration for some years and was effective in bringing them up-to-speed on the newest methods of chemical analysis. After his retirement from Cornell, he developed a second career on the international scene as a consultant on matters relating to food chemistry. He accepted a position with Winrock International Institute of Agricultural Development and worked in Bangladesh for several years and in Kuwait, Syria, Pakistan, Western Samoa and Egypt on shorter assignments.

He was a founding member of the American Society for Enology and Viticulture, Eastern Section and played a major role in its operation for some years including Chairman. He was a member of the American Chemical Society, Sigma Xi, Phi Tau Sigma, Phi Lambda Upsilon, the Western New York Section of the Institute of Food Technologists, the American Association for the Advancement of Science, and the Society for Applied Spectroscopy.

He is survived by his wife of 54.6 years, Jean Leffingwell Mattick; three sons, John (Christine) Mattick, Robert (Julia) Mattick and James (Michelle) Mattick; two daughters, Susan (Neil) Gold and Barbara (David) Smith; eight grandchildren; Nichole, Jacqueline, Kelly, Lindsey, Victoria, James, Cynthia, Jonathon; and a sister, Johanna Connell. His older brother, Joseph Mattick, who was a Professor of Dairy/Food Science at the University of Maryland, predeceased him by two years.

Georges Mauxion

— *May 15, 1917*

The following resolutions on the late Professor Mauxion, prepared by a committee of the University Faculty appointed by the President and consisting of Professors Martin and Mason, were approved by the Secretary for record in the minutes of June 13:

Whereas, our esteemed colleague, Professor Georges Mauxion, after three years of active service in the Army of France, has made the supreme sacrifice of his life in the great world struggle for the peace and liberty of nations, we who have known him as friend and co-worker in the University desire to record here our appreciation of his scholastic attainments, his ability as a teacher, his simple integrity and gentleness as a member of our community, and his heroic sacrifice in our common cause ; and we desire to express, so far as we may, our profound sense of loss in his death, and to convey to his family, whom this blow leaves broken and desolate, our deepest sympathy.

Leonard Amby Maynard

November 8, 1887 — June 22, 1972

Professor Leonard Amby Maynard was born on a farm in the town of Hartford, Washington County, New York. The rural environment of his youth stimulated his interest in plants and animals and was the basis of his lifelong work in biology and agriculture. Following eighth grade in the Hartford village two-room school, he completed his secondary education at Troy Conference Academy, Poughkeepsie, Vermont, where he received a classical training in language, literature, and mathematics. Professor Maynard then enrolled in Wesleyan University, Middletown, Connecticut, in 1907 and was graduated in 1911, cum laude. The course in chemistry taught by Professor W.P. Bradley furnished the inspiration leading to his future career. In Bradley's course he learned of the pioneer work of Wilbur Olin Atwater, who established and directed the first agricultural experiment station in the United States at Middletown in 1875. Fascinated by the accounts of Atwater's varied research activities in applying chemical knowledge and techniques to the problems of agriculture and human and animal nutrition, Maynard determined to specialize in chemistry and proceeded to take all the courses that were available.

Professor Maynard enrolled in Cornell University in the fall of 1913 as a graduate major in chemistry, after serving two years as an assistant in chemistry at the agricultural experiment stations at Iowa and at Rhode Island. During graduate study, Maynard received great stimulation from Professor Wilder D. Bancroft, whom he described as a teacher whose "facile mind, familiarity with both classic and current literature of chemistry," and whose "wealth of ideas for research and enthusiasm made contacts with him, both in lectures and conferences, of outstanding interest and value." He received the Ph.D. degree from Cornell University in 1915 and under the aegis of Professor Elmer Seth Savage, Maynard was offered the opportunity to plan and equip a laboratory for small-animal studies in nutrition. He received an appointment as assistant professor of animal nutrition in the Department of Animal Husbandry, New York State College of Agriculture. He was promoted to a full professorship in 1920.

In 1926 Professor Maynard took a sabbatic leave and carried out post-doctorate studies at Yale University under the direction of Professor Lafayette B. Mendel. He has said that, of all his teachers, Professor Mendel provided the greatest stimulation and soundest guidance for his career in biochemistry and nutrition. When Maynard arrived at New Haven, he found that laboratory space in Mendel's Department of Physiological Chemistry was very limited. A young National Research Council postdoctorate fellow in the laboratory, Clive M. McCay, offered to share his space. Out of this incident grew a lifelong friendship and scientific collaboration. In 1927 Maynard

convinced Dr. McCay to accept an assistant professorship in animal nutrition at Cornell. It exemplified Maynard's basic approach to applied problems as well as his own chemical training that he could attract a chemist to his laboratory and insist that his graduate students be trained as chemists. This was no small feat in those days, when it is realized that Maynard's Laboratory of Animal Nutrition was a unit in the Department of Animal Husbandry, one of the College of Agriculture's most dynamic applied departments, situated on one side of the campus while on the other side sat the citadel of chemistry — Baker Laboratory — where chemists were skeptical of those “cow chemists” to the east. Nevertheless, Maynard insisted that every graduate student take one minor in chemistry, and as a consequence of this, as well as participation in the local section of the American Chemical Society, mutual respect spread and collaborative projects developed.

In 1928 Professor Maynard took a leave from Cornell to study as an International Education Board Fellow at the University of Strassburg, and the Ecole Veterinaire, Lyon, France. In 1934, on a sabbatic leave, he served as visiting professor of nutrition at the University of Nanking, China. Maynard commented on his return from the latter experience that he was pleasantly surprised on a visit to an orphanage outside the city to find a very modern dairy enterprise. However, he was really chagrined to learn that the orphans did not receive the milk. Instead, it was sold in the city for cash to maintain the orphanage. Such early experiences broadened Maynard's interests and strengthened his later participation in international organizations involved with food and nutrition problems in developing countries.

Professor Maynard was recognized by his students as a superb lecturer. His lectures were highly organized, concentrated, and interestingly presented. He patterned himself after Professor Mendel, who could bring into one sentence more understanding than another could in two paragraphs. The Laboratory of Animal Nutrition seminars under Maynard and McCay were known as the Mendel type, similar to those given at Yale. Each graduate student had to report on one or several papers involving a specially selected current topic in biochemistry and nutrition. Professor Maynard selected the topic and assigned the papers. He knew the contents of each paper. Every graduate student received pertinent evaluations of his presentation. The neophytes among the graduate students each year rapidly learned to do their homework thoroughly.

Professor Maynard was noted for his dry wit and sense of humor among those who knew him intimately. In the early days of the Laboratory of Animal Nutrition he took care of the annual inventory with the help of a graduate assistant as recorder. On one occasion, after completing the list in a young assistant professor's laboratory, he

surveyed the scene and, noting his young colleague busily at work, he remarked to his graduate student recorder, in a voice that was easily heard throughout the room: “You had better put one working chemist on that list also!”

Professor Maynard’s abilities as a teacher and research investigator were the underpinning of his talent as an administrator which eventually was recognized and widely utilized extensively within the University and outside as well. Several characteristics of his administrative style were well known to his colleagues. He kept a clean desk. As the mail arrived twice a day, he made notes, consulted colleagues nearby or called those more distant. Then his secretary was called in for dictation, and replies went out that day or no later than the next. Professor Maynard was always available to students or colleagues, except during dictation or the hour before each lecture. If he was responsible for a committee or a group effort, he always talked to each member before the meeting and knew ahead of time the reaction or thoughts of those involved.

In 1939 the Agricultural Research Service of the United States Department of Agriculture established the United States Plant, Soil and Nutrition Laboratory on the Cornell campus. Professor Maynard was appointed the first director and served until 1945. He was appointed the first director of the Graduate School of Nutrition in 1941. He and Howard E. Babcock, a founder of G.L.F. (now Agway) and chairman of the Cornell University Board of Trustees, were prime movers in the, as then known, School of Nutrition. Maynard describes the trials and tribulations of the birth, infancy, childhood, and adolescence of the School in “Early Years of the Graduate School of Nutrition at Cornell” — 1941-56, published in 1968. He tells in a most modest tone not only about a successful pioneer experiment in intercollege cooperation within the University, but also some of the struggle to foster more definitive recognition of Cornell as the land-grant university of New York and of its role within the state of New York. Outside of Cornell, the School of Nutrition represented a unique model of educational pioneering in the science of nutrition. A number of sister institutions have followed Cornell’s example.

In 1940 the biochemistry unit of the former Ithaca Division of the Cornell Medical College was transferred from the Department of Zoology in the College of Arts and Sciences to the College of Agriculture and provided with space in Stocking Hall, in association with the Laboratory of Animal Nutrition. As early as 1943 Professor Maynard proposed the establishment of a Department of Biochemistry at Cornell. With the strong support of President Edmund Ezra Day and Dean William I. Myers, the budget request of 1945-46 for the College of Agriculture to the state of New York included an item for the support of the proposed new department. It was approved and the Department of Biochemistry in the College of Agriculture was established on April 1, 1945. Professor Maynard was asked to take the headship. He was appointed professor of biochemistry and together with the late Professor

James B. Sumner constituted the original faculty. Maynard, with the support of Dean William I. Myers, secured funds from the state to equip and maintain Savage Hall, completed in 1947, as a home for Biochemistry as well as the School of Nutrition. He retired as head of the Department of Biochemistry and Nutrition in 1955.

Professor Maynard's skills as an organizer and administrator did not go unrecognized outside Cornell. He served as commissioner for nutrition of the Emergency Food Commission beginning in 1943, and as liaison member of the postwar New York State Food Commission until its termination in 1948. He served as United States nutrition expert on Interallied Food Missions to London, England, in 1943, 1944, and 1945, and to Germany in 1945. He was chairman of the Food and Nutrition Board from 1951-55 and of the Division of Biology and Agriculture from 1955-58, both of the National Research Council in the National Academy of Sciences.

Professor Maynard was elected to the National Academy of Sciences in 1944. The American Institute of Nutrition honored him with the Borden Award in Nutrition in 1945 and the Osborne and Mendel Award in 1954. He was given the Order of Rodolfo Robles by the Republic of Guatemala in 1959 and presented with honorary degrees of Doctor of Science, in 1945 by Wesleyan University and in 1958 by Rhode Island State University. In 1957 he was the first man ever to be elected a national honorary member of both Omicron Nu, the home economics scholastic honorary, and the American Dietetic Association. In 1960 he was honored with Fellowship in the American Institute of Nutrition.

Professor Maynard served his country as a lieutenant, captain, and major, C.W.S., in the Sanitary Corps in France from 1917 to 1919. Before returning to the United States he was married to Helen Hunt Jackson of Iowa, who was also serving her country in France. He served as the first mayor of the village of Cayuga Heights, from 1930 to 1934.

Professor Maynard published more than a hundred original research papers. His most important contributions were: the discovery of calcium deficiency as the cause of bone troubles in swine; the finding that fluorine as a contaminant of mineral supplements to animal rations retarded bone calcification; the demonstration that the neutral fat of blood was the precursor of milk fat and that a certain minimum level of fat in the diet was essential for maximum milk secretion; the utilization of purified diets in ruminants for the study of fat and protein nutrition; and, finally, the pioneer studies with C.M. McCay showing the beneficial effect of slow growth through calorie restriction, and of calorie restriction in the adult on length of life in the rat.

Professor Maynard was the coauthor of *Better Dairy Farming* with Professor Elmer S. Savage, for whom Savage Hall was named. Before his death he was actively engaged in revising the classic and widely used textbook of *Animal Nutrition* for a seventh edition.

Professor Maynard will be remembered by his students, by his colleagues, and in the annals of Cornell University for his abilities and stature as a teacher, a research scientist, and an administrative leader. Nothing, however, illustrates more the sincere and humble nature of this true Cornellian than one of his favorite sayings, an admonition of Hamlet: “There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy.”

E. (Edwin) Scott Maynes

October 6, 1922 — June 24, 2007

E. (Edwin) Scott Maynes passed away at his home in Ithaca on Sunday, June 24, 2007 at the age of 84. He was the son of Edwin Maynes and Janet (Scott) Maynes of Meriden, Connecticut. He is survived by his wife, Blanche; his sister, Phyllis of Meriden, Connecticut; his three children: daughter, Lisa Maynes, son-in-law, Timothy Pointon, and grandson, Alexander Scott Maynes-Pointon all of Albuquerque; son, Philip Maynes of Los Angeles; and daughter, Christina Maynes of Singapore.

Born in Meriden, Connecticut in 1922, Scott was raised with interests in sports and people and developed a questioning mind. These remained essential elements throughout his life. He attended Springfield College, Springfield, Massachusetts in 1940. Entering the U.S. Army Air Force in January 1943, he served in the United Kingdom, France, and Spain as a cryptographer and was discharged in December 1945 with the rank of Sergeant. Returning to Springfield College after World War II, Scott exhausted the economics offerings of the College and was allowed to take economics courses at nearby Mt. Holyoke College, thereby becoming its first male student. He graduated from Springfield College with a B.S. degree in Social Sciences (high honors) in 1947. At Wesleyan University for his M.A. degree in Economics, he came under the influence of Colston Warne, one of the founders of Consumers Union, and from whom he derived a lifelong scholarly interest in consumers and the consumer interest, one of two interests that drove his entire scholarly career. After completing his M.A. degree in 1949, he pursued the Ph.D. degree in Economics at University of Michigan, graduating in 1956. During his Ph.D. studies, he worked and studied at the Survey Research Center, University of Michigan, coming under the influence of George Katona. Survey research became the second scholarly interest that strongly influenced his career.

His career spanned 18 years in Economics at the University of Minnesota and 17 years in Consumer Economics at Cornell, with visiting appointments at University of California, San Diego, and the University of Michigan and leaves with the Federal Trade Commission (Washington), National Council of Applied Economic Research (New Delhi, India), Instituto Torcuato Di Tella (Buenos Aires), National Consumer Council (London) and Stiftung Warentest (Berlin). Scott was recruited to join the Cornell faculty in 1975, at a time when the recently reorganized College of Human Ecology was moving to strengthen the basic disciplines underlying its main applied and policy concerns. Scott made a major contribution to this effort through his appointment in the newly named Department

of Consumer Economics and Public Policy (now Policy Analysis and Management), subsequently serving as Department Chair.

He contributed importantly to the development of the consumer economics field here at Cornell, nationally and internationally. His research centered on consumer decision-making, survey research methodology, and consumer policy. He pioneered the “perfect information frontier” model of consumer choice in which quality is conceptually specified and measured. In India, he was instrumental in designing and conducting the Delhi Savings Survey (1958-59) and he importantly influenced the All-India Urban Savings Survey (1960-61), and the Rural Savings Survey (1962-63). In Argentina, he designed several consumer surveys. He was the organizer of the first International Conference on Research in the Consumer Interest in 1986 and edited its volume of proceedings. He was the author of *Decision-Making for Consumers: An Introduction to Consumer Economics* (MacMillan); 1976, as well as more than 70 other scholarly publications. True to the legacy of Colston Warne, he served on the Board of Consumers Union and was its Treasurer, 1972-75. He was active in the American Council on Consumer Interests (ACCI), the scholarly association for consumer economists and consumer affairs professionals and was named Mentor and elected Distinguished Fellow of ACCI. He was active in international consumer affairs, participating in the worldwide consumer movement through contributions at several Congresses of Consumers International as well as consulting with both the British National Consumer Council and Germany’s Stifun Warentest. He became Professor Emeritus in 1992 but remained active in ACCI until very recently.

Scott led a fully engaged life and lived it passionately. A staunch member of the Unitarian Societies wherever he lived, he participated fully in them, frequently as discussion leader and on various committees. Scott loved people, was always interested in listening to what they did and thought, and brought to these interactions an intellectual joie de vivre that was as endearing as it was heartfelt. His sense of humor was irrepressible and came out in almost all of his conversations. He never met a baby that he didn’t love and his grandson, Alexander Scott Maynes-Pointon, was his treasure. Family, family vacations and travel were very important to him. His wife and children shared in these interests and were willing participants with him in his hiking, canoeing, cross-country skiing, sailing adventures and international travel. He wrestled in college and enjoyed attending Cornell wrestling matches with colleagues in the college. He was an avid biker throughout his life. In all seasons and in all weather, in Minnesota, Ithaca and elsewhere, he bicycled to and from the office. He met Blanche, his wife, as part of a bike-hostelling trip in 1951 on Nantucket. They married in 1953. Squash and tennis were passions that he played with a competitiveness that marked everything he did. He reveled in having canoed the length of the Connecticut River in 1950, parts of the Colorado River in 1997 in the shoes of John Wesley Powell, and the upper reaches of

the Missouri River in 1999 following the trail of the Lewis and Clark Expedition. On Nantucket during many family vacations and elsewhere, he loved body surfing regardless of the water temperature. And in winter, he could frequently be found on Connecticut Hill cross-country skiing.

Scott will be greatly missed by his many colleagues, students, and friends at Cornell and elsewhere around the world.

W. Keith Bryant, Chair; Henry Ricciuti, Jerome Ziegler

J. Congress Mphetizeli Mbata

May 15, 1919 — January 14, 1989

Early Childhood:

In 1919 J. Congress Mbata was born in Johannesburg, South Africa, the son of the late John and Martha Mbata. Then, as now, the country was gripped by a turbulent storm arising from the desire of African people to assert themselves from the oppressive forces of racist white South Africans. In 1919 the country was hit by the widespread Anti-Pass Laws Campaign as well as the massive Bucket Strike in Johannesburg. I.J. Nthatisi, in Bloemfontein, was orchestrating a popular campaign in support of a higher minimum wage for African workers. 1919 was the year of the Peace Conference in Versailles. Dr. Walter Benson Rubusana, from the Cape, headed the African delegation there, as Africans tried to inform the outside world about the nature of their brutal oppression in the apartheid system at the hands of the white South Africans. 1919 was also the year that saw Sefako Mapogo Makgatho lead the protest against the Natives Urban Areas Bills. These were the laws, long before there was a Group Areas Act, that circumscribed where African people could live, i.e., so-called Locations and Townships. In 1919 Chief Fenyang, of the Orange Free State, directed the struggle the aim of which was equality of treatment within the judicial system. Finally, 1919 was the same year Langalibalele Dube (Mafukuzela) headed a campaign in Natal for expanded African educational opportunities.

In 1919 “Congress” signified resistance to oppression. Congress was supposed to be the organization, or the concept, that would carry Africans to their national freedom. It was an expression of self-confidence in themselves and their future, and in 1919, the Mbatas named their new son, Congress, as a symbol of protest and hope for a brighter future. Their choice of a name has proved prophetic, for today the leading African protest organization in South Africa is the ANC—the African National Congress.

Educational Career:

Congress Mbata grew up like any other African child in South Africa. Then, as now, education was neither free nor compulsory for Africans. However, Congress single-mindedly pursued the purpose of intellectually equipping himself for the future. He went through the mills of the Bantu United Schools system. He then entered St. Peter’s Secondary School in Johannesburg; he proceeded to the South African Native College at Fort Hare; and he also studied at the University of the Witwatersrand.

In 1940 he joined the faculty at St. Peter’s Secondary School. At the same time he was elected the secretary of the TATA (Transvaal African Teachers Association) which became the spear and shield of Africans in their struggle for

education. The TATA was a particularly well remembered group. This was the group, which under the leadership of Z. Mothopeng, led the opposition to the infamous Bantu Education System.

TATA co-ordinated efforts with the CATA (Cape African Teachers Association), NATU (Natal African Teachers Union), OFSATA (Orange Free State African Teachers Association), and TL (Teachers League) in the Cape. It was a formidable front—an enlightened circle that pointed the way out. Needless to say, many from their ranks paid the supreme sacrifice.

In the 1940s, Congress served as chairman of the African Study Circle, a select group which met regularly to study the political, economic, judicial, cultural, and even spiritual problems facing Africans. From this group emerged a number of people who later on became national leaders in the struggle against apartheid.

In the Struggle:

In 1943 Congress Mbata was invited by Dr. Alfred Beteni Xuma to serve on the African Claims in South Africa Committee. This Committee brought together some of the best minds among the African people. Dr. J. Moroka was there from the AAC (All-African Convention). Professor Ngcobo was there from Loram Secondary School. Also present were Moses Kotane, Thabo Mofutsanyana, and Dan Tloome of the Communist Party. From Dr. Xuma's vantage point, Congress Mphetizeli Mbata was also worthy of the honor to serve on the committee. It was believed then, in 1943, that Congress was a highly-committed nationalist and a gifted thinker.

In 1944 Congress Mbata became a founding member of the African National Congress Youth League (ANCYL). Later, Congress was chosen acting secretary for the ANCYL, when Anton Muziwakhe Lembede assumed the presidency. Lembede was well known as a profound and daring thinker, a political philosopher, and a dynamic personality. He thought Mbata's more predictable style would harmonize with his own, and this turned out to be the case.

Shortly thereafter, Congress became a headmaster at Lekoa-Shandu African High School in Vereeniging. Following this assignment, he became an officer-researcher at the SARRI (South African Race Relations Institute), an independent research center whose findings have rarely, if ever, been challenged by both the proponents and opponents of apartheid.

Sharpeville and After:

In 1960, after the Sharpeville Massacre and the State's ban against the ANC, Mbata became deeply involved in the 1960 African Leadership Conference, which represented still another effort at building a united African front.

By the middle of the 1960s, Mbata was a continuous target of the fascist South African Security Police. Luckily, he obtained the status of refugee in the United States. From then on, he and the members of his family would never be allowed to again set foot in South Africa, their homeland.

In the United States, Congress began (1968-69) as a professor and researcher with the African Studies Program at Northwestern University. At the same time, he also was the head of the African Studies in the Department of Political Science at the Illinois Institute of Technology. While at Northwestern, Congress became friends with James Turner. Later, when James Turner became the first director of the newly created Africana Studies and Research Center at Cornell, Congress accepted the invitation to become one of its founding faculty members. He was appointed associate professor of African Studies, a position he held from 1969 until his death on January 14, 1989. Besides offering seminars that were very popular with undergraduates and which compared various aspects of race relations in North America and South Africa, Congress will be remembered as the person who helped fashion the graduate program in Africana Studies. Along with Dr. Turner and the faculty at the center, Congress designed the current M.P.S. degree program, negotiated its acceptance by state authorities, and served as the first graduate field representative for Africana, a position he held for over ten years. Professor Mbata's passing is especially painful and significant to Professor Turner, for Congress was the last of the original group of scholars whom Dr. Turner recruited as part of the founding of the Africana Center in 1969 (others have since moved on to successful careers in government and education).

He will be remembered very fondly as Professor Mbata—a capable, competent, and fully informed Africanist scholar. In 1975-76 he was elected president of the New York African Studies Association (NYASA), and in 1988, the NYASA presented him with an award in “recognition of meritorious services rendered ... to scholarship and African excellence . . .” Among his numerous commentaries and writings were: “Race and Resistance In South Africa” in J. Paden and E. Soja (eds.), *The African Experience* (1970), and “Profile of Change: The Cumulative Significance of Changes Among Africans” in L. Thompson and J. Butler (eds.), *Change in Contemporary South Africa* (1975).

Professor Mbata is survived by his wife, Elizabeth Mbata of Interlaken; a daughter, Mary Ann Mbata of Interlaken; two sons, Donald Ntando Mbata of Maryland and Monde William Mbata of Interlaken; a sister, Julia Manamolela of Pretoria, South Africa; and a grandson of Interlaken.

Peter Hlaole 'Molotsi, James Turner, William E. Cross, Jr.

George Alexander McCalmon

February 5, 1909 — April 6, 1965

When George McCalmon died in the spring of 1965 at the age of fifty-six, he had not yet completed thirteen academic years at Cornell University. These years were full, however, and scores of students who remember him from classroom and theatre looked upon him not only as their teacher and director but also as their counselor and friend.

Professor McCalmon was born in Pittsburgh, where he later studied at Carnegie Institute of Technology and received a Bachelor's degree in dramatic arts in 1934. He studied also at Teachers College, Columbia, and ultimately at Western Reserve University, where he earned M.F.A. and Ph.D. degrees. After teaching at Geneva College, Carnegie Institute, Western Reserve, and Florida State University, he came to Cornell in 1952 as Director of the Cornell University Theatre and Associate Professor of Speech and Drama. He was named Professor of Speech and Drama in 1959, and had begun a term as chairman in 1964.

While he taught—and enjoyed—a wide range of theatre courses, including playwriting, he was especially challenged by directing; his productions were consistently touched by his own flavor as well as his own distinction. At the time of his death, he was in the last weeks of production on *The Great Magician*, a modern adaptation of commedia dell'arte, written by his friend, Lawrence Carra.

In the summer of 1962 he was director of *How to Grow a Musical*, a Cornell University Theatre production which toured Latin America under State Department sponsorship. In 1959 he directed *The Golden Crucible*, which celebrated Pittsburgh's bicentennial; in 1956, *Horn in the West*, at Boone, North Carolina; in 1955, *The Lost Colony*, at Manteo, North Carolina. He was coauthor of *Creating Historical Drama*, posthumously published in 1965.

Professor McCalmon was active in the American Educational Theatre Association, the National Theatre Conference, the American National Theatre and Academy, the New York State Community Theatre Association, and the Institute of Outdoor Drama. In Ithaca, he was a member of the Statler Club and the local chapter of the American Association of University Professors. He was the author of several plays, as well as articles on varied phases of dramatic production.

He was an active member of St. John's Episcopal Church of Ithaca. In addition to his wife, Irene McCalmon, he is survived by a son, Byron (Cornell '62); a daughter, Heather; a sister; and a nephew.

An intensely vital yet altogether gentle man, George McCalmon was a master teacher and director, and a warm friend and loyal colleague. Those who had an opportunity to work with him are unlikely to forget either his high standards of performance or his rare sense of humor. He himself would like to be remembered, we think, as a thorough workman and a good artist.

H. Darkes Albright, William A. Campbell, Francis E. Mineka

Philip J. McCarthy

February 9, 1918 — October 10, 1994

Phil McCarthy was born and raised in Friendship, New York, a small village in western New York known for its dairy products. His father was a rural postman and dairy farmer and one of Phil's tasks was to help out on the family milk route. His mother was the teacher in a local one-room school.

He won a Regent's Scholarship from the state, then a distinct honor for a high school student, which made it possible for him to attend Cornell during the late Depression era. He was an excellent mathematics student. Like many of the brightest undergraduate mathematics students of that time, he prepared for the actuarial exams as well as the possibility that he might become a high school mathematics teacher. An important portion of the actuarial training was conventional probability, mostly counting theorems.

Upon graduation from Cornell in 1939, he was accepted as a student in the Mathematics Department at Princeton. There was little graduate statistical training in the United States or elsewhere at that time and even less in mathematical statistics, which was then nascent. Fortunately, Professor Samuel Wilks, one of its few early distinguished scholars, was in the Princeton department and took the young McCarthy under his wing. Phil studied the standard mathematical subjects, but once free of the requirements, he became one of a number of Wilks' students of that period who went on to make substantial contributions to statistics.

He worked very closely with Wilks when the latter was editor of the *Annals of Mathematical Statistics*. Then, with the outbreak of the Second World War, major concentrations of statisticians developed in Princeton and New York—and Phil was in both. Among the figures at Columbia were Harold Hotelling, Milton Friedman, Abraham Wald, and Jack Wolfowitz. In the Statistical Research Group at Princeton, there were William Cochran, Theodore Anderson, Fred Mosteller, Fred Stephan, and John Tukey. Other scientists McCarthy met at that time included John von Neumann and Dale Corson. It was a rich experience.

At the end of the war, Fred Stephan recruited Phil to come back to Cornell. Sample surveys had become a major tool as sociologists sought to put their work on a firm empirical base. But the then current designs for most of these studies had major weaknesses, and modern sampling methods were needed. Phil was hired on a Social Science Council Research grant to clarify design and related issues. When Stephan went to Princeton the following year and the quantitative sociologist Louis Guttman took an opportunity to go to Israel, Phil took over the sampling course in their department. He left for a permanent position on the faculty of the new School of Industrial and

Labor Relations at Cornell where he remained from 1948-88, continuing part-time for some years thereafter. His last published paper was in February 1994.

Before the War, statistics played only a minor role at Cornell, although Walter Wilcox held the first professorship in the subject in the United States and Professor Edmund Ezra Day, who was to become our fifth University President, was president of the American Statistical Association a generation earlier. But by the late 1940s, an extraordinary group of probabilists was present at Cornell, rivaled in the world perhaps only by Moscow. The development of mathematical and applied statistics came then and shortly thereafter, with major appointments in mathematics, plant breeding and biometry, engineering, and Industrial and Labor Relations. Phil was one of the founders of the Statistics Center and did backbreaking work in directing it, without compensation, for many very difficult early years.

His research in sampling continued, of course, and he was constantly sought as a consultant by government agencies. Whether one thinks of price statistics and index numbers or of the measurement of employment and unemployment, his mark is there. He played a considerable role when criminal justice statistics were moved from a collation of police blotter reports to the modern surveys designed to elicit information on the frequency of crimes actually experienced by the public. He played a similar role when medical reporting moved from a collation of cases which the states required physicians to report to measurement of actual disease incidence and related matters.

When the Social Security Administration sought out researchers to analyze their one percent sample of enrollees, he and a colleague used the opportunity to develop a probability model new to the social studies. The resulting ILR Press publication on labor mobility was more widely cited in the social studies than the totality of all other ILR faculty published research.

One anecdote reflects how Phil's life connected with significant statistical developments. In 1946, he, John Tukey, and Ted Anderson, published a report based on their wartime research. The military was dropping bombs from different heights to estimate the response and sensitivity of detonating mechanisms. From a statistician's point of view, this is equivalent to estimating the level of insulin which is necessary to obtain an appropriate frequency of reactions. The new approach had some use. Then a graduate student and his teacher at another university published an innovative modification which later came to be called the "stochastic approximation" method. The idea was to improve efficiency as one built up experience by making ever small changes in one's test level to approximate median dosage. The steps had to be small improvements but ones large enough so that you were sure

you were going to get to the correct value eventually. It involved some delicacy in the face of the uncertainty with which statisticians must deal.

There was a journal club run within the Mathematics Department, and Phil naturally offered to report on the paper. The report excited Wolfowitz, who had earlier been brought from Columbia to lead Cornell's group of theoretical statisticians. His paper and those which followed from a number of Mathematics Department faculty led to an extraordinary number of variations of the problem, to new theory, and to significant developments in probability. Phil was a quiet and essential link.

In 1942, Phil married Mary Ann Aselin. Phil was a fond husband and father, spending almost all of his free time with his family. He loved to walk with them in the state park near which they lived in the children's early years. And he thoroughly enjoyed ballroom dancing.

He was a competent pianist and had great skill in tennis and squash. It was a source of considerable dismay to him that joint problems made playing these sports difficult, and eventually impossible, in his later years.

In 1967, Mary Ann died in an automobile accident which also seriously injured a daughter, Nancy. Two years later he married Jane A. Lisberger, the widow of an ILR graduate student who was a former General Electric executive.

In his later years, Phil's affection for sports continued and he was an avid Cornell sports fan. He was also able to continue his extraordinary reading of mystery novels, which led to frequent consultation with literary scholars.

He was a teacher of great clarity in the classroom, in his books, and in the monographs he wrote both for statisticians and other professionals. His colleagues valued his fairness, his intelligence, and his diligence. His family, the faculty, and his students will miss this modest, gentle man.

Ronald G. Ehrenberg, Paul Velleman, Isadore Blumen

Clive Maine McCay

March 21, 1898 — June 8, 1967

Professor Emeritus, Clive Maine McCay died on June 8, 1967, at his home in Englewood, Florida. He had retired in 1962 because of ill health. Dr. McCay joined the staff of the Department of Animal Husbandry at Cornell University in 1927 after a varied experience at the Universities of Illinois, Iowa State, California, Texas A. and M., and Yale. His training, at first in chemistry and then in biochemistry fitted him well for the pioneering research in nutrition that became his lifework. Perhaps his greatest scientific contribution in this field was the demonstration that slow growth is related to greater longevity, a result that was at variance with accepted belief and common sense. He also showed that regular exercise extended the lifespan, whereas animals that became excessively fat died younger.

McCay was not content to be purely a laboratory scientist, but he was always ready to carry his work into the practical field. He helped materially in improving the diets of institutional inmates in New York State and, during World War II, served as a commander in the United States Navy with a large measure of responsibility for the nutritional well-being of the servicemen. This work took him far afield as he studied the dietary habits of the personnel on aircraft carriers and submarines. He was always ready to campaign for better nutrition of those least likely to have it, and especially for the senior citizens among us. He was in great demand as a lecturer on these topics. In particular, he devised a formula for an improved type of bread that included the latest that scientific information could suggest.

He served terms as president of the American Institute of Nutrition and of the American Gerontological Society and was an honorary member of the Swiss Society of Nutrition. For his book, *Nutrition of the Dog*, he received the first National Dog Week award and medal. In 1961, at the international convention on nutrition, vital substances and diseases of civilization he was presented with a gold medal for his researches in nutrition and his work to improve the status of human nutrition.

Dr. McCay had great ability in his chosen field of teaching and research. As a teacher he was stimulating both for the student and the staff member. He was very widely read and his depth of knowledge as well as his inclination to take a very broad view of a particular problem was most impressive. He did not suffer fools gladly and many of his students had occasion to regret lapses of performance or evidence of shoddy thinking. At the same time, he was

very competent in drawing out the best in others and in stimulating discussion. There was never a dull moment when he was around.

Dr. and Mrs. McCay were most generous in showing hospitality to graduate students and to visitors to our campus, especially to those from other lands. Their picnics and the gatherings at their home will long be remembered gratefully by men and women now scattered throughout the world.

S. A. Asdell, J. I. Miller, J. K. Loosli

John W. McConnell

October 18, 1907 — February 19, 1997

John W. McConnell will always be remembered at Cornell as a Professor of Industrial and Labor Relations from 1946, just a year after the establishment of the School. He was a former Dean of the Graduate School (1955-59) and was Dean of the School of Industrial and Labor Relations (1959-63). He was highly regarded in both roles.

The first member of his family to receive a higher education, he received a Bachelor's degree from Dickinson College in 1929 and a Ph.D. degree in Sociology from Yale University in 1937. Years later, he received honorary degrees from his alma mater and from the University of Rhode Island.

In 1943, he published *The Basic Teachings of the Great Economists*, New York: Garden City Publications (reissued in 1947 and 1956). In the School of Industrial and Labor Relations, he was a member of the Department of Labor Economics and Income Security, a perfect combination for his broad ranging interests in the sociology and economics for America's social classes and their needs and interests.

From 1946 until his death, he lived in Trumansburg. There he and his wife, Harriet Barlow McConnell, raised their four daughters and one son in their formative years. Active as he was with his university duties, John always found time to spend with the children at home or away on camping trips.

When the Whytes came to Cornell in 1948 and the McConnells were away for a camping trip, they offered their home for a few days until the mover's truck arrived with their belongings. That was typical of the McConnell's generosity with friends and neighbors.

The McConnells were actively involved in the life of the village, especially in the Methodist Church. John was also a member of Rotary International in Trumansburg. John served on the Trumansburg Board of Education from 1958-61. He was also a member of the Board of Directors of the Tompkins Community Hospital from 1980-94.

In addition to his university duties, John was highly regarded as an arbitrator and much sought after by both parties in disputes for his probing questions and fair minded decisions.

In addition to his book on the great economists, he published a study on *The Evolution of Social Classes* (1942) Washington, D.C., American Council on Public Affairs.

In his many years at Cornell, John focused his research interests on the social and economic needs of our older citizens. He was an outstanding contributor to the academic literature on gerontology at an early stage when scholars were just beginning to give attention to this field. As co-author with John J. Corson, he published *Economic Needs of Older People* (1956) New York, Twentieth Century Fund.

John McConnell left Cornell in 1963 to become President of the University of New Hampshire, where he served until 1971. During his tenure, the state university added a School of Business and Economics and a School of Health Studies, and constructed a modern complex to house the New England Center for Continuing Education. The university carried on a 40-million-dollar expansion of its facilities to accommodate an 80 percent increase in student enrollment. McConnell Hall, which houses offices and classrooms of the School of Business, serves as a permanent tribute to his endeavors.

The McConnells returned to retire in their Trumansburg home. John continued to be active in scholarly work and in arbitration cases until his health began to fail.

Duncan M. MacIntyre, Lawrence K. Williams, William Foote Whyte

Richard R. G. McCormack

June 10, 1915 — December 28, 1968

Richard R. G. McCormack, associate attending physician to The New York Hospital and clinical associate professor of medicine at Cornell University Medical College died on December 28, 1968, at the age of fifty-three years at Stowe, Vermont. Following his graduation from the College of Arts and Science, Columbia University, Dr. McCormack attended Cornell University Medical College receiving his degree in 1941. His internship at The New York Hospital began a life-long affiliation with the Center. It was interrupted by military service with the Army Medical Corps from July 1943 to April 1946, and duty in both Atlantic and Pacific theaters. Upon discharge he completed his residency in the Second (Cornell) Medical Division at Bellevue Hospital where he continued on the attending staff during Cornell's tenure there. He spent two years (1947-49) as a fellow in physiology and this was followed by private practice. For a ten year period ending in 1961 he served as assistant director of The New York Hospital Heart Station. His contacts with patients, house staff, students, and colleagues were marked uniformly by the warmth of his personality, a fine sense of humor, and his devoted excellence as a physician.

He strove tirelessly to provide a meaningful and proper experience for these students under his purview.

In 1962 Dr. McCormack left private practice to become medical director of the C. V. Starr Company, Incorporated. He continued, however to serve and to teach in the Ambulatory Care Clinics of The New York Hospital and to visit on the Bellevue Hospital wards.

Dr. McCormack was a diplomate of the American Board of Internal Medicine and a member of several learned and professional societies. He was born in Kingston, Jamaica, British West Indies. He is survived by his mother, his widow, the former Mary Rainey, by a son, Richard, and a daughter, Constance.

J. James Smith

William John McCoy, Jr.

July 30, 1924 — May 22, 2007

William John McCoy, Jr., better known as John McCoy, was born in Valeda, Kansas to William John McCoy, Sr. and Gretchen Kennedy McCoy. He grew up in Coffeyville, Kansas, which, as he sometimes reminded us, was most famous as the scene of a raid by the James brothers.

John graduated from Field Kinley Memorial High School in 1942 with top academic honors, having been elected Student Congress President. He went on to attend the University of Kansas, but in 1943 was called into the U.S. Army. After basic training, he qualified for the Army Specialized Training Program (ASTP) at the University of Chicago, where he entered the accelerated Chinese Program, and then joined the Office of Strategic Services (OSS) that was later to morph into the CIA. He earned his Parachutist's badge and served actively as an OSS member in China working with the Nationalist troops, training them in the opposition to the Japanese invasion. In February 1946, he was honorably discharged as a Sergeant, with a bronze star, along with a good conduct medal, the victory medal, and several theater ribbons.

John resumed his academic life at the University of Chicago, where he graduated Phi Beta Kappa in 1948 with a Master of Arts degree in Oriental Languages and Literature. He had intended to earn a Ph.D. degree at Harvard, but he had retained a connection with the military, serving as a Sergeant in the Marine Reserves. Thus, his Harvard experience was cut short by his being recalled to active duty during the Korean War, serving for a time in Washington. Then he had government assignments as a civilian with the Army in Tokyo and transferred to the Treasury Department for five years in the U.S Consulate-General in Hong Kong.

After that service, John entered the Cornell graduate program in linguistics, and was awarded the Ph.D. degree in 1966, with a Chinese historical linguistics dissertation entitled "Szeyap data for a first approximation of Proto-Cantonese." He was hired as a Professor by the then Department of Modern Languages and Linguistics, of which he remained a member for 18 years, from 1966-84, conducting teaching and research primarily in Chinese, but also including other languages such as Japanese and Mongolian.

John was one of the founding members of the full-year intensive FALCON Asian language program, which still continues. He served as its first director and directed the intensive Chinese language program from 1972-84. He also played a central role in the organization and activities of Chinoperl (Conference on CHINEse Oral and

PERforming Literature). He was also active for many years in the National Association for Self Instructional Language Programs, participating in workshops and conferences and testing Chinese in numerous institutions around the country. As a member of the Cornell faculty, he traveled extensively in the People's Republic of China with academic, professional and government delegations.

In 1984, John retired from Cornell and entered the business world, to serve for five years as President and General Manager of the Squibb (now Bristol-Myers Squibb) joint venture in China. Retiring from there, he served as Chief Representative for Sterling-Winthrop Drugs International, guiding their negotiations and tracking the progress of their joint venture in Shanghai. Then he served in the same capacity with Hafslund-Nycomed, a Norwegian pharmaceutical firm preparing for a start-up in Shanghai. He was co-president of the newly re-established American Chamber of Commerce in Shanghai, and also was consultant for several American companies seeking to initiate joint ventures in China, finally retiring in 1994.

John was a man of earthy good sense, a supportive and collaborative colleague, and a good friend to many. In dealing with any problem or initiating and implementing any project, he always had the general good rather than personal advancement in mind and had a balanced perspective on any issue. He was quiet-spoken but articulate, possessed a wonderful sense of humor and irony, and liked to say absurd things with a straight face. This was one facet of his ability to moderate conflicts and confrontations in a calm and measured way, often with highly pertinent humor.

John was a genial host, and in particular hosted many memorable dinners that were distinguished by the culinary offerings of his wife Stella, a chef of professional quality in several cuisines and the author of several cookbooks on Chinese cooking in which she acknowledged his help and support. He was also a man of many interests, and capabilities, extending to his taking up new ones such as the flamenco guitar. He earned a pilot's license first in gliders and then in powered aircraft.

To those of us that knew him and worked with him, he was a valued and cherished friend and colleague, and his contribution to Cornell lives on particularly in the continued success and appeal of the Chinese language program that he initiated and nourished.

His wife of 40 years, Stella Fessler McCoy; daughters, Molly and Katy McCoy; stepson, Freeman Fessler; and sister, Sue Eichorn, as well as nine grandchildren and a number of nieces, nephews and cousins survive John.

James W. Gair, Chair; Richard Leed, John Wolff

John Clarence McCurdy

April 23, 1878 — December 10, 1973

John Clarence McCurdy, professor of agricultural engineering, emeritus, died December 10, 1973, at Oak Hill Manor, Ithaca, at the age of 95. He was born in Mercer County, Pennsylvania, on April 23, 1878.

Clarence McCurdy graduated from Fredonia (Pennsylvania) Preparatory School and then taught school for three years. He then attended Grove City College and graduated with the B.S. degree in 1905. Following this, he served as principal of Vandergrift Heights schools for one year. The next year and for several succeeding summers he was in city engineering work in Grove City, Pennsylvania. In the fall of 1907 he entered the School of Civil Engineering, Cornell University. He was a student instructor in the school and taught in summer surveying camps. He graduated with the Civil Engineering degree in 1912 and did graduate work the following year in sanitary engineering. He was an instructor in civil engineering until 1915.

In September 1915, J. C. McCurdy became an instructor in Rural Engineering (later Agricultural Engineering) in the College of Agriculture at Cornell University. He was promoted to assistant professor in 1916 and to professor in 1923.

During World War I he was employed for three summers by the J. G. White Management Co. for railway evaluation work, and for two summers he was in charge of their engineering work.

Professor McCurdy did some of the early work in agricultural waste management, having done research on the disposal of creamery wastes for the New York State Milk Conference Board.

He was a charter member of the Soil Conservation Society of America and was an engineering adviser to the Soil Conservation Service from 1936 until his retirement in June 1946.

He held a New York State Professional Engineer's and Surveyor's license in the early days of licensing, when few held such licenses. He did considerable private practice, which he continued after his retirement. One job was engineer in charge of foundations for the Plant Science building on the campus.

He has written on sewage disposal and had a College bulletin on the use, construction, and building of septic tanks. He wrote on farm road construction and had a bulletin on the use and making of concrete on the farm.

Professor McCurdy was a good teacher, having taught for thirty-one years. He taught farm engineering, drainage and irrigation, and the use of concrete. His courses were taught with the best engineering ideals and the highest of standards. He instilled in his students the desire to do the job thoroughly and accurately. He was a disciplinarian, but he had a sincere interest in the students and they had a high regard for him. Students often sought him out and asked about him after graduation.

“Mac,” as he was known by his friends and colleagues, was a family man who enjoyed having his children and grandchildren around him. He and his wife, Adda Botts McCurdy, who survives him, celebrated their sixtieth wedding anniversary in 1969. He is also survived by three daughters, Mrs. Helen Grommon, Mrs. Ruth (M.R.) Shaw, and Mrs. Mary Jaffurs; a son, Colonel Leon McCurdy; a sister, Mrs. Lucille Gibson; fourteen grandchildren and fourteen great-grandchildren.

He lived in Forest Home, next to the campus, from early in his college life until his death, having spent only a short time in the Oak Hill Manor Nursing home.

A. W. Gibson, E. S. Shepardson

Boyce Dawkins McDaniel

June 11, 1917 — May 8, 2002

Boyce Dawkins McDaniel, a widely recognized and universally respected leader of the international particle physics community, died at his home at Kendal in Ithaca, New York. Mac (the only name by which he was known to his wide circle of friends, family, colleagues, and admirers) was born in Brevard, North Carolina, the youngest of the three children of Allen and Grace McDaniel. His family was poor, and at an early age, Mac learned lessons of responsibility, dedication, and dealing with adverse and changing circumstances that would serve him well, both personally and as a leader, for the rest of his life.

Mac completed high school in Chesterville, Ohio in 1933 and entered Ohio Wesleyan University, where he financed his education with a series of part-time jobs. He graduated in 1938 with the goal of becoming a diesel engineer. He went on to what is now Case Western Reserve University, but was disappointed to find diesel engineering beyond his reach given his undergraduate liberal arts degree. He settled on physics, and received his M.A. degree in 1940. Mac was excited by the rapidly unfolding field of nuclear physics, and immediately entered a doctoral program in physics at Cornell.

As a graduate student of Robert Bacher at Cornell from 1940-43, he built one of the world's first neutron time-of-flight energy spectrometers, and used it to make precision measurements of the energy levels of indium for his thesis. He initially supported himself by exchanging custodial services for lodging in the attic of Rockefeller Hall. In what little spare time he had, he met and courted Jane Chapman Grennell, a fellow Cornell graduate student in history. They were married in 1941, and were loving partners for the rest of his days.

After receiving his Cornell Ph.D. degree, Mac accepted a prestigious post-doctoral appointment at M.I.T., and he and Jane moved to Cambridge, Massachusetts. Their stay in Cambridge lasted only a few months. Mac received a phone call asking him to leave M.I.T. to join a secret government project at an undisclosed location. Without any knowledge of the project's nature and location, Mac and Jane abruptly pulled up stakes and joined the Manhattan project in Los Alamos, he as a Research Physicist and she as a Laboratory Technician.

The neutron spectrometer he had used for his Ph.D. thesis at Cornell was needed in the Manhattan project. He supervised its removal to Los Alamos, and led a research team there that made accurate measurements of the epithermal resonances in the fission of uranium and plutonium. These measurements were important in the design of the first atomic bombs.

After the war, he returned to Cornell University, where he carried out important work in gamma ray spectroscopy. Together with Robert Walker, he invented the pair spectrometer, which for many years was the most important tool for measuring gamma ray energies. He was instrumental in establishing the Cornell Laboratory of Nuclear Studies, and had a leading role in designing and building the 300 MeV electron synchrotron, one of the first such accelerators in the world. Over the next twenty years, he and his colleagues, led by R.R. Wilson, built three more electron synchrotrons of successively higher energies, each of which enabled physicists to study phenomena in a new energy range. Each of these accelerators was a masterpiece of technology, built rapidly and economically by a small team of physicists. Mac played a leading role in the construction of all of these accelerators, and brilliantly completed the construction of the last of these accelerators, the 10 GeV synchrotron. He became Director of the Laboratory of Nuclear Studies in 1967, and remained in that position until he retired from the faculty in 1985. He pioneered the technique of tagged gamma rays, and performed important measurements with each of these accelerators, including a long series of work in K-meson and Lambda-meson photoproduction and measurements of the neutron electromagnetic form factors.

In 1972, he took a one-year leave from Cornell to become acting head of the accelerator section at Fermilab. This was a very difficult time for Fermilab and the entire particle physics community. Though the accelerator had operated at a near design energy, component failure was frequent and operation intermittent. Mac threw himself into the fray with his usual enthusiasm. Thanks to his leadership, by the end of the year, the accelerator was working as it should. According to R.R. Wilson, the Director of Fermilab at the time, "This bravura performance demonstrated Mac's skill for leadership as well as his celebrated sixth sense for finding sources of trouble and fixing them."

In 1974, it had become clear to all that the Laboratory of Nuclear Studies course of electron synchrotrons of ever increasing energy had reached its end. But the proper future course for the Laboratory was far from clear. With a bold stroke, Mac proposed upgrading the existing 10 GeV synchrotron into an 8 GeV electron-positron storage ring. This radical but risky proposal, if it worked, would reduce the cost and construction time by a large factor; just enough to make its funding possible. Mac convinced the National Science Foundation to support the project, and threw himself heart and soul into the job of making it work. That it worked at all was miraculous, but not even Mac dared hope for the rich treasure trove of science that it would uncover. For more than 25 years, this storage ring has been the world's leading source of information about the b quark, one of the fundamental building blocks of matter. As a result, Cornell has been one of this generation's leading centers of research in the field of particle physics.

Mac served in numerous leadership roles in the national physics community. He was a trustee of the Associated Universities; a member of the governing board of Brookhaven National Laboratory; a member of the Department of Energy High Energy Advisory Panel; a trustee of the Universities Research Association; a governing board member of Fermilab; and chair of the Superconducting Supercollider Board of Overseers. He had a Fulbright grant to the Australian National University as well as Fulbright and Guggenheim grants to the University of Rome and to the Synchrotron Laboratory in Frascati, Italy. He was a member of the National Academy of Sciences, and held the Floyd R. Newman Chair of Nuclear Studies at Cornell.

Karl Berkelman, Albert Silverman, Peter Stein

George Robert McDermott

Professor of Naval Architecture

1860 — May 26, 1937

Professor Emeritus George Robert McDermott, who for many years taught Naval Architecture in the College of Engineering, Cornell University, passed away on May 26, 1937.

Professor McDermott was born in Glasgow, Scotland, in 1860. He received his engineering education in the Andersonian Institute of Glasgow, then entered the employ of the famous Clydebank Shipbuilding and Engineering Company, where the Queen Mary and many other famous ships have been constructed, rising to the position of Naval Architect and Assistant to the Shipyard Manager. In 1890 he joined the Southampton Naval Works as Naval Architect and Assistant to the General Manager. He came to Cornell in 1891 as Assistant Professor of Naval Architecture, and was promoted to full professorship in 1904. From that date until his retirement in 1929 he was in charge of the work in Naval Architecture in the College of Engineering at Cornell.

Professor McDermott was much in demand as a consulting engineer, the Cunard and other steamship lines calling upon him frequently for advice. During the years 1910-12, while on leave of absence from the University, he was appointed by the Brazilian Government as Engineer-in-chief in the organization and construction of the Naval Repair Station of Lloyd Brasileiro at Ilka de Mucangue, Rio de Janeiro. Again on leave from the University in 1917, he was appointed by General George W. Goethals as District Officer of the U. S. Shipping Board Emergency Fleet Corporation and afterwards was appointed by Chairman E. N. Hurley as District Officer of the Corporation, which position he filled until the end of the World War.

He was always very active in the broader aspects of naval work and was recognized as an authority in such matters. In 1921 he was appointed by the United States Government as Chairman of the Government Commission on Loadlines of Mercantile Vessels for the Atlantic and Gulf Division, and he was a member of many committees interested in Marine problems. He was a member of the Society of Naval Architects and Marine Engineers, of Sigma Xi and Tau Beta Pi, and he was the author of many papers and several books in his field, notably, the "Screw Propeller Computer" and "Textbook on Screw Propellers."

Professor McDermott was a most excellent teacher. His own scientific background was thorough and he had no patience with weak or slipshod methods of instruction. He was a thorough believer in instilling what he always described as the "fundamentals" into the minds of his students. Yet his vigorous lectures and his rigid

classroom instruction were tempered with rare humor and a winning smile. Those who elected his work were always enthusiastic over it and the success of his students bears witness to the soundness of his methods. He was a sociable man, widely informed, honest, upright, and lovable. He will be missed by a host of friends.'

Source: Fac. Rec, pps. 1607, 2008 Resolutions of the Trustees and Faculty of Cornell University, November, Nineteen Hundred And Thirty-Seven

Kenneth B. McEntee

March 30, 1921 — January 26, 2005

Professor Emeritus Ken McEntee grew up on a dairy farm in Oakfield, western New York. He received his DVM degree from the College of Veterinary Medicine at Cornell University in 1944 and spent a year in private veterinary practice in Newport, Vermont before joining the Army Veterinary Corps, serving first on Long Island and then in the Philippines. After two years of active duty, Dr. McEntee continued to serve in the Army Reserves, retiring as a Lieutenant Colonel.

In 1947, Dr. McEntee was invited to return to Cornell by Professor Peter Olafson to work on the pathogenesis of X-disease in cattle (hyperkeratosis) later shown to be caused by chlorinated naphthalenes. He credited Professor Olafson as being fundamental in his development as a pathologist. Dr. McEntee achieved international distinction as the founder of the subspecialty of veterinary reproductive pathology, being the first veterinary pathologist to devote his career to the study of diseases of the reproductive system. In doing so, he “brought order to a chaotic welter of breeding diseases known only by their clinical signs.” He earned a reputation for painstaking clinical examination coupled with detailed gross and microscopic examination, meticulous record keeping and unceasing deliberation. In collaboration with scientists of other disciplines, he undertook many experimental studies to elucidate the etiology of the naturally occurring diseases he observed. Starting with diseases of cattle because of their economic importance and his familiarity with them, Dr. McEntee’s comparative studies led him to comprehensive knowledge of the reproductive diseases of all the other domestic species. His work resulted in a collection of well-catalogued material from over 20,000 cases, which in 1979 he transformed into the International Registry of Reproductive Pathology, a resource that continues to be of great value to investigators. Dr. McEntee’s combination of diagnostic acumen and expertise in pathology made him an effective teacher of veterinary students, graduate students and practicing veterinarians. His understated style and quiet wit were hallmarks of his lectures. Students remember him as a consummate gentleman. “He had wisdom to share and he did so freely, but only when asked,” said one.

Dr. McEntee was the Chair of the Department of Large Animal Medicine, Obstetrics and Surgery and served as Associate Dean for Clinical Studies. At various times, he served as Visiting Professor in Australia, Sweden, Brazil and Taiwan. He won the Borden Award from the American Veterinary Medical Association for research on diseases of dairy cattle in 1971, and was awarded an honorary doctorate by the Royal Veterinary College in

Stockholm, Sweden in 1975. Active in many professional associations and committees, he served as President of the American College of Veterinary Pathologists in 1966-67.

Dr. McEntee retired from Cornell as Emeritus Professor in 1980. Following retirement, he spent seven years at the College of Veterinary Medicine at the University of Illinois, continuing his work on the International Registry of Reproductive Pathology. There he completed the major text and reference work, *Reproductive Pathology of Domestic Mammals* (Academic Press, 1990), which remains the definitive work of this discipline.

On August 6, 1952, Ken married Janet Fraser, the daughter of Professor Allan C. Fraser. They spent many summers at their cottage on the western shore of Cayuga Lake and enjoyed hosting friends on their houseboat. Ken was a Commander of the Coast Guard Power Squadron based in Ithaca. Ken was also an avid coin and stamp collector and he and Janet enjoyed foreign travel. Their son, Michael, earned the DVM degree at Cornell in 1980 and is currently Professor of Veterinary Pathology at the College of Veterinary Medicine, University of Tennessee. Their daughter, Margaret, received the DVM degree from Cornell in 1986, and is currently an Associate Professor of Oncology in the College of Veterinary Medicine at Cornell. Janet McEntee resides in Ithaca.

Howard E. Evans, Robert O. Gilbert, Bud C. Tennant, Donald H. Schlafer

Frances Ewing McFadden

March 21, 1922 — March 18, 1969

Frances Ewing McFadden was born in Delaware, Ohio, and grew up there as one of three children of Mr. and Mrs. A. K. Ewing, of whom a brother and sister survive. Mrs. McFadden died at Tompkins County Memorial Hospital at Ithaca, New York, following a prolonged illness.

Mrs. McFadden received her B.A. degree from Ohio Wesleyan University in 1944. She spent several summers studying at Ohio State University and Bluffton College while teaching vocational home economics at various high schools in Ohio, the last being at Port Clinton where she also served as chairman of her department.

In September 1960 Frances McFadden began graduate study at Cornell University, earning her Master's degree in textiles and clothing in 1961. She was immediately appointed assistant professor of textiles and clothing in the Cooperative Extension program at Cornell, assuming the position in September of that year. She was promoted to associate professor in 1966, continuing in that position until her death.

Honorary and professional associations to which Frances McFadden belonged included: Omnicron Nu, the American Home Economics Association, the New York Home Economics Association, Cornell Extension Club, Ohio Vocational Association, and the National Education Association.

Frances McFadden won state and national acclaim for a program "The Voice of Clothing" which she designed; for this program she received the Award of Merit from Lambda Chapter of Epsilon Sigma Phi in recognition of her achievement in advancing the work of Cooperative Extension. Another interesting program she developed was titled "Clothing and Women's Role from 1840 to the 1960s." During the time she was a member of the Cornell faculty she was also the author or coauthor of many other Extension publications; they covered a wide range of topics in textiles, performance of textile products, selection and construction of clothing, and the sociopsychological aspects of clothing. She will be remembered by many people throughout New York State for these and other highly stimulating programs she presented in order to assist consumers in solving their textiles and clothing problems. Mrs. McFadden was very much interested in the costume collection of the Department of Textiles and Clothing as an educational resource and shortly before her death gave a number of items of value to the College for the collection.

Frances McFadden was a warm, understanding, creative, and very attractive person, much liked by all who knew her. She was dedicated, conscientious, and thorough; even in the final months of her illness her work was ever uppermost in her mind—she continued to work at home as long as she was able after she became too ill to go to the office any longer. To those who witnessed her indomitable spirit during the long period of illness, she was a model of courage and devotion to her profession. She will long be fondly remembered by her many friends and acquaintances.

Jean Mclean, Elsie McMurry, Evelyn Stout

William N. “Mac” McFarland

September 11, 1925 — August 31, 2004

William N. “Mac” McFarland, an Emeritus Professor in the Department of Ecology and Evolutionary Biology (formerly the Section of Ecology and Systematics) and an internationally recognized expert in the visual physiology and sensory ecology of fishes, died on August 31, 2004, in Mt. Vernon, Washington. He was eleven days shy of his 79th birthday.

After graduating from the California Maritime Academy and serving in the Merchant Marine and Navy during WWII, Mac matriculated at UCLA where he earned his B.A., M.A., and Ph.D. degrees. His early professional work, including his graduate work done as a consulting biologist for Marineland of the Pacific, involved mostly osmotic regulation and the development of methods for safely transporting and anaesthetizing marine species. He continued with these themes while a Staff Physiologist at the Institute for Marine Science of the University of Texas at Port Aransas and, starting in 1961, as an Assistant Professor at Cornell in the Department of Zoology.

He developed an interest in the visual system while a student at UCLA, but it was not until 1965 that he and a “buddy” from grad school days, Fred Munz, published what was to become a long string of seminal papers on the visual pigments and visual ecology of fishes. By combining visual pigment and environmental light measurements they made predictions and speculations about the ecological significance of visual pigment spectral position that have stood the test of time. Together with his students, postdoctoral fellows and many collaborators, Mac continued to publish papers on this theme (as well as fish behavior and polarized light vision) until his death.

Mac was a consummate teacher and presenter. His lectures were always well prepared and delivered, but what really set him apart was the enthusiasm he injected into any discussion. Although he was involved in a number of courses and seminars, he will certainly be remembered for his contributions to two courses, Comparative Physiology and The Vertebrates. The latter ultimately led to a multi-authored book, with Mac as an original co-author that has gone through several editions.

How Mac found the time we don’t know, but he managed the usual committee and administrative work here as well as the kind of national and international responsibilities that come with excellence and respect in one’s chosen field. He became a Faculty in Residence on North Campus, and served as Chair of Ecology and Systematics twice, the last ending with his retirement in 1989. After retiring from Cornell, he moved to California where he became Director of the Wrigley Marine Science Center and an Adjunct Professor of Biology at USC. He served in this

capacity for five years after which he moved with his family to San Juan Island and continued his studies on fish vision as an Adjunct Professor at the Friday Harbor Labs of the University of Washington. There he remained active, and was working on several manuscripts when he died.

He will be remembered for his wisdom and humor. If he taught those of us who worked with him anything, it was that having fun doing science is as important as doing the science itself. Gifts in his name can be made to the Graduate Student Research Fund in the Department of Ecology and Evolutionary Biology.

John Heiser, Simon Levin, Ellis Loew

Robert B. McGinnis

October 19, 1927 — February 22, 2001

Robert B. McGinnis, of 3 Strawberry Lane, died peacefully on a day spent with loved ones in the wonderful setting of Hospicare. The son of Dorothy Abercrombie McGinnis, Bob attended high school in Oakland, California and served in the United States Marine Corps in the Pacific theater of World War II. Upon his discharge, he deposited his sidearm in a canal, and later chose golf clubs and intellect as his weapons of sport and societal impact.

He entered San Francisco State University after the War and graduated with a Bachelor of Arts degree with Honors in Sociology and Psychology in 1950. He was awarded a Master's Degree in Sociology from Stanford University in 1951 and a Ph.D. degree in Sociology from Northwestern University in 1955.

Professor McGinnis served as an Assistant Professor of Sociology at Florida State University from 1953-55 and at the University of Wisconsin from 1955-57. At that time, he pursued academic specialties in statistics, research methodology, and family. He also served as the Director of the Sociology Research Laboratory at Florida State, and completed fellowships in mathematical and statistical applications at Stanford and Berkeley.

Promoted to Associate Professor at Wisconsin in 1957, he was an Editor of the *American Sociological Review*, published a book, *Selected Studies in Marriage and the Family*, and published numerous papers on family issues. He became a full Professor of Sociology at Cornell University in 1961. He and his son drove from Madison, Wisconsin to Ithaca in an Alfa Romeo Spyder at a time when small sports cars flashed their headlights at one another in passing. Bob took great pleasure in racing the Alfa at Watkins Glen in the early 1960s.

Professor McGinnis made significant and lasting contributions in three areas of sociology. First, he was an early champion of the application of rigorous quantitative methods of sociology, working tirelessly to create a more useful, rigorous social science at Cornell and in the larger world. In 1961, the American Sociological Association approved a new Section on Methodology, as the result of efforts organized by him and colleague, Albert Reiss. His 1965 book, *Mathematical Foundations for Social Analysis*, broke new ground in providing mathematical language for modeling social behavior. His influence on the development of quantitative methodology is also reflected in his election to the founding editorial boards of *Sociological Methodology* in 1969 and *Sociological Methods and Research* in 1972.

He was a remarkable research innovator and entrepreneur. During the 1960s, he secured major grants for research training in social systems analysis, first from the Office of Civilian Defense and then (with Robin Williams) from

the National Institute of Mental Health. This program exemplified his strong interest in graduate research training with substantive sociological content. By 1969-70, McGinnis was principal investigator in no fewer than six major research and training programs.

Second, Professor McGinnis, long interested in social mobility, developed what became known as the Cornell Mobility Model, a sophisticated stochastic model for the study of social mobility. This model found application in his research on the careers of scientists, his third important contribution. Beginning in the 1960s, he conducted a series of studies on the utilization, training, and mobility of scientists and engineers. This led to the establishment of the Research Program on Social Analyses of Science Systems in 1973, with funding from the National Science Foundation, and the National Institutes of Health. The program resulted in numerous influential publications, many of which challenged orthodox positions in the sociology of science, and trained a generation of quantitatively sophisticated graduate students. Though Professor McGinnis' own beliefs were clear, his students were encouraged to strike out on their own. He was instrumental in the establishment of the Society for Social Studies of Science, and hosted its first international meeting, held at Cornell in 1976.

Besides his intellectual contributions, Professor McGinnis was an institution builder. In his most recent and perhaps greatest legacy to Cornell, he founded and led the Cornell Institute for Social and Economic Research, now a thriving institution serving all Cornell social scientists.

Upon retirement, he relished spending winter months at his home among the sunny people and beaches of Anguilla in the West Indies, and warmer months in travel with his wife, and at golf with his son, Kevin, and close friends.

Bob is survived by his wife, Mary, who retired as Coordinator of Cornell's CIVITAS Program. He is also survived by his sons, Kevin, of Hallowell, Maine and Brian, of Stockton, California; and a daughter, Meaghan, of Campbell, California. He is also survived by stepchildren, Steven, of Cranston, Rhode Island and Kristina, of Chelsea, Vermont; a granddaughter, Sarah; a grandson, Samuel; and several step-grandchildren.

His many friends and colleagues sorely miss his presence and treasure his memory.

Steven B. Caldwell, Robin M. Williams, Jr., Donald P. Hayes

John Francis McGrath

October 23, 1885 — October 15, 1949

John Francis McGrath was born in Holyoke, Massachusetts on October 23, 1885, the son of John Henry McGrath and Catherine T. McGrath. He attended the Lawrence Grammar School and Holyoke High School, graduating in 1904. Dr. McGrath entered Cornell University Medical College in 1904 and was graduated in 1908. He served his internship on the Fourth Surgical Division of Bellevue Hospital from 1908 to 1910. In 1911 he was appointed Surgeon at Cornell University Medical College Dispensary and Instructor in the Medical College. In 1918 he was appointed Instructor in the Department of Obstetrics and Gynecology. He was made Chief of Gynecology in Cornell University Medical College Diagnostic Clinic when it opened on November 1, 1921 and held those positions until the Clinic was closed prior to the opening of the present New York Hospital-Cornell University Medical College buildings in 1932. Dr. McGrath was then appointed Assistant Professor of Clinical Obstetrics and Gynecology in Cornell Medical College and Associate Attending Obstetrician and Gynecologist to the New York Hospital. These positions he held at his death. Thus for more than forty-five years, Dr. McGrath was intimately associated with the Cornell University Medical College (1904-1949).

While maintaining always an association with his beloved Alma Mater, Dr. McGrath concurrently held positions in other institutions. From 1911 to 1917 he was Assistant Gynecologist in Bellevue Hospital's Clinic and Assistant Gynecologist in New York Polyclinic and St. Vincent's Hospital Clinic. From 1917 to 1920 he was Adjunct Assistant Gynecologist at Bellevue Hospital and Chief of the Gynecology Clinic holding during these years the same position in St. Vincent's Hospital. From 1920 to 1922 he was Assistant Visiting Gynecologist to Bellevue Hospital as well as at St. Vincent's Hospital where he was chief of Gynecology Clinic. From 1924 to 1938 Dr. McGrath was Attending Gynecologist at St. Vincent's Hospital. In 1939 he became Director of the Department of Obstetrics and Gynecology at St. Vincent's Hospital and thereafter devoted his greatest efforts to the duties of that position. How faithfully and well he discharged those duties is attested by the admiration, respect and love of all those who knew him there. In 1929 Dr. McGrath was appointed Consulting Gynecologist to the New York Infirmity for Women and Children and served until 1938.

Dr. McGrath was a member of New York County and New York State Medical Societies and of the American Medical Association. He was also a member of the New York Medico-Surgical Society and of the Alumni Association of Bellevue, Lying-in and St. Vincent's Hospitals. He was a Fellow of the New York Academy of Medicine and a Fellow

of the American College of Surgeons. He was a Diplomat of the American Board of Obstetrics and Gynecology. He was a member of the Harvey Society, of Medical Strollers, New York Physicians Golf Club, the Medical Celtic Society and the Vera Cruz Council of the Knights of Columbus.

Dr. McGrath was married on October 28, 1914 to Lillian L. Nicholson. There were five children: Mrs. James F. Ryan, Dr. John Francis McGrath, Jr., Albert, Edward and Robert McGrath. Mrs. McGrath died on February 27, 1938. In 1943 Dr. McGrath married Mrs. Inez Thorpe Ford who survives him.

Dr. McGrath was a skillful conservative surgeon, an inspiring teacher, a kind and helpful friend to students and patients alike. He was endowed with a great sense of humor which seemed never to desert him.

Dr. McGrath did much to improve methods in treatment of gynecological patients. He was perhaps the first gynecologist in New York City to advocate and employ the electric cautery in the treatment of inflammatory disease of the uterine cervix. He established use of the cautery as the preferred and standard treatment of chronic cervicitis at Cornell Clinic in 1921. Subsequently it was adopted generally throughout the city and the United States. He originated a method of correcting cystocele from within the abdomen in cases of retroversion requiring suspension of the uterus. Illustrations and the technique for this operation were recorded in 1929. Other publications of Dr. McGrath were on varied subjects such as resuscitation of the newborn, changes in the ovaries associated with masculinization, malpositions of the uterus and the management of diseases of the uterine cervix.

When Dr. John Francis McGrath died on Saturday, October 15, 1949, Cornell University Medical College lost a distinguished Alumnus, The New York Hospital and the Lying-in Hospital an experienced and skillful surgeon, his associates a friend who will be long remembered.

R. G. Douglas

Malcolm Strong McIlroy

August 28, 1902 — March 4, 1956

Malcolm Strong McIlroy, Professor of Electrical Engineering, died March 4, 1956, at Tompkins County Memorial Hospital, Ithaca, N. Y. He is survived by his wife, Dorothy Wellington McIlroy, a son, Douglas, EP, '54 and a daughter, Nancy, an Arts student of the class of 1957.

Born in Rochester August 28, 1902, Professor McIlroy received his early education in Newark, N. J., and subsequently attended Cornell, where he was granted the E. E. degree in 1923. After industrial experience with the General Electric Company as a test engineer and with the Brooklyn-Manhattan Transit Corporation as equipment inspector in 1926, he joined the staff of the Central Hudson Gas and Electric Company of Poughkeepsie, where he progressed through positions of distribution engineer, district engineer, and district superintendent.

Unsatisfied with his industrial achievements, although secure and successful, McIlroy felt that his real interest was in the field of Engineering Education. Early explorations into the possibilities of this field were discouraging since it seemed that the change could be made only with prohibitive reductions in income. It was probably a course in writing offered by the Central Hudson Company to employees which unexpectedly gave McIlroy the opportunity for which he had been looking. As encouragement to other employees, he had registered for the course and chose as his project a letter to a hypothetical college president outlining the problems and needs of industry and the manner in which he felt that educators might meet these challenges. After weeks of work, in which the letter was torn to pieces and rewritten many times, it seemed just too good to be filed away as a class exercise, and so he decided to send it to President Compton of Massachusetts Institute of Technology in Cambridge. The results were almost explosive. President Compton called McIlroy and asked for an interview. A few months later in 1937 McIlroy joined the staff of M. I. T. where he served as an instructor and assistant professor and registered for the doctorate. During World War II, he served as assistant director of the M. I. T. Radar School. He was awarded a Doctor of Science degree by M. I. T. in 1947 and returned to Cornell as Associate Professor of Electrical Engineering.

Upon his return to Cornell Professor McIlroy continued the development of a nonlinear resistor that had been the subject of his doctoral thesis at M.I.T. This research resulted in an analog computer that has been a significant contribution to the solution of fluid pipeline network problems and that has brought honor to its inventor and to Cornell. Professor McIlroy was awarded the John M. Goodell prize of the American Water Works Association in 1949 for his achievement and he saw nine McIlroy Pipeline Network Analyzers, the first being at Cornell, installed

before his death. His many published papers on the subject of fluid network analysis by means of the computer he developed resulted in inquiries from many parts of the world and necessitated his appearance at many professional society meetings.

In addition to commitments resulting from the development of the Fluid Pipeline Network Analyzer, Professor McIlroy found time to be a teacher, an administrator, and a leader in professional societies.

His ability as a teacher became apparent soon after his arrival at Cornell, and he was promoted to Professor in 1948. A vigorous classroom lecturer who took great interest in the progress of his students, he did not limit himself to the technical sphere but applied his abilities in the realms of technical writing and engineering economics to courses on these subjects. These courses were as popular as those of a technical nature because of Professor McIlroy's teaching.

His ability as an administrator led to his appointment to the chair of important committees and eventually to his being appointed the Assistant Director of the School of Electrical Engineering and in 1952 to his nomination to be an Assistant Dean of the College of Engineering. Before he could begin full-time duties as the Assistant Dean he suffered a heart attack that necessitated his resignation.

In professional societies he was a member of several committees of the A. I. E. E. and was in complete charge of the technical program for a district meeting scheduled for Binghamton, N. Y., shortly after he was stricken. The excellence of the program that he had arranged was representative of his efforts in anything that he undertook. In addition to the A. I. E. E. he was a member of the A. S. E. E., the American Water Works Association, and the American Gas Association, and the professional honoraries, Tau Beta Pi, Eta Kappa Nu, and Sigma Xi.

Avocationally Dr. McIlroy was interested in Nature and especially in birds. Even in this field he applied his engineering training. While actively engaged in power distribution he observed that birds seldom if ever alighted on lines energized to potentials of 33,000 volts or more and surmised that the electrostatic effect on the bird's feathers was the probable cause of this behavior. Biologists have shown considerable interest in this observation as possibly pointing the way to a method for preventing bird damage to crops.

After he was stricken in 1952, Professor McIlroy took a leave of absence for a year before returning to duty on a part-time basis with his activities greatly curtailed. He taught his specialty courses and worked on his analyzer until his death.

It now appears that Professor McIlroy's name will remain alive in the technical field because of his development of the Fluid Network Analyzer, but his other technical papers and ideas may have more impact in the future. He will be revered by his colleagues as an inspiring teacher, an able administrator, a true professional engineer, and a faithful friend.

A. B. Credle, W. H. Erickson, Paul Kellogg

Paul L. McKeegan

March 20, 1912 — January 2, 1983

Paul McKeegan never went to college. But in all respects he was an educated man—articulate, urbane, and gracious.

For forty-seven years he was on the staff of Cornell. In 1930 he started as an assistant treasurer, then moved successively to the cashier's office and the accounting office, and then in 1956 was brought directly into association with the president of the University as director of the budget, in which position he served three Cornell presidents.

In this latter capacity he conferred with all of the University administrators and faculty members with cognizance over the annual budget allocations, working with them on their needs, their ambitions for future resources, and the immediacy of their specific annual requirements.

He was a good listener, he had an infectious chuckle, and he was imaginative in finding alternative means to attain desired objectives. He worked closely with the succession of University presidents, reporting his negotiations and asking for guidance. Thus he soon became a major source of advice on the whole range of financial problems facing the University.

His congeniality and warm hospitality made his home a center of convivial entertainment for trustees, administrators, faculty, staff, and alumni. And many are the happy memories of those who gathered with him in his home about the piano with his exuberant wife, Dot, singing all the songs of the early decades of the century, his tenor voice urging all the guests and his family to join in, tuned by good food, good fellowship, and his particular mix of "martunis."

He was also a devoted golfer, his "fearless foursome," composed normally of Norm Moore, C. E. Treman, and Paul O'Leary, playing Sunday mornings through many a year.

He found time, too, to participate in community affairs and held membership in a wide variety of organizations.

So, in this memorial we hail a great builder of Cornell, a tireless worker—and a great and loyal friend.

Dale R. Corson, Norman S. Moore, Deane W. Malott

Jean T. McKelvey

February 9, 1908 — January 5, 1998

Jean McKelvey was a superb teacher, arbitrator of labor disputes, mentor to many, and one of the ILR School's founding faculty in 1945. As "Founding Mother," Jean and now Professor Emeritus Maurice Neufeld, established the fields of study, created a curriculum, interviewed the first student applicants, and taught five courses each. Professor Neufeld remembers Jean as "the best teacher we ever had."

Jean's first love was teaching. She brought to her classroom discussion and scholarly investigations the zest for excellence that had marked her academic and athletic accomplishments at Wellesley College and as a graduate student at Radcliffe College. There she earned her Ph.D. degree with her study, "AFL Attitudes Toward Production." Before coming to Cornell, she served as a superb teacher at Sarah Lawrence College. At Cornell, ILR students cherished the privilege of enrolling in her renowned course in Arbitration. When she and Bertram Willcox, the keen-minded and gently spoken Professor of Law, joined forces, they squared the circle. Students in the Law School and ILR deemed admission to the Red and Blue Pencil Course—red for McKelvey's comments, blue for Willcox's—the entrance to the Supreme Stoa itself.

As one of Professor McKelvey's former students recalled:

"She was revered by her students. She drove her students relentlessly, but always with compassion [and] had an infectious enthusiasm about her work that inspired her students. She 'embraced' you when she evaluated your work, so you felt challenged, not put-down, when she offered criticism."

The hallmark of Jean McKelvey's distinguished career in industrial and labor relations was the linkage she forged between classroom teaching and the practitioner world. Her career reflected this dual commitment. During World War II Jean entered the field of labor dispute settlement as a hearing officer with the War Labor Board while teaching economics at Sarah Lawrence College. As Professor at Cornell's ILR School, she shared her experiences and insights from labor relations practice with her students, invited leading practitioners to campus and arranged field trips where students had an opportunity to observe collective bargaining and arbitration in action.

A pioneer for women, in 1947, Jean McKelvey was the first woman to be admitted to the prestigious National Academy of Arbitrators and in 1970 became its first woman president. She was among the most sought after and admired leaders in dispute resolution. New York's Governors appointed her to the State Board of Mediation (1955-66); United States Presidents sought her out to serve on Emergency Boards to settle disputes in the railroad

industry and appointed her a founding member of the Federal Service Impasses Panel (1970-90) to resolve employment conflicts for federal workers. She arbitrated hundreds of disputes in industries ranging from public sector to airlines and manufacturing. In addition, both the American Federation of Teachers and the United Auto Workers appointed her to their Public Review Boards to resolve internal union disputes.

Her outstanding achievements in labor arbitration were even more remarkable because it was, and to a great extent still is, dominated by men. Jean loved telling the story of her first arbitration when she “walked into the room and there was nothing but men there; one looked up and said, ‘Oh, you’re the secretary’ and I said, ‘No, I’m the arbitrator.’” When Jean’s term as President of the National Academy of Arbitrators ended, she was presented with a gavel inscribed, “To Jean T. McKelvey, President, 1970, With the Affection and Esteem of His Colleagues.” As another former student recalled, “Jean, who liked to suggest that she was sometimes mistaken as the male offspring of French-Scottish parents when selected from a list of arbitrators by parties who did not know her, chose not to have the inscription changed.”

Much of Professor McKelvey’s finest work was dedicated to opening the arbitration profession to women and minorities. She developed and directed special arbitration training programs intended to integrate the profession. These programs, in fact, trained a new and more inclusive generation of arbitrators. Many of Jean’s former students went on to fill influential positions as union leaders, arbitrators and jurists. She also helped found, chair and financially support the Saul Wallen Fund for Minority students which provides scholarships for practitioners, particularly women and minorities, to enroll in college credit and certificate courses. In her own strong and persistent way, Jean worked against injustice.

Professor McKelvey also produced important scholarly works including books and monographs such as *The Duty of Fair Representation* (1977) and *Cleared for Takeoff: Airline Labor Relations Since Deregulation* (1988). Her articles appeared in the *Journal of Negro History*, the *Journal of Political Economy*, the *Arbitration Journal*, the *Cornell Law Quarterly*, *ILR Research*, and the *Industrial and Labor Relations Review*.

During her career, Jean was the recipient of many honors including distinguished service awards from the Federal Mediation and Conciliation Service (1973), the Society of Professionals in Dispute Resolution (1989), and the Society of Federal Labor Relations Professionals (1990). Her alma mater, Wellesley College, bestowed the Distinguished Alumnae Award for Public Service in 1975 and the American Arbitration Association gave her its Arbitrator of the Year Award in 1983. In her hometown, East Orange, New Jersey, the United Automobile Workers Union (UAW) honored Jean by naming a housing project after her. In 1998, after her death, she received the UAW convention’s

prestigious award for contributions to Social Justice (an award given to such international figures as Martin Luther King and Nelson Mandela.)

At age 65, when Professor McKelvey took her official retirement from Cornell resident teaching, she began a new career in ILR extension where she conducted conferences on key labor relations issues and directed a statewide program of off-campus graduate credit programs in industrial relations. When Jean's dear friend Alice Grant died in 1988, Jean helped endow the Jean McKelvey-Alice Grant Professorship of Labor-Management Relations – the ILR School's first fully endowed chair.

One final note. Professor McKelvey's kindness and generosity extended to colleagues as well. When Professor Gross was a new, untenured assistant professor, for example, Jean invited him to teach a section of her beloved arbitration course and shared her reading lists, outlines and notes with him, all the while encouraging him to present the course in his own way. This most distinguished professor and nationally respected arbitrator was concerned about the welfare and progress of a young, untenured colleague. Her humanity and compassion were at the core of who she was and what she did.

Professor McKelvey was teacher, professional, scholar, friend, colleague, mentor to so many, and inspiration to all. As one of her colleagues said, Jean “will always bring happy recollections whenever I hear or read her name.”

Professor McKelvey is survived by her husband of 63 years, Blake McKelvey, Rochester's city historian.

Lois Gray, Maurice Neufeld, James Gross

John Milton McLean

October 24, 1909 — May 3, 1968

Dr. John Milton McLean was born in New York City on October 24, 1909, the son of Ella Louise Powel McLean and William McLean, Professor of Ophthalmology at New York Medical College. He died from a malignant liposarcoma on May 3, 1968, at the age of fifty-eight.

He prepared for college at the Collegiate School, graduating in 1926. He then entered Stevens Institute of Technology from which he received an M.E. degree in 1930. Four years later he graduated from Cornell University Medical College where his high academic attainment was recognized by election to the honorary medical fraternity, Alpha Omega Alpha.

In 1934 he became an intern at the Johns Hopkins Hospital and was advanced in sequence in ophthalmology in the Wilmer Institute to assistant resident, fellow, and resident, completing his graduate training in 1939.

He was appointed to the staff of the Johns Hopkins Hospital with the title of associate in ophthalmology in 1939 and held this post until 1941 when he resigned to become Associate Professor of Surgery (Ophthalmology) at the Cornell University Medical College and Associate Attending Physician (Ophthalmology) at The New York Hospital. One year later he was appointed chief of the section and Attending Surgeon in the hospital and in 1943 he became Clinical Professor of Surgery (Ophthalmology). He was designated Professor of Surgery (Ophthalmology) in 1967. These positions he held until his death, fulfilling them with meritorious distinction.

Dr. McLean, as Professor of Surgery (Ophthalmology) and Surgeon in charge of Ophthalmology at The New York Hospital, was a most effectual contributor not only to this medical center, but also, in a very real sense, to the world at large. Dr. McLean, the physician, was attentive to all patients, thorough and accurate in their evaluation and management, precise in his surgery and, with it all, direct, candid, and kindly. As a clinical ophthalmologist he was avid, eager, and meticulous—the basis for a diagnostic acumen exceeded only by his surgical precision relative to the problems of vision. John McLean was a teacher of undergraduates and graduates of medical school. For the former, within the restrictions of an always-crowded curriculum, his clear and concise presentations of the essence of ophthalmological problems engendered an interest that opened a path to lifelong pursuit. This was enhanced by an oft-repeated philosophical concept that today's accomplishments are but a prelude to tomorrow. A problem so presented became a challenge, something for which youth are always looking.

His monumental accomplishment was in the training of graduate students preparing to specialize in ophthalmology. Significant and appreciated by our own medical center as this training was, perhaps of even greater import was the recognition of the national and international needs for which the training provided assistance. No precursor of this inspiring teacher approached the goals he set and established during the twenty-six years he directed the division of ophthalmology. His integrity and perception of knowledge in his field created an aura unequalled by his peerage of teachers in ophthalmology. Perhaps his unrivaled reputation was due to the unique conciseness with which the clinical problems were presented by him combined with his dedication and deep conviction that solutions were to be developed through research based upon sound, scientific principles.

He trained forty-eight residents at The New York Hospital-Cornell University Medical Center, and three of these have become heads of ophthalmological surgery. Others of his students are destined to comparable posts. In addition, there were many visitors from foreign clinics who were deeply appreciative of the opportunities that he made available to them. Indeed, these visitors became a nucleus for the extension of his concepts and teaching in other institutions around the world.

No other worker in ophthalmology has ever been more productive than Dr. McLean. His research interests included clinical glaucoma, retinal detachments, cryosurgery, complications of ophthalmological surgery, surgical technique, the use of ACTH in pathological conditions of the eye and neuroophthalmological determinations—all of these are but a partial list of his research intents. These and other contributions are left to us by him in publications in some 110 scientific papers, two text books of which he was author, and five others in which he provided sections of particular interest to him.

His colleagues have been articulate in expressing their admiration for his many developments in clinical work. These include the McLean corneoscleral suture in cataract surgery, innovations to reinforce the strength of the superior and inferior oblique muscles, the standardization of the tonometer, the establishment of the first corneal eye bank, and the therapeutic and diagnostic use of ACTH. Indeed, so broad a range of new additions in clinical practice attracted all scholars in ophthalmology, and all gained thereby.

Dr. McLean was a world traveler—his interest in ophthalmology took him to almost every country around the globe. As a recognized authority in his field he was constantly besieged with invitations to attend many meetings beyond the Americas. These he was most generous in accepting, often going to those areas where advancement had been limited. He had great interest in the ophthalmological problems of the South American countries and great affection for their people. He was a member of the Pan-American Association of Ophthalmology and

served as its president from 1964 to 1968. He was an actively contributing member of the International Council of Ophthalmology and the International Congress of Ophthalmology. He was president of the Oxford Congress (England) and the National Society for the Prevention of Blindness. The honorary memberships which were bestowed upon him from foreign countries are indicative of his international standing. They include, among others, the Ophthalmological Societies of Chile, Mexico, Brazil, Peru, Australia, New Zealand, France and Spain.

One of the most illustrious members of the professional staff of The New York Hospital-Cornell Medical Center, Dr. John McLean, has died, and those who remain are well aware of our great loss. However, he leaves much to us and those who follow. It could well be said of the many facets that were reflected from the activities of John McLean, the physician, surgeon, that they blended together with a common quality of the highest titre. Perhaps among the precious stones, there is a parallel in the cut diamond; when its surface is viewed from any angle, the reflected rays are enriched by the composite structure of the whole jewel.

Frank Glenn, M.D.

True McLean

January 22, 1899 — June 10, 1994

True McLean was born in Richmond County, New York on January 22, 1899. Following his graduation from Staten Island Academy in 1916, he entered Cornell University that year as a student in the Department of Electrical Engineering, which at the time was part of the Sibley College of Mechanical Engineering, but his studies were interrupted by service in the Navy during World War I. When the war was over he returned to Cornell and received the degree of Electrical Engineer in 1922 from the newly established School of Electrical Engineering. Upon graduation, True went to work in New York City for the Western Electric Company in their development and engineering-research department that eventually became the Bell Telephone Laboratories. In 1923, he was persuaded by Professor William C. Ballard to return to Cornell to take an instructorship in the School, a decision that marked the beginning of a forty-three year academic career at Cornell. True was an Instructor for seven years, was appointed as an Assistant Professor in 1930, became an Associate Professor in 1944, and attained full professorial rank in 1946. He retired as Professor Emeritus in 1966.

Throughout his teaching and industrial career, Professor McLean's principal interests were in the electromagnetic communications field and associated electronic circuitry. He taught courses in communications engineering theory, advanced communications laboratory, and elements of acoustical and radio engineering. He was particularly effective in the classroom because of his extensive practical engineering background and developmental experience in these fields. During World War II years, True was deeply involved in the College of Engineering instructional program for service personnel, but in this same period he found time to assist Professor Elmer S. Phillips, of the Department of Communication in the College of Agriculture and Life Sciences, in the production of high-quality long-playing audio disks and instructional motion-picture films for the War Department. Throughout his career he was a consultant on radio-engineering problems for a variety of companies and organizations. In 1949-51, he had a particularly exciting task at Brookhaven National Laboratory where he made important contributions to the design of a high-power radio-frequency power amplifier that was to be used as the electric drive for their large proton synchrotron.

In the field of audio engineering, True had a very interesting assignment as a technical consultant to the Cornell Ornithology Laboratory when he assisted Professors Paul Kellogg and Arthur Allen in the recording of bird songs. True, together with Elmer Phillips, Bill Ballard, and Arthur Stallman of the well-remembered downtown-Ithaca audio electronics establishment, converted an abandoned Greyhound bus into a portable audio-control studio

that was invaluable in recording the popular long-running WHCU program “Know Your Birds.” That bus also did double duty as the audio power source for the early public-address system for football games in Schoellkopf Stadium.

In 1923, Professors Bill Ballard and B.K. Northrop obtained a standard broadcast license for Ithaca’s first radio station, then called WEAI (“We Educate And Instruct”). On his return to the campus that year, True joined the station and began a long association with the radio broadcasting field. From 1928 to 1955, he was Engineer, and then Chief Engineer of the Cornell Radio Station WHCU (and its predecessors WEAY and WESG) with responsibilities for the design and supervision of the construction of all its AM and FM transmitters. In that period he also was a consultant in the establishment of an FM relay network that brought the New York City classical radio station WQXR broadcasts into Ithaca.

On his last sabbatic leave in 1963-64, True pursued one of his major interests, precision in instrumentation. He had all of the standard instruments of the School calibrating room rechecked at the Bureau of Standards, and visited the Bureau at Washington, D.C. and at Boulder, Colorado to confirm his operation. For many years after his retirement, True would return to Phillips Hall in the summer and recheck all of the instruments in the standards room. A familiar sight in the laboratory was to see him looking over the shoulder of a student (or a professor!) who would be about to connect an instrument in an experiment. Invariably, True would take out a small screwdriver and proceed to adjust the instrument!

True enjoyed soaring sail planes and flying his small private airplane, a single-engine Lascombe 8-F. He was an official of the National Soaring Championship in Elmira, New York in 1963, and together with his long-time friend and fellow aviation enthusiast, Professor Arthur Muka of the Department of Entomology, he worked on the barograph certification for regional and national sailplane competitions in Elmira. He flew his plane in New York State for many years and would frequently surprise an invited guest in Ithaca by taking him to lunch in Syracuse! After retiring and moving to Florida, True joined the Naples Squadron of the Civil Air Patrol and participated in their twilight flights (the Sundown Patrol) along the Gulf Coast looking for pleasure boats in trouble. He engaged in this activity until he was forced by age (at 87!) to give it up, which he did reluctantly. True often said that his hobbies of astronomy, flying, and music had profound impacts on his professional and teaching careers. Astronomy and flying combined with radio engineering led him to develop a popular course in radio aids to navigation. Astronomy and radio engineering inspired him to take a deep interest in the absolute determination of time. His appreciation of music helped him in acoustics and radio broadcasting.

True was a member of the American Institute of Electrical Engineers and the Institute of Radio Engineers before the two organizations were combined into the Institute of Electrical and Electronic Engineers (IEEE). In 1965, True was named a Fellow in IEEE “for contributions to engineering education and research in acoustics, communication, and electrical measurements.” He was a licensed professional engineer in New York State, and served two successive terms as president of the Ithaca Chapter of the New York State Society of Professional Engineers. From 1959 until his retirement, he was a member of the Board of Directors of the Cornell Research Foundation, the organization responsible for university patent activities. He was a member of the honorary societies Eta Kappa Nu and Sigma Xi, and of the American Association for the Advancement of Science, and the Civil Air Patrol.

When True was an engineering undergraduate, he met Katherine Blanche Brooks, a student in the Cornell School of Home Economics. They were married on July 30, 1921 in Ithaca, New York, where they spent the majority of their seventy-three years of life together. When True retired they took up residence in Florida. He is survived by his wife who lives in Naples, Florida; a daughter, Lorna L. Craig and her husband David R. Craig of Naples, Florida; a son, Douglas B. McLean and his wife Jean of Marco Island, Florida; and two grandsons, David R. Craig, Jr. and his wife Jodi of New Boston, New Hampshire; and Douglas W. Craig of Locust Valley, New York.

True McLean will be long remembered as a conscientious teacher, a dedicated engineer, a respected colleague, and a devoted friend.

Paul D. Ankrum, Simpson Linke, William H. Erickson

James McMahon

Professor of Mathematics

1865 — June 1, 1922

Our highly esteemed friend and honored colleague, Professor James McMahon, has suddenly gone from among us. He died on the morning of June 1st, 1922, in his sixty-seventh year, after an illness of only a few hours. We the Trustees and Faculty of the University wish to record on our minutes our feeling of grief and our sense of the great loss that has come to us because of his death. We cannot yet fully realize that we shall see him no more in this life.

In our resolutions on Professor McMahon's retirement from active service in May, 1921, mention was made of his inspiring and helpful influence on the generations of students who have passed through his class-room during the many years of his service at Cornell, of his fine spirit of cooperation in the work of his colleagues in the application of Mathematics to problems in other fields, and of his wise though quiet influence in the larger affairs of national scientific organizations; but all of these outstanding merits of the man are completely overshadowed by the profound sense of our personal loss of an especially valued friend.

Modest of his own high attainments, generous of his time and counsel in assisting others to win success and renown, utterly unselfish and living a most exemplary Christian life, his going from among us is an irreparable loss—a loss commensurate with the inspiration and blessing that have come to us here at Cornell because of his many years of life and service among us.

Instructor, Assistant Professor and Professor of Mathematics, 1884-1922

Howard N. McManus, Jr.

June 20, 1921 — February 6, 1974

The untimely death of Howard McManus at the midpoint of his career is a sad loss for the Sibley School of Mechanical and Aerospace Engineering, for the College of Engineering, and for the University. In each of these areas, he was active, enthusiastic, and hard-working. He was truly an all-round academic man, with an established record in research, great interest and capability in teaching, and manifest diligence in all his many committee and administrative duties.

He was born in Brooklyn and obtained his bachelor's and master's degrees in Mechanical Engineering at the University of Iowa, in 1951 and 1952 respectively. He earned his doctoral degree at the University of Minnesota in 1956, following which he went for one year to Northwestern University as an assistant professor. He came to Cornell in 1957, initially in the Department of Thermal Engineering of the Sibley School. He received his professorship in 1967.

For his first decade at Cornell, his work lay in the areas of heat transfer, combustion, and fluid mechanics. He was, however, very much aware of all aspects of mechanical engineering, and in spite of his own deep interest in research and the training of graduate students, both in general and in his own particular area of interest, he became concerned with the problem of the integration of all engineering skills into the design function. In 1966 he served as chairman of a faculty committee which sought to appraise long-term needs in instruction, laboratory work, and research in engineering design. The report of this committee was largely instrumental in reintroducing a proper consideration of the design function into the engineering programs of the College.

In 1968 he was appointed head of the Mechanical Design Department of the School and he remained in this office until a complete reorganization in 1972 obviated separate departments. He was no titular head of this activity but started a new teaching career by conducting courses in the design area well removed from the thermal engineering discipline in which he had hitherto been engaged. At about this time he was made principal supervisor of a novel and experimental engineering design program at the doctoral level funded by grants totaling \$450,000 from the National Aeronautics and Space Administration (NASA). His interest and activity in the design area caused him to be in demand as a participant in several design conferences and workshops throughout the country whose object was to rekindle attention to the basic engineering activity.

Howard McManus labored continually over his teaching, both in formal courses and in his direction of graduate studies. His students quickly learnt respect for the disciplined approach, because he was not given to accepting

the easy answer from anyone. While very receptive to different ideas, he often looked askance at anything which seemed too permissive in the academic process. On occasion, when upset by what he regarded as unnecessary stupidity, his Irish heritage could give rise to aroused response which left his auditors in no doubt as to his opinion on the matter in hand. Such transitory choler was quickly replaced by his normal equanimity, as he possessed the essential sense of humor which allowed him to criticize himself as well as others.

Apart from his school and college work on committees, which included being chairman of the Graduate Professional Engineering Program Committee and a member of the Engineering College Policy Committee, he was active in University-wide functions such as serving as chairman of the Physical Sciences Subcommittee of the University Fellowship Board, as a director of the Cornell Research Foundation, and as a member of the Faculty Committee on Review and Procedures. With all this, he found time to act as publications reviewer for the American Society of Mechanical Engineers, the *International Journal of Heat and Mass Transfer*, the *Journal of the American Institute of Aeronautics and Astronautics*, and the *Journal of Applied Mechanics*. He also served as reviewer for many research proposals submitted to the National Science Foundation.

In his nonacademic activities, his main interest was in his family and his home. He had five children, whose upbringing was one of his paramount concerns and whose development was a constant source of satisfaction, mixed, of course, with the occasional anxieties. His main hobby was woodwork and his efforts in turning out handsome pieces of furniture were not only successful in terms of craftsmanship but, as he used to say, as “vocational therapy.” He enjoyed playing golf with his colleagues and friends, although he never quite succeeded in attaining the mastery of the mechanics of golf balls in flight that he did over more mundane engineering phenomena.

The death of Howard McManus removes one of the none-too-numerous practitioners of all-round versatility in engineering today. He established a reputation in one area of mechanical engineering and proceeded to acquire new skills and high regard in another. His premature passing can only be regretted as cutting off the fulfillment of even more impressive achievements. The regard of his colleagues, friends, and students in his work in engineering education is best shown by the spontaneous establishment of a memorial fund in recognition of his interest in all that pertained to engineering education. This fund is being used for the annual award to the mechanical engineering student presenting the most outstanding design solution to a problem or project. It will be a fitting tribute to much that he strove for in his sadly limited time at Cornell.

John P. Barlow, John F. Booker, Dennis G. Shepherd

John F. McManus

July 13, 1914 — October 3, 1980

John McManus was a dedicated Cornellian, whose whole life was wrapped up in his alma mater. He matriculated in civil engineering at Cornell in 1932 and was never long out of touch with the University until his death, October 3, 1980. He was an excellent student and was elected to three academic honor societies, including Tau Beta Pi. After his graduation in 1936, John worked for Eastman Kodak Company in Rochester, New York, as a structural engineer. In 1941 he became the resident director of the Cornell Engineering, Science and Management War Training Program in the Buffalo area. He also spent a term on campus teaching civil engineering. In 1948, after two additional years of industrial employment, he returned to Cornell as administrative assistant to Dean S. C. Hollister of the College of Engineering, ultimately becoming associate dean of the college, bearing increasingly important responsibilities in the Dean's Office of the College of Engineering until his retirement in 1980. John served five of Cornell's Engineering College deans and had a brilliant record in carrying out his many difficult responsibilities. To each of his assignments he brought careful attention, a sound knowledge of the facts, a remarkable sense of fairness, and a great deal of patience and common sense.

Sitting in his office on the second floor of Carpenter Hall, overlooking the perennial working and reworking of backhoes and maintenance crews digging away at tunnels and ditches, John was the epitome of stability, steadiness, and firmness. He was not the type of person to pass the buck and was always there, holding firm his ground, a solid pillar of the College of Engineering. When he retired, several faculty remarked, "John was always there when I needed him."

His whole existence was centered in the University, and it was natural for him to want to devote all of his time and efforts to maintaining its fine reputation. And he did give it his all. He seldom took all the vacation time to which he was entitled because he saw that there was so much that needed to be done. Conscientious to the nth degree, he worked late and often took work home with him. He was unwilling to shut his office door, and was always ready to see or talk to people. He was a quiet man, who may have appeared easy-going, but he took his many responsibilities very seriously. The Engineering College ran much more smoothly because of him, and this was recognized by many other units of the campus, which used his position and performance as a model for their own.

In his earlier years, Dean Hollister delegated to him many responsibilities in connection with the development and construction of the Engineering Quadrangle at the south end of the campus. His careful planning and attention to

detail were important in the successful completion of this major project, and he had the pleasure of planning and participating in manifold ceremonial events connected with its major milestones. These experiences were helpful to him during the twenty-one years in which he was responsible for commencement arrangements, and year after year the commencement ceremony attained a greater degree of perfection. We all owe to him Cornell's current reputation of mounting one of the most impressive commencement ceremonies in the East.

John led the life of a fine, upright, Christian gentleman and upheld and practiced those principles according to which he was reared. He was a good, noble, decent man, universally liked, respected, and admired on the campus and in the community. His activities in professional groups such as the American Society for Engineering Education and the New York Association of Engineering Colleges, his advising and counseling of numerous student organizations, and his willing assumption of a variety of committee assignments developed his reputation as an intelligent and reliable individual. John was also very active in the Louis Agassiz Fuertes Council, Boy Scouts of America, and served as president of the Statler Club. It is likely that the faculty had no higher regard for any officer of the University than they had for John McManus. He held the interests of the faculty close to his heart, always working to improve the status of professors.

In his last active year he received recognition for his quiet and effective career. From the College of Engineering he received the Cornell Engineering Award, a medal presented in recognition of his service to the college. The School of Civil and Environmental Engineering, which was always dear to him, designated a newly-refurbished student lounge in Hollister Hall as the John F. McManus C. E. '36 Lounge. He did not live to see its dedication, as he died suddenly on October 3, 1980. His wife, Elizabeth; two sons, John, a Cornell civil engineering graduate, and William, a graduate of Cornell's College of Agriculture and Life Sciences; two brothers; and two grandsons survive him.

Only those individuals who had the privilege of knowing John can fully appreciate his unique combination of personal traits—grace, friendliness, a sense of delight in the successes of others, respect and concern for his associates, and an unsurpassed level of integrity.

Blanchard L. Rideout, Richard N. White, Andrew Schultz, Jr.

Harvey Scott McMillin, Jr.

June 29, 1934 — March 29, 2006

Scott McMillin was a native of Pittsburgh, which made him a lifelong fan of teams that lost often—the Pirates and the Steelers. His grandfather, a steelworker, was killed in an accident on the job; his father had to go to work early as an office boy, though he ended up president of a wholesale hardware firm. Though raised in comfortable circumstances, Scott retained a passion for social justice.

In 1956, while in his senior year at Princeton, he met Sally Ann Hyde on a blind date for a football game; it rained hard, and they didn't attend. "I fell for Sally because she could write a good letter," he recalled years later, in his trademark deadpan. "I tried my best to write a good letter in return, and we got married soon after graduation." The couple spent their first year together in New York City, where Scott worked as a banker. The banking career was short-lived, but his love of the Broadway musical lasted a lifetime. (Once he and Sally spent the night on the sidewalk to get tickets for *My Fair Lady* and ended up standing for the matinee.) He joined the Navy the following year, but because of his eyesight, he was not on active duty; instead he founded and managed a bookstore at Fort McNair in Washington, D.C., while earning a Bachelor's degree at Georgetown University. He completed his graduate work at Stanford in 1963, where he received the Ph.D. degree in English Literature, and the following year he was hired as Assistant Professor of English at Cornell, specializing in Shakespeare and Renaissance drama. He never left. His and Sally's first son, David, was born in Palo Alto in 1961; their next two sons, Paul and Andy, were born in Ithaca.

From the beginning of his scholarly career, Scott was interested in the production conditions of Shakespeare's plays—including staging, actors, finances, and the social context of the performances—at a time when most scholars still focused on the texts. His first book, *The Elizabethan Theater and the Book of Sir Thomas More*, concerned the editing and production of a play written jointly by Shakespeare and five others. Through a detailed examination of the original manuscript, he was also able to show that the play was neither slapdash nor incomplete but "a careful piece of theatrical dovetailing and revision."

Scott's major scholarly project is a study of the Queen's Men, the most popular troupe in England in the years before the rise of the Globe. In 1983, while delivering a paper in Canada, he met Sally-Beth MacLean, a young scholar at work on the records of provincial theatrical performances in Elizabethan England, and decided to shelve his project until MacLean's records were completed. Seven years later, in an act of characteristic generosity, he

suggested that the two collaborate on a joint project, which resulted in his major work, *The Queen's Men and Their Plays* (1998). In this book, Scott and Sally-Beth argue that the visually spectacular style of the Queen's Men gave way to the rhetorically spectacular style of the younger playwrights—Shakespeare and Christopher Marlowe—whose emphasis on spare sets and extended verbal descriptions represented a revolution in dramaturgy. Since the plots of six Shakespeare plays closely resemble the plots of six probably antecedent plays in the repertory of the Queen's Men, Scott speculates not just that Shakespeare knew well the plays he “lifted” but may have toured with the Queen's Men—the most likely solution to the mystery of what Shakespeare was doing during the famous “missing years” of his young manhood (1584-1592).

In 1999, *The Queen's Men and Their Plays* won the Sohmer-Hall Prize for the best book on theater history, and the two authors read their prize lecture antiphonally at the new Globe in London. (They were amused to learn that librarians had classified their book next to a history of the Monty Python troupe.)

At Princeton, Scott had been the pianist for parties, always playing by ear, and in later years, he worked his way through the Gershwin Songbook as a student of Ithaca's legendary teacher, the late Alton Heinz. He didn't just play piano, he thought piano, and the pianists he admired were thoughtful, all-around piano players—Hank Jones, Jess Stacy, Barry Harris, Dave McKenna, Oscar Peterson. His love of the American musical eventually became a scholarly interest. At Cornell, he developed a winter-session course in which students traveled to New York to take in Broadway productions as part of their coursework.

In fall of 2006, Princeton University Press brought out posthumously *The Musical as Drama*. The American musical, now the country's most popular form of theater, is derived from vaudeville, burlesque, revue, and operetta. By offering a theory of the musical as a form, using Rodgers and Hammerstein, Sondheim, Bernstein, Kern, and others as examples, Scott treats seriously an underrated genre whose success, he argues, lies “not in the smoothness of unity but in the crackle of difference.”

Other publications include *Shakespeare in Performance: Henry IV Part One* (1991), *The First Quarto of Othello* (2001), a Norton Critical Edition of Restoration and Eighteenth-Century comedies, numerous articles on English and European drama, and a manuscript, completed just before his death, on the editing of Shakespearean texts. In the words of the theater historian Marvin Carlson,

“His wide-ranging interests, vast range of knowledge, and deep commitment to teaching and to the society around him made him a truly distinguished member of the academic community.”

Scott's passion for social justice was implicit, unqualified, and permanent. In 1990, he co-founded, with Joseph Holland, the Harlem Literacy Project, in which Cornell undergraduates met with youngsters and families in Harlem over the summer in order to build an interest in reading. In an early report he implicitly defined the aims of the project:

"By their willingness to work in Harlem all summer, [the students] were showing that a Cornell education can lead to real connections with the inner city. And they were learning how Harlem works—the education went two ways in this project."

Scott was also a faculty fellow of Ujamaa Residential College for many years, as well as an active participant in the movements of 1969 that led to the founding of the Africana Studies Program, the anti-apartheid movement of the 1980s, and the movement in the summer of 2005 to save the (former) Redbud Woods.

Scott was a superb teacher—an unsurprising early winner of the Clark Outstanding Teaching Award (1972). In the classroom, he preferred to listen, question, and gently challenge rather than hold forth, a practice that Pete Wetherbee has captured from the point of view of a colleague. "When I think of Scott," Pete recalled recently,

"he is always on the point of smiling—not smiling yet, but ready to. His bright eyes are in sharp focus—I didn't know what the phrase 'a level gaze' meant until I met Scott—watching and waiting for what I will say. . . He was one of those blessed scholars for whom everybody is a potential colleague, to be heard respectfully, answered honestly, never patronized or talked down to."

Sally-Beth MacLean's recollections of their collaboration strike a similar note:

"He wore his learning lightly, responsive to the young as much as to the elder statesmen, a gentle man who knew how to enjoy himself and others. . . what a delight it was to see Scott at work, using meticulous scholarship and an unfettered mind to challenge old pundits with fresh insights, shaping his ideas in finely tuned prose, enlivened by a deft, sometimes playful touch all too rare in academic publications."

At Scott's Memorial Service, Reeve Parker illustrated his legendary punctiliousness as a scholar by quoting from his work on the *Othello* texts:

"Finding . . . the Quarto 1 punctuation to be full of interest and more systematic than is assumed, I propose to advance upon the textual problem by way of the comma, the semi-colon, the colon and—best of all—the period."

Reeve then juxtaposed this quotation with a memory of accompanying Scott to a London production in 1993, a play titled *Not Fade Away*. His concluding sentence speaks all for the countless friends, colleagues and students who bear Scott's loss and honor his memory: "Four loving words end what I have to say about Scott: NOT FADE AWAY . . . PERIOD."

Reeve Parker, Winthrop Wetherbee III, Paul Sawyer

Elsie Frost McMurry

April 1, 1908 — July 25, 2007

Professor Emerita Elsie Frost McMurry died July 25, 2007 at age 99 in East Lansing, Michigan.

She was a graduate of Michigan State College (now Michigan State University) in 1931 with a minor in Fine Arts. She received a Master's degree from Columbia University in Related Arts with minor degrees in Fine Arts and Education in 1932.

After teaching sewing and art in the public schools of Ann Arbor, Michigan, in 1938 she began teaching at Russell Sage College in Troy, New York while she continued her studies at Parsons School of Fine and Applied Arts, New York.

In 1942, she began her career at Cornell University, where she taught apparel design and history of costume, as well as directing graduate studies. She was also Curator of the Cornell Costume and Textile Collection from 1950 until her retirement in 1972. In this role, she became particularly interested in the historical development and cultural significance of apparel, and incorporated the collection in her teaching. She also organized two major exhibitions of historic dress at Cornell, one of which included a catalog.

Following her retirement, she undertook to organize the textile and costume collection at the DeWitt Historical Society of Tompkins County. This work included dating the objects closely enough to classify them by decade. This responsibility was ongoing through long-term membership on the Collections Committee and a six-year tenure on the Board of Trustees of the DeWitt Historical Society.

In 1982, with the support of a National Endowment for the Arts grant, she undertook a chronological photographic documentation of 30 nineteenth century women's dresses from the Cornell Costume and Textile Collection. This initial project eventually led to a more extensive study of dresses from this period, the focus of which was to develop a reference guide for collection curators and scholars that would assist in the more accurate dating of garments in collections, based on the physical dimensions of documented garments. This eventually led to a major publication, *American Dresses 1780-1900: Identification and Significance of 148 Extant Dresses*. This large reference work was published in CD format in 2001, when Professor McMurry was 93 years of age. The book has been cited as a valuable contribution to the study of the history of women's clothing because of its detailed comparative analysis of actual garments. It was unique in that instead of classification based on photographs or drawings of garments, it is based on physical examination of actual garments. Through a meticulous set of measurements and

analysis of construction features, the researcher is given guidance in the examination of actual garments in order to fit them into a broader classification system. Cornell's Department of Fiber Science and Apparel Design intends to continue to make this important reference work available.

In 2002, Professor McMurry moved from Ithaca to East Lansing, Michigan to be near her niece. Her husband, Dr. Donald LeCrone McMurry, a scholar whose field was American Labor History, preceded her in death. Nieces, nephews and other members of her extended family survive her.

Charlotte Jirousek, Chairperson; Nancy Breen, Ann T. Lemley

Arthur James McNair

March 17, 1914 — October 31, 1986

Arthur James McNair, professor emeritus of civil and environmental engineering, was born in Leadville, Colorado, on March 17, 1914, and died in Denver, Colorado, on October 31, 1986. He was the son of Fred J. McNair and Goldie R. McNair. He is survived by one son, Fred P. McNair; two daughters, Adrienne McNair and Virginia L. McNair; a stepson, Wilson Chase; a sister, Florence M. Witt; and many friends and colleagues.

He received his education in the public schools of Leadville and at the University of Colorado, receiving the degrees of B.S. in civil engineering (with special honors) in 1934 and M.S. in 1935 and the professional degree C.E. in 1945. He was elected to membership in the honorary societies of Tau Beta Pi, Chi Epsilon, and Sigma Xi.

Professor McNair was an active teacher of surveying throughout his lifetime. He was an instructor, assistant professor, and associate professor at Colorado State University (1935-49). He was first appointed as an associate professor at Cornell in 1949 and served as professor and head of surveying from 1950 to 1979. Subsequent to his retirement from Cornell he was a visiting professor at Texas A & M University.

His work in combining digital computers with coordinatographs greatly increased the accuracy of measurements over those obtainable from previous methods. The application of these new methods to the measurement of the shape of the thousand-foot radio telescope in Arecibo, Puerto Rico (operated by Cornell University for the National Science Foundation), resulted in the determination of the position of points on the antenna with a tolerance of very few millimeters.

Much of that research at Cornell was funded by the National Science Foundation and other federal agencies. M.S. and Ph.D. candidates in the surveying graduate program also participated in this work. At least a half-dozen of these graduate students are teaching surveying at widely recognized universities. Three of them are authors of textbooks. Others hold responsible positions in various federal or state agencies, and still others have their own private practices in surveying.

Many engineering students remember Professor McNair as their faculty adviser. He always took time to listen to their questions and problems, personal as well as academic. Others remember him as the adviser to the Christian Science group on campus for many years.

Art was a loyal and devoted member of the Cornell community. He served on many school, college, and university committees. During his lifetime he was a member of many professional societies, including the American Society of Civil Engineers, the American Society for Engineering Education, the American Society of Photogrammetry, the Canadian Institute of Surveying, and the Colorado Professional Surveyors Association, and an honorary member of the New York State Association of Professional Land Surveyors. He was a frequent contributor to the publications of those societies. His papers addressed technical topics as well as the promotion of the surveying and engineering professions.

Art was a member of the American Society of Photogrammetry, president of the society in 1961-62, and an honorary member in 1982. He was the first member of the society to be elected from the academic communities.

During his lifetime he was a frequent participant in professional meetings on photogrammetry and geology in Europe and was awarded a number of scholarships and fellowships in photogrammetry at United States and foreign universities.

Walter R. Lynn, George B. Lyon

Gordon Palmer McNeer

November 24, 1905 — January 18, 1967

An internationally-known specialist in the treatment of cancer, Dr. McNeer died on January 18 at the age of sixty-one. He was an attending surgeon at Memorial Hospital for Cancer and Allied Diseases and at the James Ewing Hospital of the City of New York. He was chief of the gastric and mixed-tumor services of both institutions. He held the rank of Clinical Associate Professor of Surgery at Cornell.

Dr. McNeer was born in Alaska. He attended the Choir School of the Cathedral of St. John the Divine in New York and Phillips Andover Academy. He was graduated from Princeton University in 1927 and received his medical degree from the University of Pennsylvania in 1931.

During World War II, Dr. McNeer served as chief of surgery with the Fifteenth Evacuation Hospital in Burma. On his return to Memorial Center, he became one of the pioneers in the use of the flexible gastroscope to diagnose cancer and disorders of the stomach. In recent years he concentrated on analyzing malignant melanoma and in 1966 was awarded the Janeway Medal and Lectureship of the American Radium Society for his work. He wrote many scientific articles, and collaborated with Dr. George T. Pack on a book, *Cancer of the Stomach*.

Dr. McNeer is survived by his widow, the former Artemisa Evans; a son, Gordon E. of Berkeley, California; a daughter, Miss Ann B. of Florence, Italy; and two brothers, Lynn and Lawrence of Lake Alfred, Florida.

Lemuel Bowden, M.D.

Alexander Millar Meek

April 11, 1926 — March 17, 1972

With the untimely passing of Dr. Alexander M. Meek, the New York State College of Agriculture and Life Sciences at Cornell lost one of its most outstanding professors of animal science. Professor Meek died in his native country of Scotland on March 17, 1972, after a very brief illness.

Professor Meek, known to everyone as “Sandy,” was born in Edinburgh, Scotland, the youngest son of Alexander M. Meek, Sr., and the late Grace Moodie Meek. He attended the George Heriot’s School of secondary education in Edinburgh. Sandy was not farm reared, but his love for animals led him into a distinguished career in animal science. During his early youth he worked on a purebred Ayrshire farm near his home on the outskirts of Edinburgh.

He attended the University of Edinburgh and earned a B.Sc. degree in agriculture in 1946. For two years following his graduation from the university, he was herdsman and farm manager for a large Ayrshire herd in Northumberland, England. In 1948 Sandy emigrated to Canada, where he became assistant herdsman at the Nappan Experimental Farm, Nappan, Nova Scotia.

On April 14, 1949, he married Helen E. Coates of Nappan, Nova Scotia. They came to the United States and Sandy was appointed assistant herdsman of the Kansas State University dairy herd at Manhattan, Kansas. At the same time he enrolled in the College of Agriculture and received a bachelor’s degree in dairy science in 1952.

For the next two years Sandy was employed as assistant herdsman at Strathglass Farms, Port Chester, New York. In 1955 he accepted the position of farm manager at Quiet Valley Farms in Newton, Connecticut. After a successful career as herdsman and farm manager, he entered Iowa State University as a graduate assistant. He was awarded the M.S. degree in animal breeding in 1959 and the Ph.D. in animal breeding and animal reproduction in 1961.

He joined the Animal Science Extension staff at Cornell in September 1961 and immediately became one of the most sought-after extension specialists in the College of Agriculture. His practical experience and technical training combined made him one of the most widely accepted authorities in the field of dairy cattle breeding and herd management. His interests were not confined to animal breeding and he developed a thorough knowledge of mastitis control, waste management, dairy cattle housing, free stall management, and dairy cattle feeding management.

Cooperatively with dairy scientists at the National Institute of Research for Dairying, Reading, England, Professor Meek and his co-workers developed a milking management technique for the control of mastitis in dairy cattle. He was instrumental in organizing with the New York State Veterinary College a three-year field research project on mastitis control in twenty-seven dairy herds in Cayuga, Onondaga, and Madison counties. The application of the milking management technique and dry cow therapy has proved to be a major breakthrough in the control of mastitis.

Professor Meek was chairman of the College of Agriculture Interdepartmental Dairy Industry Committee. This committee provides the overall leadership and support for the development and implementation of dairy extension work for New York State.

He served as the Animal Science representative for the College of Agriculture on a joint project with the Miner Research Institute, Chazy, New York. His major responsibility was to plan the dairy cattle research facilities, assemble the staff, assemble a dairy herd, and help plan and coordinate the research work to be carried out at the Institute. Under his able leadership this project came into being, but unfortunately he did not live to see the facilities put into operation. He also provided major inputs for the planning of the Animal Science Dairy and Training Research Center at Harford, New York.

Professor Meek was a member of the Northeast Dairy Practices Committee, an exofficio member of the Eastern AI Cooperative Sire Selection Committee, and liaison with the New York State Federation of Ayrshire Breeders. He was a member of the American Dairy Science Association, the American Society of Animal Production, Sigma Xi, and an honorary member of Gamma Sigma Delta. He was also a deacon in the First Presbyterian Church of Ithaca.

Sandy Meek was capable, cooperative, hardworking, with integrity above reproach, but more than that he was a gentleman in the truest sense of the word. Never was he known to raise his voice in anger toward anyone. He was kind, compassionate, and thoughtful of his fellow man. He had the ability very few have: he never "lost his cool." He was a friend to all who knew him.

He is survived by his wife, Helen E. Meek, and a daughter, Alexandra Grace Meek, both of Ithaca; his father, Alexander M. Meek, Sr., of Lauder, Scotland; three aunts, Miss Molly Moodie, Miss Gladys Meek, and Mrs. Grace Duff, and an uncle, William Meek, all of Edinburgh.

Howard Bagnall Meek

October 30, 1893 — July 16, 1969

Howard Bagnall “Don” Meek, E. M. Statler Professor, emeritus, founder and first dean of the School of Hotel Administration at Cornell University, was internationally known as the leading educator in the hospitality industry, which today ranks as the foremost industry worldwide. In 1918 he initiated collegiate education in this field with two courses at Boston University, which led the American Hotel Association to propose him as head of a new program sponsored by that organization at Cornell University in 1922. Professor Meek built the Cornell program from four courses, for which he was the sole instructor, into an independent college with its own building and a full-time faculty of twenty-one, with an equal number of lecturers drawn from industry.

“Prof,” as he was affectionately known by the School’s three thousand alumni, interested Ellsworth M. Statler, America’s foremost hotelman of the 1920s, in giving financial support for the establishment of Statler Hall, a \$10 million complex devoted to the professional training of future hotel executives.

After his retirement in 1961, Professor Meek directed his energies toward broad educational service for the hospitality industry as executive director of the Council on Hotel, Restaurant, and Institutional Education (CHRIE), and was actively engaged in such activities at the time of his death.

Professor and Mrs. Meek traveled widely around the world, often visiting with School alumni who managed major hotels in countries abroad. Today, the Cornell school is acknowledged to be the major collegiate institution of its kind in the world and it draws about 15 percent of its five hundred full-time students from outside the United States. Summer short courses for industry employees were initiated in 1928 and executive educational seminars in 1955. Both attract worldwide attendance. Shortly before Professor Meek’s retirement as dean, he established a research department to serve the hotel and restaurant industries and also a publications department which provides a quarterly magazine, training manuals, and textbooks.

Professor Meek was past president of the New York State Minimum Wage Board for the Hotel Industry, consultant to the OPA, Point IV, AID Programs, and past president of the Tompkins County Hospital and the Ithaca Reconstruction Home. Among his professional affiliations were the American Statistical Association, the American Economics Association, Cornell Society of Hotelmen, Ye Hosts, and life memberships in the National Restaurant Association and the Club Managers Association of America. His publications include *A Theory of Hotel Room Rates* (1938), *Hospitalities Around the World* (1938) and *Hotels of Latin America* (1952).

Professor Meek was born in Chelsea, Massachusetts, on October 30, 1893, the son of Warren Lee and Eliza Fowler (Reed) Meek. He obtained his B.S. degree in mathematics from Boston University in 1917. This same institution conferred on him an honorary Doctorate of Education in 1949. He earned his M.S. degree in mathematics from the University of Maine in 1920, where he was also a member of the faculty; and his doctorate in economics from Yale University in 1933.

In 1924 he married Lois Ann Farmer, a member of the faculty of the College of Home Economics, who taught food management courses in hotel administration for several years following their marriage. Professor Meek is survived by his widow and by two children, Lois Jean Meek, who is a designer with Erio Saarinen Associates in New Haven, Connecticut, and Donald Bagnall Meek, a commander in the U. S. Navy now stationed in England.

In May 1969, Professor Meek received two honors in recognition of his fifty years of service to the hospitality industry. The School's library, the first and largest library collection of hotel and food service titles, was named the Howard B. Meek Library. The Cornell Society of Hotelmen also established the Howard B. Meek Visiting Professorship at Cornell University.

The community's awareness of his contributions is best exemplified by an *Ithaca Journal* editorial :

“It is not given to many men to found a school. Dean Meek did—the School of Hotel Administration at Cornell University, rightly famed throughout the world. In 1922 he became a one-man faculty of what was then a department in the College of Home Economics. It included twenty-one students, four courses, and the sole instructor, Professor Meek. Today, the School of Hotel Administration occupies its own home, Statler Hall, with a faculty of twenty-one and five hundred students. He was the School's first dean. His accomplishments earned him the esteem of the entire hotel industry. “Dean Meek did not confine himself to his school and the University. He found time to work on behalf of Tompkins County Hospital and the Reconstruction Home, as well as the Rotary Club. He was town as well as gown.

“His colleagues and friends will miss him, but he will not be forgotten. The School of Hotel Administration is his monument.”

Gerald W. Lattin, Charles I. Sayles, Robert A. Beck

Robert Hastings Melchionna

July 23, 1907 — August 29, 1967

Robert Hastings Melchionna, M.D., an Associate Attending Physician of The New York Hospital and Clinical Associate Professor of Medicine on the faculty of the Cornell University Medical College, died on August 29, 1967, at sixty years of age. He had been associated with the Medical Center since 1935 when he became an intern in medicine. He also served on the house staff of the second (Cornell) division of Bellevue Hospital. He later worked in the Departments of Pathology and Pediatrics as well as in the Department of Medicine. One of his interests was endocrinology, and he published a number of research papers in this field between 1931 and 1938. He was appointed to the faculty of the Medical College in 1939 in the General Medical Clinic, where for over fifteen years he was a key teacher and clinician. As Physician-in-Charge on Tuesday and Wednesday mornings, he was responsible for setting a high standard of excellence in the care of ambulatory patients. His interest in administration led to improvements in the organization of the clinic, and he was tireless in his efforts to create a proper learning atmosphere for students. Through his friendship and understanding, he was able to enlist the full support of nurses and ancillary personnel in the operation of the clinic.

He was a member of the American Medical Association, the American Rheumatism Association, the New York Pathological Society, and the American Society of Internal Medicine.

Dr. Melchionna was born in Brooklyn, New York, graduated from St. John's University in 1929, and received his medical degree from St. Louis University in 1935.

As a medical student, he was president of the Beta chapter of Alpha Omega Alpha, honorary medical fraternity, and president of Alpha Sigma Nu, honorary fraternity of Jesuit colleges. He was a member of the University Club and the Deep Sea Club at Montauk, Long Island. His recreations were sailing, fishing, and hunting.

Surviving is his widow, Mrs. Mae Beale Melchionna.

For all his many services to the Center in teaching and patient care but most of all as a loyal friend and colleague, he will be greatly missed.

George G. Reader, M.D.

Leo Meltzer

March 1, 1927 — June 4, 1994

Our respected and longtime colleague, Leo Meltzer, died of a heart attack on June 4, 1994, after an evening devoted to one of his favorite activities, serious bridge. He had been with us for twenty-six years since he arrived in 1958 from his post as Study Director for the University of Michigan Survey Research Center. He was a natural appointment for our fledgling Social Psychology program which, in those expansive and open days, was explicitly not only interdisciplinary but also interdepartmental. He came having worked with Abraham Maslow, one of the most effective undergraduate teachers of his time, and the very different but very important mentor, Floyd Allport, under whom Leo had received an M.A. degree at Syracuse University. He became the major architect of our Lambert Laboratory of Social Psychology.

Leo came to Cornell imbued with a sense of the need for a dual approach to the field—an approach that was embodied in his recent Ph.D. thesis at Michigan, entitled “Consequences of the joint consideration of individual and aggregate data in social research” (U. of Michigan, 1958). This dual approach was certainly one of the desired outcomes of the interdepartmental graduate program at Michigan, which was headed in Leo’s case by Theodore Newcomb and Guy Swanson. The “individual” aspects led Leo to welcome responsibilities in Cornell’s Psychology Department where he attended all meetings and planning sessions, served as Graduate Field Representative for Psychology and had two terms as Assistant Chairman of the Psychology Department. But the “aggregate” side of Leo’s interests led him to also attend all Sociology meetings, maintain membership in the American Sociological Association (in which he was a Fellow), review papers for sociological journals and, when the time came, to become a very energetic Executive Officer of the Eastern Sociological Society, helping to expand its scope and membership.

Leo was happier, however, when he was working in both Psychology and Sociology. He helped hold together an interdepartmental program at both the graduate and the undergraduate levels, despite growing threats from other perspectives, from other administrative plans, and from the general decline in University money for ambitious social science programs. During the expansive years of 1968 to 1978, he was particularly active in the administration of large and very successfully utilized grants for graduate training in Social Psychology, funded by the National Institute of General Medical Science; he served as the local Director in the later years of the grant. This role called for fierce dedication and concentrated joint planning during some turbulent years. He also spent two years during this period as the vigorous early Chairman of the interdepartmental faculty committee to plan a Social Science building, which is now called Uris Hall.

Leo was a pioneer in the use of scientific apparatus and computers in social psychology and had a major part in establishing the high-technical laboratory facilities which we still have in Social Psychology. Using this laboratory in its early form, he (with William Morris) found, with multiple regression analyses, that one could predict which person continues to talk after an episode of dual speaking by focussing on the behavior of the person whose speech had been interrupted. Continuation or willingness to relinquish the floor involves raising or sustaining voice level during interruptions. He used computer controlled manipulations of speaker's sound pressure to test this conclusion. Using op-amps and real-time computer control, he manipulated speakers' voice levels as they spoke and listened to one another through headphones. By comparing control and experimental passages, he could predict the outcomes of these dual speech episodes from these data, without reference to content, establishing that some mechanisms which control the stream of interaction are nonverbal.

In his published papers, Lee made several other original contributions. One was a new contribution to cognitive balance theories; indeed, he maintained an active interest in balance theories throughout his career, discussing new ideas only the week before his death. Another focussed on the role of information and its distribution among group members in shaping the evolving structure of groups. Another interest was in personality. In one experiment, Lee recruited six sets of best-friends triads. These students met five times, once with the best friends, four times with persons who were total strangers. Their speech was logged on digital tape and analyzed by special software he had devised. This design assessed the stability of each student's behavior in the presence of a changing set of others. There was great similarity in behavior while interacting with the different sets of strangers, but profound differences in how the students acted with their best friends—a finding that emphasized the eliciting nature of relationships.

Lee was well known in Europe for this kind of approach to social interaction. He enjoyed sabbaticals in England, and he served as a NATO visiting lecturer, speaking at twelve universities in Holland, Italy, and West Germany.

Over the years, Lee became increasingly effective and dedicated to undergraduate teaching. His course on social relationships (similar to work done at Harvard by Freed Bales) was popular: some students waited years to get into it. Aside from extensive readings, students kept personal logs and interacted with uncommon frankness. In keeping with his respect for research and his affection for undergraduates, a memorial fund has been established to reward the best Cornell undergraduate social psychology research paper, each year. Contributions to the "Meltzer Memorial Fund" should be sent to the Department of Sociology.

Leo grew up in Brooklyn and was a graduate of the Townsend Harris Special High School there. He received his A.B. degree from the University of California, Berkeley in 1949 (where he worked with Abraham Maslow) and an M.A. degree from Syracuse University in 1951. He loved opera, and over the years came to know much about it, particularly the work of Wagner.

He is survived by his ex-wife, Nancy of Ithaca; his wife, Anne, also of Ithaca; his five children, Jonathan, Joel, Sarah, Walter, and Elizabeth; and a brother, Ezra of White Plains.

Leo asked that no memorial service be held. Instead, we now express how much we will miss our busy, creative and wise colleague, with his talent and taste for administration, his dedication to good teaching and research and his warm, lively and supportive manner.

William W. Lambert, Robin Williams, Jr., Donald Hayes

Robert P. Merrill

November 17, 1934 — September 20, 1996

Robert Perkins Merrill, the Herbert Fisk Johnson Professor of Industrial Chemistry since January 1977, died quietly just two months before his 62nd birthday at his home in Ithaca, New York. Merrill was an active member of the Cornell Faculty for 19 years (1977-96). He was an outstanding academic colleague in chemical engineering and physical chemistry and a distinguished religious leader. He was deeply committed to excellence in his profession, in his religious commitments and in his family life.

The record of his experiences honors a great person and a man of many talents. He pioneered in the development of undergraduate and graduate instruction in both chemical engineering and applied surface science, was an outstanding mentor of graduate students, participated strongly in industrial consultation and made vital contributions to the scientific research literature.

Robert Merrill was also a product of his pioneer Mormon heritage. As a member of the Church of Jesus Christ of Latter-day Saints (Mormons), he served during his life as a teacher, High Priest, Bishop of the Ithaca Ward and President of the Owego Stake. He was a builder of his community, unswervingly devoted to emulating his Mormon beliefs in his daily living. It was said by a colleague that he lived life with an eternal perspective.

His concern for his family was a dominant part of his life. He loved them deeply and foremost but also respected every person he met, not esteeming one above another. He was a devoted husband, a caring father, a committed grandfather and, all-in-all, a caring human being to every individual with whom he came in contact.

Merrill was born November 17, 1934 in Salt Lake City, Utah of the late Olonzo David and Ruth Perkins Merrill. He attended public school there until they moved to Richland, Washington. His family subsequently moved to Wilmington, Delaware in 1946 where he attended the P.S. DuPont High School and worked summers at the DuPont Company, where his father was employed as a mechanical engineer. In 1953, Bob entered the mechanical engineering program at Cornell but soon transferred to the School of Chemical Engineering. He completed his B.ChE degree in Chemical Engineering at Cornell in 1960 and his Sc.D degree in Chemical Engineering at the Massachusetts Institute of Technology in 1964. As a new graduate student at MIT, Bob joined some like-minded fellow students to meet together each day over lunch to read and discuss holy scripture. In addition to his spiritual commitments, after completing his degree studying the surface chemistry and physics of gas-solid interactions,

he taught there. Subsequently, he moved on to the University of California at Berkeley, where he served as vice-chairman of the Department of Chemical Engineering from 1974-77.

He was brought back to Cornell in 1977 through the insight of Professor Emeritus of Chemical Engineering, Julian C. Smith, to strengthen the research base of the Chemical Engineering Department. In this, he succeeded admirably, playing important roles in recruiting sixteen new faculty members in the department and serving as a trusted and impartial advisor to departmental chairs. One of whom commented, "Right away I could count on him to provide insight into complex issues free of biases from any personal stakes". Another colleague stated that, "Chemical Engineering is today quite a different department than it would have been if he had not been there. He never pushed his own agenda". A third colleague observed that, "Merrill would never receive the recognition he deserved, because he was never selfish".

He taught graduate courses in fundamental chemical kinetics, undergraduate courses with an emphasis on reactor design and the unit operations laboratory, and he coordinated the capstone design course in chemical engineering for many years. His industrial experience was a great asset in the last-named effort. He was an outstanding mentor of graduate students. Many of his Ph.D. students have gone on to spectacularly successful careers in academia and industry.

He had a great zest for scientific inquiry and incubation of new ideas. He liked to think about new concepts and to impart his own enthusiasm to the students under his supervision. He stood for quality and integrity in many ways both intellectual and spiritual. Even when slowed down by failing health in latter years, he never compromised his standards of quality and integrity in his scientific and personal relationships. He was particularly effective in bridging professional gaps not only in the field of chemical engineering but in interdisciplinary interactions with colleagues in physics, chemistry, applied physics and engineering, with whom he had substantial scientific collaborations and cooperations.

At Cornell, he pursued a broad program of research centered on studies of the structure and chemistry of solid surfaces and the interactions of surfaces with gas molecules. A unique aspect of this research was the use of atomic and molecular beam scattering techniques to probe the structure and reactivity of atoms at surfaces and to study gas-solid collision dynamics. He also pioneered in the use of synchrotron radiation beams to study oxidation of metals, properties of oxides and heterogeneous catalytic processes on surfaces as well as the unique properties of aluminas and related materials. He realized that understanding these interactions and materials had important

practical implications in such processes as catalysis, corrosion, corrosion inhibition and the aerodynamics of flight in rarefied atmospheres.

As an academician and an engineer, Bob loved not only to pursue new knowledge but to apply it with useful impact on human life. In addition to conducting his university-based research and serving as co-director of the Cornell-Sandia synchrotron radiation beamline facility at the Brookhaven National Laboratories, Merrill was active as an industrial consultant. This was in keeping with his commitment in relating fundamental understanding to practical application, admirably fulfilling his responsibility as holder of the Johnson Chair of Industrial Chemistry. Companies he worked with included Universal Oil Products, Gulf General Atomics, Stauffer Chemical, Lockheed Missile and Space Corporation, Abcor Corporation, Raytheon Corporation, and Mobil Research and Development Laboratories.

The Herbert Fisk Johnson Professorship of Industrial Chemistry was established by Mr. Johnson, a petroleum industrialist, and head of one of the nation's largest privately owned companies at the time. The Johnson Chair was previously held by Fred H. Rhodes and by Charles C. Winding, both former directors of the School of Chemical Engineering.

Bishop of the Ithaca Ward of the Church of Jesus Christ of Latter-day Saints, Robert Merrill had a strong spiritual side to his life. He lived his life with an eternal perspective and believed that living is finite and temporary, a trial period whose duration is insignificant when compared to the eternal existence extending infinitely both into the past and on to the future. As he became a leader in the knowledge profession of the university, his teachings gained eminence through reinforcement from his personal qualities and spiritual integrity. The following from, "Ode on Intimations of Immortality" by William Wordsworth, epitomizes the spirit underlying Bob's life:

Our birth is but a sleep and a forgetting;
The soul that rises with us, our life's star
hath had elsewhere its setting
And cometh from afar;
Not in entire forgetfulness,
But, trailing clouds of glory do we come
From God, who is our home.
The homely nurse doth all she can
To make her foster-child, her inmate, man,
Forget the glories he hath known,
And that imperial palace whence he came.

Robert Merrill is survived by his wife, Jeanne Cluff Merrill; his sister, LuAnn Merrill Sorensen; his five children, Ellen Merrill Fluckiger, Laurie Merrill Grimsman, Lydelle Merrill Rumsey, David Keith Merrill and Paul Robert Merrill; and eleven grandchildren, Vanessa, Gordon, Breanna and Eleesa Fluckiger, David, Brian and Leisel Grimsman, Gregory and Christopher Rumsey and Isabeau and Hannah Merrill.

Joseph Ballantyne, Paul Houston, William Olbricht, Thor Rhodin

Ernest George Merritt

April 28, 1865 — June 5, 1948

Ernest George Merritt died in the Tompkins County Memorial Hospital in Ithaca on June 5, 1948, after a brief illness. He was born in Indianapolis on April 28, 1865. After one year of study at Purdue University, he entered the Engineering College at Cornell where he graduated with the degree of Mechanical Engineer in 1886. Following a year of graduate study as a Fellow in Physics at Cornell, he became Instructor in Physics in 1889 and was appointed an Assistant Professor in 1892, after which he spent a year of study in Berlin. He was promoted to a full Professorship in 1903. In 1919, he succeeded Edward L. Nichols as Head of the Department of Physics at Cornell. He relinquished his administrative duties to devote himself to writing and research becoming Professor of Physics Emeritus in 1935.

When the Cornell Graduate School was organized in 1909 Professor Merritt became its first Dean. He resigned this position in 1914 in order to have more time to devote to research. He was faculty representative on the Board of Trustees for three years, 1931-1933. During World War I, he directed experimental and development work for Submarine Detection at the U.S. Naval Experimental Station at New London, Connecticut.

Outside the class room and the research laboratory, Professor Merritt gave freely of his time to professional activities. A charter member and one of the active organizers of the American Physical Society, he became its first Secretary in 1899 and continued in that position until 1912 when he was elected President of the Society, an office that he held for two years. He was one of the founders and editors of the "Physical Review," which was started at Cornell University in 1893 and which was the first scientific journal in this country to be devoted exclusively to Physics. He participated actively in these editorial duties until the sponsorship of the journal was assumed by the American Physical Society in 1913. He was elected Secretary of Section B of the American Association for the Advancement of Science in 1895 and later served as Chairman of that Section.

Professor Merritt was a member of the National Academy of Sciences, the American Academy of Arts and Sciences, the American Association for the Advancement of Science, the American Physical Society, the Institute of Radio Engineers, the Optical Society of America, Sigma Xi, Tau Beta Pi, and Phi Kappa Phi.

Throughout his scientific career, Professor Merritt was active in research. Although contributing to a wide range of subjects, his chief interest was displayed in the fields of luminescence and of electric waves. In collaboration with Professor Nichols and others, he did pioneer work in investigating the luminescent properties of many materials

and in establishing quantitative relationships for the changes in these properties under varied conditions. These studies not only won international recognition, but today serve as a fundamental basis for numerous and significant applications. Electric oscillations claimed his attention as early as 1897. In more recent years, he became interested in problems dealing with the fading and polarization of radio waves and the effect of sunset or of a solar eclipse upon the direction of such waves and in other problems related to the Heaviside layer. However complicated the experiment or problem under consideration might be, he sought always to analyze the results and interpret them in the simplest possible terms.

As a teacher and personal counsellor, Professor Merritt made a profound and lasting impression upon his students and colleagues. During his years of activity at Cornell, more than 400 physicists now living received advanced degrees in physics or were members of the departmental staff. His skill as a teacher was perhaps best displayed as he led a class through a mathematical deduction, causing each alert listener to feel like a discoverer, even though the leader knew well enough where the "exploration" would end. When demonstrating the then-new phenomena of electric waves to graduate students, he was the envy and the inspiration of his pupils because of his skill in throwing together crude pieces of apparatus that would work perfectly to demonstrate the point in mind. The puzzled or discouraged student who sought him out for help came away cheered and steadied, filled with calm confidence, determined to try again.

Professor Merritt, always interested in humanity, sympathized warmly with the peoples of Europe in their vicissitudes after the two world wars. His ancestral Quaker sympathies led him to engage in practical efforts to alleviate the distress of the citizens of any European country in need of help. He made no distinction between those who fought for us and those who fought against us. In company with Mrs. Merritt, he made collections of used clothing over a period of two and one-half years for the relief of people in Europe. In addition, the Merritts sent various necessities to two schools in Alsace and food to individuals that Professor Merritt knew personally were in dire need. Nor did he forget his home community, in whose welfare problems he maintained an active interest. The Cornell campus was for Professor Merritt not only a professional workshop but also home. For forty-five of the more than sixty years, which he spent at the University, he and his family lived on the campus. His figure became familiar to many generations of students and to Faculty associates as they saw him day by day go quietly but busily about his professional duties and his personal activities. The home as well as the laboratory was a source of the helpful influence and the inspiration which so richly benefited many a colleague and former student and which will continue as an asset of the University that he served so long and so graciously.

R. C Gibbs, G. W. Herrick, H. B. Howe

Wilbur Ernest Meserve

January 4, 1901 — October 28, 1974

In the passing of Dr. Wilbur E. Meserve, we lost a distinguished colleague, a dedicated teacher, an accomplished engineer, a kind friend, and above all a humanitarian.

Professor Meserve came from Gorham, Maine. He graduated from the University of Maine at Orono in 1923, with the B.S.E.E. degree. He then worked at Bell Telephone Laboratories for a year. He was an instructor in electrical engineering at Maine from 1924 to 1926 and received his M.S. degree in physics in 1926. He was appointed as an instructor in electrical engineering at Cornell in 1926. Receiving his M.E.E. degree in 1929 and his Ph.D. degree in 1933 from Cornell University, he rose through the ranks and was named professor in 1948.

His teaching and research interests were initially concerned with electrical machines, and his practical expertise in synchros, motors, and generators and his academic training in physics and systems analysis led naturally to his pioneering work in the field of servomechanisms. He participated in Project Lincoln, MIT (the forerunner of Lincoln Laboratory), and contributed heavily to the design of control systems installed in early missiles.

He made definitive contributions in the stability of nonlinear control systems, especially in sampled-data control systems. He and his students introduced the concept of describing function into sampled-data feedback systems containing a relay element. This breakthrough enabled system designers to design and analyze such systems in the frequency domain. He published extensively in technical journals.

He acted as a consultant in the field of automatic control for General Electric, Autonetics Corporation, American Brown-Boveri, Cornell Aeronautical Laboratory, and others.

He initiated teaching of feedback control systems at Cornell and set up the Servomechanisms Laboratory, one of the first in the nation. His skill was legendary. Generations of undergraduate and graduate students remember him as an effective and warm teacher. He was the graduate field representative for 1965-68.

He was a lifetime member and a fellow of the Institute of Electrical and Electronics Engineers. He was also a member of AAAS, Franklin Institute, Sigma Xi, Tau Beta Pi, Phi Kappa Phi, and Eta Kappa Nu.

During 1955 he was a Fulbright Lecturer and organized laboratories in control systems at the University of Sydney and the University of New South Wales in Sydney, Australia. In 1961-62 and 1964-65, he was a visiting professor at the University of Hawaii, in Honolulu.

He retired in 1968 from Cornell University as professor emeritus. In 1969 he worked with graduate students on a NASA-sponsored project on moon-rover design. Their extensive travels and interests in the Pacific Basin led Professor and Mrs. Meserve to move to Honolulu. He was again employed by the University of Hawaii, where he introduced and taught new courses in technology and society. He retired for the second time in 1971.

To those of us who were fortunate enough to know him, Professor Meserve was a kind, considerate, temperate, and above all humanitarian person, and he had a genuine and understanding love for his fellow men.

For many years, especially when there was a shortage of student housing, the Meserves always had one or more students from overseas in their home at 504 Thurston Avenue. Their kindness and helpfulness have long been cherished and remembered by many international students. One of his pleasures was to travel and meet with his students around the globe.

He was a faithful follower of Cornell sports, especially football and basketball. Many a night he could be found sitting at the very top of the south stand in Barton Hall. He was very active in Masonic work and had a continuing interest in the Acacia fraternity.

Professor Meserve is survived by his wife, the former Pearle I. Westervelt, a native Ithacan; his son, David; and two grandchildren, Stephen and Pamela.

M. Kim, J. L. Rosson, H. G. Smith, H. C. Torng

Emil A. Mesics

March 25, 1907 — April 15, 1991

Emil A. Mesics had an unusually varied career, ranging from driving a beer truck, teaching and coaching in high school, working as a training director for RCA, R.H. Macy and the Otis Elevator Corporation, to serving as a university professor. To put it differently, he was ideally prepared to be a member of the faculty of the New York State School of Industrial and Labor Relations, where his combination of theoretical knowledge and practical experience were invaluable in developing both undergraduate and graduate education and extension work.

Life for many years was anything but simple for Emil Mesics. For economic reasons, as a son of immigrants from Hungary, he was unable to complete his high school education on schedule, but after driving a beer truck for a while he returned to school and later earned a Bachelor's degree from Muhlenberg College and a Master's degree from Bucknell University. He was a public school teacher in West Pittston, Pennsylvania from 1928-42 where he also coached football, basketball, and track on his own time and eventually became principal at the high school. In addition, he did graduate study toward a Doctor of Education at Pennsylvania State University and studied Personnel Administration at New York University. While he was at West Pittston, he spent two years as Administrative Head of the State College of Pennsylvania State College.

In 1942 he turned to work in corporations in the fields of training and personnel. From 1942-47 he was with the RCA Victor Division in Harrison, New Jersey as Training Director and Assistant Personnel Manager of Electron Tube Manufacturing Plant. In 1947 he moved to R.H. Macy & Company in New York as a Staff Training Director and from 1948 to 1953 he was with the Otis Elevator Company, also in New York, as a Director of Training and Management Development. While there, he taught a course in Extension at the City College of New York, and also taught at New York University and Columbia. By this time, he had achieved considerable recognition in the fields of personnel and training, and was invited in 1953 to become Training and Personnel Director of the RCA International Division in East Orange, New Jersey. While there he travelled extensively, including to Brazil and Chile. Corporate life turned out to be rather a "rat race" for Emil, and was partly the reason he decided to enter academe. Cornell invited him to come to Ithaca in 1956 as a Visiting Professor. He became an Associate Professor in 1958 and remained at Cornell until his retirement in January, 1971.

His experience and personality made him an invaluable member of the ILR faculty at a time when the School was finding its way into its special role of relating academic teaching and research to the realities of the work

place. Emil Mesics was outstanding in his capacity to contribute to this goal, and taught courses in training and personnel administration to both undergraduates and graduates. He was particularly valuable in extension work, where he was skillful in helping corporate and union personnel adjust to the rapidly changing labor-management relationship.

During his first years at Cornell, in those famous and leaky Quonset huts, he worked with Korean War veterans, and also established close working relationships with the former Secretary of Labor, Frances Perkins. He considered these associations, and his work with Dean Catherwood, as one of the main highlights of his life and these days as the most wonderful time in his teaching career.

Emil was admired and cherished by his colleagues and by students for his unfailing willingness—even eagerness—to be helpful in any way possible. Although he was constantly busy, he never failed to find time for students and younger colleagues who needed his help. An attractive ILR “institution” was the Sunday gathering arranged by Emil and his wife, Margaret, at their lovely home in Varna. In pleasantly wooded surroundings, Emil ran the grill for a long time, and invited colleagues and students to come whenever they wished. There was genuine human concern and affection there for all who came, including the children, many of whom still remember hiding to escape Emil’s “For Free” Marine Corps-close haircuts.

While at Cornell, he also found time to engage in valuable extension activities, at such places as Westinghouse in Horseheads, U.S Soil Conservationists – Syracuse, Howard Johnson Management Development, the Labor Department, the Personnel Managers Conference in New York State, and many others. He also worked for the Brookhaven National Laboratories and the New York Telephone Company in the development of corporate training programs for supervisors and managers. His contribution to the School of Industrial and Labor Relations was, therefore, very impressive. His capacity to relate theory and practice was crucial while he was at Cornell.

Even after his retirement, he was indefatigable. He organized book clubs in Colorado, and subsequently in Arizona, which turned out to be very attractive to the participants. His tireless energy and devotion to learning remained until his death.

He is survived by his wife, Margaret; one son, Joseph; and two daughters, Margaret and Sally.

James A. Gross, Vernon H. Jensen, George W. Brooks

Gordon Myron Messing

March 4, 1917 — May 15, 2002

Gordon Messing, Professor of Classics and Linguistics from 1967-87 and Professor Emeritus from 1987, died on May 15, 2002 after prolonged ill-health, still deeply grieving the loss of his beloved wife and partner of fifty years, Florence, who had passed away in June 1996. He was a gentleman of profound and far-ranging learning, a lover of books, a wonderfully eccentric family man, and one of the most fair-minded and humane colleagues one could hope to have, even though his old-fashioned and outspoken political conservatism often dismayed students and faculty. For Gordon understood better than most how to see even those with whom he profoundly disagreed as individuals whose welfare should be protected, not as manifestations of an ideology to be crushed if the opportunity arose. He lent his support to all his colleagues in their times of personal and professional troubles.

Gordon Messing's education seemed clearly to mark him for the academic world. Born on March 4, 1917 in Toledo, Ohio, he graduated from Shortridge High School in Indianapolis and entered Harvard as a Conant Fellow in 1934. He graduated *summa cum laude* in Classics in 1938 and went on to take his A.M. degree in Classics in 1940 and his Ph.D. degree in Classics and Comparative Philology in 1942, at the age of 25. Gordon wrote his dissertation on Indo-European laryngeal theory, under the direction of the great Joshua Whatmough, and in Latin: "De consonantibus quae laryngophoni vocantur, praecipue quod ad linguam antiquam Graecam attinet." While the Latin of his dissertation linked him to an age that was passing, his reference, in Latin, to Greek as "ancient Greek" put him ahead of most present day Classicists, who, to the confusion of students, still style courses in ancient Greek "Greek," and those in the contemporary language "Modern Greek." The detail is important. For Gordon had spent the year following his A.B. degree, 1938-39, the eve of the Second World War, visiting Europe on a Harvard Traveling Fellowship, before pursuing his graduate work. It was then that his passion for current vernaculars and their cultural environments began to match his enthusiasm for ancient languages and philology. Significantly, when he was recalled from retirement at Cornell to teach Greek in 1988, it was to teach Modern, not Ancient Greek. Indeed, Gordon's long monograph about Modern Greek gypsy dialects, *A Glossary of Greek Romany, As Spoken in Agia Varvara (Athens)*, published by Slavica, in his home state of Ohio, in 1988, was the product of his final years as Professor of Classics and Linguistics at Cornell.

Gordon spent the four years following his Ph.D. degree in the U.S. Army. He served with the Western Task Force in North Africa, with the Fifth Army Headquarters in North Africa and Italy, and with the USFA in Austria, and was awarded the Bronze Star Medal. Yet the academic in him remained intact. He was fond of telling how he met

the philosopher Benedetto Croce in Naples, devastated by war, and searched the whole city for some suitable book to offer him as a present. He found only an old edition of Propertius. Croce appreciated it and reciprocated with one of his own books.

Although, then, given his formal education, it is not surprising to find him appointed, after the end of the war, Instructor in Latin at Bowdoin College and then Assistant Professor of Classics and Chairman of the Department of Comparative Philology at the University of Wisconsin, it is also not surprising that he left academia in 1947 and spent the next twenty years in the United States Foreign Service. He was attached to the U.S. Embassies in Vienna (1947-53), Athens (1955-60), and Reykyavik (1962-65) before returning to the Washington area and taking early retirement in 1967. In keeping with the curious parallelism of his double career and his intellectual interests, however, his most widely-known scholarly work among classicists, his revised edition of Smyth's, *A Greek Grammar for Colleges*, was published by the press of his old *alma mater*, Harvard, in 1956, during his foreign service years. His new edition is still the most complete descriptive Grammar of Ancient Greek in the English language. Unfortunately, in some ways, his revisions, while adapting the original to modern scholarship, were made just before the publication of definitive texts of the recently deciphered Mycenaean Greek. Yet no one has yet stepped in to revise Gordon's revisions.

When Gordon came to Cornell, then, he was resuming a career in teaching, but simply continuing a career of publication. Indeed, around a third of his more than a hundred publications appeared before his official return to academia. Those who knew the tweeded, conservative Gordon of Goldwin Smith Hall found it hard to imagine the other Gordon who spoke or read around a dozen modern languages, and not only conversed with gypsies on the outskirts of Athens, but catalogued their vocabulary. He was, indeed, very much a linguist in an older, polyglot, tradition, profoundly learned in literature of all epochs, a menace to visiting lecturers who misquoted a line of Byron, Pound or Elytis or commented incautiously upon the Russian novel. Language enthralled him not only as a phenomenon in and of itself, but as the vehicle of human expression, be it lofty poetry or lowly conversation. So did music. He and Florence loved all kinds of music and could sing, very ably, popular songs from many lands and many ages (and in many languages). It was always a delight to hear them singing an old French song of Mistinguette's, or a Neapolitan song by Murolo.

Although Gordon's own Modern Greek was replete with archaisms, he championed the teaching of demotic Greek at Cornell even after his retirement. It would have saddened him greatly to know that his most popular contribution to the Classics Department curriculum, "Modern" Greek, did not stay among its offerings for long

after his death. He remains the first and last scholar holding a regular, professorial appointment, to teach Modern Greek at this university.

His children Hope, Faith, Daniel, and Seth, and all his grandchildren share our pride in Gordon and his dear Florence. Perhaps it will console them to know that many at Cornell feel their loss deeply and sincerely.

Pietro Pucci, Frederick Ahl

Christian Martinus Susseg Midjo

April 8, 1880 — December 29, 1973

Professor Midjo, native of Trondheim, Norway, taught drawing and painting at Cornell for thirty-seven years, from 1909 to 1946. He died in Malvik, Norway, at the age of ninety-three. He is affectionately remembered by students of that era and by many friends as a most stimulating and demanding teacher, a dedicated and imaginative painter, and not least, as a complex and fascinating personality.

At an early age he commenced to draw and paint strange compositions based on impressions received while endlessly sailing in all weathers in and out of the wildly romantic fjords around Trondheim in a small boat, either alone or with his younger brother Arne, who later became a sea captain and an American citizen, serving in the United States Navy in World War II. Throughout his long life Midjo's painting was to reflect his early sensitivity to the more awesome aspects of nature, the feeling of eerie light and glacial spaces peculiar to the land of the midnight sun. The lonely wanderer, wayfarer, navigator, or mountaineer was to become for him in later years a recurrent theme.

At the age of eighteen he was awarded the Gregus Jacobsens Legat, a scholarship offered by the Norwegian government for five years of art study abroad. He chose to work at the Royal Academy of Fine Arts in Copenhagen, where he achieved distinction, receiving in 1903 a diploma and medal from the hand of King Christian IX, as well as money for further travel and study.

A few years later he was appointed an instructor at Cornell on the recommendation of Professor Olaf Brauner, then chairman of the Department of Fine Arts and one of the first practicing artists to hold a post in an American university.

Bringing with him the European tradition that included a fastidious and elegant appearance in the studio, Midjo was an immediate success. He was known as a man of few words; actually at that time he was a man of few English words who found that a radiant smile and an eloquent gesture or two went quite far as teaching aids. The students became accustomed to Midjo's occasionally seizing a large brush and rapidly finishing their paintings before their eyes. Accustomed to great loyalty on the part of his students, he grew to expect it, but was surprisingly tolerant of nonconformists. He was an enthusiastic and resourceful teacher.

With his wife, the former Alcinda Cummings, a talented and accomplished violinist, he lived for a time in a converted church in Bainbridge, New York.

In these early days Midjo's blithe spirit and sense of humor endeared him to his friends and their children, whom he entertained with stories and antics worthy of a great clown. He had in his repertoire a delightful performance on imaginary skis in which he pretended to lose one ski with ludicrous consequences. He did excellent impersonations including a memorable one of a very drunk Charlie Chaplin.

But Midjo's real energies were devoted to his painting, at which he worked incessantly, striving to clarify his ideas and climbing to new heights of discovery as the light was revealed. Having had successful one-man shows in Hamburg, Washington, and the Addison Gallery of American Art at Andover, Massachusetts, he turned his back on the world of exhibitions, dealers, museums, and critics, painting only to please himself and becoming increasingly difficult to please. He habitually destroyed those paintings of his that did not meet his exacting standards.

He did figure compositions, landscapes, still lifes, and a great many portraits. He painted the portraits of Professors Harry Porter Weld and Edward Bradford Titchener that hang in Uris Hall; George Lincoln Burr, whose portrait is in the White Historical Library; Professor Alexander Drummond; Professor Frederick Marcham; and Dr. Anders Wedborg of the University of Stockholm. He also painted a portrait of Jerome "Brud" Holland, then a Cornell football player who later became a university president and ambassador to Sweden. Other portraits include those of Mrs. Frank Morse, Mrs. Richard Robinson, Mrs. Martin Samson, Sr., and "Dean" Carman, for many years the custodian of White Hall, then the location of the College of Architecture. The Telluride Association owns six western landscapes painted by Midjo while he was artist in residence at Deep Springs College, California. A large and colorful painting by Midjo of shore birds hangs in the town hall of Cayuga Heights. Mr. and Mrs. F. W. Dannenberg of San Francisco, who are avid collectors of Midjo's paintings, have donated several of them to Father Flanagan's Boys' Home in Boys' Town, Nebraska, to create a memorial to the artist.

After retirement, Midjo went to California, spending six years at Oakland and later moving to Sacramento, where a friend from Cornell days built him a studio. In 1961 he returned to his native Trondheim and made his home with his brother Arne, who also built him a studio. He continued to paint until the last year of his life, though he remarked from time to time, "The light is not what it used to be."

Thomas H. Canfield, John A. Hartell, James O. Mahoney

Howard Jay Milks

June 25, 1879 — March 30, 1954

Howard Jay Milks served Cornell University continuously for thirty-eight years, and was Professor of Therapeutics and Small Animal Diseases, and Director of that Department in the College of Veterinary Medicine at Cornell at the time of his retirement in 1947. He was born in Candor, New York on June 25, 1879. His death on March 30, 1954 was too soon. Between those dates Doctor Milks lived a full life. He is survived by his wife, Lena Vose Milks, and three sons, Clifford H. Milks of Owego, New York, Raymond C. Milks of Ithaca, New York, and Richard V. Milks of Penfield, New York.

Following graduation from the Candor High School in 1898, a spell of school teaching and two years in the Cortland Normal School, he entered the Veterinary College at Cornell, from which he received his D.V.M. in 1904. In 1904 he was appointed assistant to Doctor P. A. Fish in Physiology and demonstrated his ability as an investigator, being the first to show that mucin was actually produced by the kidney of the horse. He had over a year of general practice in Watertown, New York and Cincinnati, Ohio before doing further research, for two years, as Animal Pathologist in the Louisiana State University Veterinary Experiment Station at Baton Rouge, Louisiana. While there, he demonstrated the lesion of equine encephalomyelitis for the first time. In 1908 and part of 1909 he engaged in general practice in Owego, New York. His ability to teach and to investigate led Dean Veranus A. Moore to appoint Doctor Milks, in 1909, to head the newly formed Department of Materia Medica and Small Animal Clinic.

Doctor Milks had the unusual ability to teach students to become successful surgeons and leaders in small animal and general practice.

Doctor Milks wrote the first comprehensive book in the field of veterinary pharmacology. His "Practical Veterinary Pharmacology and Therapeutics" has become the standard textbook among veterinary colleges in America, necessitating some seven editions. He also was author of the "Laboratory Guide in Pharmacology and Materia Medica." He wrote on many canine disease conditions, producing over thirty papers in all. His paper on diabetes in the dog was the first in this country, as was also his paper describing lung worms in the dog.

Doctor Milks gained much enjoyment from associations with people, being a member of the Congregational Church and the Rotary Club of Ithaca, a member of Hobasco Lodge 716 F. & A. Masons of Ithaca and the Scottish Rite Bodies of Ithaca and Binghamton, New York. He was a charter member of the Southern Tier Veterinary

Medical Association (New York) ; a member of the American Veterinary Medical Association and the New York State Veterinary Medical Society, of which he was secretary from 1909 to 1914 and president in 1934. He founded the small animal section of the American Veterinary Medical Association and served as section secretary from 1928 to 1932. He was honored as a Fellow of the American Association for the Advancement of Science and by memberships in Sigma Xi, Phi Kappa Phi and Phi Zeta.

We could go on and on listing the important contributions to veterinary medicine made by Howard Jay Milks. However, we would like to stress his influence on his fellow faculty associates and upon his students. We would like to remember him as one who did not make snap judgements; who could understand; who loved his family and his fellowmen; who was imbued with the Cornell Spirit that led him to believe in freedom of thought accompanied by a sense of responsibility; who was devoted to veterinary medicine and finally, who was a friend of all of us. His monument will be the contribution he has made toward the advancement of the art and science of veterinary medicine.

M. G. Fincher, H. C. Stephenson, D. H. Udall

Frank Barton Miller, Jr.

May 2, 1921 — March 2, 2006

Frank Miller was a man of open, generous spirit, a quality that marked his entire personal and professional life. Frank spent much of his youth in Portland, Oregon and attended Reed College majoring in psychology. There he met Charlene Welsh who was to become his wife and close partner for 60 years.

Frank served in the Army, 1943-46, in the South Pacific as a medic and sometimes chaplain's assistant. After the war, now married, Frank worked for several years in various personnel-related jobs before heading to Ithaca and graduate study. He enrolled in the new School of Industrial and Labor Relations with a concentration in areas of personnel administration and human relations. One of his teachers was William Foote Whyte who supervised Frank's research on workplace interactions among the artisans of the Steuben works at Corning Glass.

Frank joined the ILR faculty in 1954. His teaching and research focused on personnel administration, the sociology of occupations, and applied human relations. He was particularly interested in the history and development of the field of personnel administration. He became a supporter to further professionalize the field through writings such as "Why I'm for Professionalizing" and "The Personnel Dilemma, Professional or Not?".

For many years Frank served in a number of administrative positions in the ILR School including Director of the Office of Resident Instruction, Chairman of the Department of Organizational Behavior and Chairman of the Department of Manpower Studies. Especially noteworthy, Frank Miller designed the first course on women in the workplace. He persuaded Professor Emerita Alice Cook, whose career had been significantly devoted to studying issues facing working women, to come out of retirement to co-teach with him. Later they were joined by Professor Jennie Farley in the course, which has become a continuing part of the ILR curriculum.

On sabbaticals, Frank shared his knowledge with students in Turkey, England, Mexico and Canada. At Istanbul University, his lectures were translated into Turkish and became a text for use in personnel studies. His visit also fostered a continuing exchange between Turkey and the ILR School.

For twenty years at university ceremonial events, Frank Miller, decked in his academic robes, would lead the procession as Cornell Mace Bearer. It was a role he enjoyed enormously and performed faultlessly, even though kindly Frank was hardly a menacing presence.

After his retirement in 1985, Frank continued for ten years teaching periodically in New York City as part of the ILR/Bernard Baruch College graduate program. He also served as a leader and volunteer in a variety of Cornell retiree activities including programs in the local public schools and at the hospital.

Within the ILR community, Frank was regarded as the School's own poet laureate, a versifier of great talent. No matter the occasion, he could be counted upon to produce verse of exceptional wit and charm. This talent was always displayed with evidence of his wide reading and taste for language while being delivered with modesty.

Together with wife, Charlene, Frank shared a deep interest in music, theatre, dance and the arts. Besides his wife, Frank is survived by four devoted children, Stephen, Patricia, Kevin, and Brian.

Frank Miller will be remembered for his integrity, as well as the compassion and respect with which he treated everyone. His friends and colleagues miss his presence.

Ronald Donovan, William W. Frank, William J. Wasmuth

James Gormly Miller

January 5, 1914 — September 12, 1995

In the founding and development of almost every institution, there are always a few individuals who play a critical role in its success. J. Gormly Miller was such a person. There is no question that without the vision, energy and talent for organization that Gormly brought to his task as its first Librarian, the School of Industrial and Labor Relations would have taken much longer to achieve its place as a major center of teaching and research in its field of study. In Gormly's case, "a man of many parts" was the reality, not the cliché so often attributed to the departed. Scholar, innovator and leader in the field of library management, institution builder and planner, but also a strong contributor to the political life of the Ithaca community, a devoted family man, all supported by a gracious personality describe the person whose life and accomplishments we attempt here to memorialize.

Gormly came to Cornell in Fall 1946 from Rochester, New York, his place of birth. Only recently discharged from military service, which included participation in the Normandy landings albeit in a non-combat status, Gormly was recruited by Dean Ives to build a working collection of industrial relations materials as quickly as possible. Although Gormly had had nearly five years of experience in the Rochester Public Library prior to his military service, he had no special knowledge and background in the social sciences let alone the unique field of industrial relations. On that account, it is all the more remarkable that in a few brief years the ILR library, under his leadership, not only was serving the teaching and research interests of the School's faculty and students, but was widely used by others at Cornell. Moreover, visitors and others familiar with longer-established collections at other academic institutions almost invariably remarked that the ILR collection was at least the equal of its peers in the field of industrial and labor relations.

In large part, given his initial unfamiliarity with the field and with the requirements of a virtually unique academic institution, the stature of the ILR Library must be credited to two significant aspects of Gormly's approach to his task. First, as everyone has reported to this committee, he insisted that the overarching responsibility of the library staff was service to the students and faculty. Whatever books and other printed materials might be needed, every effort would be made to add them to the collection and to make them readily accessible to users. The other was Gormly's early recognition and understanding of the unique character of a library devoted to instruction and research in its field. As Professor Emeritus Walter Galenson, an eminent labor historian told us, the materials for research, such as union publications and documents, are extremely difficult to acquire. The collection of such material under Gormly's direction Galenson describes as "pure gold."

Gormly's preparation for his career began after high school with the A.B. degree from the University of Rochester in 1936, where he majored in English. From there he went on to Columbia University where, in 1938, he received the B.S. degree in Library Service. With that background, he returned to Rochester to join its public library staff, remaining there until inducted into military service in 1943. Before leaving Europe under a special program for American servicemen, he spent Fall 1945 at the University of Paris in its bibliographic program in the Ecole des Chartes. Discharged in 1946, he returned to his hometown and its public library. His career at Cornell began with his appointment in 1946 as Librarian of the School of Industrial and Labor Relations. His talent and approach to that responsibility were soon accorded the unusual (for librarians of the day) recognition of academic rank. In 1949, he was appointed Associate Professor with tenure. In 1956, he earned promotion to full Professor.

Contemporaries of Gormly recall two facets that epitomize his career as librarian. Dean Martin Catherwood, once somewhat facetiously but with genuine appreciation, referred to him as the "Empire Builder." For Gormly, development, improvement and expansion of the ILR Library as a service institution received his continuing and unremitting attention. He was never satisfied with the status quo, but continually sought more funds to improve and expand the library's services. At the same time, he actively involved himself as a teacher in the School's academic and extension programs, and encouraged others on the library's staff to do so.

The other facet of his career, to the mild amusement of his friends and colleagues, was an apparent inability to retire once and for all. The record shows at least four such episodes. They reflect Gormly's commitment to serving his communities, both the academic and the civic, so long as his talents were useful.

Building and developing the ILR Library may have been Gormly's original intention and goal, but a series of fortuitous events combined with his immense talent for planning and management led his career well beyond that initial stage. In 1956, Dean Martin P. Catherwood, recognizing Gormly's organizational and management skills, asked him to take on the task of planning and coordinating the ILR School's move from its war-surplus buildings to its present location on the old site of the College of Veterinary Medicine. For six years, until the transfer to that site in 1962, Gormly managed to keep both the process of transition and the management of the ILR Library going like a well-oiled machine. At that point, his announced intention was to devote himself exclusively to being a librarian. Stephen McCarthy, then Director of Cornell libraries, had other ideas; and Gormly, in 1962, became Assistant Director of Libraries for Personnel and Budget. For the second time, in 1970, he retired, was named Professor Emeritus, and then skipped off to Geneva, Switzerland to serve for almost four years as Deputy Chief of the Central Library and Documentation Branch of the International Labour Office. In February 1974, he "retired"

from that position to take on once again for a year the job of ILR Librarian. In February 1975, he became Cornell's Director of Libraries, a position he held until another retirement in July 1979. For a while, Gormly continued to work on special projects and as a consultant on computerization of the Cornell library system. In September 1985, he held the office of Acting University Librarian until retiring in December 1986. Gormly remained professionally active as a consultant until his death, at which time he was engaged with former Dean Robert B. McKersie and others in the preparation of a volume commemorating the 50th anniversary of the ILR School.

His profession was not Gormly's only interest. Although his parents were staunchly Republican, probably the experience of the 1930 Depression turned him, like so many others of his generation, to the appeal of the Democratic Party. For Gormly, however, this was more than just dutiful registration and voting for the party's candidates.

He took a much more active role, initially at a time in Ithaca when a Democrat in any elected public office was a rarity. Gormly served twice, first in 1959-63 and for one year in 1968, as alderman on the Ithaca City Council. He twice served on bipartisan commissions to revise the City's charter, though in both cases the commission failed to persuade the electorate to support its proposals. Gormly also served as commissioner of the Ithaca Civil Service Commission, and Chairman of the City's Democratic Committee.

Gormly's strong sense of community extended to other areas as well, including the Boy Scouts and to St. John's Episcopal Church where he served as vestryman and as teacher in its Sunday school program. As one of our colleagues put it, with Gormly "voluntary public service was integral with his faith."

The foregoing account of Gormly's professional and public life would be incomplete, possibly even misleading, without taking notice of his personal life. Indeed the quality of his personality doubtless contributed to the success of his professional and social enterprises. Gormly was first of all a devoted family man. He and Mildred, who passed away shortly after Gormly, were a devoted couple who lived and worked together as equal partners in raising their family of three children. They apparently believed in the "invisible hand" approach to child rearing, leaving the children, each in their own way, to discover and develop their talents. In moments of leisure, Gormly liked to garden and occasionally to sketch. He had little interest in sports, organized or otherwise, preferring reading fiction, history, etc.

Without exception Gormly's colleagues have commented on his modesty, warmth and genuine affability. Gormly was that rare individual who is instantly likable. Gracious and friendly, honorable and generous in his relations

with everyone, clear-headed, unflappable in the face of the unexpected or unplanned, open to the ideas of others, and with a fine sense of humor; all of these describe our friend and colleague whose presence so enriched our lives in manifold ways.

Gordon T. Law, Jr., Jean T. McKelvey, Robert L. Aronson

John I. Miller

October 16, 1911 — December 8, 1980

John I. Miller, professor emeritus of animal science and member of the faculty at Cornell for forty years, made major contributions to education and research and to the development of the livestock industry in the Northeast.

Born in Prescott, Kansas, on October 16, 1911, Professor Miller grew up on a general crops and livestock farm. In 1933 he earned the Bachelor of Science degree in agriculture at Kansas State University, where his leadership qualities were recognized by his election as president of the Block and Bridle Club and of the agricultural student body. As an undergraduate he received the Alpha Zeta Scholarship Award and the Danforth Fellowship Award and was a member of intercollegiate judging teams in livestock, meats, and poultry. He graduated with honors and was recognized as the outstanding graduating senior in agriculture.

Professor Miller entered the graduate school at Cornell University and received the Master of Science degree in 1934 and the Doctor of Philosophy degree in 1936, with major work in animal science under the direction of F. B. Morrison. He was appointed instructor in animal husbandry at Cornell the year he graduated and was promoted to assistant professor in 1938. His interest in teaching, research, and service to livestock producers resulted in promotion to associate professor in 1942 and full professor in 1944. Professor Miller was in charge of teaching and research involving beef cattle until his retirement in 1976, and was also in charge of the meats division from 1943 to 1956.

Professor Miller was best known for his contributions as a teacher and adviser of undergraduates. Throughout most of his career, he carried the heaviest teaching load of any staff member in the department; at various times he taught five different courses. Over six thousand students were taught by Professor Miller. He also had an active research program and directed the graduate programs for about fifty American and foreign Ph.D. students and about half this number of M.S. candidates. Professor Miller was successful as a teacher because he always had an excellent grasp of subject matter, was fair and objective in his appraisal of his students, and could pass on his own genuine interest to those around him. His standards were high and the students respected him. His courses in beef cattle production, livestock selection, and management always attracted unusual numbers of students year after year despite the fact that New York is primarily a dairy cattle state. The livestock judging teams under Professor Miller's leadership and teaching made distinguished records in national competition from 1936 to 1963, when he retired from coaching. He coached a total of eleven winning teams and sixteen high men in national contests,

with one or more wins in every category. The overall records at the international contest in Chicago during the years when his teams competed ranked Cornell ninth among all universities, with the next highest eastern team ranking about twentieth.

Throughout his career, Professor Miller served each year as faculty adviser for thirty to fifty undergraduates. He served also as adviser to the Round-Up Club and to Ho-Nun-De-Kah (student honorary club in the College of Agriculture). A list of Professor Miller's former students resembles a who's who in New York State and in American agriculture. Included are dozens of current leaders in livestock production; in agriculture business and banking; in university animal science teaching, research, and extension in the United States and abroad; in governmental agencies; and in agricultural industries.

Professor Miller conducted research on practical problems related to beef cattle production, with special emphasis on needs of the livestock industry in New York State and the Northeast. His first priority in publishing data was to put the information in a form that associates, students, county agents, and livestock producers could use. Most of his research data were therefore published in mimeograph, although he also published results of a number of his studies in scientific journals. Professor Miller conducted research that was used by F. B. Morrison for recommendations on the protein requirements of beef cattle and sheep in his widely read textbook *Feeds and Feeding*. His research was also useful in developing the first National Research Council standards for sheep in 1945. Extensive trials were conducted to determine how to best utilize New York's permanent pastures in the growing and fattening of steers. Results of these investigations helped in developing guidelines for including pasture and forage crops in the feeding programs of beef cattlemen in the Northeast. A publication based on these experiments to determine the feeding value of common roughages placed first in national competition. His experiments with using propionic acid to preserve high-moisture corn were the first on this subject at a United States experiment station.

Professor Miller provided leadership in initiating a number of extension-related activities. He helped establish the New York Beef Cattlemen's Association, the Empire Livestock Marketing Cooperative, and the first Herdsman Training School in cooperation with a state breed association. He started the first official herd classification program for beef cattle (1945); in 1957 the American Angus Association adopted a national type-classification program based on the New York plan.

Professor Miller made outstanding contributions to the American Society of Animal Science (ASAS). Four years following his appointment to the Cornell staff, he was elected president of the North Atlantic section and member

of the Executive Board of the ASAS. He then held a number of positions in the society, including member of the editorial board, business manager of the *Journal of Animal Science*, treasurer, vice president, and then president in 1955. After his term as president, he served as a director. In addition, he sat on many committees of the society, including Feed Evaluation, American Feed Manufacturers Award and Morrison Award Committees, Revision of Awards Procedures, Distinguished Service Award Committee, and Nominations Committee. He served as a member of a University committee on feed requirements for livestock.

In recognition of his outstanding contributions to agriculture, Professor Miller received a number of honors and recognitions. He received the New York Farmers Award for outstanding achievements in agriculture in 1951, the Distinguished Service Award, North Atlantic section, ASAS, in 1961, and the honorary Fellow Award of the ASAS in 1980. He was a member in a number of honorary and scientific societies, including Alpha Zeta, Phi Kappa Phi, Gamma Sigma Delta, Sigma Phi, American Society of Animal Production, and American Association for the Advancement of Science. He has been listed in *Who's Who in America* since 1954, in *American Men of Science*, and in *The Blue Book: Leaders of the English-Speaking World—England*. A scholarship fund honoring Professor Miller and Professor Emeritus Myron D. Lacy was established in 1974 by friends and associates among livestock breeders and organizations in New York State.

Professor Miller is survived by Mrs. Miller, the former Viola Henry; a daughter, Carol; and two sons, Robert and James.

Kenneth L. Turk, George H. Wellington, Danny G. Fox

Malcolm E. Miller

August 1, 1909 — April 18, 1960

Malcolm E. Miller, born on a dairy farm in Durrell, Pennsylvania, received his high school education at Towanda, Pennsylvania (1928), his preveterinary training at Pennsylvania State University (1930), and the degree of Doctor of Veterinary Medicine (1934), the Master's degree (1936), and the Doctor of Philosophy degree (1940) at Cornell University. He was appointed in 1934 to teach in the Department of Anatomy of the Veterinary College. He served continuously until the time of his death April 18, 1960. In the Department of Veterinary Anatomy, he was the student assistant from 1932 to 1934, instructor from 1934 to 1940, Assistant Professor from 1940 to 1945, Associate Professor from 1945 to 1947, and Professor and Head of the Department from 1947 to 1960. He was Secretary of the Veterinary College from 1948 to 1960. In addition he served on many important committees of the College Faculty.

The international reputation which Professor Miller enjoyed was earned largely through his contribution to the advancement of the teaching of gross anatomy, particularly of the dog. His thesis for the Ph.D. degree in 1940 was entitled "The Dissection and Study of the Trunk of the Dog." His *Guide to the Dissection of the Dog*, published in 1947, is in its third edition and has been widely used in the veterinary anatomy laboratories of the English-speaking colleges. In 1946 Dr. Miller began the preparation of a textbook on the anatomy of the dog. He worked long and hard on this project, which was interrupted by frequent illnesses. Only a few weeks before he was hospitalized for his terminal illness, the contract was signed with the publisher for *The Anatomy of the Dog*. This monumental work of some 750 pages containing over 350 illustrations is to be published posthumously over his name. It is indeed most unfortunate that he was not spared to see the culmination of his efforts.

Former students will always remember Professor Miller not only for the quality of his teaching but also for his interest in their problems both in and out of the classroom. His classes consisted of students who were in their first year of the professional curriculum where his kindness, patience, and consideration were particularly valuable to those so often discouraged and lost in a new field. He carried on the philosophy of Professor Hopkins of the original Faculty in veterinary anatomy that all students have the ability to do the work but that some require more assistance and guidance. He was definitely a leader, never a driver.

He was partially incapacitated by illness in 1937, never completely recovered, and had many serious operations which provided only temporary relief. It was an inspiration to his students and to his colleagues that he was never

depressed by his unfortunate circumstances. He never expected others to share his burdens. He gave of himself to the best of his capacity and asked no quarter of any man. He was a member of many professional and scientific groups including Alpha Zeta, Phi Zeta, Phi Kappa Phi, Sigma Xi, Omega Tau Sigma, Southern Tier Veterinary Medical Society, New York State Veterinary Medical Society, American Veterinary Medical Association, American Association of Anatomists, American Society of Zoologists, American Association of Veterinary Anatomists, of which he was twice elected president, and the World Association of Veterinary Anatomists, on whose nomenclature committee he served. He served also on the nomenclature committee of the American Association of Veterinary Anatomists for many years.

He was active in community affairs in Danby where he was one of the leaders responsible for the Danby Federated Church and served on many important committees of the church. He was a member of the board of trustees, serving as president during the last year. He was frequently called as a consultant during the formation of other church federations. He gave unselfishly of his time and counsel in many worthwhile community projects. He is survived by his wife, Mary (Cornell '35) ; a son, Jesse (Cornell C.E. '60) ; and two daughters, Faith (Cornell '62) and Sharon. He gave as fully to his avocation of hunting and gardening, time and health permitting, as he did to his other interests. Over the years many a colleague and student have shared the pleasures of a day afield with Dr. Miller and his dog. Hunting companions were always welcome.

Of his many virtues the most admirable was probably the superb courage with which he endured physical infirmity for 23 years. His was a philosophy of optimism closely entwined with realism. This was reflected in his daily contacts with his fellow men and the goals which he set for living.

Gordon Danks, R. E. Habel, E. P. Leonard

William T. Miller

August 24, 1911 — November 15, 1998

Professor Miller was born in Winston-Salem, North Carolina, educated in the schools of the area, and graduated from Duke University with a Bachelor's degree in 1932. He did graduate work with Lucius A. Bigelow at Duke, one of the first to use elemental fluorine in organic synthesis, receiving his Ph.D. degree in 1935. He was then a Lilly Fellow at Stanford University, and in 1936, he came to Cornell as an Instructor in the Department of Chemistry. He then initiated a vigorous research program in fluorine chemistry to show that the uniquely high chemical reactivity of this element could be used to form an unusual variety of compounds with uniquely high chemical stability.

World War II broke out soon after Miller came to Cornell, and at the age of 30, he was recruited for the supersecret Manhattan Project, supposedly to synthesize "special materials that would lubricate bullets". Actually, a major objective of this project was to separate the fissionable U-235 from the stable isotope U-238 using "gaseous diffusion". In this process, the different isotopes make their way through the torturous paths of a porous barrier at slightly different rates so that the U-235 can be enriched sufficiently to undergo a nuclear explosion. However, the only convenient gaseous form of the unusually heavy element uranium is UF₆, which is nearly as reactive and corrosive as elemental fluorine itself. Worse yet, any fluorination with UF₆ produces UF₄, a solid that clogged the diffusion membrane. Although stainless steel could be used for many parts of the diffusion plant, UF₆ resistant materials with other physical properties, such as oils, greases, and gaskets, were also critically needed.

The resistance of the new polymer Teflon that contains only carbon and fluorine initially appeared to be very promising, but at that time, it turned out to be very hard to fabricate, was impure, and could only be produced as an intractable solid. Teflon gaskets leaked because the polymer exhibited "cold flow" under pressure. With Manhattan Project encouragement, other fluorine chemists tried to convert hydrocarbon oils, greases, etc. to fluorocarbons by replacing the hydrogen atoms with fluorine atoms; however complete replacement was nearly impossible, and a single remaining hydrogen atom was a fatal link in the chain of chemical stability.

Miller devised a brilliant alternative approach to this problem. He emulated the synthesis of Teflon, in which molecules are built up by polymerizing tetrafluoroethylene, C₂F₄. To achieve modified physical properties, he used C₂F₃Cl rather than C₂F₄. By 1943, the Miller approach appeared to be the only promising route, and his research group was moved to the Manhattan Project at Columbia University, "inside" the secret project where they could

interact directly with the diffusion plant designers on their specific material requirements. In an intensive day-and-night research effort, they synthesized a wide variety of UF_6 -resistant products: liquids for vacuum pump oils (the diffusion process was carried out entirely under vacuum), heat exchange fluids, greases and waxes for lubricants, and solids for gaskets, valve seats, and windows (UF_6 attacks glass). Critical to this was their basic research that determined how such physical properties depend on composition and molecular weight.

Polymer chemistry in the 1940s was an infant field; nylon and polystyrene had just been invented. The Miller group pioneered in solving polymer chemistry problems involving these unique new materials, such as separation, purification, and characterization. For these critical research contributions, Miller received the personal commendation of Major General Leslie Groves, the Manhattan Project military commander: “these materials were essential to our success”.

Miller’s research constituted an important part of Cornell’s early and continuing leadership in polymer science. Peter Debye, who received the Nobel Prize before coming to Cornell, developed during WWII, the method of light scattering to determine the molecular weight of polymers, a method that had a very important impact on the synthetic rubber program. Paul Flory, who joined the Cornell chemistry faculty in the late 1940s, received the Nobel Prize for his basic polymer research. These were the first of many world class polymer research programs at Cornell.

On his return to Cornell as a full Professor in 1946, Miller embarked on a broad scale basic research program that established his laboratory as a world center in organofluorine chemistry. He pioneered and illustrated the broad applicability of elemental fluorine syntheses; the extension of these basic concepts developed by his research group showed that an unlimited number of highly fluorinated carbon compounds could exist, and that such compounds exhibited a diverse and exciting chemistry. They demonstrated that fluoroolefins were also unusual in the great ease with which they suffer nucleophilic attack on the unsaturated carbon, with even halide anions showing useful reactivity. Contrary to the mechanistic expectations of the time, fluoride ion was shown by far the most reactive, with addition and rearrangement reactions analogous to those of a proton as an electrophile for unsaturated hydrocarbons. His research made possible elegant syntheses of a variety of interesting fluorohalo compounds. In later research, he discovered and exploited fluoroorganometallic compounds involving metals such as copper, mercury, and silver that showed unusual chemical reactivity.

For the Cornell Department of Chemistry, Miller played a key role in our only building project since 1923, overseeing the construction of the S.T. Olin Laboratory in the mid 1960s and the subsequent renovation of

Baker Lab. Miller visited recently constructed chemistry buildings around the country and recommended the architectural firm that had also designed the chemistry building at Brookhaven National Laboratory. Convincing the Cornell administration of this choice was a first, as the architect was not a Cornell alumnus. A unique part of Professor Miller's plan for the building was a new style of small teaching laboratory, optimized for the interaction of a small group of students with a single teaching assistant. Miller also took a very active role in construction oversight and in obtaining construction materials of far greater quality and at far lower cost, such as acid-resistant stainless steel ductwork for the chemical exhaust hoods, at nearly the cost of much inferior galvanized material through his industrial contacts. Twice, Miller was a Chemistry delegate to the Faculty Council of Representatives.

The uniquely reactive element fluorine was discovered by the French chemist Henri Moissan in 1886, for which he received the Nobel Prize. In 1986, Professor Miller received the Moissan Centenary Medal, as Moissan's worthy successor in fluorine chemistry. Miller also received the American Chemical Society Award for Creative Work in Fluorine Chemistry in 1976, the year of his retirement, and a special Festschrift issue of the *Journal of Fluorine Chemistry* was dedicated to him on his 70th birthday in 1981. He was a member of the American Chemical Society and the Royal Society of Chemistry of Britain.

The home that the Millers built next to Sunset Park in Cayuga Heights with its spectacular view of the Cayuga Lake valley was a tribute to their unusually good taste and to their passionate attention to detail. Here, Miller's love of the most challenging problems was also shown by his outstanding success with prized varieties of grapes, walnut trees, persimmons, and espaliered pears.

He is survived by his wife of 47 years, Betty Robb Miller; his brother, Robert L. Miller, of Panama City, Florida; his nephew, Robert Miller, of Belfast, Northern Ireland; and his niece, Katherine Johnston, of Opelika, Alabama.

Jerrold Meinwald, Charles F. Wilcox, Fred W. McLafferty

G. Cory Millican

August 28, 1920 — July 19, 2003

G. Cory Millican, Professor Emeritus of Design and Environmental Analysis (DEA), died on July 19, 2003, at Robert Packer Hospital in Sayre, Pennsylvania. He was 82 years old. He had been a faculty member of the College of Human Ecology from 1956 until his retirement in 1990. From 1949-55, he taught in the College of Architecture and Allied Arts at the University of Florida. He was a Veteran of World War II.

Cory had a strong passion for design history that took him around the world to gather first hand information and slides on historic architecture and interiors. He visited, photographed, and conducted research on the cultural and technological context of major sites in virtually every country. In addition to the major sites, he was always careful to include views of vernacular buildings and interiors of each of these locations and periods. He developed an extensive collection of slides and books with which he enriched his courses. Upon his retirement, he donated this collection to DEA. To this day, alumni from a wide variety of age groups remark on the wonderful classes they had from Professor Millican and of the effect he had on their careers and lives. Rhonda Gilmore, who received her Master's degree from DEA and is now a Lecturer in the department, said:

“When I first walked into Professor Millican’s office many years ago, I was immediately impressed with the quantity of books in his collection. I had never seen so many in one person’s office in my entire life. His gracious demeanor and witty comments made me feel welcome here at Cornell. Cory represented a generation of professors who lived an existence characterized by what they taught. He lived design history. He was both absorbed by and saturated with it. In so many of the discussions we had over the years, he related what we were talking about to design history. He leaves a legacy of cherished friends and a passion for his field that had an impact on many people.”

Thresa Gibian, a New York Certified Interior Designer and a graduate of DEA (B.S., 1984) had this to say about Cory:

“The most important aspect of Cory’s teaching that I remember was his enthusiasm. He really enjoyed the details of design. He was a passionate teacher who by his excitement could easily infect you to ‘feel’ the same love of details in art, architecture and furniture -- the design details that are repeated in many elements within a space or out in the landscape. He had a great sense of humor and quick wit. He was careful in his thoughts and encouraging of his students. I now practice interior design and see the value of tending to the details on my projects or within the spaces I have created for my clients.”

Cory’s colleagues also developed an appreciation of his strong sense of the lasting quality of design. Many now concede that he was right in his assessment of the sterility of the modern movement long before it became fashionable to be critical of it.

Cory made important contributions to the countries he visited. He was especially willing and fascinated to work in the developing world. During a sabbatical leave in 1976 and 1977, he and his wife Virginia (Ginny) moved to Dammam, Saudi Arabia, where Cory served as Acting Head of the Department of Architecture and Acting Dean of the College of Architecture and Urban Planning at King Faisal University. Cory was responsible for the development of a five-year program leading to the Bachelor of Architecture degree and the planning for a Master's program in this area. He also developed an undergraduate and graduate program in Interior Design. This leave had a lasting impact on Cory and Ginny. As Cory wrote in his Sabbatical Leave report:

"I am sincere in stating that this sabbatical leave was everything I expected and much, much more. I have long been intrigued with the Middle East, Islam, and the Arab world in general. I have previously visited Morocco, Turkey, Lebanon, and Egypt, and managed during this leave to visit Iran, Jordan, Kuwait, and Israel. This leave provided the opportunity for us to photograph Paris (4 days enroute) and to record many sites – Jerash, Medaba, Persepolis, Isfahan, Kerak, Cerbak, Petra, Amman, Jerusalem, Bethlehem, Mt. Nebo, Shiraz, Dammam, Al Kobar, the Jordan Valley, and Jerico to name a few. All of this photography enriches the course material for my history courses and provides slides which are unattainable elsewhere... when it came time to leave we left reluctantly and were a bit sad. We made many close friends and shall always remember this place and time with great fondness."

Cory spent another sabbatical leave teaching at the Macdonald Institute of the University of Guelph in Ontario, Canada. He was assigned to develop new courses and assist with long range planning for two evolving departments there. He designed a new course, Man and Shelter, with the expectation that he would be teaching 35 students. When the course was announced, however, he learned that he would have to accommodate over 100, which he did happily. He knew little of Canada before this experience, but enmeshed himself in this situation. At the end of his leave, he wrote that he had never been received by such genuinely hospitable, tolerant people—not just in the academic community but in all cross sections of his experience there. He stated: "There's a sincere, gentle acceptance of the individual which has endeared this place and peoples to me." The University of Guelph wanted Cory to stay and offered him a permanent position on its faculty. To Cornell's benefit, he decided to return to Ithaca.

For 34 years, Cory lived with his family in the historic Nineteenth Century Reemer House on Hudson Street in Ithaca. He loved keeping the house in excellent condition and did many repairs himself. His collection of masks, many of them from Africa, were displayed in prominent places throughout the residence. He enjoyed collecting antiques and restoring them in the old carriage house behind the home.

Cory will be missed by many – by generations of students to whom he was truly dedicated, by colleagues who appreciated his sense of humor and friendly demeanor, and by faculty members he willingly mentored in the early years of their tenure. All who were fortunate enough to know Cory understand what it means to be influenced by a gifted, caring, and gentle spirit.

William R. Sims, Joseph Laquatra

William Frederick Millier II

August 31, 1921 — February 13, 2002

A precise professional, an innovative engineer, and a ready resource for solving technical design problems has departed from the Ithaca scene. His teaching of the fundamentals for tractor power, and the specific needs for agricultural machines has helped many students to excel in their careers. His research with forage conveying, fruit harvesting, seed pelleting and pesticide application has helped many consumers benefit from low cost fruits and vegetables. During his lifetime, Bill Millier was also recognized as a faithful fireman, careful clock repairman, conscientious churchman, stubborn golfer, and loyal family leader.

William Frederick Millier was born on a farm in Mottville, New York, a few miles southeast of Skaneateles. His schooling started in a one room rural school in Sennett, and in spite of regular farm chores, he was one of the leading scholars of his class at Skaneateles High School. He entered the College of Agriculture at Cornell University in 1938. The advent of a war emergency program found Cornell undergraduate Millier preparing special bulletins to help farmers. His bulletins included “Tune up the Tractor”, “Cultivator Adjustment” and “Common Binder Problems.” As an additional contribution to the war effort, he joined the Army Air Corps in 1944, and served as an electronics technician until World War II ended.

Bill received his Bachelor of Science degree from Cornell’s College of Agriculture in October 1945. He then took a position as a District Agricultural Engineer in the Department of Agricultural Engineering, which often led him to Auburn, New York, where he married his lifetime partner, Mary Sumislawski, at an August 1947 wedding.

Recognizing the need for a graduate degree and the challenges of ventilating dairy barns, Bill became a Research Assistant working with Professor Clesson Turner and earned his Ph.D. degree in 1950. Their innovative work created a ventilation system that remains a seminal development in ventilation of structures for dairy and other animals. A half-century later in 1998, this work, developing a slot inlet ventilation system, was recognized by the American Society of Agricultural Engineers. A plaque installed at the front entrance of Riley-Robb Hall on the Cornell campus honors Professor William Millier. The inscription reads:

SLOTTED INLET VENTILATION
AN HISTORIC LANDMARK
OF
AGRICULTURAL ENGINEERING

A CRUCIAL STEP IN THE EVOLUTION OF MODERN ANIMAL AGRICULTURE WAS THE DEVELOPMENT OF MECHANICAL VENTILATION METHODS FOR ANIMAL HOUSING. AIR INLETS ARE PIVOTAL TO GOOD VENTILATION.

IN 1948, WILLIAM F. MILLIER, WORKING AT CORNELL UNIVERSITY UNDER THE DIRECTION OF PROFESSOR CLESSON TURNER, TESTED AND PUBLISHED THE CONCEPT OF THE SLOTTED INLET. PROFESSOR TURNER AND OTHERS AT CORNELL UNIVERSITY SUBSEQUENTLY CONTINUED TO DEVELOP SLOTTED INLET SYSTEMS AND SYSTEMATIZE DESIGN METHODS.

SLOTTED INLETS WERE QUICKLY AND WIDELY ADOPTED THROUGHOUT THE UNITED STATES TO IMPROVE FARM ANIMAL ENVIRONMENTS AND HAVE BEEN THE MOST WIDELY USED INLET TYPE FOR MECHANICALLY VENTILATED AGRICULTURAL BUILDINGS.

DEDICATED BY THE ASAE

1998

In 1950, the opportunities in Minnesota beckoned and the Milliers went to Saint Paul where Bill became a registered Professional Engineer and a Research Associate analyzing labor needs and developing practical processing of rations on dairy farms. Bill and Mary soon realized that Ithaca was a bit warmer than Saint Paul, and accepted when Orval C French offered the position of Assistant Professor of Agricultural Engineering, effective November 16, 1952.

During his career at the Department of Agricultural Engineering, he rose through the ranks with appointments as Associate Professor with tenure in July 1956, and Professor in July 1964. He has authored and co-authored some eighty-one publications. Upon his retirement on October 1, 1986, he was awarded the status of Professor Emeritus.

His 1959-60 sabbatical leave was spent as a Design and Product Test Engineer with New Holland Machinery Company, New Holland, Pennsylvania, testing and improving forage-handling equipment. In 1967-68, the Millier family went to Riverside, California, where Bill worked with Galen K. Brown et al at the Harvesting and Farm Processing Research Branch, AERD, ARS, USDA at the University of California, Riverside. He studied the weight loss and internal atmosphere of navel oranges influenced by washing, mechanical injury, wax coating, and storage conditions. In 1975-76, Bill and Mary went to Wageningen in the Netherlands, and his search for improvements in mechanized apple harvesting took him to many parts of Europe.

Professor Millier was a dedicated teacher as well as a creative and productive researcher. His courses in farm machinery were heavily subscribed and his laboratory exercises were noted for creativity and thoroughness. Those who were enrolled in his class well remember his demands for excellence in data processing and report writing.

His research activities were wide ranging and his creative efforts resulted in several patents and unique designs. Much of his work involved unique solutions to materials handling problems. His leadership with auger conveyor research resulted in definitive descriptions of the capacities and power requirements of screw conveyors. A belt-tube forage conveyor was also developed for rapid forage handling. His leadership in mechanized apple harvesting resulted in several machines that contributed to the improvement of handling and harvesting apples for the fresh market. Numerous graduate students benefited from his creative ideas in such diverse areas as seed pelleting, forage blower design, and fertilizer distribution. His creative contributions continued throughout his retirement through his almost daily presence in Riley-Robb where he was always ready with a new idea.

As a personal friend, he was immensely loyal and sometimes painfully honest in his support and criticism. There were no hidden agendas with Bill. You always knew that you were getting a straight answer to whatever question you raised, whether it was professional or personal. His presence at the weekly coffee gatherings in the Riley-Robb seminar room is sorely missed with the passing of a great professional, friend, and colleague.

Bill is survived by his wife, Mary; sons, William and John; daughters, Kay and Barbara; grandsons, Andrew, Robert and John. He is also survived by a sister, Rachel Gardner of Penn Yan; and by six nieces and thirteen nephews.

Roger A. Pellerin, Gerald E. Rehkugler, Wilmot W. Irish

Jason Millman

September 6, 1933 — February 22, 1998

On February 22, 1998 the faculty of the Department of Education, the College of Agriculture and Life Sciences, and Cornell University lost a valued and honored colleague. Following a long illness, Jason Millman, Professor of Educational Research Methodology, died from the effects of Shy-Drager Syndrome while with his family in Lake Oswego, Oregon.

Jay joined the Cornell faculty in 1960, immediately after completing his doctoral work in psychometrics at the University of Michigan. In the ensuing years, he rose to prominence in the field of educational tests and measurement. His professional accomplishments are too numerous to detail here. Suffice it to say that he was the author or co-author of a very large number of books, book chapters, journal articles and research reports. He frequently served as a consultant to agencies of the federal government, to the governments of a number of states, and to a host of school districts around the country. He advised Boards of Law Examiners of several states regarding their bar examinations. He was elected president of the National Council of Measurement in Education, which recognized his achievements with its Distinguished Career Award in 1996. He served as a vice president of the American Educational Research Association. He was a member of the Executive Committee of the National Assessment Governing Board, the policy making body for the National Assessment of Educational Progress. Despite such professional accomplishments, it is telling of Jay's character that many of his closest friends and colleagues at Cornell had little idea of his stature in his field. He was a thoroughly modest man, ungiven to boasting in any form.

If Jay's modesty sometimes hid his professional accomplishments from the Cornell community, other aspects of his nature made him a recognized and valued member of it. The power of his intellect and insight, his willingness to help others, and his ability to be an encouraging and reflective critic were obvious to everyone with whom he worked. Despite the demands on his time, he was always willing to spend hours carefully reading and perceptively commenting on manuscripts written by students or colleagues. He was especially generous in this way when helping junior colleagues launch their research careers. A paper given to Jay for comment might come back with everything from several pages of closely reasoned analysis of its argument to the correction of a misplaced semicolon. Indeed, a fellow member of the faculty once remarked that Jay's comments on one of his papers were more extensive, more thoughtful, and more deserving of publication than the paper itself.

Jay's willingness to help others went well beyond his profession and the university. It was also reflected in his contributions to the Ithaca community. From 1987 until the very end of his life, he gave thousands of hours of his time to the Suicide Prevention and Crisis Service. He was a phone counselor who frequently volunteered to spend entire nights manning the Service's telephones in order to be available to troubled residents of Ithaca. He contributed his expertise in program evaluation to helping that agency improve its services to the city. He served on its board of directors. Out of this experience he was instrumental in preparing a book, *Talking with the Caller: Guidelines for Crisisline and Other Volunteer Counselors* (Sage Publications, in press) that will serve as a resource manual for similar crisis intervention centers around the country. It is a testament to his character that he contributed his share of the royalties from this book to the local agency.

The paragraphs above might leave the impression that our colleague had a superb intellect, that he made numerous contributions to his profession and to Cornell, and that he gave freely of his time to help others. All of that is true, but it would miss important aspects of Jay's character. Perhaps what everyone noticed first about him was his wit, his *joie de vivre*, his sense of humor, and his playfulness. He was always ready to laugh, perhaps most quickly at himself. He loved to dance and was active in pop and contra dancing organizations in Ithaca. He was an avid poker player and a founding member of what must be one of the longest running poker games in Cornell's history. He excelled in virtually all racquet sports, from tennis to ping-pong.

In 1995, the Department of Education recognized Jay's contributions by establishing the Jason Millman Promising Scholar Program. After a comprehensive, national search, the department annually selects a person who has earned a Ph.D. degree within the previous five years, whose work promises to make a major contribution to educational research and practice. Winners are invited to the Cornell campus where they make a presentation open to the entire community, lead a seminar for faculty and students of the department, and meet with individuals with similar research interests. It is particularly appropriate to honor Jay in this manner. Certainly he freely gave his time to help his junior colleagues establish their research careers. But just as certainly, as a recent Ph.D. in the early 1960s, he was himself a promising scholar--one who went on to amply fulfill that promise.

The last years of Jay's life were difficult ones. Shy-Drager Syndrome is a rare and incurable neurological disorder characterized by the slow, progressive failure of the autonomic nervous system. This vigorous, fun-loving, vivacious, and joyful man ended life confined to a wheelchair and able to speak only with great difficulty. Yet, to the end his mind was as sharp as ever, and he was actively writing, consulting, and working with national professional

associations. And to the end, he was as warm, as quick to laugh, and as compassionate as ever. Jason met death with courage, with grace, and with dignity, an inspiration to all who knew him.

Richard E. Ripple, Kenneth A. Strike, Emil J. Haller

Adelbert Philo Mills

Assistant Professor of Materials

November 10, 1883 — October 20, 1918

The Faculty of Cornell University mourn the sudden death while in the United States service in France of Captain Adelbert Philo Mills. The circumstances of his death, arising directly from eager, unremitting, and unselfish devotion to duty to his country, is largely typical of his previous devotion to the welfare of the University. After hard training periods at Camp Lee and Camp Oglethorpe, Captain Mills overworked himself seriously in the preparation of his regiment for embarkation. His hope for ample rest on the sea voyage was not realized, for the influenza epidemic struck down nearly all of the officers on the transport, Captain Mills being one of only four officers capable of service on the ship. Weakened by the long strain of doubled hours and duties, he fell an easy victim to meningitis from which on October 20, only about a week after his arrival in France, he died at Brest.

Captain Mills was born November 10, 1883, graduated from the University of Michigan in 1906 as Bachelor of Science in engineering, and in 1909 as Master of Science. In 1909 he was appointed Acting Assistant Professor, and in 1910 Assistant Professor of Materials in the College of Civil Engineering, Cornell University. During the years of his service in this university he reorganized successfully the elementary and advanced courses in Materials of Construction and Engineering Laboratory in his college. With a keen mind and the will to work tirelessly to the accomplishment of thoroughness, he made a place for himself by productive scholarship and high standards of performance for his students.

As a consulting engineer, he carried out a number of technical researches, important both for the improvement of industrial manufacturing processes and for the advancement of engineering knowledge. In some investigations made by him he cooperated with committees of the American Society of Testing Materials. His work as a teacher was marked by the production of a 700-page book on Materials of Construction, published in 1915 and now extensively adopted as a college textbook and as a reference book by practicing engineers. In discussing educational policies, he stood uncompromisingly for a broad study of fundamental subjects rather than for high specialization in their application, as the training best fitted to prepare engineering undergraduates for their professional career.

In his death the University and the College of Civil Engineering especially suffer a serious loss.

Source: Fac. Rec. 1029 Adopted By The Faculty of Cornell University on The Eighth Day of January, Nineteen Hundred And Nineteen.

Wilfred Douglas Mills

January 29, 1895 — September 14, 1962

With the retirement to emeritus rank of Professor Wilfred Douglas Mills on April 1, 1959, and his death on September 14, 1962, the fruit growing industry of the world lost one of its most competent and respected advisers.

Professor Mills was born and reared on a farm near Tecumseh, Michigan. He entered Michigan State College in 1914, but his college career was interrupted two years later by military service on the Mexican border. Attendance at an officers' training camp in 1917 was followed by two years of active service in France. At the conclusion of World War I, he returned to Michigan State College, where he received the B.S. degree in 1920 and the M.S. degree in 1922. He taught botany for the two years he was there as a graduate student. He spent the summers as a field assistant on cereal investigations with the United States Department of Agriculture and as a state inspector of nursery stock.

He enrolled in the Graduate School of Cornell University in 1922 as a candidate for the Ph.D. degree in plant pathology. As a graduate student, he embarked upon an investigation of the seasonal development of apple scab and also served in extension as a special field assistant participating in the spray service for fruit in Nassau, Wayne, Oswego, and Ulster Counties. He was named instructor in 1926 and placed in charge of the fruit disease extension program at the College of Agriculture. After receiving his Ph.D. in 1930, he was appointed Assistant Extension Professor. He advanced to Associate Professor in 1944 and to Professor in 1949.

His high principles and intellectual integrity, coupled with a high degree of competence, resulted in significant contributions to the science of plant pathology and its application to fruit growing. To him belongs the credit for the development of an extension program in fruit diseases that is widely copied because of its high degree of excellence. That program was based on his precise observations in the field, his many field demonstrations that were actually exact experiments, his painstaking analysis of all available data, and his extreme care in the making of recommendations to growers. He won and retained the respect and confidence of growers because of his consistently sound recommendations and his accurate predictions of disease development; growers were quick to accept his recommendations and reluctant to change procedures unless advised to do so by Professor Mills.

His reputation, both at home and abroad, was greatly extended by his development of a chart relating severity of apple scab to periods of wetness as correlated with temperatures. Although the chart was based in part on the work of others, Professor Mills made his own investigations and applied the results to practical disease control.

The chart was so carefully developed that it has proved valid in a great many areas, including England, France, Germany, Spain, and the Netherlands. The term, "Mills' Tables," which refers to the data on which the chart is based, frequently appears in European scientific literature and is used frequently in discussion among European scientists.

Professor Mills was a competent statistician and made effective use of statistics in the evaluation of his own data and those of others. His application of statistical procedures to complex data on fire blight collected over a 35-year period resulted in significant new information on development of this disease, even though the disease had been intensively studied by others over the previous 75-year period. The basic information brought out by this analysis and applied to control procedures has materially improved control of this important disease. A similar study of the virus-yellows disease of cherry added materially to understanding of the development of this serious disease under field conditions. Because of his carefully planned field experiments and effective use of statistics in the interpretation of data, he was recognized as a leading authority on field plot design. His reputation in this area led to his presentation of an invitational paper on the subject in 1958 at the meeting held in celebration of the fiftieth anniversary of the American Phytopathological Society.

His early promise as a scientist resulted in election to the botany honorary society, Seminarium Botanicum, while a graduate student at Michigan State College. His outstanding record in extension, research, and help to growers was recognized by the United States Department of Agriculture, which in 1955 bestowed on him the Superior Service Award. In 1959, the New York State Horticultural Society tendered him a special citation in recognition of his important contributions to the welfare of that Society's members as fruit growers. He was a member of the American Phytopathological Society, of Acacia Fraternity, and of the honor societies Phi Sigma, Sigma Xi, and Phi Kappa Phi.

Professor Mills was author or co-author of more than seventy research and extension papers. In addition, many mimeographed reports and extension publications based on his work found wide usage among research and extension personnel, teachers, and fruit growers.

Professor Mills is survived by his widow, the poet Antonia Ybor Schwab Mills, and by two daughters and six grandchildren. The loss of Professor Mills is deeply felt by his many friends and colleagues at Cornell and among scientists and fruit growers throughout the world.

Francis Edward Mineka

July 26, 1907 — October 4, 1985

Francis Mineka was born in Caneadea, New York, and received his secondary education at Binghamton Central High School. So much of his life was intimately tied to the heart of New York State that even those close to him tend to forget that he knew the Library of the British Museum about as well as he knew Olin Library and that his affiliations with educational institutions were diverse. In the 1930s and early 1940s he did graduate work at Columbia University (receiving his Ph.D. degree in 1943), where he at times also taught Latin, and in 1933-34 he was an instructor of English and Latin at St. Francis College in Brooklyn. He taught in summer sessions at the College of the City of New York, the University of Delaware, the University of Minnesota, and the University of Illinois, and he was an assistant professor of English at the University of Texas from 1943 to 1946. In 1968 he gave the Alexander Lectures at the University of Toronto.

Fran's lifelong love affair with Hamilton College started in 1925, when he enrolled as a freshman. In his undergraduate years he was awarded a number of prizes for his skill in debate and writing, edited the literary magazine, and won his Phi Beta Kappa key. On graduation in 1929 he was appointed an instructor in English composition. He taught for three years in that capacity, meanwhile earning his M. A. degree in 1931. He rejoined the Hamilton faculty in 1934 as an instructor in English and public speaking and served as an assistant professor from 1935 through 1941. He helped to establish the Hamilton alumni magazine during those years, was awarded a Doctor of Letters degree in 1958, and was an alumni trustee of the college from 1963 to 1969. In 1934 Fran married Muriel McGregor, and Muriel has often said, jokingly but justly, "I didn't realize that when I married Fran I was also marrying Hamilton College."

Muriel might have said, with equal justness, that when she married Fran, she married Cornell. Fran was thirty-nine when, in 1946, he found the political dissension at the University of Texas so unbearable that he turned down the university's offer of tenure and took a three-year appointment as an assistant professor at Cornell. One year after his appointment he was promoted to associate professor, and a year later he was made chairman of the Department of English. In 1951 he became a professor of English and held that position until 1973. For eight years, from 1948 through 1957, he chaired the department, with a year of relief in 1952-53 to pursue his own scholarship under a grant from the Fund for the Advancement of Education. In 1956 he was made the first incumbent of the Class of 1916 Professorship.

He had enjoyed the amenities provided by the first professorial chair endowed by a graduating class for only a year when he accepted the deanship of the College of Arts and Sciences for a five-year term.

For half his active years at Cornell, then, Fran was engaged in two of the most arduous administrative positions in the university. His customary modesty and quiet determination, and his fairness and tolerance and foresight, made his years as chairman and dean memorable ones. When he took over the chairmanship, the department had lost a good deal of the distinction it had earned in the days of Joseph Quincy Adams, Lane Cooper, Martin Sampson, and William Strunk. By the time he left, he had helped reestablish it as one of the most distinguished departments of English in the world. During the Eisenhower-Kennedy years, when universities were expanding and competition amongst them was fierce, he managed somehow not only to maintain the strength of arts and sciences at Cornell but also to re-invigorate departments, particularly in foreign languages, that had languished. Nor did his skillful administrative work cease with his term as dean. From 1964 through 1968 Fran was a member of the University Library Board, and, in his last year on the board, he was responsible for a forward-looking report that has since guided library policy. Friends who are aware of his dedication to the library have established in his memory a fund that will be used to purchase books for the Hart Library, the noncirculating collection of standard texts in English literature housed in Olin Library.

After completing his work as dean, in 1962-63 Fran received concurrently a Guggenheim Fellowship and a Fulbright award. Late in 1963 his two-volume edition of *The Earlier Letters of John Stuart Mill: 1812-1848* was published by the University of Toronto Press. His preface contains Mill's words, "I found the fabric of my old and taught opinions giving way in many fresh places, and I never allowed it to fall to pieces but was incessantly occupied in weaving it anew," together with Fran's comment, "Mill was not engaged solely in reweaving the fabric of his opinions during these years, however; he was busily engaged in trying to influence the opinions of others." Those words characterize Fran, too, and his posture and his efforts not only as administrator but as teacher and scholar. His doctoral work in the literature and culture of the nineteenth century culminated in the publication of his book *The Dissidence of Dissent: The Monthly Repository, 1806-1838* (Chapel Hill: University of North Carolina Press, 1944; republished in 1972). At Cornell he influenced generations of students in his undergraduate and graduate surveys of the Victorian era; in his popular course in Browning, Dickens, and Arnold; and in his freshman and sophomore courses in expository writing. His pedagogy extended far beyond Goldwin Smith Hall when he edited the Victorian section of *Masters of British Literature* (Boston: Houghton Mifflin Co., 1958). In 1972, the year before he became professor emeritus, his decades of devotion to studies on Mill reached a climax with the publication,

in four volumes, of *The Later Letters of John Stuart Mill: 1849-1873*, edited in collaboration with a close friend of Hamilton College, Professor Dwight N. Lindley. That year, too, saw the end of twenty years of service on the board of editors of *Cornell Studies in English* but not the end of Fran's commitment to scholarly work. Retirement, for him, meant retirement to the library, where he had under way an edition of the most-interesting items of John Sterling's correspondence.

Fran's legacy to Hamilton and to Cornell is as monumental as his edition of Mill's letters. He took great pride, too, in another kind of legacy: his son, John (Cornell B. A. '58, Ph.D. '65), is a professor of mathematics at Lehmann College, and his daughter, Susan (Cornell B. A. '70), is a professor of psychology at the University of Texas.

Charles S. Levy, James McConkey, David Novarr

Philip Adams Minges

January 10, 1913 — April 27, 1978

Michel Adams Minges died on April 27, 1978, after an illness of two days, two months before his scheduled retirement. He had been professor of vegetable crops at Cornell since 1955.

Professor Minges was born on a farm near Battle Creek, Michigan, graduated from Michigan State University in 1934, and received the Doctor of Philosophy degree in 1941 at Iowa State University, where he was a research assistant doing fruit and vegetable work. He then served as extension specialist in vegetable crops at the University of California, Davis, until 1955.

At Cornell his primary responsibility was in extension, but he had significant activities in research and teaching as well. In both California and New York he put strong emphasis on training regional and county extension agents to work effectively with vegetable growers and pioneered the move toward specialized, well-trained extension agents. One of his major accomplishments was to start in 1958 the publication of “Vegetable Production Recommendations” and to serve as coordinator for the various disciplines in bringing it up to date annually. This publication was the first of its kind in the United States and has been widely distributed and appreciated. He also served as the vegetable industry program leader for five years. In recognition of his many years of effective leadership given to the state’s vegetable industry, he received in 1977 the meritorious service award of the New York State Association of County Agricultural Agents. Some years earlier the Cornell chapter of Epsilon Sigma Phi, national honorary extension fraternity, presented him its certificate for highest achievement in extension program development.

He quickly found after coming to New York that vegetable growers were interested in learning which new vegetable varieties among the multitude becoming available each year were worth trying on their farms. He took charge of the yearly variety trials and brought to their execution an unusually imaginative approach. If a variety had some important desirable characteristics but failed to grow well, he studied alternative cultural practices. Such a study on the ‘Fireball’ tomato led to its unexpected and widespread use as a processing variety, the key being either to plant the seed directly in the field or to use younger-than-usual transplants. Other observations in variety trials motivated him to conduct additional studies, including one on the blotchy ripening of tomatoes that clarified the nature of this disorder considerably. His evaluation of new varieties was highly regarded by seedsmen and by vegetable growers, and a number of important new varieties came into use in the Northeast after his recommendation that they be tried by growers.

Throughout his career at Cornell, Professor Minges taught the course Kinds and Varieties of Vegetables, in which he acquainted students with hundreds of varieties painstakingly grown for their observation in the field, described the adaptation of varieties as he had seen them from coast to coast, and taught the students how to conduct and evaluate variety trials. He also initiated a course called Special Topics in Plant Science Extension, in which he attempted to pass on to a new generation the procedures he had found most useful in his extension programs. He also served as major adviser to a considerable number of graduate students, several of whom came from other countries. Partly as a means of helping such students more effectively, he spent sabbatical leaves in Mexico in 1963-64 and in Australia in 1971.

He was active in the American Society for Horticultural Science, attending its meetings regularly and serving on many of its committees. He was twice chairman of its Extension Committee and was chairman of its Vegetable Crops Section and served on its board of directors in 1964-65. From 1961 to 1969 he served as editor of the A.S.H.S. – American Seed Trade Association Variety List, a time-consuming task but one of great value to seedsmen and horticulturists. In recognition of his contributions, he was elected a fellow of the society, received its Bittner Extension Award, and was a joint winner of its Asgrow Award for research.

Dr. Minges did more than his share of committee work at Cornell, serving on seven committees, including an active role in the one that developed the new Master of Professional Studies degree.

Phil Minges also found time to serve his community and church. He was on the school board of Dryden, New York, for twelve years and was its president for three. He was also on the BOCES board for several years and was its president in 1967-68. He was a Sunday-school teacher and an officer of the McLean Community Church and, when he died, had just completed a term as moderator of the Susquehanna Association of the United Church of Christ.

Phil Minges was a gentleman in all his dealings. Although he was a Perfectionist, he never became personal in his inquiries or his judgments. He learned the facts and let them speak for themselves. The vegetable industries of California and New York have benefited from knowing him and working with him, and the same can be said for the vegetable seedsmen and horticulturists of America, Cornell University, and the communities in which he lived.

He is survived by his wife of forty years, Ardys Mason Minges; his son, Kendall Minges; his daughter, Phyllis (Mrs. Keith Hartman); and five grandchildren.

Roger F. Sandsted, Robert D. Sweet, Henry M. Munger

Lua Alice Minns

Assistant Professor of Floriculture

January 31, 1873 — February 21, 1935

Lua Alice Minns was born on a farmstead at Lodi, Ohio, January 31, 1873. After graduating from the local high school she was employed in a bank in Lodi for several years before entering the College of Agriculture at Cornell University, where she received the B.S. degree in 1914 and an M.S. in Agriculture in 1918.

Endowed with a natural love for flowers, Professor Minns early in life acquired a broad and accurate knowledge of cultivated plants. This, together with her superior scholarship, attracted the attention of Dr. Liberty Hyde Bailey and Professor John Craig, which led to her appointment as Assistant in the Department of Horticulture in her junior year. With the creation of the Department of Floriculture in 1914, Miss Minns was made an Instructor and in 1933 Assistant Professor, a position which she held until her death, February 21, 1935.

Professor Minns was outstanding for her scientific and practical knowledge of garden flowers. The Demonstration Garden at the corner of Garden Avenue and Tower Road was the colorful result of her painstaking care under very difficult soil conditions. As a teacher of amateur flower-growing and garden flowers she is remembered by the many students who, under her guidance, gained knowledge and inspiration for gardens of their own. She showed special interest in women's work in horticulture and followed closely the work of all women graduates from the department. She was a member of the Women's National Farm and Garden Association, Sigma Xi, and the American Association for the Advancement of Science.

Professor Minns's many friends in the University community, among the townspeople, and particularly in the Ithaca Garden Club, recall her helpful interest in their garden problems of whatever nature. In her death the University loses a friendly, helpful personality that played a most useful part in the life of the whole community. The Cornell University Faculty desires at this time to pay a tribute of deep respect and of affectionate regard to the memory of Professor Minns.

Marion Minot

June 8, 1931 — August 22, 2004

Professor Marion Minot was a valued teacher, mentor to students and citizen of Cornell University. Dr. Minot's career at Cornell University spans thirty years and reflects the changes and growth of the institution to which she was devoted. She joined the faculty in 1966 as Assistant Professor and Coordinator of Home Economics Teacher preparation. She had received her Ph.D. degree from Cornell in 1966 in Home Economics Education after completing her M.S. degree at Cornell in 1954 in Home Economics, and a Baccalaureate degree from Farmington State Teachers College in 1953. Before joining the faculty of the College of Human Ecology, Marion had served as Assistant Professor of Home Economics at the University of Maine (1958-63). Her many programmatic and intellectual contributions centered on teaching. Ms. Minot felt that educational institutions and their teachers must address the barriers that prevent learners from maximizing their opportunities. As a member of the College of Human Ecology, Dr. Minot rose to the rank of Professor, and upon her retirement, was conferred the title of Professor Emeritus. She served for twenty-two years as Coordinator of Teacher Preparation Program and helped lead the College through the transformation from home economics to human ecology. This transformation included the evolution of four department changes (from the Department of Home Economics Education to Community Service Education to Human Service Studies and now Policy Analysis and Management). During her time at Cornell, Professor Minot served on twenty-two committees, often in the role of chair, providing immense service to the University. Of particular note is her role as co-chair of a major College of Human Ecology study in the mid-80s that deeply involved students and faculty in a reorganization of curriculum, structure and governance.

Professor Minot was well known outside of Cornell University through her work with teachers and schools in the upstate New York region. Marion provided assistance to the New York State Department of Education during two of her sabbaticals in the areas of curriculum development and assessment. She maintained her relationship with former students who increasingly became the core of Home Economics instruction and later the Life Skills movement in public education. She received grants from the New York State Department of Education for in-service teacher education and curriculum development and conducted numerous workshops on curriculum and education policy. Ms. Minot served on the editorial board of the *AHEA Research Journal* and the *Human Ecology Bulletin* and provided technical assistance to the Journal of Home Economics. Dr. Minot was often asked to serve as a member of program review and accreditation teams for many national organizations.

Perhaps most telling about Professor Minot's service to Cornell University is her own values and how they informed her work with students and colleagues. Professor Minot gave freely of her time to mentor many of the undergraduate students and served as a model for a number of female students. Students were drawn to the open and genteel manner in which Professor Minot discussed their concerns. As one student put it, "When I realized Professor Minot thought I was capable, I became capable." A young faculty member was taken aback by the interest and support Marion showed in their family. She often counseled that family responsibilities could not be ignored in the face of professional demands. Her concern for people was enhanced by a keen insight that she attributed to her own Maine background and her upbringing. She was very proud of her roots and her extended family, often sharing the triumphs and successes of nieces or nephews. Marion lived, as she believed; hard work, high standards and a love for family and friends were the basis for a full life. Many students and faculty miss her hallway chats and smile. Her colleagues will remember her as devoted to her students and Cornell University.

Robert Babcock, Andrea Parrot, Donald Tobias

Edward Gardner Misner

January 23, 1891 — September 20, 1958

With the retirement to emeritus rank on September 30, 1957, and death on September 20, 1958, of Professor Edward Gardner Misner, Cornell University and the field of agricultural economics lost one of their most accurate, thorough, and careful research workers.

Professor Misner was born and grew up on a dairy farm in the community of Dairyland in the Township of Wawarsing, Ulster County, New York. After graduating from Ellenville High School, he entered the College of Agriculture at Cornell in the fall of 1909 and received the degree of Bachelor of Science in agriculture in June, 1913.

Following the completion of his undergraduate work he entered the Graduate School at Cornell where he received his degree of Doctor of Philosophy in May, 1918. His major field of work for his doctorate was in the area of farm management, and his doctoral thesis was published as Cornell Experiment Station Bulletin 409, "An Economic Study of Dairying on 149 farms in Broome County, New York."

While taking his graduate work, Professor Misner was appointed an instructor in farm management and on receiving his Ph.D. degree was appointed to an assistant professorship in the College of Agriculture. In 1920 he was advanced to the rank of full professor.

Early in his life, he developed a keen interest in two aspects of dairy farming. He liked to work with dairy cattle; he was seldom happier than when he was in a dairy barn with a herd of good dairy cows. The other aspect of dairy farming in which he was always greatly interested was scientific research aimed at increasing the net financial returns from a dairy farm business by improved methods of organization and management.

Soon after completing his graduate work, Professor Misner purchased a dairy farm near Homer, New York, and from then to the time of his death he owned and managed a herd of high-producing dairy cows. From the start of his graduate work until his retirement, he was always engaged on one or more research projects in the field of dairy farm management.

Professor Misner was widely known in both farm and experiment station fields for his research work in the area of management of dairy farm businesses. He cooperated with the late Professor G. F. Warren in developing the Warren-Misner formula for calculating the cost of milk production. This was one of the first formulas of its kind and was widely accepted as the most accurate and practical of its time.

In addition to his work in the field of dairy farm management, Professor Misner also did research work dealing with management problems of poultry and vegetable farms.

He was considered an expert on the pedigrees and production records of dairy cattle. He did several valuable and outstanding pieces of research work dealing with the relation of size of dairy cattle to annual production of milk and butter fat.

Although Professor Misner was greatly interested in all breeds of dairy cattle, his personal choice of breeds was the Holstein-Friesian. He served as a milk marketing and pedigree consultant for both the Holstein-Friesian Association of America and the New York Holstein-Friesian Association. The secretary of the latter association, W. D. Brown, praised Professor Misner as a “powerhouse as an adviser and counselor to our organization.”

Professor Misner held many honorary positions and rendered valuable services on many special assignments. For three-month periods in 1945 and 1946, he was a special consultant for the Holstein-Friesian Association of America. In 1942, he was on a special assignment to Tuskegee Institute for the General Education Board. For six months, in 1934-1935, he was an Advanced Fellow to Belgium with the C. R. B. Educational Foundation, Inc. In 1934 he served as an agricultural economics expert for the Federal Farm Credit Administration. During 1930 he served as director of a dairy industry economics survey in Saskatchewan, Canada.

One of the outstanding characteristics of Professor Misner as a research worker was the demand he made on himself and those working with him for high standards of accuracy, completeness, and reliability of data. He was the author of many publications giving the findings of his research projects, but none of them carried a footnote to a table or statement of text saying “Based on Fragmentary Data,” or “Original Data Possibly Questionable.” The results of his research work had to be such that they would stand up under the careful scrutiny of the most critical student, or else they were not published.

At the time of his death Professor and Mrs. Misner were living on their dairy farm at Homer, New York, where he had spent many enjoyable vacations and weekends caring for his own individual herd of Holstein cattle and planning research studies in the field of dairy farm management.

V. B. Hart, M. C. Bond, S. W. Warren

Arthur Moore Mizener

September 3, 1907 — February 11, 1988

Arthur Mizener was born in Erie, Pennsylvania, into the kind of small-town aristocracy often portrayed by a novelist he admired, James Gould Cozzens — a tight society, white, Protestant, and Republican, whose morals, manners, and taste were in the custody of families who had lived in Erie for several generations, or who at any rate were people of wealth and a proper education and demeanor. His parents were intelligent and personable; from his adored mother especially he acquired his aim to excel and his devotion to an old-fashioned concept of gentlemanly honor and decency. In his later life Mizener maintained a respect and affection for what he saw as admirable in such a society, yet broke away from its pettier standards and attitudes to become something of a political radical in his youth, a liberal Democrat in his maturity, and (as his friends know) remarkably free from religious or ethnic or class prejudices in his friendships, as well as in his social and literary values.

In his teens Mizener was sent to the Hill School, from where he chose to enter Princeton in 1926. There he became a member of the Tower Club and was at home in the society which, earlier in the 1920s, F. Scott Fitzgerald had idealized — one where good manners and intellectual or artistic or athletic achievement were almost equally prized. Although Mizener was an able athlete, he did not make a varsity team. What he did do with distinction was to study English literature in what was then one of the country's best departments. From Professors Root, Osgood, and others he learned to value the disciplines of literary scholarship and to revere the masterpieces of the past; from Professor Willard Thorpe he caught the excitement of discovering the bright new achievements in the literature of one's own time and place. He never forgot the day he wrote his mother of his sudden realization that by becoming a professor one could be paid to read and write about books for the rest of one's life.

By the time he received the B.A. "with highest honors" in 1930, his father had suffered economic reverses. It is not hard to guess how, deprived of an income, someone with Mizener's background would, despite a heavy heart, enroll in the Harvard Business School; nor would anyone who knew him be in any doubt about the lightness of heart with which, after only a single semester, as he himself put it, he crossed Memorial Bridge to the left bank of the Charles River and enrolled as a graduate student in English. In the spring of the following year, just before receiving his M.A. at Harvard, he was awarded a Proctor Fellowship at Princeton which would pay all his expenses for the next two years. Back at his alma mater, he received his Ph.D. on schedule, and in 1934 accepted an instructorship in English at Yale.

Despite his recognized success as a teacher and the quality of his published scholarship, Mizener was passed over for tenure at that time when Yale, like other universities, was in financial trouble. But the years in New Haven had been good ones. There he had met, courted, and married a senior at Vassar, Rosemary Paris. She had been born in Kenya of a Swiss plantation manager and an English mother, had gone to school in Switzerland and Hawaii as well as in America, and was a notably gracious woman who shared her husband's intellectual and literary enthusiasms, and often collaborated with him in his scholarly enterprises. While they were still in New Haven, their daughter Rosemary Moore Mizener was born. From Yale in 1940 Mizener went to Wells College in Aurora, where his only son was born and died in infancy; from Aurora, Arthur and Rosemary used their war-rationed gasoline to drive to Ithaca in order to use the Cornell library and to visit friends.

In 1945 Mizener became a professor and head of the English Department at Carleton College in Minnesota, and there spent the next seven years in building a distinguished department and in helping to revise the curriculum and to raise academic standards. He devoted some of his summers to teaching (with John Crowe Ransom, Allen Tate, Delmore Schwartz, Philip Rahv, and other distinguished men of letters) in the Kenyon School of English. Mizener's writings were broad in their range and mode. He published in the established academic journals (*Modern Philology*, *Modern Language Notes*, *PMLA*), but also in the advanced critical journals of that time (the *Kenyon*, the *Southern*, and the *Sewanee Reviews*). His subjects ranged from Shakespeare, Marlowe, and Chaucer (his essay on the character Criseyde, in Chaucer's *Troilus and Criseyde*, is something of a classic), to many contemporary poets and novelists, and even to the movies of his day. And it was while he lived in Northfield, Minnesota, forty miles from the birthplace of his subject in St. Paul, that Mizener published in 1951 *The Far Side of Paradise*, the first critical biography of F. Scott Fitzgerald. The book enjoyed great critical and popular success, initiated a strong and continuing revival of interest in Mizener's fellow-Princetonian, and did much to establish Fitzgerald, hitherto noted primarily as the laureate of the Jazz Age, as a serious moralist and major American novelist.

On the wave of the success of this book, Mizener received an invitation to succeed David Daiches as Professor of English at Cornell. He had attended or taught at three ancient universities, Princeton, Harvard, and Yale, but the youngest member of the Ivy League, Cornell, held a special appeal for him, and with typical self-deprecating candor, he was entirely open about that fact. In an interview at the time of his retirement in 1973 he told a reporter what he had said to some friends when he first came to Cornell, that it had taken him nearly fifteen years and two outright rejections to fulfil his desire to become a member of the faculty. When the long-awaited invitation from the English Department finally arrived, apologetically offering a salary of only \$6,000, Mizener in turn

apologized to the chairman, Francis Mineka, for having delayed his answer for two days, as a gesture of respect for the President of Carleton, and wrote:

“Anyhow, now I can say yes; *yes*.” As for any deficiency in the salary, “I want to come to Cornell too much for this to affect my decision... It is the kind of climax to a career I have always looked forward to; that makes getting it almost too good to be true.”

The Mizeners settled in their Cotswold-style stone house on Highland Road, which they purchased from the recently retired Nobel Laureate in Chemistry, Peter Debye, and where they entertained at their famed dinner parties colleagues, friends, students, and often, visiting literary luminaries. Mizener devoted to Cornell twenty-two years, the prime of his professional life. He was a popular teacher, who set high standards and was not easy to satisfy, yet was generous of his time and encouragement; his office door in Goldwin Smith was always open to passing students. For some years he taught the large undergraduate class in Shakespeare; but the course he was best known for was his year-long survey of twentieth-century poets and novelists, British and American; in his early career, when traditional courses ended with the late Victorians, he had been one of the first academics to lecture on poets such as Yeats, Pound, Eliot, and Hart Crane. Mizener had an old-fashioned loyalty, even piety, to his university, and a strong sense of what one owed to the institution and its students. Until within a year or two of retirement, he taught with unflagging enthusiasm a course in Freshman English. He carried a heavy load of graduate teaching, and was unusually helpful to young staff members in their early careers. He also served for many years on the Admissions Committee of the Arts College, to which work he brought great personal concern and years of experience as an examiner for the College Entrance Examination Board.

Both Arthur and Rosemary Mizener were totally committed to a literary life, a life devoted to books and the people who write them. Mizener never seemed to harbor doubts about the importance to one's life of a liberal education, or about the central place of literary study in that education. He believed that in university teaching, as in the other professions, pros were better than amateurs, and that professional English teachers and scholars should be masters of hard-earned knowledge and skills. What he most prized in works of literature was their power to convey (in the title of one of his books) “a sense of life,” by which he meant the deeply imagined experiences of diverse human beings working and playing, loving and hating, thinking and talking, in a variety of human societies. He tried, in his deceptively casual, relaxed, and often anecdotal teaching, to open out to students the rich possibilities in experiencing literature, and his assurance that literary experience helps to shape and condition what one is. As one of his admiring students, now himself a distinguished professor of literature, has described his teaching, “Arthur

had a style and he valued it. The jauntiness, the good humor, the urbanity, the easy transitions to seriousness were all parts of a civility that was at one with his deepest convictions about how to make a life.”

Mizener’s life outside Goldwin Smith was a rich one. “Avid” is the word for his concern with Cornell athletics. He had a strong feeling for the traditionalism of sports in the American college ethos, loved the ceremony and ritual as well as the physical contests, and was a familiar figure at football games (where for years he shared a box with a few fellow devotees), and at track meets, lacrosse and hockey games, and crew races. As often as they could the Mizeners went abroad, mainly to England, sometimes with the help of a Fulbright or Guggenheim fellowship or a grant from the National Endowment for the Humanities. Mizener was also a prolific writer of letters; his correspondents included many well-known men and women of letters, as well as a host of friends and former students, to whom his letters, usually dashed off in spare moments, were full of high spirits and an ironic teasing, sometimes even a rough persiflage, that he used as a veiled expression of his esteem and affection.

One cannot do justice here to the work he wrote and published during the great years of Cornell: book reviews, articles, essays, public lectures (including a series in London for the BBC), and various books, above all his long biography of the novelist Ford Madox Ford. For this work he did years of devoted research, in the course of which he helped Cornell acquire permanently the major collections of Ford’s papers and correspondence; the result was a remarkable account of the general literary life of Ford’s time, as well as of the private life of his brilliant, important, and engaging, but also flawed protagonist. These achievements gained Mizener the first appointment to the Old Dominion Foundation Chair of English at Cornell, as well as an international reputation as a scholar and critic. When Mizener retired in 1974, he wrote to his chairman a characteristic letter proscribing any public ceremony on the occasion: “No doubt Rosemary told you, even at the risk of sounding tactless, that elaborate parties with speeches and toasts and all that embarrass me to the point of agony. No doubt this is a weakness, but there it is.”

In the course of his eighty years Mizener suffered wounding losses and disappointments that even his good friends never heard about from him; but essentially he was a happy man, leading the life he wanted to lead in the place he wanted to be. Even after his beloved wife died after a long illness, and while he himself was a victim of cardiovascular disease that limited his freedom and impaired his eyesight and memory, he continued to carry himself with uncomplaining dignity. Up to the day at which, a year before he died, he left Ithaca to go to a nursing home near his daughter in Rhode Island, he greeted friends who called on him in his little apartment on Miller Street with his usual heartiness and grace. Often they would find him sitting under a strong reading light, with the morning’s *New York Times* scattered beside him, his forefinger holding his place in the worn copy of James Gould Cozzens’ *Guard of Honor*, which he had been reading for months.

It will surprise even many who knew Mizener well that he was an author as well as scholar and critic of literature. One of his short stories won the Kenyon Review Award in 1946. He also wrote but left in manuscript a number of poems. One of these was read at his memorial service in Anabel Taylor Chapel; in it one hears the very idiom and inflection of his ordinary speaking voice as he contemplates, with his unillusioned honesty, the enigma of death in the midst of life.

FRAGMENT OF AN ENDLESS MEDITATION

And so one sits, hearing the high-pitched dignity
Of children at their game of life, watching
The leaves die in the Indian-summer sunshine
Once again. What do you make of this? What can
Anyone make of it? Here is life,
Wholly innocent; not simple or ignorant,
Not wanting deprivation, suffering, or pleasure,
Knowing these things, indeed, at their intensest.
But innocent; innocent as the child that loves
So well the garden Mistress Mary grows.
The little pig and Jesus. And here is death,
Perennial, repetitious, almost random,
The incongruous and even beautiful dying,
The endless decimation of summer lives,
Now still as loneliness where they are heaped
In the autumn afternoon's unsteady sunshine:
All this may very well surprise the leaves
But is surely an old story to the trees.
One sees the bodies piled like this in pictures,
And sometimes sees a vacant face or two,
The eyes staring, the mouth round and rigid
With the echo of a dying man's surprise.
These are merely a few of the countless millions
Of history, an old story, perennial, repetitious,
Almost random. What do you make of this?
What can anyone make of this?

Anthony Caputi, Scott Elledge, Alison Lurie, M.H. Abrams

Kenneth J. Molchen

February 5, 1932 — December 15, 1968

When a young, vigorous assistant professor committed to undergraduate education suddenly passes away, the whole university community shares in the loss. Dr. Molchen gave freely to his students and colleagues of his exceptional fund of knowledge, his dedication to precision and accuracy, his humor, and zest for academic life. The great loss we feel at his sudden death is perhaps best explained as a sense of betrayal—he represented the best of young and fresh dedication in our times.

His academic brilliance was shown by his receipt of a National Science Foundation Award to the Academic Year Institute at Harvard in 1963-64, by his service as consultant to the widely hailed Harvard Project in Physics at Harvard in the summer of 1967, and by his contribution to the Harvard-Newton Program, a study of adolescents, under the Harvard Research and Development Center on Educational Differences.

Born in Parma, Ohio, he graduated from the University of Dayton with honors in 1954, received a Master's degree in physics from Case Institute of Technology, and an Ed.D. from Harvard Graduate School of Education in 1967.

Dr. Molchen was a member of Phi Delta Kappa, the National Science Teachers Association, the American Educational Research Association, and the National Association for Research in Science Teaching. A competent, vigorous researcher, he wrote a number of impressive articles in the professional journals.

He was a most dedicated supervisor of student teachers who valued him for his warm support and his helpful suggestions. Tough-minded and precise in his studies, deeply conscientious in all his activities, warm and insightful as a counselor of students, zestful and committed to the activities of education—he demonstrated the best in the current thrust in education. He was a man of great intensity, filled with a kind of agony at the imperfections of contemporary life. We, his colleagues, who shared his tenure from September 1967 to December 1968 are richer for his generous and wise participation in the activities of his department, college and university, and indeed bereft at his death.

Arthur L. Berkey, Isabel J. Peard, Richard B. Fischer

George Sylvanus Moler

Professor of Physics

— *May 20, 1932*

In the death of Professor George Sylvanus Moler, Cornell University loses an alumnus and member of its Faculty who, through his achievement in applied science and his work during nearly fifty years as a thorough and sympathetic teacher, has exerted a strong influence for good among his colleagues and among the many students who have benefited by his instruction.

Immediately after graduation from Cornell in 1875 he joined the teaching staff in physics and as an instructor, assistant professor, and professor he remained an active member of the department of Physics until his retirement in 1917. With Professor William A. Anthony he soon after built what is believed to have been the first dynamo made in America, which was displayed and operated at the Centennial Exposition in Philadelphia in 1876 and subsequently used to operate two arc lights for the illumination of the Cornell Campus. The construction of this dynamo marked the beginning of electrical engineering instruction in this country; under Professor Moler, in annexes back of Sibley and Franklin Hall, there was developed the famous “dynamo laboratory,” in which many leaders in the fast growing electrical industry received their early training and an inspiration from Professor Moler’s personality.

Always working and trying something new, he had the knack of making a thing “go” and a patience and perseverance, not only in the execution of the work but in explaining it to his students, that caused them to become absorbed in his ideas and imbued with his enthusiasm.

Although deeply interested in electricity, Professor Moler did not confine his attention to this field. His photographic laboratory was noteworthy. Always interested in improving experimental technique in physics, he became engrossed at one time in photometry and the study of illumination; later in x-rays, when he took one of the first x-ray photographs made in this country. Many practical devices in Rockefeller Hall are due to his ingenuity and foresight.

Professor Moler was always practical. With little thought of self, he gave unstintingly of his time in aiding his many friends in town as well as in college circles. Many a practical problem—perhaps the adjustment of a church organ or a regulator for the college clock—was taken to Professor Moler for solution. He was at his best when helping others. When we think of Professor Moler, we do not think first of his ability and resourcefulness; what

comes most vividly to our minds is the picture of his kind nature and unselfish helpfulness. These are the traits that won our hearts and will continue to make his memory dear.

Retired, June 1917 (Fac. Rec. p. 910)

Theodor Ernst Mommsen

1905 — July 18, 1958

Theodor Ernst Mommsen, Professor of Medieval History at Cornell, died at Ithaca, New York on July 18, 1958. Born in Berlin in 1905, Professor Mommsen was a grandson of the eminent German historian, Theodor Mommsen, and had as uncles by marriage the sociologists Max and Alfred Weber. Professor Mommsen was given the degree of Doctor of Philosophy by the University of Berlin in 1929. From 1929 to 1935 he was a research assistant associated with the great historical enterprise called *Monumenta Germaniae Historica* and worked in Germany and Italy. He began his academic career in the United States as an instructor at Johns Hopkins University in 1936. Subsequently he held appointments at Yale University, Groton School, and Princeton University; at Princeton he was an associate professor of history from 1949 to 1954. He joined the faculty of Cornell University in 1954. He served as visiting professor at the University of Chicago and at Bryn Mawr College. He was a Guggenheim Fellow in 1948.

Professor Mommsen wrote more than twenty articles on medieval European history, covering topics as varied as St. Augustine and the Christian idea of progress, the topography of medieval Rome, and football in Renaissance Florence. Petrarch was a special subject of study both in his articles and his more elaborate works. He wrote a substantial introduction to an edition of Petrarch's songs and sonnets. Petrarch's *Last Will and Testament* he translated and edited in 1957. His early association with *Monumenta Germaniae Historica* continued throughout his life, and he edited one of the volumes of this great undertaking, *Italienische Analekten zur Reichsgeschichte des 14 Jahrhunderts*. He was corresponding member of the executive committee of Monumenta and of the Academy of Arts and Sciences of Lucca.

Professor Mommsen had an outstanding career as a teacher at Princeton and Cornell and served on many committees concerned with academic affairs at both universities. Particularly important was the work of his seminar in which his purpose was to give students the tools of historical research rather than a detailed knowledge of history. His model was the training he himself had received in Germany, where the seminar was a cooperative workshop, the professor leading and directing but not dominating his students. He believed medieval history to be an ideal subject for teaching young historians because the relative scarcity of the records available for study made every fragment precious. They must learn, as he said, "to squeeze the sources dry."

Professor Mommsen was a bachelor. He gave much time to friends, colleagues, and students and shared with them his memories of life among persons of academic and professional distinction in Germany, and his rich knowledge

of books and music. Perhaps he was happiest when a group of graduate students gathered in his apartment to enjoy a light meal, listen to his records, and talk on into the night.

When Professor Mommsen left Germany in 1935 he did so to register a protest against the totalitarian and anti-Semitic policies of Hitler. He came to the United States to affirm his faith in democracy, the equality of man and man. This choice was a continuing source of joy to him. The disasters suffered by Germany in World War II hurt him deeply, however, all the more so because on revisiting Germany in 1948 he judged that the Germans had learned little from experience. These thoughts and others arising from the state of world affairs in the postwar period saddened him; the effects of ill health made him still more unhappy in his last years. His death took from the Cornell community and from the academic community of the United States and Europe an expert scholar and a wise, witty, warm-hearted companion.

F. G. Marcham, Knight Biggerstaff, Felix Reichmann

Nell I. Mondy

October 27, 1921 — August 25, 2005

Nell I. Mondy, 83, Professor Emerita of Nutritional Sciences at Cornell University, died August 25, 2005 at Cayuga Medical Center, Ithaca. Mondy was on the Cornell faculty for more than 50 years. Her expertise in biochemistry led to a fruitful teaching and research career and took her to some four-dozen countries where she presented papers, worked as a consultant or conducted research. She was considered an international expert on the potato.

Mondy grew up in the small town of Pocahontas, Arkansas as the only child of a young widow. Getting her first degree at Ouachita Baptist University in Arkadelphia, Arkansas, in 1943 during World War II, Mondy went on to receive her M.A. degree from the University of Texas at Austin (1945) and Ph.D. degree (1953) from Cornell. For many years, she was the only woman in chemistry wherever she went.

Her early research dealt with the vitamin B6, folic acid, vitamin B12 and enzymes in choline metabolism, but the majority of her time was spent studying various aspects of the potato, which she considered to be a “food for the world.” Mondy studied several biochemical aspects of the potato. Two of the more unique subjects were the nutrition and flavor of potatoes as these are affected by variety, production practices, marketing, and preparation for consumption. Flavor of potatoes is particularly difficult to define and she was unique in her attempt to attribute flavor to biochemical composition. The breadth of her interest in the crop led her to an active participation in the scientific association in North America that focuses on potato research and extension. She was elected a life member in this organization, The Potato Association of America, the organization’s highest honor.

Dr. Mondy was honored for her work by many organizations and in many ways. Her numerous awards include the first E.F. Steir Award from the Institute of Food Technologists, the outstanding alumni award from Cornell’s College of Agriculture and Life Sciences and the Centennial Achievement Award from Ouachita Baptist University. Mondy’s professional memberships, accomplishments and honors also include being an elected Fellow of the American Association for the Advancement of Science, the Institute of Food Technologists, the Institute of Chemists and an honorary life member of Graduate Women in Science. She served as a consultant to the U.S. Environmental Protection Agency, the U.S. Department of Agriculture and food companies and agencies in the United States and abroad, including the International Institute of Tropical Agriculture in Nigeria.

In 2001, Mondy published her autobiography, *You Never Fail Until You Stop Trying: The Story of a Pioneer Woman Chemist* (Dorrance Publishing). In addition to chronicling her challenges as a woman in science, the book recounts

her efforts to improve food and nutrition worldwide, from India and Nigeria to Peru and Poland. She describes food processing behind the Iron Curtain in Warsaw in 1966; her work at the R.T. French Co. developing new products and improving the flavor of Sloppy Joes and Hamburger Helper; and visiting lepers and malnourished children and living through a military coup in Nigeria.

The author or co-author of more than 100 scientific publications, including the textbook *Experimental Food Chemistry*, Mondy is in the National Women's Hall of Fame in Seneca Falls, New York, and is listed in more than two dozen reference books, such as *Who's Who in America*, *Foremost Women in the Twentieth Century*, and the *2000 Outstanding Intellectuals of the 21st Century*. She is the namesake of the Nell I. Mondy Laboratory of Human Performance in Martha Van Rensselaer Hall at Cornell and of the Nell I. Mondy Organic Chemistry Laboratory at Ouachita Baptist University, which also sponsors a lecture series in her name.

She maintained a deep and abiding respect for her mentors at Cornell, often recounting the lessons she learned at the side of distinguished Cornell faculty such as the late National Academy of Sciences member, Dr. Leonard Maynard. She shared these values with her many students. To them, she was caring and generous with her time. She emphasized the wider value of research and hard work in life. She was a kind-hearted woman, who kept in touch with her students and their families long after they graduated. Nell made her students feel that they were her family.

Benton Sullivan Monroe

February 6, 1873 — December 13, 1968

Benton Sullivan Monroe was a member of the University for seventy-six years. He taught his first class at Cornell in 1897, his last, forty-eight years later, in 1945. Though he was not the kind of man to claim credit merely for great age, he did enjoy recalling that he had known all seven Cornell presidents and as a toddler had been lifted up by his parents at a public ceremony to see Ezra Cornell. His long life was centered with unusual firmness in the University and the University city. As a student he moved into 531 East State Street, part way between campus and business district, and there he lived until his last illness required his removal. He studied at no other university and declined to teach even temporarily at any other. Travel attracted him not at all until he was in his fifties, and even then he was never away very far or very long. All his enthusiasms were in Ithaca.

In the University he is best remembered as a versatile teacher and a sagacious committeeman. His pupils recall him as a kindly but exacting professor, who controlled his classroom without raising his voice, who gave the impression of reserves of knowledge ready if they should need to be called up, and who could twinkle benignly at an abysmally unprepared student even while writing an unmistakable F in his grade book. In his later years he taught Old and Middle English, the history of the language, and the literature of the eighteenth century. But over the full run, as the old *Announcements* show, he had taught almost all the traditional English courses. In so doing he reflected the training of his master, James Morgan Hart, Cornell's first professor of English literature. When asked why, in spite of his mainly philological experience and interest, he read Byron oftener than Beowulf and would as soon teach Walter Scott as William Langland, he replied simply, "I am a Hart man." Only contemporary literature stood outside his interests. The modern novel bored him and modern poetry repelled him.

Committee and administrative work, however, neither bored nor repelled him, whether such duties were within or without the walls. He was secretary of the Graduate Faculty from 1917 to 1941, acting dean of the Graduate School at three periods, chairman of the English Department in the year before his retirement, secretary of the faculty of arts and sciences from 1911 to 1913, secretary to the Administrative Board of Summer Sessions from 1919 to 1933, and reader for the College Entrance Examination Board from 1911 to 1930.

The city laid similar claims upon him. He was a member of the Civil Service Commission from 1921 to 1940 and chairman from 1938 to 1940, secretary of the old Town and Gown Club for thirty-five years, city archivist for twenty-one years, city historian at two periods, an ardent member of the DeWitt Historical Society for as

long as anyone can now remember, an active worker for the Ithaca Community Chest and treasurer in 1925, and a charter member of the Ithaca Rotary Club, of which he was an organizer in 1914 and president in 1917-18. Downtown Ithaca recognized the devotion of its distinguished citizen by honoring him on his ninetieth birthday at a testimonial dinner attended by the academic, industrial, professional, and business leaders of both city and county.

Complaisant and agreeable as he was, in a few matters “Ted” Monroe declined to conform to traditional patterns and legends of professorial life and insisted on following his own notions of what was right and good. For instance, though the light in his library burned long hours every night, he published very little. He refused to celebrate in print every discovery or insight that rewarded his study. He imparted these findings in the classroom, in conference with graduate students, or in correspondence with other scholars. He did contribute occasionally to *Dialect Notes*, *Modern Philology*, and the *Journal of English and Germanic Philology*, but he probably appeared oftener in the prefaces of others than in pieces of his own. He disliked giving public lectures and felt no obligation to attend annual meetings of the professional associations. On the other hand, he would stop at nothing to track down, say, the first occurrence of a dialectal form or a variant spelling, and he assembled for such purposes a huge library, beautifully indexed and carefully annotated.

His recreations were few. In athletics, either as participant or spectator, he had no interest. But a love of horses, formed when he was a boy on his father’s farm near Romulus, carried over into his adult life. He was famous in this part of the country for his “spanking” teams of matched carriage horses, for his care in grooming them, and for his skill and style in driving them. When horses could no longer be stabled in the city, he abandoned personal transportation entirely. He refused ever to own a car, and even disliked to ride in one. He became a notable walker and perhaps is best remembered by townspeople today as a vigorous pedestrian, striding up and down the Ithaca hills with a tireless lope, carrying sometimes a reticule for convenience and sometimes a walking stick for style.

Style, whether in prose, horsemanship, whist, or dress, meant a good deal to Ted Monroe. Early photographs show him as a man consciously well tailored, and even in his later years he was unusually observant and smart in dress. Style also characterized his speech. His voice, though throaty, was pleasant and controlled, his ordinary conversation formal and only rarely colloquial. He wore a steady smile, and though he could differ sharply and argue powerfully, he was not known to show anger.

Benton Sullivan Monroe was born in Romulus, New York, on February 6, 1873, attended Ithaca High School to prepare himself for Cornell, and entered the University in the autumn of 1892. He took his degree with Phi Beta

Kappa honors with the class of 1896 and immediately entered the Graduate School. In 1897 he received the A.M. degree and was appointed assistant in English. In 1900, a candidate for the doctorate, he was appointed instructor in rhetoric and English philology. He received the Ph.D. in 1902, became assistant professor of English in 1912, professor in 1931, and professor emeritus in 1941. He was recalled to teaching duties during the war years and taught until his second retirement in 1945. On June 25, 1903, he married Nina Elston in the living room of her parents' house at 531 East State Street, the house that had been his home in Ithaca before the marriage, and that was to remain the residence of the hospitable Monroes for the rest of their long and admirable lives.

James Hutton, W. M. Sale, Jr., George H. Healey

Helen Monsch

January 28, 1881 — July 31, 1959

Helen Monsch came to Cornell University in 1918 and was a teacher of food and nutrition throughout the period when home economics progressed from a department to a school in the New York State College of Agriculture, and then to the New York State College of Home Economics in Cornell University. Professor Monsch was appointed head of the Department of Food and Nutrition in 1925 when the Board of Trustees of Cornell University officially recognized the departments which had been in operation since home economics became a school; she served in this capacity for twenty years. Under her leadership the program of the department was expanded to include, in addition to undergraduate teaching and the Cooperative Extension work in the state, graduate teaching and research. The department's Faculty increased from five members in 1918 to twenty members in 1947; at this date there were also fifteen graduate assistants.

Helen Monsch was born in Louisville, Kentucky, January 28, 1881. She received the Bachelor of Science degree from the Kansas Agricultural College in 1904 and from the University of Chicago in 1909, the latter degree in chemistry and physics. In 1916 she was awarded the Master of Arts degree in nutrition by Columbia University. Professor Monsch also studied at the Iowa Child Welfare Research Station, Rush Medical College, and the Illinois College of Medicine, specializing in infant and child nutrition. She was head of food and nutrition instruction in the public schools of Gary, Indiana, from 1909 to 1913; an instructor at Simmons College, Boston, Massachusetts, in 1913-1914; head of the food and nutrition department at Iowa State College from 1914 to 1918 when she came to the then Department of Home Economics in the College of Agriculture at Cornell University. She retired as Professor Emeritus of Food and Nutrition at Cornell University in 1947.

In addition to the administration of the Department of Food and Nutrition and her classroom teaching, Miss Monsch supervised the nutrition of the children in the College nursery school and of the infants who were cared for by the students in the home management houses of the College. She also had a unique relation with mothers and babies in many homes in the community. These homes, the nursery school, and the home management houses were all used as laboratories for the teaching of child nutrition in practical situations.

Professor Monsch was co-author with Marguerite K. Harper of the book, *Feeding Babies and Mothers of Babies*. With the late Miriam Birdseye of the Federal Extension Service, U. S. Department of Agriculture, she organized

and directed the movie *For Health and Happiness*. She was the author of several Cornell Extension Bulletins and of articles on the feeding of infants and preschool children.

Miss Monsch was a member of the American Home Economics Association, the American Dietetic Association, and of Phi Kappa Phi, Omicron Nu, and Pi Lambda Theta. Locally she was affiliated with the Bethel Grove Home Bureau and the Family Welfare Society of Ithaca having served as an officer of the latter organization.

A friendly person, Helen Monsch will long be remembered for her genial smile and quick cordial greeting. Her friendly concern for people was characteristically expressed in action as well as in words. Her enjoyment of colleagues and friends, students, the children with whom she worked and their families, her neighbors, and her own immediate family was made evident by her hospitality, her generosity, and her helpfulness in many thoughtful ways. These qualities endeared her to her associates. Her great love of the outdoors, especially of her flower gardens, was continued during her retirement years in Florida. Her death occurred at her home in Winter Park July 31, 1959.

Professor Monsch was an outstanding, dynamic, and effective teacher. Students remember her strong personality, her great sense of humor, her integrity and vision. She was respected by all with whom she worked for her accomplishments and success in the area of child care and nutrition. Many students acknowledge her inspiration and guidance in their professional careers.

Catherine Personius, Beulah Blackmore, Lillian Shaben

Royal Ewert Montgomery

May 6, 1896 — June 13, 1966

Royal Ewert Montgomery, son of Robert John and Lillie Matthews Montgomery, was born in Moline, Illinois. His father was a manufacturer of building elevators. Royal Montgomery, however, did not care for business but was early attracted to the academic life. After service, 1918-19, in the military intelligence division of the United States Army, he returned to the University of Chicago. He received the Ph.B. degree from that institution in 1921, the M.A. in 1923, and the Ph.D. in 1925. His work as a teacher started before his formal education was completed and continued until his retirement. He was an instructor in the University of Missouri in 1921-22, an assistant and an instructor in the University of Chicago in 1922-27, and an Associate Professor in the University of Texas in 1927-29.

Royal Montgomery came to Cornell University in 1929 as an Assistant Professor, and became a resident of Ithaca for the rest of his life. He was promoted to Professor in 1937, surrendering that rank only to become an Emeritus Professor in 1964.

From his regular base of operations here, Professor Montgomery moved out occasionally, though usually only in an intellectual sense. Travel was not for him. Thus he was on the staff of the Brookings Institution in 1938. He served on the editorial board of *The American Economic Review* from 1938 to 1941. He was a public representative and chairman of various industry commissions, Wage and Hour Division of the U.S. Department of Labor in 1940-45. He was an arbitrator and public panel member of the National War Labor Board in 1942-45. He served as a representative of the American Economic Association on the Social Science Research Council. Beginning in 1947, he served as an arbitrator on the Federal Mediation and Conciliation Service.

Montgomery was, however, best known for his written works. His first book was *Industrial Relations in the Building Trades* in 1927. Then came (with H. A. Millis) *Labor's Progress and Problems*, and *Labor's Risks and Social Insurance*. Both were published in 1938. Another work with Millis, *Organized Labor*, appeared in 1945. These books are substantial contributions to labor economics. Some of his other and more general interests are represented by the chapters in the *Dictionary of the American Economy* on the impact of war on America, the development of collectivism in the U.S., and labor in the American economy.

Professor Montgomery was a broadly educated scholar. His interests were wide. They comprised principally the full range of economic studies including dissenting doctrines, American history, and English. He read much.

He saw labor in its setting and its economics as a part of general economics. He was blessed by an extraordinary memory, so retentive that he seemed never to forget anything. He cultivated the language. He knew the nuances as well as the meanings of words, and how to organize them for effective exposition. In short, he was an excellent writer.

He was also devoted to his teaching. He always wished to teach as many courses as possible. Although shy and never seeking popularity, he attracted the respect and liking of many students. A number of able professors in leading universities had written their doctoral dissertations under his direction.

Montgomery's adult life can be divided into three parts. The first, in the 1920's, was the period of preparation and of promise. The second, comprising the 1930's and perhaps half of the 1940's, was the period of brilliant fulfillment. It was in those years that nearly all his writing was done and that graduate students crowded his seminars. He inspired them by his immense learning as organized in his keen mind, and by his seemingly tireless energy. With the third came the shadows that, save for small and temporary departures, continued progressively to darken his days.

Royal Montgomery was a quiet, unassuming person. He had high standards of honor. His manner was singularly gentle. There was also in him an innate refinement. Nothing vulgar or intentionally unkind was ever said or done by him. He never sought preferment or pushed himself forward. In a group he was likely to say little. Not one to take the initiative in making acquaintances and cultivating friends, he was always appreciative of any attention given him.

He was never married. He is survived by his sister, Mrs. Rosemary Kupper.

Paul M. O'Leary, Leonard P. Adams, M. Slade Kendrick

Eugene D. Montillon

October 18, 1886 — September 24, 1973

A life that spans a period of ninety years is difficult to summarize and assess — when all of those years were active ones the difficulty is compounded.

Eugene Montillon was born in Buffalo, New York, and attended primary and secondary school there. In 1900 the family moved to Fort Erie, Ontario, and for the rest of his schooling Eugene claimed to have established an all-time record in international border crossings.

At an early age he developed a lasting interest in the design of buildings and thus his choice of a career in architecture was a simple and natural one. He matriculated at Cornell in September of 1903, leaving in 1907 without a degree. For two and a half years he worked in the landscape architecture offices of Townsend and Fleming in Buffalo. When Bryant Fleming was asked by the late Liberty Hyde Bailey to undertake a lectureship in landscape architecture at Cornell, he encouraged Eugene to return to the University to act as his assistant and to complete the work for his degree. The degree in Architecture was received in 1912 and, at the same time, the offer of an instructorship in the new department of Rural Art, then in the College of Agriculture. Except for a year's leave of absence in 1928-29, to work with the Westchester County Park Commission, this marked the beginning of a continuing relationship with Cornell University which lasted until 1952. He was promoted to assistant professor in 1917 and to professor of landscape architecture in 1934.

Eugene saw the development of studies in landscape architecture through the full circle — birth to death. Beginning with a fledgling department in Agriculture, through the transfer to Architecture in 1923 and the development of a strong and viable program to its ultimate demise - a victim of the depression. Upon the death of Gordon Davis in 1930, he became chairman of the department. He was involved in the establishment of the program in City and Regional Planning within the College of Architecture and during the war years taught on loan in the School of Mechanical Engineering. On July 1, 1951, at the age of sixty-eight, he was appointed professor of landscape architecture, emeritus, returning the following year to teach part time.

To Eugene the shift to emeritus status did not mean comfortable and well-deserved retirement, far from it — it merely signaled the beginning of a new career that was to unfold through the next two decades. He moved to Binghamton, New York, where he performed distinguished service as consultant in design to the Broome County Planning Board. He worked on many projects, the last being a guide to the historic architecture of the region.

He was a member of Gargoyle, Alpha Phi Omega fraternity, Phi Kappa Tau fraternity, and the American Institute of Architects, as well as a fellow of the American Society of Landscape Architects, a registered architect in the state of New York, and a member of the Cornell Club of New York. While University work absorbed the bulk of his energies he was able to do independent work in the practice of both architecture and landscape architecture.

He was an able and sympathetic teacher, a kindly and compassionate friend and compatriot. His life was long and full and we who were privileged to know and work with him will forever treasure his memory.

Burnham Kelly, Stephen Jacobs, Thomas Canfield

Clyde B. Moore

January 13, 1886 — November 4, 1973

Clyde B. Moore, professor emeritus and former member of the Education Department at Cornell, died November 4, 1973, at the age of 87.

Professor Moore was born in Boone County, Nebraska, in 1886. He attended Nebraska public schools and received the following higher education degrees: A.B. from Nebraska University in 1912, B.Ed, from Nebraska State Teachers' College in 1913, M.A. from Clark University in 1916, and the Ph.D. from Columbia University in 1920.

Coming to Cornell in 1925, he taught here until his retirement in 1954. Clyde Moore was a veteran of World War I and had been a rural school teacher and administrator and faculty member at LaCrosse (Wis.) State Normal School and the University of Pittsburgh. His own formative years in the new profession of education coincided with the period of progressive reform, and he was always a constructive critic of his discipline and profession, and an innovator in the fields of supervision, educational finance, and social studies. Professor Moore was especially well known for his contributions to children's literature and social studies textbooks.

Clyde Moore was a professional scholar in the finest traditions of the University, using the tools of his discipline to raise critical questions about the professional field and to provide leadership to practice in that field. During the span of a thirty-year career as a member of the Cornell faculty, Professor Moore combined teaching and writing with active service to local, state, and national educational organizations. He served for twenty-five years as chairman of the New York State Educational Conference Board and for thirty years as a member of the Ithaca School District Board of Education. Both the State Teachers Association and the State School Boards Association honored him with the presentations of their distinguished service awards. He was an honorary member of the Ithaca Rotary Club and an active Rotarian for over forty-five years. He served on numerous community boards in addition to the Board of Education.

A modest and unassuming person, Clyde Moore was known to a generation of students and colleagues for his wise counsel, unfailing willingness to serve his profession, and gentle criticism of human and institutional failings. He exerted a beneficial influence on many who knew and worked with him and, through his writings, on the shape and direction of public education and the children using his books.

He is survived by his daughter, Mrs. Milo J. Peterson, of Minneapolis, four grandchildren, and four great-grandchildren.

Joseph P. Bail, Frederick H. Stutz, Marvin D. Glock

David Paul Moore

June 22, 1931 — March 29, 1978

David Paul Moore, professor of agronomy and director of the U.S. Plant, Soil, and Nutrition Laboratory, died at Ithaca, New York, of a heart attack. He was born in Rocky Mount, North Carolina, the son of David Paul and Viola Jean Moore. Dr. Moore married Ruth M. Joyner in 1953. They had a daughter, Carol Jane Moore Sorenson, in 1957 and a son, Michael David Moore, in 1960.

Professor Moore attended high school at Wallace, North Carolina. He obtained a Bachelor of Science degree in soil science at North Carolina State University at Raleigh in 1953, and a Master of Science degree in soil science from the same university in 1955. From July 1953 to August 1955 he was a soil scientist at the Horticulture Crops Research Station at Castle Hayne, North Carolina, and a graduate research assistant in the Department of Soil Science at North Carolina State University. He was granted a Doctor of Philosophy degree in soil chemistry and plant nutrition from the University of California, Berkeley, in 1960.

In February 1960 he joined the staff of Oregon State University at Corvallis, becoming a full professor in 1970. There Dr. Moore taught graduate-level courses in soil chemistry and soil fertility and directed the thesis research of graduate students. His major research was in the relationship of soil chemistry to plant nutrition. One field of emphasis was acid soil problems, especially toxic effects of aluminum on plant roots. From 1971 to 1977 he was assistant director of the Oregon Agricultural Experiment Station at Oregon State University, where he coordinated soil fertility research at the branch experiment stations. In February and March 1975 and January 1976 he worked with the U.S. Agency for International Development on agricultural research needs in Jordan. He became director of the U.S. Plant, Soil, and Nutrition Laboratory in Ithaca in September 1977 and was also appointed professor of agronomy at Cornell University. He served in these capacities until his death.

He was a member of the American Society of Agronomy, the Soil Science Society of America, the American Society of Plant Physiologists, and Sigma Xi. He was an associate editor of the *Agronomy Journal* between 1968 and 1973 and of *Crops and Soils* between 1970 and 1974.

Dr. Moore served as lieutenant colonel in the Army Reserves. His most recent assignment was with the Civil Affairs Board as chief of the Food and Agricultural Branch.

Dr. Moore's keen interest in people and in people-related problems was immediately evident. He loved people and thoroughly enjoyed helping them develop their technical skills and their interpersonal work relationships. His incisive appraisals and his frank evaluations made him an unusually valuable leader and coworker and a good friend. He will be sorely missed, but he would be happy to know that his ideas and his influence on the ideas and attitudes of his coworkers will continue for many years. As one views the impact of his lifetime, one must conclude that here was a constructive life.

Dean L. Linscott, Madison J. Wright, David L. Grunes

Harold E. Moore, Jr.

July 7, 1917 — October 17, 1980

Harold E. Moore, Jr., Liberty Hyde Bailey Professor of Botany in the L. H. Bailey Hortorium, was a man of character and integrity, who exemplified the scholarly tradition of the academic profession.

Hal, as he was known to his colleagues and many friends, was born in Winthrop, Massachusetts, but spent most of his boyhood in the town of Sharon. He received his Bachelor of Science degree from Massachusetts State College in 1939 and his Master of Science and Doctor of Philosophy degrees in 1940 and 1942 from Harvard University, where his major interest was systematic botany. From 1942 through 1946, Hal served in the United States Army, being stationed in Texas as a medical officer. Following his discharge, he received his first Guggenheim Fellowship, the tenure of which was spent in Mexico studying the genus *Geranium* and the flora of the State of Hidalgo. These studies were continued as a postdoctoral student and technical assistant at the Gray Herbarium of Harvard University. In 1948, at the request of Liberty Hyde Bailey, he joined the staff of the hortorium as assistant professor of botany. He was appointed associate professor in 1951, and professor and director of the hortorium in 1960. He relinquished his administrative duties in 1969. In 1978 he was appointed Liberty Hyde Bailey Professor of Botany.

When Hal joined the hortorium, it was housed in the carnage house and adjoining buildings that had been part of the Bailey homestead on Sage Place. In that unique and close environment, working with Dr. Bailey, Miss Ethel Zoe Bailey, and Dr. George H. M. Lawrence, Hal initiated a truly remarkable research career that encompassed two principal interests. The first dealt with the systematics of the palm family, the second with that of cultivated plants.

Hal's most obvious contributions have been to the knowledge of the palms. He was without question the world's authority on this economically and biologically important group of plants. He circled the tropical regions of the globe in search of little-known and elusive species. He spent some five years of his professional life in the field and acquired an intimate and unsurpassed knowledge of these fascinating plants. Hal's interests in palms, however, encompassed far more than traditional taxonomic study. He saw the necessity of integrating all possible approaches in attempting to understand them as plants and to understand evolution within the family. This realization led to the initiation of a broad program of study involving research associates, collaborators, graduate students, and technicians. Studies of floral anatomy, carried on in collaboration with Dr. Natalie W. Uhl, were important in delineating subfamilies of palms and produced new insights into the structure of the palm flower. They have

proven relevant to understanding the evolution not only of palms, but also of the monocotyledons as a whole. Other incisive and collaborative research dealt with ultrastructure, pollination biology, cytology, chemistry, and statistical analyses of morphological data. The importance of this work has been recognized widely, and Hal's research enjoyed strong financial support from a variety of sources, particularly the National Science Foundation.

The cultivated flora of the world is not bounded geographically, and to deal with it effectively requires knowledge of great breadth. Of Hal's nearly three hundred published papers, over one-third were concerned with the systematics and nomenclature of many horticulturally important families, including members of the geranium, amaryllis, squash, and spiderwort families. For years he held a strong interest in the conifers, and before he was completely overtaken by his studies of the palms, he was the recognized authority on the New World members of the African violet family, authoring the widely sought book, *African Violets, Gloxinias, and Their Relatives*.

He was a principal contributor to *Hortus Third*, the hortorium's dictionary of plants cultivated in the United States and Canada. Not only did he produce a significant portion of the manuscript but he also edited a large percentage of the text, bringing it to his own high standards for publication. In fact, one of Hal's greatest talents and joys was in editorial work. As editor of *Principes*, the journal of the Palm Society, for over twenty years, and later of *Gentes Herbarum*, one of the scientific journals of the hortorium, he consistently was able to bring clarity to ideas and produce publications of outstanding scientific reputation. Only collaborators or authors whose papers had been edited by Hal could know how extensive, objective, and meticulous was his editing and writing.

Hal's appointment initially involved no formal teaching, yet he became an outstanding teacher, not because of spellbinding lectures but because he possessed an enormous botanical knowledge that he willingly shared quietly and fully. Most of Hal's teaching involved students at the graduate level. He dealt with all students majoring in systematic botany with equal concern, whether or not they were his direct responsibility. His interests in botany were catholic, and he served as a rallying point for students in organismic botany by opening his home to them for discussion of fundamental botanical problems as well as for social events. He particularly enjoyed his tropical plant-families course, which provided him with an opportunity to discuss the many facets of his knowledge of tropical biotas. His enthusiasm was contagious, and it influenced careers of many graduate students, both at Cornell and elsewhere. The daily accumulation of letters from the far reaches of the globe stands in testimony to the extent of his influence.

Through the years, Hal's interest in tropical botany gave Cornell a resource unavailable in most institutions, even when the needs for such expertise had become widely recognized. He was an active participant and member of

the Board of Directors of the Organization of Tropical Studies, located in Costa Rica. His intimate knowledge of the flora of that country and of other unique floras, for example, that of New Caledonia, permitted him to be of assistance both to North American scholars and to those residing in the countries that he visited. He never failed to extend a kind and helping hand to those who assisted him in the field; thus he was always at home in his world travels.

At Cornell Hal took an active interest in library development, serving on both the University Library Board and the Mann Library Committee. He was influential in the affairs of the Cornell Plantations, having been a member of the Cornell Plantations Committee for some sixteen years. He served on the Committee to Visit the Arnold Arboretum of Harvard University, was chairman of the Research Committee of the Pacific Tropical Botanical Garden, and was a member of the Board of Directors of the Fairchild Tropical Garden and the Palm Society. He was a member of the Standing Committee on the Stabilization of Specific Names for a succession of botanical congresses. In addition to a second Guggenheim Fellowship, he was also the recipient of the Founders Medal of the Fairchild Tropical Garden.

Hal was deeply moved by, and appreciative of, the action of the College of Agriculture and Life Sciences in recognizing his contributions to both science and the University by naming him Liberty Hyde Bailey Professor of Botany. It was a fitting honor. His total commitment to the ideals of the University, his honesty and compassion, and the encouragement, help, and trust that he so generously extended to those who knew him followed in the tradition of Dr. Bailey. Hal was aware of the dual needs of science and humanity, and he served both of these constituencies equally well.

Natalie W. Uhl, Harlan P. Banks, David M. Bates

Norman Slawson Moore

April 17, 1901 — April 3, 1995

Norman Slawson Moore was born in Ithaca, the son of Veranus A. Moore, M.D., a pathologist who became the second Dean of the Cornell Veterinary College. Norm was an Ithacan and Cornellian all the way. As his steadfast friend Deane Malott pointed out, he lived in only two houses for his entire life: the one he was born in and the gracious home on Pleasant Grove Road where he died.

He was graduated, *cum laude*, from Cornell in 1923 and from its Medical College in 1926. He served as House Physician at Bellevue Hospital in New York City 1926-28 and as a Research Fellow at the Rockefeller Institute for the following two years.

Norm then returned to Ithaca and opened a practice in internal medicine, the first internist in the area. He also brought with him the first electrocardiograph instrument in Ithaca. He quickly developed a busy practice here; he became a Fellow of the American College of Physicians in 1938 and one of the early Diplomates of the American Board of Internal Medicine in 1947.

Very active in the medical and general community, Norm was one of the founders and the first chairman of the Tompkins County Board of Health and in 1952 the founder of the County Mental Health Clinic. In his role with the Board of Health and with the connections he had developed with the State Health Department, he was instrumental in converting the New York State Biggs Tuberculosis Hospital to the Tompkins County Hospital in 1960, thus replacing the antiquated community hospital on South Quarry Street.

In 1939, there was increasing uneasiness about the arrangements for health care provided to the Cornell students. The system was poorly organized, quite dependent on the local practitioners, and not oriented to the needs of the student population. Several cases of serious and even fatal illness in the previous year aroused concern in the campus community. President Day expressed his concerns to Dr. Moore, his personal physician; more than that, he implored and finally convinced Norm to give up his practice and to reorganize the University Health Services and become the department's full time Director. A new Department of Clinical and Preventive Medicine, later called the Department of University Health Services, was established with Norm as Professor and Chairman.

Almost immediately, Cornell became one of the larger training sites for the instruction of cadets of the Army and Navy, which also entailed the provision of medical care for the cadets on a contractual arrangement with the

armed services. This was integrated quite successfully with the care provided to the civilian students, a process which would have been very difficult without the reorganization of the Health Services which Norm had already initiated and supervised.

After the busy days of the wartime period with its shortages of staff and resources, Norm's department began to mature in the immediate post-war years. The idea of a comprehensive service oriented to the special needs of university students was conceived and implemented. Included were not only direct medical care of high quality but preventive medicine, health education, sports medicine, and psychiatric and psychological care. In addition, the department was made responsible for monitoring occupational and environmental health on campus. A new and expanded staff was assembled; the reliance on local practitioners was reduced to consultation for surgical and certain subspecialty problems. The need for a modern and convenient facility was defined, and Dr. Moore was instrumental in persuading the Gannett Foundation to fund the Clinic building. Always interested in teaching, he also developed a medical residency program which made use not only of the Clinic for outpatients but of both the old Sage Infirmary and the Tompkins County Hospital for hospitalized students.

The development of the University Health Services served as a model for other universities, and Norm was recognized for his leadership by his appointment as editor of *Student Medicine* (later *Journal of the American College Health Association*) and his election as president of ACHA in 1954.

Dr. Moore's involvement with the University was not confined to clinical care or even the usual kinds of clinical research. Early in his tenure, he became interested in research in clinical nutrition, which was not a prominent area of study at that time. He worked with Leonard A. Maynard, Ph.D., to persuade President Day and Mr. Howard E. Babcock, Chairman of the Cornell Board of Trustees, to support the establishment of the School of Nutrition in 1941. Furthermore, he took a very active role in research programs related to medical nutrition. Indeed, the first grants to the new school were given in part to support such studies, with Norm as the principal investigator, and his involvement with research in clinical nutrition continued for the following fifteen years. During this period, Norm was an important resource for counsel and support for the School, which was having difficulties in making its way financially and organizationally. His influence with administrators in both the University and the State was most helpful.

Dr. Moore had a broad range of interests outside the University. He was active in the local community, serving on numerous philanthropic boards. He was elected President of the Tompkins County Medical Society in 1956;

he went on to be elected President of the New York State Medical Society in 1960. Norm was one of the editors of the *New York State Journal of Medicine* and for many years wrote or edited a monthly editorial column on clinical nutrition for the *Journal*.

In 1954, he was appointed to the New York State Public Health Council, the most important health policy group in the State Government, by Governor Dewey, who had come to know him during discussions in regard to the School of Nutrition. He remained as a member during the Harriman administration, and in 1968, was appointed Chairman by Governor Rockefeller. He became an insider during the Rockefeller years; he and the Governor were on a first name relationship. "Nelson" appointed him to several other advisory committees and councils, and he continued to be active and influential for a decade or more after his retirement from Cornell in 1967.

Norm was an accomplished clinician and researcher. He was an effective organizer and administrator and a perceptive long-range planner. Despite his extensive commitments to the University and to the county and the state, Norm was an outstanding leader of his professional staff. He was always available and interested in providing consultation about difficult clinical problems, and in all situations, he dealt with his staff as true colleagues.

But beyond all that, Norm was a charming and generous man. He had a forthright way about him and a twinkling humorous manner that delighted everyone he encountered. He was devoted to our University and our community. Norm and Bernice, who predeceased him in 1993, had no children, and they thought it fitting to leave the bulk of his estate to the University, including his beautiful home, which will become the premier home for the Faculty-in-Residence program.

Dearie Malott, Leroy K. Young, Allyn B. Ley

Veranus Alva Moore

Dean of the N. Y. State Veterinary College

April 13, 1859 — February 11, 1931

The University Faculty records with deep sorrow the death on February 11, 1931 of Veranus Alva Moore, late dean of the N. Y. State Veterinary College.

Born on April 13, 1859, he entered Cornell University in 1883 and graduated with the degree of B.S., in 1887. In the spring of his senior year, he entered the Bureau of Animal Industry of the Federal Department of Agriculture where he served nine years, the last one as chief of the Division of Animal Pathology. While in Washington he studied medicine and received the M. D. degree in 1890.

At the opening of the Veterinary College in 1896, Dr. Moore was appointed Professor of Pathology, Bacteriology and Meat Inspection, a position which he held continuously until his retirement. In 1908 he succeeded Dr. James Law as Dean of the College and as such served for twenty-one years. From 1898-1910 he was Professor of Pathology and Bacteriology in the Ithaca division of the Medical College.

Primarily interested in Veterinary education at a time when the general public little appreciated the need and importance of trained veterinarians, Dr. Moore did an inestimable service by instilling into the public consciousness an appreciation of the vast responsibilities resting upon a sound scientific veterinary service in the promotion of public health.

His training as a bacteriologist and pathologist gave him a keen insight into the close correlation between many of the diseases common to animals and man, and ideally fitted him to advocate public health measures of far reaching importance to both State and Nation. He likewise rendered an incalculable service to the livestock owners of the country by his research and his sound advice.

He published many special papers, gave numerous addresses, and prepared books in his field. A teacher for more than thirty years, his influence upon successive generations of students was profound and he inspired them with something of his own high ideals for their chosen profession. His quiet dignity and exceptional ability won for him the highest admiration and affection of all his colleagues.

In a wider circle of his relations, the same high appreciation of his character and abilities is apparent. His successive appointments as delegate of the United States to the International Veterinary Conference in Budapest; Member

of the International Commission for the control of tuberculosis in cattle; member of the Commission for revising the Federal Meat Inspection regulations; an Adviser to the Surgeon General's Office in the World War; member of the White House Conference on Child Health and Protection, all alike are indicative of the confidence felt by public officials in the wisdom of his counsels and his single minded desire to promote the public well-being. In addition he gave generously of his time to the local Board of Health, Board of Education, Memorial Hospital, and other organizations.

The bestowal of honorary degrees upon Dr. Moore by two great universities and his recent election to membership in the Royal College of Veterinary Surgeons in London are well merited academic honors.

A successful and sympathetic teacher, just administrator, wise counselor, and steadfast friend is gone, but the memory of his consecrated life will long be cherished as an incentive and a benediction.

Retired: June 1929 (Fac. Rec. p. 1594, 1682)

Richard Allen Mordoff

June 23, 1886 — June 4, 1961

Richard Allen Mordoff, Professor of Meteorology, Emeritus, died June 4, 1961, in Lakeland, Florida. Dr. Mordoff had retired from his active service with the College of Agriculture on August 16, 1949.

Dr. Mordoff was born in Scottsville, New York, on June 23, 1886, and there he received his early education. He entered Cornell in 1907 and was graduated with the degree of Bachelor of Science in agriculture in 1911. During his senior year, 1910-1911, he served in the College of Agriculture as assistant registrar; he also served in this capacity during the period 1913-1917. During the year 1912-1913 he was an assistant in physical geography.

Following his work as assistant registrar in the College, he received in 1917 an instructorship in meteorology. At the same time he entered the Graduate School. In 1918 he was awarded the degree of Master of Arts.

During the year 1918-1919 he was in military service, holding the rank of second lieutenant in the U.S. Army. After completing his military service he again returned to his graduate studies and to his teaching. In 1921 he received the degree of Doctor of Philosophy, and in that year he was advanced to the rank of Assistant Professor. In 1924 he was promoted to a professorship in meteorology. During the years 1925 to 1929 Dr. Mordoff was acting head of the Department of Meteorology prior to the inclusion of this department in the Department of Pomology. Thereafter he continued as Professor of Meteorology until his retirement when he was made Professor of Meteorology, Emeritus.

The major part of Professor Mordoff's time in the College was spent in teaching meteorology and climatology to undergraduate students who registered in large numbers in his classes. His well known publication, "The Climate of New York," appeared in 1925. He was a member of Alpha Gamma Rho fraternity. Professionally he was a member of the American Meteorological Society and the American Association for the Advancement of Science.

Shortly after retiring, Dr. Mordoff left Ithaca for Lakeland, Florida, where he resided until his death.

He is survived by his widow, Laura Fish Mordoff of Lakeland, two daughters, Mrs. Helen Campbell of Baton Rouge, Louisiana, and Mrs. Betty Stevenson of Cambridge, Massachusetts, and two sons, Richard A. of Columbus, Ohio, and Theodore of Merrick, New York. His brother, Cornell Professor William Emerson Mordoff, who died a few months earlier, is memorialized in the following article.

A. W. Gibson, R. M. Smock, C. H. Guise

William Emerson Mordoff

December 4, 1889 — November 15, 1960

After a full half-century of association with Cornell University as a student and teacher, Professor Emeritus William E. Mordoff died on November 15, 1960, following a short illness.

Professor Mordoff worked his way through both high school and college and graduated from the College of Engineering at Cornell in 1913, receiving the M.E. degree. From 1913 to 1915 he taught physics at Rochester's East High School. In 1915 he returned to Cornell as instructor for one year in the department of Rural Engineering, College of Agriculture. From 1916 until his retirement in 1956, he was a member of the staff of the Sibley School of Mechanical Engineering, serving as instructor in machine design from 1916 to 1918, as instructor in experimental engineering from 1918 to 1923, as instructor in mechanic arts for the year 1923-1924; as Assistant Professor of Machine Construction from 1924 to 1942, as Assistant Professor of Engineering Drawing from 1942 to 1946, and as Associate Professor of Engineering Drawing from 1946 to 1956. He became Professor Emeritus of Mechanical Engineering on July 1, 1956, thus terminating a teaching career of forty-one years on the Cornell campus.

Professor Mordoff was born on December 4, 1889, at Scottsville, New York, the son of Charles and Ann Emerson Mordoff. He had one brother, Richard, who served Cornell as Professor of Meteorology (see the preceding article).

Professor Mordoff's early years were spent in the vicinity of Rochester, New York. He attended primary and secondary schools in Scottsville and Rochester, graduating from West High in 1909. His high school career was interrupted for a time when he left East High to work full time at the Ritter Dental Manufacturing Company. Later, upon entering West High School, he attended classes mornings and continued to work for Ritter afternoons and Saturdays. This early contact with industry influenced his decision to become an engineer and undoubtedly led to his forty-one years of teaching in the field.

Professor Mordoff was extremely versatile in his ability to adapt himself to teaching in whatever department seemed to present a challenge, moving from physics to rural engineering, to machine design, to experimental engineering, to mechanic arts, to machine construction, and finally to engineering drawing. Professor Mordoff was devoted to his teaching and always regarded teaching as his full-time responsibility. He demanded honest labor, neatly and reliably done. His discipline was firm, tempered with gentlemanly counseling, and he was always admired and respected by his students. During his last fourteen years he taught freshman drawing and descriptive geometry.

His earlier experience in more advanced courses provided an excellent background as a basis for stimulating interest in his freshman courses.

Outside the classroom, until recent years, his principal diversion was that of a small-time farmer—purely an avocation. Professor Mordoff possessed a great love for leisurely labor in the out-of-doors. His care for struggling garden plants and flowers coupled with his detestation for weeds was most admirable. However, he and Mrs. Mordoff, the former Elizabeth Cassidy, during the last decade turned their attention to promoting the welfare of animals. Upon retirement, when questioned as to his plans for the future, his stock answer was, “I guess I’m going to the dogs.” He and Mrs. Mordoff maintained an extensive small-animal shelter at their home on West Hill and over the years cared and provided medical attention for literally hundreds of homeless dogs, cats, birds, and other small creatures, many of whom he personally rescued through the volunteer services of the Animal Emergency Club, which was started by Mrs. Mordoff. Seldom were there less than twelve to fourteen animals at any one time that were receiving their kindly attention.

Those who knew him well cannot forget the twinkling eyes and genial conversations, generally occasioned under a shade tree while sitting on a bench or leaning on a hoe handle.

William C. Andrae, George R. Hanselman, Roger L. Geer

Robert Swain Morison

November 25, 1906 — December 2, 1986

Robert Morison spent only eleven years of a long and distinguished career at Cornell University, but his accomplishments were immense. He played a crucially important role during the 1964-70 period in the development of Cornell's programs in the basic biological sciences. In the second half of his Cornell career he was of major importance as a teacher and adviser in helping to develop Cornell's new interdisciplinary Program on Science, Technology and Society (STS).

Morison was born in Milwaukee and spent his early years there; summers, however, invariably in New Hampshire. He attended the Phillips Exeter Academy and Harvard University, obtaining a medical degree in 1935. He spent several of the following years at Harvard doing research and teaching in physiology and anatomy. He there met and married Beningna Rempel, whose death preceded his by only three years. In 1944 Morison moved to the Rockefeller Foundation in New York, where, as a senior member of the foundation staff, he directed programs in medicine and public health for twenty years. Those were years in which programs of the Rockefeller Foundation contributed in major ways to the less-developed nations. The most-publicized accomplishments were in agriculture. The area of support that Robert Morison managed, however—medicine and public health—was equally important and equally successful.

Robert Morison came initially to Cornell to chair a committee of outside experts established by President Perkins in 1963 to study a problem of wide concern at the university—the need for new directions in teaching and research in biology. The Morison committee soon identified the major problems and recommended a bold solution—to establish a Division of Biological Sciences that would be a home for all of Cornell's biology efforts, excepting only the programs at the Medical College in New York and the College of Veterinary Medicine in Ithaca. Specifically, biologists from the state-supported colleges and those from the private colleges of Cornell were brought together to teach and do research as unified groups. Also recommended was a considerable expansion of the biology program to permit adequate attention to new subject areas like molecular biology and environmental studies. The proposal was ambitious in its call for new faculty, new buildings, and, inevitably, new funds. There was wide faculty support for the new direction. A university committee chaired by Provost Corson studied the recommendations and concluded that a university-wide division along the recommended lines operating under a single overall director was the desirable solution. The problem then was, Who should be the first director? Fortunately word had come

to President Perkins that Robert Morison might consider the Cornell position and, after some negotiation, in July 1964 Morison became a professor of biology and the division's first director.

The assignment was a formidable one. It called for a restructured group of basic biology sections with revised undergraduate and graduate teaching programs and for integration into them of faculty from Cornell's state and private colleges. Costly new buildings and equipment were needed for expanded teaching and research. Close to twenty new faculty positions were needed, for which funds were to come from both state and private sources. Chairpersons were needed for the new and modified sections. An essential requirement for the director was close and continued collaboration with the involved Cornell colleges and their deans. There was nearly universal agreement on the goals for the new program but no shortage of difficulties to be surmounted.

Remarkably, in only about four years the essential components of the new structure were in place: people, buildings, new sections, new majors, and new and revised courses of study. In accomplishing this there was credit enough for everyone involved, but a large portion of it must go to Robert Morison. He had the vision to see what could be done. He worked effectively with the entire Cornell faculty and with the administration. He participated actively and with considerable success in the recruitment of new faculty. His close connections with the National Institutes of Health and the National Science Foundation helped in fund-raising. He was the chief architect of a structure that has grown and flourished and, along with it, Cornell's stature and effectiveness in the many fields of biology.

In accomplishing all this, Morison made many close friends and virtually no enemies. He became an integral part of the Cornell community and with his wife, Beny, entered into its social and cultural life. He and Beny greatly admired Bordeaux wines, and their wine-tasting dinners became famous.

In 1970 Robert Morison retired from the directorship of the division. He joined Cornell's Program on Science, Technology and Society and there became an active teacher and scholar. On this change of assignment he was awarded the first Richard J. Schwartz Chair of Science and Society. Morison taught both undergraduate and graduate courses in the STS program and contributed papers to major publications. He was a popular and widely admired teacher.

Robert Morison had wide outside interests. Among many other assignments he was a member of the National Science Board of the National Science Foundation from 1963 to 1972, a member of the science advisory committee of the General Motors Corporation, a trustee of Bennington College, and the author or co-editor of several books.

In 1975 Morison retired from Cornell, and he and Beny moved back to his family's ancestral home in Peterboro, New Hampshire. He was soon brought back into teaching, however, this time by Massachusetts Institute of Technology, which persuaded him to become a part-time member of its own new program in science, technology, and society. Once again Robert Morison became an admired and influential teacher and colleague. Illness finally led him to retire fully in 1985. Although in increasing pain in his last years, he remained intellectually vigorous, outgoing, and friendly until he died in his sleep in early December 1986.

To all of his friends Robert Morison was a very special person. He loved to converse, to speculate on new science, and to examine the ethical implications of science and medicine. He was deeply concerned with the governance of the United States and with the state of the world. It is typical that he joined the Hastings Center for Ethical Studies soon after it was established and contributed extensively to its meetings and its publications. Most of the papers authored by Morison in his later years were concerned with major social issues, such as, for example, "Where Is Biology Taking Us?" and "Misgivings about Life-extending Technologies." He was co-editor and contributor in 1979 for an influential book, *Limits of Scientific Inquiry*. In his writings, as in his teaching, the special features were his broad knowledge, his concerns about human progress and well-being, and his deep sense of social responsibility.

Robert Morison made major contributions to Cornell's administrative structure and to its teaching. More consequential to dozens of his friends and associates was the impact on our lives of a knowledgeable scholar who was bright, provocative, inquiring, and ethically concerned and who above all had a rare and special gift of friendship. He was a joy to know and to work with.

Thomas Eisner, Adrian M. Srb, Franklin A. Long

Charles V. Morrill

March 9, 1884 — July 24, 1970

Dr. Charles V. Morrill died July 24, 1970. He was 86 years of age. He was born in New York City, March 9, 1884. He received his A.B. in 1903 from City College of New York, and his A.M. (1906) and Ph.D. (1910) from Columbia University. He was appointed to the staff at Cornell in 1915 and retired as a professor of anatomy in 1952.

Dr. Morrill was one of the last of the class of people whose entire professional lives were dedicated to the teaching of gross anatomy. As far as I know he did no original research after his doctoral thesis, at least none that he ever mentioned. His two outstanding contributions to the field were (1) providing an appreciation of and a solid foundation in gross anatomy to many classes of medical students at Cornell, and (2) a textbook on gross anatomy.

During his tenure, gross anatomy was taught six days a week for twenty-two weeks. Each day started with a one-hour review session in the amphitheater. The students arrived before him and quiet occurred when Dr. Morrill announced his presence by tapping his pipe against the metal ashtray in the hall. There are probably many physicians around the country who would still come automatically to attention at that gentle sound, even though they wouldn't know why. I never heard him give a lecture. Rather he would ask a student a question and carefully guide the discussion. If a student showed he was lost, Dr. Morrill would quickly shift to another student. If there was more general confusion, or if a point was raised that required elaboration, he would step in. The blackboard usually contained a number of drawings that he anticipated would be used. So smooth was the transition from student to student, or from the asking of a question to clarification and elaboration on obscure points, that these sessions combined the best features of both the lecture and individualized tutorials.

His textbook, *Regional Anatomy: Descriptive, Topographic, and Functional*, was never commercially published. It was privately printed M Edwards Bros. (1946) It was one of the earlier attempts at producing a regional textbook of anatomy that have subsequently become so popular. It was remarkable in several respects. Although it consisted of fewer than eight hundred typewritten pages, it was in no sense intended as a synopsis, nor did it omit significant details. In contrast to many currently popular texts it contained no mnemonic aids. Both its conciseness and its readability were achieved by preciseness of expression. Dr. Morrill would say something once and say it so clearly that it was understood and remembered. The text was not only used successfully at Cornell, where the author was present to interact, but in at least three other medical schools. This was true despite the fact that he never got around to providing illustrations, a fact that would render most texts unusable and may have been the reason

it was not acquired by a commercial publisher. To this day I find myself turning to this source when I want an accurate and concise description of an anatomical relationship. These volumes were sold to the students at cost, but Dr. Morrill found he had a slight profit, so they were distributed free for the last one and a half years in order for him to come out even.

Dr. Morrill never married, and he appeared to be a lonely man in his later years. He had cared for his mother until her death, at which time he was 55. He had no close relatives, and friends of earlier years had either died or moved away. Nevertheless he enjoyed companionship when the opportunity presented itself. He was a connoisseur of fine foods, good spirits, and according to his own reports, of attractive women. At age 65 he was still willing to demonstrate his considerable ability in ballroom dancing, if asked, at student parties. He was immaculate in his dress, having a tailor come to his office to fit his lab coats.

I met him when I was a first-year student, six years before his retirement, and I suppose I still picture him with some of the awe of those early years; but I do have some personal recollections that may help portray the man. Although we spent many hours talking about many things, I somehow never got around to inviting him home for dinner and an evening. This was because he had spoken so often of just how food should be prepared, that we were afraid we might make a mistake. I once had anxiety which seemed directly related to giving a certain lecture, and decided to confide in him. He related that a similar thing had once happened to him. He had gone to an internist who told him that such things could be due either to something in the mind or to something in the diet, and that he had more success in treating the diet. For a year or more I was probably the only medical student who found tranquility in ascorbic acid. He was very sparing in his compliments, but when he did say that you were good at something, it somehow caused you to want to make it true, even if it were not entirely warranted at the time. It may interest those who, like myself, may remember this man as a distinguished and scholarly gentleman, that he spent two years of his life as a ranch hand in Montana before the turn of the century, before returning East to get an education.

Wilbur D. Hagemen, M.D.

Edward P. Morris

October 12, 1924 — January 7, 1989

Ted Morris joined the Cornell faculty in the Department of Romance Studies in 1961 and remained one of its most devoted teachers and citizens until his death. A man of immense culture and learning, which he shared with students and colleagues alike, he loved most what was fresh, unconventional, and unpretentious about Cornell. A man of refined taste in a great many things, he loved living on the banks of Salmon Creek in Ludlowville, New York.

Ted's teaching was legendary, and no merely "clear expository prose," as he liked to call it, would suffice to render a sense of the poetry of his teaching. There was, for example, its gentle anarchy. Co-teachers and students never knew quite what to expect. The syllabus often had to yield to what Ted had read that morning. Any text would do, because what really mattered was how that text was read and talked about. Rabelais, Freud, Montaigne, Virgil, Dante, the latest issue of *The New Yorker*, the course catalog, poetry, science fiction, Toast-R-Ovens—any text could provide something worth talking about. He could reach, or so it seemed, almost anywhere from any text. Boundaries dissolved, disciplines merged. It was the connections between things that fascinated Ted, and the kinds of systems that made these connections possible, and the theory that made these systems intelligible. And he pursued these connections in what must be the most remarkable career of interdisciplinary teaching that this University has ever seen, in courses with colleagues from half a dozen or more departments, including especially History, the History of Art, and Music. In each case the course was but the beginning of a long friendship in which those connections, systems, and theories were continually pursued.

Much of what went on inside his classroom bore a close resemblance to what went on outside it—in chats over coffee at Zeus or the Dragon, at lunch, after lectures, or just on the Quad. This is why so many of his students became his friends and why so many of his friends numbered him among their most influential teachers. His exchanges with both students and friends were marked by his genuine curiosity about their views on whatever subject was at hand. He was both a great talker and a great and generous listener.

He maintained that the principal reason for pursuing any subject or activity was the pleasure that it gave. This praise of pleasure emerged in part from his polemic against the professionalism, the specialization, and the pursuit of power that he saw as dangers to the classroom and the university. And this polemic was also expressed in his reluctance to reduce his thoughts to print in the usual academic genres, though he wrote copiously on subjects

ranging from Rabelais to John Cage. His own publications, always subtle and stimulating, whether in professional journals or the *Grapevine*, were few compared with the traces that he left in the publications of others.

Although he was a specialist in Renaissance studies, the activity that came closest to embodying the full range of his interests was his direction of more than a dozen French plays spanning the seventeenth and twentieth centuries. In this, too, he was a perfectionist who worried about every detail: costumes, music, choreography, sets, programs, posters, the very shape and color of tickets. In art nothing was indifferent. What was left after all of his own efforts and those of his collaborators in these productions was principally a memory in the mind of the spectator. But nothing pleased him more, for this was the ultimate form of creative generosity, as, in some other ways, was teaching.

A member of the Yale class of 1945, he did graduate study in the Yale French department under Henri Peyre, receiving the Ph.D. in 1954. While a graduate student, he co-founded, with Robert Greer Cohn, the journal *Yale French Studies*. In France he studied at the Faculté des Lettres in Grenoble, and in 1962 was a fellow at the Centre d'Études Supérieures Médiévales in Poitiers.

Before his appointment at Cornell, Ted taught at Bryn Mawr College from 1949 until 1952, at Wesleyan University from 1952 until 1954, and at Harvard University from 1954 until 1961. At Cornell he was honored with the Clark Award for Excellence in Teaching in 1969, and he was named a senior fellow in the Society for the Humanities for 1970-71. His steadfast devotion to the ideals of general education and to the cultural life of the campus community was reflected in his participation in the work of numerous campus committees, including the Educational Policy Committee and the Dean's Committee on General Education in the College of Arts and Sciences, the University Library Board, and the Committee on Campus Planning. In Romance Studies he served two terms as graduate field representative, presiding over a curriculum revision and many procedural innovations; for more than twenty years he directed the Honors Program in French; during the past decade he served on the editorial board of *Diacritics*; and from 1982 until 1988 he was faculty sponsor for A.D. White Professor-at-Large, Jacques Derrida. In 1982-83 he held a Fellowship for Independent Research from the National Endowment for the Humanities.

He is survived by his wife, Emoretta Yang, of Ludlowville; a son and daughter-in-law, Dr. and Mrs. Humphrey Morris, and grandson, Dylan Humphrey Morris, of Cambridge, Massachusetts; a daughter, Sylvia Mendelssohn, of Middlebury, Vermont; his first wife, Franziska Kempner Morris, of Ithaca; a sister-in-law, Janet Drake Morris, of Elk, California; and several nieces and nephews.

John M. Najemy, Alain Seznec, Don M. Randel

Fred Bishop Morris

October 25, 1896 — July 2, 1989

Fred B. Morris, Emeritus Professor of Extension, died in Ithaca, July 2, 1989, at the age of 92. He had served the Cornell Faculty and Ithaca community for sixty years and was known for his expertise in organizational techniques, leadership development, and effective program building. He pursued these areas of expertise with vigor and enthusiasm in both his professional duties and as a participant in the community groups with which he was affiliated.

In 1928 Professor Morris joined the College of Agriculture Faculty at Cornell as an assistant state leader of agricultural agents. In 1943 he became the state leader and in 1958 he retired as an emeritus professor of extension. After retirement he worked part-time hosting foreign visitors to Cornell, and became actively involved as a volunteer in community organizations. He served in key volunteer roles until shortly before his death. He was truly “active to the end”.

Fred Morris was a native of Shelbyville, Indiana. His father and grandfather were merchants. As a high school student he worked in his Uncle Orville’s drugstore. It was here he first became acquainted with farm families, liked them, and decided he would make a career of working with farm people. After graduation from Shelbyville High School he enrolled at Purdue University to study agriculture.

World War I interrupted his studies at Purdue. He served in the Quartermaster Corps in Virginia training pack mules for service. Upon release from the Army he decided to locate in New York State where farm land prices were lower than in Indiana and he was fascinated by the beauty of the countryside.

At Cornell, Professor Walter Tailby hired and trained Morris to be a “milk tester” for the Dairy Herd Improvement Association. He was assigned to Erie County. The milk testers at that time stayed with the farm families where they were testing. Through this experience Fred learned much about farming and family life. After a year and a half he decided to move to Ithaca where he was hired by Dr. G.F. Warren to work on his dairy farm.

In 1920 Fred Morris enrolled in the College of Agriculture at Cornell and in 1922 received a B.S. degree with a major in general agriculture. By working his way through college he had little time for outside activities but did manage to be a member of the dairy cattle judging team and to participate in the Eastman Stage Public Speaking Contest.

Following graduation from Cornell, Morris was employed as a 4-H Club agent in Erie County, a position he held for two years. In 1924 he moved to Oswego County where he became an agricultural agent and served until 1928 when he was invited to become a member of the Cornell faculty.

Agricultural extension was in the early stages of development when Fred Morris started. The work was of an experimental nature. It was a time for creative ideas and courageous leadership. These traits Fred Morris had and used well over the thirty-six years he served the New York State Extension Service. Also during these years there were emergencies to cope with including the great depression, World War II, labor shortages, and the introduction of numerous improved practices. These called for flexibility and changes in extension procedures which the state leader team was helpful in providing.

The concept of an informal educational program that used research to help farmers solve problems and improve their quality of life was relatively new when Professor Morris embarked upon his career in extension. There were many questions about how to organize and conduct this new kind of educational work. Fred Morris was challenged by these questions, was willing to experiment, and soon developed an expertise in these matters. He became a firm believer in the importance of strong leadership and the development of programs by the local people. This led to his lifelong emphasis on leadership development and grassroots program planning as key factors for success. In 1936 while attending the Graduate School in the United States Department of Agriculture, he wrote a bulletin on program planning which was used by agricultural extension agents throughout the United States.

Other points which Fred Morris strongly promoted were the importance of mental stimulation and growth, maintaining a sense of humor, and being flexible. He stressed these in his work with colleagues, agents, farmers, and rural leaders. Continuing education through regular study and in-service training, he believed, were essential in the building of effective programs. In his own career he practiced these points by reading widely, enjoying good humor, and by spending two of his sabbatical leaves studying at the USDA Graduate School and at the University of Chicago.

New knowledge from research and the development of better teaching methods gives rise to the need for changes in extension programs. Professor Morris as an extension administrator was unusually skillful in bringing about needed changes in the agricultural extension programs. Over time, the agents were encouraged to shift from generalists to specialists and to be ever alert for new and better ways of bringing about improvements. Agents were urged to improve themselves as teachers and leaders. To promote this concept, in 1955 Fred Morris provided

a starter gift for establishing a county agricultural agents professional improvement fund which is administered by Cornell University.

Dean W. I. Myers, at the time of Professor Morris' retirement, pointed out the important part that his enthusiastic leadership had played in broadening the scope of the college's extension programs, in the development of effective farm leaders, in the introduction of new and improved farm production and marketing methods, and in bringing about better living conditions for the farm people in New York State.

Professor Morris' professional concerns extended beyond New York State. In 1948 he went to Greece to assist in establishing extension work in that war torn country. From 1959 to 1964 he worked part-time for the University hosting foreign visitors to Cornell. He also was instrumental in developing an orientation program for new international students in the College of Agriculture. The Morris family served as hosts and entertained many foreign students in their home and from these experiences they developed friendships which continued long after the students had returned to their home countries.

The things Fred Morris stressed in his professional work he practiced in his personal life. He was a strong proponent of group action as a way to solve personal and community problems. His interests were broad as was reflected in the range of organizations in which he was an active participant. Among these were: Epsilon Sigma Phi (honorary extension fraternity), County Agricultural Agents Association, Acacia Fraternity, Cornell Westminster Foundation, Rural Church Institute, Tompkins County Horticultural Society, Cayuga Student Lodge, Cornell Federal Credit Union, Ithaca Consumers Society, Tompkins County Senior Citizens Council, Rotary International, Town and Gown Investment Club, Ithacare Board of Directors, and First Presbyterian Church of Ithaca. In all of these he was more than just a passive member, he usually was in a leadership role. In his later years he often assumed the role of a "Constructive Critic" for the organization submitting written comments on their programs.

Family life and home ranked high in Fred's value system. His wife of more than sixty years, Lillian Rafferty Morris, was a teammate and loyal supporter of his work. Whiffle Tree Farm, their home for many years, was not only a place of beauty and charm but also was a place of warmth and hospitality to the many who visited there.

Fred Morris' wife, Lillian, preceded him in death in April 1987. He is survived by two daughters, Mary M. Kelsy and Margaret M. Fletcher, both Cornellians; a son-in-law, George Fletcher; seven grandchildren; seven great grandchildren; and a host of friends. Fred Morris will long be remembered for his meticulous and humorous manner, and as a caring person, dedicated to helping people, and making the world a better place in which to live.

Charles E. Ostrander, John C. Swan, C. Arthur Bratton

James O. Morris

February 8, 1923 — June 30, 1985

James O. Morris, professor of industrial and labor relations at Cornell's New York State School of Industrial and Labor Relations, died on June 30, 1985, at age sixty-two after a short illness. At the time, he was an active member of the Department of Collective Bargaining, Labor Law, and Labor History.

Jim came to Cornell in 1955 as an assistant professor, trained by Sidney Fine at the University of Michigan as an American historian (with a minor in Latin American history), and soon demonstrated his capacity to master new fields of scholarly endeavor. In 1958, the year in which Cornell published his first book, *Conflict within the AFL: A Study of Craft versus Industrial Unionism, 1900-1938*, he prepared himself to become a Spanish-speaking industrial relations specialist on Latin America. He accepted a Fulbright research fellowship for a year of study in Chile and, after a brief return to Cornell, went back to Chile in 1959, this time as ILR's representative in a three-year cooperative venture with the University of Chile in Santiago.

In those years he laid the foundation for a distinguished reputation in the field of Chilean industrial relations. He published, with Roberto Oyaneder, *Afiliacion y finanzas sindicales en Chile, 1932-1959* (Santiago: University of Chile Press, 1962) and, by himself, the more important work *Elites, Intellectuals and Consensus: A Study of the Social Question and the Industrial Relations Systems in Chile* (Ithaca: Cornell, 1966). In addition to these accomplishments he helped develop teaching and research in industrial relations at the University of Chile and, upon his return to Cornell in 1962, contributed for several years to ILR's own resident instructional program in international industrial relations by offering a course on Latin America.

In 1967 Jim returned to the field in which he had started his professional career. Henceforth he devoted his courses, research, and writing to United States industrial relations history, a subject in which he came to find biography and courtroom trials especially satisfying as a teacher of ILR undergraduates. In his research he stressed the period of his early interests and made time to acquire manuscripts and archival materials for the Catherwood Library. Collecting became a passion. ILR's especially strong holdings in American railway unionism are a testimony to the many hours he spent on the road. In 1975 he published the *Bibliography of Industrial Relations in the Railroad Industry* (Ithaca: Cornell, 1975). Before illness forced a sudden halt, he was hard at work on a book-length manuscript entitled "The Genesis of the Railway Labor Act: Politics, Power, and Progressivism in the 1920s."

Colleagues in labor history recognized these and other achievements. For many years he served on the editorial board of *Labor History*. He was a founding member of the New York State Labor History Association and served as its president and vice president. Most important of all, his colleagues recognized Jim as one of the few trained American historians in the mid 1950s who made a difference in the ways historians wrote about American organized workers.

In the life of the school he came to be trusted and respected for his sense of academic responsibility and fair play. He served for several years as associate editor and acting editor of the *Industrial and Labor Relations Review*. For three years he chaired his department, and he was also the first chairman of the Philip Taft Labor History Award Committee, which annually awards a prize to the best book published in the field of labor history.

Outside the domain of scholarship Jim was also a man of achievement. As an undergraduate at Hiram College during World War II, he enlisted, and soon, as a U.S. Air Force bombardier, he was flying out of southern Italy into Central Europe. Before the end of the war he had completed fifty missions, an extraordinary accomplishment. He returned to Hiram College and, by the time of his graduation, had married Nadie Lee Mathews, a fellow student. Nadie Lee and their children, Jim, Steve, Lisa, and Patty, and perhaps his grandsons, Scott and Kevin, more than anyone else appreciated the determination, thoroughness, care, and affection that characterized his work, for at home he also devoted himself to collections: to “contemporary antiques.” He restored in loving detail vintage automobiles that won prizes in national competition. Over the years he also assembled a large and unique collection of globes from old-fashioned gasoline pumps and, more recently, had begun a collection of early radios. Jim Morris will be missed and remembered.

John F. Burton, Jr., Ronald Donovan, Gerd Korman

John Lewis Morris

Sibley Professor of Practical Mechanics and Machine Construction

— *November 19, 1905*

“The Faculty of Cornell University desire to express their sorrow at the death of their colleague John Lewis Morris, to record their appreciation of his services to the University, and to extend their sympathy to his family.

At the time of his death, Professor John Lewis Morris had been a member of the Faculty of Cornell University for thirty-seven years, of which thirty-five were spent in active service. His labors began with the opening of the University in 1868, and he had the rare privilege, with his associates in the original Faculty, of shaping in a peculiar manner the destiny of the University. His loyalty and enthusiasm in hours of depression, his frankness of criticism, the resourcefulness of his varied experience, and the transparent sincerity of his character, were weighty factors in the early history of the University.

He lived to see the firm establishment and extraordinary development of the department which he founded and fostered through many years of discouragement, and to win the grateful affection of a host of students, to whom he was an unselfish friend and constant benefactor

The Faculty mourns the loss of an efficient colleague, a helpful friend, and an upright, useful citizen.

Resolved, That a copy of this expression of esteem and regret be entered upon the records of the University Faculty and transmitted to the family.

Frank Barron Morrison

May 17, 1887 — April 7, 1958

Frank Barron Morrison, Emeritus Professor of Animal Husbandry and Animal Nutrition, died unexpectedly on April 7, 1958. With his passing, agricultural science lost one of its greatest leaders.

Born at Fort Atkinson, Wisconsin, Professor Morrison received a B.S. degree in Agricultural Chemistry from the University of Wisconsin in 1911. From 1911 until 1927, he served his Alma Mater as an instructor, Professor of Animal Husbandry and as Assistant Director of the Experiment Station. In 1927 he accepted the Directorship of the Cornell Agricultural Experiment Station and the New York Agricultural Experiment Station at Geneva, but transferred to the Ithaca campus in 1928 as Professor of Animal Husbandry and Animal Nutrition and Head of the Department of Animal Husbandry. He served Cornell in this capacity until 1945 when he resigned as Head of the Department to devote more time to his writing assignments. He retired in June 1955.

In viewing Professor Morrison's accomplishments as an educator, an administrator and as an author, it is most difficult to single out any one role and assign it dominance. He probably took most pride in the large numbers of graduate students that came from dozens of different domestic and foreign universities to obtain advanced degrees in Animal Husbandry. Many of these men now occupy key positions in universities, governmental agencies, and agricultural businesses. Among these are three university presidents, two deans and several directors. As an administrator, and with the backing of a council of prominent livestock men, he guided the Department of Animal Husbandry to the point where it became one of the largest and best known in the country.

Many will probably remember him best as the author of *FEEDS AND FEEDING* and its abridged editions. This text and reference book has been so outstanding that it has never been seriously challenged in its field. Started by Dean Henry of the University of Wisconsin in 1898, Professor Morrison became coauthor in 1915 and then sole author in 1932. This book, now in its 22nd edition, has been translated into Portuguese, Spanish and Russian and is used the world over.

Professor Morrison was an avid traveller and lectured in almost every state and some half-dozen foreign countries. He served on several commissions to recommend improvements in the livestock industries of Germany, the Philippines, Argentina and Venezuela.

His vigorous leadership was recognized formally on several occasions. He served as President of the American Society of Animal Production. His portrait was hung among the great in the livestock industry at the Saddle and Sirloin Club in Chicago and another was presented to Cornell University at the time of his retirement. He holds honorary D.Sc. degrees from the University of Vermont and the University of Wisconsin.

Professor Morrison was a member of several scientific and fraternal organizations, among which were the American Association for the Advancement of Science, American Society of Animal Production, American Dairy Science Association, American Chemical Society, Alpha Zeta, Phi Kappa Phi, British Nutrition Society and the Rotary Club.

Through his generosity, the Morrison Award, given annually to a notable scientist in the field of Animal Production, was established in the American Society of Animal Production. In addition, he endowed a fellowship at Cornell University for worthy graduate students in the field of livestock feeding.

Two sons, Roger and Spencer, and his wife, the former Elsie R. Bullard, survive and will continue to publish his books.

Professor Morrison had many friends on this campus and elsewhere. To them his sterling character and enthusiasm for his field of work were a constant source of inspiration. They greatly respected him in particular for his accomplishments, his keen insight and his sound judgment. His passing has left a void in the fields of Animal Husbandry and Animal Nutrition which will not be easily filled.

S. E. Smith, L. C. Norris, K. L. Turk

George H. Morrison

August 24, 1921 — June 11, 2004

Our good friend and colleague, George H. Morrison, died peacefully in his sleep on Friday, June 11, 2004 in Delray Beach, Florida, and was laid to rest in Ithaca, New York. His loving wife of over 50 years, Annie; three children, Stephen, Katherine, and Althea; and five grandchildren survive him. He was immediate past Editor of Analytical Chemistry, serving this publication with distinction through the years 1980-90.

George, a proud native New Yorker, was born on August 24, 1921 in Brooklyn. He received a B.S. degree from Brooklyn College in 1942 and was drafted into military service soon afterward. He was assigned to work at Princeton, New Jersey on the chemical purification of uranium for the Manhattan Project, an effort that led to an outstanding commendation from the U.S. Army for his contributions to the successful conclusion of World War II. George earned a Ph.D. degree from Princeton in 1948 at a time when it was one of the leading institutions for analytical chemistry, under the direction of N.H. Furman. There he met many of the individuals who like he, would lead and define analytical chemistry for decades.

George was an internationally recognized authority in the field of trace element analytical chemistry and materials characterization. He was a leader in the development of modern physical methods, including ion microscopy, solids mass spectrometry, neutron activation analysis, and atomic spectroscopy and their application to important solid state, cosmochemical, biological, and medical problems. He was one of a very select group of analytical chemists who made important contributions to both classical wet chemical methods of analysis and modern instrumental methods.

During his ten years as Head of Inorganic and Analytical Chemistry at GTE Laboratories, he made great contributions to methods for the characterization of semiconductor materials, which advanced the development of solid-state devices. During this time and together with James Cosgrove, he developed the technique of instrumental neutron activation analysis, which became one of the most effective tools of non-destructive trace element analysis. In 1957, he co-authored with Henry Freiser, *Solvent Extraction in Analytical Chemistry*, which was translated into more than a dozen languages and became the primary reference book in the field for decades.

George joined Cornell in 1961 as a Professor of Chemistry and Director of the Materials Science Center Analytical Facility and continued his pioneering research in trace analysis. He received the ACS Award in Analytical Chemistry in 1971 for performing the most complete and detailed analysis of the Apollo Lunar samples; an accomplishment

of which he was especially and rightfully proud. As editor of *Analytical Chemistry*, he not only maintained and enhanced the leadership position of the journal, but also advanced the stature of the field worldwide. The last decades of his research career were directed toward biomedicine, and his analytical innovations led to new concepts in the cell biology of calcium, and of boron, fluorine, and isotopically labeled therapeutic anti-cancer agents.

As a scholar and mentor, George trained generations of analytical chemists who went on to most successful careers in academia, industrial and government labs. To his students and research group members, he was unfailingly loyal and generous with his time. He co-authored over 400 professional articles many of which represented seminal contributions. In addition to the ACS Award in Analytical Chemistry mentioned above, George received numerous awards for his scholarly achievements including a Guggenheim Fellowship (1974-75), the Eastern Analytical Symposium Award (1986), and the Pittsburgh Analytical Chemistry Award (1990).

As a colleague, George was gracious and generous. We, as his former colleagues, students and members of the wider community of chemists, mourn his departure, but celebrate his contributions. His dignity, good humor, and wise counsel on matters beyond the world of ions and molecules will be deeply missed.

J.T. Brenna, S. Chandra, F.W. McLafferty, H.A. Scheraga, H.D. Abruña.

Chandler Morse

March 29, 1906 — December 5, 1988

Chandler Morse was born in Brooklyn and raised in Putnam, Connecticut. He received his A.B. degree from Amherst College in 1927 and the M.A. degree from Harvard in 1928. He subsequently taught at Dartmouth and worked at the Federal Reserve Bank of New York (1929-35) and in Washington, DC, with the Federal Reserve Board of Governors (1935-41, 1946-47). He joined the U.S. Office of Strategic Services during World War II. He was one of the principal authors of the Krug Report entitled “National Resources and Foreign Aid,” prepared for the U.S. Department of the Interior. Subsequently, he became a member of the faculty, first at Williams College and then in 1950 at Cornell. After becoming professor emeritus in 1971, Chan remained in Ithaca for a decade, and continued to be involved in the life of Cornell. He and his wife, Katrina Pease Morse, then retired to Sarasota, Florida. Chan died on December 5, 1988.

As professor of economics at Cornell during the 1950s and 1960s, Chan taught about the problems and possibilities of economic development at the time of decolonization. This was also the period when the field of Development Economics was in its formative stage. While many Western academic representatives of the field did little more than provide an apologetics for neocolonial relationships, Chandler Morse put human welfare at the forefront of his concerns. He stressed the pivotal role of institutional change—especially institutional change that broadened participation in the benefits associated with economic development.

The leitmotif of his writing and of his life-long pursuit of the keys to economic development was the proposition that differentiation of economic roles (he often used “division of labor” in the same sense that it is employed in the *Wealth of Nations*) was the other face of economic growth and modern society. The principal obstacle to growth (as well as to economic development, which evaluated growth according to the “true”—as opposed to the individually perceived and socially conditioned—needs of man) was to be found in the stress, alienation, conflicts of individual interest, and disjoint between the interests of the individual and that of the broader society (e.g. environmental degradation). To design new institutions to “reintegrate” increasingly differentiated societies and keep them moving along the road toward modernism was the huge task confronting the developmental economist.

Chan found that traditional economic theory was of little assistance for it assumed not only virtual identity between individual and attainable societal goals, but also a plasticity (as opposed to structural rigidity) characteristic of existing economic institutions (e.g. firms and product/labor markets) that allowed them to accommodate economic

expansion while simultaneously containing the stress, alienation, conflict and the negative externalities that Chan viewed as the principal threat to modernization. It heralded the competition that—in Chan’s eyes—degraded, rather than the cooperation which elevated, man. The typical economist, he believed, had much to unlearn on route to becoming a useful developmentalist.

African socialism embodied Chan’s hope that rhetoric could sustain solidarity among diverse peoples and ease their way, perhaps not to socialism (in the form of public ownership, which represented simply an alternative instrument) but toward the end of a humane, modern society, a genuinely socialist society. In an earlier age, Chan might well have been a member of the Fabian Society.

His authority and expertise in matters of African economic development stemmed in part from the knowledge and experience he gleaned through his study of southern Africa. In 1959 he headed the mission to Great Britain’s High Commission Territories, which produced *Basutoland, Bechuanaland Protectorate, and Swaziland: Report of an Economic Survey Mission*. Soon thereafter his research agenda took him to Ghana, Guinea, Mali, Nigeria, Senegal, and Tanganyika. He developed a particularly strong interest in Nyerere’s efforts to initiate and sustain a participatory and grassroots approach to economic development. This was evident in his “Economics of African Socialism” [in Friedland & Rosberg (eds.) *African Socialism*, 1964]. The key to Chan’s theoretical concerns more generally is found in *Modernization by Design*, (1969) which he edited and to which he contributed the concluding chapter “Becoming vs. Being Modern.”

Chan’s professional interests encompassed other issues as well. With Harold Barnett he authored *Scarcity and Growth: The Economics of Natural Resource Availability*, which for some time was considered the authoritative work on the subject. Other writings include “Making Science & Technology for LDC’s” (*Columbia Journal of World Business*, 1976), “Depletion, Exhaustibility and Conservation” [in Vogely (ed.) *Economics of Mineral Industries*, 1976], and “Natural Resources as a Constraint on Economic Growth” (*American Economic Review*, 1973). He was a member of the Ocean Policy Committee of the National Academy of Science 1973-76, a consultant to MIT’s Marine Technology Transfer Project in 1974, and chairman of a workshop on Needs for Marine Technical Cooperation in the Gulf & Caribbean in 1975.

Chan’s humanistic concerns extended beyond the classroom and printed page. His impact on the Cornell community is noteworthy. He served as chairman of the Center for Religion, Ethics and Social Policy, 1971-73. He played a founding role in the birth of COSEP and remained actively engaged in the development and operation of the COSEP program up to the time of his retirement in 1971. In the highly charged atmosphere that prevailed

on campus, Chandler served as acting director of the Afro-American Studies Program from its establishment in 1968 until 1969 when James E. Turner was named director of the Center for Afro-American Studies, now the Africana Studies and Research Center. During the years 1972-75, Chandler—along with other Cornell colleagues, in particular Herbert Mahr, Jaroslav Vanek, and William F. Whyte—founded O.S.A. (Organizing and Support Agency) to provide support, training and education for minorities and the disadvantaged. This organization, in turn, spawned a new similar organization of a regional character, the Federation for Economic Democracy. Chandler worked selflessly as O.S.A.'s acting administrator and treasurer; his contribution greatly surpassed that of his collaborators.

On a more personal level, Chan and Katrina Morse provided a haven to countless Cornell students. Their home was always open, and they provided the sort of nurturing support and friendship that helped many a graduate student. It is perhaps from this latter constituency that one finds the most eloquent tributes to Chandler Morse. The acknowledgements of many a doctoral student are quite telling:

... his enduring faith and encouragement as a teacher and friend were indispensable ...

he guided, cajoled, inspired me, and above all, cared ...

... he did not give up on me, accepting my thoughts . . . with compassionate respect. . . until his excitement at what he forced me to articulate threatened to equal mine.

Andrew Pienkos, Jaroslav Vanek, Tom Davis

Lewis Wilbur Morse

August 24, 1903 — January 25, 1982

Lewis Wilbur Morse, law librarian and professor of law emeritus, quietly left us after a notably active life distinguished by the theme of helpfulness to others.

Lew, born in Elmira, came to the Cornell Law School in 1925, after having been graduated in 1925 from Colgate, of which he remained an ever-loyal and active alumnus. In 1928 he received from Cornell the Bachelor of Laws degree. Upon graduation, Lew practiced in Newark, New York, and in Hawaii and then returned to practice in Pulaski, New York.

In 1931 Lew joined the Cornell Law School faculty as lecturer and assistant law librarian and was instrumental in moving the law library to the new Myron Taylor Hall from the later-demolished Boardman Hall. He became law librarian in 1936 and served with distinction in this post for thirty years, until he was named associate dean of the school in 1965. With minimal budget and staff through the Great Depression, he maintained the position of the Cornell law library among the top ten American law school libraries. In 1940-41 he served as president of the American Association of Law Librarians.

World War II, with the depletion of law students, decreased funding for the law library, and Lew's four-year military absence was a holding operation for the library. Lew, upon his return, restored the prewar momentum, providing efficient, economic, personal, and gracious library service for students, faculty, alumni, the local bar, visiting scholars, and other patrons.

While Lew was law librarian, the collections grew from about eighty-one thousand volumes in 1936 to one hundred eighty thousand volumes in 1965 and the library staff from one to seven, with the budget eventually reaching \$50,000. This was a record of remarkable growth during years when library resources were limited.

From 1965 to 1969, Lew rounded out his services for Cornell as associate dean for alumni affairs and placement. In 1969, Lew, having progressed through the various academic ranks, retired as professor emeritus. He thereafter represented his clients and real estate interests.

During World War II, Lew was in charge of the Army Judge Advocate General's law library buildup in the continental United States and around the world, an accomplishment recognized by the Legion of Merit Award. Lew retired as full colonel, remaining active in the Retired Reserve Officers Association.

Besides his professional associations, Lew cherished his nonresident membership in the Elmira City Club—on Church Street, across from the armory where his father once commanded the local National Guard.

Lew Morse possessed outstanding human qualities. He gave generously of himself. He was never too busy to listen to the needs and concerns of others and was always ready to put aside his own personal pursuits in order to give a helping hand to someone else. He had scores of friends and admirers whose lives had been touched in one way or another by his warmth and compassion. A typical remark heard at a Cornell law alumni gathering would be: “How is Lew Morse? Lew really helped me out when I was a student, and I owe him so much!” It is no wonder that Lew had such a strong claim on the affections of Cornell lawyers throughout the country, for his own life was a model of concern and service to others.

Lew left a devoted wife, Lorraine; two sons: Lewis Wilbur “Bill,” of Elmira, and Robert Clark, of Pelham Manor, both members of the New York Bar; and five grandchildren. When the grandchildren greeted Lew as “Gramps,” the affection was obvious.

Lew was an avid squash player, overwhelming most opponents in the Myron Taylor Hall and Grumman squash courts and continuing to play well beyond his seventy-fifth year. Through his squash games Lew developed many warm and lasting friendships, and squash proved to be an important part of his life.

Family services were held for Lew in his home in the Christian Science tradition, which sustained him in life and death. Interment was in the Onondaga Valley Cemetery, Syracuse, in April.

W. David Curtiss, Ernest N. Warren, Harry G. Henn

Roger A. Morse

July 5, 1927 — May 12, 2000

Roger A. Morse was a major figure in the field of Apiculture/Entomology for more than 40 years. During this time, he contributed abundantly to the scientific and popular literature on honeybees and touched many, many lives with his knowledge, generosity, humor, and enthusiasm for bees and beekeeping.

Roger Alfred Morse was born in Saugerties, New York. There his father, a superintendent of schools, kept bees as a hobby and instilled the interest in his son. Roger began keeping his own hives when he was about 10. He joined the U.S. Army in December 1944, before formally graduating from Saugerties High School in January 1945, and served in Europe until 1947. Upon returning to the United States, he enrolled at Cornell, where he earned all three of his post-secondary degrees: a Bachelor's in 1950, a Master's in 1953, and a Doctorate in 1955. In postgraduate work, he was State Apiculturist for Florida for two years. In 1957, he became an Assistant Professor of Horticulture at the University of Massachusetts, working there for six months before being appointed to the Cornell faculty as Assistant Professor. At Cornell, he rose through the ranks to become full Professor and to serve as the Entomology Department's chair from 1986-89. Over the years, he was also a Visiting Professor at the University of Helsinki, Finland; the University of São Paulo, Brazil; and the University of the Philippines, at Los Baños.

Over his life, Roger A. Morse turned his childhood interest in beekeeping into an encyclopedic knowledge that made him one of the best-known scientists of honeybees in the world. He was a prolific author with a special ability to straddle the worlds of scientific bee biology and practical beekeeping. Much of his renown came from his books written for amateur beekeepers which are classics in the beekeeping literature, such as *The Complete Guide to Beekeeping* (E.P. Dutton) and *A Year in the Beeyard* (Charles Scribner's Sons), and from his monthly column "Research Review", which appeared for over 40 years in the world's most widely distributed beekeeping journal, *Bee Culture*. He also traveled the world, often for the United States Department of Agriculture, learning about the diverse ways of keeping bees and sharing his knowledge to help local beekeepers, from Africa to South America, improve their craft.

When Roger A. Morse was not thinking about how to improve the practice of beekeeping, he was probing the inner workings of honeybee colonies, often in collaboration with one of his 27 graduate students and 6 postdoctoral students. Under his authorship or co-authorship, approximately 300 research and extension papers and 12 books were published. He is best known for his contributions to our knowledge of the pheromones of queen honey bees

and for his studies of the incursion of the Africanized honey bee, known popularly if fancifully as the “killer bee”, which escaped from a laboratory in Brazil in the 1950s. This bee’s reputation for aggressiveness made for many scary headlines as they made their way north, eventually arriving in the United States in the early 1990s. He was more optimistic than many in the beekeeping profession, suggesting that after the Africanized bees began mating with our familiar (and gentler) bees they might end up strengthening the current population of honey bees. Of greater concern to Roger A. Morse were two species of mites that parasitize adult honeybees. Introduced to the United States from Asia in the 1980s, these mites have virtually eliminated the wild colonies of honeybees and have forced beekeepers to monitor and medicate their colonies vigilantly.

Besides keeping and studying bees, Roger A. Morse taught the Introductory Beekeeping course and laboratory course on Practical Beekeeping throughout his career at Cornell. Both courses were extremely popular, attracting students as much by the reputation of the provocative teacher as by the timeless appeal of learning about the intricate societies of bees.

Roger A. Morse died peacefully, in his sleep, on Friday, May 12, 2000, at his farm outside Ithaca. Besides his wife, Mary Louise Morse, whom he married in 1951, two daughters, Susan and Mary Ann, and one son, Joseph, survive him. To those of us who knew him well, the memory of his generosity, humor, outspoken manner, and avid affection for the bees will long live on.

Donald M. Burgett, Nicholas W. Calderone, Arthur A. Muka, Thomas D. Seeley

Robert Glen Mower

September 27, 1928 — December 27, 2005

Professor Emeritus Robert (Bob) Mower, age 77, passed away December 27, 2005, at the Cayuga Medical Center at Ithaca of pneumonia following surgery to repair a broken hip suffered in a fall earlier in the month. Bob was born September 27, 1928 in Gasport, New York. His family lived in Johnson's Creek, New York. He attended elementary, junior high and high school at Barker Central School in Barker, New York. Time after school and during summer recesses were spent working at a neighbor's fruit and dairy farm that enhanced his interest in agriculture. At an early age, he demonstrated an aptitude for drawing and painting. In high school, he took an intensive correspondence drawing course and art classes. Teachers and school administrators noted his artistic abilities, thus, he was invited to paint murals on selected walls at Barker Central School that he accepted and completed. These paintings stood the test of time. They were just recently destroyed as the result of necessary school remodeling. Later in life, Bob's enthusiasm for drawing helped him in a very major way as a teacher of plant materials at Cornell University.

After graduation, Bob enlisted in the United States Navy in July 1948. His four-year tour of duty included the Korean War. Following his honorable discharge from the U.S. Navy, he enrolled at Paul Smiths College in September 1952. The following fall, Bob transferred to the College of Agriculture and Life Sciences at Cornell University to study horticulture in the Department of Floriculture and Ornamental Horticulture. After graduation, he was accepted into the Graduate School at Cornell. He was appointed as a turfgrass research graduate assistant under the direction of Dr. John Cornman in the Department of Floriculture and Ornamental Horticulture. After receiving his M.S. degree in June 1959, he shifted to the Department of Plant Pathology where, under the direction of Dr. Roy Millar, he worked on the histology of selected turfgrass diseases during the infection process. The requirements for the Ph.D. degree were completed in 1961 after which he was hired as an Assistant Professor in the Department of Floriculture and Ornamental Horticulture. During the years that followed, Bob conducted research and Cooperative Extension programs but he truly distinguished himself as an outstanding teacher of landscape plant materials. His courses in woody, herbaceous and interior plant identification and use were outstanding in their content, detail (his drawings of plant identification clues were outstanding) and rigor. Students who took these courses certainly learned a great deal about plants. But they also developed a respect and adoration of the person in charge—Professor Robert G. Mower. Bob received awards for his outstanding teaching, including The Professor of Merit Award, New York State College of Agriculture, and the Louis and Edith Edgerton Career Teaching Award

also of the New York State College of Agriculture and Life Sciences. But more importantly to him was the love and respect that students demonstrated in their own way on his behalf. Certificates and plaques of appreciation were commonly given to him by students at the conclusion of each semester because of his excellent teaching.

His teaching effort included courses in woody, herbaceous and interior plant identification and use. He taught two 3- to 4-hour courses each semester. In addition, he offered an independent study course each term. He was a master at organizing such courses for large numbers of students. His Wednesday night independent study course covered various topics over the years such as in-depth examinations of specific plant groups, designing perennial gardens and construction of outdoor garden furniture. In the spring semester, he offered an additional Saturday morning course (late March to early May) that focused on hands-on garden maintenance practices as well as the transplanting of thousands of annual transplants in on-campus greenhouse facilities. These seedlings were used in many of the gardens on campus each year including the Lua Minns Garden. Few courses challenged Bob's organizational skills as these Saturday morning classes did because of the numbers of students who needed to be deployed at the various gardens and greenhouse facilities on campus but he always managed to mastermind the location assignments in an efficient manner. Surprisingly, attendance at this Saturday morning class was excellent. Because these special topics courses were offered at times when few others were, students including many from colleges other than the New York State College of Agriculture and Life Sciences heavily subscribed them.

Bob also devoted himself, in association with the University Grounds Department and scores of students, to the development and/or maintenance of several gardens on campus including the Lua Minns Memorial Garden, the Willard Straight Rock Garden and the A.D. White Museum Garden that are collectively enjoyed by thousands of individuals each year. A plaque acknowledging his contributions to the Willard Straight Rock Garden and a memorial bench in the A.D. White Museum Garden provide ample evidence of his work.

One cannot conclude this memorial statement without commenting on the controversy that Bob generated in his woody plant classes regarding the worth of the native tree, boxelder (*Acer negundo*). Most professional horticulturists are of the opinion that boxelder is a woody perennial weed having few if any virtues. The flowering of this species offers nothing as far as landscape value nor does it offer any attractive fruit or fall color. Seed production can be significant, but since the seed can germinate on sites that other species find unsatisfactory, it can very easily become a weed management issue. To the contrary, Bob would defend the use of this plant in the landscape for a variety of reasons. How could such a learned individual take such a stand? Was Bob sincere in his defense of boxelder or was his position on this matter simply a ruse? Most believed it was the latter though we will

never be sure. However, it does not really matter. The issue served to enhance student interest in woody plants both in and outside of the classroom and to stimulate student interaction with Bob and between themselves.

Bob retired in 2000. His parents, Fern Burns Mower and Glen Mower, predeceased him. He is survived by his sister, Betty Mower Anderson, Trumbull, Connecticut; and nephews Richard Anderson, Trumbull, Connecticut, Alan (Michele) Anderson, Murrieta, California, and Mark (Elizabeth) Anderson, Union, Maine. A memorial gathering of family, friends, alumni and colleagues was held on the afternoon of June 30, 2006 at the Robert G. Mower Memorial Bench in the A.D. White Museum Garden.

Nina L. Bassuk, Kenneth W. Mudge, George L. Good

James C. Moyer

February 24, 1914 — December 12, 1996

James Moyer, Professor Emeritus of Chemistry in the Department of Food Science and Technology at Geneva died of Alzheimer's disease at the Huntington Nursing Home, Waterloo, New York.

A native of Canada, Dr. Moyer obtained a B.S. degree in Agriculture from the University of Guelph in 1936, a M.S. degree in Agronomy from the University of Toronto in 1938, and a Ph.D. degree in Biochemistry from Cornell in 1942. He joined the Cornell faculty at Geneva as an Instructor in 1942. He retired in 1982 as Professor of Chemistry.

Although his training was in chemistry, Jim had strong interests and skills in food processing technology. The effect of different equipment and processing conditions on the quality of fruit and vegetable products was a particular concern throughout his professional career. The pilot plant was as much his professional home as was his laboratory, and he often jokingly referred to himself as a "bucket" chemist. His research included studies on the dehydration of fruit and vegetable products using various methods, electronic and steam blanching of vegetables, improved methods for the pressing and clarification of apple and grape juices, concentration and essence recovery of fruit juices, the flor sherry fermentation, and improved analytic procedures for measuring fruit constituents.

Moyer was a part of the team of agricultural engineers, viticulturists and food scientists who developed the equipment and procedures needed for the mechanical harvesting of the grapes that were to be used by New York's Concord juice and wine grape industry. Jim's studies in the Pilot plant defined the conditions that would produce juices and wines of a quality comparable to that obtained with hand picked fruit. As a result of this project, most of the grapes currently processed in the Northeast are harvested by machines.

Over 100 technical publications resulted from his different studies.

Jim's broad knowledge of fruit and vegetable processing technology made him an important asset for New York's canning and freezing industry. Although he had no formal extension assignment, he spent many hours in New York's processing plants and often consulted with food industry management regarding problems large and small. On at least several occasions, he played a major role in the design of new food processing facilities. He also worked with equipment fabricators regarding modifications that would improve the quality of fruits and vegetables

Dr. Moyer's skills resulted in valuable contributions to Cornell's Geneva campus. He was a major planner of the Food Research Laboratory, completed in 1960, which houses the Department of Food Science and Technology. His input in the design of the pilot plant and the selection of processing equipment was an especially noble achievement. Later, he carried out a similar role in the planning of the Raw Products Building completed in 1972.

Moyer was well known both nationally and internationally. His outside activities included serving as a Fulbright Lecturer at the University of New South Wales, Sydney, Australia during 1953-54. In 1962, he was the leader of a National Research Council Committee concerned with the documentation of literature in food science, an activity that led to improved abstracting practices in the field. Other National Research Council committees on which he served was a study of Agriculture and the Quality of the Environment, and an advisory committee, which he chaired, on fruit and vegetable products for the military.

Jim is survived by his wife, Mary Mann; and their three children, Margaret, Steven and Elizabeth.

D.F. Splittstoesser, M.A. Rao

John Robert Moynihan

March 16, 1906 — December 15, 1986

John R. Moynihan died at Tompkins Community Hospital last winter after sixty years as a Cornellian. Jack was born in Buffalo, New York, of Irish immigrant parents, Cornelius E. and Mary Fitzgerald Moynihan. He came to Ithaca in the 1920s and received his B.S. in engineering; he was also awarded a master's degree in mechanical engineering in 1932. Jack lived in Ithaca for most of his adult life and moved away from the Finger Lakes to a winter home in Florida only after his retirement in 1971. It was there that his wife, Loretta Scanlon Moynihan, died in 1975, at which point he returned to Ithaca to be close to his daughter, Maureen M. Schmitt, and his granddaughter.

Jack Moynihan retired as professor of theoretical and applied mechanics forty-two years after he had begun his teaching career as an instructor of engineering at Cornell in 1929. Over the years at Cornell he served as chairman of the Department of Materials, acting chairman of the Department of Mechanics, and longtime secretary of the faculty of the College of Engineering. Jack took to these roles agreeably. While he was always easy to deal with, he was not pushed around by anyone. His fund of good, sound common sense served him well in confronting various academic problems and personalities.

Besides his academic duties at Cornell, Jack consulted for the Lincoln Laboratory of the Massachusetts Institute of Technology, the Johns Hopkins Applied Physics Laboratory, and Therm of Ithaca. He was a member of the American Society for Metals, the American Society for Testing Materials, Tau Beta Pi, Sigma Xi, Phi Kappa Phi, and Pi Tau Sigma.

Jack's Gaelic heritage was apparent in the twinkle in his eye, his love of a good tale, and his willingness to raise a glass with his many friends. "Happy Jack" Moynihan, as he was affectionately known to several generations of undergraduate engineers and colleagues alike, had a wonderfully buoyant personality with a ready smile and a chuckle. He is remembered by scores of post-World War II Cornellians who studied in the mechanics laboratory that Jack ran together with the late J. O. Jeffrey. His friends and colleagues in mechanics fondly recall his love for his work and his well-known remark, "Where else but at a university can you get paid so well for doing what you like to do?"

Even in his late years Jack was active in athletic and social events around campus and town. For years he was the faculty adviser to Cornell's baseball team, and he accompanied the team on many spring trips to warmer climates. He was proud to be one of the few emeritus professors in the Cornell Figure Skating Club. He enjoyed summer

evenings by the lake at the Ithaca Yacht Club and convivial winter gatherings at the Ithaca Country Club. In his difficult last years Jack frequently attended St. Catherine of Siena Church in Cayuga Heights, thereby gaining much comfort.

Jack was always at his best in dealing with people. It is those same people who will most miss him. Goodbye, Jack, we will always remember you.

H. D. Conway, Richard H. Lance, Joseph A. Burns

Leo Augustine Muckle

November 9, 1892 — March 28, 1942

Death came suddenly to Leo Augustine Muckle, Professor in the Extension Service and Assistant County Agent Leader, at his lake-side cottage, which he was opening for the summer season on the afternoon of March 28, 1942. He died as he would have wished, active in a setting of nature which he loved so well.

Professor Muckle was born on November 9, 1892, at Potter, Yates County, New York, son of Thomas and Margaret Delaney Muckle. His grade studies were begun in district schools in that township. In 1903, he moved with his family to Stanley, Ontario County, where his elementary school studies were completed. He prepared for college at the Old Cathedral High School, Rochester, New York, graduating from that institution in 1912. After two years at Notre Dame University, he transferred to the New York State College of Agriculture at Cornell University, where he received a Bachelor of Science degree in 1916.

His first position out of college was in Argentina, South America, with an English land company. When the United States entered the First World War, Professor Muckle returned to the United States and entered county extension work. He served successively as county agricultural agent in Rockland, Schuyler, and Niagara counties.

In July 1933, Professor Muckle came to Cornell University as Assistant County Agent Leader. He served efficiently in that capacity until his death.

It is difficult to measure the contribution Professor Muckle has made to the agriculture of New York State. His sound judgment, accurate knowledge, and keen understanding of people made his work invaluable. Because of his sympathetic understanding and keen knowledge of human nature, he was an outstanding supervisor.

New York farmers' problems were Professor Muckle's problems. He felt keenly the impact of war on agriculture and the responsibilities of the Extension Service to help farm people in the hour of trial.

Farm people will miss his religious philosophy, his sparkling humor, and his deep friendship. Those at the University who were associated with him have lost a noble friend; agriculture has lost a loyal and devoted worker.

Walter Conrad Muenscher

May 30, 1891 — March 20, 1963

Dr. Walter C. Muenscher was born in Fischbach, Germany. He came to America when young, attended schools in Washington, and secured his A.B. from the State College of Washington in 1914. He received the M.S. in taxonomy and ecology from the University of Nebraska in 1915. During the summers of 1915 and 1916 he was an instructor at Puget Sound Marine Station. There he published his first paper on the ecology and growth of certain brown algae. For the year 1915-1916 he taught in a high school in South Dakota.

In the fall of 1916 he came to Cornell as an instructor in botany and served continuously until his retirement in 1954, except for service with the United States Army during 1918-1919. He received the Ph.D. in plant physiology in 1921, was made Assistant Professor in 1923 and Professor in 1937.

Dr. Muenscher served in various capacities with the Bureau of Plant Industry, U.S.D.A., during the summers of 1917, 1923, and 1924. For a number of years he was a consultant to the Tennessee Valley Authority. From 1926 through 1938 he was botanist during the summers for the New York State Biological Survey.

Dr. Muenscher's varied activities and broad background in botany led to a number of important books, all of which have been widely used throughout the country. The experience with the Biological Survey led to his *Aquatic Plants of the United States*. During his long tenure at Cornell he answered over 25,000 extension letters, many of which requested information about weeds. His book *Weeds*, now in its second edition, is one result of this work. Other results are a series of Experiment Station Bulletins on weeds, a series of experiments on the germination of weed seeds, large collections of weed seeds that made possible the identification of unknown seeds, and pioneer experiments on weed killers. In all of this work he was ably assisted by willing graduate students who found ample material for doctoral dissertations and who then went out to become leaders in the field.

Still another outgrowth of his extension work was a realization of the need for an informative book on poisonous plants. He wrote *Poisonous Plants of the United States*, now in its second edition. That book served as a text in his course on poisonous plants and has been of great value to medical and veterinary medical men.

For many years Dr. Muenscher offered a course on the taxonomy of woody plants that was especially popular. He wrote *Keys to Woody Plants* to aid in the course and had the keys printed privately. The keys were so widely used

and in so much demand that he turned the publishing over to Comstock Press, a unit of Cornell University Press. The little book is now in its sixth edition.

In a similar vein Dr. Muenscher and Dr. L. C. Petry collaborated in the writing of *Keys to Spring Plants*, likewise in its sixth edition and published by Comstock.

Dr. Muenscher and some of his graduate students became interested in herbs. An Extension Bulletin, a doctoral dissertation, numerous popular articles, and an herb garden resulted. The culmination of this interest was *Garden Spice and Wild Pot-Herbs*. This beautiful book, with text by Muenscher and Myron Rice, was issued in an edition limited to one hundred copies. Miss Elfriede Abbe, Scientific Illustrator for the Department of Botany, produced all of the woodcuts, set the type, and printed the volume by hand on her own press. Subsequently the Comstock Press has issued a trade facsimile of this book.

One factor that contributed to Professor Muenscher's interest and first-hand knowledge of plants was his traveling and collecting in every state in the Union. Of particular interest to him, however, was Whatcom County, Washington, the most northwestern county in the United States, which has a wide range of environments. In 1941 he published privately *The Flora of Whatcom County*, including discussions of the county's habitats, its poisonous plants, its native ornamentals, the significant botanical explorations made within its confines, and its native, wild vascular plants.

He became interested in the flora of Bergen Swamp, about twenty miles west of Rochester, New York, during his work with the New York Biological Survey. Later he helped found, and was for many years an officer of, the Bergen Swamp Preservation Society, Inc. Several of his graduate students made floristic studies in the area.

The total number of his publications was 125, and he had forty graduate students, chiefly doctoral candidates. He and his family retained as vigorous an interest in the students after they left Cornell as during their stay here, and one seldom sees a group of students so loyal to their mentor. He retained both the respect and the friendship of these students in a way that few of us can hope to emulate.

In retrospect Dr. Muenscher appears as a broadly trained taxonomist who adapted his abilities in such a way as to fill a void with every contribution. He began with the taxonomy of higher plants, became well versed in lower plants (algae, mosses, slime molds), added ecology by years of patient observation, and took his doctorate in plant physiology. He practiced all of these disciplines during his long career.

Dr. Muenscher's productive career was capped fittingly by the award of a Certificate of Merit in 1959, the highest award of the Botanical Society of America. In 1958 his students presented a circular bronze plaque in his honor, which was erected in the Poisonous Plants Garden at Cornell.

He was a Fellow of the American Association for the Advancement of Science, a member of the Wildlife Preservation Society of America, New England and California Botanical Clubs, American Society of Plant Taxonomists, American Society of Plant Physiologists, Limnological Society, Torrey Botanical Club, Botanical Society of America, Phi Kappa Phi, and Sigma Xi.

William J. Hamilton, Jr., John M. Kingsbury, Harlan P. Banks

Frederick George Munding

April 7, 1891 — February 19, 1972

Following a brief illness, Professor Munding died at his home in Geneva, New York, February 19, 1972. He had retired as an associate professor of entomology in the New York State Agriculture Experiment Station on September 30, 1957.

Professor Munding was born at Utica, New York, April 7, 1891. His family moved to Dolgeville, New York, when he was four and this village continued to be his home until he completed his undergraduate training at Syracuse University. He obtained a Bachelor of Science degree from Syracuse in 1914 and then accepted a teaching position with the Collingswood, New Jersey, high school. When the United States became involved in World War I, Professor Munding enlisted and served in the field artillery division. He was discharged in 1919 with the rank of second lieutenant.

Professor Munding registered in the graduate school of Syracuse University in 1920, and in 1922 he was awarded a master's degree. Although continuing his graduate training at Syracuse, he accepted summertime employment with the Geneva Station in 1923, in the Hudson Valley area, conducting research on the pear psylla. This led on to his appointment on May 1, 1924, to the staff of the New York State Agricultural Experiment Station as an assistant in research. He was placed in charge of entomological research at the Station's Hudson Valley Fruit Research Laboratory at Poughkeepsie, New York. Office and laboratory space were provided for him on the campus of Vassar College.

During his ten-year sojourn in the Hudson Valley, Professor Munding quickly became the area authority on insects. His findings on fruit insects did much to shape the pest control practices of the growers in this fruit district. He was especially active in conducting biological and control studies on the apple maggot, pear psylla, pear midge, and various pentatomid bugs which produce dent-shaped injuries on pear and other fruits.

In 1934 Professor Munding was transferred to Geneva, where he was placed in charge of research work on insect pests of pear, strawberry, and the bush fruits — raspberry, blackberry, and currant. Probably his most important contribution during this part of his career, or from 1934 to 1957, was the development of effective means of combatting the pear psylla, this fruit's most important pest. His studies on the tarnished plant bug as a pest of berry fruits were also noteworthy. He established that this insect was responsible for the failure of fruits to set and to produce dwarfed or malformed berries.

By nature Professor Munding was a quiet, kindly, self-effacing individual. He asked nothing better than to have an opportunity to sit down with his microscope and notebook, to fill in some knowledge gaps on the seasonal or life history of some pest species from a painstaking examination of an insect collection or infested plant material.

He was a member of the Entomological Society of America and also of the following honor societies: Sigma Xi, Alpha Xi Sigma, and Phi Kappa Phi.

Professor Munding was deeply concerned with the lot of nonacademic personnel. He effectively championed their cause by becoming a member of the New York State Employees Association, by serving as an officer of the local chapter of this organization, and by making himself freely available as a consultant and adviser to these employees.

Professor Munding elected to remain in Geneva after his retirement. Here he busied himself with the maintenance of his home on Washington Street and in taking care of family affairs. He is survived by his wife, a daughter, a son, and two grandchildren.

James M. Hamilton, George L. Slate, Paul J. Chapman

Mancel Thornton Munn

January 31, 1887 — November 16, 1956

Mancel Thornton Munn, Emeritus Professor of Seed Investigations and formerly Head of the Department of Seed Investigations, New York State Agricultural Experiment Station, Geneva, died at his home in Arcadia, California, November 16, 1956, following a long illness.

Professor Munn was born on a farm near Plainwell, Michigan. He received the B. S. degree from Michigan State College in 1912 and the M. S. degree in 1917. He was appointed Assistant in Research in the former Department of Botany at the New York State Agricultural Experiment Station in 1912, becoming Assistant Botanist in 1918, Associate Botanist in 1929, and Professor and Head of the present Department of Seed Investigation in 1936. With his retirement July 31, 1952, the Board of Trustees of Cornell University approved his appointment as Emeritus Professor of Seed Investigations, effective August 1, 1952.

The year 1912 which marked the beginning of Professor Munn's 40 years of service to the agriculture of New York State was also the year in which the Legislature enacted the first of a series of laws governing the inspection and sale of seeds within this State. Professor Munn supervised the official seed testing from that date forward until his retirement. He devised many procedures and technics for testing seeds in the laboratory that are now routine operations in seed laboratories everywhere. He also pioneered the practice in this country of making field performance tests an integral part of official seed testing. This innovation of trueness-to-type testing is of great importance because it recognizes the increasing contribution of superior germ plasm in improving crop production efficiency.

Among scientific and professional societies in which he held membership are the American Association for the Advancement of Science, the American Phytopathological Society, the Association of Official Seed Analysts of which he was President in 1920, the International Crop Improvement Association, and the New York State Agricultural Society. He was also a member of Theta Chi and Sem Bot, an honorary botanical society at Michigan State University.

Professor Munn traveled extensively throughout the United States in connection with his official duties and attended International Seed Congresses in several European countries as an official United States delegate. He played an important role in formulating regulations governing the movement of seeds in international trade.

Exceedingly productive in the publication of technical articles in scientific and trade publications and of bulletins of the Experiment Station, he also contributed extensively to farm papers and other popular mediums. In collaboration with the Bureau of Plant Industry of the New York State Department of Agriculture and Markets, with which he cooperated closely in the seed inspection work, he issued a long series of official seed inspection reports. He also served for many years as Editor of the *Proceedings* of the Association of Official Seed Analysts.

Forty years of tireless effort on Professor Munn's part are reflected in the exceptionally high standards which characterize the seed-producing and seed-dispensing business, particularly for farm, vegetable, and flower seeds in New York State, and have won for him the abiding respect of seedsmen, farmers, and professional colleagues alike. His influence for good in the seed industry, resulting in better seed for the planter, will be felt for years to come.

Professor Munn married Eunice Rosser of Traverse City, Mich., July 1, 1913, who survives him. Also surviving are five children, Rachel, Myrta, Helen, Irving, and Roger. Throughout his active career he was interested in young people, particularly in Scouting. He pioneered many innovations and achieved an outstanding record in local Boy Scout circles. He was also quite active in the Baptist Church in Geneva. With Mrs. Munn, he took a leading part in the social life of the Experiment Station and was the first President of the Station Club, a social organization of Station employees.

We share with his family the deep sense of personal loss and the memory of a gracious friend and colleague.

B. E. Clark, A. A. Johnson, J. D. Luckett

Carleton Chase Murdock

July 29, 1884 — June 5, 1971

Carleton C. Murdock will be remembered as the personification of the legendary professor, a man whose very presence created an atmosphere of dignity and humanity, of intellect and service.

He was first a teacher of physics but no less an inspiring colleague. His own care and rigor induced care and rigor in students and colleagues alike.

All great teachers find their rewards when students grasp difficult subjects. But Professor Murdock responded to more than the usual call of duty—he systematically sifted each examination paper in search of, and in delineation of, these rewards, marking each paper three times, from three different viewpoints, so both he and the student would understand thoroughly just what the student had mastered and where the difficulties lay. His formal courses were always exercises in the discipline of physics, intellectual integrity, and human courtesy, all in the highest calling.

Many will remember him as the teacher of a special course. From the late 1920s until 1935 he was the leader in a novel advanced laboratory experience for seniors and graduate students. This was more than a “course”; much of the subject material was only barely past the stage of significant research experiments. Each student under Carleton Murdock’s general guidance was expected to design his own experiment (usually to highlight some important physical principle), to choose the equipment needed, and perhaps to fabricate some of the necessary components. In this pedagogical setting, Professor Murdock was outstandingly effective in encouraging high performance and in instilling enthusiasm for the joy and beauty in understanding the “world of physics.” His spirit continued in this laboratory for some two decades after his direct responsibility for it terminated. “Murdock’s lab” became a byword in other institutions and a topic of conversation among returning alumni at Cornell.

If a single sentence were to be added in extolling his proclivities as a teacher, it would certainly refer to his lifelong devotion to a genuine high-quality style of life practiced not only by himself but among the entire academic family. He grieved deeply when any member of the family, especially an esteemed colleague, did not live up to the standards he believed characteristic of a scholar. He was rarely, if ever, challenged on these standards and his message of overflowing personal devotion bore home day after day and did much to sustain the entire community in its best tradition.

As a researcher, he was at first attracted to photoelectric reactions, and among his early publications is one coauthored by his wife, Dorothy Waugh Murdock. He soon became fascinated by the then new developments in X-ray physics and, in particular, by the use of X-rays in deducing the structure of crystals. His enthusiasm focused on the complicated task of computing, from subtle aberrations in X-ray diffraction patterns, the extent of imperfections in crystals and the size and shape of crystals far too small to be seen under the microscope of his day. Such studies comprised the bulk of his extensive research career.

Despite his own preoccupation with research in pure physics, he was a patient and interested adviser to students in applied sciences—e.g., the Ph.D. thesis of one of his first graduate students, published in the initial issue of the *Journal of Applied Physics*, is a classic in the literature of the field of soil physics.

He was a member of Sigma Xi, of Phi Beta Kappa, and of Phi Kappa Phi; a member of the American Physical Society, of the Optical Society of America, of the American Society for X-ray and Electron Diffraction, and of the New York Academy of Sciences.

A native of Cooperstown, New York, Carleton Murdock was graduated from Colgate University in 1907. After a year at the University of Maine, he came to Cornell as an assistant in 1908, but, after three weeks, was appointed instructor in physics. On completing his Ph.D. in 1919 he was promoted to assistant professor, a title held until 1932 when he was appointed to the rank of professor. In 1945 he was elected dean of the University Faculty and he continued in that office until elected professor emeritus in 1953.

A special comment is worthy on his deanship. In 1945 Carleton Murdock brought to that office unfailing dignity and courtesy, together with strength and wisdom, during a time of difficulty for the University. The end of World War II was followed by a surge of enrollments, by a period of inflation that eroded the value of faculty salaries and impaired faculty morale, and by the emergence of McCarthyism that deeply unsettled the campus. The retirement of President Day left the University groping for leadership through an extended interregnum. In those trying times, Dean Murdock gave stability to a shaken faculty, and his term was extended until a new president had been installed and his own retirement was at hand.

Long after his retirement, Professor Murdock's tall thin figure was to be seen about the campus from time to time, reviving nostalgic images of Cornell that now live only in the memories and legends of the past.

Robert D. Miller, Trevor R. Cuykendall, Lyman G. Parratt

John V. Murra

August 24, 1916 — October 16, 2006

John V. Murra died in his home on October 16, 2006, at the age of 90. Noted for his contributions in historical anthropology and particularly in Andean studies, his loss will be felt in a wide range of communities.

Born Isak Lipschitz in 1916 in Odessa, Ukraine, Murra then grew up in Bucharest, Romania. Expelled from his last year at the lycée for belonging to the Social Democratic youth, he eventually received his federal baccalauréat as a privately prepared student, and worked in paper factories in Romania and in Croatia. There he observed the political and ethnic divisions of Serbs, Croats, Gypsies, Bulgarians, Saxons, Greeks, etc. He also had several short stays in jail in 1933-34, once as the only “red” in a group of Iron Guardists, which he survived in part through his knowledge of soccer.

His uncle, a virtuoso musician in Chicago, arranged for Murra to enter the University of Chicago, which he had read about as becoming a radical institution under the presidency of Robert Maynard Hutchins. He arrived at the end of 1934, and soon gravitated to the social sciences, where he found particular interest in the worldwide and comparative scope of anthropology as taught by Fay-Cooper Cole, with a prominent historical dimension. Still using his birth name, Murra graduated in June 1936.

As he recalled later, “nothing in academic life compared with the urgencies of politics,” and that fall Murra joined the International Brigade and went to fight in the Spanish Civil War. That experience added nuance to his political stance:

“Few experiences will do as well as participating in a modern civil war to explore the realities of ‘democratic’ centralism or the strength of national and ethnic ties over class ascription.”

But despite some disillusionment, Murra remained committed to progressive action. He later maintained, “I did not graduate from the University of Chicago. I graduated from the Spanish Civil War.” After the war, he was interned for about six months in camps in France; he was divorced from his first wife during the war, dissolving his formal connection to the United States and leaving him something of a man without a country.

Unable to fight in WWII because of wounds received in Spain, he was finally able to return to Chicago in 1939. At Chicago, Murra, who began to use that name around this time, embraced the historically oriented anthropology of Fay-Cooper Cole, and also worked with Fred Eggan. He completed his Master’s degree in 1942. In 1941, he traveled

to Ecuador with Donald Collier, where he ignited his passion for ethnography in conjunction with ethnohistory. This work led to published contributions in the *Handbook of South American Indians*. In 1942-43, Murra worked with John Dollard and Ruth Benedict interviewing Abraham Lincoln Brigade veterans, and in 1943, he began teaching at Chicago, filling in for Fred Eggan while he was in military service. Although never an Africanist, Murra felt that the contributions of the British social anthropologists working in Africa—which he had learned through Radcliffe-Brown at Chicago—were among the most significant works of the time, and he began teaching a course on “African ethnology” in 1944. He was a deep believer in comparative understanding, and kept up with African scholarship for the rest of his career. As a European who spoke many languages and had lived in many countries, Murra was impatient with what he called North American parochialism. He insisted that his students learn foreign languages.

In 1946, Murra was turned down for U.S. citizenship on the grounds that he had fought with the Spanish Republican Army, which cost him the SSRC grant that would have funded his dissertation research in Ecuador. Murra’s radical history continued to haunt him in the era of McCarthyism; he was eventually granted citizenship in 1950, after a lawsuit, but did not receive a passport until 1956. Denied the possibility of travel to South America, he ultimately chose to write a dissertation that did not involve fieldwork. He defended his dissertation, “The Economic Organization of the Inca State,” in 1955. There Murra first proposed his model of “vertical archipelagos,” a structure of exchange and access to the altitudinally separated resource zones (*pisos ecologicos*) of the Andes that were taken as fundamental to Andean civilizations. The Inca system moved vast amounts of goods through ritual rather than simple trade, and redistribution included products of remote ecological zones and brides trained in the royal institutions. This model has been corroborated in the Andes, where it remains one of the most powerful analyses for the economic and political basis of Andean state formation. In more general form, it was also applied in many other parts of the world, and has been of particular influence in the study of pastoralist societies and precapitalist states.

To support himself through this period, he taught at several universities, including the University of Puerto Rico—during which time he also served as the field director (1948-49) for The People of Puerto Rico project led by Julian Steward—and Vassar College, where administrators defended Murra from the government’s efforts to have him deported. He spent two years in the late 1950s teaching and doing archival research in Peru. He continued traveling, researching and teaching in a series of limited appointments through the early 1960s.

In 1968, John Murra joined the faculty at Cornell University, taking the Andean position opened by the untimely

death of Alan Holmberg. Andean studies at Cornell had long been a major focus, but with a different orientation than Murra's historical interests; in some ways he was "a square peg in a round hole" at Cornell. He found some companionship among his colleagues, particularly with Bernd Lambert and Bob Ascher, but was often on "the other side" in local debates and developed something of a reputation for being ornery. He always particularly liked teaching undergraduates, and felt that he was able to do less of that at Cornell than he had during his peripatetic years. The innovation at Cornell he was most proud of was a course on the history of U.S. anthropology as an institution and a craft rather than as a survey of ethnological theory. Not known for his patience with anyone he saw as naïve, facile, or selfish, Murra nevertheless could be quite generous, and is remembered warmly by many former students and colleagues.

After his retirement from regular teaching in 1982, Murra continued research, and remained an active if increasingly occasional participant in the department even well into the 1990s. He was always active in the international professional societies, and worked continually to improve communications between Latin America and the English-speaking scholarly community. He served as President of the American Society for Ethnohistory (1970-71), the American Ethnological Society (1972-73), and the Institute for Andean Research (1977-83), and gave the Lewis Henry Morgan Lecture in 1969, "Reciprocity and Redistribution in Andean Civilizations." Murra's many stints in Latin American institutions, from the 1950s through his retirement years, reflect a deep commitment to building research and educational institutions and opportunities in the region, a pattern followed by many of the Latin American students whose studies Murra supervised at Cornell. Murra was a founding member of the Instituto de Estudios Peruanos, the Asociación Peruana de Antropólogos, and the Instituto Nacional de Antropología e Historia, Ecuador. In 1987, he was awarded the Great Cross of the Order of the Sun by the government of Peru. After Franco's death, Murra was able to renew his passionate connections with Spain, returning several times for research, honorific teaching engagements, and helping fellow veterans of the Abraham Lincoln Brigade revisit the land they had fought for.

John Murra published extensively, and his work touched on many disparate fields. His best known works are probably *The Economic Organization of the Inca State* (1956, 1980; published in Spanish in 1978, and in Italian in 1980); *Cloth and its Functions in the Inca State* (1962); *Current Research and Prospects in Andean Ethnohistory* (1970), and the series of articles from the late 1960s and early 1970s, explicating the model of vertical archipelagos, one of the contributions Murra is best known for today. The other would be his focus on historical perspectives within anthropology; Murra's ethnohistory was a comparative and theoretical approach, but always empirically

grounded in the local, and integrated archaeological, archival, and ethnographic sources. Through close readings of chronicles, lawsuits, and other documents, Murra emphasized the recapture of voices as close as possible to the daily lives and ethnic identities of the colonial-Inca world. He was a strong optimist about the chances of recovering the past; Frank Salomon recalls Murra saying in seminar, “Don’t say lost, say not yet found.”

John Murra was married and divorced twice, leaving no children. His papers are available to researchers at the National Anthropological Archives. John Murra’s legacy will be found in many fields, in many individuals, in the Andes, the United States, and elsewhere.

Jane Fajans, Chair; Frederic W. Gleach, John Henderson, Bernd Lambert

Edward M. Murray

April 5, 1938 — October 18, 2000

Edward M. Murray, Associate Professor in the Department of Music and musician, teacher, and scholar extraordinaire, died on October 18, 2000. Professor Murray's abilities in all areas of music were multifaceted. He received his Bachelor's degree in History from Harvard University and his Ph.D. degree in Music Theory from Yale University. He also held a graduate degree in Conducting from the Mannes College of Music and trained for the podium under such teachers as Pierre Monteux, Pierre Boulez, and Walter Siskind. A brilliant musical scholar, Murray's training in music theory included work with Carl Schachter and Allen Forte. He was appointed to the Cornell music faculty in 1975 as a music theorist and conductor. He was a superb music theory teacher who communicated with novice undergraduate and sophisticated graduate students with equal seriousness and enthusiasm. He taught, at one time or another, theory courses at all levels. His vast knowledge of music, both classical and non-classical, was always an amazement to his students and colleagues. One of his specialties was twentieth-century music.

He was Director of the Cornell Symphony Orchestra during his 25 years at Cornell, which amounted to a third of the orchestra's history. He was successful in maintaining a large symphonic orchestra of primarily undergraduate players throughout the entire period of his directorship. Among the memorable performances that he gave with the orchestra were Stravinsky's, "The Rite of Spring," "Petrouchka," and "The Firebird," and Webern's, "Six Pieces for Orchestra." In 1992, Murray led the Cornell Symphony Orchestra and Chorale in a performance at Lincoln Center for the Mozart Bicentennial Celebration.

Soon after Murray arrived at Cornell, it became clear that he was committed to the practical, physical side of making music. As a pianist, conductor, impresario, and (occasionally but to memorable effect) falsetto singer of the alto parts in Renaissance motets and madrigals, he made himself an indispensable fixture in our musical life, on campus and off.

Murray was also a champion of new music, and gave numerous premieres, both as conductor and pianist, of new works with Cornell and area ensembles. Among the ensembles Murray conducted are the St. Louis Symphony Orchestra, the DaCapo Chamber Players, and the Cayuga Chamber Orchestra. Prior to arriving at Cornell, he served as Director of the Plainfield, New Jersey Symphony Orchestra. His work as a conductor and pianist is recorded on several labels, including Columbia, Nonesuch, and Spectrum. He served as Director of the Cornell

Musica Nova contemporary music series, and for more than twenty years was musical Director for the Ithaca Opera Association. He was also a regular performer with the Syracuse Society for New Music. As a pianist, he collaborated regularly with colleagues in song recitals and other chamber music performances. A 1995 classical cabaret concert in Barnes Hall with soprano Kathryn Fields was a typical example of Murray's musical tastes. It featured works by Kurt Weill, Leonard Bernstein, and William Bolcom, a Cole Porter rarity titled, "After You, Who?" as well as Murray's arrangement of Irving Berlin's, "Top Hat, White Tie, and Tails."

Murray's accomplishments as a jazz pianist were particularly well known and widely appreciated. His colleague, David Borden, has written about their musical collaboration:

"Working with Ed Murray, preparing two-piano concerts of American pop and jazz standards was one of the most fulfilling experiences of my musical life. This collaboration started when Ed gave me a tape to listen to on a long trip, of him playing some of his favorite tunes. He called his own arrangements 'meditations'. This allowed for unique interpretations of familiar tunes like George Gershwin's 'Strike Up the Band' as a dreamy fantasy or Cole Porter's 'Ev'ry Time We Say Goodbye' as a Debussy Prelude. In fact, Ed would often quote from the classical repertoire in his arrangements, sometimes embedded so deeply that only he would know what was going on. When this happened, a smile of mischievous accomplishment would flash across his face while he played the passage."

David Borden, John Hsu, Steve Stucky, Martin Hatch

Robert Burns Musgrave

April 15, 1913 — July 20, 1989

Robert Burns Musgrave had an extraordinary and lasting impact on Northeastern agriculture. His analyses and innovations are firmly embedded in concepts and practices used at every stage in the production and preservation of grains and forages destined to be consumed by the public in the form of dairy products. His was an uncanny knack for looking behind clichés to expose fundamental questions—and their answers—about the ways in which soils, fertilizers, crops, farm machinery, farm structures, and not least, a farmer's time and energy could most effectively be used for the benefit of all. Those questions were addressed by an inventive mind with unfailing dedication to the disciplines of science and an unparalleled mastery of the art of farming.

Bob's professional career began in the days when technological and scientific breakthroughs were beginning to check—and then to reverse—the seemingly inexorable decline in productivity of American farmlands. Farmers in the Northeast shared in this turnaround, but only the most attentive had any idea that one man had such a large role in developing so many of the specific practices that are taken for granted today.

Early in his career at Cornell, Bob demonstrated the advantages of early seeding of winter wheat, a contradiction of conventions of that day. His rationales for his basic recommendations for planting dates and fertilization of both wheat and oats have never been improved upon. His perception of the potential for greatly increased yields through judicious nitrogen fertilization—if lodging of overgrown stems could be controlled—helped stimulate the development of modern stiff-strawed varieties of small grains.

In the 1940s, Bob was a central figure in a major college program to improve the nutritive value, preservation and storage of forage crops. He and J.K. Loosli (Animal Nutrition) showed that stage-of-growth was the most important factor influencing the nutritive value of forages at the moment of harvesting, a finding that led to the introduction of methods of preservation compatible with timely harvesting, including ensiling of hay. They also showed that, given timely harvesting, the nutritive values of grasses and legumes were much the same, which made yields, production and storage costs decisive. One result was a dramatic increase in the production of alfalfa and birdsfoot trefoil in the Northeast even as the total acreage devoted to hay declined. Bob Musgrave and Jeffrey Dawson (a soil scientist) established the fact that in the absence of direct sunlight, most of the energy responsible for evaporation of water from moist forage comes from respiration by the plant tissue itself, and from

the respiration of microorganisms—both consuming the most readily-digestible components. Modern methods of forage preservation are based on this finding, which effectively ended installations of costly and inevitably inefficient barn-drying systems in the Northeast.

Bob questioned the prevailing view that New York's dairy farmers should grow only forage, purchasing the concentrated feed supplements that they required. Accordingly, he established long-term experiments involving intensively managed crop rotations to produce both forages and grains, and developed the cropping systems that characterize efficient dairy farming of the present era. He did this at a time when cost-analysts were busy "proving" that corn-for-grain was uneconomical for New York. But Bob was quietly proving that corn-for-silage and corn-for-grain both had great potential, producing far greater feeding value per acre—more economically—than any other crop, even for the problem soils and cool environment of the Allegheny Plateau. He showed that, in rotations, the major return to inputs of lime and phosphate for forage legumes was realized from corn following those legumes. His innovative work on row spacings and population densities for corn is reflected in planting and harvesting machinery that farmers use today. By the time that Bob retired, corn acreage in New York had increased by half, and both total production and per-acre yields of corn-for-grain had doubled.

Bob was particularly conscious of the role of commercial fertilizers and farm manure in the production of animal feeds. His evaluations of lime, phosphorus, potassium and nitrogen (including anhydrous ammonia) ranged over the entire state. His conclusion that very high levels of nitrogen fertilization were unwarranted in grain and forage production did not make him popular with those who promoted the opposite view. He insisted that the cost of "disposing" of manure by spreading it on fields to be planted to corn should not be counted as a cost of producing the corn (thereby making it appear more economical to purchase imported corn), but should be charged to the cost of maintaining the dairy herd that produced the manure. His attention to essentials led him to invent a system for plowing land and planting corn with a single pass of the tractor, starting the trend toward "no-till" systems in use today.

About 1960, Bob began a series of direct studies of physiological and environmental influences on the photosynthetic and respiratory activity of corn plants (and later, sugar cane) growing under field conditions. He expected to be able to identify superior genotypes as materials for plant breeders. His field facility, and its ingenious systems of control and measurement, became the prototype that many have copied. His findings suggested, however, that genetic expressions were far more sensitive to microvariables than had been suspected, compromising the routine evaluations of genotypes that he had hoped for, but raising questions that continue to preoccupy his successors.

Bob found time to test his hypotheses under tropical conditions. In 1957-58, he was a visiting professor at the College of Agriculture at Los Baños, in the Philippines. He returned there in 1964-65 to develop a graduate program in crop ecology and physiology, and again in 1970 to work with graduate students and faculty in that program.

Bob Musgrave was born and raised on a farm near Hutsonville, Illinois. After graduating from high school, he farmed with his father for a year before entering the University of Illinois, where he earned a B.S. degree in 1936, an M.S. degree in 1938, and a Ph.D. degree in 1940. He had majored in crop production and plant physiology and joined the faculty of Cornell's Department of Agronomy as an assistant professor of field crops, specializing in crop ecology. In 1978, after 38 years of service, he retired as professor emeritus, and at that time received the prestigious New York Farmer's Award for outstanding contributions to the agriculture of the Northeast. In 1988, an anonymous donor honored him by creating the Robert B. Musgrave Award, to be awarded annually to a student for excellence in agronomy.

In death, he was survived by his wife, Mildred; a son, R. Bruce Musgrave; three daughters, Martha Fellows, Margaret Bennett and Mary Blasiak; and nine grandchildren.

Marlin G. Cline, W. Keith Kennedy, Timothy L. Setter, Madison J. Wright, Robert D. Miller

Clyde Hadley Myers

February 6, 1883 — August 5, 1944

Clyde Hadley Myers retired from active service as Professor of Plant Breeding at Cornell University on March 7, 1944, and at the next subsequent meeting of the Cornell Board of Trustees was made Professor Emeritus. He was born on February 6, 1883 at Randolph, Illinois, and in 1907 was graduated from the Illinois Wesleyan University with the degree of Bachelor of Science. He served as Assistant in Plant Breeding at the University of Illinois from 1907 to 1910, and at the end of that period he was awarded the degree of Master of Science. He then entered the Graduate School of Cornell University, where he continued his studies in genetics and plant breeding. In 1912 the degree of Doctor of Philosophy was conferred upon him. In that year he was appointed Assistant Professor of Plant Breeding and in 1913 became Professor, which position and title he held until his retirement. His wife, Fleda Straight Myers, whom he married in 1910, and a son and a daughter survive him.

Dr. Myers' interests in research were concerned largely with bud-variation problems and the effects of environment on the known hereditary characters of plants. He chose potatoes as material for experimentation and showed that hereditary changes in vine and tuber characters were in some cases due to apparent alterations in the germ plasm. His experiments with potatoes had a very practical bearing on the kind and efficacy of methods used in bud-selection. In his teaching he laid much emphasis on this avenue of approach to the isolation of superior types of plants.

In his earlier investigations he was greatly interested in corn improvement and made extensive use of ear-to-row breeding procedure. Dr. H. J. Webber had initiated work in this field, but Dr. Myers carried it to the point where three new and valuable varieties were established. One of these is still the best open-pollinated strain of corn for grain production now existent in New York State. From 1912 to 1916 he gave much of his time to extension work, laying emphasis particularly on hill selection of potatoes and mass selection of corn. From 1916 until his retirement he devoted most of his effort to the breeding of timothy and cabbage. He produced two valuable strains of the former and several highly uniform new varieties of cabbage. From time to time he published bulletins covering results of his breeding work. His research in the genetics of cabbage and related Brassica species was such that he attracted a considerable number of graduate students whose interests were mainly concerned with improvement of vegetable crops.

Dr. Myers also helped organize the Crop-Improvement Program for China, which was a cooperative project between the University of Nanking, the former International Education Board, and Cornell University. In developing this program Dr. Myers spent the greater part of the years 1926 and 1931 in China, where he supervised a large program of plant breeding and conducted classes for training Chinese in methods of plant breeding and genetics.

He was a member of numerous professional and honorary societies, among which were the American Association for the Advancement of Science, American Genetic Society, American Society of Agronomy, Sigma Xi, and Gamma Alpha.

In 1939 Dr. Myers suffered a breakdown in health, a circumstance which eventually necessitated his retirement. Though it was the fervent wish and continuing hope of his colleagues in the Department of Plant Breeding, and of his numerous friends throughout the community, that Dr. Myers regain health and strength, this was not to be. He passed away quietly in the early morning hours of August 5, 1944.

Loyalty to his department and the things for which it stands was one of his outstanding characteristics. Ever a hard worker, he was never too busy to assist student or colleague in meeting situations or to aid others in the solution of problems. Sympathetic understanding characterized his professional and social contacts, and to this was added a fine geniality and a keen but always kindly wit. His superb tenor voice was for many a year a source of delight to students and townspeople. To his colleagues, accustomed to the charm of his unique personality, and to his wide circle of friends and associates, his sudden passing has brought a deep and painful sense of loss.

Henry Alonzo Myers

April 9, 1906 — May 2, 1955

Henry Alonzo Myers, Professor of English, died in Tompkins County Memorial Hospital on May 2, 1955, after an illness of some months. He is survived by his wife, Elsie Phillips Myers, M.A., Cornell, 1933, and two children, James Phillips and Helen Priscilla Myers.

Born in Newburgh, New York, he received his early education in schools in and near Lewiston. After graduation from Niagara University in 1929, he entered Cornell University to pursue graduate studies in philosophy and in English and American literature. Cornell awarded him the Ph.D. degree in 1933.

After an additional year as a teaching assistant in English at Cornell, he was awarded a research fellowship by the American Council of Learned Societies for a year of study at Harvard University. He returned to Cornell in 1935 as Instructor in English and two years later became Assistant Professor of English; in 1940 he became Associate Professor and in 1947 Professor. In 1952-53 he served as Acting Chairman of the English Department.

For many years his special interest was in dramatic literature, and it is in this connection that many Cornellians best remember him and his work. His effort to formulate a modern theory of tragedy resulted in many memorable lectures, a number of published articles, and in plans for a book on the subject. In 1945-46 he held a Visiting Professorship in Dramatic Literature at Stanford University.

His second major interest lay in American Studies. For nearly twenty years he taught courses in American literature, and more recently he helped to develop—and served as the first chairman of—an interdepartmental program in American Studies at Cornell. In 1951-52 as Fulbright Lecturer in American Literature and Civilization he offered the first course on American literature at the University of London, which initiated at King's College of the University a program in which American literature became a subject for the B.A. Honours Degree in English. He also lectured at Salzburg in the Seminar in American Studies and in various universities in the British Isles. The breadth of his philosophical and literary interests led to his appointment for 1953-54 as the first Visiting Professor of Humanities at Stanford University, where his task was to inaugurate a new type of program for a Doctorate in the Humanities.

A teacher and lecturer in whom students found unusual stimulation and appeal, Professor Myers had few equals in his College during his time. Possessed of rare intellectual capacity, a truly searching curiosity, and an intense

interest in his fellow men, he exerted a telling influence on successive generations of graduate and undergraduate students alike. His sense of humor, though quiet, was warm and generous; and he was both cherished and respected by persons of widely divergent backgrounds.

In his books and many articles he has left enduring testimony to his breadth and his strength. His books include *A Short History of English Literature* (written with Elsie Myers; 1938, revised edition, 1952); *The Spinoza-Hegel Paradox: A Study of the Choice between Traditional Idealism and Systematic Pluralism* (1944); and *Are Men Equal? An Inquiry into the Meaning of American Democracy* (1945), republished by the Cornell University Press a few months after his death.

Of his last book it may be said that no one can read it without being moved by the passionate and compassionate spirit evident in it from beginning to end.

It was written by a man who, though he saw the infinite worth of every human being, felt his own finiteness and was aware of his own and all men's frailty. It was of himself as well as of others that he wrote: "Only through loneliness and comradeship can one learn to accept others as his equals in ultimate value. Only after sharing sorrow and joy with others can one arrive at a tragic understanding that all men are subject to a common fate." For twenty years Henry Myers strove to formulate a theory of tragedy, as a key to the problems of life. Time failed him for the final formulation, but in the striving he achieved a rare insight into human beings and a warm sympathy for human suffering.

H. D. Albright, M. R. Konvitz, F. E. Mineka

William Irving Myers

December 18, 1891 — January 30, 1976

William I. Myers died at his farm home overlooking Cayuga Lake near Ithaca, New York, on January 30, 1976, at the age of eighty-four. His death terminated a long and distinguished career in education, agriculture, finance, and public service.

Dr. Myers was born at Lowman, New York, in 1891. He grew up and worked on his grandfather's dairy and tobacco farm in Chemung County, New York. When he enrolled at Cornell in 1920, he fully intended to return to his family farm. But Professor G. F. Warren, among others, influenced him to change his mind about returning to the farm after he was graduated in 1914. He stayed on at Cornell to continue his education in the newly established Department of Farm Management, now the Department of Agricultural Economics. He received the Ph.D. degree in 1918, then became an assistant professor in farm management, and two years later was promoted to professor.

As a young faculty member, Dr. Myers specialized in farm management, farm finance, and cooperative organization and management. He taught classes, conducted research, directed graduate students, and participated in extension activities. He was an inspiring teacher, counselor, and friend of those with whom he worked. In spite of his numerous activities, he always seemed to find time to assist others who sought his help.

Dr. Myers was an organized man who was able through exceptional talent and long hours of hard work to accomplish the full program he assigned to himself. He sought advice from those who could help him, and, in dealing with others, he was forthright in his comments of praise or suggestions for improvement, whichever he felt were appropriate. He served as secretary of the American Agricultural Economics Association from 1927-31 and as president in 1943. The Cornell faculty elected him a faculty trustee of the University in 1939.

In 1933, at the height of the depression years, Dr. Myers was asked to go to Washington by President Roosevelt to work on the reorganization and expansion of the federal farm credit agencies. He served as governor of the Farm Credit Administration from 1933 to 1938 and was largely responsible for the creation of the Farm Credit System. That system consists of twelve federal land banks, twelve federal intermediate credit banks, thirteen banks for cooperatives, and hundreds of production credit associations and federal land bank associations. For more than four decades this farmer-owned cooperative system has provided the means to channel billions of dollars in credit from the money markets to this nation's farmers. He resigned the Washington position in 1938 and returned to Cornell as a professor and head of the Department of Agricultural Economics. The untimely death in 1943 of one

of his close associates, Dean Carl E. Ladd, was the occasion for the president and trustees of Cornell University to ask Dr. Myers to be dean of the New York State College of Agriculture at Cornell University, a position he held with distinction until his retirement in 1959.

Dean Myers's counsel and advice were sought constantly by scores of public and private organizations. Within New York State alone he served on many commissions and committees whose functions were to study issues and advise the governor, members of the legislature, and other public officials on matters of policy. In national capacities, he served three presidents: Roosevelt, Truman, and Eisenhower. He advised President Roosevelt on issues other than farm credit. President Truman asked him to work on the Famine Emergency Committee and the Committee on Foreign Aid. He was chairman of President Eisenhower's National Agricultural Advisory Committee, which worked closely with Secretary Ezra Taft Benson. All the governors of New York State during his tenure at Cornell relied on him for guidance.

In addition to serving on the boards of the Rockefeller Foundation and Agricultural Development Council, he served as a trustee or a member of the board of directors of numerous other organizations, including the Federal Reserve Bank of New York, General Education Board, American Institute of Cooperation, Twentieth Century Fund, Carnegie Institute of Washington, Eisenhower Exchange Fellowships, New York State Association for Crippled Children, Elmira College, and Vassar College. He was a member of the board of directors of many corporations, including Mutual Life Insurance Company of New York, Continental Can Company, Insular Lumber Company, W. S. Industrial Chemicals, Inc., New York State Electric and Gas Corporation, AVCO Corporation, Smith-Corona Marchant, Inc., Marine Midland Corporation, and Grand Union.

Dr. Myers received many other honors. In 1938, the American Farm Bureau cited him for "distinguished service to agriculture." In 1949, his Cornell Class of 1914 awarded him its Outstanding Achievement Award, and in 1958 he was elected a fellow in the American Agricultural Economics Association. He traveled widely and participated in numerous programs designed to build a stronger international agriculture and improved relationships among the people of the world family of nations.

Bill Myers, as he was affectionately known by all who worked with him, remained close to the soil throughout his productive career. He purchased a farm near Ithaca and for many years maintained a commercial poultry operation, as well as a large garden that occupied part of his time for relaxation. His bright cherry greeting, his fairness in dealing with others, his vision and guidance for the future of agriculture, will long be remembered.

Dr. Myers was married to the former Marguerite Troxell. He is survived by three daughters: Elizabeth Martin of Cincinnati, Ohio, Marian Kira, and Margaret McElwee, both of Ithaca, New York.

Glenn W. Hedlund, Robert S. Smith, Charles E. Palm

Louis Lindo Nangeroni

September 13, 1918 — December 12, 1989

Dr. Nangeroni, or “Lou” as he was known to most of us, entered Rutgers University in the fall of 1938 and was a familiar figure on campus as a wrestler and owner of a scarlet colored Model A Ford with a black “R” on the rumble seat and doors of his car. His Rutgers education was interrupted by World War II when he enrolled in the Army Air Corps Officer Training Program. Lou completed flight training and was soon on his way to Africa ferrying a B-24 Liberator bomber to Tunisia. After the usual pre-combat training, the squadron moved into Italy with the invasion forces, and Lou began flying missions over Europe, ultimately completing 100 of those missions.

Dr. Nangeroni returned to Rutgers and graduated in 1947. He then entered the College of Veterinary Medicine at Cornell University and received the D.V.M. degree in 1951, the M.S. degree in physiology in 1952, and was appointed to the faculty in 1952. During the next 25 years he taught animal physiology, advanced experimental physiology, and conducted research in electroanesthesia and bioassay methodology.

Dr. Nangeroni’s thesis research was concerned with ruminant physiology, specifically the factors that influenced the temperature of the rumen. This work was subsequently published in the *Cornell Veterinarian*. Over the years, Dr. Nangeroni published various reports on pharmacology and gastroenterology in farm animals. He made the important observation that one drug, chlorpromazine, decreased the dose of pentobarbital required to attain surgical anaesthesia, which was important in advising clinical veterinarians about the proper use of commonly administered drugs.

During the 1960s, Dr. Nangeroni collaborated with the Nobel laureate, Dr. Vincent du Vigneaud, then of the Department of Chemistry at Cornell. This work was concerned with syntheses of analogs of oxytocin, a peptide hormone involved in the control of milk secretion and in parturition. Dr. Nangeroni’s role in this collaboration was the quantitation of the biological activity of the oxytocin analogs. Two bioassays were used, one based on vasodepressor activity in birds, and the other on the degree of uterine contraction in mammals. These papers with Dr. du Vigneaud were published in the *Proceedings of the National Academy of Sciences*.

Experimental surgery was Dr. Nangeroni’s most effective medium. He gave a generation of animal scientists, nutritionists and physiologists the tools of the experimental surgeon. Working with groups of graduate students he carefully developed their skills. He demonstrated the knowledge of a large number of procedures. He was always sensitive both to the animals and students and displayed calmness and confidence, often in the face of great

uncertainty on the part of the beginning student. These qualities of confidence and quiet expectation that each one of them would succeed was, perhaps, his most powerful and endearing attribute.

After Dr. Nangeroni's retirement from the veterinary faculty in 1977, he moved to the Food and Drug Administration in Rockville, Maryland, as a veterinary medical officer with the Center for Veterinary Medicine. He served in this capacity until his death.

Lou was a devoted family man and an inveterate quantity food buyer. He loved to cook and bake and act as host for huge picnic-style feedings. When the tomatoes ripened in his garden, huge pots of tomato sauce were always cooking in the kitchen. It was obviously a page out of his father's restaurant background.

When the East Hill Flying Club held their Fly-In Breakfasts, it was Lou who made certain they had enough fresh food and condiments ("real maple syrup—none of that imitation stuff!"). Even his move to Maryland didn't dissuade him from his regular return trips to the Ithaca area for his New Hope Mills flour. He didn't believe in using the small five- or ten-pound packages—nothing short of one-hundred-pound bags of wheat, oat and rye flour would satisfy him. However, he would buy the smaller unit packages for his wide circle of friends after he had convinced them that New Hope Mills flour was the best.

Lou owned and flew his own airplane for many years and, as an avid Cornell hockey booster (they always had several hockey players living with them), never missed an ECAC tournament. Those flights to Boston were memorable for their gustatory adventures—"once the landing gear was retracted it was snack time for the entire flight."

Hunting, handball, bicycling, sail planes, real estate and stock investing were also important facets of Lou's life. In each of these pursuits he maintained his strong inner sense of values and honesty. But, above all it was his quiet commitment to his family and circle of friends that continued as his strong suit. He brought four wonderful daughters through their formative years and guided them from "roller skate-hall rats" (on weekends in the Veterinary College) to "Comfort Patrol" for the horses being treated at the College. Family involvement was a paramount part of Lou's life whether it involved bringing a beef heart home so he could help the girls with their school projects, or convincing them that a "camp out" under an old Army tent in King Ferry was a vacation.

Lou leaves behind a legacy of quiet inner strength for life and living that will serve as guidelines for his family and friends. He is survived by his wife, Carrie; his four daughters, Cheryl Nangeroni, Linda N. Scorsone, Jill Nangeroni and her husband, Mark Reader, and Diane Nangeroni and her husband, David Parkins.

Edgar L. Gasteiger, Daniel N. Tapper, Robert H. Wasserman, John C. Thompson

Abraham (Al) Nash

September 16, 1915 — August 3, 1996

Al Nash is remembered by his friends and colleagues as a social activist, an inspirational teacher, and an insightful writer on political and labor related issues. He was born in Baltimore, Maryland to parents who were working class immigrants from Italy and Russia. His family moved to New York City where Al attended De Witt Clinton High School. After graduation, he became involved in radical politics. Like many of his generation he was initially inspired by ideals of the Russian revolution but later disillusioned by the results. When he managed a labor bookstore in Greenwich Village, he was reputed to read every title that came in the store. Not only well read but also highly articulate, Al spoke on street corners and organized anti-Nazi and pro-socialist rallies and meetings.

At the outbreak of World War II, he went to work at the Brewster Aircraft Plant on Long Island where he was elected as a steward in the United Automobile Workers, a union connection he maintained throughout his life. Drafted into the army, he found it ironic that he was assigned to guard former Nazi officials in a prisoner of war camp in Germany. He also tried to organize his fellow soldiers into a union. After discharge from military service, Al moved to Detroit to work in the Chrysler Corporation's Jefferson Plant where he was elected chief steward of UAW Local 7. His subsequent career encompassed staff positions in several unions where he organized and represented diverse occupations including electrical manufacturing, municipal employment and social workers.

From his earliest years in the labor movement, Al gave priority to worker education and was increasingly involved in teaching not only in the unions with which he was affiliated but in university sponsored courses at Rutgers and Cornell University. His thirst for knowledge led him to complete his formal education enrolling at age 40. He earned a B.A. degree from Columbia College, an M.A. degree from New York University, and a Ph.D. degree in Sociology from Columbia University, graduating at age 57.

In 1966, he joined the ILR Extension faculty in New York City where he continued until his retirement in 1985. He was revered by the labor union leaders and activists who participated in his classes. For example, when Harry Van Arsdale, Jr., headed the New York City Central Labor Council, Al Nash was asked to train leaders of newly organized Taxi Drivers and Hospital Workers and was credited with playing a key role in foundation of these unions.

Always the social activist, Al Nash conducted Cornell conferences that dealt with controversial political and economic issues. For example at a time of conflict in the 1960s, he organized a major dialogue between leaders

of the civil rights movement and labor unions. Dedicated to building union strength, he was also committed to union reform, serving for many years as an active board member of the Association for Union Democracy which monitors union practices and provides assistance to union members who seek to exercise their democratic rights.

In 1974, in recognition of his excellence in teaching and scholarship, Al Nash became a full Professor in the ILR School's Department of Extension. His published works dealt with adult and labor education, organizational change and quality of work life.

Among his accomplishments as a labor educator at Cornell was the leadership he provided in the establishment of courses for university credit for adult students in New York City. He directed and taught in the Labor Relations Certificate Program, which ILR offered in cooperation with Empire State College (SUNY). Citing his contributions, Empire hailed him as "a distinguished labor educator who dedicated his life to the advancement of working people." The United Auto Workers, with which he had an association throughout his adult life, paid tribute to him as "a labor organizer, teacher and writer whose vision of social economic justice in a world of peace inspires us all."

Most of all, he was admired by the hundreds of students for whom he served as mentor and role model and with whom he empathized as a lifelong labor activist who completed his own education while working full time.

Al Nash is survived by two children, Paul and Margo, who have endowed an essay prize for labor studies students in his name, a fitting tribute to their father.

Ron Donovan, Phil Ross, Lois Gray

John Jacob Natti

September 5, 1912 — April 9, 1971

John Jacob Natti, professor of plant pathology at the New York State Agricultural Experiment Station, Cornell University, in Geneva, New York, died of a sudden coronary arrest on April 9, 1971.

He was born in Gloucester, Massachusetts, the son of Finnish immigrants. After completing his elementary and secondary schooling in Gloucester, he entered Essex County Agricultural School from which he was graduated in 1935, at the depth of the Great Depression. Unable to continue his education because of finances, he then operated a market garden and poultry farm for five years. From this source he acquired sufficient funds by 1940 to enter the University of Massachusetts, which awarded him in 1944 the B.S. degree in agronomy and chemistry. Following graduation, he accepted a position with the United States Rubber Company as assistant chemist in the Agricultural Chemicals Division, where his duties comprised the development and testing of chemicals as candidate fungicides for control of plant diseases. During this period he became interested in plant disease pathogens and determined to devote his career to their study and control. In 1946 he entered graduate school at Cornell University, which awarded him the Ph.D. in plant pathology in 1951. He immediately accepted an appointment as assistant professor at New York State Agricultural Experiment Station, Geneva, where he was promoted to associate professor in 1954 and to professor in 1960.

His research at Geneva dealt with a wide spectrum of fungus and bacterial diseases of vegetables and resulted in sixty-two publications. Long before many of the dangers of pollution were realized, he strove to achieve disease control whenever feasible by identifying and selecting individual plants with resistance to disease. After stabilizing this property by intensive breeding and selection, he released materials to commercial seedsmen for development of new and improved varieties. Many cabbage, broccoli, and snap bean varieties currently grown in New York are descended from Professor Natti's selections.

His interests were wide and varied. He played an active role in church affairs, variously serving as teacher and superintendent of Sunday School, deacon, and elder of the First Presbyterian Church. He devoted much time to the Boy Scouts and Little League. He was a talented landscape painter, a keen and skillful bridge player, and an excellent conversationalist with a dry, subdued humor. He is survived by his widow, Lora Patricia, and three children, John Martin, Thomas Alexander, and Elizabeth Anne.

A. J. Braun, R. M. Gilmer, W. T. Schroeder

Arthur Leslie Neal

May 3, 1911 — January 6, 1991

A. Leslie Neal was appointed associate professor of biochemistry in the College of Agriculture in 1947. He continued in that position when the Division of Biological Sciences was established and was followed by a major expansion of the Section of Biochemistry, Molecular and Cell Biology. He retired as professor emeritus in July 1976. During his years as a member of the Cornell faculty many changes occurred, both administrative and scientific, following developments in biochemistry and the rise of molecular biology.

Professor Neal was born in Belmont, Wisconsin, on May 3, 1911. His schooling took place in a number of towns in Illinois, to which his father, a rural minister, was assigned. He received a B.S. degree in 1934 from Monmouth College in Illinois. His graduate work was initially in physical chemistry, and he obtained the M.S. degree from the University of Illinois in 1935. Following this, he spent five years first as a research chemist for the Continental Can Company in Chicago, and then as instructor in organic chemistry at Kansas State College (now Kansas State University) in Manhattan, Kansas. He entered the University of Wisconsin as a graduate student in biochemistry in 1940, and obtained a Ph.D degree in 1943, working with F.M. Strong on aspects of the chemistry and biochemistry of pantothenic acid. Four years as a research associate in the Agricultural Chemistry Department at Michigan State developed his interest in the interactions between plants, and the bacteria and other microbiota of soil.

On appointment to the faculty of Cornell in 1947, his dual teaching assignments were to develop courses appropriate for students in both the two-year and four-year programs of the College of Agriculture. These courses were intended for students with little background in chemistry, and covered basic aspects of chemistry as well as introductory principles of the rapidly developing field of biochemistry. Professor Neal continued to teach and develop the first of these courses until the two-year program was ended, and the second until the time of his retirement. The sum of his experience in teaching in the two-year program was put into a textbook: *Chemistry and Biochemistry: a Comprehensive Introduction*—which first appeared in 1971. Following his retirement, he planned to write a second textbook based on the course developed for the four-year students but unfortunately, ill-health prevented him from completing it.

In addition, he participated for a number of years in teaching a laboratory course developed by Dr. Louise Daniel. A textbook resulted from this collaboration in 1967: *Laboratory Experiments in Biochemistry*, by L.J. Daniel and A.L. Neal. His experience in teaching freshmen was also extended to developing courses for and instructing high

school students, and he taught summer session courses in introductory biochemistry both for college and for high school students for a number of years in the 1950s and 1960s. He was outstandingly successful in developing their interest, and in helping them to understand many complex aspects of the subject matter. These attributes were also evident in his role as an undergraduate adviser. Although his major focus was on teaching students at a relatively early stage in their college careers, he also taught a graduate course in plant biochemistry. Seven graduate students did their thesis research in his laboratory.

Dr. Neal's research interests covered a number of areas that reflected his strong background in chemistry and facility for collaborative research. At one time or another, he worked on methods for improving the yield and keeping qualities of fruits, on factors affecting the emergence of encysted nematodes, and on bacterial and fungal metabolism, particularly as affected by growth factor availability. His main interest during the period just preceding his retirement was in the possible value of hydrazide derivatives of amino acids and sugars as anti-cancer agents. His research interests led to the publication of about 30 scientific papers, and also to his visiting and working in a number of laboratories around the world during his sabbatical leaves. However, his major contribution to his department and his college undoubtedly lay in his dedication to teaching, particularly as it involved younger and academically less specialized students, who benefitted immensely from his understanding and gentle persistence in presenting a clear and relevant account of the basic principles of chemistry and biochemistry.

Dr. Neal was a fine experimentalist and technician. This skill carried over into a hobby that gave him much pleasure in his later years—he was an excellent photographer.

Dr. Neal is survived by his wife of 54 years, Arline Nelson Neal, of Ithaca; two sons, Arthur and David; and two daughters, Janet and Nancy.

J.M. Calvo, L.J. Daniel, J. Gibson

James George Needham

March 16, 1868 — July 24, 1957

James George Needham, Emeritus Professor of Entomology, died on July 24, 1957. Throughout a long and busy life he served Cornell University as a great biologist and a productive scholar.

Dr. Needham was born in Virginia, Illinois, on March 16, 1868. He attended public schools and Knox College, from which he received his B.S. and M.S. degrees. In later years, he was fond of telling about the good fun he had with other youngsters while attending a country school on the prairie. After graduating from Knox College, he taught there from 1894 to 1896. During this time he prepared and published a text, "Elementary Lessons in Zoology". This was unique in its presentation of subject matter, and attracted the attention of Professor John Henry Comstock who invited him to come to Cornell to study with him as a Goldwin Smith Scholar. During this period he collaborated with Professor Comstock in establishing a new interpretation of the morphology of insect wing venation. This classical work became accepted by biologists throughout the world and did much to modify entomological procedures.

From 1898 until 1907, Dr. Needham was professor of biology at Lake Forest University. For several summers while teaching there, he worked for the New York State Conservation Department in the Adirondack region, studying aquatic life as a means of maintaining and increasing the food supply of fresh water fishes. In 1907 he was invited to return to Cornell as assistant professor of limnology, to establish for the first time in any American university the subject of limnology as a field of instruction and research. Out of his effort grew the excellent program in limnology that attracted students from many parts of the world. Dr. Needham worked for years at the biological field station in the Renwick Marsh area at the head of Cayuga Lake, studying fresh water biology.

In 1914, Professor Comstock retired as head of the Department of Entomology and with his recommendation, Professor Needham was appointed head of the department, a position he filled until his retirement in 1935.

In 1909, Dean Liberty Hyde Bailey asked Professor Needham to give a course in biology. This course, with modifications, still exists in our college curriculum and has long served as an introduction to biology for students who are majoring in other areas of subject matter. His keen interest in the broader aspects of human biology enabled him to develop a course in the biology of the human species which received widespread acclaim from students in many colleges of the University. The course was noted for his unique manner of presentation, for his wholesome philosophy of life, and reflected the thinking of a great naturalist. He loved students and they

responded with deep affection and respect. From all lands, they came to Cornell to study with Dr. Needham and found him a stimulating, sympathetic teacher, but also one who expected the best that one could give.

Ecology entered the teaching curriculum of the Department of Entomology because Professor Needham developed it along with limnology and biology. Any student who had the privilege of going into the field with him has a lasting memory of a great naturalist at work. Nature unfolded its intricacies around him and with warmth and enthusiasm he made one see the life in a pond, in a stream, on an alder bush, or a goldenrod plant as one had never dreamed it existed. Professor Needham was so much at home with all of his friends in the plant and animal world that students sensed his inspiration and shared his enthusiasm for nature. With a twinkle in his eye, he would show students a parasite attached to a caterpillar and muse about bigger fleas have smaller fleas upon their backs to bite them! He could portray the living interrelationships of plants and animals in simple, understandable terms that students grasped.

Among Professor Needham's most distinguished research is his work with the aquatic insects—the stoneflies, caddis flies, damsel flies and dragonflies. To the damsel flies and dragon flies particularly, he gave much of his time in study of the biology and classification. His outstanding work *A Manual of the Dragonflies of North America*, revised in 1954 with a former student, Dr. M. J. Westfall, as co-author, was published by the University of California Press only a few years before his death. During his career Professor Needham published more than 250 scientific articles, educational papers, and textbooks. His writing was clear, concise, and interesting to read. His style was typically and uniquely his own.

No tribute to the life and work of Professor Needham would be complete without mention of his poetry and philosophical writings. Some years ago friends and former students persuaded him to publish a collection of his poems. Often during his active years he invited groups to his home, and as they sat around the fireplace on a winter's evening, he read from his poems, or perhaps an article about life on the frontier, or an "Uncle Remus" tale, with a buoyancy of spirit that reflected in the entire gathering.

Always a staunch advocate of teaching biology where it existed—in nature, Professor Needham was instrumental in obtaining for Cornell University several of the biological preserves which presently are a great asset to all phases of the biological sciences. He was active in the Entomological Society of America, the American Association for the Advancement of Science, the Limnological Society of America of which he was a past president, and numerous other scientific societies. His teaching and research in China brought him widespread recognition. Many Chinese graduate students came to Cornell to study with him. Professor Needham's life was a wonderful example of

devotion to his family, his students, and his work. His genial personality and friendliness endeared him to his associates and students at Cornell for more than half a century of continuous association with the Department of Entomology. His great pioneering spirit advanced the work he loved so well until almost the very end of his days. His influence will always be felt on the Campus and, in a broader sense, throughout the world.

C. E. Palm, C. O. Berg, J. C. Bradley

James Maffet Neill

July 6, 1894 — September 16, 1964

James Maffet Neill was born July 6, 1894, in Clarion, Pennsylvania. He received his B.S. degree from Allegheny College in 1917, and then continued his studies at Massachusetts Agricultural College, now the University of Massachusetts, where he served first as a graduate assistant and later as an instructor in microbiology. He obtained his Ph.D. in 1921 and was then appointed an assistant at the Rockefeller Institute, where he worked in the laboratories of Doctor O. T. Avery. At the Institute he was engaged in studies on the biology and immunology of the pneumococcus, and was a collaborator with Doctor Donald D. Van Slyke in the development of the classic Van Slyke-Neill manometric gas apparatus.

In 1925 Dr. Neill joined a group of able young people recruited to staff the newly reorganized School of Medicine of Vanderbilt University. His appointment was as Associate Professor and chairman of the Department of Bacteriology and Immunology; in 1926 he became Professor and chairman. Before going to Vanderbilt, he had worked at Harvard in the laboratory of the late Dr. Hans Zinsser with whom he formed a lifelong friendship.

He was an indefatigable worker and contributed much to the success of the new institution at Vanderbilt. Although he became involved in administration and teaching, his research efforts did not lessen. Studies on the oxidation and reduction of blood pigments and immunological substances, which he had begun at Rockefeller, were continued. In addition, he engaged in investigations dealing with the natural immunity of man and other animals to pneumococci and diphtheria bacteria, and with hypersensitiveness to toxin and other diphtheria bacterial products. These years at Vanderbilt were busy and highly productive ones for Dr. Neill and his group.

Dr. Neill was appointed Professor and chairman of the Department of Bacteriology and Immunology at Cornell Medical College in 1931. The Medical College was preparing to move in 1932 to its present location and, for the second time within the short span of six years, he was charged with the responsibility of equipping and organizing a new department of bacteriology. This task received the major portion of his attention during the following year, but time was found to continue laboratory work in the department at Nashville, where he maintained his residence until the summer of 1932.

During Dr. Neill's tenure at Cornell his research interests were varied. Especially noteworthy were his studies on the immunology of fungi and the occurrence of serologically reactive material in sugar and other foods. His concern with the latter subject led to an extensive investigation of the serological reactivity of dextran, a substance

that was being used as a blood volume expander. During his later years his interest in teaching deepened, and this interest commanded more and more of his time and energy. His objective was not only to provide the students with a comprehensive course in microbiology, but also to acquaint them with the larger involvement of the science in man's affairs.

Dr. Neill was a member of several scientific societies, including the American Association of Immunologists, The American Society of Microbiologists, the Association of Pathologists and Bacteriologists, the American Public Health Association, the Society of Experimental Biology and Medicine, the Harvey Society, and the New York Academy of Science. He was an Associate Fellow of the New York Academy of Medicine and a member of Sigma Xi and Phi Delta Theta. In 1940, he returned to Allegheny College where he was awarded an honorary Doctor of Science degree.

After 31 years of service to Cornell, Dr. Neill retired on July 1, 1962, and was appointed Professor Emeritus. This marked the end of an era at the Medical College. Of the men who served as department chairmen when the College opened its doors at its present location in 1932, Doctor Neill was the last to retire.

Dr. Neill died at The New York Hospital on September 16, 1964. He is survived by his wife, Jessie Stratton Neill; a daughter (Mrs.) Ilah Dales Neill De Paoli, Schenectady, New York; a son, William Alexander Neill, Portland, Oregon, who was graduated from Cornell Medical College in 1955 and is now a member of the staff in the Department of Medicine at the University of Oregon Medical School; and by seven grandchildren.

While research and teaching occupied a major portion of Dr. Neill's life, his interests and activities extended beyond the laboratory and classroom. He had a special interest in the historical aspects of medicine and of the biological sciences. In pursuit of this interest he acquired a collection of rare and valuable books, and it was to him a happy occasion whenever he encountered a student who shared his interest. During the years that he resided in Nashville and in Scarsdale he was an avid rose gardner. He had a lifelong interest in sports, having played both baseball and football during his school days. When his son, Bill, developed as an outstanding sprinter in Scarsdale High School and at Amherst, he became interested in track. He loved to fish and enjoyed his summer vacations at their family camp at Belgrade Lakes, Maine. To these interests, as well as to his professional activities, he brought an intense commitment and an infectious enthusiasm.

Dr. Neill will be remembered by different people in different ways—as a scholar, as a scientist, or as a teacher. A number of his younger colleagues now hold important academic appointments in institutions over the country. To

those who were privileged to know him and associate with him over a period of years ne was, above all, a steadfast friend and amiable companion. To his family, he was a devoted husband and father.

John Y. Sugg, Joseph C. Hinsey

A. Gordon Nelson

May 25, 1910 — April 7, 1986

A. Gordon Nelson died on April 7, 1986, at Duke University Hospital in Durham, North Carolina. Following his retirement, in 1971, from the Department of Education, College of Agriculture and Life Sciences, as professor emeritus of counseling psychology, he and Martha established residence in Chapel Hill, North Carolina. He had been appointed in October 1945 as an assistant professor of educational and vocational guidance in the School of Education, the first person appointed to that field at Cornell. He became an associate professor in 1948 and a full professor in 1955. The name of his field was officially changed to counseling psychology in 1967.

Gordon was born in New Market, New Jersey, in 1910 and was educated in the public schools of New Jersey. In 1931 he received the B.S. degree in psychology from the University of Pennsylvania, followed by the M. A. degree in clinical psychology from the same university in 1933. In 1943 he received the Ph.D. degree from New York University in the relatively new field of applied psychology: educational and vocational guidance.

From 1931 to 1934 Gordon was a public school teacher in Pennsylvania; from 1934 to 1937, a school psychologist in New Jersey; and from 1937 to 1944, director of guidance in the Fairfield, Connecticut, public school system. In 1944 he came to Cornell as a counselor in the Veterans' Administration Center, helping returning World War II veterans make appropriate academic and career choices. The following year he was appointed to the faculty of the School of Education, in which he became a pioneer in organizing programs and courses, both on and off campus, to meet the needs of high school guidance counselors and college-level student personnel workers.

His research at Cornell focused on the development of techniques and approaches to counseling, the determination of needs in vocational and technical education, the establishment of training programs for counselors in schools and colleges, and the construction of various inventories for measuring student interests and aptitudes. He was the author of forty articles in professional journals and a contributor to six books and eleven monographs. Topics covered included secondary school counseling and guidance, college-level student personnel administration, career information, and related areas that apply to educational and vocational guidance. During his tenure at Cornell he served as the major adviser to 25 doctoral candidates and 125 master's degree students and as the minor adviser for 60 doctoral candidates and 140 master's degree students.

Gordon's professional influence extended internationally throughout his career. In 1952 he served as a Fulbright lecturer for a semester at the American University in Cairo, Egypt. During the spring term of 1958-59 he was

a Fulbright lecturer-consultant at Annamalia University, State of Madras, India, and he served additionally in India for the entire academic year 1965-66. In 1960 he spent six weeks making a pilot study, under sponsorship of the International Communication Agency of the University of Liberia, in regard to a possible ICA contract between Cornell and the University of Liberia. For the eighteen months immediately following his retirement from Cornell he served as a vocational guidance consultant to the International Labor Organization offices in Geneva, Switzerland, and New Delhi, India. His final international service was as a lecturer at Kevin Greene College in Brisbane, Australia.

Gordon was an active member of numerous college and university committees at Cornell, including those on educational policies, graduate degrees, and international education. For eleven years he was a member of the Language Examination Board of the Graduate School. He was elected to the Cornell Constituent Assembly in 1969. He was a member of several task forces on counselor education, human resources development, and academic affairs. He was a consulting editor to the *American Educational Research Journal* and a review editor for a number of commercial publishers, and served as consultant to a number of New York State-sponsored research studies as well as to some sponsored by the U.S. Office of Education.

He was a member of several professional organizations: a fellow in the American Psychological Association, a diplomate in counseling psychology for the American Board of Professional Psychology, and a member of the American Personnel and Guidance Association, the New York State Personnel and Guidance Association, and the National Vocational Guidance Association. He was elected to Phi Kappa Phi (an academic honorary) and belonged to Phi Delta Kappa (a national professional fraternity in education).

Gordon was preceded in death in 1980 by his wife, Martha, who was the director of elementary education in the Lansing Central School System for many years. He is survived by their daughter and her husband, Betty and James Marshall of Cheney, Washington, and one grandson.

His low-key personality was deceiving. He possessed a lively sense of humor. He had a keen analytical mind—his ability to knife through to the core of a problem was often evident in faculty discussions. He was extremely well organized and thorough; this was evident both in his courses and in his writing. He was an effective communicator, both as a classroom lecturer and as a writer. He was a demanding editor in respect to the theses and other written work submitted by his graduate students. He was also an excellent listener. These qualities plus his analytical ability combined to make him an especially effective counselor.

Despite his absence from the Ithaca area for the past fifteen years, he kept in touch with several of his former colleagues at Cornell. He maintained a busy retirement schedule, continuing to write and to travel widely until the time of his death. During his tenure here he contributed much to his department, the college, the university, his students, and his professional field. Both as a thorough professional and as a warm, friendly human being, he will be missed.

Howard G. Andrus, Dalva E. Hedlund, Marvin D. Glock

Helen Young Nelson

November 19, 1913 — January 8, 2001

Helen Young Nelson, Professor Emeritus of Human Service Studies in the College of Human Ecology, was a competent and dedicated professional in the field of evaluation in education and home economics education. Her competence was recognized both at Cornell and throughout the country.

Helen Young was born in Minneapolis and spent her early years there. From the University of Minnesota she earned the B.S. (1938) and M.S. (1942) degrees in Home Economics, and the Ph.D. (1952) degree with a joint major in Educational Psychology and Home Economics.

She began her professional career as a high-school teacher in Minnesota. Her reputation as an outstanding teacher, coupled with strong academic credentials, made Helen an attractive candidate for college-level positions, including teacher education.

In 1944, Helen Young and Carl B. Nelson were married. They had one daughter, Victoria. Carl's professional interest is music education. After he joined the music faculty at S.U.N.Y. Cortland, Helen explored possibilities in upstate New York where there might be career opportunities for her in home economics teacher education and program evaluation.

In January 1958, Helen Nelson accepted a faculty position in the Department of Home Economics Education (HE Ed.) at Cornell. This was a period when funding for higher education was expanding both from the federal government and from a number of large foundations. The Home Economics Education Department was successful in obtaining a grant from funds allocated by the National Defense Education Act (NDEA) for fellowships intended to "increase the quantity and quality of potential faculty members." NDEA fellows were expected to enter the program as seven-year doctoral candidates, i.e. to have had no formal study beyond the Bachelor's degree. This stipulation was expected to decrease the time required for formal education and thus increase the quantity of potential faculty members, but it challenged the universities involved to find ways to increase the quality of their graduates. This was one of the first grants made under the NDEA program. Helen assumed major responsibilities for implementing the HE Ed. program supported by the grant, and continued to play an important part in it for its duration. Students, who completed the program, including some who did not qualify for fellowships because of the seven-year criterion, became teacher educators in home economics units in a number of land-grant colleges

and universities, including Cornell. Some also became college administrators. Helen became a mentor for young faculty members.

Helen also taught for several years in a teacher education program developed by a consortium of faculty members in four upstate New York universities and funded by the Ford Foundation. She carried major responsibility for home economics education on the Cornell staff for this project. The first publication of that program, and one of the most widely distributed, was the Master's thesis of one of Helen's students. Largely at Helen's insistence, the Cornell faculty allocated resources for evaluating this program, although the Foundation grant had not provided for, nor required, evaluation.

Throughout her 25 years at Cornell, Professor Nelson was an important part of the instructional staff of the college. She taught a basic course in program evaluation at the graduate level, as well as undergraduate courses in this and related topics. She offered short courses and directed summer workshops for teachers.

Professor Nelson's influence on the development of the HE Ed. graduate program was particularly strong. She placed high value on providing opportunities for students to work alongside of faculty in meaningful and stimulating research. She saw such training as an effective and efficient way to help today's students gain research competencies needed by tomorrow's leaders—those who will be responsible for the development of an increasingly research-based profession. Helen served as chairperson for a large number of graduate students, probably more than did any other faculty member in the field of Human Service Studies at the time.

The evaluation of innovative educational programs was Helen's primary interest. She expected students to immerse themselves in real-world evaluation efforts. Working with interested students, she moved from evaluating programs designed by others toward active involvement in designing programs to be field-tested; she expanded the scope of her interest from secondary school and teacher education programs to other human service efforts. Throughout her work, emphasis was placed on clear-cut definition of objectives; assessment of change in understandings, attitudes, skills, and/or overt behaviors during the period of instruction; and follow-up after instructions had ceased. She was more deliberate in her approach than were many workers in the field.

Because she was interested in teaching strategies and tools of instruction as well as evaluation, most of her studies produced materials representative of then-current developments (e.g., programmed instruction geared to a variety of educational objectives other than merely information-giving, educational games, single-concept films, complete curriculum packages).

Helen kept abreast of the rapid changes in emphasis that characterized the school and non-school educational efforts of the late sixties and the seventies. She and her students evaluated secondary school programs in family relationships, programs designed to prepare high school students for wage earning and the dual role of homemaker and wage earner, and programs in consumer and homemaking education for low-income adults. She was awarded grants for those studies from the U.S. Office of Education and the New York State Education Department. Working with Cooperative Extension personnel and with funding from the United States Department of Agriculture (USDA), she provided leadership in evaluation of the effectiveness of paraprofessionals in the Expanded Food and Nutrition Education Program. Also, with USDA support, she evaluated interagency cooperation in the provision of services in isolated rural areas. She evaluated tenant education programs with funding from the New York City Housing and Development Administration, the New York State Urban Development Corporation, the Rockefeller Brothers Fund, and the Ford Foundation. She emphasized measurement of program outcomes in terms of understanding, skills, attitudes, and overt behaviors of the learners. When the “learners” were paraprofessionals or other trainees, the evaluation focused not only on the trainees but also, at appropriate times, on the next generation of learners—the persons taught by the paraprofessionals. Selecting or developing measurement tools was a necessary part of each evaluation project. Helen and her students were generous in sharing their tools with others.

She participated in research projects that involved cooperative work among researchers in the U.S. Office of Education and several universities. Professor Nelson emerged as the leader. Most of her work in the sixties was supported from federal funds for vocational education research, coming to the university either directly from the U.S. Office of Education or indirectly through the Bureau of Occupational Research of the State Education Department.

The quality of Professor Nelson’s contributions to research in vocational education was recognized in many quarters. She prepared the home economics section for the 1969 and the 1983 editions of the *Encyclopedia of Educational Research*. She wrote the second edition of *Review and Synthesis of Research on Human Economics Education*—one of a series of manuscripts commissioned by the ERIC Clearinghouse in Vocational and Technical Education at Ohio State University. She served on the editorial board of the *Home Economics Research Journal* and chaired the editorial board of the *Journal of Vocational Education Research*. She and her students regularly reported their research at meetings of the American Vocational Association and the American Educational Research Association. She served as consultant to such diverse groups as state departments of education, Job Corps, the New York City Board of Examiners, and Science Research Associates.

On two occasions, Helen was given special “recognition of outstanding leadership and distinguished service” to the Home Economics Division of the American Vocational Association and to the development of the Home Economics Education Program in the nation.

The Nelsons managed to find time and energy for a good life outside of their professions. They bought and remodeled a house in Cortland, with plenty of space for family needs and interests and for entertaining. The house sits on a hillside, part of which they converted into a lovely Japanese garden by adding tons of stone and a few well-chosen plantings. They were active members of the Cortland community and, to a lesser extent, of the Ithaca community, as well.

Their daughter Victoria graduated from the College of Human Ecology. She married Ralph Nuzzo and had two children, Matthew and Emily Nuzzo, of Champaign, Illinois.

Mary Margaret Carmichael, Sara Blackwell

Walter Ludwig Nelson

May 27, 1911 — November 22, 1985

Walter L. Nelson loved Cornell, and his life was interleaved with the university, both personally and professionally. Until a few weeks before his death, he was still active on behalf of Cornell. Walt first came to Cornell as a graduate student in 1938. He had received both the B.S. and M.S. degrees in chemistry from the Philadelphia College of Pharmacy and worked for four years as a chemist at the Norwich Pharmaceutical Company. He received the Ph.D. degree in nutritional biochemistry in 1941. After a two-year stint as head of the by-products utilization division of Schenley Distillery, Walt returned to Cornell to stay. Within ten years Walt was promoted from research associate to professor.

Although Walt's research interests were diverse, the central theme of his research was the metabolism of fats in mammals. He maintained a large guinea pig colony in the basement of Wing Hall. Walt was also willing and happy to show off the colony to children of faculty members and staff. A shrewd manager, Walt actually made a profit from the colony, which he used to help support his research. He became interested in lactation and studied oxidative metabolism in guinea pig mammary tissue. In addition to making a number of significant observations on the basic biochemistry of mammary tissue, Walt used a machine, developed by B. L. Herrington, in dairy science, for the efficient milking of guinea pigs. Walt was active in the laboratory until his retirement on July 1, 1974, when he was appointed professor emeritus. Toward the end of his research career Walt became interested in mitochondrial function in hibernating bats. The bats were kept in a cold room adjacent to his laboratory, and Walt would happily show them to anyone. Somehow, the guinea pigs were more popular.

Walt was technically superb in the laboratory and inventive as well. He designed a number of useful laboratory gadgets. He also developed methods still in use today. Few could match either Walt's precision or his enthusiasm for experimental biochemistry. No one could interest students in laboratory work better than Walt. His enthusiasm for the subject was infectious, and his open, friendly manner encouraging. He demanded, and usually got, excellent performances from students in the laboratory.

In addition to his teaching, research, and advising of students, Walt served the university in several capacities. He was the secretary of the Graduate School of Nutrition, a member of many committees, the field representative of the Graduate Field of Biochemistry for seven years, and the president of the Statler Club in 1961. Walt understood the university's administrative structure and could get things done with relative ease. He was among the persons

responsible for the awarding of a graduate student training grant in biochemistry by the National Institutes of Health. The grant has been renewed several times and is still in effect today.

Walt was always prepared to help. His warm, open manner, great story-telling abilities, and knowledge of Ithaca, the university, and biochemistry made Walt an ideal adviser. Not only was his advice excellent, but one always felt better after talking with Walt about a problem. Many of the faculty members who joined the Section of Biochemistry and Molecular Biology came to rely on Walt's knowledge. His fondness for the university raised their spirits.

A walk down Tower Road with Walt could take a long time, even though Walt did not walk slowly. Walt seemed to know nearly every person who crossed his path, and they would stop and chat for at least a few moments. He extended his friendship to everyone. An excellent golfer and bowler, Walt was very active in the university leagues even after his retirement.

In spite of the time Walt devoted to biochemistry, the university, and sports, Walt was an excellent husband and father and always managed to find time for his family. Rae and Walt raised three children, Peter, Albert, and Linnea. Walt was proud of each of them, and they were a very close family.

Walt was a colleague and friend of Professor James B. Sumner, the Cornell biochemist who won the Nobel Prize in chemistry in 1946. After Professor Sumner's death, Walt assumed responsibility for Sumner's laboratory, then in Savage Hall. He took on the task of sorting through Professor Sumner's papers, a project that took up much of his time after his retirement. Walt thought that Cornell had not done what it should to honor Professor Sumner's memory, and was instrumental in the establishment of the James B. Sumner Lectureship. He raised a substantial endowment for the lectureship and helped to interest the class of 1942 in it. The Class of 1942 James B. Sumner Lecture, held on April 21, 1986, was dedicated to Walt.

Walt served Cornell up to the time that heart disease necessitated surgery. He died of complications from the surgery, leaving behind a legion of friends and admirers. He has been, and will continue to be, missed by all of them.

Harold H. Williams, David B. Wilson, Richard E. McCarty

Curtis Putnam Nettels

August 25, 1898 — October 19, 1981

Curtis Putnam Nettels, trained at the University of Kansas and the University of Wisconsin, had an active teaching career at the University of Wisconsin and Cornell from 1924 to 1966. From the outset he centered his research and writing in the colonial and early national period and quickly became one of the best and most effective teachers, writers, and critics on seventeenth- and eighteenth-century America. His move to Cornell pushed its Department of History into the front rank of colonial history.

Nettels was born in Topeka, Kansas, from old New England stock, as all three of his names suggest. His father was a court stenographer, local politician, and lover of music, as his son became. With the University of Kansas only twenty miles away, it was natural for him to go there for his undergraduate education and equally natural that he should do his graduate work at Wisconsin, which had a very strong American history section.

Under the influence of Frank Hodder at Kansas, who had begun his teaching at Cornell University in 1885, and Frederic L. Paxson, the ‘frontier’ historian who succeeded Frederick Jackson Turner when he left Wisconsin for Harvard in 1910, and in an atmosphere permeated by the progressivism of Richard Ely, John R. Commons, and Selig Perlman in economics; John M. Gaus in government; E. A. Ross in sociology; and, most of all, the LaFollette family, Nettels emerged as a progressive historian, concerned about the problems modern industrialism had created, the ravages that uncontrolled capitalism had done to soil, forests, and water of the West.

Nettels’s early teaching was heavily influenced by the detailed multi-volume works of Charles McLean Andrews and Herbert Levi Osgood, enlivened by Charles Beard’s stress on economic factors and by Frederick Jackson Turner’s emphasis on the frontier in American society and government. One of his earlier articles was on Frederick Jackson Turner and the New Deal. “Historians,” he said, “like Turner, place the present in its appropriate setting. They make clear to laymen how the elements of modern society took form.”

Nettels’s first research project was a history of colonial money, a topic on which little work had then been done. American archives and libraries could provide some information, but the detailed correspondence between British colonial officials and their superiors in London was essential for a thorough understanding of the subject. Fortunately, a Guggenheim Fellowship enabled Nettels and his wife, Elsie Patterson Nettels, to spend a year in England working in the Public Record Office collections of countless letters, reports, and miscellaneous documents

bearing on trade relations, appointments, directions, regulations, and protests against them. Out of this work came *The Money Supply of the American Colonies*, a study that no scholar could afford to neglect.

Nettels's synthesis of colonial history appeared in 1938 as *The Roots of American Civilization: A History of American Colonial Life*, which was widely used as a text in courses on the colonial period. It stressed the economic growth of the colonies, their institutional adaptations, their trade and political relations with England, the causes of their friction with the mother country, and the colonists' insistence on the preservation of their legal and natural rights as Englishmen that finally brought about the Revolution. Here Nettels showed himself a strong defender of the American position and a critic of those in the profession who accepted any approximation of the Tory interpretation. That he was a devoted nationalist is reflected in everything he wrote.

As one of five editors, Nettels had a share in the planning, editing, and writing of the ten-volume *Economic History of the United States*. His volume two, *The Emergence of a National Economy*, like his *Roots*, was admirably organized and thorough and reflected well his deep faith in this country and its democratic processes. At the same time, the economic side of history is here made clear and attractive. Nettels was proud of his major works and pleased to see them remain in print throughout his life. He also served as chairman of the program committee of the American Historical Association and served as a member of the editorial boards of the *American Historical Review* and the *Mississippi Valley Historical Review*.

With the coming of World War II, Nettels began to take an active part in the burgeoning public debate over American aid to the Allies, which he vigorously supported. This led on one occasion to his being asked by the president of the University of Wisconsin during World War II to defend the American position against Oswald Villard in a public confrontation.

At Cornell he concentrated his energies more on writing and gave less time to professional societies or national politics. As a citizen-historian he felt he must devote his energy and abilities to correcting popular misapprehensions about the country's history. He was convinced, for example, that most writers on George Washington had failed to grasp the leadership he had shown in the years from 1765 to 1776. His *George Washington and American Independence* forced all later writers to give careful attention to the role of Washington in these early years, even if it prompted some to charge that he was trying to make Washington more important than he actually was. Another attitude that perturbed him was the tendency of conservatives to return to Calhoun for constitutional arguments against New Deal policies. Not only did they revive Calhoun, they attempted to glorify—Nettels felt, to exaggerate—the political argument for states' rights and to minimize the role of Lincoln and Grant. This brought

Nettels to his fundamental question: Which existed first, the Union or the states? If it were the states, then the case for their sovereignty and that of the conservative against the growth of federal power would be greatly strengthened.

These questions deeply moved Nettels. Both before and after retirement he spent much effort to publicize his views in letters to daily newspapers (more than a score were in the *New York Times*), to historical journals, and to weekly and monthly periodicals, arguing brilliantly from his deep understanding of American constitutional history. In all of his writing he had an extraordinary facility for drawing on his wide reading to support his views so that even those readers who did not agree with him found his conclusions ingenious, strikingly relevant, and not easily discounted. Nettels was a member of Phi Beta Kappa, the Massachusetts Historical Society, and the Colonial Society of Massachusetts. He replaced Samuel Eliot Morison for a year at Harvard and taught for short periods at Columbia University and Johns Hopkins University. He took much satisfaction in the work of his students.

Curtis Nettels is survived by his wife, Elsie Patterson Nettels, who aided him materially in his early research, and a daughter, Elsa Nettels, who teaches American literature at William and Mary College.

Knight Biggerstaff, Edward W. Fox, Paul W. Gates

Maurice F. Neufeld

October 27, 1910 — April 10, 2003

Maurice F. Neufeld was a respected scholar, beloved teacher, and one of the two founding faculty members of the School of Industrial and Labor Relations at Cornell University.

Maurice (he pronounced his name Morris) was born to immigrant parents in the District of Columbia on October 27, 1910. He was educated at the Webster School and Central High School in the District and subsequently enrolled at George Washington University and, a year later, in Alexander Meiklejohn's experimental college at the University of Wisconsin. He earned the B.A. and M.A. degrees in American History there by 1932 and was always grateful to the experimental college and Wisconsin for this defining experience in his intellectual life. The University of Wisconsin awarded Maurice the Ph.D. degree in 1935. While an undergraduate, he was elected to Phi Beta Kappa.

Jean McKelvey and Maurice were appointed the first faculty members of Cornell's newly created ILR School in 1945 by its founding dean, Irving Ives. Mr. Ives left the university shortly thereafter for the United States Senate. Maurice served as secretary, then chair, of the committee that governed the school between Ives's resignation and the appointment of Martin P. Catherwood as Dean of the School in 1947. One of Maurice's most valuable contributions to the school was during this formative period in its history. By virtue of his dignity and erudition, as well as his considerable political skills, Maurice greatly facilitated the acceptance of the initially controversial multidisciplinary ILR School into the larger university community.

Maurice continued to serve a succession of deans and the university in a variety of administrative capacities until his election as Professor Emeritus in 1976. Nonetheless, his greatest legacy was as a scholar and, particularly, as teacher and mentor to four generations of Cornell students.

A gifted and inspiring professor, Maurice was urbane and dapper, demanding and thought provoking. He was possessed of a prodigious memory and a flair for the dramatic.

Maurice was devoted to his students and they to him. Invariably, when reminiscing about his classes, those who studied with him would recall Maurice's intellectual rigor and vast range of knowledge, his insistence on critical and analytical thinking in his students and on a clear and unaffected prose style in their written assignments. These were lessons, many of them would say, that would inform their lives. But they would also remember, as well, his sense of humor and his personal kindness.

For Maurice, teaching did not end at the classroom door. Countless ILR students in search of academic advice, or merely in need of a kind word, would turn instinctively to Maurice Neufeld, who was, until 1992, ably aided in a life of good works by an equally remarkable and dedicated partner, Hinda Cohen Neufeld. Hinda and Maurice's commitment to "their" students often led to a lifelong mutual regard and frequent exchange of letters and visits.

Replying to one such letter in March 1978, Maurice commented:

"You knew more teachers than you thought when you knew me as a teacher. They stretch back through the centuries through me to you...the writers of the Bible; Plato and the Greek dramatists; Virgil and Catullus and Tacitus; Dante, Petrarch, Machiavelli, and Wolfram von Eschenbach; the nineteenth and twentieth century novelists and playwrights...and the great poets...You knew them unawares."

He went on to recount all of the teachers who had inspired him and why, from Miss Farnsworth and her colleagues at Webster School (whom he individually named and described in detail) through Alexander Meiklejohn and George Clark Sellery at Wisconsin. "Keep in touch," he concluded, "I expect you to carry that torch, which in the ancient games, was passed on from runner to runner."

Maurice did not limit his generosity to students. Throughout his career he was a mentor for his younger colleagues and a succession of deans as well, and his services to the larger university community were legion. Maurice's scholarship is enshrined in thirty-five articles, monographs, and books on a variety of subjects, not the least of which is a translation into English poetry of Sophocles' *Antigone*, first published by the University of Wisconsin during his sophomore year at college and which was available in print for decades thereafter.

Prior to coming to Cornell, Maurice enjoyed a distinguished career as a labor official, state official, and officer in the United States Army.

Between the years 1935-39, Maurice was employed as an organizer for the Amalgamated Clothing Workers in Philadelphia and, subsequently, was the education director of a large local of the International Ladies' Garment Workers' Union in Trenton, New Jersey. He then took a position as Secretary and Chief Assistant in Research and Economics for the New Jersey State Planning Board. In September of 1939, Maurice was appointed the Director of the New York Division of State Planning, and, in May of 1941, was appointed as the state's Deputy Commissioner of Commerce.

Early in World War II, Maurice was appointed Director of the New York State Bureau of Rationing, and Chairman, Planning Committee, Federal Advisory Council of Defense, Health, and Welfare Services. Having entered the

United States Army in 1942, Maurice spent most of his military career in Italy. During the last two years of the war, he was executive officer (Captain), Regional Headquarters, Allied Military Government for the Sicily, Naples, Rome, and Milan Region.

In addition to his professorial duties while at Cornell, Maurice also found time to serve as a scholarly editor, as labor relations consultant for the Xerox Corporation for 31 years, and on arbitration and mediation panels for three states and the federal government.

Maurice's papers relating to his government career are at the Library of Congress. The balance of his records are housed at the Kheel Center for Labor-Management Documentation and Archives in the school's Catherwood Library.

Michael Gold, James Gross, Richard Strassberg

Ellen Foot Neuman

February 23, 1913 — May 11, 1945

The death of Dr. Ellen Foot on May 11, 1945 brought to a close a career of great promise and a happy and productive life. She was born in Chestnut Hill, Massachusetts, February 23, 1913, the daughter of Nathan Chandler Foot and Emma May Foot and from both sides inherited the tradition of academic medicine in which she herself entered and was coming to play an important part. Receiving her elementary and secondary education in private schools in Milton, Mass. and in Cincinnati, she attended Smith College, graduating in 1934, A. B.-*magna cum laude*. She entered Cornell Medical College the same year and made an outstanding record, graduating second in her class with election to Alpha Omega Alpha and receiving a John Metcalf Polk prize for general efficiency and a Gustav Seligmann prize for efficiency in Obstetrics. After an internship in Medicine in the New York Hospital she went into anesthesia and took a position as interne in this department in the Massachusetts General Hospital. From 1941 to 1944 she was Resident in anesthesia in the Presbyterian Hospital in New York City and in the latter year became Anesthetist-in-chief in the New York Hospital and Assistant Professor of Surgery-Anesthesia in Cornell University Medical College. It was particularly gratifying to those concerned that Dr. Ellen Foot could be obtained to develop a full time sub-department of anesthesia and she brought to this task not only a splendid background of training and experience but a quiet enthusiasm and energy which produced striking results despite the handicaps imposed by a war time shortage of personnel. She at once increased and greatly broadened the teaching of anesthesia to medical students and both by consultation and practical demonstration gave to the members of the resident staff a wider understanding of the choice of anesthetic agents and of the effects which these might be expected to produce. She was very popular as a teacher and the suspension of her regular exercises due to illness brought many inquiries as to when they would be resumed. The plans which she drew up for the future development of the department showed a keen grasp of the field and projected a program of investigations which could only have been very fruitful. Dr. Foot was a member of the American Society of Anesthetists and of the N. Y. County Medical Society, and with Dr. Virginia Apgar was co-author of the section of anesthesiology in Nelson's Loose Leaf System of Medicine. She was a diplomate of the American Board of Anesthesiology and of the National Board of Medical Examiners and in the latter examination stood first in the country in Pharmacology.

On July 15, 1940 she was married to Dr. Charles G. Neumann and among their common interests was the development of ideas for lines of investigation in problems of concern both to surgery and the field of anesthesia. A son was born about two weeks before her death.

Dr. Foot had a mind which showed great capabilities and a wide variety of interests. Throughout her scholastic years from secondary school on she was the recipient of honors for scholarship, and with these she combined an interest in sports, language, music and the student activities, being chosen president of her house in college and a member of the Student Council. Her intellectual curiosity and interest in research were stimulated no doubt by her work with her father in his laboratory during the summer of 1931 which produced a paper entitled "A Technic of silver impregnation for general laboratory purposes" published in the American Journal of Pathology, vol. 8, p. 245-1932. This describes the staining method which bears both their names. Having acquired her medical training and experience in anesthesia she came to her new department with an enthusiastic outlook and interests which, while including the technics of the various anesthetic methods, looked beyond these in the direction of improvements in anesthesia as an aid to surgery and of studies of the basic physiology of the anesthetized patient. It is to be hoped that the influence of her tragically brief tenure may be felt for some time to come.

Dr. Foot's personality was characterized by quiet, genuine pleasantness and by thoughtfulness for others. Even under stress she appeared unruffled and in command of the situation, and this was due, it seems, to a basic philosophical outlook which never failed her. One cannot forbear to comment on the way in which during the closing days of her life when, facing with quiet courage the end which she fully recognized, she bent her efforts to relieve those near her and to put at ease those who inquired anxiously about her. The breadth of the feeling which swept the institution at her loss is a tribute to the effects of her brief career here.

Charles Merrick Nevin

September 12, 1892 — March 24, 1975

Charles Merrick Nevin, professor emeritus of geology, died in Ithaca on March 24, 1975. He was born in Helton, Pennsylvania, on September 12, 1892, the son of William Scott and Lida Merrick Nevin. As a boy he became interested in geology, and when the time came to enter college, he knew what he wanted to do, settling on Pennsylvania State College, where there were several geologists under whom he wished to study. He received the B.A. degree in 1916 and then came to Cornell for graduate work in the Department of Geology under the late Heinrich Ries. He was awarded the M.S. in 1922 and the Ph.D. in 1925. Dr. Nevin began a long and productive teaching career while still a graduate student. In 1936 he was appointed to the rank of professor, and from 1939 to 1944 he served as chairman of the department. After retirement in 1952 he served a term as visiting professor at Kansas State University.

Professor Nevin was well known as a rigorous but sympathetic teacher, specializing in advanced courses in structural geology and sedimentation. For many years he conducted a very popular course in geology for students from the state colleges at Cornell, giving them the fundamentals of the earth sciences. He organized and taught field courses for geology majors and graduate students at the department's Henry Shaler Williams Field Geology Camp at Spruce Creek, Pennsylvania, and thus contributed significantly to one of the most important parts of the geologist's training. Many of his graduate students have gone on to distinguished careers in the academic and professional worlds.

His research was mainly in the field of economic geology, in which he published papers on the origin of petroleum, sedimentary processes, the sand, gravel, and molding-sand deposits of New York, and structural geology. His highly successful textbook, *The Principles of Structural Geology*, was published in 1931 and issued in new editions in 1936, 1942, and 1949. From the time he came to Cornell he was a consultant on many problems of economic geology. He was a member of the Geological Society of America, American Association of Petroleum Geologists, Society of Economic Geologists, Sigma Xi, and Phi Kappa Phi.

Professor Nevin is survived by his wife, Ruth Naomi (Coats), whom he married in 1924, and by two sons, Scott, of Albion, Indiana, and Brian, of Ithaca.

John W. Wells

Therese Wood Nevin

June 16, 1899 — May 29, 1995

Therese Wood Nevin was born in Boston, Massachusetts on June 16, 1899. Her parents were Samuel and Elizabeth Wood. Her Canadian-born father and German-born mother, both American citizens, were associated with the Salvation Army; her father was a member of the Executive branch. She grew up with a closely knit family guided by parents whose professional careers focused on problems of human welfare.

Therese attended Russell Sage College for two years and completed her Bachelor's degree at Western Reserve University in 1923. She received her Master's degree from Columbia University in 1939.

Following graduation she worked as a hospital dietitian and later as a high school teacher. She began her career in Cooperative Extension as a Food and Nutrition specialist at the University of Maine in 1928, and she came to Cornell University in 1935 as an Instructor in the Foods and Nutrition Department to work with the 4-H Program in Cooperative Extension. In 1942, she transferred to the Adult Extension Program in Foods and Nutrition.

From the outset she was interested and thoroughly dedicated to the aims and ideals of Cooperative Extension. Specifically, she was interested in good nutrition for the entire family.

Therese, in her professional contacts with New York State families, had the special ability to empathize with their problems, which were compounded by the Great Depression as well as World War II. She recognized the need to help homemakers create well-balanced meals while curtailed by limited income. She also understood and practiced successful money management and was committed to working through problems with a pragmatic approach. Her goal was to find tasteful combinations of foods that would appeal to diverse New York families who had different cultural food preferences, nutritional needs, and limited resources.

An excellent teacher, Therese insisted on teaching the "why's" as well as the "how to's" to Extension leaders. She took advantage of training schools to include the nutritional values of the foods being prepared, to present the best way to retain the optimum amount of nutrients, and to teach the safe handling of food. Her high standards of food preparation set an excellent example for the homemakers with whom she worked.

Her years in Maine gave her a special interest and knowledge of fish cookery which she introduced to the rural homemakers in New York State through a series of lessons.

Therese was an expert in food preservation, an important and necessary skill for homemakers during the Depression and war years. She wrote several bulletins concerning the preservation of fish, meat, poultry, fruit, and vegetables. She directed the making of a color-sound movie on the canning of fruits and vegetables and gave many demonstrations and training schools for leaders throughout the states. Freezing foods was just developing during this period, and Therese included this new method after much experimenting and testing to discover the problems homemakers might encounter. She often conferred with professors in Animal Science, Poultry Science, and other professors in Food and Nutrition to enable her to present the latest research to her audiences.

On sabbatical leave in England in 1950, she worked for the *Farmers Weekly*, demonstrating the canning of meat and poultry to various groups including Women Institutes (similar to county extension groups in the U.S.). She also attended the triennial meeting at the Associated Country Women of the World. The goals of the ACWW were to cultivate international understanding and friendship; to create appreciation of the talents and achievements of the people in all countries; and to study their varied contributions to the culture, beauty, and wealth of one world.

Throughout her professional life and following retirement, she enjoyed travel, going to Brazil, Europe, India, and the Holy Land. She was a splendid ambassador for the college and university.

Therese retired from Cornell in 1964 as Professor Emerita and joined her sister in Ocean Grove, New Jersey, where she was active in the American Association of University Women (AAUW), the local Bible study groups, and the Historical Society.

In 1980 she married Dr. F. Reese Nevin, a long-time friend, and moved to Plattsburg, New York, where her husband was professor at the state college. To a happy late marriage, she shared her intellectual interests in reading, gardening, and traveling. Their joint interest in young people was expressed in various ways. She established a scholarship for students in the biological sciences at SUNY at Plattsburg in honor of her husband.

Therese Wood Nevin died at age 95 on May 29, 1995. Survivors include her husband, a stepson, her sister Laura, and several nieces and nephews. She will be remembered with admiration by her former colleagues and friends.

Mildred Dunn, Nell Mondy, Hazel Reed

Allan G. Newhall

July 20, 1894 — January 31, 1995

Allan G. Newhall was one of those comparatively few individuals who was blessed with over one hundred years of active and fruitful life. He was born on July 20, 1894, in Germantown, Pennsylvania, and died on January 31, 1995, in Ithaca, New York. Allan moved with his family at an early age to Minneapolis, Minnesota. He was educated there in primary and secondary schools, and went on to the University of Minnesota to complete a B.S. degree in 1918.

As so often happens in a young person's formative years, two outstanding scientists, both prominent in the agricultural field of Plant Pathology, had an impact upon the ultimate direction in which Allan's vocation would take him. The first was Professor E.C. Stakman, a world renowned Plant Pathologist at the University of Minnesota; the other was H.H. Whetzel, Chairman of the first Department of Plant Pathology in the United States. Professor Whetzel was looking for a prospective graduate student to fill a newly formed field fellowship position with vegetable diseases in upstate New York. Stakman strongly recommended Allan Newhall, then teaching Botany at Grinnell College in Iowa. That was the beginning of his association with Cornell University; Allan subsequently received a Ph.D. degree in Plant Pathology in 1925. He was appointed to a professorship at the Ohio State Agricultural Experiment Station in Wooster, Ohio, and in 1929 was asked to return to Cornell to work on muckland vegetable diseases. This began a long and rewarding career in extension and research in New York which did not end until his retirement in 1960.

On his first sabbatical leave in 1936, Professor Newhall spent six months at the University of California, Berkeley, working on storage rots of carrots, identifying causal organisms of disease, and perfecting control recommendations. In 1947, he went to Turrialba, Costa Rica, to conduct studies on cacao diseases for the Pan American Union and American chocolate interests in Central America. When the US/International Cooperative administration financed the Cornell-Los Banos project in the Philippines in 1954, Newhall was asked to teach and direct plant pathology research at Los Banos. He introduced and taught a course on plant diseases and helped to rejuvenate the Philippine government's coffee production through disease control and the introduction of rust-resistant coffee varieties.

In 1957, Professor Newhall was asked to investigate disease problems in banana production in Panama by the United Fruit Company. Later, after retirement, he returned to Costa Rica, and in 1967, he studied the black pod

rot disease of cacao. His experience with cacao diseases brought him international requests for presentation of illustrated papers, from Bahia, Brazil, in 1965, and in Ghana, Africa, in 1969.

Among Professor Newhall's contributions to the control of vegetable diseases were new findings in soil sterilization by means of heat, electricity and soil fumigation by chemicals and hot water or steam. He worked in an era of the use of chemicals in the control of plant diseases, but he emphasized the need for "pasteurization" rather than sterilization of soil in order to kill soil-borne pathogens while saving the beneficial microorganisms. Professor Newhall was the author of over 100 bulletins and technical articles on vegetable diseases, soil treatment, and nematode control.

Professor Newhall was active for many years in the Society of Plant Pathology and was made a Fellow of the American Association for the Advancement of Science. One of the last formal recognitions of his contributions to the Vegetable Industry was an award by the National Onion Growers Association, given to him at a Conference in Ithaca in December 1993. This award symbolized the satisfaction and respect of the growers and industry for a man who really had their interests at heart. A recent letter from a fellow colleague and friend of Allan's, Professor Arthur Rawlins of the Department of Entomology, who spent many hours on the road and in extension meetings with Allan, sums up his attitude: "After a meeting, Al would be talking with a knot of growers, oblivious of the time, lateness of the day, and the long road home. He would apologize for holding us up and say, 'I like to know what problems the growers have and what we can do for them. I learn a lot and I hope they do too.'" Friendliness and an infectious sense of humor, often at the expense of himself, endeared Allan to all whom he met, all over the world.

In retirement, which lasted over 30 years, Newhall's activity was not abated. He continued to travel, filling requests for presentation of scientific papers. He fulfilled personal desires, finding more time to breed for blossom color in the Impatiens plants in his backyard, and joined the American Chestnut Society, planting seedling clones of the American chestnut tree in an effort to find a source of resistance to chestnut blight. Allan was always active in community affairs. He was deacon and member of the First Presbyterian Church. He organized drivers for the local organization FISH which provides food for the less fortunate. At the request of a longtime friend, the Mayor of Ithaca signed a plaque proclaiming July 20, 1994, as Allan Newhall Day and it was presented to him at his 100th birthday.

Allan G. Newhall is survived by a daughter, Dr. Mary Alice Mathews from his first marriage to Hazel Newhall, who died in 1970. He had a granddaughter, Betsy Mathews and two great grandsons, David and Erick, all of

Newton Center, Massachusetts. In April 1975, Allan married Ruth Bartsch. Ruth has a daughter, Martha Jane Stage, married to Dr. Everett Stage. Through this union, Allan acquired a granddaughter, Nancy, and two great grandchildren, Katie and Mac; and a grandson, Robert, and three great grandsons, Patrick, Tracy, and Matthew.

H. David Thurston, Thomas A. Zitter, Carl W. Boothroyd

Herbert Frank Newhall

June 13, 1916 — November 6, 1988

Herbert F. Newhall, professor of physics, died November 6, 1988 in Robert Packer Hospital, Sayre, Pennsylvania, after a discouraging ten-month battle to recover from a heart attack and stroke.

Born in Santa Fe, New Mexico, Newhall spent his early years in Colorado. Following graduation from Colorado College in 1937, he came to Cornell as a graduate student in physics. For the next 44 years, until his retirement and assumption of emeritus professor status on July 1, 1981, he was engaged in research and teaching in physics at Cornell. Following completion of the Ph.D. degree in 1942, he served as instructor in physics during World War II, then worked at Cornell during 1945-46 on a research project in physical electronics sponsored by the Stromberg-Carlson Company. In 1946, he returned to his duties as assistant professor of physics. For several years he also held a joint appointment in the School of Engineering Physics.

Newhall carried out a research program in the area which was then called “Physical Electronics” for several years following World War II. He supervised half a dozen M.S. and Ph.D. thesis students in the period from 1946 to 1952. Not long ago, Newhall commented, in characteristic understatement, that his work had “not noticeably set back progress in the area.”

He was instrumental in the planning and construction of the Technical Operations Laboratory in Rockefeller Hall, the base upon which the current extensive facility of the Materials Science Center in Clark Hall was built.

But the primary focus for his faculty career at Cornell was in the pursuit of excellence in his own teaching and in helping young physicists at Cornell become better teachers. The constant quality of his effort and the unflagging energy of his search for better ways to achieve the goal of effective instruction in physics was remarkable. That persistence is perhaps best exemplified in his development of computer-assisted instruction materials in the years following his retirement. Here was a retired, emeritus professor leading the physics faculty into the use of computers to enhance the effectiveness of instruction!

Several milestones along the way are notable. In 1957, the late Professor J.E. Hedrick of the School of Chemical and Metallurgical Engineering wrote to Newhall, “... Somewhat to the surprise [of freshmen in the School] physics has proved to be their most interesting course. They agree that it’s tough but expected this at Cornell. . . . Of course, several are having trouble, but it is significant that even including these, there is unanimous agreement that your teaching is excellent. Now this is a rare situation. Students don’t usually go around praising anything, least of

all professors” The dedicated teacher doesn’t need much more than this. In years following, several notable contributions serve as further milestones along Newhall’s path of excellence. He wrote and used his own textbook, *Introductory Analytical Physics*, in his teaching of freshmen engineers. In 1972 he launched a new teaching format for Cornell’s one-year, calculus-based physics course. This “core-and-branch” plan, described by Newhall in an article published in the *American Journal of Physics* in 1978, was used successfully for several years by Newhall and other instructors. His interest in electronics and computers next led to a stint in teaching a junior-level electronics course. Newhall then turned to his final accomplishment—launching the computer-assisted instruction program noted previously.

Many graduate student teaching assistants and junior faculty members assigned to teaching with Newhall soon found that he was much more than a first-rate lecturer. By example, through obviously thorough preparation for lecture recitation section or staff meeting, lucid explanations of physics content, clear and equitable policies in dealing with students, and consistent good nature and civility with everyone he encountered, he became a mentor to his own staff—an educator of teachers. He thus had great influence on the professional development of literally hundreds of young physicists, whether or not their future work centered on teaching.

Newhall led a quiet personal life. Unmarried, his social life centered around interaction with close friends on the faculty. In the early 1960s, Newhall acted as convener of an informal faculty luncheon group which met daily at 11:30 a.m. in the Rathskeller of the Statler Club. Members of the group, who on any given day between three and ten, operated under a set of unwritten rules: there was to be no talk of either politics or the academic shop. In the daily repartee, Newhall’s succinct comments, leavened by a dry wit, are remembered by the group as a particular delight. All returned to their several academic responsibilities with a light heart.

Newhall’s deep interest in classical music led him to study the physical capabilities of several woodwinds, horns, strings, and percussion instruments. His interest in music and his quiet humor came together in a collection of recordings of various musical spoofs. His musical knowledge was accompanied by an unusually complete knowledge of the classical literature.

Newhall is survived by a sister-in-law, Marianne M. Newhall of Pinellas Park, Florida; two nephews, Steven W. Newhall of Pinellas Park and Michael M. Newhall of Milwaukee, Wisconsin; and a niece, Mrs. Paul (Nancy Ann) Hannon of Boulder, Colorado.

Dale Corson, Robert Cotts, Alvin Sellers, Donald Holcomb

Katherine J. Newman

July 7, 1923 — October 9, 2004

Katherine Newman was born July 7, 1923 in Manhattan, Kansas, the daughter of Porter and Nellie Newman. She had three brothers, whom she frequently challenged as she was growing up with her curiosity and questions about natural phenomena, such as why strawberries are red and beans green in the same garden area. She graduated from high school in 1940 and enrolled at Kansas State College in Home Economics, though her primary interest was in the biological sciences. By combining summer school and extra classes at the university, she graduated with a Bachelor of Science degree. Working at part-time jobs to help pay her way through the university gave her valuable experience in a variety of disciplines. From 1943–46 she was a full time Research Assistant under Dr. Stearns in the Department of Pediatrics at the University of Iowa, and obtained an M.S. degree in Biochemistry in 1946. Following this, she was an Instructor in the Department of Home Economics at Iowa University where she taught elementary nutrition. In 1947, she joined the staff of the research laboratory of the Children's Fund of Michigan, where she participated in studies on maternal and child health and nutritional status with Dr. Icie Macy Hoobler.

In 1949, she joined the faculty of the Department of Food and Nutrition at Cornell as an Instructor, using summers to continue further graduate study. She completed her doctorate in 1956 at the University of Iowa, was appointed Assistant Professor at Cornell that year, and in 1960, was promoted to Associate Professor. With her expertise and unique training in nutrition, in growth and development of children, and in the biochemical aspects of nutrition, she added a valuable resource to the program. She taught courses in Maternal and Child Nutrition, in Nutrition of Growth, and assisted in teaching the advanced course in nutrition and the graduate seminar. Personnel having advanced training in nutrition with specialization in the area of child and maternal nutrition were very limited in number. Part of her responsibilities related to nutritional aspects of the noon lunch for children in the College Nursery Program, in which capacity she supervised the work of a graduate student who planned the meals. She was also available for consultation concerning feeding the baby in the homemaking apartments, though this decreased markedly with program changes. She served on a wide range of college and department committees, including interdisciplinary programs, student-faculty committees, Interdisciplinary Research Group on Poverty, and the High School Natural Science Program. She was also a member of the steering committee for the Ghana program.

Professor Newman was exceptionally well informed in nutrition in general, and in her area of specialization, the nutrition of growth. She was always ready to help students and had an interesting way of challenging them and stimulating them to investigate related areas. Professor Newman worked with both graduate and undergraduate students. She served as Graduate Field Representative and at times as advisor in the Honors program, an option open for senior undergraduates. In both of these roles, she assisted students in identifying research areas they might pursue. She read widely in related areas in both nutrition and growth, and had the knack of discussing the subject matter in new ways, challenging students on the impact of factors other than food on nutritional status. She had several graduate students at both the Master's and Doctoral levels, and these students were encouraged by the informal discussions of the opportunities for investigation in the interaction of nutrition and related areas. Professor Newman's various contributions for the department's programs were always highly valued by the department.

She had a wide interest in many aspects of nutrition, their relationship to a wide range of problems and the approaches needed to solve them. In 1968, she took a sabbatic leave to gain an understanding of sociological theory and some experience in the analysis of sociological data as these might be utilized to enhance the effectiveness of applied nutrition programs. Since this direction for her interests involved a new discipline, and changes were occurring in the department structure, it is perhaps not surprising that she chose an early retirement in 1973 in order to continue her studies independently.

In addition to her contributions to students and the program at Cornell, Katy will be remembered for her ability to converse on a wide range of subjects, and her genuine interest in and concern for others. She resided in Ithaca until two to three years before her death, when she moved to Omaha to be near family members. She was predeceased by her parents and two brothers and is survived by her brother, Robert; several nieces and nephews; and three sisters-in-law. She is buried in Manhattan, Kansas next to her mother and father.

Henry N. Ricciuti, Mary A. Morrison

Benjamin Nichols

September 20, 1920 — November 24, 2007

Benjamin Nichols was born in Staten Island, New York and died of complications of lymphoma and leukemia at age 87 in Ithaca. He was a member of the faculty of the School of Electrical and Computer Engineering for 42 years and a former Mayor of Ithaca (1989-95).

Ben's association with Cornell began in 1937 when he entered as a freshman in the School of Electrical Engineering (now Electrical and Computer Engineering). In 1941, he enlisted in the U.S. Army soon after Pearl Harbor. After nearly four years of service, he returned to Cornell in 1945 and obtained his B.S.E.E. degree in 1946. He began graduate studies in Electrical Engineering at Cornell the same year and held the rank of Instructor for three years. After receiving the M.S.E.E. degree, he became an Assistant Professor in 1949. During the 1951-52 academic year, he was a Faculty Fellow of the Ford Foundation Fund for the Advancement of Education, an interest that he would resume in later years.

At about the same time, he began research at Cornell in collaboration with Professor Henry Booker on radio-wave studies of the ionosphere. At the time of his promotion to Associate Professor in 1953, he was in charge of the radio and communications division in the School. During a sabbatical leave of absence in 1955-56, he was a Research Associate at the Geophysical Institute of the University of Alaska, where he studied radar echoes from the aurora, and received the Ph.D. degree in Geophysics from that institution in 1957. He was promoted to full Professor at Cornell in 1959. He served as a U.S. delegate to the 11th and 12th International Assemblies of the International Union of Radio Science and also was Cornell's representative at the University Corporation for Atmospheric Research. During this period, he wrote or co-authored several papers and reports on Cornell's ionosphere research program.

In 1963, Ben discontinued radio-wave research because of its military applications and military support, and shifted his interest to science education. In 1964-65, he spent a sabbatical leave with Education Services, Inc. in Watertown, Massachusetts as director of an elementary science study whose goal was to develop textbooks with a new approach to education in mathematics and science at the grade-school level. Upon his return to the campus, Ben entered a four-year period of university-wide activity, first as Acting Director of the Center for Research in Education, followed by a period as Director of the Office of Teacher Preparation, and finally as Director of the Human Affairs Program. He was also a member of the Faculty Council before the creation of the

Faculty Council of Representatives, and he served on several committees of the University Faculty, including chairing the Committees on the Economic Status of the Faculty, on Minority Education (he was deeply involved in the development of the Black-Studies Program) and on Admissions and Financial Aid, and as Director of the Upward Bound Program. During the existence of the first University Senate, he served as chair of its Executive Committee and later as Speaker. He took part in several special commissions, including the original Committee on Special Education Projects (COSEP) and the Commission on Financial Aid. He chaired the Cornell section of the Association of University Professors (AAUP) during the Willard Straight Hall takeover in the spring of 1969 and was instrumental in resolving the crisis.

In the College of Engineering, Professor Nichols served as chair of the Policy Committee and the Common Curriculum Governing Board. In 1980, he was appointed Assistant Dean of the Engineering College Division of Basic Studies and held that position for two years, during which time he was a member of the committee that outlined the core curriculum for the College.

At the School level, Ben concentrated his efforts on undergraduate teaching, particularly on development and improvement of the basic electrical science and electrical engineering courses. He held the position of Assistant Director for Undergraduate Studies and subsequently was a member of many committees in the School that were concerned with curricular changes and school policies. He served as the School's Graduate Field Representative in the academic year 1968-69, and was the Associate Director of the School from 1985 until his retirement in 1988. He was a member of several professional societies.

Along with these administrative duties in the School and his other responsibilities in the College of Engineering, Ben continued to give attention to the classroom, particularly in the required sophomore course, *Introduction to Electrical Systems*. With Professor Michael Kelley, he published in 1989 a text for that course entitled *Introductory Linear Electrical Circuits and Electronics*. Ben was also an active class advisor throughout his career in the School. He retired on July 1, 1988 as Professor Emeritus, almost 51 years after he first entered Cornell as a freshman.

No account of Ben's career would be complete without mention of his political activities, especially after his retirement. From an early age, he was influenced by his parents, who were political refugees from Czarist Russia, dedicated Communists who strongly believed that education was vital to the improvement of society. (Ben's mother ran for the U.S. Congress on the Communist Party ticket and one of her relatives is buried in the Kremlin wall!) So it is not surprising that Ben was committed throughout his life to the promotion of social justice and education, especially science education. In 1968, he ran for Congress on the Democratic ticket against the

Republican incumbent but was defeated. Later he became involved in community affairs, was elected to the Ithaca Common Council in the late 1980s, and also served on the Board of Public Works, the Board of Planning and Development, the Cable Transmission Commission, and the Hydropower Commission.

Following his retirement, Ben launched an active campaign for mayor on the Democratic ticket and this time won the election in November 1989 with a platform that emphasized programs for youth, affordable housing, increased public participation in community affairs, and improved relations between the city and Cornell (including increased financial support from Cornell for the city, in lieu of taxes, to help defray fire protection and other costs). He was reelected in November 1991 and 1993 and served until 1995. (An interesting historical note: many years earlier another professor of electrical engineering also ran for mayor of Ithaca, but lost.) Ben was quite pleased to be known as “Ithaca’s Socialist Mayor” (he was a member of the Democratic Socialists of America).

Even in his 80s, Ben continued to argue publicly and passionately for his personal beliefs and causes. He served on the Ithaca City School Board and participated in a demonstration demanding the resignation of the superintendent of the Ithaca City School District over the application of a New York State Human Rights Law to an Ithaca racial discrimination case. He had the “honor” of receiving a police citation while joining students in fervently protesting the clearing of Redbud Woods to make way for a parking lot for the new west campus dormitories. Less than two months before his death, he spoke at the dedication of a plaque marking the spot near University Avenue where these woods once stood.

Ben and Ethel Baron were married in New York City on September 10, 1942. Ethel died nearly 49 years later in Ithaca on July 20, 1991. Ben married Judith Van Allen in Ithaca on September 20, 1995. Ben is survived by Judith and her daughter, Adrian; by the children of his first marriage, Mary Nichols Daum, and her husband, John, and his son, Jeffrey N. and his wife, Arlene; by his older brother, Joseph Nichols; and by five grandchildren and three great grandchildren.

Professor Nichols was a dedicated educator and a provocative colleague who was passionate in his concern for social justice for both men and women. He worked hard to make the world a better place.

Edward Leamington Nichols

Professor of Physics; Head of the Physics Department

September 14, 1854 — Nov. 10, 1937

Born of American parents in Leamington, England, on September 14, 1854, Edward Leamington Nichols matriculated as a student at Cornell at the opening of the sixth year of instruction at the University. After receiving the B.S. degree from Cornell in 1875, he studied successively at the Universities of Leipzig, Berlin, and Göttingen, from the last of which he received the doctorate in physics in 1879, a degree that was re-awarded to him by that institution fifty years later. Returning to this country he sought advice from his alma mater in regard to getting a position. It was a period of depression after the panic of '73 and there were few openings. Aided by a letter from President White he secured appointment to a fellowship at Johns Hopkins University. The following year he spent with Edison in his laboratory at Menlo Park. After serving for two years as professor of physics and chemistry at Central University in Kentucky and for four years as professor of physics and astronomy in the University of Kansas, he returned to Cornell in 1887 where he remained head of the department of physics until his retirement from active teaching in 1919. He died in West Palm Beach, Florida, on November 10, 1937.

Professor Nichols attained a place of high scientific distinction. His extensive publications embraced almost every branch of the physics of his day and in several important fields such as illumination, physiological optics, and luminescence, he was recognized as a pioneer. In recognition of his pioneer work he was awarded the Ives Medal of the Optical Society, the Elliott Cresson Medal of the Franklin Institute, and the Rumford Medal of the American Academy, and was made an honorary member of the Optical Society of America and of the Illuminating Engineering Society,

With the firm conviction that the advancement of knowledge through research was an important if not the prime function of a University, Nichols exerted a widespread influence in quickening the spirit of scientific inquiry and investigation as a pattern for university as well as individual development. When he entered upon his scientific career the contributions from this country to the advancement of the physical sciences were comparatively insignificant. In only a few universities was research actually under way or even regarded as a proper function for a college teacher. The possibilities of industrial research laboratories in physics had not then been recognized. Nichols contributed more than any other physicist of his generation to change this situation and he was almost the last remaining member of that small group of men who kept physics alive in this country during the last two decades of the last century and prepared the way for the remarkable progress of the last twenty years. His

enthusiasm and untiring activity as a scientific investigator served as an inspiration to others. As president of the American Physical Society, of Sigma Xi, and of the American Association for the Advancement of Science, he kept continually before the public the importance of scientific work. He was one of the most active of the small group who organized the American Physical Society in 1899. *The Physical Review*, founded by Nichols in 1893 and conducted for the first twenty years under his editorship, was the first journal of physics in this country and was an important factor in stimulating scientific activity in that field.

As a member of the Cornell faculty, Nichols's influence was always in the direction of liberality of opportunity. He looked forward not backward. While he shared with his colleagues the glory that came to Cornell for more than one daring experiment in education, yet he was ever ready to recognize the fettering influence of tradition against which he continually and effectively raised his voice in protest, for to him the shackles of tradition signified narrowness, apathy, and sterility. A brief quotation from a dinner speech that he made during the Semi-Centennial celebration will serve to remind us of how he conceived a university should ever struggle for development. "My dream is of a Cornell that shall be the first to break away into the glorious freedom that surrounds us; into the glad Bohemia at our very doors—fit for the times in which we live." Essentially a radical in his educational ideals, he nevertheless recognized the importance of advancing no faster than the change could be assimilated by those most affected. He disliked the routine of administrative duties and gladly left them for others to assume. As Dean of the College of Arts and Sciences for two years, he advocated and initiated numerous educational policies of a progressive character. His wise and unprejudiced approach to the general educational problems of the University made him a most valued and trusted member of the faculty.

To those who had the good fortune to be among his students or associated with him as a colleague, his never-failing and sympathetic interest in any scientific problem brought inspiration and encouragement. His quiet dignity, his unaffected simplicity, his interest in and love of all knowledge was irresistibly infectious. Endowed with a rare combination of curiosity, creative imagination, and good judgment, he developed at Cornell a center of research in experimental physics that quickly brought the department to a position of leadership in this country. Similar developments elsewhere were stimulated by his example. More and more students found it unnecessary to go abroad for graduate study in physics. Many other departments of physics and not a few industrial laboratories owe their original development to the pioneer efforts of physicists trained by him.

Nichol's scientific activity did not cease or diminish when he retired. On the contrary the vigor and interest with which he continued his researches for considerably more than a decade beyond his retirement revealed anew

his unquenchable thirst for conquest in the realm of science. This distinguished scientist, respected teacher, and beloved colleague has passed on; but his influence will remain and the memory of what his life and work has meant to Cornell we shall ever cherish as a rich heritage.

Retired: June 1919 (Fac. Rec. p. 998)

Melvin L. Nichols

November 30, 1894 — March 29, 1981

Melvin L. “Pete” Nichols, emeritus professor of chemistry, who died March 29, 1981, at the age of eighty-six, enjoyed a career that almost perfectly characterizes a true-blue Cornellian. He was, in fact, a member of that very small group of our faculty that had been personally acquainted with every Cornell president. As Melvin Nichols, he left his home town of Dayton, Ohio, in 1914 to enter Cornell as a freshman. He remained in Ithaca, known to his many friends as Pete, until 1978, when, in failing health, he moved to California to be close to his only daughter, Sally. After receiving his Bachelor of Chemistry degree in 1918, he was appointed an instructor in chemistry at Cornell and simultaneously embarked on a graduate study program under Professor Orndorf, majoring in organic chemistry. He was awarded a Doctor of Philosophy degree in 1922 and was promptly appointed assistant professor in chemistry. He remained on the chemistry faculty until his retirement in 1962.

Nichols’s field of teaching and research was analytical chemistry, and for many years he was unofficial head of the analytical teaching group of the Chemistry Department. He wrote two textbooks on analytical chemistry, *Gas Analysis*, coauthored with L. M. Dennis, and *Laboratory Manual of Analytical Chemistry*. In 1950 Nichols agreed to become executive director of Cornell’s Chemistry Department, a new position which involved supervision of the support facilities and the nonacademic staff of what had become a large and complex establishment. He held this position until his retirement in 1962.

The forty-eight years of Pete Nichols’s life as a student and teacher at Cornell were years of great change for Cornell chemistry. The science itself became more physical and more theoretical. Applied fields such as agricultural chemistry, sanitary chemistry, and chemical microscopy, which had once been central at Cornell, were spun off or phased out. Industrial chemistry was transformed into chemical engineering and moved into the College of Engineering for its separate and independent development. There was a disastrous fire in 1916 which destroyed Morse Hall, the chemistry building; fortunately, a splendid new Baker Laboratory building opened in 1922. That chemistry at Cornell survived these changes and indeed grew stronger and more effective over the years was due in large measure to the successful adjustments and continuing contributions of Pete Nichols and other faculty members of his generation. Cornell is in their debt.

In 1926 Nichols married Mary Bancroft, the attractive and lively-minded daughter of one of Cornell’s eminent chemistry professors, Wilder D. Bancroft. When newcomers to Cornell first learned of this marriage, they were

prone to mutter something about “marrying the boss’s daughter,” and were chagrined to learn that the true situation had been almost the exact opposite. Nichols was a coworker and protégé of the other strong-willed Cornell chemist of the time, L. M. Dennis, and Dennis and Bancroft had a long-established and well developed dislike of each other. Hence, to Dennis, a Nichols involvement with a Bancroft was akin to joining up with the enemy. It is a tribute to his tact and his persistence that Pete Nichols rode out the storm and kept his Cornell position.

Mary Nichols died suddenly in 1967, and Pete Nichols lived on alone in Ithaca, actively involved with his wide circle of friends. He will be missed by his Ithaca friends and colleagues as well as by the hundreds of Cornell students that he taught.

Albert W. Laubengayer, William T. Miller, Franklin A. Long

Thomas Rud Nielsen

October 12, 1926 — January 31, 1963

Thomas Rud Nielsen was born in Oklahoma City, Oklahoma, the second son of a distinguished physicist, Professor J. Rud Nielsen of the University of Oklahoma, and Dr. Gertrude Nielsen, a practicing physician. His early years were spent in Norman, Oklahoma. He entered the University of Oklahoma in the summer of 1943 but promptly withdrew to enter military service with the United States Navy. He returned to his studies in the summer of 1946 and graduated with honors in chemistry three years later.

Dr. Nielsen received the Ph.D. degree from the University of California at Berkeley in 1953 and was appointed Instructor at the Davis campus of the University. In 1955 he was promoted to Assistant Professor. His reputation as a teacher of soil chemistry led to an invitation to join the Department of Agronomy of the College of Agriculture at Cornell University in 1956, and the introductory course in soils at this institution became his major responsibility. In 1959, he was promoted to the rank of Associate Professor.

Dr. Nielsen's interest in undergraduate students was manifest from the beginning of his career at Cornell. He served as an undergraduate adviser and as faculty sponsor of the Agronomy Club, which became an enthusiastic and active organization under his influence. In 1960, Ho-Nun-De-Kah, honor society for seniors in the College of Agriculture, named him recipient of their Professor of Merit Award in recognition of his outstanding ability as a teacher.

In the same year, Dr. Nielsen was elected to the University Faculty Committee on Student Affairs. He became chairman of this important committee and served as faculty adviser to the Executive Board of Student Government. He quickly gained the respect and confidence of student leaders, faculty, and administration alike. His detailed knowledge of various points of view during a period of restless relationships had a profound effect upon the direction and rate of progress toward development of a Social Code, a document that guides student activities on the Cornell campus. Although final steps in formulating the code were taken after his death, Dr. Nielsen's philosophy and influence will be felt by generations of students yet to come.

Dr. Nielsen devoted his greatest efforts to undergraduates and their problems but at the same time maintained scholarly activities in his special field. He inaugurated an undergraduate seminar on advanced topics in soil science. He served his colleagues in the Department of Agronomy as radiological officer and received a grant

for study at the Oak Ridge Laboratory of the Atomic Energy Commission. He contributed technical articles to scientific journals and semi technical articles to student publications.

Dr. Nielsen was a member of Phi Beta Kappa, Sigma Xi, Alpha Chi Sigma, the American Society of Agronomy, the Soil Science Society of America, and the American Association of University Professors. He is survived by Mary Nielsen, mother of his three sons, Randolph, Bryan, and Stephen.

Marlin G. Cline, Jeffery E. Dawson, Robert D. Miller

Walter Lindsay Niles

January 2, 1878 — December 22, 1941

In the death of Walter Lindsay Niles on December 22, 1941, Cornell University Medical College lost not only one of her most distinguished graduates but also one of her most loyal friends and wise counsellors.

Dr. Niles was born on January 2, 1878 on one of the farms of the community known as “Niles Settlement” founded in 1808 in the town of Lebanon, N. Y. by his great, great grandfather Nathum Niles and his sons, and there both his father, Isaac Newton Niles and his mother, Harriet Lois Lindsay, were also born.

His paternal ancestor in America was John Niles who arrived from England on the ship Speedwell and settled in Dorchester, Massachusetts in 1634. His maternal ancestor came to this country from Scotland in 1645. Dr. Niles was of the ninth generation descended from John Niles. This then is the foundation upon which his character was built. No wonder he possessed great courage, common sense to a high degree, a perfectly educated will and honesty of purpose. Virtue and genius were in his blood.

In his early boyhood he attended the district school in Lebanon. He graduated from the High School at Norwich, N. Y. in 1896 and in the autumn of that year entered the School of Civil Engineering, Cornell University, with the aid of a scholarship won in competitive examination.

With the death of his father in 1898, Dr. Niles decided not to complete his engineering course but to enter the school of medicine.

During his school-boy days, Walter Niles commanded the respect and affection of his companions and even his elders in the community recognized in him the leader and representative of his age group on any matter affecting policy. As an undergraduate in Cornell he rowed on the freshman crew squad and sang on the glee club. He was the chairman of a committee which published the “Songs of Cornell” and was a member of his senior banquet committee. He was a member of Sphinx Head, a senior honorary society, and of the Savage Club.

After his graduation from medical school in 1902 he served two years as a member of the intern staff of Bellevue Hospital. One of the attending physicians on the medical service at this time was the then Professor of Medicine at Cornell, Dr. W. Gilman Thompson, and it was he who persuaded Dr. Niles, after he had finished his internship in 1904, to remain in New York to take up the practice of medicine. From the day this decision was made down to the

time of his death, he devoted himself to every phase of medical care and served humanity with great distinction to himself and to his profession.

Very shortly after the completion of his internship, Dr. Niles was appointed to the attending staff of Bellevue Hospital as adjunct assistant attending physician. Later he became a consulting physician to this institution. He was also consulting physician to the Memorial Hospital, the New York Infirmity for Women and Children and the Southampton, Nassau and Jamaica Hospitals. He was attending physician to the New York Hospital.

For nearly forty years Dr. Niles was identified with the teaching staff of Cornell University Medical College and for more than half of this time he was a professor of clinical medicine. He possessed both the art and the power of teaching and a rare gift for kindling enthusiasm among his pupils by whom he was universally beloved and respected.

Dr. Niles' great capacity for organization led to his appointment as Acting Dean of the Medical College on the retirement of Dr. William M. Polk in 1918. In 1919 he became Dean, an office he held until 1928. Indeed, due to the illness of Dr. William S. Ladd, he was again Acting Dean at the time of his death.

Dr. Niles played an important role in bringing about the close relationship which exists between The Society of the New York Hospital and the Cornell University Medical College, and he was a member of the Joint Administrative Board of this association.

In 1908 Dr. Niles was elected a Fellow of the New York Academy of Medicine. During his more than thirty years of Fellowship he served on the following committees of the Academy:—Admissions, Public Health Relations, Medical Education, Problems of Medical Practice, Professional Standards, Fund raising, and finally he was Chairman of the Board of Trustees and the Executive Committee of this Board. He declined an invitation to become President of The New York Academy of Medicine because other duties to which he was already pledged would not give him sufficient time to do this office full justice.

Dr. Niles was a member of numerous scientific societies and organizations among which were: The Association of American Physicians, the American Climatological and Clinical Association, the Harvey Society, and the Practitioners Society. His clubs were: The Links, Century Association, Cornell, National Golf Links, Shinnecock Hills Golf Club, Meadow Club (Southampton), Piping Rock, and Deepdale.

In the very early days of the first World War Dr. Niles received a telegram from Dr. Theodore Janeway offering him a commission as major in the United States Army Service Medical Corps. He was persuaded, against his own

wishes, that he could best serve his country by retaining his teaching post in the medical school. Once he was convinced of this he made the sacrifice cheerfully.

Dr. Niles was as successful in private practice as he was in every other phase of medicine with which he was identified. People liked him and he liked people. One man was heard to give the following reason for his success in the practice of medicine: "People felt safe in his hands." That statement is substantial evidence that his good judgment and wisdom were associated with high character, objective, straight thinking and complete honesty, blended with kindness, gentleness, patience and tolerance. One of the reasons why he did so many things well was that he possessed the rare quality of being able to do one thing at a time to the exclusion of all else. When he played, and he loved to play, he concentrated on play. When he worked, all his thought was centered on the single problem in hand.

On May 20th, 1908, he married Louise Vezin, daughter of Charles Vezin and Adah Delamater. There were four children of this marriage, John Lindsay Niles, Charles Lindsay Niles, Harriet Lindsay Niles, now Mrs. Edward A. Hurd, Jr., and Nelson Robinson Niles. The latter two children and his wife survive him.

Schiller said: "Genuine morality is preserved only in the school of adversity." There was plenty of adversity in Walter Niles' life and in every instance when he was compelled to face ill fortune, he did so with a decision and nobility that was characteristic of him. He refused to be crushed. He carried on with a fine sense of his obligation to the world. Whatever concerned humanity, concerned him. He refused to permit Fate to destroy him until she did a complete job of it. He loved life but only a life capable of doing things. His death came with the suddenness he would have wished and it came at the very zenith of his career.

Arthur Edward Nilsson

July 22, 1900 — September 20, 1985

Arthur Nilsson, professor of finance emeritus in the Samuel Curtis Johnson Graduate School of Management (formerly the Graduate School of Business and Public Administration), died on September 20, 1985, at the age of eighty-five. He was born in Boston. He earned the bachelor's degree in civil engineering from Tufts University, the M.B.A. degree from the Harvard Business School, and the Ph.D. degree in economics from Yale University (studying under Irving Fisher).

Professor Nilsson came to Cornell in 1948. When he retired, in June 1970, he had served on the University Faculty for twenty-two years. Prior to 1948 he taught at the College of William and Mary, Yale University, Oberlin College, and the Harvard Business School. He also worked while on leave from Oberlin as the head security analyst for the Securities and Exchange Commission.

Nilsson was a friendly, kind human being with a great knack for story telling. He was a real gentleman with a hearty laugh and a warm smile. In addition to his academic interests in finance and economics, he was devoted to the game of football and was an intense Civil War buff. He was also an artist with wood, having remodeled his two homes, the Mill in Ithaca and his manor house in Cohasset. He loved both of them. As an undergraduate he played end on the Tufts varsity football team. At William and Mary and Oberlin, in addition to teaching economics, he was the assistant football coach. As a result of his attending football coaching schools, he became acquainted with Knute Rockne. At age sixty-five he played third base in a student-faculty baseball game (he did well).

He became interested in the Civil War while at William and Mary. As a consulting civil engineer, he surveyed large segments of Virginia and began uncovering Civil War markers that had been lost. He walked most of the Civil War battlefields and read all the accounts of the war in *Harper's Weekly*.

As a teacher at Cornell's business school, he offered course work in financial management, investment management, and other aspects of corporation finance. He was an extraordinarily good teacher, and students frequently followed him from the classroom in order to continue discussions. His one fault as a teacher was in failing to adhere to the limitations of the assigned class time. He was too enthusiastic a teacher to stop in the middle of an important point.

He was one of the first employees of the Securities and Exchange Commission, serving there from 1934 to 1937. Many of the analytic procedures still in use at the SEC are those that Arthur developed. His Washington experience enabled him to bring a great deal of realism into the classroom.

In addition, he served either as an economist, consultant, or staff member for a number of employers, including the state of Ohio, the Office of Price Administration, and the War Assets Administration. Later in his career he served on a continuing basis as a financial consultant for Agway and Mohawk Airlines (now USAir).

For fifteen years he was the coordinator of the finance week session of the school's Executive Development Program. He was one of the few people conducting sessions for that program who always received standing ovations from the businessmen attending.

Arthur Nilsson's wife, Una Nilsson, and a daughter died at an earlier time. A son, six grandchildren, and three great-grandchildren are still living.

Harold Bierman, Jr., Frank F. Gilmore, David A. Thomas

Leo Chandler Norris

March 6, 1891 — February 3, 1986

Leo Chandler Norris, professor emeritus of nutrition, died on February 3, 1986, in Lawrence, Kansas, four weeks before his ninety-fifth birthday. He was born on March 6, 1891, in Canaseraga, New York. His life and work spanned much of the period of the development of the science of nutrition, and he was one of the principal architects of Cornell's commitment to nutrition as an important academic endeavor. Leo Norris earned a Cornell B.S. degree in animal husbandry in 1920 and was one of the university's early Ph.D.'s in animal nutrition, working under the direction of L. A. Maynard. He was first an instructor in poultry husbandry in 1923, an assistant professor in 1926, and a full professor in 1936. He was given the title of professor of nutrition in 1943.

Leo Norris will long be remembered as one of Cornell's great mentors of graduate students. Thirty-five individuals received their Ph.D. degrees under his direction at Cornell. They became the faculty members and research workers throughout the United States who developed the science and application of nutrition not only in the field of poultry science, but broadly in the field of animal nutrition. He was a demanding faculty adviser. He insisted on accuracy, hard work, attention to detail, and preparation in basic sciences that allowed application of those sciences to problems facing the poultry industry. Although graduate work with Leo was demanding, his students were devoted to him. The experience and training they received from studying with him molded their scientific lives. Though he did little formal classroom teaching, the U.S. Poultry Science Association gave him the association's Teaching Award in 1957, a unique tribute to his work with graduate students.

Leo Norris's research spanned the major era of discovery of essential nutrients in nutrition. In 1921, when he began his Ph.D. study, vitamin A was known, the B vitamins had not yet been clearly identified, and vitamin D and vitamin E were not yet established as entities. By the time of his retirement from Cornell in 1959, all the vitamins we now recognize had been isolated, characterized, and synthesized and their basic functions established. Many of the trace mineral elements were not considered dietary essentials in the 1920s. The Cornell group led by Norris was in the midst of the race to isolate and identify the unidentified growth factors found in natural foodstuffs. Norris and his students contributed to many of the vitamin discoveries of his era. They carried out work with riboflavin, pantothenic acid, folic acid, biotin, vitamin B₁₂, and vitamin K. They were also concerned with phosphorous utilization and with trace elements, including manganese, zinc, and molybdenum.

Norris described the deficiency of riboflavin in young chicks, and he identified whey, a by-product of cheese making, as an important source of the vitamin. That led to the development of an industry that recovered the whey solids, which had previously caused a disposal problem for the cheese industry. He also discovered the importance of manganese deficiency as a cause of leg weakness in commercially grown poultry. The supplementation of feed with manganese solved a major problem limiting the intensification of the poultry industry in the United States. He was anxious to ensure that results of scientific research would be available to the feed industry in the United States, and in 1934 he initiated the Cornell Nutrition Conference for Feed Manufacturers, which is still in existence.

Though Norris is primarily recognized for his work and discoveries in poultry nutrition, he was concerned with the broad application of this new science. Along with L. A. Maynard, he was instrumental in forming a school of nutrition at Cornell, which brought together the various groups interested in nutrition from the Departments of Animal and Poultry Husbandry and the College of Home Economics. He served as the first secretary of the school. During World War II his laboratory was involved in studying the adequacy of K rations and other formula foods supplied to soldiers in the field.

He was the long-term chairman of the Committee on Animal Nutrition of the National Research Council (1954-62) and was responsible for developing standards for feeding most species of farm and other domestic animals. His role in the scientific community was broad: he served as president of the American Institute of Nutrition and was active in the U.S. Poultry Science Association.

When Leo retired from Cornell in 1959, he moved to the University of California at Davis, where he developed another academic career. He carried out research on mineral metabolism, continued to guide graduate students, and published original work until a few years before he died.

Leo Norris was a Cornellian, a scientist, and a teacher whose legacy will remain part of scientific agricultural production and the science of nutrition. He will also be remembered as a scientific ancestor to a substantial number of members of the nutrition community.

L. J. Daniel, R. J. Young, M. C. Nesheim

Burdette Kibbe Northrop

June 23, 1893 — October 25, 1957

The death of Professor B. K. Northrop, on October 25, 1957, came as a shock to associates and students in the School of Electrical Engineering as well as to his many friends throughout the whole Cornell community.

Professor Northrop was born June 23, 1893, in West Danby, New York. His father was a clergyman who later moved his family to Florida. There, as a lad, Prof. Northrop attended school and entered Stetson University from which he transferred into Cornell and graduated with the degree of ME in EE, December 20, 1918.

While still an undergraduate, B. K. Northrop began his teaching career in Electrical Engineering as a student assistant. Upon graduation, he was appointed Instructor in E. E. In 1923, Prof. Northrop left Ithaca to accept an appointment as Asst. Prof. of Physics at Colgate University where he remained until 1929, when he returned to Cornell as Asst. Prof. of Electrical Engineering, becoming Associate Professor in 1943 and Professor in 1946.

In June 1920, he married Mary Etta Thatcher of Ithaca, who survives. Also surviving are two daughters, Mildred (Mrs. Rollin L. Wiseman) of Niagara Falls, and Geraldine (Mrs. Richard L. Jones) of Biloxi, Miss. There are three grandchildren. Professor Northrop was one of four brothers, all of whom entered educational work.

In addition to teaching at Cornell, Prof. Northrop was active in industry during the summers and sabbatical leaves. He was a registered professional engineer in the State of New York. For a total of eleven summer periods, Prof. Northrop worked with W. S. Murray, Inc. at Utica, N.Y. or with the Oneida Community, Ltd., at Sherrill, N.Y. For the former company he worked on the design of an automatic electric welder and on the design and building of a machine for expanding steel tubing. For the latter company, he worked on the improvement of chemical recovery and on special electroplating processes for which he obtained two patents. Since 1937 and during his sabbatical leave, Prof. Northrop was a consulting engineer for the Allis-Chalmers Manufacturing Company of Milwaukee. In this capacity, he worked on the mercury-arc rectifier and on radio and refrigeration equipment.

Working with the late Prof. W. C. Ballard, Prof. Northrop was one of the pioneers in the development of the electronic-tube machine facilities and high radio vacuum apparatus at Cornell. Together, they also established an early experimental broadcast station at Cornell. Prof. Northrop developed the industrial electronics program of the EE School. During World War II, he was in charge of the Cornell ESMWT radio and electronics teaching program. He published articles in technical journals on subjects in electronics and lightning.

For the past eight years, B. K. Northrop devoted much of his time to advising freshmen in the School of Electrical Engineering. In this capacity, he exerted great influence on many students. To most of the freshmen, he was not only their advisor but also their first friend on the faculty, and, for many, he was their best friend through all five years.

Prof Northrop was also admissions officer for the School of Electrical Engineering, and he was a member of the University Faculty Committee on Student Conduct. Until recently he was also a counselor at frosh camp, and for two terms he served on the Board of Control of Cornell United Religious Work.

Prof. Northrop was a "life member" of the American Institute of Electrical Engineers and was past chairman of the Ithaca Section of that organization. He was also an active member of the Institute of Radio Engineers, American Society of Engineering Education, Eta Kappa Nu, (a professional honorary fraternity), the Power Squadron, and the U.S. Coast Guard Auxiliary.

Prof. Northrup was a member of Acacia Fraternity; a member and past master of the Masonic Blue Lodge, Hamilton, N. Y.; a member of the Methodist Church; and served on the Board of the Wesley Foundation.

The passing of B. K. Northrop is deeply felt by all who knew him. His influence in the college and on the students will never be forgotten.

C. L. Cottrell, E. M. Strong, W. W. Cotner

Clark Sutherland Northup

July 12, 1872 — May 18, 1952

When after forty-five years as an active member of the faculty, Clark Sutherland Northup retired in 1940, he had to his credit so many achievements and honors (including a Doctorate of Letters) that a mere enumeration would cover more than a page. Rather than list here the many things that he accomplished by the way, we shall speak chiefly of his major projects and services.

A history of his connection with Phi Beta Kappa Society is almost a history of its later years. Soon after becoming a member, he began a campaign to make it larger and more important; and before relinquishing active work, he had the satisfaction of seeing his hopes realized. For thirty years he held the office of Senator, except for two terms as National President; and he published two large records of the society's activities.

Although in his later years he might have contemplated such distinctions with great satisfaction, he never seemed to do so. Even in his last decade, he had his eye on the future and his chosen work. If he had to proceed more slowly with his projects, he still continued to keep several in hand, and until his health gave way, stood on the verge of further successes.

One motive runs consistently through his activities. He had arrived upon the academic scene just as serious study of literature entered upon a huge expansion, with scientific research displacing panegyric and ethical criticism. Workers in the new style needed special tools; and Professor Northup turned to the task of furnishing those invaluable helps to scholarship which made his name known everywhere: bibliographies of Gray and Mrs. Gaskell; the much-used *Register of Bibliographies*; and (for a time) an indispensable annual list of articles and books. He died as a bibliography of writings by and about Robert Browning (undertaken in collaboration with Professor L. N. Broughton) was about to appear.

The scheme of the new scholarship involved publication; here too Professor Northup did what he could to help. He supervised the publication of thirty volumes of the *Cornell Studies in English*; for forty-five years he was listed as cooperating editor of the *Journal of English and Germanic Philology*, for which he reviewed a book in almost every issue. A colleague spoke of him as "rendering indispensable services in his long and distinguished career;" and many a young scholar received an ungrudging appraisal or encouraging word when such things meant much.

His students at Cornell had him to thank for the establishment and operation of the Hart Memorial Library, with its ample desk-space and sets of reference-works. They also discovered in him a novel attitude toward study and research. He felt sure that any one who would school himself properly in the new techniques could contribute something important; by his example, he filled others with confidence in their powers and destiny. Many who doubted their own abilities received from him encouragement and cheerful assurance.

He set an even more important example with his industry. For most of his life he worked day and night as a matter of routine, without showing signs of fatigue or exhaustion. If he tired of one task, he found relaxation in turning to another of equal importance. He even regretted having to relinquish, as an individual project, a Middle English Dictionary—a labor of Hercules that for the past twenty years has received generous financial support and has enjoyed skilled direction and the full-time efforts of several expert collaborators.

Professor Northup's determination to keep himself continuously employed at preparing things of use to other scholars and teachers contrasted sharply with the negligent individualism found in so many quarters. He set a higher value upon utility than upon self-expression. He remained close to the Cornell tradition of finding and making available the durable materials of scholarship, no matter how hard to come by, or how enticing or ready to hand the proffered substitutes.

His colleagues can scarcely hope to express an estimate of his work that would have proved more satisfying to so good a Cornellian.

Harry Caplan, W. H. French, B.S. Monroe

Leland Bernard Norton

January 29, 1910 — June 10, 1953

After an illness of approximately a year, Leland Bernard Norton passed away at his home near Ithaca on June 10, 1953. His untimely death brought to an end an association with Cornell University which had extended over a quarter of a century as student, teacher, and research worker. This association began when Professor Norton was only eighteen years old and ran continuously until his death at forty-three. Its termination means a great personal loss to his many friends, the loss of an excellent teacher and research worker to the University, and the loss of a keen mind to the science in insecticidal chemistry.

Professor Norton was born at Inlet, New York, on January 29, 1910. He prepared for college at Watertown High School, attended Hamilton College, and received the Bachelor of Science degree from Hamilton in 1928 when only eighteen years of age. The next step in his education was the attainment of the Ph.D. degree in Chemistry at Cornell in 1934. Meanwhile he received practical experience in the field of chemistry of insecticides as a temporary assistant for three summers and one full year at the New York State Agricultural Experiment Station at Geneva. At this same institution he served for two years, 1935-37, as Assistant in Research on feed and fertilizer analysis, and for six more months under the same title while working on maple sugar products.

In 1938 Professor Norton became Assistant Professor of Insecticidal Chemistry at Geneva. This was undoubtedly the real beginning of his career as it afforded him the opportunity to conduct research in a field of chemistry in which he had found interest as a temporary undergraduate assistant. Soon he was publishing papers on the use and safening of arsenical sprays on fruit. As the use of arsenicals became more and more restricted because of the residue problems, Professor Norton turned his attention toward the development of safer nicotine sprays. Then came World War II and a search for sources of insecticides to replace those made unavailable because of trade restrictions and the needs of our armed forces. With Professor T. R. Hansberry as Toxicologist, Professor Norton conducted research on a number of substitute materials, including the yam bean. During the latter days of the war his attention became focused on DDT;—its various formulations as dusts, sprays, and emulsions; the problems of its toxicity to spray operator and to consumer; and the controversial matter of how to determine most accurately by chemical means the residues of active ingredients left on or in the edible portions of crops treated for insect control.

The advent of DDT ushered in a new era of work in the field of synthetic organic insecticides. Each new material brought its own problem of formulation, toxicity, and residue determination. The entire field of insecticidal chemistry became full-grown in a period of two or three years and it was deemed absolutely necessary that the entomology department at Cornell should have a staff member well trained in this line of work. The purpose of such a man was seen to be two-fold in conducting research and in giving guidance to graduate students and staff members as they became involved in physical chemistry. Professor Norton most admirably filled this need. Having transferred from Geneva to Ithaca in 1945, he was made Associate Professor of Insecticidal Chemistry in the Department of Entomology and Limnology in 1946, and Professor of Insecticidal Chemistry in 1950. Shortly after his arrival in Ithaca he became surrounded by graduate students in economic entomology as they recognized the necessity of being well versed in the chemistry of insecticides. Soon he became a co-founder of a formal course in the chemistry and toxicology of insecticides, and the men he trained readily secured positions in other institutions. Chemists and toxicologists of private industry and the federal government were his friends and his co-workers in the solution of many difficult problems of residue analyses. Professor Norton published approximately thirty papers dealing largely with the chemistry of insecticides.

The capabilities and achievements of Professor Norton were not without recognition. He was a member of Phi Beta Kappa, Sigma Xi, the American Association of Economic Entomologists, the American Chemical Society, and the Gamma Alpha fraternity.

Professor Norton is survived by his mother, Mrs. Edith Fox of Barnes Corners, New York, and his widow, Mrs. Katherine Wheeler Norton of Ithaca. Also surviving are three children, a daughter Eleanor by his first wife, formerly Miss Eleanor Seeley, who died in 1943, and two sons, Peter and John born of his marriage in 1946 to Miss Katherine Wheeler.

In spite of his keen interest in his work, 'Nort', as he was affectionately known by his friends, found time for other activities. For a number of years he often played golf and bowled. In each of these sports he was the recipient of several trophies. He was an ardent fly fisherman, tying his own flies and bowing to no man in the skill of their use in the deception of trout. He liked to hunt deer and grouse, to play bridge, to garden, and to work at odd jobs around his home.

In all of his life's activities it may be said of 'Nort' that he was strong of conviction but amenable to reason, earnest and sincere but always cheerful, and always helpful but never obtrusive. These and other fine qualities endeared him to many. His passing is a keenly felt loss to his profession and to his many, many friends all over the country.

J. L. Brann, Jr., C. E. Palm, T. C. Watkins

David Novarr

June 29, 1917 — January 21, 1987

It is difficult to overestimate the contributions of David Novarr to the postwar history of the Department of English. Beyond David's superb scholarship and genial influence as a wise and penetrating teacher, beyond his stalwart services to the department, the university, and the scholarly community at large, his students and colleagues were beneficiaries of even rarer qualities: uncommon common sense, generosity of spirit, unfailing friendliness, and constant collegial support of young and old alike.

David Novarr was born in Hartford, Connecticut, the older son of a respected (and still-active) merchant. Family relationships were always of prime importance to David. In his last book, *The Lines of Life* (the titular phrase occurs in both Shakespeare and Ben Jonson), David alludes movingly to what he has learned about those "lines" in his own family, from his grandparents to his grandchildren, "all of whom have made me more aware of my involvement in generations than even Erik Erikson's work has." David's father would take him along on business trips to New York and, like as not, the two of them would visit Yankee Stadium before returning to Hartford; as a Yale undergraduate, David wrote a few lines to his mother every day.

David was from the first an outstanding scholar. At the Thomas Snell Weaver High School in Hartford he was the valedictorian and winner of the Sterling Memorial Connecticut High School Scholarship to Yale. At the college he continued to win many prizes and scholarships and was elected to Phi Beta Kappa in 1938. In the fall of 1939 he enrolled in Yale's doctoral program in English. In February 1942 he was married to Ruth Victoria Gordon of Hartford. Shortly thereafter he enlisted in the U.S. Navy and served for forty-three months with the Communications Security Section of the Chief of Naval Operations in Washington, D.C. His final rating was chief specialist in cryptography. While still in the Navy, David taught English at George Washington University (October 1943 to March 1944). In the fall of 1946 David, Gordy, and Johnny Novarr came to Ithaca, where David took up his duties as instructor of English at Cornell. David was promoted to faculty instructor in 1949, the year he received his doctorate from Yale; to assistant professor in 1951; to associate professor in 1956; and to professor in 1963.

In 1951-52 David received a Ford Foundation Fellowship to complete his research for a book on Izaak Walton's *Lives* of Sir Henry Wotton (a diplomat and minor poet) and of four notable Anglican churchmen: John Donne, Richard Hooker, George Herbert, and Robert Sanderson. Two of the churchmen, Donne and Herbert, were of

course superb artists in verse and prose, as well as divines. Later perceptions of all five men had been profoundly influenced by Walton's supposedly straightforward and "artless" biographies. By 1958, the year David's massive study, *The Making of Walton's Lives*, appeared under the Cornell imprint, it was abundantly clear that a strong voice had been added to seventeenth-century studies. David's scholarly contributions were meticulously researched and beautifully executed. Even before publication of the Walton book a senior seventeenth-century scholar praised David's work for throwing "more light on Walton's craftsmanship than anyone hitherto has done." Later, a senior Walton specialist wrote in *Modern Philology*: "This study is one of the most important in Waltonian scholarship ever to have appeared, and one that will have a far-reaching effect upon seventeenth-century scholarship generally." David demonstrated that Walton (1593-1683) was far from straightforward and objective; rather, through successive revisions the biographer presented his subjects as exponents of his own sense of ideal conduct and of the Anglican faith. *Walton's Life of Donne* "increasingly veered toward hagiography in its revisions," and he had other ideal "patterns in mind when he wrote the other lives." With the appearance of David's book, studies of Walton, Donne, and Herbert could never be quite the same again.

Donne was the poet whom David most loved to analyze. In 1956 his article on Donne's "Epithalamium Made at Lincoln's Inn" had startled and impressed scholars by its brilliant argument that the poem had been written not for a genuine but for a mock wedding staged by the law students and that the "bride" addressed in the poem was in reality a male in bridal dress. David's path-breaking studies were collected in *The Disinterred Muse: Donne's Texts and Contexts* (Cornell University Press, 1980). Of this important volume a leading seventeenth-century scholar has written: "[This book] dramatizes remarkably the processes of true scholarship put to the services of literary understanding, response, and judgment. Novarr... sifts the evidence concerning the occasions, genres, and purposes of the poems Donne wrote after taking holy orders, and ... comes up with fresh insights, significantly new datings or radically new interpretations. He has illuminating things to say about the Holy Sonnets and the great hymns and the most remarkable insights into the translations and the devotions that I have seen. All scholarly readers, like all future editors, will have to take into account Novarr's work."

David's most recent book, *The Lines of Life: Theories of Biography, 1880-1970* (1986) is also certain to be gratefully received by both scholars and lay readers. It is a characteristically acute and expert examination of biographical theorists from the heyday of Victorian positivism to the threshold of deconstruction and the contemporary denial of coherent personality. David was also editor of the fine Borzoi anthology *Seventeenth-Century English Prose* (Knopf, 1967).

It is of course not merely incidental that in the 1950's David taught "the first course in biography offered by the [English] Department, a survey from Plutarch to Strachey." From 1980 to 1985 he taught a popular course in traditional and experimental twentieth-century biography from Freud and Lytton Strachey to Virginia Woolf and Nancy Milford.

David's administrative services to Cornell were varied and notable. Among other offices he was director of freshman English (1956-59) at a time when every freshman in the university took one or another version of the course, chairman of the Committee on the Preparation of Secondary-School Teachers of English, president of Phi Beta Kappa, assistant chairman of the Department of English (1966-68), and acting chairman (1968-69). The years between 1965 and 1970 were momentous, and the department had a momentous agenda: among other things, to institute the new Freshman Humanities Program, to reduce the heavy teaching load, to set female instructors on the road to tenure, to hire Black faculty members at both the professorial and junior levels, to attract the best possible assistant professors at a time when the baby-boom generation was inundating admissions offices and when new Ph.D.'s could take full advantage of a roaring sellers' market. Without David's heroic services these departmental goals, among many others, could not have been so satisfactorily achieved. And in 1968-69, the most turbulent year in Cornell history, David preserved the integrity of the department at a time when centrifugal forces were exceedingly strong. Again, just two weeks before David relinquished the chair, he sent a letter to Professor J. Saunders Redding, asking whether he would be interested in an appointment at Cornell. The happy outcome of that inquiry is known to us all: when Professor Redding accepted the Ernest I. White Chair of American Studies and Humane Letters, Cornell added to its roster an outstanding literary and scholarly figure.

Although David remained actively engaged in the life of the department and the university, he was now able to devote himself more fully to scholarship, to teaching, and to his family. A fellowship at the Huntington Library (1978) helped him to finish his book on Donne. He developed new courses. He served on the Advisory Screening Committee of the Senior Fulbright Program. The Novarrs loved to entertain in their charming home. Journeys to other countries afforded instruction and delight. Gordy and David enjoyed theatergoing both at home and abroad. One day after returning with Gordy from a theatrical tour of London, only to be greeted by a stateside blizzard, David died suddenly of an aneurysm. Characteristically, during the few hours that had been left to him in Ithaca, David wrote a covering note to a scholarly journal, enclosing an article on John Donne that he had completed just before Gordy and he departed from Ithaca.

A great many people were the beneficiaries of David's warm, instinctive concern for others. He was realistic and tough-minded and could be blunt about pretentious or discourteous persons. But he looked for the best in people and greeted it generously. He had indeed a genius for friendship: when he was a nontenured instructor he and his family made a twenty-mile trip to greet a new non-Ph.D. instructor in an outlying village; another instructor, who shared a small office with David for one year, admired him from the start and grew more and more fond of him as the year went by. Installed after a time in an office of his own, David would greet visitors, in his warm baritone, with the hearty invitation, "Come sit!"

It is not difficult to discover the reasons for David's affection for so many persons and for so many persons' affection for him. David believed, with John Donne, that no one "is an island entire of itself," that everyone "is a piece of the continent, a part of the main[land]," and that those engaged in a common enterprise would of course do all they could to encourage one another. That is the secret of David's hold on us, and of our hold on him, "while memory holds a seat / In this distracted globe."

In addition to Gordy, David is survived by a son, John Gordon Novarr; by a daughter, Frances (Mrs. David Sheldon Strayer), and by four grandchildren.

Anthony Caputi, Charles Levy, Walter Slatoff, Ephim Fogel

Edwin Nungezer

February 25, 1902 — July 10, 1950

Edwin Nungezer was born in Pooler, Georgia, on February 25, 1902, the son of a clergyman. His childhood and youth were spent in the South. In 1923, he received the degree of Bachelor of Science from Furman University where his major subject of study was Physics. Yet, Ed Nungezer's principal and abiding interests, which were to contribute to his distinction as an outstanding teacher at Cornell, were in the humanities. Thus, he came to Cornell where he earned the M. A. in 1925 and the Ph. D. in 1927. His intensive study of English literature began, however, when, as an undergraduate, he was a part-time compositor during the academic year, and during summers a full-time compositor in a printing company. In these non-academic interims, he read widely in English literature, apparently in anticipation of his later graduate studies.

Professor Nungezer was a member of the honorary societies, Phi Beta Kappa and Phi Kappa Phi. He regarded as an equal honor his election to honorary membership in Kappa Alpha Fraternity, in recognition by his students of his qualities as a friend. For the year 1938-39, he was awarded a fellowship at the Folger Shakespeare Library. At Cornell, he was a member of the Goldwin Smith Library Committee, of the Graduate Committee of the Department of English, and of the faculty Research Club.

As a graduate student at Cornell, Ed Nungezer worked under the direction of the distinguished Shakespearean scholar, Joseph Quincy Adams. He became Adam's favorite student and justified that high estimate by his doctoral thesis, *A Dictionary of Actors to 1642*, published by the Yale University Press in 1929 and well received by scholars. For some thirteen years Professor Nungezer had been working on a definitive edition on the writings of Samuel Daniel (1562-1619), poet, critic, and historian.

When J. Q. Adams was appointed Director of the Folger Shakespeare Library in Washington, D. C, he again expressed his very high opinion of his former student by recommending that Ed Nungezer succeed him at Cornell. Thus, after having been assistant professor at the University of Oklahoma from 1927 to 1931, Ed Nungezer came to Cornell as assistant professor of English. In 1940 he was promoted to the rank of associate professor.

As a graduate student Ed Nungezer demonstrated some of the qualities that later were to make him a successful teacher, particularly with his graduate students, of whom he had a great many. He himself was an intensely devoted and serious student, working so single-mindedly as actually to impair his health, yet living in the joyous conviction of achievement and of the value of humanistic scholarship. As a graduate student and as a professor

he tackled whatever he believed needed to be done with a determination to see it through without regard for his personal pleasure or pain. In his teaching and research, Ed Nungezer was always methodical, thorough, concise, and comprehensive, the notations in every volume of his large personal library giving eloquent testimony of that fact.

Professor Nungezer expended the major portion of his time and energies on his students,—undergraduate and graduate—believing that first a professor must prove his worth as a teacher. He earned the respect and affection of his students,—of his graduate students in particular, many of whom developed for him a devotion and personal affection that have endured. They found in him a man who could share their problems and joys; a man who taught them humanism at its best; a man who demonstrated the responsibilities and satisfactions of scholarship. When his former graduate students were professionally successful, he shared their pleasure and satisfaction. In publications, which resulted from their theses directed by Professor Nungezer, his students invariably expressed their frank and sincere acknowledgment of his helpfulness and kindness. As a matter of fact, however, had he been concerned with the full recognition of his share in these publications, his name could justly have been on the title-pages as co-author of a number of them.

Between Ed Nungezer and his friends there was a strong and abiding affection. His friends were impressed by his sympathetic understanding, his generosity and ready appreciation, his complete unpretentiousness and honesty, his sturdy independence. His attitude was that the person before him was in all essential respects, as a human being, at least his equal.

R. C. Bald, F. S. Freeman, H. A. Myers

Paul M. O’Leary

November 29, 1901 — December 25, 1997

Paul Martin O’Leary died on Christmas Day, 1997, at the age of 96.

A native of Lawrenceville, Kansas, he earned his Bachelor’s degree in 1922 from the University of Kansas, where his father was a professor of English for 40 years. Paul was a classmate of former Cornell President, Deane W. Malott, beginning a friendship that spanned more than 70 years.

Along with election to Phi Beta Kappa, he was a star on the university track team – 440-yard champion of the Missouri Valley Conference, setting the university record of 50 seconds. The latter information would not have been surprising even to someone who saw him for the first time at 96, taking his prescribed regular “walk” along the corridors of the Kendal at Ithaca retirement community, performing calisthenics by raising his walker rhythmically over his head; or was a witness to his devoted playing of golf, until his very late years, beginning each year as soon as the snows had melted.

After earning an M.A. degree from Harvard, he came to Cornell in 1924 as an Instructor and graduate student – and, naturally, as an assistant to the university track coach, Jack Moakley. Upon receiving his Ph.D. degree from Cornell in 1929, he became an Assistant Professor, was promoted to full Professor in 1936, Chairman of the Department of Economics in 1944-49 and the Ernest I. White Chair in 1959.

Professor O’Leary’s national prominence resulted from four tours of public service. He was Advisor to the Consumer Advisory Board of the National Recovery Administration, early in the Roosevelt administration. In 1939, he was Chief Economic Analyst with the Commerce Department. Then, beginning in 1941, he was with the predecessor agency of the Office of Price Administration and OPA itself, in which he held positions, successively, as Price Executive for Textiles, Leather and Apparel, Assistant Director of its Price Division, and finally, Deputy Administrator in charge of the wartime rationing programs, an appointment memorialized in an editorial in the *Ithaca Journal*:

*Remember the plainspoken teacher of economics? The man a great many of us who are still here had for Eco one and two?
Well, that’s the man.*

And finally in 1949, he served as a member of the Dodge Commission, appointed by President Truman, to advise General Douglas MacArthur on the restructuring of the Japanese monetary and banking systems. The Commission

played an important role in bringing about monetary and financial stabilization—substituting a fixed exchange rate for the previous hodgepodge of rates, liberalizing financial markets and stopping inflation—which laid the basis for the startling resurgence of the Japanese economy in the ensuing decades.

He left the OPA, along with Professor J.K. Galbraith, evidently because of disagreements with its new administrator, Prentiss M. Brown, who reportedly wanted to appoint “administrators more likely to be popular and sympathetic with the public and business” (according to a contemporaneous account in the *Ithaca Journal*), and he was critical of what he regarded as the overly hasty abandonment of price controls immediately after the war, which was indeed followed by an outburst of inflation and the recession of 1948-49.

After his service with the OPA and a brief interim stint with Leon Henderson’s Research Institute of America, he returned to his years of major service to Cornell, first in a five-year term as Chairman of the Department of Economics (1944-49). He then served as chairman of the university-wide committee, constituted by President Day, which recommended the establishment of what became the Graduate School of Business and Public Administration (now the Johnson Graduate School of Management). The logic that led to joining business and public administration, as he explained it, was that:

“Relations between government and business are now so close as to require little comment,”

and

“they will continue to be close in years to come. My own experience as an economist and administrator in business and in government has convinced me that both business and government have a desperate need for men and women trained in economics, business operations and practices, and in the processes of government,”

He was the natural choice as the School’s first Dean, in which position he served from 1946-52. During that period, he helped recruit the distinguished faculty that laid the foundation for B&PA’s future achievements. Two of the first appointments (1946) were John G.B. Hutchins (business history) and William H. Shannon (accounting). They were joined in 1949 by Melvin de Chazeau (economics) and Arthur E. Nilsson (finance), all of whom finished their distinguished careers at Cornell and were widely respected throughout the university. They were joined in 1951 by Edward H. Litchfield, (administration) who later served as the School’s Dean, before going on to the Presidency of the University of Pittsburgh. The total faculty consisted of nine professors in 1952, at which point President Malott appointed Paul, Dean of the College of Arts and Sciences. He served from 1952-57, the only person at Cornell to have served as dean of two major colleges in this way. In 1957, he returned to full time teaching in the Department of Economics until his retirement in 1967.

A specialist in American financial history and corporate finance, Paul published several books and articles in that field, the most prominent of which were his *Corporate Enterprise in Modern Economic Life*, in 1933; and *An Introduction to Money, Banking and Corporations*, in collaboration with John H. Patterson, in 1937. Articles included: "Coinage Legislation of 1834," in the *Journal of Political Economy*, in 1937; "The Role of Banking Groups in Corporate Reorganizations," in the *American Economic Review*, in 1939; "Wartime Rationing and Governmental Organization," in the *American Political Science Review*, in 1945; and a note, "The Scene of the Crime of 1873 Revisited," in the *Journal of Political Economy*, in 1960.

He also served as member of the Board of Directors of the prestigious National Bureau of Economic Research, then housed at Columbia University.

In consideration of those academic interests, as well as his broad experience in public life, he was invited to membership on the Board of Directors of the Tompkins County Trust Company, a position he held from 1949 until his retirement, wherefore he remained as advisor to the Board. He was a familiar, respected figure in the Ithaca community. His many friends on the hill and downtown will remember also with great affection his wife of 57 years, Hattie, daughter of Colonel Frank Barton (for many years head of the ROTC program at Cornell), who died in 1986.

Harold Bierman, Seymour Smidt, Alfred E. Kahn

John Alfred O'Regan

April 19, 1893 — October 6, 1948

John Alfred O'Regan, M.D., F. A. C. S., was born April 19, 1893 at St. John, New Brunswick, Canada and died October 6, 1948 in New York.

Dr. O'Regan received the degree of M.D., M.S., from McGill University in 1916 and thereafter served an internship at the Royal Victoria Hospital, Montreal. He was later commissioned a Captain in the British Army Medical Corps and served throughout World War I in the Near East and in India.

After leaving the army, he came to New York where he served as Resident Gynecologist at Bellevue Hospital from 1919 to 1921 and as Resident Obstetrician at the New York Lying-In Hospital in 1922.

The following year he was appointed Associate Obstetrician to the New York Lying-in Hospital which he served until his death. In 1932 he was appointed Assistant Professor of Clinical Obstetrics and Gynecology at Cornell Medical College.

Dr. O'Regan was a diplomate of the American Board of Obstetrics and Gynecology, Fellow of the American College of Surgeons, Fellow of the New York Obstetrical Society and of the American Medical Association. From 1946 to 1948 Dr. O'Regan was President of the Alumni Association of the Lying-In Hospital.

Dr. O'Regan was an outstanding physician who was greatly loved by a host of friends, patients and colleagues.

R. L. Craig

Charles Edward O'Rourke

January 4, 1896 — January 10, 1947

In attempting to put down in words a brief record of the life and attainments of Professor O'Rourke, one cannot escape sensing that his death was a most untimely loss. Although that record displays many brilliant attainments as a teacher, consulting engineer, and prolific author of articles and widely used textbooks on structural engineering, there is the feeling that here is an important page in the record of Cornell teachers cut short of final fruition.

Many classes of civil engineering students profited from his friendly and excellent teaching over the years and this is perhaps the best memorial that a teacher might hope for. Professor O'Rourke was also a man who attracted the friendship and respect of his Faculty associates, all of whom were proud of his attainments in civil engineering and his exceptional ability as a teacher.

"Pat" O'Rourke, as he was called by his many friends, was graduated from Cornell in 1917 and served as a member of the Civil Engineering Faculty from 1919 until the date of his death in the Cornell Infirmary on January 10, 1947. He became an Assistant Professor in 1923, Professor of Structural Engineering in 1934, and was Head of that Department at the time of his death. His teaching experience was broadened and enriched elsewhere during leave of absence periods. In 1921 he was Visiting Professor of Structural Engineering at the Carnegie Institute of Technology; during the years 1926-27 was in charge of the Structural Engineering Department of the Imperial University at Tientsin, China; and in 1941 he was Visiting Professor of Structural Engineering at the University of Hawaii, Honolulu.

His active and keen mind was also attracted to the practical side of civil engineering. He successfully combined his teaching career with private practice, acting as designer or structural consultant on many steel, concrete, and timber buildings, bridges and other structures. He also served as a second lieutenant in the Army during the First World War. From 1920 to 1928 he was designer for the Concrete Steel Company of New York City, and in that capacity helped design the well known Thayer Hotel at West Point. Since 1937 Professor O'Rourke had been consulting engineer for the Cooperative Grange League Federation on various stores, grain elevators, and freezer locker plants erected by that concern in New York, New Jersey, and Pennsylvania. He was a consultant for the American LaFrance-Foamite Corporation of Elmira, N. Y. in charge of a project involving the re-design of their 85 and 100 foot aerial ladders. In 1938 he was a member of the Jury of Award for the \$200,000 awarded by the James F. Lincoln Arc Welding Foundation, and in 1944 served on a special committee to formulate rules for the

1946 textbook award program. The widely publicized reinforced-concrete flight hanger for the Curtiss-Wright Company of Buffalo, N. Y. is probably the best known testimony to his skillful knowledge of design.

As a third facet to a well rounded career, Professor O'Rourke attained eminence and distinction as an author and editor in civil engineering fields. He had a gift for sensing the kind of textbooks that were needed and welcomed in the structural departments of engineering schools throughout the country. He was co-author of several such books, including "Design of Concrete Structures," "Stresses in Simple Structures," "Design of Steel Structures," "Handbook of Formulas and Tables for Engineers," and "Elementary Structural Engineering." The positions of Editor-in-Chief of the "General Engineering Handbook," and Consulting Editor of the Civil Engineering Series of the International Textbook Company of Scranton, Pa., were among his editorial activities.

Professor O'Rourke's students often remarked that he seemed to have the quality of "living" bridges and buildings. His teaching and his publications were imbued with much of this same feeling.

In spite of his busy professional career and honors achieved, Professor O'Rourke always remained a modest and friendly man who participated actively in many phases of the life of the community. He and his charming wife, the former Miss Hilda Julia Mullon of Patton, Pa., were familiar figures at social affairs. A son, Robert Edward, and a daughter, Patricia Ann, completed the family. While in college, Professor O'Rourke joined Sigma Phi Sigma Fraternity and was elected to Chi Epsilon and Tau Beta Pi, honorary engineering societies. He was also a member of Pyramid and Gargoyle, honorary architectural society.

The death of Professor O'Rourke cut short a career that all had hoped might bring forth still further achievements in the engineering profession. It is a loss to that profession, a loss to Cornell, and the civil engineering students will miss one of their best and most popular professors.

Carl Crandall, H. B. Meek, George Winter

Fred William Ocvirk

December 28, 1913 — May 21, 1967

Fred William Ocvirk was born in Chicago, Illinois, on December 28, 1913. His unexpected death, at the age of fifty-three on May 21, 1967, cut short a career of service that was notable for significant accomplishments in the past and for the promise of many more years of productivity.

Professor Ocvirk obtained his education in the field of civil engineering, receiving the B.S. degree from Wayne University in 1938 and the M.S. degree from the University of Illinois in 1940. His association with Cornell University began in 1940 when he became an instructor in the engineering science management war training program conducted by the University in Buffalo. He taught courses in mechanics, aerodynamics, aircraft structures, and civil engineering structures and was appointed Assistant Professor of Aeronautical Engineering in 1944. Later in that year he took a leave of absence to accept a position with the Johns Hopkins University Applied Physics Laboratory as a senior engineer in the design of structural components for gun directors and guided missiles.

In November of 1945, Fred Ocvirk joined the Cornell faculty in Ithaca as an Assistant Professor in the Graduate School of Aeronautical Engineering, and in 1947 he transferred to the Sibley School of Mechanical Engineering where he taught in the Department of Mechanics.

In 1949, his deep interest in the applications of engineering mechanics to problems in engineering design led him to accept an appointment for part-time research on bearing lubrication in the Department of Machine Design in the Sibley School of Mechanical Engineering. This research was a project that was sponsored by the National Advisory Committee for Aeronautics (now NASA). In 1950, he became a full-time Research Associate and in 1951 he was appointed Associate Professor of Mechanical Engineering in the Department of Machine Design. Although from this date on, the major share of his time was given to teaching undergraduate and graduate courses and to working with graduate students, his interest in and enthusiasm for lubrication research continued at a high level and at the time of his death, he was a principal investigator for a project sponsored by the National Science Foundation.

He was the author or co-author of some fifteen papers and reports on lubrication and became internationally known for his analytical development in 1952 of the “short bearing” theory. His development is now universally known as the “Ocvirk solution.” It was particularly gratifying to Professor Ocvirk when his investigations led to a better method for designing journal bearings. In the process of correlating experimental data with theoretical results it

was observed that the family of curves previously required to express the most important relationship between bearing parameters and performance criteria could be collapsed into a single curve if a particular dimensionless group, that came out of the theory, were used as the independent variable in plotting experimental data. Professor Ocvirk called this dimensionless number the “load number,” but, since 1960, others working in lubrication have called it the “Ocvirk number.”

In 1955, Professor Ocvirk was awarded the Alfred E. Hunt Memorial Medal by the American Society of Lubrication Engineers in recognition of his paper, “Measured Oil Film Pressure Distribution in Misaligned Plain Bearings,” judged to be the best paper published in 1954 on the subject of lubrication. In 1958, he received the Outstanding Alumnus Award from Wayne State University. He was promoted to Professor of Mechanical Engineering at Cornell University in 1959.

Professor Ocvirk was a major contributor to the development of new courses and curricula. He was an outstanding teacher in the classroom and further gave much of his time in helping students individually in his office. He regularly was in charge of a multisectioned course, and he worked diligently and enthusiastically with his fellow professors in planning the course. Although he was interested in every facet of machine design and had taught almost every course offered by the department, he was uniquely qualified, by education and professional engineering experience, in the subject of high-speed rotating machinery. A result of this special capability was the development of an elective course, “Mechanical Design of Turbo-machinery,” that was selected by practically every graduate student with a major or minor in machine design. Taking this course was a particularly valuable experience because of the opportunity for getting thoroughly acquainted with Professor Ocvirk’s philosophy relative to engineering design, in particular, and to life, in general. Professor Ocvirk is also widely known for his text, “Mechanisms and Dynamics of Machinery,” written with H. H. Mabie, published in a second edition in 1963.

Professor Ocvirk served in a consulting capacity with many major companies and research organizations, such as the Bendix Corporation, the Boeing Airplane Company, the Carrier Corporation, the Cornell Aeronautical Laboratory, Glacier Metal Company, Ltd. of England, and the University of California.

Professor Ocvirk was a willing worker and carried more than his share of responsibility as a member of numerous honor and professional societies. He was a member of Phi Kappa Phi, Pi Tau Sigma, Sigma Xi, Tau Beta Pi, the American Society for Engineering Education, and the American Society of Mechanical Engineers. He was particularly active as a member or chairman of many important committees of both the lubrication division and the southern tier section of the American Society of Mechanical Engineers.

Professor Ocvirk's dedication to his profession left little time for the usual hobbies. His favorite method of relaxing was to travel, preferably by ship. His interest in travel began with a trip made with friends one summer while in college. The trip to the West Coast was made "on a shoestring," and Fred liked the experience and the sights so much he resolved to spend his extra money and time on travel. Almost every summer in later years found him and Mrs. Ocvirk overseas. They traveled to Hawaii and through the Panama Canal, to the West Indies, several times to Europe, and around the world. The latter trip was in conjunction with a Fulbright Award in 1963 for a visiting lectureship at the University of New South Wales in Sydney, Australia. On their way they visited with former students in India. They had planned to spend the summer of 1967 in Scandinavia.

His wife, Milacent Grimes Ocvirk, is supervisor of English in the Ithaca public schools and is associated with the work in education at Cornell University as supervisor of practice teaching in English in Ithaca public schools. Together they carried on their professional careers, and their circle of friends included many persons associated with the secondary schools of Ithaca as well as Cornell University.

Arthur H. Burr, George B. Dubois, Dennis G. Shepherd, Richard M. Phelan

Henry Neely Ogden

April 30, 1868 — September 29, 1947

Henry Neely Ogden was born on April 30, 1868 at Dexter, Maine, the son of the Rev. Charles Talcott Ogden, and a descendant of John Ogden an Englishman, who emigrated to Long Island in 1640 and who finally settled in Elizabethtown, New Jersey, in 1664.

As a boy Henry Neely Ogden attended Episcopal Academy in Philadelphia for two years, and Cheltenham Academy in Cheltenham, a suburb of Philadelphia, for five years. During these years he resided with an aunt, Miss Frances E. Bennett, principal of the Ogontz School, and had an opportunity of observing the daily life and problems and compensations of one engaged in teaching as a calling. At Cheltenham Academy he was awarded the Fold Medal for general scholastic excellence.

In fact, when the time came for him to enter college his father and his mother would have preferred to have him prepare himself to enter the ministry, but while the idea appealed to him his interest in things mechanical and his diffidence about speaking in public at that time led him to matriculate in September 1885, in the College of Civil Engineering at Cornell University, from which he was graduated in June 1889 with the degree of Civil Engineer.

From the time of his graduation in 1889 until the time of his death in 1947 his interest in Civil Engineering, particularly in the field of Sanitary Engineering and Public Health, and in the work of the Episcopal Church led him to undertake numerous and overlapping activities.

In September 1889 he became an instructor in the College of Civil Engineering at Cornell University, remaining at such until June 1892. Having decided to obtain professional experience in Sanitary Engineering, he obtained employment with the Sanitary District of Chicago where, from June 1892 to June 1893, he gained experience as transitman, and in the office. From June 1893 to June 1894 he practiced engineering at Norfolk, Virginia, with J. E. Hill, under the firm name of Hill and Ogden. From June to October 1894 he was employed as City Engineer for the city of Deering, Maine. However, in October 1894 his interest in teaching as a vocation led him to return to Cornell University as an instructor and from that time until his death on September 29, 1947 he remained a member of the Civil Engineering Faculty at Cornell, serving as Asst. Professor from 1898 to 1908; as Professor from July 1, 1908 to July 1, 1938; and as Professor Emeritus from July 1, 1938 to the time of his death.

During his period of service as a member of the Civil Engineering Faculty he availed himself of sabbatic leaves on

three occasions: February to June in 1906 and in 1914, and from September 1925 to February 1926. Concurrently with his return to Cornell as an instructor in 1894 he began actively to engage in Sanitary and Public Health Engineering, and in the work of the Episcopal Church.

From 1895 until the time of his death he was employed in numerous engineering and other activities, in addition to his teaching duties. As an engineer and a consultant he served the cities of Ithaca, N. Y.; Akron, Ohio; Binghamton, N. Y.; Grove City, Pa.; Sandpoint, Idaho; Groton, N. Y.; Richmond, Indiana; the New York State Health Department; the public Health Council of the State of New York; and the Government of Cuba.

As an author, in addition to numerous articles of a technical character, he wrote three books: "Sewer Design" in 1899, "Sewer Construction" in 1908, "Rural Hygiene" in 1913, and was a joint author with H. B. Cleveland of "Practical Methods of Sewage Disposal for Residences, Hotels, and Institutions" in 1912.

During his sophomore year in college, again in 1890 and a third time in 1910 he visited Europe going to England, Germany and France to study and inspect the construction and operation of sewerage works. Numerous lantern slides prepared from photographs taken on the last trip attest to his regard for European practice, and now form a part of the educational equipment of the Department of Sanitary Engineering at Cornell University. When he began his career as a teacher of Sanitary Engineering the engineers of this country depended largely upon the result of research at the Lawrence, Mass. Experiment Station and upon European experience and practice. Professor Ogden's high regard for foreign practice is further attested by his attendance at the International Congress of Hygiene held at Brighton, England, in 1890 and his membership in the Royal Sanitary Institute of England. The esteem in which he was held by his English contemporaries is evidenced by his election to honorary membership in the Association of Managers of Sewage Disposal Plants of England, and by his appointment by the Council of the Royal Sanitary Institute to be one of the delegates from the Institute to the International Engineering Congress at San Francisco in June, 1915.

He claimed gardening and carpentry as hobbies, but considered Administrative Church Control as a special avocation. His service as a Trustee at St. Faith's School at Saratoga Springs, N. Y. and of St. Stephen's College, (now known as Bard College) at Annandale, N. Y.; his active participation in the life of St. John's Episcopal Church of Ithaca, over a period of sixty-two years, serving the church for forty-two years as vestryman and warden; his many years of service as a lay delegate to the annual conventions of the diocese, a delegate to the Provincial Synods, and a deputy from the diocese to six General Conventions; his membership in the Diocesan Council and on the

Provincial Board of Religious Education; furnish ample evidence that he had a special interest in such work, and that his father's career exerted a marked influence upon his activity.

As a teacher his success was unquestioned by those who knew him—Colleagues and students alike. Almost to the time of his retirement he was the fortunate possessor of a strong physique which enabled him to work long hours and to carry on numerous activities concurrently. His keen and energetic mind; his constant urge to more activity; his analytical ability and his varied experience which enabled him to present the subject matter of the occasion to his students in a stimulating manner; his early recognition of the value, to the engineer, of a training broader than technical subject matter, which led him to offer instruction in a course dealing with the association of engineers with municipal officials, and in another course involving the use of the written word and called "Technical Reports"; made him an outstanding member of the Faculty of the College during his long career as a teacher. The exhibit which he prepared for the Fifteenth International Congress on Hygiene held at Washington, D. C. in September and October 1912 received a Diploma of Merit awarded to the "Department of Sanitary Engineering, College of Civil Engineering, Cornell University" . . . "for an exhibit of its practical methods of Instruction," and demonstrated his belief in an educational effort extending beyond the classroom.

As a member of the American Society of Civil Engineers, and a registered professional civil engineer; as a member of the American Society of Municipal Improvements, the Royal Sanitary Institute of Great Britain and the New York State Sewage Works Association; as a member of the honorary scientific society of Sigma Xi; as a trustee of three colleges, including Wells College not previously mentioned; as one who assumed an active part and rendered much service to his College, his church, his home city, and his state, Professor Ogden leaves an enviable record of accomplishment and one which will serve as an incentive and a challenge to those who follow.

Ernest Merritt, P. H. Underwood, C. L. Walker

Robert Morris Ogden

July 6, 1877 — March 2, 1959

Robert Morris Ogden, born in Binghamton, New York, entered Cornell as a student of engineering. In his sophomore year, he transferred to the College of Arts and Sciences, from which he graduated in 1901 with the degree of B.S. Having as an undergraduate become deeply interested in psychology, he went for graduate study to the University of Wurzburg, one of the distinguished centers of research in that subject, and there earned the degree of Ph.D. in 1903.

Upon his return to the United States, Professor Ogden was, until 1905, an assistant in psychology at the University of Missouri. While at Missouri, he married Nellie Dorsey in 1905. Between 1905 and 1914, he advanced from the rank of Assistant Professor to that of Professor of Philosophy and Psychology at the University of Tennessee. The following two years he spent at the University of Kansas as Professor of Psychology. In 1916, he returned to Cornell, becoming Professor of Education and chairman of the department. He continued as chairman until 1931. In 1939, he was appointed Professor of Psychology. From 1919 to 1923, he was chairman of the administrative board of the Cornell Summer Session. During the spring semester of 1923, he was lecturer in psychology at the Harvard Graduate School of Education. On July 1, 1923, Robert Ogden began his term as Dean of the College of Arts and Sciences, an office he held until retirement on June 30, 1945, when he became Professor Emeritus. In recent years, he devoted much of his time to selecting and editing certain newly discovered papers of Andrew D. White, which have since been published by the Cornell University Library.

Professor Ogden was president of the Southern Society of Philosophy and Psychology in 1912; and from 1913 to 1916 he served as secretary-treasurer of the American Psychological Association. He held the following offices as well: cooperative editor of the *Psychological Bulletin*, 1909-1929, and of the *American Journal of Psychology*, 1926-1958; councillor of the American Psychological Association, 1918-1920; vice-president of the psychology section of the American Association for the Advancement of Science, 1936; president of the Association for the Advancement of Science, 1936; president of the Association of Colleges and Universities of the State of New York, 1938-1939; president of the Division on Aesthetics, American Psychological Association, 1954. In addition to these activities, Professor Ogden maintained an active interest in professional and academic societies: Phi Beta Kappa, Sigma Xi, Phi Kappa Phi, and Phi Delta Kappa.

This mere recital of positions and offices held by Robert Ogden indicates his versatility and the range of his interests but does not provide an adequate description of the man. His distinction derives not only from the quality and duration of his services to Cornell and other institutions, but also from the banner in which he worked and from the kind of person he was.

Professor Ogden had tremendous capacity for work: teaching, administration, committee duties, research, writing. Yet he never appeared to be driven or impatient; he was always courteous, gracious, and free with his time, whether his visitor was a senior professor, a fledgling instructor, or a student.

As scholar and scientist, Robert Ogden was extraordinarily modest, his achievements notwithstanding. He was the author of *The Psychology of Art* (1938), *Hearing* (1924), *Psychology and Education* (1926 and 1932), and *An Introduction to General Psychology* (1914). With Max Meyer he translated from German, *The Problem of Form in Painting and Sculpture* (by Adolf Hildebrand) (1907), and also from German, *The Growth of the Mind* (by Kurt Koffka) (1924). In addition, he contributed many papers to learned journals.

Professor Ogden's rendering of Koffka's book was the first volume published in the United States in the field of *Gestalt* psychology—a psychological theory which Ogden introduced, expounded, and developed in this country also through his *Psychology and Education*, the first book written on the subject by an American scholar. Furthermore, he was responsible for bringing to Cornell, from Germany, three of four leaders in Gestalt psychology, men who later settled in this country. Thus Ogden was the first American “gestalt psychologist”; he was principally responsible for introducing a theory which has since had wide influence upon psychological theory and research.

As Dean, he maintained that his colleagues, the faculty, were the College; that his duties were to provide leadership and initiative, to coordinate and reconcile, to execute the mandates of the faculty; for he followed the principle that he represented a company of peers in teaching, science, and scholarship. With noteworthy success he guided the College of Arts and Sciences through a long period of development and progress, including the critical years of World War II. He impressed his colleagues by the quiet, easy efficiency with which he handled problems; by his open-mindedness; by his friendly but perceptive interest in younger members of the faculty; and, by the soundness of his judgments when he was presented with unusual problems.

Robert Ogden was a man of broad culture, charm, and urbanity. He was gentle but not weak in his personal relations; he was of good humor but well aware of values; he was generous in his judgments but not uncritical; in short, he was an ideal colleague and friend. All who knew him and worked with him realize that, as Professor

and Dean, he contributed greatly, though in a characteristically unobtrusive way, to Cornell's development in an illustrious period of her history.

F. S. Freeman, Harry Caplan, P. M. O'Leary

Robert Carroll Ogle

March 28, 1889 — September 9, 1967

Robert Carroll Ogle, Professor of Poultry Husbandry, Emeritus, served Cornell University and the poultry industry well for thirty-five years.

Professor Ogle was typical of many early extension specialists in that he had no formal training in his specialty. His early training and experience were in the fields of law and business administration and he was employed for several years in the offices of the Western Maryland Railroad in Baltimore, the city of his birth. He was forced to give up this employment because of an attack of tuberculosis. A year at the Trudeau Sanatorium at Saranac Lake, New York, resulted in the recovery of his health, but he was advised not to return to indoor work, and shortly thereafter he developed a commercial poultry farm in Rockland County. Professor Ogle was an innovator and soon developed a number of special fields in connection with his new enterprise, particularly in marketing. His successful management drew the attention of others, and he became a consultant to a number of large commercial poultry operations in nearby areas. Professor Ogle was a promoter and soon became active in the organization of several special and general farm organizations.

His activities and success in these efforts brought him to the attention of Professor J. E. Rice, then Head of the Poultry Department of Cornell, who hired him to supervise cost account projects and to do some extension teaching in the lower Hudson Valley and on Long Island. In 1924 he was appointed instructor and was transferred to Ithaca. In 1940 he became an Assistant Professor of Poultry Extension, Associate Professor in 1946, and Professor Emeritus in 1953.

Few in poultry extension work were more widely known than Bob Ogle. He was equally at home with the fanciers who devoted their time to the breeding and exhibition of standard bred poultry and with the poultryman whose primary interest was in economic returns. His services to the former were recognized in 1947 at the Boston Poultry Show when he received an award for outstanding contributions to the poultry industry. This was a rare recognition since the exhibition poultryman had little in common with the staff of the agricultural colleges where the emphasis was on economic aspects of the industry.

Professor Ogle served as a poultry specialist until 1931 when he was given the responsibility of developing and supervising two New York State Poultry Testing Stations, one at Horseheads and one at Stafford. With his

customary enthusiasm and attention to detail, he set out to make them two of the outstanding test stations in the country and in this he succeeded. He also served as poultry editor for several general agricultural journals.

In 1954, Professor Ogle felt the need of a new challenge and assumed the responsibility of revitalizing the extension program for young people, the 4-H educational endeavor. With his customary energy and enthusiasm, he devoted all his talents of organization and ingenuity to making it an outstanding success. It was a remarkable feat for a man who had spent all his career with adults to be able to make the transition that he did to working with youth. Professor Ogle developed a variety of teaching materials for the use of 4-H agents and volunteer leaders. The annual award trip to New York City, which he started, continues as an important part of the 4-H program with its emphasis on acquainting youth with employment opportunities in the poultry industry. Under his leadership 4-H poultry enrollment increased nearly 50 percent. In 1952, the Cornell Chapter of Epsilon Sigma Phi presented Professor Ogle with an Award of Merit for outstanding leadership in developing the extension youth program in poultry.

The extension leaders with whom he worked always spoke highly of his efforts and the results. He was active in regional programs, and the Northeastern Poultry Producers Council gave him special recognition for his extensive teaching work with adults and youth.

Professor Ogle is survived by six daughters, twenty-five grandchildren, one great grandchild, and a sister. Mrs. Ogle died in 1965.

Robert C. Baker, Wilbur F. Pease, J. H. Bruckner

Don Ohadike

October 4, 1941 — August 28, 2005

It is with deep sorrow that the family of Don Ohadike and the faculty, staff, and students of the Africana Studies and Research Center at Cornell University announce the passing of Professor Don Ohadike. Professor Don Ohadike, the prominent scholar of West African history and former Director of the Africana Studies and Research Center, died on Sunday, August 28, 2005. Professor Ohadike, who joined Cornell's Africana Studies and Research Center as an Assistant Professor in 1989, served as an Associate Professor since 1996, and as Director of the Africana Studies and Research Center from 2001-2005. Prior to joining Cornell, he held academic appointments and prestigious visiting and postdoctoral fellowships at several institutions, including Stanford University in 1988 and Northwestern University in 1988-89; University of Jos in Nigeria as Chair of History Department from 1984-88; and as lecturer at the School of Humanities, University of Port Harcourt in Nigeria from 1977-79. Ohadike earned his M.A. and Ph.D. degrees in History from the University of Birmingham in England in 1977 and the University of Jos in 1984, respectively; and his B.A. degree in History and Archaeology from the University of Nigeria in Nsukka in 1975.

Ohadike was among the best and most productive scholars of his generation in the field of African history and more specifically West African history. In the field of African and Diaspora history, Ohadike represented the uncommon combination of an active scholar, a committed teacher and a good citizen of the university and the profession. Above all, he was a very fine human being. This combination enabled him to pursue new paths of exploration and analysis in the research and teaching of African and African Diaspora history. He was impressive in the range of his work and the depth of his knowledge of African history. His scholarly work covered several areas including slavery in Africa; anti-slavery and anti-colonial resistance movements in Africa and the African Diaspora; disease, epidemiology and food security in Africa; and Nigerian history.

Ohadike authored several books and articles in scholarly journals. His published books include: *The Ekumeku Movement: Western Igbo Resistance to the British Conquest of Nigeria, 1883-1914* (Athens: Ohio University Press, 1991), *Anioma: A Social History of the Western Igbo People* (Athens: Ohio University Press, 1994), and *Pan-African Culture of Resistance: A History of Liberation Movements in Africa and the Diaspora* (Binghamton: Institute of Global Cultural Studies, Binghamton University, 2002). He also completed a manuscript on resistance movements in Africa and the African Diaspora, tentatively called *The Sacred Drums of Liberation: Religions and Music of Resistance in Africa and the Diaspora*. He was working on the manuscript just a few days before his passing. A

clear indication of Ohadike's highly regarded status in the field of Igbo history and culture was the invitation by Heinemann, the original publishers of the famous *African Writers Series*, to write the introduction to Chinua Achebe's masterpiece, *Things Fall Apart*, which he did for its 1996 edition.

Don Ohadike was an outstanding and exemplary teacher. His commitment to teaching and to bridging his scholarship and practice in the classroom was clearly illuminated in the record of highly innovative courses that he taught at the graduate and undergraduate levels. All the courses he taught embodied his philosophy of bridging his research and teaching. His course on African Cultures and Civilizations, which he taught for 14 years, attracted more than 100 students per semester. Ohadike was known as a great storyteller and students often left his classroom with smiles on their faces. Over the years, Ohadike had gained the reputation among his former students as a passionate, compelling teacher and a highly respected mentor.

In Igbo society, a person's greatness is measured by earned titles and by a concurrence reached with the guardian spirit called *chi*.

Ohadike had them both; he was indeed a great person with many accomplished and well-deserved titles. In Ohadike's passing, the Africana Center and Cornell University as well as the Ithaca community that he wholeheartedly embraced, have certainly lost an extremely generous colleague and a very wonderful human being. His memory is going to stay with us for a long time to come.

Don Ohadike was born on October 4, 1941 in the city of Jos in Plateau State, Nigeria. He is survived by two sons, Azuka Ohadike, of Lagos, Nigeria and James Ohadike, of Jersey City, New Jersey; two daughters, Ophelia Ohadike of Washington, D.C., and Sandra Ohadike, of Silver Springs, Maryland; wife, Veronica Ohadike; and four grandchildren, Jason Obinna Ohadike-Sidle, Cassandra Nneka Ohadike-Sidle, Olisemeka Ohadike, and Oluchukwu Ohadike.

Ayele Bekerie, Salah Hassan, Robert Harris

Peter Olafson

January 25, 1897 — September 3, 1985

“Cattle die, kinfolk die, even to us ourselves will death come. But the good fame which a man has won for himself will never die.” These words from the Icelandic poem “Hávamál” were suggested to us by Lennart Krook and Leon Saunders. Their simple elegance defines the life philosophy of Dr. Peter Olafson.

He was the son of Sigurbjorg and Olafur K. Olafson, Icelanders who had settled in Gardar, North Dakota. His rural upbringing taught him resourcefulness and self-sufficiency, traits that he never outlived. When his primary and secondary schooling was completed, he spent seven years on his father’s farm at Edinburg, North Dakota. In addition to his farm duties, he taught all eight grades at a local rural grammar school.

In 1922 he matriculated at North Dakota State Agricultural College and in the spring of 1924 completed the veterinary courses offered. During that summer he worked in the laboratory of Dr. Schalk, a veterinarian well known for his work in ruminant digestion.

That autumn he entered the New York State Veterinary College [at Cornell] as a third-year student. He was awarded the D.V.M. degree in 1926, having spent his final year as an instructor in the Department of Pathology and Bacteriology.

Beginning as an assistant professor following his graduation in 1926, he earned an M.S. degree in 1927, became a professor in 1936, and was named head of the department in 1946.

Dr. Olafson’s capacity for research and medical inquiry was enhanced by postgraduate work for a summer with Percival Bailey in Chicago and in 1935 with Karl Nieberle at Leipzig, as well as by studies in Munich and Copenhagen. Bailey and Nieberle were his role models. From this firm background he made fundamental contributions toward understanding a number of diseases in cattle. The first to describe virus diarrhea and to define listeriosis, he also studied muscular dystrophy in calves and lambs, toxoplasmosis, cardiac anomalies, “wobblers,” brain tumors, and sterility in all animals. His crowning achievement, however, was his work on hyperkeratosis in cattle.

By a conservative estimate that disease was causing losses to the cattle industry of two to four million dollars annually. In 1955-56 Olafson was sent to Israel by the U.S. Overseas Mission to help with the diagnosis and prevention of hyperkeratosis. The Israeli government presented him with a scroll of honor for his work, the first ever awarded to a non-Israeli.

Dr. Olafson was the recipient of many honors and awards. In 1959 he was elected president of the New York State Veterinary Medical Society, and that same year he was presented the Borden Award by the American Veterinary Medical Association. The state society selected him as Veterinarian of the Year in 1968. He was regarded by many as an international figure. One of his cherished honors was the designation of distinguished member of the American College of Veterinary Pathologists. Probably no honor pleased him more, however, than the esteem in which he was held by his graduate students.

He was a member of the American Association of Pathologists and Bacteriologists, the American Veterinary Medical Association, the New York State Veterinary Medical Society, the Southern Tier Veterinary Medical Association, Sigma Xi, Phi Kappa Phi, Phi Zeta, the American College of Veterinary Pathologists, the Conference of Research Workers in Animal Diseases, and the International Association of Medical Museums.

Peter Olafson was a dedicated man, both to his work and his family. Through his influence on his graduate students much of his dedication has been retained in succeeding generations of veterinary pathologists. To many of these men Peter Olafson was the “Father of Pathology.” He once described his philosophy regarding research by saying: “You go up blind alleys to find one that leads somewhere. It can be discouraging—you spend a year or two on a project and then find you are just plain wrong. But there’s no point to having a nervous breakdown over it. Just wash it out and start over. Most problems can be solved if you’re resourceful and stubborn enough. No matter how worthless the results are, you usually learn something.”

Regarding his work on hyperkeratosis, his laconic remark was, “It isn’t often a man who discovers a disease lives long enough to see it disappear.”

His wife, Harriette Elizabeth Smith, whom he married in 1929, predeceased him in 1984. He is survived by four daughters: Aldies Edwards of Athens, Georgia; Sigrid Farwell of Boulder, Colorado; Erna Olafson of Lafayette, California; and Freya Olafson of Cambridge, Massachusetts.

Francis H. Fox, John M. King, Ellis R. Leonard

Charles Townsend Olcott

March 28, 1890 — August 1, 1966

Dr. Olcott, Professor of Pathology, Emeritus, Cornell University Medical College, and Consultant Pathologist to The New York Hospital, died at his country home in Orillia, Ontario, on August 1, 1966.

Charles Townsend Olcott was born in New York City on March 28, 1890. He graduated A.B., Princeton, in 1911, and M.D., Cornell, in 1916. After holding an internship in The New York Hospital from July 1916 to January 1918, he entered the Medical Corps of the United States Army in February 1918 and served for some time at the Walter Reed Hospital. After the armistice he was medical officer with the American Expeditionary Force in Siberia. In 1920, Dr. Olcott taught at the Medical School of the University of Colorado and served as resident physician at St. Luke's Hospital in Denver. On leaving Colorado, he became research assistant in bacteriology at the Highland Hospital, Rochester, New York.

In 1926, he was appointed instructor in pathology at Cornell Medical College and in 1927, Assistant Pathologist to The New York Hospital. Dr. Olcott served under Doctors Ewing, Opie, Dock, and Kidd as instructor, Assistant Professor, and Associate Professor of Pathology until his retirement in 1958. Since that time, as Professor, Emeritus, he had worked constantly in the Department of Pathology until the time of his death—in all, a period of forty years.

Dr. Olcott was a former president of the New York Pathological Society, a diplomate of the American Board of Pathology, a member of the American Association of Pathologists and Bacteriologists, a member of the American Association for Cancer Research, a member of the International Academy of Pathology and a member of the New York Academy of Medicine. In addition, Dr. Olcott was formerly vice-president and a director of the Hudson River Day Line of which his grandfather, Alfred Van Santvoord, was founder and president.

Throughout his academic career, Dr. Olcott published numerous papers including some on experimental argyrosis and on spontaneous tumors in animals. In 1934, with Dr. Nathan Chandler Foot, he made observations on Letterer-Siwe's disease which led to a clearer understanding of this condition. He was greatly interested in the histological types of bronchogenic carcinoma and in 1955, propounded the hypothesis that one cell type of this tumor may transfer into other cell types. During the past few years Dr. Olcott became interested in the natural history of various types of malignant tumors, and this work was completed a few months before his death and is ready for publication.

Dr. Olcott was widely traveled and had a variety of interests, especially the history of medicine. In his youth he had visited many of the famous pathological institutes in Germany and was an authority on the history of pathology and especially its development in the United States.

Both students and colleagues respected Dr. Olcott; he was a gentleman of the old school with an air of kindness and friendliness about him which on numerous occasions gave encouragement to many an inexperienced member of the staff. He took a great interest in the young pathologists in training and on many occasions helped them, not only professionally but with their personal problems also.

Dr. Olcott will be remembered in this medical center not only for the help he gave to many but also for his personal characteristics. His tall, distinguished, white-haired figure was frequently seen at clinical pathological conferences, evening lectures, and many pathology meetings. He was never alone in the doctors' dining room. His humor, love of argument, friendliness and enthusiasm always ensured a gathering of young and old around him. Dr. Olcott lived a long life and a full one, to those who were privileged to know him and associate with him he was a steadfast friend and a most amicable companion.

Dr. Olcott is survived by his widow, the former Katherine Eaton; two sons, Peter Alexander, and Andrew Eaton; a daughter, Miss Kate Van Santvoord Olcott; a brother, Mason of Claremont, California; and a sister, Miss Katharine Van Santvoord of New York.

A. Whitley Branwood, M.D.

James Edward Oliver

Professor of Mathematics

— *March 27, 1895*

The Faculty of Cornell University, desiring to show their appreciation of the character and services of their late colleague, Professor Oliver, have directed that the following expression of their sorrow and sympathy be incorporated in their records, and be communicated to the family of their departed associate.

In the death of James Edward Oliver this Faculty mourn the loss of a colleague endeared to them through many years of intimate association, by his warm friendliness, his frank and gentle nature, his patient conscientiousness, and his steadfast adherence to high standards of thought and conduct.

In him the body of students have lost a faithful and inspiring teacher, and a devoted friend and the cause of education is deprived of a liberal and earnest advocate, and a thinker original and profound.

His memory will always be cherished as one who long bore a prominent part in the development of the University, and contributed greatly in matters of scholarship and administration to its progress and success.

Roy A. Olney

June 4, 1891 — October 7, 1949

The sudden death of Roy A. Olney on October 7, 1949, marked the passing of one who has served the field of Agricultural Education not only at Cornell University and in the State of New York but also in the States of North Carolina and West Virginia.

Roy A. Olney was born on a farm near Victor, New York, June 4, 1891. He graduated from the Victor High School in 1911 and entered Cornell University, graduating with a B.S. degree in 1915 as a member of one of the first groups trained to teach Vocational Agriculture in secondary schools. He taught Vocational Agriculture at the Union Academy of Belleville from 1915-18; he served as a critic teacher in the Trumansburg Practice Center from 1918-1920; and then served for three years as assistant state supervisor in North Carolina. He joined the staff in Agricultural Education at West Virginia University in 1923 as an assistant professor; he was appointed an associate professor in 1929, upon the completion of his Ph.D. degree, and continued to serve the State of West Virginia as a teacher trainer and itinerant teacher trainer for a total period of fifteen years, or until 1938. He resigned his position in West Virginia to become an Assistant Professor of Rural Education at Cornell University to work in the program for training teachers of Vocational Agriculture. He was appointed Associate Professor in 1942 and became Chairman of the Agricultural Division of the Department of Rural Education, upon the retirement of Professor R. M. Stewart in 1946. He became Professor of Rural Education in 1947.

In addition to his regular appointments, Professor Olney conducted a special survey in Pennsylvania and served as a member of the Summer Session staff at Iowa State College in 1938 and at the University of Vermont in 1944.

Professor Olney was an active member of the Association of Teachers of Agriculture of New York, the New York State Vocational and Practical Arts Association, the American Vocational Association, the Theta Chapter of Phi Delta Kappa and several community organizations. One of his greatest services to organizations was made to the Future Farmers of America as chairman of the Board of Trustees of the State F.F.A. Camp at Camp Oswegatchie. He was tireless in his efforts to make the camp a success and his achievements in raising funds and in shaping camp policy were outstanding. He also served on several important educational committees and councils in his own department.

During the period from 1935-39, Professor Olney was editor of the Agricultural Education Magazine. In this capacity he made a decided contribution to the literature of his field. He also served with the State Supervisory

staff in the Food Production War Training program during World War II with a major responsibility for supplying teaching materials, of the emergency type, to our teachers of Vocational Agriculture in New York, who were actively engaged in conducting courses for increasing the production of agricultural commodities. As a result of studying and evaluating all the supervised farming programs of all boys enrolled in Vocational Agriculture in New York, he compiled a valuable summary in mimeographed form. This was entitled, "Farming Programs for Pupils in Vocational Agriculture", 1946, and it has been a valuable contribution to the field of Vocational Education in Agriculture.

Professor Olney's greatest contribution was made as a teacher. His many former students, both in New York and West Virginia, have testified as to his teaching success. One of his last professional contributions was made in relation to our present plan of apprentice teaching in training teachers of Vocational Agriculture in New York. This plan has met with general approval throughout the State. His point-of-view was always practical in nature, as directed toward useful applications of his teachings. More specifically, this might be called the pragmatic point-of-view.

It may be said that Professor Olney was a good representative of the field of thought that directs students to seek the application of principles; to study and use scientific findings; or to conduct original research in the pursuit of knowledge to be used in the solution of practical problems. Though Professor Olney gave his life to the cause of Agricultural Education, his philosophy will live on for it may be truthfully said of him that Agricultural Education was only his medium for teaching boys and in turn for teaching men to become leaders in directing the lives of rural youth.

Professor Olney's personal characteristics were strongly reflected in his philosophy of education. He was well known for his cheerfulness and friendly attitude toward life; for his loyalty to a worthwhile cause; and for his cooperative spirit toward the several services related to his own. These and many other fine personal qualities will long live in the hearts of his students and associates.

E. R. Hoskins, S. W. Warren, F. B. Wright

Gerald W. Olson

March 22, 1932 — October 31, 1987

Gerald W. Olson was associate professor of soil science in the Agronomy Department at Cornell University. He was born in Gothenburg, Nebraska. He received his B.S. in technical science in agriculture in 1954; M.S. in soil microbiology in 1959 from the University of Nebraska; and Ph.D. from the University of Wisconsin in 1962 in soil genesis and morphology where he also served as Soil Survey Field Party Chief for Wisconsin Geological and Natural History Survey. His career at Cornell began in 1962 as soil technologist and he was promoted to assistant professor of soil science in 1966.

Gerry was one of the first soil scientists to specialize in soil resource development for nonfarm use of soils. He conducted research on the influence of soil properties on past and present land use. He taught a course on the use of soil resource inventories for land use planning, and served as a resource person for Cooperative Extension. He was respected by town planners, county boards of legislatures and cooperative extension agents for his ability to interpret and teach soils information for nonfarm uses. His many publications on interpretation of Soil Surveys for nonfarm use will serve as a guide for future generations within this area. His two books *Soil and the Environment* (1981) and *Field Guide to Soils and the Environment* (1984) are used as college texts. Gerry was active in many organizations, especially with the American Society of Agronomy and recently served as president of the Soil Conservation Society of America. He was elected a fellow of the American Association for the Advancement of Science in 1982 and in the Soil Conservation Society of America in 1987.

As senior consultant to the Food and Agriculture Organization of the United Nations and the United States Agency for International Development, Dr. Olson witnessed the effects of mismanagement of soil resources. He worked on solutions to issues of world hunger in numerous developing countries. He theorized that there was a relationship between the quality of life and soil characteristics especially for earlier cultures. Because of this he believed that the landowner was only a steward of the land and had the responsibility to treat the soils with the care and respect due their important position within the environment.

Gerry served as consultant on soil evaluations and interpretations for archeological expeditions at Tikal El Peten, Guatemala and in Saris, Turkey; Gerry concluded that the demise of the Mayan culture was the direct result of their misuse and mismanagement of soil.

He was quoted in the *Cornell Daily Sun* on March 3, 1986 as saying “the environmental situation is closely linked with the political situation. Real national security is in the stability and productivity of the environment and in all social and moral strength of the people — not in military armaments.” This is further evidence of the importance he placed upon the care and use of the environment resources.

Gerry was pleased to be a faculty member at Cornell, but his greatest pleasure was that he and his wife Mary had three sons, Bradford, David, and Eric, to graduate from Cornell.

Ray B. Bryant, Robert F. Lucey, W. Shaw Reid

Paul Olum

August 16, 1918 — January 19, 2001

Professor Emeritus Paul Olum, formerly of the Department of Mathematics at Cornell, died on January 19, 2001 in Natick, Massachusetts, having suffered for some years from a variant of Alzheimer's disease. He served with distinction on the Cornell faculty from 1949-74, at which time he left to become Dean of the College of Natural Sciences at the University of Texas at Austin. Paul was predeceased in 1986 by his wife, Vivian—nee Goldstein—a 1957 Cornell Ph.D. in Psychology; and by his daughter, Judith in 1990. He is survived by a daughter, Joyce Olum-Galaski, a rabbi in Amherst, Massachusetts; and by his son, Ken, of Sharon, Massachusetts, who is a Research Associate in Physics at Tufts University.

In 1976, Paul left Texas for the University of Oregon to serve as Vice President for Academic Affairs and Provost and later as President. He retired from that position in 1988 upon reaching the age of 70. In 1989, he moved to Greece to be with his friend and companion, Margarita Papandreou. His illness forced him to return to the United States in 1996 to live with his son, Ken, and Ken's partner, Valerie White.

Despite Olum's early departure from Cornell, his department colleagues, as well as former Cornell President Dale R. Corson, strongly supported his nomination for emeritus status in light of his many years of service both to the department and to the university.

Paul was born in Binghamton, New York, on August 16, 1918, and received his early education there. He attended Harvard University, earning an A.B. degree summa cum laude in Mathematics in 1940. The world-renowned mathematician Hassler Whitney, who was destined to become Paul's graduate thesis advisor after World War II, wrote that Paul's senior thesis was "almost the equivalent of a Ph.D. thesis." Nevertheless, Paul went to Princeton University to begin graduate work in physics—which at the time he felt was "more 'real' than mathematics." However, his outlook changed.

"Two years later, I came to the conclusion that this was pretty illusory and that one can make quite as good a philosophical case for the reality of the formal world of mathematics as for the particular world we happen to live in, and anyhow I liked mathematics better, so I changed back and [in 1942] got an M.A. degree in it."

Many years later, Paul related an amusing anecdote that may reveal an additional dimension to his career decisions in 1940-1942. Paul stated that he did leave mathematics and go to Princeton as a graduate student in physics. However, his office mate in Princeton was clearly so much more brilliant and able, that Paul became discouraged.

If that's what it took to do graduate work in physics at Princeton, well, then he just wasn't up to it. So he switched back to mathematics. The punch line to the story, which Paul related with obvious relish, was that the office mate was the legendary Richard Feynman. So the mathematics community has Feynman to thank for returning Paul to the fold.

In that period, Paul joined the physicists at Princeton who were working on the Manhattan Project. Feynman, who remained a lifelong friend, was later to write of Olum,

“He was of very great practical assistance both there at Princeton and at Los Alamos, which we went to later. Although primarily interested in [the mathematical field of] topology, his interests and knowledge were sufficiently broad to enable him to contribute in important ways to physical and mathematical problems arising in engineering the atomic bomb . . . I believe he joined the project through a feeling of social responsibility and the belief that he could be of greater service on a project such as ours.”

Olum spent the period 1943-46 in Los Alamos, but at the end of that time decided to return to Harvard, where he received his Ph.D. degree in Mathematics in 1947 under Hassler Whitney. After one postdoctoral year at Harvard and another at the Institute for Advanced Study, Olum joined the Cornell faculty as an Assistant Professor in the Department of Mathematics. At that time, he was the only representative of the field of algebraic topology. Historically, that field has deep roots, but it was in the twentieth century, particularly in the latter half, that it would grow into a broad and powerful subject that would touch virtually every branch of mathematics. Olum was clearly aware of the historical trajectory of his field, and while he was anything but parochial in his interests and in his leanings in faculty development, he vigorously and successfully encouraged the growth of topology in the department. Paul was quickly promoted to Associate Professor (1951) and became a full Professor in 1957. He served as department chair from 1963 to 1966.

Some words are now in order about Paul's own work in topology, and this in turn requires a few words by way of background. Algebraic topology is an outgrowth of certain combinatorial and geometric problems involving graphs, networks, surfaces, and solids that go back as far as the sixteenth and seventeenth centuries. The basic problem has been to get some sort of numerical, algebraic or computational handle on the vast variety of geometric objects with which mathematics and physics are confronted. Numbers and algebraic entities are amenable to systematic symbolic manipulation and analysis, whereas geometric entities generally are less so. Thus, connecting the two could provide a powerful method for analyzing the latter. Topology concerns itself with the properties of geometric objects—or, as topologists say, properties of “spaces”—that are invariant under continuous transformation. Numerical or algebraic quantities that are associated with spaces and remain unchanged under

such transformations are known as “topological invariants.” Thus, for example, if two spaces have different topological invariants, then they cannot be continuously transformed to one another. Even such limited, negative information has useful applications, for example to the theory of differential equations in applied mathematics and physics. Of course, such invariants should be meaningful and non-vacuous in terms of our geometric intuition, and one has to be able to define them precisely and effectively, as well as to compute them. Such requirements pose formidable problems: indeed, they form the core of the subject of algebraic topology.

Paul’s specialty in algebraic topology was the study of certain kinds of invariants known as “obstructions.” They arise in the following schematic way. Try to continuously transform (or map) one space to another. This may be very hard, but perhaps you can do so with a small, simple piece of one to a small piece of the other—so far, so good. Now try to enlarge the domain of the transformation by extending it to another small, simple piece, and so on. Perhaps in this way, after a number of such steps, you can get the complete transformation. Or perhaps you get stuck. Now, if you choose your pieces and your method of extension very carefully, you might be able to measure (by using some other simpler invariants already studied for these pieces) how badly stuck you are. With luck, the simple invariants, when equal to zero, may tell you that a small change may get you unstuck, and when not zero will tell you that no small change will help. This kind of invariant—a provisional index of success, as it were—is known as an obstruction. Paul’s thesis and subsequent article in 1950 in *Annals of Mathematics*, the flagship journal for pure mathematics—gave a comprehensive, general treatment of obstruction theory that is still a standard reference work today. Indeed, Hassler Whitney wrote with prescience in 1948: “Olm’s Ph.D. thesis, on the classification of mappings will, I believe, take its place as one of the basic contributions in algebraic topology.” Paul’s subsequent work in algebraic topology involved devising computational schemes for calculating obstructions and applying the general theory to specific problems. It should be emphasized that the theory of obstructions gives a method for tackling a vast array of topological questions, so it has played a role in a large proportion of the major topological developments of the latter half of the twentieth century. Thus Paul’s work was influential in ways that greatly transcended obstruction theory itself.

The foregoing outline of Paul’s academic and research career omits many of the qualities and activities that distinguished him. Among these qualities were his energy and enthusiasm, his personal brilliance, intellectual breadth, and articulateness, his charm and likeability and, perhaps most important, his strong moral sense, which informed all his important decisions. This was already evident in his decision to work on the Manhattan Project and would also be important later in numerous contexts, both academic and non-academic. Paul was highly regarded in the university community, playing a major role for years on numerous university committees. For

example, he served on the Academic Records Committee, the Educational Policy Committee, the Committee on Academic Freedom and Tenure, and the Humanities Council. He was also an accomplished parliamentarian, which he frequently used to great advantage at the monthly University Faculty meetings that formed the basis for faculty governance through the late nineteen sixties. During the troubles at Cornell associated with the takeover of Willard Straight in 1969, Paul was one of three faculty members asked by President Perkins to serve on an Emergency Advisory Board. Later he chaired a special committee of the Constituent Assembly to draft a constitution for the nascent University Senate and to propose changes in the structure of the Board of Trustees. Among other things, the committee recommended the creation of a student-elected trustee position. In 1971, Paul became the first faculty member elected to this position, serving as a Trustee until 1975.

Paul's department activities were similarly energetic and important. He was a strong, uncompromising advocate of high academic standards in the hiring and promotion of faculty members, and he devoted himself tirelessly to the task of faculty development throughout his tenure as department chair. He also initiated, in 1962, the Cornell "Topology Festival," an annual, regional professional gathering at which the major developments in the subject were presented. This became the most prestigious topology conference in the country for many years, and it is still held every year during the last week of Spring classes. It set the standard for the many annual topical conferences in mathematics now held around the country.

Paul became Department Chair in 1963 after a period of serious, internal department dissension. In fact, he was on leave during 1962-63 at the University of Paris and the Hebrew University in Jerusalem. During that year, the department chair had a serious falling out with the tenured faculty, the first such contretemps in department history. At a faculty meeting that was held without the knowledge of the chair, a vote of no confidence passed by a large majority. As a result, the chair left Cornell at the end of that academic year, while the department, which had always been a model of tranquility and collegiality, was rife with factionalism. "Some of the faculty were simply shattered by the turmoil," recalls Anil Nerode, who has been a member of the department faculty since 1959. Paul, both by the fortuitous event of his absence and because of the esteem in which he was held by the entire mathematics faculty, became the obvious choice to head the department. Of Paul's success in restoring tranquility, the then Provost, Dale Corson—a friend of Paul's from their Los Alamos days—was later to write:

"He was Chairman of the Department of Mathematics during a period of turmoil and did an excellent job in bringing order out of chaos and restoring the Department to an effective group working together toward common goals."

Paul's tenure at the University of Texas was brief, and this deserves some further mention. At the time of his departure from Cornell in 1974, Paul was a leading candidate for the position of Dean of the College of Arts and Sciences. He was also being courted by the University of Texas, more specifically, by its President, Steven Spurr, to become Dean of the College of Natural Sciences. Paul had made a conscious decision to leave research mathematics (though perhaps not teaching) and to devote the last decade of his career to academic administration. He felt that this was where he could have the biggest influence on academic programs. He was very favorably impressed by President Spurr, particularly by the latter's commitment to the goal of academic excellence. Of course, Cornell shared this goal. However, Cornell certainly had nothing like the resources available to the University of Texas with which to implement the goal. In addition, one might speculate that the two institutions were so structured that Paul felt he would have greater flexibility and opportunity for achieving his academic aims at Texas. In any case, Paul did choose Texas. However, he did so without a full appreciation of the political problems at that university. That appreciation came quickly, however, and virtually on the eve of his departure from Cornell, he expressed regret at his decision and the realization that it had been a mistake. Indeed, he must have foreseen some of the serious problems ahead, for early that same Fall, President Spurr, on whom Paul had based much of his enthusiasm for the move, was fired by the Chancellor of the University of Texas without even the trappings of due process. Paul realized immediately that he had to leave Texas, and, after considering a number of offers from universities throughout the country, decided in 1976 to go to the University of Oregon.

His tenure as President of the University of Oregon will be more appropriately recorded elsewhere. Mathematical colleagues of Cornell faculty members regularly reported from the University of Oregon the universal esteem in which Paul was held by both faculty and students. From these reports it would seem that Paul did, indeed, achieve the academic goals he set for himself in university administration. In 1996, the University of Oregon honored Vivian Olum with the dedication of the Vivian Olum Child Development Center. And in 1997, the university honored Paul's presidency by dedicating the Paul Olum Atrium in the center of the new science complex, for which he (and Mark Hatfield) had secured the funding.

Dale R. Corson, George R. Livesay, Beverly H. West, Peter J. Kahn

Eugene Lindsay Opie

July 5, 1873 — March 12, 1971

The Medical Board of the New York Hospital notes with a keen sense of loss on the death of Eugene Lindsay Opie, M.D., in Bryn Mawr, Pennsylvania, on Friday, March 12, 1971, at the age of 97.

Since 1932 Dr. Opie has been a notably productive and valuable member this—and a much wider—medical community. Our high regard for him stems largely from our intimate knowledge of his important influence on medical affairs hereabouts. Before considering this influence in some detail, however, we must briefly take note of a number of previous events in his life.

He was born in Staunton, Virginia, on July 5, 1873, his parents being native Virginians and members of distinguished Virginia families. He received his bachelor's degree in 1893 from the newly founded Johns Hopkins University and his M.D. degree from Johns Hopkins Medical School in 1897.

During his training period in pathology under Welch at The Johns Hopkins Hospital (1897-1904), Dr. Opie won worldwide renown as a pathologist for his original observations on diseases of the pancreas. His book, *Diseases of the Pancreas*, published in 1904, is generally considered a classic in the literature of pathology. During this period he also won worldwide renown as medical scientist—this for his discovery of the pathogenetic relationship between injury of the cells of the islets of Langerhans and diabetes mellitus. The observation provided substantial confirmation of the important concept—initially conceived some years previously by Minkowski and others that an internal secretion (a hormone) provided by cells of the islets of Langerhans is necessary for the proper metabolism of glucose; the concept led directly to the experiments of Banting and Best a few years later in which the hormone (insulin) was directly demonstrated.

In 1904 Dr. Opie moved to New York for the first time (he was then 31 years old) to become a (founding) member of the then-fledgling Rockefeller Institute for Medical Research. It is significant that Dr. Opie, while working “full-time” as a member of The Rockefeller Institute, also served as part-time director of a newly created Department of Pathology at Columbia's College for Physicians and Surgeons and part-time Pathologist at Presbyterian Hospital during the period 1907 to 1910, this arrangement having the full knowledge and approval of the Institute and Columbia- Presbyterian; it admirably served Dr. Opie's need to “keep his hand in” as a pathologist and also to remain in close contact with clinical medicine. Russell Cecil and Eugene DuBois served as interns in pathology in the new department under Dr. Opie's direction.

In 1910 he accepted the Chair of Pathology at the newly reorganized Medical School of Washington University, St. Louis, where he served with great distinction until 1923 as teacher, pathologist, investigator, medical administrator, and humanist.

During World War I Dr. Opie served as a colonel in the medical corps of the Army, first in France in association with the Barnes Hospital–Washington University Unit—later on a commission for the study of trench fever, and finally with Francis Blake, Thomas Rivers, and others on a commission for the study of epidemic influenza and other acute respiratory infections in soldiers who, coming from distant localities across the land, were inevitably crowded into military camps. The second endeavor led to the clear demonstration that vermin spread trench fever from one soldier to another, so that its elimination could be forecast. The third endeavor brought to light much valuable medical information about the epidemiology and pathogenesis of acute infectious respiratory diseases and led to the publication of an important book.

In 1923 Dr. Opie accepted the directorship of The Henry Phipps Institute for the Study and Treatment of Tuberculosis, The University of Pennsylvania, Philadelphia. Soon thereafter he was made professor of pathology and head of the Department of Pathology at the University.

In 1932, happily for us, Dr. Opie returned to New York as pathologist of the New York Hospital, professor of pathology at Cornell University Medical College, and head of pathology in what was presently to become the New York Hospital-Cornell Medical Center. Also, most fortunately for us, he soon became a member of this Medical Board. His immense erudition, his wisdom, his rich experience, his long perspective, and his uncommon good sense were welcome indeed. Moreover they proved exceedingly useful. For at this formative stage in the development of the joint institution, the Board was often confronted by knotty administrative and pedagogic problems; these nearly always became manageable under Dr. Opie's precisely reasoned and temperate influence. In addition, his influence was called upon with ever increasing frequency by more and more of his senior colleagues in relation to problems concerning the departments they headed.

Dr. Opie's accomplishments as teacher of pathology and trainer of young pathologists here are particularly noteworthy. Mainly by example, and in an unhurried and modest yet firm and effective way, he instilled in students and Young and older colleagues a devotion to learning—in pathology, in medical science, and in clinical medicine. He brought medical students and graduates alike into awareness of the wonders and the mysteries of the autopsy and of medical research. His standards were high; others were quick to see this and adopt them. With his own hands he collected and prepared a notable series of specimens illustrating a wide gamut of gross lesions;

further, while training a neighborhood boy in the arduous task of mounting, cataloging, labeling, and arranging these specimens into a museum, he created at once the post of museum curator on the staff of the Department of Pathology, a curator who became his friend and rendered yeoman service in the teaching of pathology long after his retirement, and a pathological museum having large teaching value today.

Dr. Opie gathered around himself here a number of young associates who were later heard from in their professional careers, notably—to mention only a few—Robert A. Moore, Murray Angevine, Jacob Furth, Jules Freund, and Charles Olcott.

Also, almost incredibly, Dr. Opie managed while here to tend his own research garden—a continuation of his exceedingly important and practical studies on tuberculosis begun years before in St. Louis and carried on with increased intensity in Philadelphia. Knowledgeable critics assert that here he came closer than anyone else has yet done to demonstrating an immunologic means for preventing tuberculosis.

While here Dr. Opie served for several years on the council of The Harvey Society and was its president during the period 1936-38. In 1939 he was granted a leave of absence in order to serve as visiting professor of pathology at Peking Union Medical College; while in Peking he collected many mementos of oriental medicine, some illustrating the practice of acupuncture; presently Dr. Opie wrote a book giving his perspectives on Chinese medicine.

Following his retirement from this Medical Center in 1941 at age 68, Dr. Opie accepted a unique position—that of guest investigator at a neighboring institution, The Rockefeller Institute for Medical Research, now become Rockefeller University. There he again took up his laboratory labors full time and pursued these steadily and fruitfully for 28 years, until he was 96 years old. During this period he published numerous scientific papers and gave a third Harvey Lecture, the only scientist ever to do so. His publications show that throughout his retirement Dr. Opie thought and worked effectively on a number of quite diverse and important scientific problems, all having basic significance for pathology and medicine—e.g., the pathogenesis of cancers of the liver induced by nutritional means, cytoplasmic basophilism of parenchymal cells in relation to their content of ribonucleic acid, and the movement of water in tissues. In each instance he published his observations and data in detail in the rigorously edited *Journal of Experimental Medicine*.

As a physician of note and a near-octogenarian, Dr Opie was interviewed by the *New Yorker* in 1952 (Talk of the Town, Nov. 22). He was characterized as “... an outstanding pathologist, an authority on tuberculosis and interstitial fluid ratios, and a man of extraordinary sweetness and courtesy,” whose researches at The Rockefeller

Institute centered around changes in tissues that accompany almost all diseases. At the time, Dr. Opie said of his investigations: “. . . this kind of research goes down to foundations and has no practical aim in immediate view.”

He had a lively and gentle sense of humor that was cherished by those of his colleagues who were privileged to share it with him. It often hinged upon medical academia. A story he loved to tell ran something like this: When Dr. Opie’s much respected former chief, Professor Welch, retired from the Chair of Pathology at Hopkins, the faculty committee, appointed to recommend his successor, agreed after much deliberation that what they really needed was another Dr. Welch. At which point the professor of anatomy is said to have muttered: “Why don’t we hire two of them?”

We of the Medical Board of the New York Hospital realize that we have lost—and that medicine has lost—a noble exemplar, a creative discoverer, and a great benefactor of our profession. In this time of serious questioning and rapid change, it is good that we can contemplate numerous tangible examples having large and enduring value for Medicine. Dr. Opie’s life provides an unbroken series of such examples.

It is not possible to distinguish between nature and nurture as sources for Dr. Opie’s exceptional qualities as physician, scientist, and humanist. But certain it is that determinations of his own largely influenced the lives of many others around him.

While trying as best we can to emulate the examples provided by Dr. Opie’s life, and to attract to our midst others of Dr. Opie’s kind, we are glad indeed to have before us this brief record to supplement the memories of his works and life which remain vivid to the minds of many of our colleagues.

John G. Klidd, M.D.

Morris Edward Opler

May 16, 1907 — May 13, 1996

Cornell University Professor Emeritus Morris Edward Opler, died Monday, May 13, 1996, in Norman, Oklahoma.

He was born May 16, 1907, in Buffalo, New York. His academic career began at the University of Buffalo, where he was graduated with a Bachelor's degree in Sociology in 1929 and an M.A. degree in Anthropology in 1930. He received his Doctorate from the University of Chicago in 1933.

He was a Fellow of the Social Science Research Council in 1932-33 and again in 1946 and 1947. He served as research assistant, then research associate, of the Department of Anthropology at the University of Chicago from 1933-35. From 1935-36, he was a Fellow for the General Education Board. From 1936-37, he was an assistant anthropologist with the Bureau of Indian Affairs.

He began his teaching career in 1937-38 as a visiting lecturer in the Department of Sociology at Reed College in Oregon. He served as Assistant Professor of Anthropology at Claremont College in California from 1938-42. During that time, he also was a summer lecturer for the Department of Sociology and Anthropology at the University of Wisconsin. He was named a Fellow of the John Simon Guggenheim Memorial Foundation from 1942-43.

From 1943-44, during World War II, Dr. Opler served as a social science analyst with the War Relocation Authority in Manzanar, California, site of one of the Japanese-American interment camps. In 1944, he moved to Washington, D.C., to become a social-science analyst with the Office of War Information. In 1945, he was appointed as deputy chief and then as chief of the Foreign Morale Analysis division with the Office of War Information (later under the Department of State), and served until 1946. In the fall of 1945, he was visiting professor at Howard University in Washington, D.C., and in 1946-48, was an assistant professor at Harvard University.

Dr. Opler became Professor of Anthropology and Asian Studies at Cornell University in 1948, and taught at Cornell until he retired in 1969, and was named Professor Emeritus.

A renowned author, researcher, and teacher, he joined the faculty of the University of Oklahoma in 1969, where he was Director of the National Endowment for the Humanities Postdoctoral Fellow Program in American Indian Studies from 1971-72.

He held membership in many professional and honorary societies including Sigma Xi, Phi Beta Kappa, Alpha Kappa Delta, and Phi Delta Kappa. He was a Fellow of the American Anthropological Association, serving on its executive board from 1949-52, as president-elect from 1961-62, and as president for the term 1962-63. He was a Fellow of the Society for Applied Anthropology and the American Folklore Society.

His wife, Lucille, served as a dedicated partner in his work. Although the Oplers did not have any children of their own, they “parented” numerous students through their educational pursuits.

He is survived by his wife, Lucille, of Norman, Oklahoma.

Office of the Dean of the University Faculty

William Ridgely Orndorff

Professor of Organic Chemistry

1862 — Nov. 1, 1927

Through the death of William Ridgely Orndorff, Cornell University and the scientific world have lost an able and inspiring teacher and an eminent investigator,

Born in Baltimore in 1862, he attended Baltimore City College, and in 1887 received the degree of Doctor of Philosophy from Johns Hopkins University, where he had held the position of personal assistant to Professor Remsen.

He came to Cornell in 1887 as instructor in organic chemistry, was advanced in 1890 to an assistant professorship of organic chemistry, and to the professorship of organic and physiological chemistry in 1901, his title being changed to professor of organic chemistry in 1923.

Professor Orndorff was the author of a Laboratory Manual of Organic Chemistry, and he translated Salkowski's *Laboratory Manual of Physiological and Pathological Chemistry*. He was also the coauthor, with Professor Remsen, of one of the leading text-books on organic chemistry. He was a member of the International Jury of Awards, Paris Exposition, 1889, the St. Louis Exposition, 1904, the Panama Pacific Exposition at San Francisco, 1915, and was a special agent, U. S. Census, 1890. He was a member of a number of scientific and honorary societies. The organization of the Summer School of the University (now termed the Summer Session), and also of the Town and Gown Club of Ithaca, were largely due to Professor Orndorff's initiative.

The lectures of Professor Orndorff were unusually clear, logical and comprehensive, and displayed a wealth of information concerning all branches of chemistry as well as of sciences other than his own.

His published investigations comprise seventy-four articles, each of which embodies the results of very thorough and accurate experimental work. He was a steadfast supporter of sound scholarship and was severely critical of superficial or inconclusive experimentation.

His influence upon many generations of students, both graduate and undergraduate, was profound, and he inspired them with much of his own enthusiasm and devotion for the science. This is attested by the high standard which his former students have continued to maintain in their later work.

Both to his colleagues in the Department of Chemistry, and to those working in other scientific fields, who came to him for advice and assistance, Professor Orndorff was always ready to give freely of his time and of his abundant store of information and experience. The willingness of one so fully occupied with his own important work to be of help to others aroused among his colleagues a feeling of most sincere and grateful appreciation,

One of his outstanding traits was his loyalty: loyalty to the Department of Chemistry and to the University which he served unselfishly and without thought of public acclaim, loyalty to his family, to his colleagues and to his friends. By all who knew him his passing is sincerely mourned.

Samuel Peter Orth

Goldwin Smith Professor of Political Science

1873 — Feb. 26, 1922

Samuel Peter Orth in a few short years won for himself as Goldwin Smith Professor of Political Science no mean place in the life of Cornell University. Coming to us in the maturity of his powers after varied experience in law, in public office, and in teaching, enriched by contact with problems political and social at home and abroad, he had been trained by affairs no less than by books. For a decade he gave without stint to his classes here the ripe fruit of his experience, inspiring them by precept and example to recognize the peremptory claims of citizenship in a democracy. His gift of epigram, his zest for telling speech, the incisive vigor of his written word, were evidence of convictions carefully formed and firmly held. Wise in the ways of men and of nations, tolerant with a sympathy never sentimental and never veiling his impatience of shams, he believed profoundly in the wisdom of enthusiasm and the efficacy of effort. First and last he was an active citizen striving to broaden and deepen the civic life that he shared with all his neighbors. The University and the entire community have been the richer by his life and are the poorer for his untimely death.

Robert Elim Osborn

March 18, 1911 — April 14, 1989

Robert Elim Osborn was born in LaFayette, Indiana, on March 18, 1911. The eldest of three children in a family where the father was a practicing civil engineer (a builder of bridges), Bob developed an early interest in electrical engineering, the field that was to become his life's work. After receiving the B.S. degree in electrical engineering from Purdue University in 1933, he spent a year with the U.S. Coast and Geodetic Survey and another year with the Delco-Remy Division of the General Motors Corporation. In 1935 he was appointed head of the Electrical Engineering Department at Indiana Technical Institute (now the Indiana Institute of Technology), a position he held until 1941. During his final year at the Institute, he was also engaged as an instructor in electrical engineering in the Engineering Defense Program at Purdue University, with responsibility for developing and helping to teach a course in industrial electronics for practicing engineers from industries in the region. These classes were the first ones given in Indiana under the Engineering Science Management War Training (ESMWT) program and indeed were among the first in the nation. Bob's first association with Cornell came about as a result of his success with the Indiana program.

In the fall of 1941, Bob accepted an appointment as instructor of electrical engineering in the Cornell ESMWT program in the Niagara Frontier Office in Buffalo, New York. In 1943 he became supervisor of instruction, and in 1944 he was promoted to assistant professor in that program. Bob transferred to the campus proper in the spring term of 1945 as an assistant professor in the School of Electrical Engineering, and remained at Cornell for the rest of his career except for sabbatical leaves at several distinguished organizations. He was promoted to associate professor in 1949, and to professor in 1970. He became professor emeritus in 1976. A registered professional engineer in New York State, he served on several important technical-society committees and was a Life Senior Member of the Institute of Electrical and Electronic Engineers (IEEE). He was also a member of the American Society for Engineering Education (ASEE), the American Association for the Advancement of Science (AAAS), and Eta Kappa Nu, the electrical engineering honor society.

Throughout his tenure as a member of the electrical engineering faculty, Bob Osborn was concerned with the study of electric-machine theory and with laboratory practice in machinery and power-system equipment. Together with his colleague Professor L.A. Burckmyer, he was responsible for course development and instruction in these disciplines when they were required of all electrical engineering undergraduates. In later years he offered elective

courses in these areas to both graduate and undergraduate students and developed a reputation as a valuable resource in electric-power systems. He made a profound impact on the careers of his many students at Cornell by his firm requirements for clear thinking and careful application of engineering principles. Bob always felt that with a proper amount of guidance a student learns best by thinking things out for himself. Since he followed this philosophy in both the classroom and the laboratory, many students were often disconcerted by his inclination to de-emphasize lectures. On returning to the campus after several years of industrial experience, however, these same students would gratefully acknowledge that Professor Osborn had taught them the importance of developing their own individual methods of absorbing and processing information.

Bob Osborn's normally quiet, unassuming, and somewhat reserved manner hid a lively sense of humor that would come to the surface in unexpected ways. He particularly enjoyed preparing stunts for the popular "Engineer's Day" exhibitions of earlier years. Once he placed a massive steel cylinder on a sensitive "strain gage" so that the visiting high schoolers and non-engineering students could make the needle of a display instrument go off-scale by the slightest pressure on the top of the bar. Bob would look solemn and assure the amazed participants that they were actually bending the cylinder (as indeed they were). He designed and built a huge tesla coil that allowed him to draw spectacular three-foot-long electric arcs to a hand-held fluorescent tube, all the while keeping a perfectly straight face as if to imply that he was not doing anything out of the ordinary. Bob is probably most famous for his casual remark to students in the laboratory after they had successfully synchronized a small three-phase AC generator to the line, " Now you are supplying power to the entire Northeast."

Bob made his greatest academic contributions in the field of engineering design. Over the years he supervised many graduate and senior design projects, and was particularly effective in directing the design and construction of the electrical and control portions of the Cornell/RPI/NASA Martian Rover Project that was conducted under the Master of Engineering Program in the early 1970s. It should come as no surprise to learn that Bob designed and personally built every component of his own home.

On May 22, 1938, Bob married Doris Arter in Akron, Indiana. He is survived by his wife, who lives in Ithaca, New York; a daughter, Judith Ann Davis of Glenview, Illinois; a son, John David of Pleasant Lake, Michigan; and six grandchildren. Bob took great satisfaction from John's decision to follow in his father's footsteps and become a power engineer with Consumers Power Company in Jackson, Michigan.

Bob Osborn will be long remembered as an outstanding teacher, a respected colleague, and a good friend.

Paul D. Ankrum, William H. Erickson, Joseph L. Rosson, Simpson Linke

Joseph Oskamp

January 22, 1888 — May 12, 1971

Joseph Oskamp was born and reared on a farm near Cincinnati, Ohio, the son of Joseph A. and Elizabeth (Stall) Oskamp. He attended high school in Kansas City, Missouri, and received the B.S. degree from the University of Missouri in February, 1912.

Following graduation at the University of Missouri, he served at Purdue University as assistant in horticulture in 1912-13, research assistant in Pomology from 1914 to 1916, and associate in pomology from 1917 to 1920. During this period his efforts were devoted to research in the area of orchard culture. His early publications showed him to be one of the first workers in his field to recognize the value of field plot technique, emphasizing replication of treatments and statistical analysis of data.

In 1920 he was appointed horticulturist at the Missouri State Fruit Experiment Station, Mountain Grove. He held this position for one year before coming to Cornell in 1921 as extension professor to begin a successful career in pomology extension and research. Professor Oskamp was an outstanding extension teacher who enjoyed the respect of fruit growers. He possessed a thorough knowledge of the scientific and practical aspects of fruit growing and blended them together in an admirable way. He freely shared his experiences and knowledge with co-workers and inspired them with his enthusiasm and good judgment.

Professor Oskamp was a charter member of the Cornell Extension Club and a regular attendant at its monthly meetings. His main interest in the activities of this group was the improvement in communications between extension and the farmer. His efforts in this area benefited the total extension program.

During the 1930s Professor Oskamp gave much attention to studies correlating fruit tree performance with the physical properties of the soil profile. This research was conducted in all the major fruit areas of New York State and included all the soil types on which commercial orchards existed. The results clearly emphasized the importance of soil aeration, soil depth, and moisture holding capacity in obtaining maximum performance of perennial fruit plants. This work stresses the fact that the root system must inhabit a favorable environment if the tree top is to perform satisfactorily. Complete reports of these studies are recorded in eight Cornell Experiment

Station bulletins and four research papers published in the Proceedings of the American Society for Horticultural Science. This work has served as a technical basis for the orchard location service offered by pomology extension

during the past thirty years and has provided growers the opportunity to locate new plantings on only the most suitable soils. It has proven to be a major contribution in obtaining consistently high yields and keeping the state's fruit industry in a competitive position

As his work on fruit soils developed, Professor Oskamp participated in the department's special topics course designed for senior majors and graduate students. His part of the course was confined to fruit soils and nutrition. He conducted it as a seminar, assigning each student topics for discussion. Serving as referee, Professor Oskamp brought forth strong interest and competition within the group.

Because of a chronic illness, Professor Oskamp chose retirement in 1940. During his active career he authored or coauthored eighty-four extension and research publications on fruit growing and related subjects. His talks before the New York State Horticultural Society, recorded in the annual proceedings of the society, are distinctive in their conversion of detailed research data into practical suggestions. Large framed, with a deep voice and a slow but precise delivery, he spoke with a dry sense of humor that older fruit growers well remember. His work approached a passion. With little consideration for time or fatigue, he performed his extension and research with zest and vigor.

He was a member of Sigma Xi and the American Society for Horticultural Science.

Joseph Oskamp is survived by his wife, the former Achsa Moore, whom he married in 1914, and by a daughter, Mrs. Ralph H. Hill, both of Beach Haven, New Jersey; and by two grandsons, Jeffrey Hill of Columbus Ohio and Gary Hill of Wayne, New Jersey.

All those who knew him will remember Professor Oskamp as a dedicated person and a loyal Cornellian. His life recalls a quotation from James Oliver: "The world is blessed most by men who do things and not by those who merely talk about them."

M. Peech, R. M. Smock, M. B. Hoffman

Charles E. Ostrander

October 30, 1916 — April 15, 1994

Charlie Ostrander will long be remembered by the poultry industry of New York State and of the United States. He was an outstanding poultry extension person and excelled in the field of poultry management, bird behavior, poultry house ventilation, poultry lighting and poultry wastes. If a poultry producer was in trouble, Charlie was quickly on the scene to find a solution to the problem.

Professor Ostrander was born October 30, 1916 in Jamestown, New York. He graduated from Ellington High School in 1934 where he earned letters in three sports. All during high school and for three years while he worked following high school he dreamed of studying agriculture at Cornell University. His dream came true and he entered Cornell the fall term of 1937. Charlie graduated from Cornell's College of Agriculture in 1941 where he earned a B.S. degree with majors in rural education and poultry science. During college he was a member of the Poultry Science Club, the Round-Up Club, F.F.A., and Ho-Nun-De-Kah, the senior agricultural honorary society.

Following graduation, he taught vocational agriculture for five years at Portville and Clymer in New York and in Washington, New Jersey. Ostrander then joined the New York State Agricultural Extension Service where he served as Assistant County Agent in Allegheny County and later as Associate County Agent in Onondaga County. While in Onondaga County, he was responsible for both the poultry and fruit programs where much of his time was devoted to improving the poultry industry and developing marketing programs. He was responsible for an egg marketing program in Central New York that operated successfully for many years.

In 1951, Ostrander was invited to join the Cornell Poultry Department as Extension Poultryman. This was the first time an extension field person had been employed by the Poultry Department. After serving in this capacity for two years, he accepted a managerial sales position with a leading hatchery in New York State with responsibility for the breeding program. Charles Ostrander served in this capacity for four years and returned to Cornell as an Extension Poultry Specialist and Project Leader in Poultry Extension. His primary responsibility was in production, management and waste management. He was one of the first to work in the waste management field and saw it grow from one of little importance to one of major concern and effort. He was a member of the original planning committee for the first National Symposium on Poultry Waste Management in 1963. He participated in every national conference and many regional conferences.

Professor Ostrander received the M.S. degree in Poultry Management from Michigan State University in 1960 with major emphasis on controlled lighting for poultry. He spent considerable effort researching and developing lighting programs for poultry. He also researched and promoted the use of less intensive light for laying hens. This has aided in preventing cannibalism, resulting in less hysteria in flocks and has saved the industry many dollars. He conducted research on density requirements in cages and promoted precision debeaking, which has also been helpful to the industry. He realized the importance of environmental control in poultry housing with proper insulation and ventilation and was a strong advocate for this for many years.

Charles Ostrander was promoted to Associate Professor in 1962 and to Professor in 1973. He served on the Governor's Commission for the Preservation of Agricultural Land in New York State, was a member of the Council of Agricultural Advisors to the Department of Environmental Conservation, chairman of the Interdepartmental Poultry Industry Committee and served as a member of the College Committee on Environmental Studies and the College Energy Committee. He was also a consultant to the Canadian Department of Agriculture on poultry matters. He served on many national and statewide poultry committees and organizations. He was a member of the National Poultry Science Association and was a member of the World's Poultry Science Association.

In 1962, Ostrander was invited to spend a sabbatical leave at the University of California studying their poultry waste disposal problem. Since 1959, he had devoted a considerable amount of his time studying and working with this problem both in research and extension activities. Ostrander was invited to spend a sabbatical leave at the University of Reading, Reading, England in 1970 to work with them on waste management problems. He also worked with the Ministry of Agriculture on this problem while in England. He also looked at the waste problems in Scotland and the Netherlands. He was again invited to spend a sabbatical leave in England in 1980 at the Institute of Agricultural Engineering at Silsoe working with problems in ventilation and the formation and elimination of ammonia problems in poultry houses. In 1980, Professor Ostrander was the recipient of the Pfizer National Poultry Extension Award from the Poultry Science Association in recognition of his outstanding work in Poultry Extension.

Following his retirement in 1981, Charlie devoted much of his time volunteering for various organizations including the Senior Citizens Council of Tompkins County and drove regularly for Gadabout. He liked helping others and if someone was in need, Charlie was always there; he was a faithful and loyal friend.

Professor Charles Ostrander is survived by his wife, Gracia; two daughters, Linda Schoffel and Marcia Humphrey; and four granddaughters. Professor Charles Ostrander is and will be sorely missed.

R.C. Baker, A. vanTienhoven, R.J. Young

Ralph Spencer Overman

June 30, 1916 — September 10, 1953

Ralph Overman was born in Huron, South Dakota on June 30, 1916. He was brought up in Urbana, Illinois where he attended the public schools and graduated from Urbana High School in June, 1934. During his high school days he was very active in Boy Scout work and became an Eagle Scout. Dr. Overman was graduated from the University of Illinois in 1938 with a B.S. degree. He continued his education at the University of Wisconsin where he received degrees of M.S. and in 1942 a Ph.D. in Biochemistry. While at Wisconsin he worked under Professor Karl Paul Link and participated actively in the isolation and synthesis of the coumarin derivative, Dicumarol. These studies were reported in a very significant series of publications and the use of Dicumarol, the first of the coumarin derivatives to be used as an anticoagulant, opened up enormous new vistas in the study of blood clotting mechanisms and in the treatment of thromboembolic diseases of the heart and blood vessels. Dr. Overman was coauthor in a number of these reports.

In 1942, Dr. Overman joined the staff of the Maltine Company of Brooklyn as Assistant Director of Research for this organization. While there he was instrumental in the further development of preparations, including thromboplastin, which were of value in the study and treatment of thromboembolic conditions.

In 1946, he became associated with the Vascular Research Laboratory of the Department of Medicine of the Cornell University Medical College and the New York Hospital, here working closely with Dr. Irving S. Wright. He acted as Chief of the Laboratory for this research group with the title of Assistant Professor of Biochemistry in Medicine. During the remainder of his life he made numerous scientific contributions in his chosen field.

1. Overman, R. S., Stahmann, M. A., Sullivan, W. R., Huebner, C. F., Campbell, H. A., and Link, K. P.: Studies on the hemorrhagic sweet clover disease. VII. The effect of 3,3'-methylenebis (4-hydroxycoumarin) on the prothrombin time of the plasma of various animals. *J. Biol. Chem.* 742:941, 1942.
2. Overman, R. S., Stahmann, M. A., and Link, K. P.: Studies on the hemorrhagic sweet clover disease. VIII. The effect of 2-methyl-1, 4-naphtho-quinone and ascorbic acid upon the action of 3,3'-methylenebis (4-hydroxycoumarin) on the prothrombin time of rabbits. *J. Biol. Chem.* 14-5:155, 1942.
3. Overman, R. S., Field, J. B., Baumann, C. A., and Link, K. P.: Studies on the hemorrhagic sweet clover disease. IX. The effect of diet and vitamin K on the hypoprothrombinemia induced by 3,3'-methylenebis (4-hydroxycoumarin) on the rat. *J. Nutrition.* 23:589, 1942.

18. Overman, R. S., and Wright, I. S.: Prothrombin time determinations on patients with myocardial infarction. *J.A.M.A.* 147:227, 1951.
19. Overman, R. S., and Wright, I. S.: Preliminary report on the absorption of various derivatives of alpha-tocopherol and their effect on prothrombin and antithrombin levels in human plasma. Fourth Conference on Blood Clotting and Allied Problems, Josiah Macy, Jr. Foundation, January, 1951.
20. Overman, R. S.: Further studies on the chemistry of a thromboplastin inhibitor. Fifth Conference on Blood Clotting and Allied Problems, Josiah Macy, Jr. Foundation, January, 1952.
21. Tulloch, J. A., Overman, R. S., and Wright, I. S.: The failure of the ingestion of cream to affect blood coagulation. *Am. J. Med.* 24:674, June, 1953.
22. Overman, R. S., McNeely, J. M., Todd, M. E., and Wright, I. S.: Effects of vitamin E preparation on plasma tocopherol levels. To be published in the May-June, 1954 issue of the *Journal of Clinical Nutrition*.

Dr. Overman was a member of the American Chemical Society, the New York Academy of Science, the American Association for the Advancement of Science, The Harvey Society, and the scientific fraternities of Sigma Xi, Alpha Chi Sigma, Phi Lambda Upsilon and Gamma Alpha.

Dr. Overman was married to Josefina Maldonado.

Dr. Overman was an investigator of outstanding integrity. His contribution in education was largely confined to graduate fellows and the resident physicians of the New York Hospital staff. He was a wise counselor and many young men turned to him for advice in all types of problems dealing with the mechanism and pathogenesis of blood clotting. He was ever willing to share with these young men and his older confreres his knowledge and carefully conceived thoughts in these fields.

The work of Dr. Overman has been of a permanent nature and information which he has contributed will be used throughout the civilized world for many years to come. He was seriously ill for months prior to his untimely end. His confreres record with deep regret the passing of this fine man and splendid investigator before he had achieved the high goals which he had set for himself.

I. S. Wright

Charles E. Palm

June 24, 1911 — February 25, 1996

Cornell University's first Liberty Hyde Bailey Professor of Agriculture and Life Sciences, Charles E. Palm, died at the Cayuga Medical Center at the age of 84. Under Palm's direction, the College of Agriculture and Life Sciences grew in strength and accomplishment to become a leader in research and teaching among land grant universities. Palm was Dean from 1959-72.

Three years after being granted the Ph.D. degree (Cornell, '35) in Entomology, Charley Palm became Chairman of his department, a position he held for 20 years. At 27, he was the youngest professor to serve as a Chair in Entomology. Under his direction, the Department became a leader in the innovation of pest management techniques. In 1957, he became Director of Research in the College of Agriculture, and two years later he was appointed Dean. He was able to convince the scientific community and the New York State legislature in particular that agriculture, the State's largest industry, deserved broad support. Palm's wisdom became most evident as agriculture moved into the era of integrated pest management (IPM). In recognition of the basic studies needed to support the college, Palm promoted a change in name to the College of Agriculture and Life Sciences. The Department of Entomology was well positioned to take a significant role on the national level in the development of integrated pest management (IPM).

Palm was born in Austin, Texas and learned the essentials of farming as he grew up on a fruit and vegetable farm in Arkansas. In 1931, he earned the Bachelor of Science degree from the University of Arkansas and immediately entered graduate school at Cornell in Entomology and Plant Pathology. He was appointed Instructor in the department in 1934, a year before being granted his doctorate. He established programs in insecticide toxicology, insect physiology, and insect biochemistry. Again recognizing the growing importance of basic biological sciences, he was instrumental in the creation of the Division of Biological Sciences, an organization that spans the Colleges of Agriculture and Life Sciences and Arts and Sciences. With the strong commitment to research, the Division and the Department of Entomology developed a vigorous program in graduate training.

Charley was well known and respected among the farmers of the State as a practical entomologist. He earned the reputation with his development of control methods for various insects, especially for management of the alfalfa snout beetle. The temporary laboratory at which he conducted field studies was located on Myers Road

near Minetto, New York. He supervised a small group of graduate students at the location and thus the laboratory became an important resource for the local farmers in the solution of problems with pest insects.

Palm was Chairman of Entomology and then Dean of the College at a time of rapid change in environmental management and in agriculture. It was during this period that the scientific community recognized that no combination of chemicals would solve all agriculture's problems and indeed there were many hazards to be avoided. He exhibited great skill in transmitting the information to resolve these conflicts to those who supplied funding for the College. The agricultural industry needed support from the governor and members of the New York State Legislature. Palm served as the interpreter to gain that support. He was a member of the National Academy of Sciences and chaired that organization's National Research Council Committee on Plant and Animal Pests, producing a six-volume treatise establishing present-day pest management practices.

Not a colorful speaker, Palm had at his command, the reasoning and statistics to make strong arguments and he generally came away from formal presentations with the support of his listeners in hand. He moved the college from the old tradition of teaching farm practice to one of a more scientific approach to problems.

Palm was instrumental in bringing about the relocation of the Boyce Thompson Institute for Plant Research from an urban location in Westchester County to the Ithaca campus. This strong research organization was yet another boost to the international reputation of Cornell. Charlie retired officially in 1976 but he continued to serve as liaison between the Boyce Thompson Institute and the various cooperating scientists on the University Faculty.

Charles E. Palm is survived by his wife, Geraldine Gibson Palm; and a son, Alan, of Washington, D.C.

W. Keith Kennedy, Arthur A. Muka, Edgar M. Raffensperger

Arthur Palmer

August 30, 1889 — February 18, 1954

Dr. Arthur Palmer, Attending Surgeon in Otolaryngology at The New York Hospital and Professor of Clinical Surgery, Otolaryngology, at Cornell University Medical College, died February 18, 1954. He had been associated with The New York Hospital since 1932 and on the teaching staff of Cornell Medical College for 31 years.

Dr. Palmer was born in Oswego, New York, on August 30, 1889, the son of Jennie Roberts and the Reverend William H. Palmer. He was graduated from Brown University in 1911 with the degree of B.A., and received his degree of Doctor of Medicine from Cornell University Medical College in 1915. Dr. Palmer served a one-year internship at St. Charles Hospital in Port Jefferson from 1915 to 1916. He then interned on the Second Medical Division at Bellevue Hospital during 1916 and 1917. In 1917 he joined the United States Army as a First Lieutenant in the Army Medical Corps and saw active service in France. He continued as a reserve officer after the war and held the rank of Major from 1925 to 1929.

From 1924 to 1925 he took post-graduate studies in bronchoscopy at the University of Pennsylvania. He also studied plastic surgery at the University of Cincinnati, and otolaryngology at the University of Vienna.

In 1927, Dr. Palmer became Assistant Professor of Clinical Surgery and Acting Director of the Department of Otolaryngology of Cornell University Medical College. In 1932 he was appointed Associate Attending Surgeon in Otolaryngology at The New York Hospital. In July, 1947 he was appointed Attending Surgeon, Otolaryngology, New York Hospital, and Professor of Clinical Surgery, Otolaryngology, Cornell University Medical College, which posts he held at the time of his death.

In 1948 Dr. Palmer originated the yearly award of a first and second prize for efficiency in Otolaryngology, to be given to the two students of the graduating class who showed the best performance in Otolaryngology during their third year.

In addition to Dr. Palmer's association with New York Hospital and Cornell University Medical College, he was also associated with the New York Infirmary for Women and Children as consulting laryngologist; with the Mather Memorial Hospital, Port Jefferson, L. I., as consulting otolaryngologist. He was also affiliated with the Southside Hospital, Bayshore, L. I., as consultant. From 1939 to 1942 Dr. Palmer served as President of the Society of Plastic and Reconstructive Surgery. He had also been a past President of the Society of Alumni of Bellevue

Hospital. Dr. Palmer also was a member of a number of national and local medical societies, as well as a member of various local clubs, which include: the American Medical Association; New York County and State Medical Societies; Diplomate, American Board of Otolaryngology; Diplomate, American Board of Plastic Surgery; Fellow of the American College of Surgeons; American Academy of Ophthalmology and Otolaryngology; Academy of Medicine; Association of Military Surgeons; American Association for the Advancement of Science; Harvey Society; Lambda Chi Alpha Fraternity; Nu Sigma Nu; University Glee Club; Brown University Club of New York; North Hills Country Club, L.I., Carmel Country Club, Carmel, N.Y., and the Salt Air Yacht Club, Salt Air, L.I.

During Dr. Palmer's medical career he wrote on a number of subjects related to his specialty and many of his articles were published by the national societies of which he was a member.

In 1921, Dr. Palmer married Lillis Oliver, who died in January 1950. There were two children by this marriage: a son, Arthur Palmer, Jr., a graduate of Brown University in 1947, and now teaching at that University; and a daughter, Mrs. Lillis Palmer Nelson, a graduate of Pembroke, and now a teacher in Lexington, Massachusetts. In 1951, Dr. Palmer married Inga Wolford, who survives him. Dr. Palmer is also survived by a brother, Ralph M. Palmer; a sister, Miss Marion Palmer; a stepson, James C. Wolford; and a stepdaughter, Janice Wolford.

Dr. Palmer gave generously of his time and of himself to his chosen profession and to the institutions with which he was associated. His death was a great loss to the hospital, the medical college, and the community.

J. A. Moore

Ephraim Laurence Palmer

July 8, 1888 — December 18, 1970

Although retired from Cornell University since 1952, E. Laurence Palmer continued writing and lecturing almost until his death on December 18, 1970. This prolific man was a major contributor to a worldwide nature education movement stressing the study of living things and their environment. Teacher, scholar, and humanitarian, he was known throughout this country and abroad for his tireless efforts to promote field study and preservation of natural areas.

Palmer was born in McGraw, New York, on July 8, 1888, to Laura Darrow and Ephraim Clark Palmer. A sister was born in 1890 and the family lived above a corner store until 1893 when they moved to Cortland, New York. Palmer's dad had been elected county clerk, and perhaps this was one influence that gave Eph Palmer his penchant for leadership expressed through eighteen organizations in which he participated actively.

Eph Palmer was educated at Cortland State Normal School, graduating in 1908. An able student, Palmer won a four-year scholarship competition and chose to enroll at Cornell University in 1908. Although repelled by his first college biology course, his close association with Professor Rowlee sustained him. His career as a teacher began in 1910 when he was appointed as a teaching assistant to Professor Rowlee. Palmer earned the A.B. degree in 1911 and the M.A. degree in 1913.

In his first full-time teaching appointment at Iowa State Teachers College, Palmer began building his reputation as a scholar in field biology and as a teacher. He returned to Cornell for further study and completed the Ph.D. in systematic botany in 1917. After a brief tour in the navy, he was appointed assistant professor of rural education at Cornell in 1919. His interest in teaching led him to study education at Teachers College, Columbia University, in 1921. This was also the year he married Katherine Van Winkle. A son, Laurence, was born in 1923 and a second son, Robin, in 1930.

Professor Palmer's prolific writing career began in 1919 with his contributions to the *Cornell Rural School Leaflet*, a publication he edited for thirty-four years. He also began as director of nature education for Nature Magazine. His contributions to the latter journals and to many other Journals number over seven hundred. He wrote or contributed to numerous books and pamphlets, and his *Fieldbook of Natural History* remains a classic reference for students of nature. He received numerous honors and awards and was elected president of six professional

organizations. An active supporter of the Boy Scouts, Palmer received the Silver Beaver Award in 1947 and the Silver Buffalo Award in 1964.

Largely bored with his experience in elementary and secondary school, Palmer worked throughout his career to improve education. He promulgated concern for relevance and preservation of our environment decades before the current popular appeal for these issues. He chastised the recluse but respected quiet scholarship. In all his associations with students, he urged development of their powers of observation and analysis, now popularized under cries for “process education.” He was a severe critic of the meaningless memorization of scientific facts so common in schools and colleges during his career as well as now.

Students and colleagues knew Eph Palmer as an energetic, vivacious, smiling personality. Most did not know that he was driven in part by the heartache of his eldest son’s illness which continued for fourteen years. Even when death came to Laurence in 1940, Palmer carried his memory with him constantly. In spite of this burden, Eph Palmer made time for his friends and his students. His close collaboration with Katherine, a scientist in her own right, was a source of constant strength and personal resolve.

We are fortunate to have a careful account of Eph Palmer’s work in the Ph.D. thesis work of Joseph Bellisario. Completed at Pennsylvania State University in 1969, this study summarizes the contributions Palmer made to nature education and education in general. Those of us who have known Eph Palmer shall continue to profit from the meaning he gave to life.

Charles E. Palm, William J. Hamilton, Joseph D. Novak

DeForest H. Palmiter

May 12, 1904 — November 4, 1972

Dr. DeForest H. Palmiter died of a heart attack on November 4, 1972. He was born in Antigo, Wisconsin, on May 12, 1904. He held a B.S. degree from Oregon State College and received his Ph.D. degree from the University of Wisconsin in 1932. His doctoral thesis dealt with growth and sexual reproduction of the apple scab fungus, *Venturia inaequalis*, on artificial media. Dr. Palmiter joined the staff of the Department of Plant Pathology of the New York State Agricultural Experiment Station in 1937. He was stationed at the Hudson Valley Fruit Investigations Laboratory at Poughkeepsie, which later was moved to Highland, New York.

Dr. Palmiter was in charge of research on diseases of orchard fruits in eastern New York. His pioneering work with organic fungicides, initiated in the early 1940s, resulted in recommendations for disease control in orchards throughout the northeastern states. In his fungicide trials, special emphasis was placed on fruit quality, finish, and yield as well as on disease control.

During his career, he published more than eighty scientific articles and numerous popular reports dealing with fungicide evaluation, eradication action, and virus and nematode problems of tree fruits. His investigations were not limited to eastern New York for he was called upon to assist with disease problems in Europe, South America, Australia, New Zealand, and the Philippines. His most recent sabbatical leave was from September 1967 to March 1968, when he spent six months at the Central Philippines University at Iloilo City. In the Philippines he studied courses at the University related to plant pathology and worked with local agricultural leaders to determine the more important plant diseases limiting food production in that particular area.

Dr. Palmiter was a member of the American Phytopathological Society, Sigma Xi, and an honorary member of the New York State Horticultural Society. In 1949 he served as president of the Northeastern Division of the American Phytopathological Society.

Bud, as he was known to his friends and associates, rendered considerable aid to fruit growers of the Hudson Valley through his counsel on their specific problems. Their appreciation was expressed in a citation presented to him by the New York State Horticultural Society at their annual meeting at Kingston, New York, on January 28, 1970.

Dr. Palmiter was a member of the Arlington Rotary Club and the Senior Citizens' Housing Corporation, of which he was a past president. He attended the First Baptist Church in Poughkeepsie and was an active member of the Dutchess County Council of Churches. Dr. Palmiter had completed plans to journey to Nicaragua in January 1973 to help build a church in Managua.

Upon his retirement in December 1969 Dr. Palmiter was appointed professor emeritus.

Dr. Palmiter is survived by his wife, Viola; a daughter, Mrs. George (Ruth) Spencer; and two sons, Russell and Richard.

Michael Szkolnik, Alvin J. Braun

George Nicholas Papanicolaou

May 13, 1883 — February 19, 1962

A scientific career of the first magnitude ended on February 19, 1962, with the sudden death of George Papanicolaou at age 78 in Miami, where he had gone only three months before to become Director of the Papanicolaou Cancer Research Institute. A quiet, gentle man, entirely devoted to research, had conceived, forty-six years before, the cytology of the vaginal smear as an accurate reflection of the cyclical events of estrus in laboratory animals and women, a conception soon to prove fundamental in the subsequent rapid developments in female endocrinology. A scientist, persisting always in the conviction that a microscopic study of exfoliated epithelial cells could reveal important processes in the intact mammalian subject, had conceived nearly forty years before, and nearly twenty years before any of his contemporaries, a simple and reliable method of recognizing early human cancer. The thread of his long productive effort is clearly followed from his doctoral thesis on sex differentiation in 1910 to the publication of the second supplement to his now classic *Atlas of Exfoliative Cytology* in 1960.

George Nicholas Papanicolaou was born on the Isle of Euboea, Greece, May 13, 1883, and at age fifteen began a didactic study of medicine at the University of Athens. Upon graduation in 1904 he was expected to follow in the respected and remunerative footsteps of his father in the practice of medicine. Nicholas Papanicolaou had little sympathy for an academic career in philosophy or science, which his son proposed, and was never to learn of his son's later fame in science and medicine. The son prevailed and was permitted to continue his studies abroad. Disenchanted with his study of philosophy in Vienna but with a newly acquired spark of interest in experimental biology, Papanicolaou enrolled as a graduate student in Hertig's Institute for Experimental Biology at the University of Munich under the direct supervision of Richard Goldschmidt. This was the exciting time of the recognition of chromosomes as bearers of Mendelian units of heredity, and Goldschmidt was achieving recognition in a degree similar to that of Thomas Hunt Morgan in this country. Papanicolaou's interests were directed to sex differentiation and sex determination in daphnians. During these years in Munich, Papanicolaou became acquainted with fellow students Frederick Gudernatsch and Robert Chambers and barely missed meeting Charles Stockard, with all of whom he was to be associated a few years later in the Department of Anatomy at Cornell University Medical College.

In 1910 with a Ph.D. from the University of Munich, Papanicolaou returned home and married a friend of his boyhood, Mary Mavroyeni, who was to remain his staunch support throughout his life and who even yet carries

on his research in Miami. On their honeymoon to Marseille, Papanicolaou by chance was offered a position as physiologist at the Oceanographic Institute of Monaco, which he accepted. But a year later, with the outbreak of the Balkan War, he was called to military service as a medical officer. In these campaigns of 1912-1913, Papanicolaou became enraptured with the United States through descriptions by American medical officers serving as volunteers in the Greek Army, and he decided then to pursue his scientific career in America. In the autumn of 1913, Dr. and Mrs. Papanicolaou arrived in New York with only the legally required \$250 and without friends or introductions. Aware of the reference of his Munich doctoral thesis in Morgan's just published *Heredity and Sex*, Papanicolaou called on Morgan at Columbia University and was found a part-time job in the Department of Pathology and Bacteriology of the New York Hospital. A year later he obtained a full-time research position at Cornell Medical College in the newly created Department of Anatomy under Professor Charles Stockard, and in this department Papanicolaou was to pursue his interests for forty-seven years, until a few months before his death.

Stockard's research involved the extensive breeding of guinea pigs and a need to know the time of ovulation. To Papanicolaou it became apparent how little was known of the estrus cycle in any mammal, including man. In 1917, he was able to publish with Stockard a definitive description of the histologic changes in the estrus cycle of the guinea pig, in which was established the correlation of the cytology of the vaginal smear with the ovarian and uterine cycles. Within a few years the method was generally accepted as valid and essential to the experimental approach to mechanisms underlying estrus, and it had been extended to other laboratory animals in other departments of anatomy by Corner, Long and Evans and Allen just prior to the discovery of the hormonal nature of follicular fluid by Allen and Doisy.

After 1923, in extending the correlation of the vaginal smear cytology with the ovarian cycle in pregnant and nonpregnant women, and in taking care to include specimens from patients with endocrine and genito-urinary disease, Papanicolaou began to recognize cells from carcinoma of the uterus and in 1928 published this finding. Neither at home nor abroad did he receive encouragement or acceptance, and he was not to resume this research until a decade later, with the encouragement of Stockard's successor, Joseph Hinsey, and the effective collaboration with the gynecologist Herbert Traut. A series of decisive publications with Traut followed, culminating in their monograph *Diagnosis of Uterine Cancer by the Vaginal Smear* in 1943.

In the succeeding decade the diagnostic technique was extended to the recognition of cancer of the respiratory, urinary, and upper gastrointestinal tracts and breast through the cytology of exfoliated cells. In the diagnosis of cancer, exfoliative cytology began to receive worldwide recognition. Pathologists and technologists from

more than forty foreign countries came to learn its application at first with Dr. Papanicolaou, later in a training program under his associate, John Seybolt. Honors and invitations poured in on Papanicolaou—Borden, Amory, Lesker awards to name a few; the highest decoration by the King of Greece; honorary degrees in three universities, honorary fellowships in every conceivably relevant scientific or medical society. But Papanicolaou could nearly always be found alone, or with one associate, in his laboratory bent over his microscope. Striving largely successfully to keep himself free of all but the most puzzling individual diagnostic problems, torn between choosing to pursue his research toward developing new applications of exfoliative cytology in cancer diagnosis or toward attempting to reveal new reflections of physiologic processes in exfoliative cytology, he chose the former and spent much of this remaining time in the compilation of his magnificent *Atlas*. Although nearly two decades of active research remained to him and nearly two-thirds of his publications were yet to appear, the second of his two great contributions had now been made.

Statutory retirement was nominally recognized in 1948 but made no real change in Papanicolaou's laboratory.

Never enthusiastic or very effective as a teacher, he was enabled by the College in his forty-seven year association with it to pursue his research with minimal teaching responsibility. Partly as a consequence, and despite the fact that hundreds of technologists trained under his supervision and dozens of senior investigators collaborated with him, he developed very few young men to succeed him in his research.

In later years, facing several opportunities from outside the University, he began to dream of an institute for research and training in exfoliative cytology, and after long consideration and in the face of the expressed hopes of his many friends and associates at Cornell that he continue in his established laboratory and home, he finally in 1961 decided to accept the directorship of the Papanicolaou Cancer Research Institute of Miami. Although many at Cornell feared such a move might this late in life overwhelm him, none but could admire his great courage and glint of determination as he described his plans for the new Institute.

Surely the institute Dr. Papanicolaou envisioned will develop and contribute significantly, and surely young scientists will follow along the path which Dr. Papanicolaou traveled so far by the most careful and persistent microscopic observation and along which path he could, even at age 78, see so far.

Roy C. Swan

James Wenceslaus Papez

August 18, 1883 — April 13, 1958

James Wenceslaus Papez, Emeritus Professor of Anatomy, died on April 13, 1958, in Columbus, Ohio, of a heart attack. The third in a family of eleven, he was born in Glencoe, McLeod County, Minnesota. He received his early education in the township of Brookfield and his college education at the University of Minnesota. After graduation in 1908, he entered the Medical School where he earned the M. D. degree in 1911. At Minnesota he became interested in the studies of the nervous system by the great comparative neuroanatomist, J. B. Johnston, and subsequently elected neurology and academic medicine as a career. Upon graduating from the Medical School, he joined the faculty of the Atlanta College of Physicians and Surgeons as Associate Professor of Anatomy; and then later (1914-20) as Professor of Anatomy, Histology and Embryology at Emory University Medical School. In 1920, he came to the Ithaca division of the Cornell Medical School as Assistant Professor of Anatomy and later was made Professor. When the Ithaca Division was dissolved, in 1939, he remained on the campus as Professor of Anatomy in the Department of Zoology, where he taught the following courses: Human Growth and Development, Physical Anthropology, Cerebral Mechanisms, Gross Human Dissection, and Comparative Neuroanatomy. He retired in 1951, after 31 years at Cornell, and left Ithaca to become Director for the State of Ohio of the newly established Laboratory for Biological Research at the Columbus State Hospital. Here he continued his productive works on the human and vertebrate brain.

At Cornell he served as Secretary and Curator of the Cornell Brain Association (also known as the Burt Green Wilder Brain Collection) whose officers included Professors B. F. Kingsbury, A. T. Kerr and H. D. Reed. The collection of human brains, housed in Stimson Hall, was begun by Doctor Wilder (1841-1925), first professor of Zoology at the opening of Cornell, who advocated . . . “the need of studying the brains of educated persons rather than those of the ignorant, criminal or insane, in order to determine their weight, form and fissural pattern, the correlation with bodily and mental powers of various kinds and degrees, and the influence of sex, age, and inheritance . . .”. In his early days at Cornell, Doctor Papez devoted most of his time to the accumulation, care, and study of the brains bequeathed by former Cornellians and others to the collection. He published a number of morphological studies on these brains including one on the brain of Doctor Wilder.

It is important and interesting in remembering Doctor Papez to remark that the first area of research interest in biology at Cornell was Comparative Neurology. At the suggestion of Professor Agassiz of Harvard University, who

served as visiting lecturer in Zoology in the early days of Cornell, Doctor Wilder, his former student, undertook the collection and study of vertebrate brains. Neuroanatomical research and teaching has remained to this time a part of the curriculum and research in biology; and the fact that Cornell is known today as a center of neuroanatomical work is due in large part to the efforts of Doctor Papez.

Professor Papez published approximately one-hundred works on the structure of the brain of vertebrates including man. He published a well-known and still widely-used book entitled "Comparative Neurology" and another, coauthored by Dr. W. Haymaker, "The Hypothalamus, Anatomic, Functional and Clinical Aspects." Perhaps his greatest single contribution, and certainly one of the most important publications from the Ithaca Division of Cornell Medical School, was his paper entitled "A Proposed Mechanism of Emotion" which appeared in the Archives of Neurology and Psychiatry in 1937. This paper served as the foundation for much of subsequent psychobiological experiments on emotion and for the elucidation of many clinical observations on the human, particularly after frontal lobotomy. It is to be regretted that many scholars missed the importance of this work until many years later and it is only in the last few years that it has attracted the attention it deserved. John F. Fulton, eminent medical historian and Emeritus Professor of Physiology at Yale, wrote as follows in his recent book, "Frontal Lobotomy and Affective Behavior", concerning the significance of this contribution: "At the time of its appearance it seemed to many to be highly speculative, for Dr. Papez was able to adduce little in the way of positive experimental evidence for his view that 'the hypothalamus, the anterior thalamic nuclei, the gyrus cinguli, the hippocampus, and their interconnections constitute a harmonious mechanism which may elaborate the function of central emotion as well as participate in emotional expression*. This shrewd deduction has been richly vindicated by all the recent experimental work herein described, and his further comment that 'emotion is such an important function that its mechanism, whatever it is, should be placed on a structural basis' will no doubt become something of a classic in the history of neurology." And, Gerhardt von Bonin, in his "Essay on the Cerebral Cortex", commented that the emotional mechanism was first propounded by Papez "in a brilliant synthesis of many hitherto unrelated anatomical facts." Still other of his papers, particularly those on the basal ganglia and subthalamus, are at present among the standards of neuroanatomical works.

The literary efforts of Doctor Papez include also a number of published verses and a book of poems entitled "Fragments of Verse"; many of the poems were written to his wife, Mrs. B. Pearl Sowden Papez. Mrs. Papez, an artist, is responsible for all of the illustrations in his publications. She was his constant companion and assistant in his studies. They have three children and nine grandchildren.

Dr. Papez was of gentle and kindly disposition; he was admired and appreciated by his students with whom he spent many hours in conversation and instruction. His best teaching was in the laboratory in personal instruction.

In 1957, Doctor Papez was honored by the University of Minnesota with its Outstanding Achievement Award medal. During the Second World War, Dr. Papez served as a member of the Selective Service Board, N. Y. and was awarded a Congressional Medal of Selective Service. He was a member of the American Association of Anatomists, American Society of Physical Anthropologists, American Association for Advancement of Science, Association for Research in Nervous and Mental Diseases, American Neurological Association, American Anthropological Association, Human Genetics Society, Society of Biological Psychiatry, Alpha Epsilon Delta, Sigma Xi, and Phi Kappa Phi.

J. A. Dye, H. S. Liddell, Marcus Singer

Kenneth Gardner Parker

March 22, 1906 — October 1, 1981

Kenneth G. Parker, professor emeritus of plant pathology, died suddenly on October 1, 1981, thus ending more than a half-century of association with Cornell University.

Dr. Parker was born in Little York, Indiana, on March 22, 1906. After graduating from high school in Little York, he entered DePauw University and received the Bachelor of Arts degree in 1928. His first association with Cornell was in summer school, in 1927, when he enrolled in Elementary Mycology, and General Plant Pathology. He began graduate study in the Plant Pathology Department in September 1928. He took a leave of absence from the Graduate School beginning October 1, 1931, and served as graduate assistant to Dr. T. E. Rawlins at the University of California, Berkeley. There he worked on the “buckskin” disease of sweet cherry and also continued his Cornell thesis research on the fire blight disease of pear and apple. He returned to Cornell to continue graduate study in September 1933 and was awarded the Doctor of Philosophy degree in January 1934. Soon thereafter he accepted a position as extension fruit pathologist at Pennsylvania State University but resigned when he was appointed assistant professor of plant pathology at Cornell in July 1934. Dr. Parker was stationed at the Boyce Thompson Institute for Plant Research in Yonkers, New York, where, together with other Cornell faculty, he conducted research on the Dutch elm disease. The results from this research were a major contribution to the understanding of this important disease and its causal organism. Shortly after the beginning of World War II the elm disease project was terminated, and Dr. Parker returned to Ithaca to continue his studies on diseases of fruit crops. He was appointed associate professor in 1947, professor in 1951, and professor emeritus on his retirement in 1970.

Professor Parker made many contributions to fruit tree pathology. He spent several years helping develop, perfect, and test spraying and dusting equipment for use in commercial orchards. He was instrumental in establishing the effectiveness of streptomycin blossom sprays for control of fire blight. He was also responsible for perfecting the gibberellic acid treatment of “yellows”-affected sour cherry trees, which decreased crop losses from this disease. His detailed analyses of virus diseases under orchard conditions yielded some of our best information on the dissemination of viruses of perennial plants. In cooperation with others he initiated studies on the relation of nematodes to root disease problems concerning orchard trees.

Professor Parker served as fruit tree extension pathologist from 1967 until his retirement. He was recognized as a leading world authority in the diagnosis of complex diseases and other disorders of fruit trees. Dr. Parker was

especially helpful to graduate students, young faculty, and to others concerned with tree fruit production in New York.

Professor Parker persistently made efforts to broaden his knowledge. In the early forties he spent a sabbatic leave studying soil phenomena at the University of Wisconsin. To become better acquainted with the numerous virus-caused diseases of stone fruits, he divided a leave in 1951 between Riverside, California, and Wenatchee, Washington. In 1957-58 he did bibliographical work on *Verticillium* wilt of fruit trees for the United States Department of Agriculture, in Washington, D.C. This work resulted in a definitive review of the topics.

As a result of his fundamental research on diseases of tree fruits, Dr. Parker gained an international reputation. The students he trained, now located in various regions of the United States and in other parts of the world, are currently continuing this high level of research.

Professor Parker's contributions were recognized in 1961, when the New York State Horticultural Society presented him with a citation noting his contributions to the fruit industry. The citation noted his work on virus diseases, on the development of disease-free planting stock, on fire blight, and on nematodes and associated organisms, and cited his cooperation in the development of spray machinery. Also noted were his patience and cooperative efforts to help fruit growers and extension agents to diagnose, interpret, and control fruit disease problems. In 1970 a similar citation was presented him by the National Apple Institute.

Professor Parker held memberships in the American Phytopathological Society, the American Association for the Advancement of Science (fellow), the American Institute of Biological Sciences, Sigma Xi, and Phi Kappa Phi.

He is survived by his wife, Elinor Barnes Parker, of Trumansburg; a niece, Donna Morgan Smith, of Louisville, Kentucky; an uncle; and several grandnieces and grandnephews and their children.

Steven V. Beer, Leon J. Tyler, William F. Mai

Lyman G. Parratt

May 17, 1908 — June 29, 1995

After a long illness, Cornell Professor of Physics, Emeritus, Lyman G. Parratt, died on June 29, 1995 at his home in Redmond, Oregon. He was born in Salt Lake City, where he was raised and received his public education and formative discipline. In 1929, he earned an A.B. degree from the University of Utah with a major in physics, holding an assistantship in physics in the year following. He went from there to graduate study in physics at the University of Chicago, where he was again an assistant in the Department. After but three years, he was awarded a Ph.D. degree in 1932 for his work in X-rays, a field in which during his lifetime he became a recognized authority both in concept and in experiment. He carried on in postdoctoral research at Chicago for the year following.

In 1933, he came to Cornell University on a National Research Council Fellowship in F.K. Richtmyer's group, thus beginning a sixty-year association with the Physics Department. In a little over two years, he was appointed Instructor, advancing to Associate Professor by 1942, his research and stature in the X-ray field steadily growing. But with increasing threat of war, the Navy requested in 1941 that he take leave for work at the Naval Ordnance Laboratory in Washington, D.C. for an important effort on submarine detection and the de-magnetization of surface ships. The University granted this leave and he spent the next two years at NOL as Physicist and Head of the Engineering Division. He was called from that task to Los Alamos early in the Manhattan project and spent the rest of the war years as Group Leader in this effort. He returned to Cornell in 1946 and took part with four others in the Physics Department's reorganization, which would put it at the forefront of the nation's physics departments. The reorganization recognized the preeminence of nuclear physics at that time and of the coming era of high energy physics. As a result, the Laboratory of Nuclear Studies was established as a major component of the Department, and some ten years later, in 1959, Lyman Parratt was chosen as the Department Chair at a time of yet a second reorganization. This resulted in the establishment of the Laboratory of Atomic and Solid State Physics. Both reorganizations saw administrative difficulties, the second more so than the first. Parratt rode through his first term and established some ground rules to be followed if he was to serve a second term. The Department agreed, almost eagerly, and he thus served another five years much more agreeably. In his role as Department Chair he was ably assisted over many years by his wife, Rhea.

His research greatly lessened with his assumption of the chairship; nevertheless, over the years, he and his students published some 80 papers related to X-ray physics (not including many war reports at NOL and at Los Alamos).

His abiding interests related to X-rays—spectrographic instrumentation, detectors, production, and utilization. This high resolution work led him to consider the effects solid state binding had on x-ray spectra, both in emission and absorption, which involved relaxation of outer electrons around an inner electron vacancy. He also studied thin films and solid surfaces by means of total x-ray reflection. At the time, his instrumentation and measurements were without peer. A 1990 review article on x-ray physics recognized his contributions this way—“the concepts he introduced have played central roles in x-ray absorption and emission anomalies so actively investigated ever since”. Lyman’s work elucidated the states of multiply excited atoms and greatly extended our understanding of atomic structure. With his student, C. Hempstead, he also studied anomalous dispersion in x-ray scattering and absorption.

In the latter part of his career, he turned his attention to the study of electronic band structure of solids using x-ray spectroscopy. A short paper he wrote in 1958 accurately foretold of the possible uses of synchrotron radiation, and the present Cornell High Energy Synchrotron Source is remarkable testimony to his insight. He authored an excellent text on experimental error which is still used in teaching the subtleties of probability and statistical error in experimental physics. And his chapter on x-rays in Richtmyer and Kennard’s early book, *Introduction to Modern Physics*, remains a classic tutorial on the basic physics of x-rays. He was a great educator as well as an outstanding experimental physicist. Even after his retirement in 1973, he maintained his interest in the field and was frequently called on for advice and expertise.

In his earlier days, Lyman Parratt was something of an outdoors man and athlete. Favorite tales recall him sharing his sleeping bag with a rattlesnake, and of going off in his Chicago days on a canoe trip into the far wilderness of the North Woods only to have the aluminum canoe break in half. He was an avid—almost compulsive— tennis player, competing even well into his final illness. In the first year here at Cornell, he with another Postdoctoral Fellow, cleaned out the Rockefeller Hall attic of accumulated pigeon guano and built there two handball courts, back to back, which were widely used by Department personnel, both staff and students. That building improvement is long gone. He was a fighter, whether it be for his ideas, in competitive sports, or his ultimate illnesses; it was not until the last week or so before his death that at age 87 he finally took to his bed.

He taught in and for many years led Cornell’s long-lived and well known Advanced Laboratory course in physics. It was under his supervision that it undertook a continuing modernization which pervades the course even today. He had broad interests, and abilities which went well beyond physics. Parratt was vitally concerned with the teaching of physics and the concerns of students, initiating a number of innovations at Cornell. He always had

the interests of students in mind and he involved them in Department affairs. Following the “student revolution” of the sixties, he initiated graduate student participation at the regular Department Monday lunch, where they have for long taken part in all but the most confidential of Department affairs. He served actively in the American Association of Physics Teachers, and he was a Fellow of the American Physical Society and member of many other professional organizations.

He is survived by his wife, Rhea; daughters, Portia Kowalowski of Redmond and Carolyn Schumacker of Salt Lake City; and three grandchildren.

Boris Batterman, Paul Hartman, Neil Ashcroft

Percival John Parrott

May 28, 1874 — August 10, 1953

Percival John Parrott, formerly Director of the New York State Agricultural Experiment Station at Geneva and Professor of Entomology, Emeritus, Cornell University, died at his home in Geneva on August 10, 1953, following a long illness. He was born at Croydon, England, on May 28, 1874, and was brought to this country by his parents as a small child. The family settled near Clay Center, Kansas, and experiences of his childhood under the pioneer conditions of the time and place were a fertile source of many lively anecdotes in his conversation in later life.

Professor Parrott attended the University of Kansas, receiving the A. B. degree in 1897 and the A. M. degree in 1898. Cornell University also granted him the A. M. degree in 1902; and in 1943 the Kansas State College of Agriculture conferred upon him the honorary degree of Doctor of Science.

His first professional assignment was that of assistant entomologist at the Kansas Agricultural Experiment Station at Manhattan, which was followed by appointment as entomologist for the Kansas Horticultural Society. It was in 1900, however, that Professor Parrott began a career dedicated to the interests of New York State farmers that was to continue until the day of his death, with the exception of a period of two years (1902 to 1904) when he was associated with the Ohio Agricultural Experiment Station at Wooster.

He was recalled to the Experiment Station in Geneva in 1904 to head the Department of Entomology there. He served in that position until 1938, acting also as Vice Director of the Experiment Station from 1929 to 1938, when he was named Director. He retired in 1942.

His approach to and successful solution of the first major problem to confront him in 1904 were characteristic of the scientific ability and the qualities of leadership which he was to bring to bear on many other problems through the years. At the time of his appointment the fruit industry in New York State was waging a losing fight against the San Jose scale, and it was his effective and energetic attack on this pest that won him widespread confidence among fruit growers and farmers in general, a confidence which he held through the years by his conservative and commonsense approach to farm problems.

He had a pleasing personality and by his sense of humor, witticisms, and fairness was a great pacifier between groups when tempers became ruffled. He usually was able to evolve points of view which were agreeable to both sides. This was true not only among co-workers in his profession but also applied to meetings of farmers and fruit

growers, all of whom had great respect for his opinions and especially had confidence in his ability to solve their entomological problems by practical means.

“A practical scientist” is a term one commentator employed in reporting Professor Parrott’s passing and it is one that we are sure he would have cherished. Upon his retirement he was made an honorary life member of the New York State Horticultural Society.

But Professor Parrott’s abilities were recognized far beyond the limits of New York State and he was called upon to render important service in far away places. He traveled the entire length of the African Continent in 1936 as a special agent of the federal Department of Agriculture. He was also called upon by the Department as a neutral observer and consultant at the time of a threatened invasion of the Florida citrus industry by the dread Mediterranean fruit fly, in 1929 and 1930. He served for many years on the executive committee of the Division of Biology and Agriculture of the National Research Council. He was a member of the American Association for the Advancement of Science, a Fellow of the Entomological Society of America, and a past president (in 1914) of the American Association of Economic Entomologists in which he was active throughout the years. He was the author of numerous Experiment Station publications and articles in scientific journals.

It will be the human qualities of the man that will long be remembered by his professional associates and friends, however. A wholly unpretentious nature and a warm friendliness of spirit made themselves evident to high and low alike upon first meeting and as long as the acquaintanceship endured. “He was such a friendly person” was the universal comment of those who mourned his passing. And this spirit of friendship was also characteristic of his wife, Florence Mildred Hubbard of Geneva, whom he married in 1906 and who died in 1929. The gracious hospitality and friendliness of their home did much to smooth the way for many newcomers to the Experiment Station.

A full and arduous professional life did not interfere with active participation in community affairs. Professor Parrott was truly a civic leader, the YMCA, the Salvation Army, the Geneva Community Chest, the Geneva Youth Center, the Geneva Rotary Club, the North Presbyterian Church, along with numerous other agencies, benefited from his enthusiasm and constructive leadership.

Professor Parrott is survived by a son, John P. of Geneva, a daughter, Mrs. Robert Holt of Montpelier, VT, three sisters, a brother, and four grandchildren. He had a rich and full life and his memory lives on in his good works and in the hearts of his family and friends.

F. Z. Hartzell, J. D. Lockett, Richard Wellington

John Thomas Parson

May 26, 1870 — April 28, 1951

John Thomas Parson, Professor Emeritus of Engineering Drawing, died in Conklin Sanitarium, Ithaca, on April 28, 1951, following a long illness. He was born in Washington, D. C. on May 26, 1870, and received his education at Corcoran Scientific School and George Washington University. On September 16, 1896 he was married to Bertha Champlin of Washington, D. C, who survives him.

After three years of employment in the United States Engineer Office at Washington, and extensive travels in Cuba, West Indies, South and Central America, Parson came to Ithaca in 1893 to work with Estevan Antonio Fuertes, Dean of the College of Civil Engineering, on plans for Brazilian sewer systems. He then did further work as a consulting engineer on sewer design in Washington, Philadelphia and Harrisburg, before returning to Ithaca in 1895 to accept an instructorship in civil engineering. Thus began a teaching career that was to continue for 43 years until the time of his retirement in 1938. He was promoted to the grade of assistant professor in 1903 and was made Professor of Drawing in 1919.

Professor Parson was an excellent and well-liked teacher who gave unsparingly of his time and effort in order to inspire students with his own enthusiasm for good drafting. He himself was a highly skilled illuminator and engrosser, and for many years he was called upon to ornament membership “shingles” for student organizations and the credentials of delegates representing the university at academic functions. He was the author of a textbook on “Lettering for Beginners”. As a collateral enterprise he formed and operated the Armstrong Company, which for a number of years carried on the manufacture and sale of portable school buildings.

Professor Parson was perhaps best known to students, and will be recalled by alumni, for the part he played in the development of a winter sports center around Beebe Lake. Near the turn of the century, with the full approval of President Schurman who was himself a skillful skater, Parson personally secured the necessary funds, machinery and staff for clearing snow from Beebe Lake and putting the ice in suitable condition. Year by year, largely through his efforts, new facilities were added, including the first two toboggan slides, a temporary shelter house, and music. Parson’s infectious enthusiasm and his faith in the need and value of the whole project were fully justified by the results; and the burden of operation was then taken over by the Athletic Association, permitting him to step out. Now on the site where he labored, the permanent building known as the Johnny Parson Club commemorates his useful service and the community’s gratitude to Professor Parson.

He was a member of Zeta Psi Fraternity, Volunteer Fireman's Association of Ithaca, Protective Police, and was actively interested in civic affairs in Ithaca.

The death of John Thomas Parson brought to a close a versatile and colorful life, most of which was devoted to the service of the university and its students. His genial disposition, his kindly interest in people, and his evident desire to help his students in every possible way will long be remembered by a host of friends.

Romeyn Berry, Carl Crandall, R. Y. Thatcher

Kermit Carlyle Parsons

July 15, 1927 — December 9, 1999

Kermit Carlyle Parsons, 72, died peacefully in his sleep at home on December 9, 1999. A few days earlier, he became Professor Emeritus of City and Regional Planning at Cornell University where he taught for more than forty years. He received a Bachelor of Architecture degree from Miami University of Ohio in 1951, and a Master of Regional Planning degree from Cornell in 1953. For the next four years, he worked for the Cleveland City Planning Commission, rising to become head of the Community Planning Section.

Kermit (K.C.) returned to Cornell in 1957 as Assistant Professor, becoming Associate Professor three years later. In 1965, he was appointed Chairman of the Department of City and Regional Planning and promoted to Professor. He also served as Visiting Professor in the graduate program in planning at the University of Puerto Rico and as a Visiting Lecturer at the School of Architecture, University of the Philippines.

In 1971, he became Dean of the College of Architecture, Art, and Planning, a position he held for nine years. It was not easy to be dean of a chronically under-funded college occupying crowded, obsolete buildings and where the requests from four independent-minded departments always far exceeded available resources. K.C. not only emerged intact and unbowed but with several significant achievements.

Dean Parsons began the first concerted college effort to obtain significant outside financial support. He succeeded in attracting the interest of Olive Tjaden, an architectural alumna, and it was her bequest that made possible the complete renovation of Franklin Hall with modern facilities for the Department of Art.

He was equally successful in his meetings with Aline Stein, the widow of the pioneering architect-planner, Clarence Stein. At her death some years later, she left the college a generous fund to support the Stein Institute for Urban and Landscape Studies. This provides a continuing source of research and travel grants, conference support, and a publications program in city planning, and urban and landscape design.

In 1979, he was instrumental in establishing and supporting the Architecture Program in Washington. This made it possible for students to spend a semester participating in design studios and related courses focused on projects in the national capital. The university's later Cornell-in-Washington Program drew on this experience as did the college's present Rome Program.

Under his leadership, the two departments of planning that had resulted from a division of the former single department amicably united to again become the Department of City and Regional Planning. It was to that growing department that he returned to teach, a position that deans with long tenure sometimes find difficult. K.C.'s transition to full-time studio and classroom activities could not have been more successful, as his colleagues and students were quick to note and appreciate.

From 1985-88, he directed the university's Cornell-in-Washington Program. This provided further opportunities to pursue his studies of urban planning projects in Washington and Baltimore, work begun earlier with grants from the Skidmore, Owings and Merrill Foundation and as a Fellow of the Woodrow Wilson International Center for Scholars where he examined urban policy making in the executive branch of the federal government. Returning to his department, he taught until his retirement in 1999.

K.C. published over 50 journal articles, consulting and research reports, monographs, and books on university campus planning, urban renewal, downtown planning, national urban policy and the history of urban planning. Recognizing the merit of his research and writing, several organizations supported his efforts with grants. In addition to those mentioned above, they included the Ford Foundation, National Science Foundation, National Endowment for the Arts, the Graham Foundation, and the Aline MacMahon Stein Fund.

He was a long-time member of the Society of Architectural Historians, American Planning Association, American Institute of Certified Planners, Urban Land Institute, National Association of Housing and Redevelopment Officials, and the American Institute of Architects, among others.

His book, *The Cornell Campus: A History of its Planning and Development* (1968), became a model for those preparing similar studies of other colleges and universities. He was instrumental in founding the Society for College and University Planning and was its president from 1966-68. A more recent book was *The Writings of Clarence S. Stein: Architect of the Planned Community*, a volume of selected and profusely annotated letters and other writings.

More than a dozen of his articles and conference papers were on aspects of Stein's work and were to be chapters in a book on this influential architect-planner, a work that his colleagues hope to see through to publication. Another book may also appear: the edited papers presented in September 1998 at the international conference K.C. organized at Cornell to mark the centennial of the publication of Ebenezer Howard's garden city concept.

An important part of his career was professional practice. He was Planning Consultant for the City of Cleveland and several architectural firms in that city, Wayne State University, the New York State University Construction Fund, the Mid-Hudson Patterns for Progress, the Chemung Valley Study of Higher Education, and as an expert witness in cases involving planning issues. He was also active in efforts to preserve at Cornell the buildings of earlier eras.

K.C. served as Consultant to the Philippine Ministry of Education on a campus plan of the Miagao campus of the University of the Philippines and in Puerto Rico on the Rio Peidras campus planning program for the University of Puerto Rico. For the Department of State, he traveled to Nigeria to advise on the projected University of Ife, and for the World Bank, he provided advice on the design of agricultural markets in Mexico and in Seoul, Korea.

An avid reader from early childhood, K.C. became an equally avid book collector. His extensive library on architecture and planning included all of the standard works and a number of rarities. He was equally successful in assembling a very large collection of books, maps, and prints on London, a city he knew well and loved. Somewhat smaller but highly selective groups of small press volumes and books by and about Ruskin were among the other treasures that graced the shelves of the library wing he had recently added to his house.

It was there that he spent his last weeks, visiting with colleagues, and students who came to say farewell. His life touched them all, and they will never forget the confidence and poise that characterized his life and the courage and composure with which he faced his death.

Stuart S. Stein, Roger T. Trancik, John W. Reps

Robert S. Pasley

March 16, 1912 — June 21, 1995

Robert S. Pasley, the Frank B. Ingersoll Professor of Law Emeritus, died on June 21, 1995 at his retirement home in Sarasota, Florida, at the age of 83. With his death, the Cornell Law School community lost a beloved and esteemed member.

Bob was born in New York City on March 16, 1912. He attended Princeton University, earning his A.B. degree there in 1933. While at Princeton he was Circulation Manager of the *Daily Princetonian* and was elected to Phi Beta Kappa.

Bob pursued his legal education at Cornell and was awarded the LL.B. degree in 1936. He was Business Manager as well as a member of the Board of Editors of the *Cornell Law Quarterly* and was President of the Law Student Association. He ranked first in his class and was elected to Phi Kappa Phi and to the order of the Coif.

From 1936-42, Bob was associated with the New York City firm of Cadwalader, Wickersham and Taft and was concerned primarily with corporate law problems. During the latter part of 1942 he was with the New York Office of the Alien Property Custodian, as Chief of the Real and Personal Property Section of the Division of Investigation and Research.

With the coming of World War II, Bob began a period of military service that would last until 1946. After joining the Army as a private, he was selected to attend the Judge Advocate General's Officer Candidate School and was commissioned in December 1943. Assigned to the European Theater of Operations, he handled mainly the review of court-martial cases and other military justice problems. Following separation from the Army, Bob held a commission as Colonel in the Judge Advocate General's Corps Reserve and served as a member of the Board of Visitors of the Judge Advocate General's School in Charlottesville, Virginia.

Bob's military service was followed by eight years as a government lawyer with important responsibilities in the Office of General Counsel of the United States Navy Department. These included his successive appointments as Counsel for the Office of Naval Research in 1947, as assistant general counsel of the Navy Department in 1949, and as acting general counsel in 1953.

In 1948 Bob served as a special consultant to the Morgan Committee which was appointed by the Secretary of Defense to draft the Uniform Code of Military Justice. During 1952-54, as a Lecturer at Catholic University of America Law School, he taught the course in corporation law.

In September 1954, Bob joined the faculty of the Cornell Law School as Associate Professor of Law. He was also made Director of Admissions and administered the admissions program for three years. He served as the School's representative on the Educational Testing Service's Law School Admission Test Policy Committee as well as on the LSAT Test Development Committee. He was promoted to Professor of Law in 1957 and was named to the Frank B. Ingersoll chair in 1974. He retired in 1976.

Bob taught an impressive array of courses during his twenty-two years at Cornell. These included Government Contracts, Equity, Trusts & Estates, Legal History, and Remedies. A pioneering course on Computers and the Law also deserves special mention.

The Cornell Law Class of 1968 gave Bob a silver bowl which was inscribed with a quotation from Chaucer's Canterbury Tales: "SOUNNIGE IN MORAL VERTU WAS HIS SPECHE AND GLADLY WOLDE HE LERNE, AND GLADLY TECHE".

Bob was not only an excellent teacher but also an outstanding scholar who wrote extensively on a wide variety of subjects. His practical experience as a government lawyer made his articles on government contracts particularly insightful and his broad personal experience in the military enabled him to write on the subject of court-martial and military justice with considerable authority. In a more popular vein, he also published several articles on Sherlock Holmes in the *Baker Street Journal*.

Bob's Cornell years provided him with a number of opportunities to teach and do research elsewhere through summer school and sabbatical leave teaching appointments. These included the University of Wisconsin Law School, Stanford Law School, Catholic University of America Law School, Case Western Reserve Law School and Queen Mary College Faculty of Law, University of London.

Among Bob's professional memberships were the American Bar Association, Association of the Bar of the City of New York, Tompkins County Bar Association, American Society for Legal History, and American Law Institute. He performed invaluable public service as a consultant to the New York State Law Revision Commission as well as to the New York Joint Legislative Committee to Study Revision of Corporation Laws.

Bob's active involvement in Cornell affairs was not limited to the Law School but extended to matters of University-wide concern. In 1969-70 he chaired a committee which reviewed the organization and procedures of the University Faculty and recommended the establishment of a Faculty Council of Representatives to serve as the Faculty's principal voice in the governance of Cornell. From 1971-74, Bob was the Law School Representative on

this Council. He was a consultant on legal and business matters for the Arecibo Observatory Upgrading Project, a Cornell project sponsored by the National Science Foundation. During 1962-66, he was on the Board of Traffic Control and in 1963-67, was a member of the Committee on Student Conduct, serving as its chairman in 1965-66. Bob also served a term as President of the Statler Club.

While a resident of Ithaca, Bob gave generously of his time and talents to wide-ranging civic and community causes. serving as a member of the City of Ithaca Board of Zoning Appeals as well as the Tompkins County Human Rights Commission. He served as a Trustee of the Cornell Library Association (Ithaca Public Library) and was a founding member and first President of the Ithaca-Cayuga Rotary Club.

In his April 22, 1974 recommendation of Bob for appointment as the first Frank B. Ingersoll Professor of Law, Dean Roger Cramton paid a fitting tribute to his faculty colleague and friend. Dean Cramton said, in part:

Professor Pasley's service at Cornell has demonstrated a rare combination of abilities. He is a highly effective, stimulating and kindly classroom teacher, and at the same time a careful, capable and productive legal scholar. He has a highly cultivated mind and has won the universal affection and esteem of both his colleagues and his students. He has contributed his time unstintingly to university activities, bringing tactful good judgment to issues of community concern...

A man of culture, Professor Pasley has high moral principles, is straightforward and effective in his relationships with others. Well read, a good conversationalist, tolerant of the views of others, warm and congenial manner, he contributes much to any group of which he is a part. It is not surprising that he is highly respected by his colleagues.

In a note to Dean Russell Osgood shortly after Bob's death, his wife Mary wrote: "Bob's heart was left in the Cornell Law School. His 22 years of dedicated teaching were the most fulfilling part of his life."

Eight months after Bob's death, his wife, Mary Pasley, died on February 27, 1996 in Sarasota, Florida. He is survived by his daughters, Nancy Pasley of Deerfield Beach, Florida, and Mary Pasley of New York City; his son and daughter-in-law, Robert S. Pasley, Jr. and Gay L. Pasley, and two granddaughters, Virginia and Heather, of Alexandria, Virginia.

W. David Curtiss, Gray Thoron, Russell K. Osgood

John Baptiste Pastore

June 5, 1905 — August 18, 1951

Dr. John Baptiste Pastore, the son of Frank and Carmella, was born in Providence, Rhode Island, on June 5, 1905. He received his primary and secondary school education in the public schools of his native city and later entered Brown University from which he graduated in 1927. It was necessary, because of financial considerations, for Dr. Pastore to supplement his income by outside work in different commercial fields during his college years and yet he excelled scholastically and earned membership in the Phi Beta Kappa and Sigma Xi societies. This early business training undoubtedly was of great value to him in the solution of many problems in later years.

Dr. Pastore entered the Johns Hopkins Medical School in the fall of 1927 where he distinguished himself as an excellent student and graduated with the degree of Doctor of Medicine in 1931. Before the completion of his third year he became especially interested in obstetrics and gynecology and medical center at its new location and entered into preliminary negotiations during his fourth year for a resident appointment on the staff of this institution. While awaiting completion of the new buildings he served faithfully as an intern in the Woman's Hospital in Baltimore, Maryland. On September 1, 1932 he entered service in the New York Hospital as a Senior Intern in the Department of Obstetrics and Gynecology and did more than his share in establishing order and in the solution of many of the problems of that historic era of this institution.

For the following three years Dr. Pastore served the New York Lying-in Hospital conscientiously and with great equanimity. This was a most difficult time and yet his devotion to his duties and to improvements in the organization was outstanding. On July 1, 1935, upon completion of his resident training period he was appointed as a Research Fellow in the Department of Obstetrics and Gynecology of the New York Hospital and as an Instructor in Obstetrics and Gynecology to Cornell University Medical College. In 1936 he was appointed Assistant Attending Obstetrician and Gynecologist to the New York Hospital and retained his University appointment. During his years of resident training he became intrigued with the problem of hemorrhage as encountered in obstetric practice. For the following 5 years he worked intensively as a full-time member of the department and devoted the major portion of his time to research projects in hematology and related fields. He made many notable contributions including the development of a unique apparatus for the accurate measurement of blood loss at the time of delivery. He devised charts that could be used to predict what would happen to the formed blood elements and innovated many new ideas and concepts in this field. As a direct result of his work practice in the

institution was modified and new routines established in order that the obstetrical patients might benefit from his work. Greater availability of blood became essential and accordingly, in his characteristic way, Dr. Pastore solved the problem by the establishment in his laboratory on the 7th floor of the Lying-in Hospital of the first blood bank in this institution. After its organization and successful operation was well established it was turned over to the Central Laboratories because he accurately predicted the rapid growth and usefulness of this service in the institution as a whole.

At the height of his investigative enthusiasm and partly because of the nature of his investigations, Dr. Pastore became interested in various administrative problems as he saw them in his every day life. Following conversations with Mr. Murray Sargent, then Director of the New York Hospital, who realized his ability as an administrator, Dr. Pastore retired from the Department of Obstetrics and Gynecology on January 1, 1940, and joined the administrative staff of the New York Hospital in the capacity of Assistant Superintendent. During his later years in this department he was appointed Assistant Director of the New York Hospital. He continued his interest in the Department of Obstetrics and Gynecology but he rapidly expanded his endeavors as a hospital administrator. Within a matter of 3 years he commenced publishing papers relating to hospital administration problems. He soon became associated with the local and national societies and associations in this field. Later in his administrative career Dr. Pastore was largely responsible for reconstructive changes in the hospital that resulted in the addition of 100 beds to the number then in existence. These facilities provided a very useful purpose following World War II in providing greatly needed beds which he had predicted would be required. In addition, Dr. Pastore was cognizant of the changes that were taking place during the war years in the hospital staff and was ever mindful of what might be done to facilitate the return to civilian life of those members of the staff who were serving in the armed forces. Post-war experiences proved that these added facilities made it possible for veterans to bring patients to the institution which would have otherwise been impossible.

Dr. Pastore served as Study Director to the Committee on Future Plans of New York Hospital and Cornell University Medical College. He adopted the principle that all members of a community should be provided with comprehensive high quality medical care. He prepared in great detail a program that might be put into operation for such care to 40,000 subscribers by a medical group associated with the hospital. Although this scheme was never adopted and put into operation it was at the same time unique and most complete in all architectural, financial, statistical and legal details. It was subsequently used by others interested in the problem.

During the 6 years that Dr. Pastore served on the administrative staff of the hospital his reputation spread far beyond the walls of our institution. In February 1946, he accepted the position of Executive Director to the Hospital Council of Greater New York. He saw in this organization which was designed to coordinate and improve the hospital services of New York City and to plan the development of these services in relation to community needs, the opportunity of devoting his time and efforts to a new field that proved even more intriguing than that of hospital administration. That he never lost interest in this latter subject is evidenced by the many institutions that called on him for help. Among the many hospitals that sought his assistance might be mentioned the respective institutions in Mount Vernon and New Rochelle which served the community where he resided.

One of the first problems that Dr. Pastore assigned himself to was the completion of the "Master Plan for Hospitals and Related Facilities for New York City". Undoubtedly one of the great highlights in his distinguished career occurred on the evening of April 23, 1947 when he presented this plan following a dinner given by the Hospital Council for the city's most prominent citizens who were interested in the endeavors of the Council. Many instances of tangible evidence of the subsequent execution of this plan developed, such as the announced merger in November, 1949, of the New York Eye and Ear Infirmary with the Manhattan Eye, Ear, and Throat Hospital. Dr. Pastore was steadfast in his opinion that the requirements of the community in the way of medical care were, at all times, most fundamental. He adhered to the belief that what was for the community's best interests was, in the last analysis, in the best interests of the hospital.

In 1950, by presidential order, Dr. Pastore was appointed as a member of the Health Resources Advisory Committee of the Office of Defense Mobilization and as a member of the National Advisory Committee to Selective Service on Selection of Doctors, Dentists and Allied Specialists. This added responsibility was, of course, in addition to his other work and proved to be a great physical strain as it necessitated biweekly meetings in Washington and many additional conferences in New York. Characteristically, in the last week of his life he faced the call to duty and attended a very important meeting of this latter committee in Washington, which both he and his physician knew was not in his own personal best interests.

Dr. Pastore served in the New York Hospital as Senior Intern and Assistant Resident from 1932-1935 and as Research Fellow and Assistant Attending Obstetrician and Gynecologist from 1935-1948. In 1948 he was appointed as an Associate Attending Obstetrician and Gynecologist which title he held until his death. He was an Instructor in Obstetrics and Gynecology in Cornell University Medical College from 1932-1948 and in 1948 was elevated to an Assistant Professor of Obstetrics and Gynecology. During the period from 1940-1946 he was Assistant

Superintendent and Assistant Director of the New York Hospital. From 1946-1951 Dr. Pastore was Executive Director to the Hospital Council of Greater New York. He was a member of the Federal Hospital Council and a consultant to the United States Public Health Service, a lecturer at the School of Hygiene of Columbia University and a guest Lecturer of the School of Public Health of Harvard University. He was a member of the Greater New York Hospital Association, the New York State Hospital Association, the Medical Administrators' Conference and the Society of Medical Administrators and a Fellow of the American College of Hospital Administrators.

Dr. Pastore had a gentle and kind personality. At the same time he had the attribute of forceful determination. His decisions were based on a thorough study of all data pertaining to the subject. He listened attentively, gave consideration to all phases of subjects under discussion but at all times he adhered to that singleness of purpose that in the last analysis the community must benefit. His opinions might be modified but only if he was convinced that it was in the best interests of the community. He dedicated himself to a job, gave of himself unstintingly and acquired the admiration of his many friends in his home community, in New York City and in the country as a whole.

On August 18, 1951 at the conclusion of a busy week serving the Hospital Council in New York and the people of our country in Washington, Dr. Pastore died suddenly at his home. He was but 46 years old, at the height of his powers, and making his most important contributions for the improvement of medical care in this community. His untimely death leaves a great void and represents an irreparable loss. Surviving are his wife, Mrs. Alice Fogg Pastore, a son, John F., a daughter, Miss Susan, and his father, Frank Pastore.

R. G. Douglas

Donald R. M. Paterson

December 11, 1933 — May 7, 1993

University Organist Donald R.M. Paterson died May 7, 1993, at his home in New Hampton, New Hampshire. Professor Paterson joined the Music faculty as University Organist in 1964, and in 1966 he became Sage Chapel Choirmaster, posts he held until his retirement in January, 1993. In addition to his responsibilities as organist and choirmaster, Don Paterson was for a number of years instructor of the rigorous course which was the foundation for advanced work in the department, Elementary Theory. While his formal manner demanded respect and high standards from his students in the classroom and in the choir, his subtle wit earned their loyalty and affection, expressed in the affectionate acronym (“DRuMP”) by which the choir members referred to him. In October, 1971, the Committee on Academic Revision, a student panel funded by the College of Arts and Sciences, named him one of the College’s best teachers (along with Urie Bronfenbrenner, Walter LaFeber, Will Provine, Peter Stein, and others).

Don Paterson was born December 11, 1933, in New York City. His early music training led to his first position as church organist in Tuckahoe, New York at the age of twelve! He graduated from Williams College, *cum laude*, in 1955. While an undergraduate he served as organist and choirmaster in Stockbridge, Massachusetts, and was a member of the Williams Chapel Choir and Glee Club. He then began graduate study at the University of Michigan, serving as teaching assistant in keyboard harmony, and earning his M. Mus. degree in 1957. While in Ann Arbor, he was also organist and choirmaster at the First Unitarian Church. Don then served sixteen months in the Army, following which he spent the spring term, 1959, as acting choirmaster at Culver Military Academy, and two years as instructor in music at Stephens College (Missouri). From 1962 until 1964 he returned to Culver as choirmaster, and in 1964, he joined the Cornell Music faculty.

A chronological listing of Don’s organ and harpsichord teachers from 1946 until 1961 includes Doris Voester, Everett Tutchings, Robert Owen, Robert Barrow, Robert Noehren, Gustav Leonhardt and Nadia Boulanger. An accomplished organ recitalist, Don Paterson performed in both the United States and Europe. His 1981 recital tour of England, Scandinavia, and the Low Countries was particularly successful. He was noted particularly for his meticulous preparation of programs that were chosen to show the potential of historic pipe organs. His last recital was at the National Convention of the Organ Historical Society in August of 1992, where he was described as “a

mature performer who knows how to communicate music; the playing was elegant, stylish, and vigorous—the type of [playing] that we have come to expect from this artist.”

Don was an eminent organ historian. A founding member of the Organ Historical Society, he served as its president from 1961 to 1965, and was recipient of the Society’s Distinguished Service Award in 1980. He was involved in the effort to preserve many historic organs, especially in the northeast.

In 1979, Don Paterson was co-chairman of the First International Romantic Organ Music Symposium which he hosted at Cornell and in 1990 he arranged a festival of six concerts for the Fiftieth Anniversary of the Sage Chapel Organ, and published *An Account of the Organs in Sage Chapel* to celebrate the occasion.

Don represented the Music faculty on the Sage Chapel Advisory Council and the Department Concert Committee, and he served as director of Undergraduate Studies for five years.

For a quarter of a century Don provided leadership for music in Sage Chapel through organ and choral music for Sunday services, broadcasts, and especially, the Sage Chapel Christmas Program, which he made one of the best-loved, most faithfully attended events of the Cornell year, and which remains a memorial to his devotion to music in the life of Sage Chapel and the University.

H. Irene Patterson

January 27, 1901 — August 20, 2001

Professor H. Irene Patterson celebrated her 100th birthday on January 27, 2001 with family, friends and former colleagues. A native of Wauseon, Ohio, she earned a Bachelor's degree in Home Economics from Michigan State and a Master's degree from the University of Minnesota. Additional graduate study was done at the University of Chicago and at Ohio State University.

Prior to her tenure at Cornell University, she taught high school home economics in Michigan, was a member of the faculty at Adrian College, and supervised student teachers as she developed an adult education program at Michigan State. Her interest in adult education broadened when she was appointed to the faculty of the Pennsylvania State University in 1938. During World War II, Professor Patterson worked with men and women from industrial occupations to increase their skills as educators in wartime production.

In 1945, she joined the faculty of the (now) College of Human Ecology as Assistant Professor in the Department of Home Economics Education, where she again pursued her interests and competencies in adult education. She was promoted to Associate Professor with tenure in 1947. Her courses attracted students majoring in the department as well as majors in other fields of education. She chaired graduate committees for approximately 40 students. As a teacher educator, Professor Patterson was concerned that teachers be knowledgeable about and involved in their communities. In addition to her research and practice, several student theses/dissertations contributed to this philosophy.

Professor Patterson made a unique contribution not only to the Home Economics Education program at Cornell but also to the (then) School of Education through her work in adult education and school–community relationships. She helped to make possible and to maintain desirable relationships between the college and the Ithaca community. Her ability to organize and promote adult education in the community programs was recognized by the State Education Department; several divisions of the Department depended upon her continuous help in leadership education. While serving several years as chair of the Cornell-PTA Institute Committee, she helped develop similar programs for PTA personnel.

Miss Patterson was honored with life membership in the PTA in 1958, and with special recognition in 1965. She became a frequent presenter at local, state, and national adult education conferences. She was a New York State delegate to three national meetings of the Adult Education Association, USA, and a group leader at the 1958 and

1963 International Congresses on Home Economics. She contributed to the College's international program by teaching a course at Winneba Training College in Ghana and serving as outside examiner for home economics graduates of that college.

Professor Patterson's articles were published in professional and practitioner educator journals. Her co-authoring of a Cornell Cooperative Extension guide on leadership was reprinted several times and utilized statewide by extension home economics educators in their work with lay leaders.

In addition to her earlier faculty membership at Adrian College, Michigan State, and Pennsylvania State University, she taught in summer school sessions at Douglass College and Colorado State University. She was an active member of Phi Kappa Phi (National Association of Women Educators); Pi Lambda Theta; Adult Education Association, USA; American Association of University Professors; American (and New York State) Home Economics Association; and the Fédération Internationale of L'Enseignement Ménager (International Federation of Home Economics).

In 1966, Professor Patterson retired from Cornell as Professor Emerita, loved and respected by her students for her ability to challenge their thinking with her high standards of quality, demands for exact statements and her wide range of knowledge and interests. During her long retirement, she continued to live in Ithaca, moving to Kendal at Ithaca in 1996. She traveled extensively and developed numerous interests at home and at her cottage on Cayuga Lake shared with a longtime friend and colleague. Past students and friends were always made welcome and sought her for her practical good sense, her wit, and helpful counsel, never offered unless requested.

Bettie Lee Yerka, Jean Failing

Woodford Patterson

October 6, 1870 — August 2, 1948

Woodford Patterson was born in Newark Valley, New York, on October 6, 1870. He entered Cornell as a freshman in 1891 and for fifty-seven years thereafter was one of her most devoted sons. Soon after his graduation in 1896 he joined the editorial staff of the New York Evening Sun. There for nine years he further developed the uncommon gift for writing which he had already begun to train in literary courses at Cornell. In 1906 he returned to Ithaca to edit with skill, style and success the Cornell Alumni News. He was made Secretary of the University in 1917, and remained in that office until 1940, when he became Secretary Emeritus. He was University Publisher from 1917 until 1941 and thereafter until 1944 served as consulting editor of the Cornell University Press. On August 2, 1948 he died in the same house in which he was born.

Woodford Patterson was one of the leading figures of his generation in our university life. He initiated effective programs of relations with the press and with the alumni; he played a chief role in the development of the Cornell University Press; he was a foremost authority on the history of the University; he performed a variety of services beyond the duties of his office, and, not the least of these, gave wise and friendly counsel to many students.

He was a man of rare culture and literary taste, especially erudite in metaphysical and religious poetry, and in the history of book-making; this excellence of taste was manifest in the official documents he wrote for the University and in the inscriptions he composed for the University buildings, and was a source of charm to his friends. He had a great gift for companionship, and was admired for his integrity, his modesty, and his warm humanity. His extensive reading gave him an intimate acquaintance with Christian history and theology; he found the Book of Common Prayer in every way congenial to his own spiritual aspirations. He believed it his "bounden duty ... to work and pray and give for the spread of His kingdom."

In Woodford Patterson Cornell had a fine product of its training and a fine representative; in her service he repaid the debt he always said he owed to her.

W. L. Conwell, Donald English, J. N. Tilton, Jr.

Nathan Allen Pattillo

July 6, 1899 — March 16, 1986

Nathan Allen Pattillo joined the Cornell faculty in 1946 as an instructor in the relatively new Department of Fine Arts, as the History of Art Department was then known in the College of Arts and Sciences. Only the second appointment in the department, he went on to become an assistant professor in 1948 and an associate professor in 1954 before retiring as a professor emeritus in 1966. For twenty years Allen Pattillo devoted himself to teaching and research at Cornell in a discipline that he had come to late in life, in the midstream of an academic career that had begun two decades earlier in an entirely different field of study, that of economics. When he retired from the university he left behind him a record of dedicated teaching in art history that, in terms of breadth of subject matter, few could hope to match today.

Allen Pattillo was born in Harrisonburg, Virginia, in 1899. He remained a Virginian throughout his formative years and took his undergraduate degree at Randolph-Macon College in 1919. He was attracted sufficiently to the field of economics, then one of the major areas of academic study, that he ventured north to begin graduate training at the University of Chicago. He transferred to Harvard University a year later, in 1921, and there earned his master's degree and eventually his doctorate in economics in 1929. He returned to the South in 1924 to begin his teaching career in economics at Trinity College of Duke University and then at the College of William and Mary. After he completed his doctorate he took an appointment at Saint Lawrence University, where he taught until 1940.

As was the case with so many of his generation, World War II marked a major turning point in Allen's life. Because he was fluent in Italian he volunteered to serve in the armed forces as an interpreter and translator, and he worked for a time with Italian prisoners of war. In that capacity he not only came to know a number of Italians with whom he retained a friendship that was to prove useful later in his career, but he came to know Italy as a country that had produced some of the world's greatest artistic monuments, and that was to alter his life in a very fundamental way. His wartime experience of Italy turned him in the direction of art history, and after the war Allen decided to abandon completely his earlier career in economics and return to graduate school at Harvard to take up the study of art history. He spent nearly two years at the Fogg Museum of Art pursuing his newly discovered love of the Italian Renaissance with Chandler Post. At the same time he became acquainted with the arts of Asia through the teachings of the great Langdon Warner. What he learned from those two famous teachers at Harvard was to serve

Allen well when he came to Cornell to organize the first courses at this university devoted exclusively to the arts of Renaissance Italy and of Asia.

Throughout the decade of the fifties Allen Pattillo remained firmly attached to the arts of Italy and attended assiduously to the teaching of Renaissance virtues to hundreds of Cornell students. But his contribution to the teaching program of the department went well beyond the Italian Renaissance, for he was instrumental in developing the second half of the survey of Western art, a course that he offered as an alternative to the regular yearlong department survey that was always oversubscribed. More than any one thing he did at Cornell, that course, History of Art 104, sums up what Allen Pattillo wanted to be known for at the university: it was a truly civilized course, one that students took with complete confidence that they would move among the visual wonders of Europe in the company of a man who loved its cathedrals, monuments, and museums and who spoke about them with deep respect and precision of detail. For several generations of Cornell students Allen Pattillo's introductory survey became the equivalent of the grand tour that once was the dream of all college youth. When Allen retired in the mid sixties, the course no longer served its original purpose, for Cornell and its students had changed, both now more sophisticated in the ways of Europe. But in his time Allen Pattillo was the perfect man for a particular task that was noble in its definition.

A confirmed bachelor, Allen was a familiar figure around the basement of Goldwin Smith Hall late at night, where he worked every evening, preparing his lectures with a meticulousness that matched his dignity of bearing and his correctness of attire. A man of very orderly habits, he traveled to Europe every summer, ending his tour in Italy, where he said he always was able to refresh his eyes and correct his notes. There he also continued his lifelong research into color theory in Italian Renaissance painting. His absorption in Italy never wavered, but neither did his love for his native state of Virginia. Unfailingly courteous to all, he remained throughout his life the exemplary Virginian gentleman, and we have memories of him nodding and tipping his hat to everybody he met. He took great pains to learn something about every student who took his courses, even when enrollment in those courses numbered in the hundreds. His uncanny ability to remember faces and names, and his inquiring after the smaller details of a particular student's life—a sister or a brother who may have graduated earlier, a fraternity or sorority event long past—was the stuff of which campus legends are made. And Allen Pattillo was indeed something of a legend, at least in that part of the university campus that he trod regularly in his careful, measured steps. A quiet and intensely private man, reserved even among his close colleagues, Allen will be remembered by us as someone who expressed himself the fullest when he was before his students and before the work of art. And by those

students he will be remembered warmly as the quintessential guide to the great treasures of Europe, a traveling companion without peer.

When he retired from the university and returned to Lynchburg, he said of himself that he was ready to begin the third chapter of his life. He looked forward to going home to his beloved Virginia after two very distinctly different academic lives. We were fortunate that one of those lives was spent with us at Cornell.

Knight Biggerstaff, Albert S. Roe, Martie W. Young

Robert L. Patton

October 31, 1913 — June 25, 2008

Robert L. Patton, 94, formerly of Ithaca, died on June 25, 2008 in Ann Arbor, Michigan.

He was born in Livingston, Montana, to the late Alva L. and Annie L. Patton. He received a B.S. degree from Montana State College, Bozeman and a Ph.D. degree from the University of California, Berkeley. He married Mary Louise Trask (1913-2000) on September 6, 1938 in Deer Lodge, Montana.

In 1939, he joined the faculty at Cornell. His field was Insect Physiology, to which he contributed research, a textbook and mentored 22 graduate students, several of whom went on to become distinguished contributors as well. He was a pioneer in the field of electrophysiology as applied to insects, and in the early 1950s, he was able to monitor activity of the nervous system of an insect using electro-mechanical equipment of his own design. This breakthrough was reported in Newsweek Magazine. In 1978, he was named a Professor Emeritus, and in 2002, he was honored by the creation of a permanent visiting lectureship in his name.

He was skilled in ultra-micro chemistry, and during World War II, he was a member of the team that developed an extensible method for chemically isolating Plutonium 239. In 1948, President Truman cited him for this contribution to the war effort.

He was very active in scouting, serving as a troop leader and in other roles for which the Silver Beaver Award recognized him in 1981. He enjoyed playing the clarinet and was an accomplished woodworker.

He is survived by his son, James L. Patton (Carol) of Dexter, Michigan; his nephew, Beyer R. Patton of Golden, Colorado; his granddaughters, Elisabeth A. Freeland of Portland, Oregon, Dr. Susana R. Patton of Dexter, Michigan, and Catherine L. Patton of Madison, Wisconsin; as well as three great-granddaughters. His parents, his wife, his brother, Alva R., his son, Robert W., and granddaughter Alice H., preceded him in death.

A family memorial service was held in Michigan. Burial was at East Lawn Cemetery, Ithaca.

Jeffrey G. Scott, Chairperson; Angela Douglas, Cole Gilbert, James L. Patton

George Eric Peabody

July 31, 1896 — July 3, 1967

George Eric Peabody was born in Wayland, New York. The son of a country doctor, much of his early informal education and philosophy of life was gained while accompanying his father on trips throughout the countryside. A broad variety of interests in the fields of literature, psychology, sociology, history, and meteorology were stimulated by his father and these continued throughout his life. His formal education included attending the Bryant-Stratton Business College in Buffalo before entering Cornell University in 1914. Upon receiving the B.S. degree in 1918, he served in the United States Army Quartermaster Corps until the armistice. After working as a salesman, farmer, and druggist, he returned to Cornell in 1921 with an appointment as instructor in oral and written expression. While serving as instructor, he enrolled in the Graduate School and received the M.S. degree in 1924. He was appointed Assistant Professor in 1927 and Professor in 1937.

His forty-three years of teaching were characterized by a sincere interest in and understanding of students. He was an inspiring and challenging teacher in helping thousands of students develop poise, self-confidence and, in his concise words, the ability to “stand up—speak up—and shut up.” His students were encouraged and helped to organize and present their ideas based on a sound knowledge of their material and clear thinking. Inaccurate material or lack of clarity were not tolerated in his classes. His teaching was not confined to the classroom as literally thousands of hours were spent in individual conferences to help students prepare their speeches. He gave particular guidance to contestants in public speaking in the Eastman and Rice Debates. Many of these contestants have become leaders in agriculture, industry, and other fields. His book *How to Speak Effectively* has been the textbook for public speaking classes for many years in the State College of Agriculture and elsewhere.

Because of his keen understanding and sincere interest many students sought his advice and counsel on matters outside the classroom. His door was always open to such students with counsel freely and wisely given. In 1958, students demonstrated their appreciation for his teaching and interest by selecting him for the Professor of Merit Award.

His interest in and concern for students led to his serving as chairman of both the University Faculty Committee on Student Conduct and of the University Faculty Committee on Student Activities. At the end of World War II he also served as assistant director of Veterans Education, where he was able to help many returning veterans adjust to civilian life and obtain a college education.

This interest was also evident in his service on various committees of the College of Agriculture. These included membership on the College Educational Policy Committee, chairman of the Petitions Committee, and chairman of the Scholarship Committee.

His interest and leadership were also recognized by the Ithaca community. His was a life representing the best in “town and gown” relations. His services to the community covered a wide spectrum. He was connected with the Ithaca Community Chest from 1923-48, being major of the drive in 1940 and 1941, program chairman, 1941-48, and member of the board of directors 1942-48. He was chairman of the Tompkins County Red Cross from 1943-47 and a member of the Tompkins County War Council from 1943-45. Elected to the Ithaca Board of Education in 1944, he served until 1953, being vice-president from 1948-53, and acting president for one term. One of his last contributions to the community was to serve as a member of the City Planning Board from August 1962 to January 1964.

Professor Peabody’s other interests, in addition to his devotion to students and the community, included literature (he was an avid reader able to converse intelligently on many subjects), travel with particular interest in the geography of the United States, and medicine where both his father and son were doctors. He had a layman’s rare understanding and knowledge of the field of medicine.

He deemed himself one of the most fortunate of men in having as a source of constant understanding, encouragement, and stimulation his wife, the former Mary Margaret Roche, whom he married on October 25, 1919. Theirs was a very devoted and close relationship.

He was truly a great teacher with the ability to stimulate, challenge, and guide students. He was also a dedicated member of the Ithaca community as evidenced by his many civic leadership contributions. He will be remembered by all who knew him as a warm friend, a source of wise counsel, and a fighter against hypocrisy.

George S. Butts, A. W. Gibson, Chester H. Freeman

John Musser Pearce

October 23, 1908 — March 22, 1960

Dr. John Musser Pearce was born in New York City, October 23, 1908, the son of Mary Musser and Richard Mills Pearce. His father was an eminent physician and scientist. He received his undergraduate degree from Yale in 1930 and his M.D. degree from Harvard in 1934. He married Moira Brady on September 14, 1932. While on a holiday in Florida he met a tragic death by drowning on March 22, 1960. His widow and their two daughters, Mary and Jane, survive, as do also his mother and a sister.

Dr. Pearce interned and had resident training in pathology at the Presbyterian Hospital in New York from 1934 to 1938. Desiring further experience in research, he then worked for one year in the Princeton division of the Rockefeller Institute for Medical Research. Following this he became Associate Professor of Pathology in Long Island College of Medicine, serving in that post, in association with Dr. Jean Oliver, until 1948 when he came to the New York Hospital-Cornell Medical Center as Professor of Pathology, Professor of Pathology in Surgery, and Surgical Pathologist and Attending Pathologist. He was a member of the American Association of Pathologists and Bacteriologists, the American Society for Experimental Pathology, the Society for Experimental Biology and Medicine, the American Public Health Association, and the New York Pathological Society, of which he was secretary from 1940 to 1942 and president for two years beginning in 1951.

Dr. Pearce was elected a resident member of the Century Association in 1953, his father having been a member during the period 1919-1930. He took great pleasure in the art exhibits and in the monthly meetings of that association. He also very much enjoyed gardening at his delightful summer place in Dorset, Vermont.

While at the Rockefeller Institute for Medical Research, Dr. Pearce discovered the important fact that certain viruses bring about myocarditis under experimental conditions, notably when the host is rendered hypoxic. Working further on this theme throughout a substantial part of his subsequent career, he had recently uncovered another noteworthy finding, namely that materials which work against the enzyme hyaluronidase will suppress the lesions caused by certain viruses but do not interfere with the development of immunity in the infected host. He conceived that this fact might well have practical importance in the study of means whereby vaccination can be effected against virus diseases in human beings.

Dr. Pearce became Surgical Pathologist to the New York Hospital on July 1, 1948, succeeding the late Dr. N. Chandler Foot. In this position he was in constant and close association with all members of the surgical staff. His

responsibility was great in diagnosis at operation and in definitive evaluation. He was truly an able and articulate consultant to his associates in the Department of Surgery.

Perhaps Dr. Pearce's greatest contribution rested on his teaching of surgical pathology to the residents as they rotated through his laboratory. They accompanied him to the operating rooms to see pathological lesions in situ and at his direction often made frozen sections to establish immediately the diagnosis. The young men participated in the day's work of the Laboratory of Surgical Pathology with members of the resident staff in pathology. Dr. Pearce made this a most valuable experience for the surgeon in training. He had the wisdom and understanding so essential in the guidance of medical students and resident staff, and these together with his pleasant and friendly personality placed him high in the esteem of those who came under his instruction.

At the weekly grand rounds Dr. Pearce usually had the final word to answer the most complex clinical problems presented by the staff. Not only did he provide the unequivocal pathologic diagnosis but often outlined the probable ensuing clinical course. His was an enviable and respected position at these Saturday morning sessions when the follow-up results of surgical problems were reported.

The death of Dr. Pearce is a great loss for the Medical Center as a whole. In the Department of Surgery, where he was so intimately associated with the relatively small group, his death is keenly felt. Not only are we deprived of his knowledge and counsel, so important to the daily activities of the department, but also of his enthusiasm, loyalty, and pleasant personal association. The accomplishments of the twelve years of participation in the work of the Department of Surgery and Pathology established him as one of our more able teachers and investigators. His death interrupted a career dedicated to training and teaching at the undergraduate and graduate level, in both departments at the Center.

Frank Glenn, John G. Kidd

Isabel Jane Peard

September 13, 1910 — April 11, 2004

Isabel Jane Peard, Professor Emeritus of Education, was born on September 13, 1910, in Batavia, New York, the only child of George and Jennie (Dennison) Peard. She attended public school in Batavia, and graduated from Batavia High School. Entering the New York State College at Albany, New York, she majored in English and History graduating with an A.B. degree in 1932.

Her first teaching experience was one year in the Montgomery public school, followed by a ten-year term in the Millbrook, New York, Memorial School. She had a strong conviction about service to others, and in 1943 joined the USO Club. Her first service was with the American Troops as Program Director in San Luis, Brazil. Later she served as Club Director in Skagway, Alaska. Following this service, she began employment and graduate study at Cornell, earning the Master of Arts degree in 1943. Following its completion, she entered a doctoral program in personnel administration and philosophy, earning her Ph.D. degree in 1951. After earning advanced degrees, she stayed on as Professor of Education. Dr. Peard also studied at Columbia University and did postdoctoral study in philosophy at Oxford University. During her time at Cornell, she served as Administrative Assistant to the Dean of Women and Director of the Graduate Residence Program in Student Personnel Administration. Dr. Peard's responsibilities in the Department of Education were in the area of philosophy of education and the education of prospective teachers of English. Meticulous in her own oral and written English, it was not surprising that she was much interested in producing outstanding teachers of English. In time, however, she moved almost entirely into the field of philosophy of education.

Dr. Peard was a member of the Philosophy of Education Society, the National Association of Deans of Women, the American Association of University Professors, and of Phi Kappa Phi, Pi Lambda Theta, and Sigma Xi. She also served on a number of university committees, including University Faculty Council, and the Board of Control at Cornell United Religious Work. In 1989, a Cornell Tradition Fellowship endowed by former students, friends, and colleagues was named in her honor. The Cornell Tradition Program embodied her philosophy of giving back, in some measure, what had been given to her in the Cornell experience.

Dr. Peard was a gentle person, strongly committed to her educational and ethical principles. She was not given to outbursts of indignation, but when something went awry in either program or practice, she used her keen sense of humor and well-developed empathy and insight to "explain the matter." She could, in her quiet way, skewer an

opponent and still retain a twinkle in her eye. Seemingly incapable of social or professional hostility, she had more subtle, gentle ways of making others see and appreciate her point of view. Her home for many years was in Forest Home, at the edge of the Cornell campus. It was simple, spotless, and always open to visitors. She and her pet dog and cat were gracious hosts, but her pets were not always reluctant to express an opinion about when guests should leave. Her walls were lined with books, and she loved nothing better than to share with visitors some of the wisdom in their pages. A friend of Anna B. Comstock's, she was, indeed, one of "the old school" at Cornell. Retired as Professor Emeritus in 1971, she lived quietly but maintained her open door policy and loved professional as well as social intercourse with friends and colleagues. Dr. Peard especially enjoyed an occasional dinner out, and was anything but a recluse. A good day was one filled with stimulating conversation, capped by a dinner at The Antlers. Long after formal retirement, she continued her interest in, and involvement with, Cornell events and programs, welcoming many new professors to the Cornell community and its traditions.

Her final days were spent at Oak Hill Manor where she was forced to move when she could no longer care for herself. Dr. Peard passed away there on April 11, 2004, and a memorial service was held in Forest Home Chapel on May 1. To her friends and colleagues, she will be remembered as a rare combination of grace, warmth, and sparkling intellect.

Richard E. Ripple, Deborah J. Trumbull, Verne N. Rockcastle

Frank A. Pearson II

December 31, 1887 — May 31, 1981

Frank A. Pearson was a member of Cornell's class of 1912 and an enthusiastic participant in reunions of that outstanding class. Following graduation he became associated with the University of Illinois, where he rose to assistant chief of dairy husbandry. In 1920 he returned to Cornell and entered the Graduate School, receiving the Doctor of Philosophy degree in 1922.

He was a member of the staff in Agricultural Economics from 1920 until his retirement in 1957. His specialty was prices and statistics, and he was an earnest developer of basic facts on the history of prices. One of his major contributions to the field was the development of a monthly index number of wholesale prices in the United States beginning in 1797. His research results were published in many articles, bulletins, and books. With the late George F. Warren, he wrote three outstanding books, which the publisher (Wiley) designated as the *Price Series: The Agricultural Situation* (1924), *Prices* (1933), and *Gold and Prices* (1935). His books were widely read and studied, and had a major influence on agricultural and price policies of the United States.

From 1923 to 1957 Pearson was editor of *Farm Economics*—a regular publication of the Department of Agricultural Economics. In addition to writing many of the articles, he edited and rewrote numerous articles by graduate students and younger staff members, teaching them to express themselves briefly, accurately, and clearly. The circulation of *Farm Economics* increased to ten thousand copies, and its readership included agricultural leaders of the state and nation. The editorial emphasis on the use of statistics to analyze the economic problems of agriculture had wide impact in the field.

He was an inspiring teacher, particularly of graduate students. He chaired over fifty graduate committees and served as a minor committee member for over one hundred others. His classes in prices and statistics for advanced undergraduates and graduate students were a special experience for several thousand students. His sparkle and fresh approach to these subjects captivated the students and encouraged them to study for genuine understanding. They recognized that the teaching materials were reflecting the ideas of an original and forceful mind.

Pearson's philosophy of life—and of economics—was expressed in an article published in *Farm Economics* in 1956:

The farmer has only one way to improve his standard of living and that is by increasing his efficiency. There are a lot of bright urbanites with sharp pencils working nights and Sundays in the hope that they can gain an advantage over their competitors.

There are a lot of horny-handed farmers with stubby pencils doing just exactly the same thing. There is nothing wrong with the rule that the race is to the swift and to the victor belong the spoils—a higher standard of living.

Following his retirement, Pearson pursued a number of special interests, including his flower growing, golf, photography, the campaigns of the Civil War, and the Fortress of Louisbourg in Nova Scotia. He gave his outstanding collection of pictures of Cornell scenes and people to the University Archives. He led a full life and encouraged others to do likewise.

He is survived by his wife, Amelia Feldkamp Pearson of Ithaca; two sons, Dr. Raymond Pearson of Springfield, Illinois, and Frank Pearson III of Ithaca; and seven grandchildren.

Maurice C. Bond, Edward C. Lutz, Stanley W. Warren

Roger C. Pearson

September 8, 1946 — April 4, 1993

In his 20 short years at Cornell, Roger C. Pearson rose from research associate to become, as a professor of plant pathology in Geneva, the foremost expert on fungal diseases of grapes, not only in New York, but nationally and internationally. However, Roger is missed as much for his friendly, unassuming personality, as for his excellence in plant pathology.

Roger grew up on a peach and grape farm near Kingsburg in the central valley of California. He worked on the farm and also, in the summers of his undergraduate years, at the local Del Monte peach cannery. Roger enrolled at the University of California, Davis and successively obtained his B.S., M.S., and Ph.D. degrees there. Of great influence on Roger's future career was the close and mutually respectful relationship he developed with his major professor, Dennis Hall. Dennis instilled in Roger an appreciation for the practical value of careful, in-depth research that was to be a hallmark of his future work on grape diseases. Dennis was an extension professor with wide-ranging responsibilities for vegetable crops in California, so he was also able to show Roger the methods and rewards of good extension. Roger's graduate research results on the black mold disease of tomato are still instrumental in protecting the important California tomato crop.

Roger came to Cornell in 1973 as a research associate in the Geneva Department of Plant Pathology and was stationed at the Hudson Valley Laboratory in Highland, New York. His responsibilities were primarily on tree fruits. He joined the faculty as an assistant professor in 1975. Two years later he relocated to Geneva and began his career as a grape pathologist. He was promoted to associate professor in 1981 and to professor in 1990.

Roger had statewide responsibility for research and extension on fungal diseases of grapevines in New York. He did pioneering research on the most important diseases of grapes caused by fungi. His research on powdery mildew, the most important grape disease in the world, gained him particular recognition. Although studied for more than 100 years, the powdery mildew life cycle was not properly understood until Roger and his colleagues demonstrated that spring infection of grapevines in New York originate from spores released from spore-producing structures surviving the winter in cracks on the bark of vines. This finding is revolutionizing strategies for control of this disease. Roger also discovered angular leaf scorch and grapevine yellows, both related to serious diseases in Europe, as potential threats to grape growing in New York.

Roger's daily activities and long-term goals reflected a genuine and abiding concern for the needs of grape growers to control destructive diseases. His basic research was always closely followed by an application of the results to improved disease management programs. He traveled extensively throughout New York vineyards during the growing season to talk to growers. A typical day during summer involved several hours of telephone calls from growers, managers, and even other extension, research, and industry pathologists to solve various disease control problems.

Despite the frequency with which he helped others, Roger was a remarkably productive researcher. He simultaneously managed research projects on biological control of powdery mildew with *Ampelomyces quisqualis*; biological control of downy mildew with fungal antagonists; epidemiology and control of powdery mildew, downy mildew, black rot, angular leaf scorch, grapevine yellows, Botrytis bunch rot and Phomopsis cane and leaf spot. The respect that this basic and applied research program was accorded by his colleagues and the viticulture industry is evidenced by the numerous competitive grants awarded to Roger by the USDA, the Sustainable Agriculture program, the New York State IPM program, and the New York Wine and Grape Foundation.

In addition to numerous journal papers and book chapters, Dr. Pearson co-edited and authored the internationally recognized *Compendium of Grape Diseases*. His commitment to producing an up-to-date, truly international, and comprehensive treatment of the known diseases of grapevine involved nearly three years of writing, editing, re-writing, arbitration between reviewers and authors, and hundreds of pages of correspondence. However, the end result was the realization of the goal: a high quality publication of great value worldwide.

Roger's authoritative knowledge of grape diseases was respected worldwide. He was named a research fellow of the Alexander von Humboldt Foundation in 1982, and he was presented the Agway award by the Northeast Division of the American Phytopathological Society in 1990, and the Lee M. Hutchins award of the national American Phytopathological Society in 1991. In 1982, Roger spent a six-month sabbatical at the Biologische Bundesanstalt, Institut für Pflanzenschutz im Weinbau, Bfrenkstel-Kues, Germany, and the Institut National de la Recherche Agronomique, Station de Pathologie Végétale, Bordeaux, France. In 1988, he spent a sabbatical at the Eidgenössische Forschungsanstalt für Obst-, Wein- und Gartenbau, Wädenswil, Switzerland.

Despite his success as a scientist and his genuine affection for his work, Roger's first love was clearly his family. He met his wife Karen in California. They have three children, Heather, 15, Adam, 12, and Alicia 7. Roger delighted in talking about their achievements, which are many.

His concern for others, his kindness, and his quality work were highly appreciated in his Department, at Cornell University, and throughout the worldwide scientific community. We have truly lost an outstanding scientist and a dear friend.

Thomas J. Burr, James E. Hunter, Herb S. Aldwinckle

Laverne L. Pechuman

October 18, 1913 — March 30, 1992

LaVerne L[eRoy]. Pechuman, or Verne to nearly everyone who knew him, Professor Emeritus of Entomology and an international authority on the taxonomy of the blood-sucking flies of the family Tabanidae, died Monday, March 30, 1992, at Strong Memorial Hospital, Rochester, New York, after a short battle with cancer. He was 78 years old, and had continued to be active in his research until about three weeks before his death.

He was born October 18, 1913, in Lockport, New York, the son of Henry J. and Anna Brege Pechuman. He attended the Lockport public schools, and graduated from Lockport High School in 1930. After one year of post-graduate work, he matriculated at Cornell University, and graduated in 1935 with a bachelor's degree in Entomology. In July 1935, he was appointed an Assistant in Entomology for the Dutch elm disease investigation being conducted jointly by the Departments of Entomology and Plant Pathology. He was admitted to the Graduate School at Cornell in September 1935. During the initial course of work on the Dutch elm disease, it was thought advisable to, conduct a comprehensive survey of the various insects found associated with elm, and with special reference to their potential to transmit the causative organism of Dutch elm disease. Verne carried out these early biological investigations, first begun in 1934 by Drs. Philip A. Readio and Henry Dietrich, under the aforementioned professors' direction and later that of Dr. D.L. Collins. Pechuman's work culminated in a thesis entitled "Preliminary account of the insects found in the bark and wood of the American elm (*Ulmus americana* L.)," and in February 1937 he successfully completed requirements for a master's degree in Entomology. Verne's doctorate work was a continuation of his research on the Dutch elm disease, again under the able direction of Dr. Readio. A thesis entitled "The insects found in the bark and wood of the American elm (*Ulmus americana* L.)" was submitted to the Faculty of the Graduate School of Cornell for the degree of Doctor of Philosophy in June 1939.

Upon the completion of Verne's doctorate, he gained employment with the Ortho Division of the Chevron Chemical Company (formerly California Chemical Co.). Beginning as a field representative (1939-45) in the company, he rose through the ranks, first from a Branch Manager (1945-47), to a District Manager (1947-61), and finally to a Senior Research Scientist (1961-62). After nearly 25 years of dedicated service to Chevron Chemical Company, he returned to academia and Cornell University, joining the Entomology Faculty in 1962 as an Associate Professor and curator of the world famous insect collection. He was named Full Professor in 1972. Soon after his retirement in 1982, he was awarded the title of Professor Emeritus.

Among his academic peers and colleagues, Verne Pechuman will be best remembered as a world authority on the systematics, biology, and distribution of horse flies and deer flies (Tabanidae). During his 20 years as curator of the Cornell University Insect Collection, he is credited with amassing a collection of well in excess of 40,000 tabanid specimens, the largest and most geographically diverse assemblage of world Tabanidae in a North American university collection.

In the early 1970s, while collaborating with Dr. Mathias J. Kemen, Jr., a Cornell veterinarian, on the annoying biting and blood-sucking habits of horse and deer flies, and, in an attempt to answer the plight of New York dairymen and horse owners, Verne designed a mechanical trap (a prototype of which he used previously to make general collections of tabanids) to capture and significantly reduce the number of flies in a given area. It is a known fact that dairy cattle attacked by these biting flies often show a significant drop in milk production, and in horses these flies can be vectors of a debilitating viral disease known as equine infectious anemia. His broad-based knowledge of tabanid biology and especially of some of the behavior traits of these flies was the basis for the efficacy of this mechanical trap. Tabanid flies, which are attracted by dark, moving objects, are lured to the trap by a swinging, shiny, black ball, and a carbon dioxide supply (dry ice), which fools the flies into thinking there are live animals about (anthropomorphically speaking!). Once inside the trap, the flies move upward towards light and are captured and killed by an insecticide in the trap head. This trap design is still in use today.

Although his primary taxonomic and biological work focused principally on the horse and deer flies, other interests of his included following the emergence of the various broods of the periodical cicada (the 17-year locust) in the eastern United States, a fascination with the effect of Pleistocene glaciation on several groups of insects, and yearnings in the history and pre-history of Upstate New York, local native American history, archaeology, and botany.

Verne loved the out-of-doors, and on many occasions he seized the opportunity to go collecting, usually to his favorite bogs around central New York to find his pesky horse and deer flies. He also had an admiration for plants, for which he knew many, if not most, of the local native and cultivated species. He had a special fondness for trilliums, however; so much so that he authored two articles in the early 1960s: "Trilliums of Western New York," and "Trillium Variations in Western New York." He also exchanged Trillium specimens with botanists in Japan, which are still known to be growing in his native Lockport, and donated a Trillium collection to the Cornell Plantations.

Perhaps one of Verne's rarest tributes was his welcome as a guest at Tonawanda and Tuscarora Indian ceremonies. As well he was an adopted member of the Tonawanda Band (Hawk Clan) of the Seneca Indians. Through the years, Verne was always deeply concerned about the welfare of the native Americans. On his many travels about New York State, he was known occasionally to detour to an Indian reservation to speak to and share times with his "adopted" brethren. In 1961, as a Director and Editor of *The Niagara County Historical Society*, Verne wrote an introduction to one of the early writings of David Cusick, a Tuscarora Indian: "Ancient History of the Six Nations," which was reprinted by the Society. In Verne's closing statement in this introduction, he wrote, "It is hoped that by reprinting this work of a Tuscarora Indian, it will be more readily available not only to students of anthropology but to anyone interested in a peculiar bit of Americana."

His numerous professional affiliations included the American Association for the Advancement of Science (AAAS), Entomological Society of America, Entomological Society of Ontario, American Entomological Society, New York Entomological Society, American Mosquito Control Association, Sociedade Brasileira de Entomologia, Buffalo Society of Natural Sciences, New York State Archaeological Association, and the Society for Pennsylvania Archaeology. As an active advocate for habitat preservation locally and globally, he belonged to The Nature Conservancy, Nature Sanctuary Society of Western New York, Bergen Swamp Preservation Society, and the Wilderness Society. He held advisory positions in many of these associations. Among his honors he was a member of Sigma Xi, appointed a fellow of AAAS in 1964 and a fellow of the Rochester Museum of Arts and Sciences in 1965, and listed in the *American Men of Science*. In 1960 he was made an honorary member of the Rochester Academy of Science, and also in that same year received a citation as "distinguished scientist" from the University of Buffalo.

Verne was author and coauthor of nearly 100 scientific papers and monographs. He described 22 species (and subspecies) of horse and deer flies from around the globe as new to science. Reflecting the respect that other entomologists had for his work, Verne had 26 species named after him as of 1986, mostly flies, but also including an aphid, a dragonfly, a stonefly, several wasps and hymenopteran parasitoids, and a protozoan.

He is survived by a sister and brother-in-law, Dorothy and Benjamin Neal of San Jose, California; daughters and sons-in-law, Patricia and William Ferris of Bergen, New York, and Jean and James McIntyre of Waterville, Maine; grandchildren William and Michael Ferris; and one niece and several cousins. His wife of 52 years, Berta, preceded him in death on December 3, 1991. Following a memorial service held in Ithaca, New York, he was buried in the family plot (Cold Springs Cemetery) in Lockport, New York on April 4, 1992.

Professor Pechuman has left an enduring mark on the systematics of the Tabanidae to which he did much to fashion. As well he leaves behind a legacy of scholarship and dedicated service to Cornell University that includes not only his own publications but, also, his large collection of tabanid flies. The lives of his long-time colleagues and students are much richer today for having known and worked with him. We will remember him with fondness and great respect, and for his generosity of time, dash of good humor, and as an enthusiastic conversationalist and delightful companion. He will be dearly missed by his colleagues in the profession and by his many other friends.

Carolyn Klass, James K. Liebherr, E. Richard Hoebeke

Bertel Sigfred Pedersen

February 9, 1943 — February 28, 1978

Bertel Sigfred Pedersen's death on February 28, 1978, following surgical implications deprived the Department of Comparative Literature of its youngest and one of its most wonderfully gifted members. Pedersen had barely passed his thirty-fifth birthday—and the tenth anniversary of his residence in the United States—when he died, but the scant measure of his years scarcely reflected the ripeness of his erudition and wisdom. Though Pedersen himself would have been the first to laugh off the phrase “pure intellectual” (Pedersen laughed easily) as suggesting more of mummified scholasticism than of humane learning, few of his generation lived the life of the mind as resolutely and harmoniously as he lived it; and though he participated in the activities of the department and the college as fully as anybody, at bottom he subscribed to the injunctive “From these distractions, fly” as fit notice to the scholar-teacher. His homes were the library and the classroom.

A native of Denmark, Bertel Sigfred Pedersen was born in Nørresundby northern Jutland on February 9, 1943. He received his early schooling in the nearby city of Aalborg. After his family moved south to Hornslet, Bertel attended Aarhus Katedraskole, from which he graduated in 1962. From 1962 to 1966 he studied Danish literature and philology and comparative literature at Aarhus University, at that time the center of comparative studies in northern Europe and home of the leading Scandinavian comparatist, Erik Lunding. The year after his graduation Bertel came to this country to pursue his doctoral work in comparative literature at the University of Illinois; he received his Doctor of Philosophy in the summer of 1971. The same year he was appointed assistant professor of comparative literature at Cornell, the position he held at the time of his death.

It may well have been a temperamental affinity with his subject that led Pedersen to choose as the topic of his doctoral dissertation “The Theory and Practice of Parody,” for, despite an almost lifelong struggle against physical pain, Pedersen's bent—in theory and practice—expressed itself essentially in his humor and an intractable sense of the comic: to his friends and his work alike he brought the playfulness and the sophisticated wit that reflected the spirit of his favorite writers. And despite his upbringing among the “happy nations of the moral North,” or more likely because of it (Bertel had a penchant for quoting and a penchant for elaborating his syntax in parentheses), Bertel developed a certain quixotic passion for American manners and mores, forever quoting statistics from the latest sports matches or discoursing on the latest in movies, rock groups, and media events.

At the same time he never lost touch with his roots. Very much a family person, he revisited Denmark nearly every year; last Christmas was his last reunion with his parents and homeland. And he loved to divert his chums with histories and vignettes of Danish customs, Denmark's inner as well as outer "profile," her tedious traditions and modern accommodations— speaking in his slightly probing, deliberate manner, often with that affectionate belittlement and friendly irony that seem to be among the Danes' birthrights.

In his curriculum vitae Pedersen owned to a "working" knowledge of eight languages. The fact is that he could have conducted a class in Old Norse with his left hand before walking into a class on the New Critics, and taught both with meticulous precision. Emphatically, in his pedagogy and his publications, he focused on the modernists, notably the modern novelists, as the source of his solicitude, though his course descriptions in themselves reveal his genuine scope: European and American poetry, the European novel, myth and literature, literary theory from Russian formalism to French structuralism, the Scandinavian playwrights, Kierkegaard, and Nietzsche.

In his conduct as a teacher Bertel displayed the finely honed humor and total scrupulosity that he displayed elsewhere; and it is mere fairness to note that he largely attracted and appealed to the brightest undergraduate and graduate students. Again, his painstaking and leisurely attention to a given text (or call it absence of negative capability) was such that he was known to spend half the term on a novel by one of his most cherished authors— and then be asked by his undergraduate constituency kindly to spend the rest of the term on the book. Had he needed an uplifting excuse for his expansiveness beyond the mandate of his students, he need only to have turned to the first page of the novel under discussion, which happens to promote the opportune thesis that "only the truly exhaustive is truly amusing." The amusement and insight were always there: as one of Bertel's students once remarked, "What a pleasure to be taught Kierkegaard by a Dane!" Kierkegaard a pleasurable object? Exactly; because exactly.

In his writing as in his teaching, Pedersen managed to cut across genre lines almost programmatically: literary criticism, philosophy, fiction, drama, poetry—all the gay sciences and scientists from Nietzsche to Nabokov, Ibsen to Ionesco, Lotman to Lacan. Pedersen broke into print in 1969 with an essay in Danish on Northrop Frye, and his productiveness in the brief span left to him never slackened. Among his major articles, a piece on Kierkegaard's pseudonymous texts deserves to be singled out for the sure-fingered erudition and analytic clarity with which Pedersen guides the reader through Kierkegaard's labyrinthine pseudo-seriosities.

In his major work, *Parodiens teori*, published in Denmark last year, Pedersen examines with astonishing concentration the whole problem of parody as a reflex of the modern literary sensibility; the book combines vast

tracts of aesthetic theory with sustained readings of some half-dozen performers in the parodic mode—Mann, Joyce, Borges, Beckett. As an essay in applied criticism alone the book is concisely first-rate. It parts radically from the customary maiden academic book in that in range and depth it far outstrips Pedersen's doctoral thesis, which served as no more than preliminary exercise and was to form its nucleus. It parts, too, from most substantial works of criticism in being accessible to both the specialist and the sensitive common reader—provided the specialist and common reader know Danish. Its translation into handier languages will be a mere matter of time: on its publication, the foremost Scandinavianist in America called for its translation into English as essential.

Among his literary remains, Pedersen left nearly complete or formulated essays on Borges, Nabokov, and Dinesen—writers whose fine frisks and gambols and curlicues and intellectual gamesmanship he watched with marvelous gusto. His book reviews—models of their kind—display Bertel's commitment to modern critical theory.

In Bertel we lost one of the most active and conscientious members of the department. He served as field representative in his last year; the year before his death he initiated and conducted a series of weekly proseminars for faculty members and graduate students in comparative literature—conducted them so skillfully that in the judgment of the participants most public lectures pall in the comparison.

Bertel's parents, Sigfred and Ebba Pedersen of Hornslet; his wife, Jane, and stepdaughter, Melora, of Ithaca; and a sister, Mrs. Inger Steen- Mikkelsen, survive him. The crowd of friends, students, and colleagues who attended a memorial service for him on March 14, 1978, merely confirmed how deeply this quiet young man had touched each of them in some distinctive way. His parting was sudden and unforeseen: the arrows of death fly unseen at noon.

W. Wolfgang Holdheim, William J. Kennedy, Edgar Rosenberg

Carl Severin Pederson

April 30, 1897 — September 2, 1987

A son of Norwegian emigrants, Carl Pederson was born in South Milwaukee, Wisconsin. Following graduation from high school, he enrolled at the University of Wisconsin where he obtained the Bachelor of Science degree in food chemistry in 1924 and the Master of Science degree in biochemistry in 1925. He joined the Department of Bacteriology at the New York State Agricultural Experiment Station in 1925 as an assistant in research. He received a Ph.D. from Cornell in 1929 with a major in bacteriology. He became the equivalent of an assistant professor in 1929 and a professor in 1931. He retired from Cornell in 1967.

Carl was a world recognized leader in food microbiology. His areas of expertise were vegetable fermentations, the preservation of tomato products, sanitation in food processing, and the microbiology of fruit juice beverages. Over 200 publications resulted from his investigations. His book, *Microbiology of Food Fermentations*, was widely acclaimed by food microbiologists.

Dr. Pederson was perhaps best known for his research on the sauerkraut fermentation, an area that he first studied at the University of Wisconsin under the guidance of Professors W.H. Peterson and E.B. Fred. Pederson's greatest contribution was his discovery that a specific sequence of bacteria was needed for the production of quality sauerkraut. He found that this sequence could be achieved by regulating factors such as concentration of salt, temperature of fermentation, exposure to air, and proper sanitation. His research also demonstrated that sauerkraut could be successfully preserved when canned at a lower temperature than was customarily used at the time, a change that not only improved flavor and texture but also reduced processing costs.

Dr. Pederson's research on vegetable fermentations led to his interests in the taxonomy and physiology of the lactic acid bacteria. He contributed to a number of editions of Bergey's *Manual of Determinative Bacteriology* and his paper with G.J. Hucker on the genus *Leuconostoc* served as the definitive taxonomic reference for many years.

Spoilage of tomato products was a serious problem for the canning industry when Carl first arrived at the Experiment Station. By studying the physiology of the microorganisms that were responsible he discovered that certain combinations of salt, sugar and vinegar prevented their growth in catsup and chili sauce and, as a result, spoilage of these foods is now a rare event. His research on tomato juice showed that spoilage by heat resistant sporeforming bacteria could be prevented by the addition of a small amount of citric acid to lower the pH.

His research on fruit juices involved the preparation of beverages from all of the important New York fruits and the development of processing methods for their successful preservation. His studies on apple juice revealed that undesirable browning reactions resulted from the activity of certain enzymes present in the apple and that by adding vitamin C to the juice immediately after pressing, these changes could be prevented. This discovery resulted in the development of a new light colored, fresh tasting apple juice.

In 1965 Pederson accepted a two-year assignment at the University of the Philippines in Los Baños under Cornell's International Agricultural Development Program. While there he established a research and teaching program in food science, a program that greatly aided the Cornell food scientists who followed him.

Carl possessed an outstanding ability of applying scientific research to practical problems and throughout his career, worked closely with the food processing industry. He spent long hours in the different factories that freeze, can, and ferment fruits and vegetables and was well-known to company managers as well as to the most junior technician. His zest to help the food processor stayed with him throughout his professional life: while in the Philippines he collaborated with Philippine companies to improve the quality of their cucumber pickles.

Although extension was not an official responsibility for Carl, he played an active role in numerous programs designed to transfer information to the food industry. For many years, he hosted a mold count school for the tomato industry that was co-conducted with the New York State Canners and Freezers and the National Canners Association. In his campaign to improve the quality of sauerkraut, he held annual "cutting bees" with the National Kraut Packers Association to assess samples of sauerkraut from all over the United States.

Pederson received the Forty-Niner Service Award in 1968. This most prestigious award of the Canning Machinery and Supplies Association is given annually to the individual who has made the most significant contributions to the food processing industry. He was a founding member of the Institute of Food Technologists and of Phi Tau Sigma, a fraternity for food scientists. He was a fellow of the American Public Health Association and a member of the American Society for Microbiology, Phi Lambda Upsilon, Alpha Zeta, and Sigma Xi.

In community affairs, Carl was active in the First Presbyterian Church of Geneva where he served as a Sunday school teacher, a ruling elder, and as Clerk of the Session. He received the Silver Beaver award for his many contributions to the Boy Scouts of America, and a citation from the Salvation Army for serving on its board for many years. A long time member of Rotary, he was especially interested in the club's camp for handicapped children.

Dr. Pederson is survived by his wife, Marian; his daughters, Jane and Carolyn; his son, Donald; eleven grandchildren; and several great-grandchildren.

Paul J. Chapman, John R. Stamer, Don F. Splittstoesser

Michael Peech

March 28, 1909 — October 6, 1988

Michael Peech, born and raised on the Canadian prairie, died in Ithaca, New York, after a long and distinguished career at Cornell University. After completing his primary and secondary education, he enrolled in the University of Saskatchewan, from which he received his B.S.A. degree in agricultural chemistry in 1930. He then began his graduate studies at Ohio State University under the direction of Professor Richard Bradfield and completed his Ph.D. degree in 1933. He began his professional career as assistant chemist at the University of Idaho. After three years he became soil chemist at the Florida Citrus Experiment Station at Lake Alfred. Meanwhile, Richard Bradfield, his mentor at Ohio State, became head of Cornell's Department of Agronomy, and in 1941 invited his former student to Ithaca as professor of soil chemistry, where he completed his professional career. He became professor emeritus in 1974 and remained in Ithaca until his death.

A classical inorganic chemist, Professor Peech brought basic insights, patience, and rigor to the demanding problems of soil science, beginning with efforts to develop and verify sound analytical methods with which to estimate the specific needs of farmers' fields for lime and fertilizers. Possibly his best known and most widely distributed paper, "Rapid Microchemical Soil Tests," was a classic that set standards for soils laboratories throughout the world.

Professor Peech was active in a revival of studies of adsorption and exchange reactions at the surfaces of soil particles, including poorly organized alumina-silicates. He studied the behavior of very slightly soluble compounds in plant nutrition. In the fifties, efforts to measure specific ion activities in soil solutions using selective ion electrodes fostered controversies that involved all the leading soil chemists of the day, including Professor Peech.

In the meantime, along with Professor Bradfield, he maintained an abiding interest in the chemistry of soil acidity. He and his colleagues concluded that soil pH was not responsible for the deleterious effects of acid soils on plant growth, but that high concentrations of aluminum in soils were responsible. The result was a series of papers on the chemistry of aluminum in soils, done with the customary care that characterized the work of Professor Peech. Late in his career he became interested in the differences in behavior of highly weathered soils of the tropics and less weathered soils of temperate regions. The result was a paper leading to new understanding of the electrochemical nature of clay minerals, including fixed and variable electrical charge density associated with their surfaces. This and other studies completed within the last year before his retirement capped a career of continuous achievement.

Professor Peech was a teacher of remarkable talent. He was well-known for the lucidity of his prepared lectures. Students from many departments and countries came to enroll in his soil chemistry course. He served as major professor to 55 students during his tenure at Cornell. His seminars and professional papers were exceedingly well received. At the same time, in informal discussions, he was celebrated for the mercurial excursions of his brilliant mind. His colleagues and his students were hard-pressed to keep pace with him as he debated the issue at hand, making points and counterpoints with astonishing rapidity.

Membership in professional societies included the American Chemical Society, the American Society of Agronomy, and the Soil Science Society of America. He served on many important committees of these societies, and early in his career, he served as president of the Soil Science Society of Florida. Many honors came to Professor Peech, including a Guggenheim Memorial Foundation Fellowship, Fellow of the American Society of Agronomy, the American Society of Agronomy Soil Science Achievement Award, and the New York Farmers' Award for Outstanding Achievement in Agriculture.

Professor Peech became a naturalized citizen of the United States in 1937. He was preceded in death by his wife, Sonia, and his son, John. His daughter, Marjorie, survives. In an academic community, where individualism is the norm, Michael Peech will always be remembered by those whose lives he touched.

Murray B. McBride, Robert D. Miller, Douglas J. Lathwell

Claude Marc Pendleton

July 20, 1894 — August 22, 1943

Claude Marc Pendleton Assistant Professor of Structural Engineering, died suddenly at his home in Forest Home, on Sunday morning, August 22, 1943; he had just come home after giving, as was so characteristic of him, kindly assistance to some one in trouble.

Professor Pendleton was born on July 20, 1894, at McDondonugh, Chenango County, New York. He received his primary and secondary school education in the city of Binghamton, and entered the College of Civil Engineering at Cornell on September 21, 1914, and received the degree of C.E. in January 1919.

Professor Pendleton was appointed Instructor in Civil Engineering on July 1, 1919, and held the Marc Eidlitz Instructorship from September 1925 until he was promoted to the position of Assistant Professor of Structural Engineering. In the fall and early winter of 1924-25, he gave valuable help to the Astronomy Department in the preparations for observations of the total eclipse of the sun on January 24, 1925.

Very few, if any, men in recent years have taught as great a number of different courses in Civil Engineering as has Professor Pendleton. He was justly regarded by his colleagues and by the student body as one of the best teachers in the School of Civil Engineering. He was always ready to help any student needing aid in any subject, and, because of his patience and versatility and the clarity of his explanations, his aid was eagerly sought. Perhaps if some good angel had protected him from such an incessant drain on his time and energy, he would still be with us.

It is difficult to measure the contribution of Professor Pendleton to the profession of civil engineering, but if one could look into the hearts of the many people whom he has helped, one might get a glimpse of the value of his service to engineering education through his assistance, so freely given, to engineering students.

Both faculty and students, who were associated with him, have lost a loyal, noble, unselfish friend and the civil engineering profession has lost an able and devoted teacher.

Norman Penney

August 29, 1926 — December 30, 1981

During the final days of 1981 the Ithaca community was shocked by the tragic death of Norman Penney during a burglary of his Washington, D.C. apartment.

Half of Norm's fifty-five-year life was devoted to the Cornell Law School, ending with his move to the American University, Washington College of Law, in June 1981.

From 1944 to 1946 Norm served as a staff sergeant in the United States Army in the Philippines and Japan, receiving a postrelease commission. He entered the Cornell Law School in 1950, from Yale College and the Hill School. He was managing editor of the *Cornell Law Quarterly*, was elected to the Order of the Coif, and received the Bachelor of Laws degree with distinction.

Upon graduation, Norm joined his uncles' Buffalo law firm, founded by his grandfather, Thomas Penney, who, as district attorney of Erie County, successfully prosecuted Leon Czolgosz, the assassin of President McKinley. Norm had impressive professional experiences representing clients. In academic settings Norm always remained essentially a lawyer, expecting his students to be prepared for the demands of challenging practice and worrying when they did not meet his expectations.

In 1957 Norm, with Judge Charles S. Desmond, later chief judge of New York, offered a course on problems of trial and appellate practice. Norm then became an assistant professor of law, was promoted to associate professor in 1960, and became professor of law in 1962. He was demanding and compassionate as a teacher, as he was in all his endeavors.

Well-rounded in the law because of his years of practice, Norm soon received recognition both in the United States and abroad as an authority in commercial and banking law.

To help promote New York's adoption of the Uniform Commercial Code, since enacted in all of the states (except Louisiana, a civil-law jurisdiction), Norm and his "code twin," Professor William E. Hogan, now at New York University, in 1961 coauthored the New York Annotations to the code. Norm also coauthored (with Professor Richard F. Broude of Loyola University, Los Angeles) a casebook on land financing (1970; second edition 1977). He also coauthored in 1980 (with Donald I. Baker) a seminal work on computerized banking transactions, *The Law*

of Electronic Fund Transfer Systems, completing a supplement in December 1981 for 1982 publication. Norm was also a frequent contributor to legal periodicals.

Norm's major teaching contributions were in the important law school areas of commercial law, banking transactions, insurance, and land financing.

From the beginning of his academic career, Norm combined administration with teaching. During his first three years on the faculty he was director of admissions, resulting in his membership on (1970) and presidency of (1972-74) the Law School Admissions Council. From 1962 to 1965 Norm was associate dean of the Law School, and in 1969 its acting dean. He was a superb administrator, often sought for deanships at other law schools.

Norm accepted more than his share of demanding faculty committee assignments. He also volunteered his services on many problems of campus and student concern, such as fallout shelters and options for students avoiding the Vietnam War draft. He was the first speaker of the Cornell Constituent Assembly.

Campuswide recognition came in 1971 when he was elected to a three-year term as dean of the University Faculty by more votes than the combined votes of the other candidates. His services during very trying years for the University included valuable counsel for the president and other senior administrative officers and earned him the respect of all. As chief administrative officer of the faculty and liaison between faculty and administration, Norm effected the organization of the Faculty Council of Representatives. Further recognition came with Norm's election as faculty trustee (1974-79).

Norm's visiting professorships included teaching at the University of Khartoum, Sudan (1965-66), the University of Melbourne and Monash University in Australia as a Fulbright Scholar (1975), and McGeorge School of Law of the University of the Pacific (1980).

Among Norm's consultantships were those for the New York Commissioners on Uniform State Laws, the New York Law Revision Commission, the United States Department of State (Advisory Committee on Private International Law), and the Federal Reserve Board (Consumer Affairs Division). Since 1970 he served as an American delegate to the United Nations Commission on International Trade Law.

In every area of academic life—teaching, research, writing, law school administration, and University committee work and administration—Norm excelled. But he also had ample time to be a genuine person and friend who never dissembled and was fun to be with, whether on many and varied social occasions, sailing on Cayuga Lake, playing squash, or clamming on Nantucket.

Memorial services for family and close friends were held in the Anabel Taylor Chapel on January 4, 1982. The Reverend John Taylor conducted the service based on the theme encribed in the Myron Taylor Hall Moot Court Room: "The Law Must Be Stable and Yet It Cannot Stand Still." Professor Hogan gave a moving eulogy. Participating also was the Reverend David Moore, a relative who had co-officiated at the marriage of Norm's only daughter less than six months before in Sage Chapel. Subsequently, American University sponsored more-formal services in Washington, D.C., attended by some five hundred persons paying tribute to Norm's friendships and many contributions to his profession and to public service. Norm is survived by his wife, Sue; four children: John Belding, of Buffalo, David Wright, of Detroit, Celia Elizabeth (Mrs. Robert Flynn), of Summit, New Jersey, and Christopher Young, Yale '83; a granddaughter, Hilary Eve Penney; and his mother, Mrs. Bertina F. Spangberg, of Ithaca, New York.

Dexter Perkins

1890 — May 12, 1984

Dexter Perkins, holder of the John L. Senior Professorship at Cornell University from 1954 to 1959, died on May 12, 1984, at the age of 94. He was born in Boston and was educated at Boston Latin School and Harvard University. At Harvard he studied under Archibald Cary Coolidge and Charles Homer Haskins and began his work on the history of the Monroe Doctrine. This subject became the central feature of his research and writing in the middle years of his life. His book on the history of the Monroe Doctrine became the standard work in the field.

The range of his studies reached out into the whole of American foreign policy. He followed the development of the League of Nations, the World Court, and the United Nations; indeed, he took part in the organizational meetings in 1945 that shaped the constitution of the United Nations. The history of American foreign policy and the significance of events in the emerging international politics of his day were the substance of his scholarly career, a career of great variety.

The basis of Perkins's career was his distinguished service at the University of Rochester from 1915 to 1954. He was the first holder of the Pitt Chair in American History and Institutions at Cambridge University, in 1945-46. He lectured at Oxford, at London, at the University of Wales, and in Sweden, Japan, India, and Taiwan. Within the United States he lectured at Harvard, Indiana, Johns Hopkins, Cincinnati, Pittsburgh, Virginia, Colorado, the National War College, and Wells College, where he held the Campbell Chair for one year.

He was president of the American Historical Association and used his office to urge fellow historians to bring inspiration and vigor to their teaching. He shared in writing *The Education of Historians in the United States*. Throughout his career he kept close to his alma mater, Harvard, where he was a member of the Board of Overseers and chairman of the Harvard Foundation for Advanced Study and Research. He was a frequent adviser to the Harvard Department of History. He organized, directed, and presided over the Salzburg (Austria) Seminar in American Studies.

Perkins was a public lecturer with great gifts, as his career at Cornell University testified. He established a program of weekly lectures addressed to the layman and took as his subjects aspects of American foreign policy and important events and attitudes in the domestic politics of the day. The insight of the historian, wit, vigor, and abounding enthusiasm were the characteristics of his style as a lecturer. Throughout his five years in Ithaca his

lectures drew lively response from the whole community, city folk and academics, to the number of about three hundred, week by week. Some two thousand attended his final lecture in Ithaca.

Deep admiration for Woodrow Wilson was a central feature of his judgment of American foreign policy. Later presidents he appraised according to their attitudes towards international security, the League of Nations, and the United Nations. In Perkins's gallery of successful presidents Franklin D. Roosevelt had a place close to Wilson, but he did not hesitate to show examples of their weaknesses and errors of judgment.

The wife of Dexter Perkins, Wilma Lord Perkins, died at an earlier time. A son and four grandchildren are still living.

Paul W. Gates, Frederick George Marcham, Knight Biggerstaff

Harold C. Perkins

October 29, 1891 — October 24, 1986

Harold C. Perkins was born on October 29, 1891, in Forest Home, New York. He entered Cornell and graduated with a mechanical engineering degree in 1915, and after gaining practical experience as an apprentice engineer at the Remington Arms Company, he returned to Cornell in 1916 as an instructor in mechanics. Apart from a year at the University of Wisconsin—also as instructor in mechanics—his whole career was spent at his alma mater, from which he retired in 1959 as professor in the Department of Engineering Mechanics and Materials. He died on October 24, 1986, in Syracuse, New York, where he had made his home since 1975.

The above are the bare facts, and they shed little light on Harold's very real and varied accomplishments. First and foremost he was a dedicated teacher with a real enthusiasm for imparting a love of his subject to his students. The undergraduates passing through his classes in mechanics will never forget his passion for the drawing of the all-important "free-body" diagrams. So great was his enthusiasm for this subject that the students quickly gave Harold the affectionate name of "Free-Body Perkins," a title that he wore with justly deserved pride.

Despite the heavy undergraduate teaching loads that were typical in his day, he nevertheless found time for research. In 1947 it was decided to reactivate Cornell's laboratory of photoelasticity, an important tool in the experimental study of stress analysis. Perkins not only completely reorganized the laboratory but he was the first researcher to extend photoelastic measurements from the static into the dynamic range. The results of that considerable and important achievement were published in 1953 in the *Journal of Applied Mechanics* of the American Society of Mechanical Engineers. Firmly believing that the simplest possible experiments were frequently the best, Harold found that the liquid that best supported his dynamic loading specimens was a well-known brand of hair-setting lotion!

But that was by no means Perkins's only foray into original research. Other studies in which he extended the knowledge of the subject were in investigations of helical springs, high-velocity impact, welding design, and the calculation of the distribution of loads on the threads of screws. A particularly interesting investigation culminated in a graphical analysis for solving problems of torsion, which he published in the *Proceedings of the Fifth International Congress of Applied Mechanics*, which cover the meeting held in Cambridge, Massachusetts, in 1938. The above work was stamped with the characteristic simplicity and originality that marked all Perkins's researches.

Harold Perkins was a kindly, modest man with a dry sense of humor that enlivened his classes and his conversations with his colleagues and friends. He was completely enamored of his field of study and of the teaching of it and remained so until his retirement in 1959. The older members of the faculty will remember with nostalgia the picnics that Harold and his wife frequently gave for the members of the Department of Engineering Mechanics and Materials at their cottage on Cayuga Lake off Taughannock Boulevard. Colleagues, wives, children, students, and friends were all invited and made to feel that they were at home and that they were members of the same family.

Professor Perkins is survived by a daughter, Martha Melfi of Syracuse; fifteen grandchildren; and twelve great-grandchildren. He enriched the lives of his friends and students and will be remembered with affection by all who knew him.

Arthur L. Ruoff, Yih-Hsing Pao, Harry Conway

James A. Perkins

October 11, 1911 — August 19, 1998

James Alfred Perkins served as the seventh President of Cornell University from 1963-69. At the time of his death, he was Chairman Emeritus of the International Council for Educational Developments, which he had founded in 1970. Perkins devoted most of his life to the improvement of higher education in the United States and abroad. As Cornell President Hunter Rawlings stated: “Jim Perkins represented the highest ideals of liberal education, and he left a permanent legacy not only on the Cornell campus but also in the foundation of our nation’s dynamic postwar education and research institutions.”

Born in Philadelphia, Perkins was the son of Harry Norman Perkins, a banker, and Emily Cramp (Taylor) Perkins. Although his parents were not Quakers, he attended the Germantown Friends School, founded by the Monthly Meeting of Friends in Philadelphia in 1845, a school whose goal was “to give a thorough education by providing moral, intellectual, and physical training that will fit boys and girls to become useful men and women...Christian influences, positive in character, are fostered as the highest value in school life.” In his senior year, Perkins was editor-in-chief of the student literary magazine, the *Pastorian*.

Perkins entered Swarthmore College in 1930, at a time when pacifist sentiment was gaining strength on college campuses across the nation. He had attended weekly Friends’ Meetings in high school and so it was rather to be expected that during his undergraduate years he would join the Religious Society of Friends (Quakers). In the spring of his junior year, students at Swarthmore and more than sixty other American colleges solemnly took the “Oxford Pledge,” declaring their opposition to military service and participation in war. Perkins graduated from Swarthmore in 1934 with high honors.

He then entered the Doctoral program in Political Science at Princeton University, where he studied with the prominent scholar, William S. Carpenter. The topic he chose for his dissertation, “Congress Investigates Our Foreign Relations,” reflected Perkins’s ongoing concern with contemporary problems of war and peace. In 1934, the U.S. Senate had created an investigating committee under Gerald Nye of North Dakota to probe the influence of the armaments industry on American foreign policy. In 1936, the Nye Committee issued a report, which asserted that bankers and munitions makers had played an essential role in pushing the United States into the First World War.

In his dissertation, which he completed in 1937, Perkins examined the munitions inquiry as one example of many congressional attempts – beginning with a 1919 Senate investigation into conditions in Mexico – to influence presidential conduct of the nation’s foreign policy or federal policies affecting trade and immigration. Perkins’s conclusion, which he published in the April 1940, *American Political Science Review*, was that congressional investigations “have repeatedly failed to have much influence on the course of our foreign policy.” Much of his effort went to explaining the political and structural reasons for that failure, and to calling for “self-restraint” on the part of Congress so that its future actions might be “in harmony with the requirements of our democracy.”

His Ph.D. degree in hand, Perkins decided to remain at Princeton, first as Instructor in Political Science from 1937-39, and then as Assistant Director of the School of Public and International Affairs from 1939-41. On June 20, 1938, he married his college sweetheart, Jean E. Bredin (Swarthmore ‘36), and the couple eventually had five children: Barbara, Joan, John, David, and Tracy. By 1941, Perkins had already acquired valuable experience in academic administration at Princeton, and the entry of the United States into World War II in December provided him (and thousands of other able young men and women) with an extraordinary opportunity to develop his managerial skills in wartime civilian administration.

Perkins moved to Washington, D.C. in 1941 to take a position with the Office of Price Administration (OPA). Created by President Franklin D. Roosevelt in order to prevent inflation and profiteering, the agency was led by the flamboyant New Deal economist, Leon Henderson. Perkins headed the Pulp and Paper Division which had responsibility for many commodities: wrapping paper, paperboard, boxes, wastepaper, printing and writing paper, industrial paper, converted paper products, pulpwood, and wood pulp (special grades of which were used for rayon and nitrating purposes). Since the war had interrupted shipments of lumber from the Scandinavian countries, prices had begun to rise sharply. So Perkins’s Division endeavored to obtain voluntary agreements from leading producers to hold the line on prices, and, when unable to arrange for such informal compliance, to formulate and implement a schedule of maximum prices. Within about a year, most of the needed regulations were in place, and the work of the Division thereafter consisted chiefly of refining and adjusting existing standards.

In 1943, Perkins left the OPA to become Assistant to the Administrator of the Foreign Economic Administration (FEA). Headed by Leo T. Crowley, the agency had been created in September of that year to bring a measure of consistency to the efforts of the Office of Economic Warfare, the Office of Lend-Lease Administration, and the Office of Foreign Relief and Rehabilitation Operations. The FEA also sought to coordinate the work of these

agencies with that of the State Department. Perkins was now involved in issues such as the provision of Lend-Lease aid to Great Britain, the restoration of private trade in the liberated areas of Europe, and the making of plans for postwar Germany. Perhaps Crowley's most controversial decision, made in May 1945, was to cut off virtually all Lend-Lease aid to the Soviet Union.

With the end of the war, Perkins returned to academic administration, this time as Vice-President of his alma mater, Swarthmore. He remained in that office from 1945-50, years of rapid expansion in American higher education, largely as a result of the G.I. Bill of Rights, but years also noted for the relative tranquility of campus life. In the summer of 1950, he left Swarthmore to become an Executive Associate at the Carnegie Corporation, a foundation whose purpose was to promote "the advancement and diffusion of knowledge and understanding among the people of the United States." Appointed a Vice President in November 1951, Perkins remained with the Carnegie Corporation until 1963 when he moved to Cornell. In his first year at Carnegie, the Corporation made grants totaling about \$5 million; ten years later, the annual amount had reached nearly \$10 million. While at Carnegie, he helped prepare a widely circulated document, "The Power of the Democratic Idea," under the auspices of the Rockefeller Brothers Fund.

At the same time, Perkins also served as a Vice President of the Carnegie Foundation for the Advancement of Teaching, then headed by John Gardner (who also was President of the Carnegie Corporation). The Foundation had been established in 1905 as a pension fund for college professors, but its charter authorized it "to do and perform all things necessary to encourage, uphold, and dignify the profession of the teacher and the cause of higher education." The Foundation sponsored surveys and initiated policy reviews, and during Perkins's tenure, it paid particular attention to the emerging federal presence in higher education, and the implications of that presence for the autonomy of universities and the preservation of academic freedom.

In 1951, Perkins took a leave from his duties at Carnegie to serve as Deputy Chairman of the Research and Development Board of the Department of Defense. He summarized some of the Board's findings and recommendations in a paper published in the *Public Administration Review* in the spring of 1953. Criticizing various organizational shortcomings, Perkins suggested that the Joint Chiefs of staff be relieved of certain administrative tasks so that they could concentrate on military planning. He also recommended that policy planners in the State Department and National Security Council be kept better informed about new concepts of military strategy and economic planning. In April 1960, testifying before a Senate subcommittee, Perkins said that organizational shortcomings

were largely to blame for the failure of the National Security Council to provide the President clearly-defined policy alternatives.

In 1963, following the retirement of Deane W. Malott, the Cornell Board of Trustees elected Perkins President of the University. Commenting on his selection, trustees and faculty members not only mentioned the positions he had held in government, academia, and the world of private foundations, but also noted his service as the Chairman of President John F. Kennedy's Advisory Panel on a "National Academy of Foreign Affairs," and as a member of General Advisory Committee of the United States Arms Control and Disarmament Agency, the United States Committee for UNESCO, the Herter Committee on Foreign Affairs Personnel, and the Board of Trustees of the Rand Corporation. Clinton Rossiter, the John L. Senior Professor of American Institutions, said he had seen Perkins at various conferences, "and I have always been impressed by his learning, common sense and high standards."

Perkins was inaugurated on October 4, 1963, not long after Martin Luther King's "I Have a Dream" speech at the March on Washington, and not long before President John F. Kennedy's assassination. John Gardner, in his introductory remarks, praised Perkins as "an extraordinarily kind, warm, decent and charitable human being," sounded a note of caution – which, in the event, proved prophetic – when he said that, "like every other social institution, universities are subject to disintegrative forces, are the scene of power politics, and are susceptible to the decay that so often sets in at precisely the hour of triumph."

Perkins's inaugural address, however, emphasized only the exciting opportunities facing Cornell. Calling for a "sweeping reexamination" and "redefinition of our mission," he proposed that Cornell embrace its role "in the hard world of affairs." Forecasting the future of American universities, he declared:

"Having meshed their gears with society, they must now develop the institutional policies and the administrative muscle required to be a driving rather than merely a spinning gear. The university has a direct stake in the shape and substance of the society in which it will do its work. If free universities require free societies, universities cannot shirk their obvious responsibilities."

Perkins elaborated on some of these ideas in November 1965 when he delivered the Stafford Little Lectures at Princeton University, later published as, *The University in Transition*, a book which sparked considerable controversy. The university, Perkins said, was "increasingly vital in the application of knowledge to the problems of modern society."

In his six years in Day Hall, Perkins brought about far-reaching changes in virtually all areas of Cornell life. The very look of the campus changed with the planning and construction of the Herbert F. Johnson Museum of Art, the Space Sciences Building, the Robert R. Wilson Synchrotron Laboratory, the Noyes Student Center, the underground Campus Store, and Uris, Clark, Emerson, and Bradfield Halls. There were innovative modifications in departmental structure, too, such as the formation of the Division of Biological Sciences (which combined departments from the endowed side of the University with departments from the New York State statutory side), and the Department of Computer Science (which belonged jointly to the Engineering College and the College of Arts and Sciences). Perkins's administration also witnessed the creation of the Plasma Physics Laboratory, the Water Resources Institute, and the Cornell Institute for Social and Economic Research.

Changes in the academic life of the university and the role of the professoriat were equally significant. In his first year in office, President Perkins persuaded the trustees to provide an across-the-board salary increase that dramatically improved the faculty's standard of living. He initiated the Andrew D. White Professors-at-Large Program that brought eminent scholars to campus for two-week visits; he saw to the creation of 23 endowed professorial chairs for distinguished faculty members; and he established the Society for the Humanities. During Perkins's presidency, the university moved to a more structured use of internal ad hoc committees in cases involving tenure and promotion. A system of five-year terms for department chairs became the rule rather than the exception.

The undergraduate experience, too, was transformed during the six years of Perkins presidency. Under Professor W. Rea Keast, who was appointed Vice President for Academic Affairs, committees were established to evaluate many areas of undergraduate education. A committee headed by Professors Alfred Kahn and Raymond Bowers issued a far-reaching report regarding curricular changes. Another group, led by Professor Alain Seznec, explored the possibility of establishing residential colleges, and, indeed, the International Living Center was established, as was Risley House for students interested in the performing arts. The College Scholar program was created in order to free some of the ablest students from the ordinary requirements of a departmental major, and the faculty decided to switch from a numerical to an alphabetical system of grading. A six-year Ph.D. program was instituted, which, while it did not prove successful, nevertheless demonstrated Perkins's imagination and ability to obtain funding for his ideas. During his presidency, also, Perkins saw to the completion of two capital fund-raising campaigns that raised more than \$100 million for Cornell and the Medical College in New York City.

No change was more significant, however, than the adoption of a new minority admissions policy. A believer in the cause of racial justice and the university's role in achieving it, Perkins set up a new procedure to recruit African American students. In 1963, when he assumed the presidency, there were fewer than ten African-American undergraduates at Cornell. Perkins created a Committee on Special Education Projects that fostered non-traditional admission criteria, emphasizing not only grades and scores on standardized tests but also an applicant's motivation and leadership skills. By 1969, because of these efforts, African American undergraduates numbered nearly 250.

Yet while Perkins, like others of his generation, supported integration, nonviolence, and gradualism, the motivating ideals of the early civil rights movement, many African American students who had entered Cornell were devotees of Black Power, with its emphasis on nationalism, self-defense, and non-negotiable demands. Under the circumstances, conflict was unavoidable, and it reached crisis proportions in the years 1968 and 1969. African American students demanded that the university create a separate Black Studies program, and demanded, too, that Black students who had violated campus rules as part of a political protest be exempted from appearing before the judicial system. Perkins attempted to steer a middle course, agreeing to create and fund a largely autonomous Africana Studies Center, but not interfering in the ordinary workings of the judicial system. "I operate on the assumption that the Cornell community will function reasonably if I and my colleagues deal reasonably with these demands," he said in December 1968.

Tragically, by the following spring that assumption was proven unworkable. At six o'clock in the morning on Saturday, April 19, 1969, a number of students in the Afro-American Society (AAS) took over Willard Straight Hall, armed themselves when they feared an assault from hostile whites, and plunged the campus into crisis. National media attention focused on the most sensational events of the following week: Black students leaving the Straight brandishing rifles and shotguns, AAS leaders making speeches over the radio threatening the lives of professors, thousands of students occupying Barton Hall and demanding the faculty nullify the judicial system's reprimand of the Black activists, and, finally, the faculty's decision to reverse itself and to rescind the penalties.

The actions of the administration in persuading the AAS to leave the Straight and in persuading the faculty to rescind the penalties succeeded in averting what Perkins feared most: a violent confrontation between students and the police. However, Perkins paid a heavy price, indeed, for he appeared to his critics as weak, vacillating, and indecisive. Many faculty members, particularly in the Law School, publicly expressed a lack of confidence in his commitment to academic freedom and his ability to maintain law and order. Many alumni, troubled by the

adverse national publicity surrounding the events of April, concluded that Perkins had been unwilling to stand up for basic principles but rather had caved in to the demands of radical students. On May 31, 1969, he offered his resignation and the Board of Trustees decided to accept it immediately rather than have him remain, in effect, as a “lame-duck” president.

In the years that followed, he avoided commenting on the tumultuous events that had led him to leave Cornell. Nevertheless, in a speech to the Tower Club shortly before his resignation he defended his actions. His foremost goal, he said, was to prevent violence. Responding to the argument that he should have called in the civil authorities to end the Straight takeover, he explained: “We calculated that the odds were in the direction of loss of life on the Cornell campus if the Black students were not evacuated from Willard Straight promptly.” Perkins’s aversion to the prospect of violence may have reflected his Quaker background; it certainly reflected his conviction that, in the end, the greatest danger to the university community and the consensus on which it necessarily had to rest was the use of armed force on campus. “If we in higher education cannot find useful avenues toward racial cooperation,” he said, “then I honestly do not know how society at large will be able to deal successfully with this problem.”

On leaving Ithaca, Perkins returned to Princeton, New Jersey, to establish the International Council for Educational Development (ICED) which, over the years, proved highly successful. In 1970, he suffered a profound loss when his wife, Jean, died after a long illness. He would eventually be remarried to the former Ruth B. Aall. In 1990, he retired from the ICED and was named Chairman Emeritus. In 1992, Cornell established the James A. Perkins Professorship in Environmental Studies. In 1995, Cornell trustee Thomas W. Jones, (who had been one of the most militant leaders of the AAS in the 1960s) established the James A. Perkins Prize for Interracial Understanding and Harmony, awarded annually.

President Perkins once declared it his hope that universities could muster the “compassion,” “patience,” and “courage” to perform the important work which society needed. To his closest acquaintances during his Cornell years, those qualities indeed, best described James A. Perkins.

Dale Corson, Robert Miller, Richard Polenberg

John Edwin Perry

December 15, 1884 — October 7, 1973

John Edwin Perry, professor emeritus, remains for many alumni of the School of Civil and Environmental Engineering the clearest recollection of their Cornell years. For nearly forty years he inspired students by his teaching of courses in the design, construction, operation, and management of railroads; in contracts and specifications; and in other aspects of transportation.

Professor Perry's varied experience in professional practice provided the background needed to guide the students in Civil Engineering Camp in learning to apply the subject matter learned in the classroom to the solution of then current problems arising in professional practice.

His experience with the Pennsylvania State Department of Health and several railroads after his graduation from Pennsylvania State University in 1908, his continuing activity in professional societies, and his consulting activities enabled him to identify the ever-changing major transportation problems and to stimulate his students in their search for innovative solutions to these problems, as well as to those in other areas of engineering.

His understanding of students, their interests, aptitudes, and problems; his willingness to listen; and his common sense, tact, and discretion led many students to seek his counsel on numerous occasions. The enthusiastic greetings by alumni at the annual reunions and other occasions, and their special efforts to visit him at home during later years, were the greatest demonstrations of their respect for him.

He was a member of several professional engineering societies including the American Society of Civil Engineers, American Railway Engineering Association, and the American Society for Engineering Education. He was a charter member, and one of the most active founders, of the Ithaca Section of the American Society of Civil Engineers, and he was secretary of the Section for a number of years.

His activities in civic affairs at the local and state level contributed to his maintenance of current perspectives on engineering practice. He was a member of the Ithaca City Planning Commission for ten years and a member of the New York State Flood Control Commission for the following decade. He served his political party as county chairman for nearly fifteen years. His long tenure in these positions clearly demonstrated the great respect of his fellow citizens for his contributions in civic affairs.

Professor Perry's community activities included active membership in the First Presbyterian Church of Ithaca, as well as in the St. Augustine Commandery of Knights Templar of Ithaca and several other Masonic bodies, and as commissioner of the Louis Agassiz Fuertes Council of Boy Scouts of America. He received the Council's Silver Beaver Award for Outstanding Service.

Professor Perry was elected professor of civil engineering, emeritus, in July 1952, after thirty-seven years as a member of the faculty of the School of Civil and Environmental Engineering. He was recalled to active duty in 1953. Subsequently he served as a consultant to this School on numerous occasions.

He is survived by two sons, John E. Perry, Jr., and Henry M. Perry, M.D., and four grandchildren.

S. C. Hollister, F. O. Slate, G. B. Lyon

Edgar Cooper Person, Jr.

April 19, 1910 — September 5, 1952

Dr. Edgar Cooper Person, Jr. was born in Pikeville, North Carolina on April 19, 1910. He was the son of Dr. Edgar Cooper Person and Mrs. Virginia Tyson Person. He was the fourth physician in a direct line of the Person family since pre-Civil War days.

He attended the Woodbury Forest Preparatory School at Orange, Virginia. He received his A.B. degree at the University of North Carolina in 1931 and continued his studies there through the first two years of medical college. He came to Cornell University Medical College as a third year student in 1933 and graduated in 1935. Subsequently he served his surgical internship and completed his residency at The New York Hospital on December 31, 1942. He was then appointed to the senior staff and at the time of his death held the positions of Assistant Attending Surgeon in the hospital and Associate Professor of Clinical Surgery in the medical school.

During his career, one of his principal interests lay in the training of the younger surgeons. Because of his untiring efforts to assist and encourage them, he enjoyed a unique position with his students and the members of the resident staff. He was recognized by his colleagues as an unusually skillful surgeon and diagnostician. In addition, he was deeply interested in experimental work, especially problems concerning the pancreas and stomach, and studies of these were published in the medical literature together with other important contributions to clinical surgery.

Dr. Person did much to consolidate the ideals of Pan-Americanism and worked to encourage the exchange of doctors for broader training. He was well known to the medical profession of Latin America for on several occasions he was invited to lecture at medical meetings and performed operations at many of the hospitals in Ecuador, Peru, Venezuela, Panama and Cuba. In 1948 he was a member of a special committee of the American Medical Association to survey medical facilities in the Caribbean region.

He took an active interest in Alumni affairs and was Chairman of Alumni Day in 1951. He was a member of the Planning and Building Committee for the F. W. Olin Hall, the new student residence of Cornell University Medical College.

He was an Associate Visiting Surgeon on the Second (Cornell) Division of Bellevue Hospital and was Consultant in Surgery at the Station Hospital of Mitchell Field, Air Force Base on Long Island. He was a member of the Society

of University Surgeons, New York Surgical Society, New York County Medical Society and Associate Member of the Harvey Society. He was also a Fellow of the American College of Surgeons and a member of the New York Academy of Medicine. He was a member of the University Club and his academic societies were Phi Chi and Nu Sigma Nu.

He died at the New York Hospital on September 5, 1952 after a long illness. He is survived by his wife, Mrs. Mary Elizabeth Altemus Person, of New York and Upperville, Virginia, by his mother, Mrs. Edgar Cooper Person, Sr. of Pikeville, North Carolina, and three sisters, Mrs. Jack Hollister of Newbern, North Carolina, Mrs. Walter Crouch of Greensboro, North Carolina, and Mrs. Frank Kugler of Nashville, Tennessee.

In the death of Dr. Person the center has lost a friend as well as an important member of its professional staff. His participation in alumni, resident, and undergraduate activities was invaluable. His death has been felt keenly by his students and many friends throughout the institution, but particularly by his surgical colleagues. His share in the activities of the Department of Surgery, his role as a teacher of both resident staff and medical students, and his contributions to patient care can hardly be filled by others.

Frank Glenn, R. H. Melchionna

Catherine J. Personius

August 5, 1904 — October 31, 1994

Emerita Professor Catherine J. Personius joined the faculty of Home Economics in 1930, when Martha Van Rensselaer and Flora Rose were co-directors. She provided a continuation of strong leadership in the college until she retired as Coordinator of Research in 1966. When she came to Cornell, a new building was in the process of being erected and before she retired she helped develop plans for a new addition.

Catherine was born in Elmira, New York and graduated from Elmira College in 1925 with a degree in home economics and chemistry, subsequently joining the staff as foods instructor. In 1928, she completed a M.A. degree at Teacher's College, Columbia University and then accepted a teaching position at Hampton College in Virginia for two years. She was at Cornell during the thirties, a time best remembered for the depression, and joined the Home Economics staff first as an Instructor, later as a Research Assistant, or as a supervisor of the Home Management House. At the same time, like others of her generation, she studied for a doctoral degree, not in home economics, but in the field of biological chemistry, bacteriology, and physical chemistry. It is little wonder that she learned to manage time and resources, a prelude to her later career where she assumed a large range of responsibilities. After obtaining her degree from Cornell in 1937, she joined the faculty as an Assistant Professor. From 1940-43, she was an Associate Professor at the University of Wisconsin, Madison, and then was invited back to Cornell as Professor and co-Head of the Department of Food and Nutrition and a year later as Head. In 1947, she added two more responsibilities—Coordinator of Research for the College and Assistant Director of the Experiment Station. She was the first woman at Cornell to hold the latter position and one of two in the entire United States. These responsibilities she carried until her retirement. Thus not only did she have a significant role in the development of the Department of Food and Nutrition but she also influenced the direction of the College, most significantly in development of research programs.

She provided strong leadership for the Department in teaching, extension and research. Not only was she a dedicated teacher herself but she encouraged department faculty in a commitment to teaching. She was instrumental in developing courses that emphasized the physical and chemical properties of major groups of food products in relation to their utility. During most of her career at Cornell, Catherine continued to teach. She came to know the seniors well and was instrumental in encouraging them in various career paths. It is perhaps significant that she was honored in 1976 by a scholarship in her name endowed by two former students, a mother and daughter,

giving us a glimpse of her impact over a generation. It is perhaps less well known that CJP, as she was known by the faculty, took time from her busy schedule to address the needs expressed by some upper level students, namely that they have the opportunity for additional depth in subject matter and be allowed to pursue individual projects in the laboratory—and the opportunity was provided. This actually became the basis for the Honors Program in Food and Nutrition started in 1961. There seems little doubt that she was ahead of her time encouraging the involvement of undergraduates in research.

Catherine was equally committed to encouraging extension and research programs in the department. In the late forties she participated in a weekly radio program, “What’s New in Home Economics”, where she interviewed different faculty members about research programs. She also worked with the Nutrition Council, a state-wide association, and in alternate years provided leadership for a program at Cornell where recent research findings were made available to state based health professionals. She was more diligent than many in reviewing the various publications which were developed in the department. She also served as an Administrative Advisor on many regional research projects in the Northeast. She had a knack of posing just the right questions to steer diverse individuals toward a common goal, and was one of the most effective people in this role and was sorely missed following her retirement by those who had the benefit of her guidance.

One of the lasting influences on the college was probably her encouragement of research-based personnel as an addition to the faculty. Using her role as Coordinator of Research, she encouraged departments to seek individuals with discipline-based research and to encourage these individuals to adapt their research to the needs of the department program. She believed that while Home Economics was the focus of the college, the strength was in utilizing the education of those who were in areas basic to program areas in the college. She believed that students needed to understand basic principles that would enable them to use knowledge intelligently, to think analytically, critically and constructively when facing new situations.

Although her schedule did not permit extensive involvement in her own research, she was, nevertheless active with a number of research areas, and worked with graduate students. Further, during the war years, and shortly after, many new methods of food preservation and utilization were studied as part of the war effort. Her published work is found in *Food Research*, *Cereal Chemistry*, *Food Technology* and *Journal of Home Economics*. She was recognized throughout the country for her leadership in research.

The many demands on her did not deter her from responsibility to the university community. Among her commitments were Long-Range Planning, Review of University Calendar, Executive Committee of Center for

Housing and Environmental Studies, Governing Board of Social Science Research Center, Board of Control of Cornell United Religious Work, Board of Trustees Cornell Research Foundation, and the Faculty Council. It is perhaps illustrative of her career that she was the first woman to be a faculty representative on the Board of Trustees where she served from 1959-64.

At the national level, she was appointed to a number of committees, including the Executive Committee for both the Association of State Universities and Land Grant Colleges, and the Home Economics division of the Association. She also served as member of the U.S.D.A. Advisory Committee on Home Economics Research, the Commission on Home Economics and as an advisory member of the N.Y.S. Nutrition Council.

She belonged to a number of professional organizations including American Home Economics Association, American Association of Cereal Chemists, Institute of Food Technology, American Chemical Society, American Association for the Advancement of Science, among others. She was also a member of honorary societies such as Omicron Nu, Phi Kappa Phi, Sigma Xi, Phi Tau Sigma, Alpha Lambda Delta (honorary member).

She decided to retire at the peak of her career, long before any of us thought she should. After a year or so of involvement at the national level, she returned in leadership roles in the community. She was active with volunteers at the Tompkins County Hospital, and had a regular schedule there. She served as treasurer for the Directors of the Ladies Union Benevolent Society, an organization concerned with housing of the elderly. She was active at St. Paul's Methodist Church where she taught a Sunday School Class and helped with a day care program for children. In 1979, she moved to Horseheads, New York near her family home. Here she worked with nursery school children where interaction of the older adults and children was beneficial to both. Catherine once said that Flora Rose was a person of enthusiasm who would try anything once and that Martha Van Rensselaer was a very effective leader. Catherine had qualities of both.

Throughout her life she retained a strong interest in activities at Cornell. Her greatest regret being away from Ithaca was the loss of interaction with former colleagues and the opportunity to take advantage of Cornell events. Although during her career at Cornell she was involved in what can only be described as a rigorous program, she still took time to encourage students and faculty. She routinely did more than she asked of any of us. She perhaps exemplified the motto "Freedom with Responsibility". As faculty members we had leeway to develop different pursuits and interests with the understanding (never expressed) that we had a responsibility to both

the department and to the college. By those who knew her, either as a student or a colleague, she will long be remembered and she has significantly influenced our lives.

Henry Ricciuti, Mary A. Morrison

John George Pertsch Jr.

1887 — August 23, 1928

Professor of Electrical Engineering

On 23 August 1928, Professor Pertsch saved from drowning a person struggling in the rough waters of Cayuga Lake. The effort proved too much for his strength, and he met his own death in a deed that was of a piece with his kindly, generous life.

John George Pertsch Jr. was born in Baltimore in 1887. He received from Cornell University in 1909 the degree of Mechanical Engineer. On graduating he was made an assistant in his college, and by successive promotions came to a professorship of Electrical Engineering. His whole academic life was spent in Cornell. He was a contributor to the journals of his profession and was a member of many learned societies.

In recording his death the Faculty wishes to bear witness to the fine qualities that made Professor Pertsch a valued and well-loved colleague. His students found him an admirably informed and wholly sympathetic teacher; few indeed of the teaching staff aroused a deeper response. His associates recognized in him a constant kindness and fair-mindedness, a straightforward manliness, a thoroughness in dealing with his subject, a steady industry, that well explained his popularity. In his death the University loses a teacher and scholar difficult to replace, and very many members of the faculty lose a true friend.

Arthur H. Peterson

December 12, 1910 — November 24, 1988

Arthur H. Peterson came to Cornell in 1932 as a graduate student. He left Cornell in 1977 as controller emeritus and professor of business administration, emeritus. When he joined the Cornell administration in 1939, he was charged with setting up a central business office for the statutory colleges. His title then was assistant to the treasurer. Subsequently, he became bursar, director of finance, controller, and, in 1976, was named university treasurer and chief fiscal officer.

During his tenure, Peterson served five Cornell presidents—Edmund Ezra Day, Cornelius de Kiewiet, Deane W. Malott, James Perkins, and Dale R. Corson, the last of whom noted, “Over the years, Pete has been asked to take over everything that has gone wrong. He has done so and made them right.” During his entire career he worked on twelve-month appointments, never worked less than a fifty-five hour week, started every work day by 7:00 a.m., never had a leave of absence for any purpose, and had only eight days of sick leave. In the words of his wife, Helen, “He opened and closed the University daily.”

At one stage, the president sought to arrive in his office early enough in the morning to drop by Peterson’s office to leave a note asking him to call the president. He finally succeeded one day—by arriving at six o’clock. He did not persist, however; it was not worth it—better to let Peterson continue to be the first in the building.

The only words of complaint Arthur Peterson ever uttered had to do with dishonest practices or disorderly administrative practices. When the decision was made to go to completely centralized computing, with business computing incorporated, he did not complain, even though he knew it was an unwise decision. Eventually business computing was changed back to dedicated computers, as Peterson always knew it should be.

Several features characterized him and his work. He never ate lunch, so his colleagues knew they could always find him at his desk—with his office door open—over the lunch hour. He always carried half a dozen sharpened pencils in his shirt or coat breast pocket. He always wore a black suit, even when he attended the annual Safety Division picnic. Peterson always had a large amount of data at his fingertips: he knew, for example, how many trips he had made to Albany in his career—the number was in the many hundreds.

No one understood the complexities of the fiscal workings of Cornell as well as he. Not only did he have a mind suited perfectly to the intricacies and subtleties of the Cornell hybrid which has been called “demonstrably

unworkable in theory,” but through attention to all details, he made it work. He was devoted to Cornell and although he had his own strong sense of what was right, when those above him told him what they believed would be best for Cornell, he found a way to make things move quickly and surely in the direction they desired. One of his former colleagues described Pete as “. . . totally honest, totally forthright, and totally reliable... .”

He never questioned any new assignment, even though he had a full-time primary responsibility. In consequence he had, at times, four or five major jobs. He always organized these operations properly and put them back on a firm base. Occasionally a program was reassigned to someone else, once it was functioning satisfactorily.

At one time or another, Peterson had general supervisory responsibility for just about every Cornell administrative unit on the campus and off, including the Statutory Finance and Business Office, Laboratory of Ornithology, Radio Station WHCU, Cornell Aeronautical Laboratory, Safety Division, Housing, Dining, Fleet, Life Safety, Insurance, Cashier’s Office, Bank Accounts and Cash Management, Non-Academic Personnel, Auditor’s Office, Budget, Campus Store, Print Shop, Photo Science, Cornell Plantations, and Shoals Marine Laboratory. In addition, he was the University central contact point for some 60 major construction projects.

In the community, Peterson was active with the Boy Scouts of America for fifty years, and was chairman of the L.A. Fuertes Council, board member of the Community Chest and United Way, president of the Ithaca Rotary Club, chairman of the Tompkins County Red Cross, chairman of the Ithaca Council of Churches, chairman of Cornell United Religious Work, board member for twenty-two years and chairman of the board for eleven years of Citizens Savings Bank, and board member of the Southside Community Center.

Peterson was a modest man. Knowing in his own mind that a job had been well done was all the credit he seemed to want. When he retired he declined to allow a dinner in his honor, even though he had a large number of friends in the University, in the community and in Albany who wanted to recognize all that he had contributed to Cornell and to Ithaca. He moved from Ithaca to Chapel Hill, North Carolina, the moment he retired. He did not want to interfere in the work of his successor (or successors) by continuing to live in Ithaca.

In thanks for his many contributions to the University, anonymous alumni on their own initiative funded the Arthur H. Peterson Oak Grove at Cornell Plantations. On hearing of this honor, Peterson wrote that it “brought tears to my eyes.” The plaque, on a boulder at the site bears the words, “Over Thirty-Seven Years ... From Dawn To Dark.”

Dale Corson, John Kingsbury, Robert Plane

Lester Carl Peterson

July 29, 1914 — August 24, 1970

Lester Carl Peterson was born July 29, 1914, in Quincy, Massachusetts, son of the late Carl W. and Ellen C. Johnson Peterson. He was educated in the Quincy school system and entered Massachusetts State College in 1932. His major subject was botany and he served as an assistant in the botany department from 1933 to 1936. Following receipt of his B.S. from Massachusetts State College he entered Cornell University as a graduate student in plant pathology in 1936. Professor Peterson completed the Ph.D. in 1942 and continued on the staff in the department of plant pathology, becoming instructor in 1944, assistant professor in 1947, associate professor in 1949, and professor in 1956.

During most of his professional career, Professor Peterson sought the improvement of potatoes through the development of varieties resistant to the major diseases of the potato plant in New York. His early work with Professor F. M. Blodgett on the control of late blight led to his association with Professor Donald Reddick's research on the transfer of the resistance from *S. demissum* to commercial potato varieties. Their research produced eight varieties carrying *S. demissum*'s simply inherited genes for resistance. The most significant aspect of this research program was the knowledge produced about races of the pathogen and their interactions with the genes for resistance from *S. demissum*. Upon the retirement of Professor Reddick, Professor Peterson took charge of this program. Soon after this the golden nematode was discovered on Long Island and Professor Peterson shifted the emphasis of this research to develop varieties resistant to this new pest. Working with nematologists in the department, a screening technique was developed and a source of resistance was identified. An alternative source of resistance was identified in England and because it was more simply inherited, it became the basis for Professor Peterson's breeding program. In 1956 this program was integrated with the one in the Plant Breeding Department and from the combined program came the variety Peconic, the first U.S. variety with golden nematode resistance, and a second variety soon to be released. In the past three years he had been devoting much of his time to the development of methods for identifying the potato spindle tuber virus.

Although Professor Peterson did not participate directly in the formal educational programs of the department, he was superb at teaching by example and on the job. All students in the department, especially the several whose graduate programs he directed and many others on whose committees he served, profited from his concern that graduate students and staff know the techniques and tools for production of high-yielding crops and how to use

effectively those tools and techniques. He enjoyed doing the field work himself and consequently knew potato growers, their problems, and their needs. He knew no variety could survive solely on disease resistance and, therefore, was also interested in potato improvement involving yield, quality, and commercial use.

In July 1939, Professor Peterson married Marie Evelyn Topping, who survives him. Also surviving are their four children, Mrs. Joanne M. Lucy, Mrs. Sally V. O'Connor, Mrs. Ellen A. Christopher, and Robert Karl; and one grandson. He will be remembered for his devotion to his family the amount of his time he gave to others, his determination, and his good humor.

R. L. Plaisted, A. F. Ross, G. C. Kent

Loren Clifford Petry

September 22, 1887 — May 4, 1970

The death of Loren Clifford Petry, professor of botany, emeritus, ended the career of an outstanding student and teacher of botany. Not only was Dr. Petry renowned as a teacher of introductory botany to thousands of students at Cornell but his dedication and vitality became equally famed during his retirement years on Cape Cod.

Petry was born of Quaker parentage in New Paris, Ohio. His first interest was engineering and his B.S. degree from Earlham College in 1907 was taken in that field. A year later he earned a second B.S. at Haverford College. During the following two years he taught science in the high school at Urbana, Ohio. On the advice of another noted teacher of botany, Millard Markle of Earlham, he decided to further his interest in plants by pursuing graduate studies in botany at the University of Chicago. There he earned the M.S. degree in 1911 and the Ph.D. in 1913.

Petry's first post was an instructorship at Syracuse in 1914. He was raised to assistant professor in 1916 and associate professor in 1919. From 1922 to 1924 he was on leave from Syracuse as acting assistant professor of botany at Cornell. During the years 1919-25 he served as director of Summer Session at Syracuse. Finally, in 1925, he was appointed professor of botany at Cornell where he remained until his retirement in 1955. His administrative talent was recognized again when he was appointed director of Summer Session at Cornell in 1934, a post which he held until 1944. During this period he reorganized and coordinated what had been four separate units. From 1943 through 1944 he served as director of the Army Specialized Training Program and in 1944 he became director of Veterans Education, resigning this post in 1948. At the outset about a dozen veterans were attending Cornell under G.I. benefits. When he left the post the number had risen to about five thousand. For the years 1953 and 1954 he served as secretary of the Faculty Senate, State University of New York.

Throughout his career at Cornell, Loren Petry served on significant University and college committees and participated actively in faculty affairs.

Particularly valuable was his effectiveness in the teaching of introductory botany. An inveterate traveler and observer of all aspects of the environment, he felt that facts should be used as tools in the solution of problems rather than as things to be memorized and stored away. As a result, his lectures emphasized ways of learning and using rather than memorizing. His students were encouraged to think. Two tangible results of this attitude were a laboratory manual for introductory botany written in collaboration with E. M. Palmquist and *Keys to Spring*

Plants, written in collaboration with W. C. Muenscher. Approximately twelve thousand students were exposed to his botanical wisdom during the thirty-year span of his teaching at Cornell.

Optional Saturday afternoon field trips were a hallmark of Perry's teaching. Many a prospective major student was encouraged to undertake a botanical career by these excursions. It was not simply plants that were observed on these trips. Geology, physical geography and any other item of possible interest was fair game for his and the student's powers of deduction. Perry's success with undergraduates is reflected in a study by the National Research Council which showed that Cornell led the nation between 1936 and 1950 in the production of undergraduate botany majors who subsequently went on to the Ph.D. degree at this or some other institution.

Equally important were the breadth and understanding of botany imparted by Loren Petry to the more than one hundred graduate students who assisted in the freshman botany course. Many of them went on to highly successful careers as faculty members at other institutions partly because of this exposure.

The honor most prized by Dr. Petry was the Professor of Merit Award voted him by the senior class of the College of Agriculture in 1952.

Petry's research interest centered around the first plants to occupy dry land (Devonian Period). His early collecting expeditions to the Gaspé Peninsula resulted in a splendid collection of Devonian plants at Cornell that has been increased by his students until it is now one of the best in the world. His enthusiasm led others to this area of study and the plants of this period have now become a critical item in studies of plant evolution. Petry's enthusiasm for paleobotany also led him and Ralph Chaney of Berkeley to found in the late thirties a paleobotany section of the Botanical Society of America. Petry served as the second chairman of this group (1938).

Loren Petry served botany also through participation in its national organization, the Botanical Society of America. In 1933 he was elected to be its secretary for a three-year term. In 1937 he was elected vice president of the Society. From 1936 to 1939 he was a member of the Society's Committee on Education where he was instrumental in the production of two publications, *An Exploratory Study of the Teaching of Botany in the Colleges and Universities of the United States* and *Achievements Tests in Relation to Teaching Objectives in General College Botany*. Both of these reflected some of his own philosophy in teaching.

In addition to his activity in the Botanical Society of America, he was a member of the American Association for Advancement of Science, Sigma Xi, Phi Beta Kappa (president, Cornell Chapter, 1954), Phi Kappa Phi (president, Cornell Chapter, 1950), American Association of University Professors, Gamma Alpha, Research Club of Cornell

University (president, 1953), Statler Club of Cornell University (an organizing member and later president, 1951), Hoh-Nun-De-Kah (student honor society, Cornell), Quill and Dagger (student honor society, Cornell).

One of Petry's outside interests demonstrates well the breadth of his vision and enthusiasm. In the early twenties he became interested in motorless flying and in 1927-28 he saw the first glider school in America in operation at Corn Hill, Cape Cod. From 1930 onwards he attended glider meets in Elmira, New York, and from 1938 to 1940 he helped with the operation of the Ithaca Glider Club. On several occasions he served as an official at national glider meets in Elmira. Both Petry children were caught up in this activity as daughter Ruth became an expert glider pilot and son Loren V. is now a pilot for TWA on overseas runs.

The extent of Dr. Perry's dedication to observation, to interpretation, and to teaching can be measured by his activity in the fifteen-year period following his retirement in 1955.

He taught for various periods at the University of Missouri, Hofstra College, the University of Utah, and Wellesley College. He was also a member of a national panel of lecturers sponsored by the American Institute of Biological Sciences. In 1960 he moved permanently to Cape Cod and continued to lecture locally and abroad, including one series at the University of Reading, in England.

On Cape Cod he became associated with the Cape Cod Museum of Natural History, Brewster, Massachusetts, for which he led trips for young and old to view geological phenomena, salt marsh plants, and wildlife in general. He cut and marked nature trails. He lectured on a range of topics from edible mushrooms to salt marsh plants to the glaciation of New England. He devised exhibits and experiments to attract and to explain.

He was also active in the establishment of the Cape Cod National Seashore through the Yarmouth Conservation Commission. Here, sponsored by the National Park Service, he lectured on "Vegetation of Cape Cod—an Historical Account" and "Salt Marshes of Cape Cod."

Many of Loren Petry's thoughts were brought together in his essays, *A Beachcomber's Botany*, illustrated by Marcia Norman and published by the Chatham Conservation Foundation, Inc. He was also working, with Mrs. Petry, on another series of essays to be entitled *Places of Scientific Interest in New England and the Maritimes*. For many years Mrs. Petry's keen interest in mineralogy had led them to many an overlooked spot in search of new specimens. Never did they fail, on such trips, to note all the interesting features of the area. Much of this lore would have appeared in the proposed book.

Many of his former colleagues will understand quickly the joy he took in the Cracker Barrel Club at Yarmouth, Massachusetts, where a segment of his general philosophy and wit was summarized by a single remark. He arrived at a meeting to find the places all occupied. Immediately he observed, “Mr. President, I always stand when I speak ... and vice versa.”

It was no surprise that in 1966 his alma mater, Earlham College, rewarded him with an honorary D.Sc. nor that he was immensely pleased to be presented for that degree by the late Millard Markle, who had originally influenced him to go on to graduate work at Chicago.

John M. Kingsbury, John W. Wells, Harlan P. Banks

Marion C. Pfund

November 16, 1897 — January 5, 2000

Dr. Marion C. Pfund came to Cornell in 1928 as an Acting Assistant Professor of Foods and Nutrition, became an Assistant Professor in 1929 and was named a full Professor of Foods and Nutrition in 1933. She retired from Cornell's College of Home Economics in 1953, but was not granted Emerita status because of a Trustees ruling that only professors who had attained the age of 60 could be granted that title. More than forty years later, in 1992, with a changed policy, she was granted the title of Professor Emerita.

Professor Pfund received her B.S. degree from Simmons College in 1919. During her sophomore year, she marched with other home economics classmates in a suffragette parade, carrying a "Votes for Women" sign. The summer after her junior year, she did war service work and ran the Bergenfield, New Jersey Food Administration Office by herself. She taught at Vassar while studying for a Master's degree, which she received in 1921. She continued to teach at Vassar while doing her Doctoral work in Organic Chemistry at Yale, and in 1927-28, she was Research Librarian and Assistant to the Chief Chemist of Calco Chemical Company.

Professor Pfund taught a 10-credit Food Chemistry course that the college's students recall as extremely tough, but one which later gave them a competitive edge in the food industry. Former student, Elodie Mayer Huffman, '48 wrote: "I had such great respect for her during my undergraduate years and have felt her influence in my professional life."

She was known for her research on apples, potatoes and custards. She participated in the establishment of the nutritional standard for bread. She authored a textbook, *Chemistry and Food Preparation*, and for several years, she wrote the sections on food technology for *Encyclopedia Britannica*. She also directed a movie on home canning.

Her hospitality for students was generous; she regularly invited students to her home for dinner. Her interest in foreign students was chronicled by an Assistant to the Dean of the College of Home Economics, Caroline Morton:

"Miss Pfund's interest in foreign students on this campus, her work with the Cosmopolitan Club, and her interest in international relations is of long standing. She works well with foreign students, and they come to her frequently with their problems. I have seen her spend hours with a foreign student who was having difficulty in her course. I know of no one on our staff who has done more to foster good international relationships than Miss Pfund."

Her interest in international travel was well known. In 1963, she and fellow Professors Beulah Blackmore and Sarah Boswick, took a six-month sabbatical and toured the world: Japan, China, Singapore, the Philippines, Sumatra,

Hong Kong, Ceylon, Bali, Java, India, and Egypt. They traveled by Tonga, dandy, steamship, train, airplane and rickshaw. They sent reports back to the faculty, which revealed Miss Pfund's keen sense of humor. She wrote on a post card from Egypt with the three women on camels and a pyramid in the background: "The picture shouts altogether too loud to need further comment. To be really good, this picture should have been taken while we were trying to mount or dismount."

She was a member and office holder of many scientific, professional and honor societies. She was a Fellow of the American Association for the Advancement of Science. Membership in other professional organizations included the American Association of University Professors, the American Chemical Society, the American Home Economics Association, and the Institute of Food Technologists. Her membership in honor societies included Iota Sigma Pi, Phi Kappa Phi, Sigma Delta Epsilon and Sigma Xi.

With Professor Pfund's retirement from Cornell in 1953, she transferred the responsibility of the 10-credit Food Chemistry course to her colleague, Dr. Nell Mondy, who she had carefully groomed for the position. She acknowledged the help of Dr. Mondy in the writing of her book entitled, *Chemistry and Food Preparation*. This book for many years was used in the teaching of the course.

Dr. Mondy recalls many interesting and enjoyable occasions shared with Professor Pfund, the perfectionist. The two chemists shared much in common and worked diligently to make certain that all the teaching assistants in the multiple-section food chemistry course were adequately trained in both chemistry and food science. Professor Pfund, whose early childhood was spent in Boston, had a distinct Bostonian accent and a special fondness for seafood. Dr. Mondy, from Texas, did not share this enthusiasm for seafood, so Professor Pfund decided to do something about it. She invited Dr. Mondy and other faculty to dinner, where she proceeded to serve only lobster. She believed that anyone teaching food chemistry should like all foods, and thus made her opinion clear.

Her interest in students was well known, and she was especially careful to train them in scientific writing. One of her graduate students, after numerous revisions of her thesis, handed it back to Professor Pfund and stated, "You may change the date of my birthday if you wish." This brought much laughter to all including Professor Pfund, for the student had made her point and Professor Pfund became less demanding.

With Miss Pfund's retirement from Cornell, she became a Co-Dean of a new College of Family Living at Brigham Young University from which she retired in 1958. She then became Chairman of the Department of Home Economics at San Jose State University and retired from there as Professor Emerita in 1965. In her late nineties,

Miss Pfund wrote:

“Much of the academic revolution in the past few decades has been positive, but at too many universities—and almost all secondary schools—the changes have excluded family as a subject of study. We now have millions of high school and college graduates who know next to nothing about taking care of a family. They haven’t been taught the fundamentals of nutrition, child development, family dynamics, consumer finance—all essential to bringing up healthy and stable children. And at the same time, many haven’t had the beneficial role models that children in past generations did.”

For many years following her retirement, she continued to visit her friends in Ithaca. She especially enjoyed visits with a colleague, Frances Johnston, who owned a cottage on Cayuga Lake where Professor Pfund could enjoy swimming every day. Throughout her long life, she never lost her fondness of swimming. On her 100th birthday, she posed for a photo in her bright blue swimsuit and sent the photo to Dr. Mondy.

Pfund did not own a car while at Cornell and walked to campus. Years later, while living in California and approaching the age of 100, she decided she needed an identification card since she had no driver’s license for identification. She wrote Dr. Mondy that she had purchased the card, which was good until 2002, and that she didn’t expect to lose a penny of it. She retained her wonderful sense of humor until the end.

Both of the writers of this statement kept up with Miss Pfund: Professor Emerita Mondy over all the years following her retirement from Cornell, and Dean Emerita Firebaugh during her tenure as dean. During the celebratory luncheon held after Miss Pfund was named Professor Emerita, with a warm spirit she elucidated and corrected the statement written about her. At that time she was still swimming each day, and was active in St. James by the Sea Episcopal Church in La Jolla, California where she lived in a retirement complex. Seeing her the day before her 102nd birthday, she had a warm smile of welcome for the Firebaughs and the assistance of a long time and close friend, Doris Wood. She wanted to cross three centuries in her life and she accomplished that. She leaves a legacy of a life oriented to education and committed to improving the quality of life. To quote the Priest at a memorial service, “The truth is that she never stopped thinking of other people.”

Nell Mondy, Francille M. Firebaugh

Albert Charles Phelps

World War Memorial Professor of Architecture

April 8, 1873 — July 4, 1937

On July fourth of the present year, Cornell University lost by the death of Albert Charles Phelps a great student and an outstanding teacher. He gave thirty-eight years of his life to this Institution with little if any thought to his own advancement or personal fame. During all of these years he was a teacher of the History of Architecture.

With each succeeding year he grew in wisdom and that kindly tolerance for a differing point of view—a differing point of view based upon accurate study and honest conviction. Of careless thinking or of pseudo-scholarship he was a biting critic. He had a passion for accuracy and for honesty. He set for himself a high standard, scorning all sophistry or compromise. In his mind the end never justified the means, and at any such suggestion he would flash into sudden anger. His mind was quick to penetrate to the gist of the question. His intimate colleagues all remember that low chuckle engendered by the implications unintendedly inherent in a remark of some fellow faculty member.

He was a modest man, a very quiet man who probably never realized the extent to which his influence moulded and gave direction to the growth of the College of which he was a member. He joined that faculty at a time when professional education was to too large an extent vocational training. He gave to that College thirty-eight years of unwavering devotion to the ideals of high scholastic attainment and honesty of thinking. In his mind the aims of professional education and of broad scholarship, were identical.

Looking back at the earlier years of his long service one may dimly appreciate the steadfast and unswerving patience, the self-forgetting patience of the man who set himself an ideal none too well understood in those beginning years of his work at Cornell.

His was a mind too big to be confined within the artificial boundaries of an administration division and with each added year, his influence reached out beyond his own College walls.

The last month of his life set in relief as none others had, his self-forgetting patience and integrity. He then knew that his future was but a succession of days of increasing pain. This future he never mentioned to his friends in tone of complaint, but only as it was necessary in his mind for the discharge of some duty or the finishing of some uncompleted task.

Albert Charles Phelps was born in Lockport, Illinois on the eighth of April, 1873. He graduated from the University of Illinois with the degree of Bachelor of Science in 1894. Later in the year of 1897 he studied at the Bavarian Technical School in Munich. He travelled and studied in Europe in 1902 and in 1903 received the degree of Master of Architecture from his Alma Mater. In 1898 he received his architectural licence from the State of Illinois.

He came to Cornell in 1898 as an instructor, being made an assistant professor in 1903, and full professor in 1913. In 1910 he was appointed World War Memorial Professor of Architecture. In 1901 he joined the American Institute of Architects and in 1930, in recognition of his contribution to the profession, he was made a Fellow of the Institute.

He was the director of architectural tours abroad, first for the Institute of International Education of the Carnegie Foundation and later for the Bureau of University Travel, spending many of his summers in this work. He was an occasional lecturer at the Metropolitan Museum of Art in New York and contributor to various professional publications.

This brief schedule of the events of his professional life is the one his own modesty wrote. He did not care for public display or for public honors. He gave himself so wholeheartedly to the task of the teacher in all its minute details that little of the vast knowledge which he amassed found its way into print.

His codified notes, which he left to his College are a vast mine of information to which he was ever adding. They are the evidence of what he did to fit himself to be the better teacher, but invaluable as they may prove, they cannot transcend the value of the continuing influence of the memory of his ideals.

No written testimonial can be a lasting memorial of any man but those intangibles which Albert Charles Phelps left behind will endure.

Shailer S. Philbrick

May 11, 1908 — August 19, 1994

After a short illness, Shailer Philbrick died on August 19, 1994, at Tompkins Community Hospital, ending almost thirty years of association with Cornell University.

Shailer was born in Columbia, Missouri on May 11, 1908. He was educated at DePauw University where he first came in contact with the Cornell influence. While at DePauw, he worked as an assistant to Professor Ernest R. Smith, a former student of Cornell Professor G.D. Harris and a member of Harris' 1914 and 1915 expeditions to the Atlantic Coastal Plain on his boat, the *Ecphora*. Shailer received his A.B. in Geology in 1930 and was elected to both Phi Beta Kappa and Sigma Xi. He continued his studies at Johns Hopkins University, receiving a Ph.D. degree in 1933. His dissertation dealt with contact metamorphism of the Onawa pluton in Maine, a work that provided what is now considered a classic description of that area (*Am. J. Sci*, 5th Series, V. 31, pp. 1-40, 1936). Portions of the resulting paper were republished many times in subsequent metamorphic petrology texts.

During the fieldwork for his dissertation, Shailer found it necessary to prepare his own topographic map of the heavily forested research area lying between the villages of Monson and Katadin Iron Works, Maine. In the process, he laid out the route of that portion of the Appalachian Trail and described it in the original trail guidebook. In his memory, his family is preparing a plaque to be placed on an overlook along the Appalachian Trail in his dissertation area, and a brochure to explain the geology to passing hikers.

Shailer's professional career began when he joined the United States Geological Survey as a Junior Topographic Engineer in 1934 and worked out of the Craftsbury and Lyndon, Vermont offices. The next year he moved to the Soil Conservation Service in Zanesville, Ohio. In 1936, he joined the Department of the Army, Corps of Engineers, as a civilian employee. During his thirty years with the Corps, mostly working out of the Pittsburgh, Pennsylvania office, he rose from GS-5 to GS-14, and he had a major role in many Corps projects. He was in charge of the geologic and foundation investigations and planning for three locks and dams on the upper Ohio River and six locks and dams on the Monongahela River. For one of these, the Youghiogheny Dam, he designed the landside portion of the spillway which required a cut slope of 310 feet, the highest such slope in the area at that time. For details of his many contributions during his time with the Corps of Engineers, please refer to "Memorial to Shailer

S. Philbrick (1908-1994)” by Brian H. Green and R.E. Gray; *Environmental and Engineering Geoscience*, V. 1, No. 1 (Spring), 1995, pp. 125-126.

His teaching career began toward the end of his tenure with the Corps, first as a Visiting Lecturer in Geology at Northwestern University in the fall of 1960. In 1963-64, he was a Visiting Professor at Cornell University. Then in 1966, with Professor Storrs Cole nearing retirement, Professor George Kiersch, the new department chairperson, asked Shailer to become a full-time faculty member. Thus, forty years after working with Ernest Smith, Shailer came to Professor Smith’s old university.

Professor Kiersch was quite familiar with Shailer’s work and first met him in 1955 when Philbrick was chair of the Engineering Geology Division of the Geological Society of America. Philbrick’s first stay at Cornell in 1963-64 was as a temporary replacement for Kiersch who was on leave that year. Kiersch described Philbrick as, “...an imminent pioneer in his chosen field of applied and engineering geology” (letter to A.L.B., Sept. 22, 1994).

He quickly applied to his new career the same energy, vitality, and dedication that had been his trademark with the Corps of Engineers. One of his teaching assignments was the introductory geology class. In only two years, Shailer’s knowledge, his ability to communicate this knowledge, and his engaging personality, resulted in dramatic enrollment increases in those courses. In fact, as enrollment reached 250 in one semester, he lectured in a room so large that he failed to notice the attractive blonde woman student in a rear seat who faithfully attended for the entire semester before revealing herself as his beloved wife, Billie, in a wig!

While at Cornell, Philbrick’s paper “Kinza Dam and the Glacial Foreland” was selected by the Association of Engineering Geologists for the Claire Holdredge Award for its outstanding contribution to the Engineering Geology profession. Also, from 1966-75, he was a consultant to the Buffalo (NY) District, U.S. Army Corps of Engineers and participated in their Niagara Falls preservation project. He was appointed Emeritus Professor upon his retirement December 31, 1972. For many years Shailer provided excellent geological engineering expertise to his local community as a Trustee of the Village of Cayuga Heights and a member of the Southern Cayuga Lake Intermunicipal Water commission. He was a deacon and member of the First Presbyterian Church of Ithaca.

He was an active member of many professional societies and charter member of several, including The American Institute of Professional Geologists (AIPG). His AIPG registration number in 1964 was 274. He was a founding member of the Pittsburgh Geological Society in 1944 and served as its president in 1947-48. He was also a member of the Society of Economic Geologists, a Fellow in the Geological Society of America, and was Chair of

the Engineering Geology Division of the Geological Society of America in 1955. The Association of Engineering Geologists made him an honorary member in 1986.

He is survived by his wife of 58 years, Elizabeth (Billie); two children, John W. Philbrick and Anne P. Isenbey, both of Poughkeepsie, New York; four grandchildren; a brother; and a sister. His daughter, Margaret P. Maurer, and a brother predeceased him.

In accepting the Honorary Member Award of the Association of Engineering Geologists, he spoke about his profession: "Let us always bear in mind our duty to provide factual information and to call the shots as we see them even if this runs counter to the views and desires of our employers. An honest geologist is the first requirement now and in the future." These are words of wisdom that he lived by and shared with his many students at Cornell. The citation for his award concluded: "Shailer S. Philbrick, through his distinguished practice, teaching and writing, has set an outstanding example of professional excellence in engineering geology."

William R. Brice, Jack E. Oliver, Arthur L. Bloom

Elmer Strobel Phillips

May 21, 1908 — August 28, 2004

Elmer S. Phillips had a profound influence on visual communications as a profession and was often called the “father of visual aids” in agricultural colleges in the U.S. Land-Grant University System. He was affiliated with Cornell for most of his long lifetime. That affiliation began in 1928 as a freshman at the University, continued after his graduation in 1932, and lasted until his death at age 96. He climbed the “academic ladder” from Instructor (1935), to Assistant Professor (1941), to Associate Professor (1944), to Professor (1955) and Professor Emeritus (1968).

He was born and brought up in Brighton, New York, a son of George and Cora Phillips, and attended Elementary School #33 and East High School in Rochester. Known as “Flip” in those years because his young friends thought him to be flippant, the nickname lasted throughout his lifetime.

To help pay for his college education, “Flip” Phillips applied his photographic skills as a freelancer, making pictures for Cornell faculty members who needed them for their research and extension papers submitted for publication. In 1932, he graduated with a Bachelor of Science degree in Cornell’s College of Agriculture, and that year married Gladys “Pat” Douglas of Rochester. Because his part-time photographic work increased over the next two years, he approached the Dean of Agriculture with a proposal to establish an official full-time photography unit. Although sympathetic to the proposal, the Dean turned it down. However, Phillips was appointed as a Lecturer to teach oral and written expression courses and to broadcast the College’s Farm and Home Hour over the University radio station. Also, he was the “Voice of Schoellkopf Stadium” on a freelance basis for 28 years—the first person to “man the mike” at Cornell football games.

Even with that heavy workload, his photography interests continued. The Dean requested him to make a color motion picture to be financed by Ralston Purina Company. It would show the miracle of life developing in a chicken egg. The film, produced in cooperation with the Poultry Department and titled “Where Life Begins,” received national recognition. Widely used in commercial and educational circles, it was reviewed in a three-page color spread in *Life* magazine in the October 4, 1937 issue. Also, the Society of Motion Picture Engineers invited Phillips to present the film at its annual meeting that year in Washington, D.C. The invitation came because it was the first complete motion picture of a biological subject photographed with Kodachrome film. Phillips maintained close connections throughout most of his career with Eastman Kodak Company in Rochester. It provided him with

new types of color film before they were put on the market. However, of more value to him was the opportunity to become involved with pioneering experiments in photographic methods.

During World War II, motion pictures and slide sets were used by the College of Agriculture to aid efforts to increase food production and food preservation. In a three-year period during the early 1940s, approximately 30 motion pictures and 30,000 color slides were provided to County Extension Agents in New York State. An example of one of those motion pictures produced by Phillips in cooperation with the Pomology Department, showed farmers how to save labor in apple harvesting while maintaining quality of the product. It was the first farm labor film produced anywhere in full color. Professor Phillips also helped the Vegetable Crops Department produce the first live agricultural television program by a land-grant college. It was broadcast on March 24, 1943 over the General Electric Station in Schenectady, New York. (The topic: "Victory Gardens.") This initial venture into television ushered in a new era in communications for Cornell's Extension Service.

At the end of the war, a new joint Department of Extension Teaching and Information was established in 1945 for the College of Agriculture and the College of Home Economics. (The Department's name was later changed to Department of Communication Arts and the College of Home Economics to the College of Human Ecology.) Professor Phillips became head of the Visual Aids Service and it flourished under his leadership with additional staff, different audiences, and refined methods. Also, he taught visual communication courses for large numbers of Cornell students, conducted training schools for Extension personnel, and wrote several publications. Because television stations in the 1960s started to swing away from live public service presentations and put greater emphasis on filmed programs, he organized the Television Film Center to produce films for 29 TV stations and another unit to prepare scores of exhibits for educational purposes, including the New York State Fair in Syracuse and Farm and Home Week on the campus. Other exhibits were displayed abroad, including a large one for an international agricultural exhibition in Cairo, Egypt viewed by more than 800,000 persons from Near East and Middle East countries. Another told about Cornell's long-standing relationships with South American institutions and was shown in Brazil.

Professor Phillips served as a consultant for the Inter-American Institute of Agricultural Sciences in Turrialba, Costa Rica in 1956 and for the National Project in Agricultural Communications with headquarters in Michigan from 1957-59. During this period, he developed plans for visual workshops to train foreign nationals at the request of the U.S. Department of Agriculture.

Soon after “partially retiring” from Cornell in 1968, he was asked to direct the production of a 28-minute color motion picture showing the significance of agriculture in New York State. (Title: “Roots of Empire.”) It was sponsored by the College of Agriculture at Cornell, New York State Agricultural Resources Commission, Department of Agriculture and Markets, and Department of Commerce. The term “partially retiring” was an appropriate designation because he continued to maintain contacts with the University for several years on a less formal volunteer basis, accepting requests to be a guest lecturer in several courses and helping to solve visual communication technical problems.

His professional affiliations included these organizations: Photographic Association of America; Biological Photographic Society; American Association of Agricultural College Editors (Northeast Regional Director); American Wine Society (Editor of the Society’s *Journal*). He served in numerous leadership roles in the Ithaca community: chairman of the training committee for the Louis Agassiz Fuertes Council of Boy Scouts; a member of the Greater Ithaca Fact-Finding Board; chairman of the committee to draft the Town of Ithaca zoning ordinance; a member of the planning committee for a new Tompkins Community Hospital and a member of its Board of Managers. He was the longest continuous member of the City Club of Ithaca (58 years) and one of the architects of the breakaway from the national Exchange organization in the late 1950s as a protest against its restriction of blacks from membership. His hobbies ranged from fishing in streams and lakes of New York, Canada, and Costa Rica to woodworking, gardening and home winemaking.

In February 1996, the Phillips (“Flip” and “Pat”) moved to Kendal at Ithaca, a life-care retirement community near the Cornell campus. His wife predeceased him. Survivors include two sons and a daughter: Lawrence of London, England; John of Philadelphia, New York; Patricia Marion of Garden Valley, Idaho; and eleven grandchildren.

Professor Phillips will be long remembered as a man of many “firsts” and a highly creative and skilled communicator.

Royal D. Colle, Ronald E. Ostman, William B. Ward

Everett Franklin Phillips

November 14, 1878 — August 21, 1951

Everett Franklin Phillips, Emeritus Professor of Apiculture, died at his home on August 21, 1951, after a lingering illness. In spite of his disabilities, he worked on problems of beekeeping until the day before his death.

The son of a Methodist clergyman, Dr. Phillips was born and received his early education in Ohio. He was graduated from Allegheny College and took advanced work in Zoology at the University of Pennsylvania. At Pennsylvania he held scholarships and fellowships, and was granted the degree of Doctor of Philosophy in 1904. In 1905 he went to the Department of Agriculture, Washington, and after two years became head of the work in Apiculture, which post he retained until coming to Cornell University. In 1929 his alma mater granted him the honorary degree of Doctor of Science.

Professor Phillips' doctorate thesis was a study of the compound eye of the honeybee, and that work interested him in beekeeping. On being made Head of the Division of Bee Culture in Washington he began to develop the much needed scientific work, and enlisted the help of scientifically trained men whose names are now familiar in the world of beekeeping. In 1911 he undertook work on one of the most important problems in beekeeping, the behavior of bees in winter and the wintering of bees. He worked out methods for the eradication of European foulbrood, which have been highly successful. Work begun in Washington on physical properties of honey and expanded at Cornell contributed greatly to our knowledge of methods of handling honey.

He also worked on the bee louse, and in 1922 was influential in obtaining legislation to protect the industry in North America from the introduction of bee diseases from other continents. He did much work on pollination and presented the available evidence on the effect of the insecticides on other pollinating insects. He also studied the relation of bees to fireblight.

During the first world war Doctor Phillips conducted an intensive campaign to stimulate beekeeping, primarily by encouraging a change from comb honey to extracted honey production. Commercial honey production increased in that period about 400 percent. It was then that extension work in beekeeping was begun in a few states, and the work was so successful that it has been continued. A notable group of men performed their first public service to beekeeping in this undertaking. For some years these men held most of the state positions, and when more men were needed, several of Professor Phillips' students from Cornell became engaged in this work. Doctor Phillips was editor of the apiculture section of Biological Abstracts and twice served on the editorial board of the Journal

of Economic Entomology. He was the author of "Beekeeping", published by the Macmillan Company, which has been translated into Russian. He wrote more than 600 bulletins and articles for technical and scientific journals, several of which have been translated into other languages.

He visited Europe four times and studied the work of leading investigators in Switzerland, Austria, Germany, England, Scotland, Jugoslavia, Czechoslovakia, Cuba, Mexico, Puerto Rico, Hawaii and every state of this country. He maintained correspondence with leading apiculturists all over the world and he was honored by election as Fellow of the international Apis Club, of which he was president in 1926. This Club awarded him its medal in 1924. He also received medals from three French beekeeping societies and one in Czechoslovakia. In 1932 at the invitation of the government he visited the Soviet Union to assist in beekeeping aspects of the Second Five Year Plan. He was a member of Phi Beta Kappa, Sigma Xi and other honorary scholastic societies, and of the social fraternity Phi Delta Theta.

Professor Phillips was responsible for the establishment of the Miller Memorial Beekeeping Library at the University of Wisconsin and built up a similar library in the Bureau of Entomology of the United States Department of Agriculture. On coming to Cornell he again started a beekeeping library and arranged for its endowment. He presented his personal collection on beekeeping to the Library and obtained additional books and journals through exchanges with individuals and institutions in other lands.

Some notable private collections have been included, such as the entire library of Moses Quinby, all books known to remain in the libraries of L. L. Langstroth and Dr. C. C. Miller, the Evard French library, the John Anderson Scottish library, and a large collection of European first editions. Langstroth's hand written journal, his letter press book, and a diary of Quinby are among the most precious items.

The library now consists of more than 3000 books and volumes of bee journals and with adequate funds assured, this library will remain supreme. In recognition of the contribution which Doctor Phillips made in this field, the Board of Trustees designated this collection as the "Everett Franklin Phillips Beekeeping Library".

As a teacher Dr. Phillips attracted many graduate students to Cornell. Most of them are now in charge of important phases of beekeeping in this country as well as in Canada, China, Czechoslovakia, India and the Union of South Africa. He gave unsparingly of himself to his students and all of them were stimulated by his interest and enthusiasm in their work. For example, the help and encouragement given one graduate student resulted in a method for processing honey which is now used throughout the world. The patent for this process was given to

the University and largely because of his interest and supervision it has brought to Cornell a considerable sum of money for research in apiculture.

Doctor Phillips worked also with entomologists. He served on various committees of the Association of Economic Entomologists and the Entomological Society of America and as president of the former in 1935. At the outbreak of the last war he became chairman of the joint committee for coordination of entomology with the war effort. He was a member of the Crop Protection Committee of the National Research Council and a committee of the Economic Entomologists to promote the establishment of a national science foundation. He was a member of the Philadelphia Academy of Natural Sciences, the Society of Naturalists, and the Biological Union.

People in Ithaca probably knew Doctor Phillips best for his civic activities. He was president of the Ithaca Community Chest, on the executive committee of the Council of Social Agencies, member of the boards of directors of the Ithaca Reconstruction Home for Infantile Paralysis, the Salvation Army, and the Family Society. He was a commissioner of the Department of Public Welfare of the City and chairman of a committee on a war memorial. He was also a trustee of the Hazel Hurst Foundation for the Blind, Monrovia, California, and Tompkins County chairman for United Service Organizations. In 1945, he was elected a director of the New York State Association for Crippled Children, was made Vice President in 1940, and became President in 1950. A resolution passed by that Association at the time of his death said in part: "Infirm in body. . .but unquenchable in spirit, he served us well until the very day of passing."

Rotarians everywhere knew him as well as did beekeepers. He was president of the Ithaca Rotary Club and the next year became governor of former District 28 of Rotary International. In 1936-37, he was chairman of the International Service Committee, and in 1939 was elected director and third vice-president of Rotary International.

Doctor Phillips was well known in the beekeeping industry throughout the world and was directly or indirectly responsible for much of the basic research work in Apiculture. His keen analytical mind and forthrightness of character engendered respect and confidence among all who knew him. It is common knowledge among men engaged in the beekeeping industry that he will go down in the records of beekeeping history as the greatest scientific apiculturist in our time.

Dr. Phillips is survived by his wife, Mary Geisler Phillips, three sons, and five grandchildren.

E. J. Dyce, P. J. Kruse, C. E. Palm

Mary Geisler Phillips

May 13, 1881 — January 25, 1964

Mrs. Mary Geisler Phillips was a beloved member of the staff of the New York State College of Home Economics for eighteen years, and she kept closely in touch with her friends at the College through the fifteen years following her retirement. As editor, writer, and friend she contributed generously and importantly to the College's work and aims. Upon her retirement in 1949 she was made Associate Professor Emeritus of Home Economics.

The wife of Everett Franklin Phillips, Professor of Apiculture in the College of Agriculture from 1924 to 1946, Mrs. Phillips was already familiar with the College of Home Economics when Miss Van Rensselaer, aware of her abilities, offered her the position of extension instructor in 1931, to work on a series of radio scripts. The following year she joined the college editorial office, working as an assistant, part-time, to the editor for the next ten years. She became assistant editor of the College in 1943 and in 1944 acting editor. In 1945 she was made editor and in 1947, after the Department of Extension Teaching and Information had been established in 1946 as a joint enterprise of the Colleges of Agriculture and Home Economics, she became also Associate Professor of Home Economics in that Department.

Mrs. Phillips was graduated from the University of Pennsylvania in 1902 and spent the next year there in graduate study in biology and chemistry. Prior to her marriage she taught those subjects for three years in the High School for Girls in Philadelphia, studying also for part of this time. From 1924 to 1930, as assistant editor for the National Research Council, she worked on the Botanical and later Biological Abstracts.

Her marriage to Everett Franklin Phillips in 1906 opened new doors. Drawn to one another in part by their mutual interest in biological sciences, they maintained this interest, as shown in her writing, throughout their life together. As senior apiculturist for the United States Department of Agriculture and later Professor of Apiculture at Cornell Dr. Phillips' work grew to world-wide fame. He became more and more in demand as a speaker at national and international conferences. Mrs. Phillips frequently accompanied him on these travels and on others, which he made as United States representative of Rotary International. She came to know people of all walks of life, many of them world leaders, and knew the customs of homes and families of many lands. She could speak as well as read a number of languages.

Her skill in writing was nurtured in the early years of her marriage when she assisted her husband in preparing his book, *Beekeeping*, and translated many articles. In these years too her ability as a writer of children's books took form. Her first book, *Honey Bees and Fairy Dust*, published in 1926, resulted from stories that she told and wrote for her children in answer to their questions about bees and what their father did with them. Her active career as a writer for children continued into the years of her retirement.

Ant Hills and Soap Bubbles followed in 1927, *Spider Webs and Sunflowers* in 1928.

The D. C. Heath Company of Boston became interested in her ability to present science to children and published school editions of these titles in 1929. She edited and revised two series of science books for children for this publisher, *Glimpses into the World of Science*, and *Nature by Seaside and Wayside*.

Many are familiar with her name through her short stories for children that were published in *Youth's Companion*, *St. Nicholas Magazine*, *American Boy*, and *John Martin's Book*.

The last two of her eleven books for children appeared after her retirement: *The Makers of Honey* in 1956 and *Dragon Flies and Damsel Flies* in 1960, both published by Crowell. She contributed also to the bee journals, two articles appearing as late as 1962.

Throughout her years in the editorial office of the College of Home Economics she continued to do free lance writing in addition to her daily work, adding to her writings for children many magazine and newspaper articles on subjects of interest to homemakers.

Her work as an author was tied closely to her love of her home and family, and her unusually successful career supplemented her success as a wife and mother. She is survived by three sons: Everett Franklin, Jr., of Darien, Connecticut; Howard G. of Alexandria, Virginia; and William T. in Kuala Lumpur, Malaysia.

Mrs. Phillips' work as College editor used not only her ability as a writer and editor but also her teaching skills. She conducted writing and radio workshops and taught units in several classes at the College. She worked with community organizations on their publicity programs. She assisted extension staff and students with their writing problems. Her enthusiasm and friendliness were infectious. She had a way of making people feel that even small accomplishments were important ones. The head of the Department of Extension Teaching and Information, in a letter to the Dean of the College of Home Economics, wrote in 1949: "In my opinion, Mrs. Mary G. Phillips has performed a service to the College of Home Economics that would be difficult to surpass. Her capacity for doing excellent work and for making and keeping friends cannot be exaggerated.

“Mrs. Phillips was always willing to do just a little more than was expected of the editor of home economics. . . . Her energy seemed boundless and she played a large part in helping to improve and enlarge the informational activities of the College. Her work is appreciated not only by those who work with her here at the College, but by the home demonstration agents and homemakers throughout the State.”

The students and the community knew her in still other ways. As an alumna of the Kappa Kappa Gamma sorority, she was instrumental, with other Ithaca alumnae, in arranging for the present chapter house. In 1949 the members of Psi chapter in Ithaca gave a reception in recognition of her work for the sorority and in honor of the fiftieth anniversary of her initiation. At that time she was president of the Psi Chapter Corporation Board and past president of the Alpha province, which includes Cornell.

In Ithaca she was active in educational and literary organizations, contributing generously through her own work and creativity.

Her enthusiasm for continuous reading and study was evident, even in her statements on a routine “personnel” form. In 1940 she wrote, “I let no year go by without some special study just to keep my mind limber. This year I am attending lectures twice a week in Insect Behavior and once a week attend a class in Spanish.” Her mind was always “limber,” as she read widely and far beyond her first loves of biology and languages. To talk with her about a book was to find new inspiration.

The picture one retains of Mrs. Phillips is one of vigor, warmth, and generosity in all her work and personal relationships. At the memorial service held in Sage Chapel, the Reverend James Moore, a long-time friend and fellow member of the Cornell staff, who conducted the service, spoke of a recent visit which he and his wife had with Mrs. Phillips, of her gaiety, and hospitality, and thoughtfulness of them. “We went,” he said, “to see if we could be helpful in any way. As we walked back to the car a phrase kept running through my mind — ‘not to be ministered unto but to minister.’” This, in essence, is the spirit that pervaded the life of this gifted friend and co-worker.

G. Eric Peabody, Mary F. Henry, Esther H. Stocks

Ellis A. Pierce

May 12, 1919 — November 4, 1978

Ellis A. Pierce was born and raised in Onida, South Dakota, and received his Bachelor of Science degree from South Dakota State University. After four years in the army in World War II, he reentered South Dakota State University and received his Master of Science degree in agriculture in 1948. He was appointed as an assistant professor in the Department of Animal Science at South Dakota State University in charge of teaching and research in meats. In 1953 Professor Pierce enrolled in the graduate school at Cornell University and was awarded the Doctor of Philosophy degree in 1955.

Professor Pierce was a member of the animal science faculty of the College of Agriculture and Life Sciences at Cornell University from 1955 until his retirement in 1975. He spent a six-month leave in 1961 doing advanced study at North Carolina State University and a seven-month leave for study in Europe in 1968. Upon his retirement the University Board of Trustees appointed him professor emeritus.

As a member of the animal science faculty, he was responsible for the development of the meat and swine extension programs for New York State. At the time of his appointment as assistant professor there were few, if any, guidelines for conducting such programs in the United States. This situation existed because of the relatively minor emphasis given by the producers of livestock to the interests of consumers of meat products and to the marketing of meat and livestock, especially swine. Due to the large urban and city populations within New York State, Professor Pierce felt the best methods for expanding extension programs would be those directed primarily toward the consumer. Thus, he developed programs in the area of consumer education in cooperation with staff members of the College of Human Ecology, on the identification of cuts of meat, quality of meat, best choices of meat, storage and preparation of meat, outdoor cookery of meat, and many other subjects related to the purchase and use of meat by the consumer.

As an extension specialist Professor Pierce was responsible for the swine as well as the meat program. He recognized the interdependence of the two programs and utilized it to augment each. The market hog pool was developed and involved swine producers, marketing agencies, and meat packing companies. Hogs were sold for slaughter on a graded basis through this improved system. Professor Pierce actively participated in developing swine and beef cattle evaluation programs, which established the relationship between live animals, their carcass grade, and their cutout value. He started the annual Quality Meat Contest at the New York State Fair. Through his

initiative and leadership he prepared many bulletins, reports, and articles covering practically all phases of swine production and meat subjects. The development and success of both the swine and meat programs was a tribute to his persistence, originality, and resourcefulness.

Professor Pierce worked closely with all the livestock organizations of New York State and held offices in several of them over the years. His leadership was not limited to New York State, however, for he was recognized throughout the country as an authority in the field of carcass judging and the evaluation of meats. He served as assistant superintendent of the Quality Meat Contest of the International Livestock Exposition at Chicago for many years. He was a charter member of the American Meat Science Association, a member of its executive committee, and chairman of its board of directors. He was the recipient of the American Meat Science Association Extension Award in 1966 in recognition of his leadership and his development of extension meat programs.

Professor Pierce was a guest professor in the Institut für Tierzucht und Haustiergenetik at the University of Göttingen, Germany, in 1968 and travelled extensively in Scandinavia, Western Europe, and Great Britain studying livestock production practices and research methods at agricultural colleges and institutes. He authored a chapter on the meat industry of the United States for Collier's *Encyclopedia*.

From his retirement in 1975 until his death, Professor Pierce was a livestock and meats economist with the United Nations Food and Agriculture Organization in Rome, Italy. His duties were primarily involved with the development of projects submitted by the various member countries to advance their livestock and meat industries to increase and better their nutrition and diets. In this work he travelled extensively, advising and consulting on these proposals.

He is survived by his wife, Patricia Noethe Pierce, who resides in Ithaca, New York.

Robert W. Spalding, George H. Wellington, Samuel T. Slack

Eric Polisar

June 29, 1923 — July 31, 1968

When Eric Polisar died of cancer on July 31, 1968, there was lost a brilliant, unorthodox, mercurial, and engaging colleague. At the time of his death, he was a member of the faculty of the School of Industrial and Labor Relations, a post which he had held since 1961. During those seven years he undertook varied research and was a provocative and successful teacher of undergraduate, graduate, and extension courses. Professor Polisar had previously worked for the Extension Division of the School of Industrial and Labor Relations in 1952-53 as field representative in the School's Albany Office. Before then, for two years, he taught at what was then called the New York State Teachers College at New Paltz. Afterwards, between 1953 and 1961, he served in several important capacities on the staff of the Amalgamated Clothing Workers of America, including that of assistant to the president.

All this was preceded by study at the University of Wisconsin. He earned the B.A. in 1949 and the M.A. in 1950. He completed work on the Ph.D. in history except for a dissertation on the movement and quartering of British troops in the American colonies during prerevolutionary times—a subject which, although not entirely defeating Eric Polisar's unbounded capacity to discover social significance, finally proved too remote for his concern with the more immediately relevant.

Still earlier he had served as an enlisted man in the European theater during World War II.

The foregoing review of Eric Polisar's career does not in itself convey the vigor, verve, and variety of the man. He was a captivating speaker, and he wrote with flair. More importantly, he had a perturbing gift for prophesying problems before they became apparent or acute. A listing of some of his *pre-1965* interests will suffice. These included declining urban economies, race relations, and labor problems in the public service. Concerning them, he wrote, taught, and advised government and union officials as well as academic colleagues. These things he did with wide knowledge, sharp insight, and openhanded generosity.

Eric Polisar brought an uncompromising honesty to his work and concerns. Not all of the victims of his occasional verbal thrusts found his articulate and sometimes acid assaults comfortable to endure. Yet there was tolerance in him, as exemplified by his service as a member of the Board of Cornell United Religious Work, a role at first difficult to reconcile with his *Weltanschauung*. But it was in keeping with his indefatigable willingness to keep laboring at human betterment and with his own zestful mode of life. These traits, revealing an underlying romanticism and

heroism of Cyrano-like proportions, were the more poignant because they were in sharp contradiction to equally strong strands of skepticism and pessimism in his outlook.

Eric Polisar is survived by his wife, Anne Drew Commons Polisar, and three children.

Maurice Neufeld, Ronald Donovan, Kurt Hanslowe

Robert A. Polson

July 6, 1905 — July 4, 1997

Robert A. Polson, Professor of Rural Sociology Emeritus, died on July 4, 1997 at his home in Ithaca, New York. Bob was a part of the Department of Rural Sociology for 66 years starting in 1931. He was department head during 1948-57. His career, which spanned the decades before and after World War II, had a significant change in a career path, and was marked by years of generous contributions to the university and the community, and a devoted dedication to family and friends.

Born in Nova Scotia, Canada, Bob and his family moved to the state of Washington where he was reared on a large dairy farm. His initial career goal was to stay in the dairy industry, but after only two years at Washington State College in Pullman, he transferred to the University of Wisconsin where he received a B.S. degree in Agricultural Economics in 1928. He then continued at Wisconsin in the field of Rural Sociology and earned a Ph.D. degree in 1933. He also did graduate work at the University of Chicago and postdoctoral studies at Columbia University.

Polson's dissertation research was used for a Wisconsin publication, *Trends in Town-County Relations* (1933), co-authored with his thesis advisor and one of the founders of the discipline of rural sociology, J.H. Kolb. This study was conducted in the same county used 16 years earlier by Charles J. Galpin for his pioneering work reported in *The Social Anatomy of an Agricultural Community* (1915). Polson's was one of the first locality group restudies made by sociologists. The restudy was in cooperation with the U.S.D.A.'s Division of Farm Population and Rural Life and with President Hoover's Committee on the Study of Recent Social Trends. Though the nature of Professor Polson's career changed dramatically, his interest in the community continued.

Polson came to the then Department of Rural Social Organization in 1931, the same year Warren Hall, the Cornell home of rural sociology, was built. His appointment as an extension instructor in rural social organization had been preceded by a year as rural sociologist at Virginia Polytechnic Institute. During the years of the depression, Bob assisted New York communities in planning and developing improvements in community services such as fire districts (the number grew fourfold in the 10 years preceding World War II) and in training officers of community organizations. World War II made new demands on faculty, especially those who might give some assistance to the war effort. In this regard, Bob had two special assignments: he was first called upon to organize civilian defense programs while on the field staff of the New York State War Council, and in 1944 and in 1945, he was the

State Supervisor of the Emergency Farm Labor Program run by the Cooperative Extension Service at Cornell. This program helped house and feed seasonal farm workers.

Polson's career underwent a change in 1948 when he began a nine-year term as department head. The task of administration exposed him to the broad scope of programs and activities covered by the department and facilitated a more marked change in his career. This change began during 1952-1953 with a Fulbright appointment the purpose of which was to start a rural social science research program at Silliman University in the Philippines. The results of the original research and restudy were reported in *Rural People's Response to Change: Dumaguete Trade Area, Philippines* (1973). The work also began a long affiliation with Professor Agaton Pal. Polson was also asked to help train the first group of community development workers who inaugurated President Magsaysay's barrio improvement program. The theme of local community improvements was the same as that begun as an extension specialist in rural social organization many years earlier. The exposure to Philippine villages, and later, under the auspices of International Cooperation Administration and the Ford Foundation, similar exposure to rural development programs in 13 countries in the Far and Near East, changed the domain of his work. He turned to the under-developed areas of the world where technical assistance programs undertaken by the United States government and by public and private international agencies called for the contributions which social scientists could make to understand the problems of rural communities and regions and to the train staff for development agencies. Bob specialized in training students, foreign and U.S. citizens, in the application of sociology to the organization, the conduct, and the evaluation of rural community development and agricultural extension programs.

Bob had a key role in the formative years of Cornell's international programs in the 1950s and 1960s. He helped establish the Office of International Agricultural and Rural Development in the College of Agriculture and Life Sciences. In 1953, he was a cooperating member of the prestigious graduate program in South and Southeast Asia. His work at Silliman University added considerable strength to the university's many new efforts in the Philippines. Even his classroom interests shifted to courses in social change and organization. Over the years, he was an advisor to more than 200 graduate students of whom more than half were from Asia and Africa.

Professionally, his work was recognized through service in 1950-51 as President of the Rural Sociological Society. He was also a member of the American Sociological Society, the American Academy of Political and Social Science, the American Association for the Advancement of Science, Alpha Gamma Rho, Phi Kappa Phi Honor Society, Epsilon Sigma Phi, and Alpha Zeta.

In his devotion to the betterment of the communities in which we live, Ithaca was not overlooked. He served as President of the Ithaca Rotary Club, was director of the Ithaca Community Chest, the YMCA, the Tompkins County TB and Public Health Association, and the Cooperative Consumers Society. Similarly, his personal generosity supported a student emergency fund in the Department of Rural Sociology. Dozens of students benefited from the Polsons' contributions to this fund. In 1989, this fund was named the Polson-Larson Fund for Excellence and has since grown to be an important source of support for Department of Rural Sociology programs.

The warm hospitality of Professor and Mrs. Polson, who opened their home to graduate students and faculty, was widely recognized. Professor Polson is survived by Ruth E. Polson, his wife of 67 years; and a daughter, Margaret R. Polson, of Boone, North Carolina. A second daughter, Marion, died in 1975. Bob was devoted to his immediate family and to his extended family. (He proudly displayed photos of his family's large dairy farm and, later, their logging operation in western Washington.) It is extraordinary that on July 4, 1997, the day Bob Polson died, the Polson Museum, devoted to the long Polson family history, was opened and dedicated in Hoquiam, Washington.

Olaf Larson, Philip Taietz, Eugene Erickson

Eugene Hillhouse Pool

June 3, 1874 — April 9, 1949

Eugene Hillhouse Pool, Emeritus Professor of Clinical Surgery at Cornell University Medical College, New York, died on April 9, 1949 in his 75th year. At the time of his death, Dr. Pool was also Consulting Surgeon to the New York Hospital and an Honorary Governor.

Dr. Pool was born on June 3, 1874, the son of John Hillhouse and Sophia Boggs Pool. He was graduated from St. Paul's School in Concord, New Hampshire, and received his A.B. degree from Harvard College in 1895. Four years later he was graduated in medicine from the College of Physicians and Surgeons, Columbia University. In 1900 he was appointed Senior Assistant House Surgeon at the New York Hospital, becoming House Surgeon the following year. From 1901 to 1904 he served as Assistant Demonstrator in Anatomy at the College of Physicians and Surgeons, Columbia, and as Instructor in Surgery from 1904 to 1912. From 1912 to 1915 he was Associate in Surgery. During this period, in 1907, he was appointed Associate Attending Surgeon to the New York Hospital. In 1915 he became Professor of Clinical Surgery and Attending Surgeon in charge of the Second Surgical Division. He served in this capacity until 1932, when the New York Hospital joined with Cornell University Medical College at its present location. He was then appointed Professor of Clinical Surgery in Cornell Medical College and Senior Attending Surgeon to the New York Hospital, which posts he held until his retirement in 1947.

One of the most distinguished surgeons to be associated with Cornell, Dr. Pool did much to develop surgery as we know it today. He was recognized throughout the country and abroad as a master surgeon, an inspired teacher, and an acknowledged leader in his profession. His wide and varied activities produced major achievements in clinical surgery and research. His interest in the young men he gathered about him was deep and lasting, and to many he gave freely of his time, advice, and material assistance to guide them into the positions of responsibility they occupy today in various communities.

As one of the leading surgeons of the United States, he was prominent in surgical circles and made many valuable contributions to meetings and to the current literature. It is a lasting tribute to his name that he held the highest positions in the surgical societies and medical organizations of his era. He was elected President of the New York Surgical Society in 1923, of the Society of Clinical Surgery from 1927 to 1929, of the American College of Surgeons in 1926 and was appointed to the Board of Regents of that organization in 1928. He was President of the American

Surgical Association in 1935, President of the New York Academy of Medicine 1935-1936, and held many other offices of honor and responsibility.

During World War I he went to France with the New York Hospital Unit, Base Hospital No. 9 and then served as Chief Surgeon of Evacuation Hospital No. 1. He was later advanced to Consulting Surgeon to the 5th Army Corps, and at the end of the war was Consulting Surgeon to the First Army. Among his decorations for service were the Legion of Honor from France, the Distinguished Service Medal and a citation from General Pershing for "meritorious service".

Dr. Pool was interested in civic affairs and served on a number of committees for the State, lending advice to those in high position. Of particular note was his work as chairman of the committee appointed by Governor Lehman in 1935 to rewrite the medical provisions of the Workmen's Compensation Act. He was Administrative Consultant in Surgery for the City Hospitals of New York and a life Trustee of Columbia University.

Throughout his professional life Dr. Pool was closely associated with the affairs of the New York Hospital. He was a member of the Medical Board until his retirement, and served as its President from 1929 to 1931. During his tenure of office he worked untiringly for the advancement of the Cornell Medical Center to its present position.

It would be difficult to estimate the number of lives he saved or made more bearable by his surpassing judgment and surgical dexterity. His patients benefited not only from his operating skill but from his kindly interest in their personal problems. His wise counsel, friendship and loyalty will be sorely missed, not only by the institution, but by the community at large.

Frank Glen

Robert Morris Pool

February 22, 1940 — June 10, 2006

Bob Pool was a Professor of Viticulture in Cornell's Department of Horticultural Sciences, College of Agriculture and Life Sciences at the New York State Agricultural Experiment Station in Geneva. Although his primary responsibility was to serve the research and production needs of New York viticulture, Bob's research and personal interactions significantly benefited viticulture across the globe. Bob was awarded the Cantarelli Prize in 1997 from the Italian Academy of Vine and Wine in recognition of his outstanding contributions to research in the mechanical regulation of crop load and fruit quality in grapes. This award reflects the impact of his research and its contribution to reduced production costs for the grape industry.

Bob received his B.S. degree in Enology at the University of California, Davis, his Master's degree in Food Science, also at Davis, and his Ph.D. degree in Pomology at Cornell. In 1974, he was hired as an Assistant Professor at Cornell in grapevine breeding. In 1979, he changed his research responsibilities to vineyard management. He was promoted to Associate Professor in 1981, and to full Professor in 1988. His professional society memberships included the American Society for Horticultural Science, the International Society for Horticultural Science, and the American Society of Viticulture and Enology. He also served as the U.S. Representative of the Organization International de La Vigne et du Vin.

Bob was active in developing the USDA National Grape Germplasm Repositories (grapevine collections) at Davis, California and Geneva, New York. He formed the Grape Commodity Committee of the National Plant Germplasm Committee and served as chairman for ten years. For five years, Bob served as program leader of the National Germplasm Repository for apples and American grapes at Geneva.

Upon his promotion to Professor, Bob said he was pledged to

“the development and adaptation of the technology and art required for vineyardists and winemakers to achieve a consistent realization of maximum quality potential that resides in classic vinifera wine grape varieties.”

Clonal selection, matching soil type, rootstock and variety, vine spacing and summer pruning were major research interests. Bob was fully committed to extension outreach and for many years had an extension commitment in his position description. In that capacity, Bob served as a member of the board of several grape extension educators, and for many years, he organized and ran Cornell's grape extension workgroup. Bob coordinated with grape extension staff in developing grape grower conferences and grape extension bulletins. His extension talks

and publications included topics such as mechanical or minimal pruning and thinning, row and vine spacing, dormant bud cold acclimation and winter cold injury. His grape web pages provided lots of information and many links for the growers and included a tongue-in-cheek comparison of New York State grape production areas with other important world viticulture areas entitled “Does New York have terroir?”

Bob’s final viticulture lecture was presented at the Finger Lakes Grape Growers Conference in March of 2006. In typical fashion, Bob managed this despite receiving chemotherapy the day before. He was entertaining; making jokes at his own expense that had the audience roaring (the authors included). Bob was presented with a book of letters from colleagues, students and industry members and representatives. In reviewing this book, Bob was gratified that the growers mentioned those accomplishments that he hoped had been important to them.

Bob was a complex individual, endearing and frustrating, often at the same time. He cared passionately about his research, student education, Cornell University, the Station and the department, yet this passion often fueled intense and sometimes rancorous debate about appropriate strategies for the future. His convictions were strong and their expression sometimes less than diplomatic. Bob had a quick wit and loved to exchange barbs. Sitting next to him at faculty meetings was never boring.

Yet, Bob was a friend that could be counted on, whatever the need or the time. He was also a kind and caring advisor who demanded the best from his students. His students are some of the most recognized viticulturists in the U.S. and Canada. Bob was a generous host who loved to entertain and was well known for his excellent cooking and choice of wines. The outdoor wood-burning oven he constructed produced vast numbers of loaves of bread and some extremely diverse pizzas (size, ingredients and degree of crispness!). Pizza making became a very popular activity with guests of all ages. Bob and his family were also involved in the community, with Bob very active in various church roles and in chorus groups.

Bob’s wife, Jennifer Morris, and his children, Alex, Ron and Sue were his foundation, and his dream of developing a winery was realized with their help. Billsboro Winery produces some unique varietals and blends, with equally unique names such as Eclectsia, but it is the Pinot Noir, produced with a clone Bob researched, that has become especially well known for its excellent quality.

Bob’s long battle with illness provided time to reflect on his career. One of his great joys was teaching and mentoring students in the classroom, but especially in the vineyard. As he approached retirement, Bob had planned to become more involved in teaching “his” viticulture courses. He was pleased to see the establishment of

a Viticulture and Enology Program at Cornell, but he was frustrated that due to his illness he was no longer able to teach Introduction to Viticulture and Vine Management I and II, as he had intended. Yet his legacy will live on in his family, students, research publications, ideas and innovations in grape production systems, and within the viticulture industry to which he dedicated his career.

Leroy Creasy, Martin Goffinet, Susan Brown

Paul Russel Pope

October 27, 1877 — January 12, 1950

Paul Russel Pope, Professor of German, Emeritus, died in Ithaca on January 12, 1950, five years after his retirement in 1945. Professor Pope was born at Ann Arbor, Michigan, on October 27, 1877, the son of a prominent Methodist minister. He received his B. A. degree from Western Reserve University in 1898 and, having decided to devote himself to the study of the modern languages, he went to Germany to seek what was then the best possible training in that field. After several semesters at Halle and Berlin he obtained his Ph. D. from the University of Leipzig in 1903. It would be difficult to imagine a more distinguished faculty than that under which the young Paul Pope acquired the tools and, above all, the spirit that were to make his own career so effective. Among his teachers were the psychologist Wilhelm Wundt and the literary historian Albert Koster, and his dissertation on *Die Anwendune Der Epitheta Im Tristan Gottfrieds Von Strassburg* was written under the guidance of Professor Eduard Sievers whose revolutionary methods of phonetic analysis continued to influence Pope's subsequent work. At Leipzig he devoted himself as well to the study of the violin—he worked especially under Becker and, later, Duncla—and developed that understanding and enthusiasm for music that was to remain such a characteristic element of his later life.

He was appointed Instructor in German at Cornell University in 1902 and continued throughout his life to teach in that Department. He was promoted to an assistant professorship in 1906, and became Professor of German in 1915. He served repeatedly as Chairman of the Department. On several occasions he returned to Europe, and, in 1913 and 1914 spent a year in Switzerland, Italy and at the University of Munich.

His skill as a teacher of the German language and literature was remarkable from the very beginning, and by his numerous text books (especially his admirable *Einführung ins Deutsche*) he exercised a considerable influence upon modern language instruction throughout the country.

But what above all made him a stimulating figure in the University community was his sensitiveness to every aspect of the intellectual and artistic life. By his own playing of the violin and his lectures on the appreciation of music, he contributed significantly towards the development of an ever wider enthusiasm, particularly for chamber music. He served for several terms on the Music Committee of the University. It was, perhaps, his great admiration for Richard Wagner and his circle that made him proud to insist that he, too, was, in Nietzsche's phrase, *Philologe und Musiker*. Some of his literary studies were devoted to and they were to have been more fully developed in a work

on *Wagner's Debt to Literature*. But Paul Pope was not merely an efficient and beloved teacher. His home became a center of the most congenial fellowship: many of his friends will recall with affection the Sunday afternoons at Overlook Road where it was impossible not to be delighted by Paul Pope's music or impressed by his faith in the vitality of the civilizing values of art and letters which, for him especially, the interplay between American and European life provided.

His summers in Canada gave him an opportunity, not only for boating and canoeing of which he was so fond, but for the development of his interest in Indian languages and relics.

Professor Pope's services to the profession were early recognized: he was a member and frequently an officer of the Modern Language Association of America and of the American Association of the Teachers of German. He helped to found the German honorary society Delta Phi Alpha and continued for many years to function as a national adviser. He was a member of the scholastic honorary societies Phi Beta Kappa and Phi Kappa Phi. During the early years of the second World War he served, after his retirement, on the Cornell staff of the Army Specialized Training Program in German.

His colleagues and students will remember Paul Pope with affection and the University will count him among its distinguished faculty members.

A. L. Andrews, Victor Lange, R. M. Ogden

Joel Porte

November 13, 1933 — June 1, 2006

Joel Porte, Ernest I. White Professor of American Studies and Humane Letters Emeritus, died of esophageal cancer at the age of 72. An internationally renowned scholar of American literature and an Emerson specialist, Joel came to Cornell in 1987. He spent his earlier career at Harvard, where he resigned as Ernest Bernbaum Professor of Literature and Chair of the Department of English to join Cornell as the Frederick J. Whiton Professor of American Literature. From 1989-98, Joel served as Director of American Studies at Cornell. Retired from the faculty in 2004, he received the national Emerson Society's Distinguished Achievement Award in 2006.

Joel Porte earned his Ph.D. degree from Harvard in 1962, when he won the coveted Bowdoin Prize for an essay on Emerson—an award which George Santayana, a favorite author of his, had failed to capture in 1886. At 36, he became one of the youngest full professors in the Department of English. He was a Rockefeller Scholar in Residence in Bellagio, Italy (1979), and a John Simon Guggenheim Fellow (1981-82). He served as a visiting scholar and lecturer around the world; as scholarly consultant for publishing companies, universities, professional associations, and media groups; and on the editorial boards of key academic journals.

Joel's life journey approached that "zigzag line of a hundred tacks" celebrated in Emerson's "Self-Reliance." Beginning in Brooklyn, where he was born to second-generation Russian Jewish immigrants, it led him through an early fascination with amateur radio, which brought him a license to operate station W2YIR; to Brooklyn Technical High School, where he excelled in mechanical drawing and printing technology; and to Cooper Union, where he discovered his lack of interest in an engineering career. While reading on his subway commute, he was moved by a paragraph in Mark Van Doren's, *A Liberal Education*, to devote himself instead to literary study, and he enrolled in night school at Brooklyn College and then in the City College of New York, after presenting himself uninvited to the Registrar.

At C.C.N.Y., from which he graduated *magna cum laude* in English and Classics, he won two Claflin medals for excellence in Greek, the Ward Prize in English Composition, and election to Phi Beta Kappa. Throughout college, he studied the cello with famed teacher Otto Deri, and worked as a runner and office boy at the Atlas Corporation to help support his mother and younger brother. There, he received crucial support from the woman he considered his intellectual "mother," Emilie Dixon. Although he was to travel to Harvard and to Cornell, his outsider status as a young man informed a lifelong generosity to others.

Joel published twelve books as well as introductions, articles, and reviews. His most notable volumes include his literary biography of Emerson, *Representative Man* (Oxford 1979; rev. ed., Columbia 1988); *In Respect to Egotism: Studies in American Romantic Writing* (Cambridge 1991); and *Consciousness and Culture: Emerson and Thoreau Reviewed* (Yale 2004). His edited and co-edited volumes are international standards in the field; they include *Emerson in His Journals* (Belknap/Harvard 1982); the Library of America Emerson (1983); the Cambridge *New Essays on Henry James's Portrait of a Lady* (1990); *The Cambridge Companion to Ralph Waldo Emerson* (1999); and *Emerson's Prose and Poetry: A Norton Critical Edition* (2001). He co-edited the latter two volumes with Professor Sandra Morris of Bucknell University, his former doctoral student at Cornell.

The circuit of Joel's scholarship was large, often expanding and as often returning upon itself. Coming to believe that his early *Emerson and Thoreau: Transcendentalists in Conflict* (Wesleyan 1966) was at once "too polemical and inadequately respectful of Emerson's complexities," he returned in *Representative Man* to write a compendious imaginative biography of the man and, in shorter studies, to insist on the writer's achievement as a literary artist, "in his tropes and *topoi*, his metaphors and verbal wit, in the remarkable consistency of his conceiving mind and executing hand." Having studied the fiction of Cooper, Poe, Hawthorne, Melville and James in *The Romance in America* (Wesleyan 1969), he returned, with *In Respect to Egotism*, to the greater cultural significance of American subjectivity in these figures and in Frederick Douglass, Harriet Beecher Stowe, Walt Whitman and Emily Dickinson. His essays and lectures ranged from the Puritans to Santayana's philosophy, from the poetry of Wallace Stevens to Jewish-American literature, from "Emerson's French Connection: Montaigne, Fénelon, Madame de Staël, and Others" to the history of cereal boxes and the Quaker Oats Man as cultural symbol. On all these subjects he wrote with passion, urbanity, impish humor and wide allusiveness. Only in Joel's writing could Dr. Strangelove and Molly Bloom rub shoulders so comfortably with Thoreau and Isaac Watts; only Joel could find such pleasure and significance in Thoreau's meditations on a mushroom called the *phallus impudicus*—or express such delight at discovering another one in Mann's *Magic Mountain*. The circling went on. In a late essay on Henry Roth's *Call it Sleep*, he remarked that his

"return, as a student of American writing, to the talmud torah of my childhood in the works of Jewish authors required a kind of circling back from the standard canon of American literature to which I devoted myself in graduate school."

Or perhaps not so. His Harvard, his *cheder*, was the same that had nourished

"my quasi-Hebraic masters, Emerson and Thoreau, and that, over the years, would open its doors, willy-nilly, to many Jewish scholars and writers, enabling them (in Emerson's words) 'to translate the world into some particular world of [their] own.'"

In his teaching as in his scholarship, Joel stretched the boundaries of American literature and American Studies. He played a central role in the renaissance of the latter program at Cornell. Appointed director, he swayed the dean to provide resources to enhance the visibility and reach of the program, and within a couple of years American Studies had its own offices and administrative assistant. Along with American Literature and American History, American Government became a “core” discipline within the major—but Joel reached out to faculty in Anthropology, Music, Women’s Studies, ethnic studies, and Industrial and Labor Relations as well, and by the early 1990s, American Studies had become one of the fastest growing undergraduate majors in the College of Arts and Sciences. As a senior hire in English, he anchored the department’s advanced and graduate offerings in early American literature and the American renaissance and offered a popular course in Jewish-American writing. He served on the special committees of numerous graduate students who sought him out, both those whose interests intersected closely with his and those who realized the importance of working with someone who would treat their work with capacious generosity and a skeptical eye. For these students and others, Joel was an intimidatingly learned but benevolent and loyal figure who inspired them with his passions for literature, language, and imagination. He read them poetry in English, Greek, Latin, Italian, French, and German, and amused them with his usually decorous and always graceful jokes. His coworkers remember him as a wonderful friend and deeply dedicated colleague.

They remember, too, his other passions—for life with Helene Sophrin Porte, his wife of twenty years and a senior lecturer in Psychology at Cornell; for cooking and entertaining with her at Whiffletree Farm on Hanshaw Road and then at their home on Mitchell Street; for his daughter, Susanna Maria, child of an earlier marriage to Ilana d’Ancona, which ended in 1977; for the intricate logistics of air travel, which took him and Helene abroad frequently, and to Rome in his last year; and for the life of the mind in Ithaca and Vermont, Cambridge and New York City. They will miss his intellect and humanity, but perhaps most of all, his laughter.

Glenn Altschuler, Edgar Rosenberg, Stuart Davis

Joseph P. Porter

October 9, 1883 — March 1, 1980

Through the many years Cornellians and area residents were privileged to know him, Joseph P. Porter—”Tip” to his colleagues and friends—was recognized at the University and in Ithaca for his humanity, his thoughtful consideration of his students, as well as his genuine interest in wanting to understand and to be of help.

Professor Porter’s association with Cornell continued uninterrupted for over sixty-five years. After receiving a master’s degree in landscape architecture in 1918, Porter spent the next forty years teaching at Cornell and in 1957 retired as professor emeritus.

Porter was noted for his pioneering innovations in landscape design and teaching. While still a student at Cornell, Porter served as draftsman for what is now the Cornell Plantations. After graduation, he began working for Cornell as the first full-time extension teacher in landscape design for New York State. Working in many counties, Porter dealt with the existing poor conditions in residences, farmsteads, and one-room schoolhouses. He spoke to civic groups, schools, and rural churches informing them of changes that were needed to improve living conditions in their areas. Playgrounds and larger schools were advocated and farmers were instructed on new methods for better living conditions.

During eleven years as an extension teacher, Porter became the first Cornellian to give an instructional radio program relative to landscape design, as well as the first to present an educational television program at Cornell.

In 1928 Professor Porter transferred to undergraduate teaching on campus. He was known as an enthusiastic and inspirational teacher and had an unusual ability to awaken in other persons an interest in landscape design. As an adviser he would go that extra step and share personal concerns about courses and career aspirations. His courses were noted for practical field experience, which he expertly incorporated in them. Porter secured the cooperation of the superintendents of several of the local and state parks, and he involved his students in the design of plans as well as their implementation in park construction. Some of their accomplishments include the bridges and the swimming pool found at the foot of Buttermilk Falls. At these locations students worked and had an opportunity to “philosophize.” One of his most noteworthy professional accomplishments was the designing and development of the grounds of Raybrook Hospital, formerly a hospital for tuberculosis patients. He modestly commented that he was asked to design Raybrook’s grounds to encourage the patients to enjoy the out-of-doors. “I agreed to work on the project under the condition that they would let me live in the hospital for seven days as a patient prior to

making any plans. It was the only way I could understand exactly what the patients were feeling and what their needs were. Staying there helped me decide what needed changing,” said Porter.

In 1978 W. Keith Kennedy, then dean of the College of Agriculture and Life Sciences, went to Professor Porter’s home to present him with a scroll honoring his lifelong association with Cornell, first as a student, later a faculty member, then as retired professor. Tip Porter reacted by saying: “This is a wonderful climax of a wonderful story.”

Those of us who are intimately knowledgeable about that “wonderful story” treasure the fond memories of a dedicated, inspiring, very humane Cornell faculty member, Joseph Porter.

Marvin I. Adleman, John G. Seeley, Arthur S. Lieberman

Richard F. Porter

February 8, 1928 — September 1, 1991

Richard F. Porter, our friend and colleague, died in Ithaca on September 1, 1991.

Richard F. Porter was born in Fargo, North Dakota on February 8, 1928. He attended Marquette University, in Milwaukee, graduating with a Bachelor of Science degree in 1951. He received his Ph.D. degree from the University of California, Berkeley, in 1954, having worked under the direction of Professor Leo Brewer. His thesis research was on thermodynamic and spectroscopic properties of high-temperature gas-phase species. Dr. Porter then spent the year 1954-55 as a Postdoctoral Research Associate in the Physics Department of the University of Chicago under the tutelage of Professor Mark Inghram. It was at Chicago, working with Inghram and William Chupka, that Dick began his lifelong association with mass spectrometry, which he applied at first in further studies of the high-temperature gas phase of refractory materials. He joined the Chemistry faculty at Cornell as an Instructor in 1955 and spent the rest of his career with us.

Recognition by his peers came early for Dick. From 1960 to 1964 he was an Alfred P. Sloan Fellow, and in 1964, the year of his promotion to Full Professor at Cornell, he was named a John Simon Guggenheim Fellow. He spent half that year on leave at the laboratories of the National Research Council of Canada, in Ottawa, where he was associated with C.C. Costain (with whom he collaborated on a study by microwave spectroscopy of a cyclic molecule of boron, oxygen, and hydrogen) and with the world-renowned spectroscopist and future Nobel laureate, Gerhard Herzberg. The rest of that year he served as a Visiting Professor at the University of Florida. In the academic year 1970-71, Dick was a NATO Senior Postdoctoral Fellow at the University of Freiburg. He had an appointment as Visiting Collaborator at the Brookhaven National Laboratory (1978-82), where he was associated with the group of L. Friedman, and in 1985 he was appointed Visiting Scientist at the laboratories of the Exxon Research and Engineering Corporation, where he collaborated with a research group headed by his former graduate student, Andrew Kaldor. Dick maintained close contact with both laboratories over the years. He was also a Consultant at the Corning Glass Company.

While Dick was an excellent experimentalist who used the most sophisticated techniques, his primary research goal was the exploration of the basic characteristics of matter. His interests focused on mass spectrometric, electron-diffraction, and spectroscopic studies of gaseous systems at high temperatures. These included thermodynamic studies of vaporization, high-temperature boron chemistry, the photochemistry of boron compounds, and ion-

molecule reactions. His work spanned a broad range of science, as evidenced by his bibliography, which lists 144 articles in 35 different periodicals.

Dick was also a scientific catalyst for others. He co-authored papers with colleagues in the Department of Chemistry and in Cornell's College of Engineering, as well as with faculty members at other universities and with scientists at the laboratories he visited. With Professor Arthur Ruoff of the Department of Materials Science and Engineering in our College of Engineering, he studied the properties of solid ammonia and the ammonium halides under very high pressures, in a search for the onset of metallization. Dick was one of the original members of Cornell's Materials Science Center.

In much of Dick's most recent research he used a new technique he developed, "neutralized ion beam spectroscopy", to prepare and study unstable radicals and metastable states. In this way he undertook very beautiful spectroscopic studies of some of the metastable states of triatomic hydrogen and deuterium. First he produced the singly positively charged triatomic species by the reaction of the diatomic molecule ion with the ordinary neutral diatomic in an ion-molecule reaction, and then allowed the charged triatomic to be neutralized by near-resonant electron transfer from alkali metal atoms. It was from the latter step that the technique derives its name. Before he became too ill to travel, Dick had been planning to spend nine months as a Visiting Scientist at the Institute for Molecular Science in Okazaki, Japan, but, sadly, he was unable to pursue those plans.

Dick was a dedicated and enthusiastic teacher and adviser of undergraduates. As late as July of 1991 he had been looking forward to meeting his class at the end of August, but that was not to be. He was a friend as well as mentor to his graduate students and postdoctoral associates, many of whom will feel the loss all the more keenly because of the close relationships he had established with them. He was a stalwart participant in the Chemistry poker game, where he displayed skills equal to and not altogether different from those he showed in the laboratory. There, too, he is sorely missed.

Professor Porter's first wife, Dolores, whom he had married in 1955, died in 1978 while they were on leave in Brookhaven. They had two children, Patricia and Thomas. In 1983, he married Marjorie Louise Haupin, then an Administrative Supervisor at the Johnson Art Museum, and who, together with his two children, survives him.

In his life as in his science, Dick was a person of absolute integrity. He was modest, straightforward, generous, and kind — a loved and valued colleague and friend.

S.H. Bauer, W.D. Cooke, B. Widom

Kenneth Post

November 24, 1904 — October 25, 1955

Kenneth Post was born November 24, 1904 at Lake Odessa, Michigan and died at the height of his career on October 25, 1955 at Ithaca, New York. He began his professional training at Michigan State College receiving his B.S. in 1927. His Master's degree followed in 1928 from Iowa State College, and his Doctorate from Cornell University in 1937.

Dr. Post's career as an educator began at Iowa State College where he was an assistant in floriculture from 1927-28. In 1928 he returned to Michigan State College where he was the first extension floriculturist in the United States to work with commercial florists. He came to Cornell University as an instructor in floriculture in 1930 and was promoted to Assistant Professor of Floriculture following the receipt of his doctorate in 1938. He was promoted to the position of Associate Professor of Floriculture in 1940 and to Professor of Floriculture in 1946. Dr. Post was appointed Head of the Department of Floriculture and Ornamental Horticulture in September 1955, a position which he held until his death.

The honor societies of Sigma Xi, Phi Kappa Phi, Alpha Zeta and Pi Alpha Xi elected Dr. Post to membership. In the professional societies he was active in the American Society for Horticultural Science, of which he was president in 1940, in the American Society of Plant Physiologists, and in the American Society for the Advancement of Science. He was a charter member of the American Carnation Society, the Chrysanthemum Society of America and the New York State Flower Growers. He was active in the last named organization from its beginning and this close association did much to put into operation the practices which Dr. Post had developed.

Dr. Post's technical papers are to be found mostly in the Proceedings of the American Society for Horticultural Science and in various bulletins published by the Cornell Agricultural Experiment Station. He was particularly successful in popularizing research, and used the florist trade papers throughout the United States and Canada as active instruments in passing on to the practical men the results of technical research. His writing culminated in the publication of "Florist Crop Production and Marketing" in 1949, a book which has been exceptionally successful in interpreting research for the commercial grower. An earlier book, "Plants and Flowers in the Home," published in 1944 is now in its second edition and is standard in that field.

Dr. Post's knowledge of the problems of the florist industry began during college days when he worked in the commercial retailing of flowers. At that time floriculture was considered small business. Through the years

he worked steadfastly and efficiently to solve the production and marketing problems with which the florists' industry was confronted. He was particularly successful in adapting the research done in the basic plant sciences and other fields of horticulture to the problems of the floricultural industry. Thus the response of flower crops to light, daylength, temperature, moisture and nutrients were first tested and then set up on a demonstrational basis. Presented in this way the practices were quickly taken over and used by the practical men. The results of research were further carried to the industry by a timely and effective extension program in which Dr. Post headed a team including representatives of the Departments of Entomology and Plant Pathology.

Some of the outstanding contributions made by Dr. Post are his studies on photoperiodism in various crops, particularly chrysanthemums. Largely as a result of his research and demonstrations and his presentation to the trade, chrysanthemums are now grown the year around as an important commercial crop through the control of daylength and temperature. Other changes in commercial practice growing out of Dr. Post's research include low temperature storage of cut flowers, various automatic devices for watering, and numerous other smaller contributions to labor saving in the growing of florist's crops. Among these the glass wick irrigation of pot plants has received wide use.

Dr. Post was active and influential in obtaining recognition of florist and nursery crops as major agricultural products in the State and Nation and he did much to stimulate the work of others in establishing the industry on a firm basis. He was chiefly responsible for the initiation of the first major study of the economics of the florist industry as a whole. The Cornell system of weight grading of flowers, which is coming into wider use, is largely the work of his research and promotion.

Noteworthy, also, is Dr. Post's success as an organizer. The annual Cornell Short Course for Florists, started in a small way in 1930, is recognized as a function of national importance with a yearly attendance of more than 300 drawn from Maine to California. The New York State Flower Growers, Inc., which developed under his guidance and counsel, has been followed as a model by flower growers in a number of other states. As superintendent of the Flower Department of the New York State Fair, Dr. Post reorganized its program of operation from an almost defunct department to one of dynamic interest backed widely by garden clubs and commercial interests.

Dr. Post's contributions to the florist industry have received wide recognition both in the United States and abroad. In 1953 he was named the First Florist of the Land by the Michigan State Florists Association. In 1952 Dr. Post and one of his graduate students, Dr. Charles W. Fischer, shared the annual award of the Society of American Florists

and Ornamental Horticulturists for the outstanding research of the year for their work on the long term storage of cut flowers. In 1955 one of his graduate students was awarded the first Fulbright scholarship in Floriculture.

As a teacher and particularly as a director of graduate students, Dr. Post was outstandingly successful. Many of those in key positions in the ornamentals field in the colleges and universities of the United States took their degrees at Cornell under his direction. He had the ability to point out and direct problems into channels that would lead to valuable contributions and yet be sufficiently limited to allow the student to complete the project. His success as a teacher and director of research was due in large measure to his outstanding keenness of perception—his ability to see the implications of what he observed, and to his infectious enthusiasm for the object of his interest, whether it be photoperiodism, turkey raising, floricultural economics, or organizing a community center. His students will remember him not only as a stimulating teacher but as a warm personal friend.

Dr. Post was active in church and community affairs. He was an elder of the Presbyterian Church and a Rotarian, and was active in his local community of Ellis Hollow on the outskirts of Ithaca. His untimely death at the age of 50 is mourned by his colleagues, both here and abroad, and by his many friends in the florist industry in the United States and Europe.

A. W. Dimock, L. H. MacDaniels, A. M. S. Pridham

Whiton Powell

September 21, 1903 — June 23, 1980

Whiton “Pete” Powell, retired professor of business management and librarian, died in his sleep at his home in Ithaca on June 23, 1980, at the age of seventy-six. His death terminated nearly sixty years of association with and dedicated service to Cornell University and the Ithaca community. He was actively involved to the end, his death having been discovered when he did not appear for a scheduled Meals-on-Wheels volunteer assignment.

Professor Powell was born in Silver Springs, New York, and attended schools in Buffalo. He entered Cornell in 1920, earned his Bachelor of Arts degree in economics with honors in 1924, and received both a Master of Science degree in 1926 and the Doctor of Philosophy degree in 1929 in the Department of Agricultural Economics, where his major interest was in business management.

Upon completion of his formal graduate studies Dr. Powell accepted a position as assistant professor of accounting at Lehigh University. After one year he moved to Washington, D.C., as an agricultural economist with the newly created Federal Farm Board where he worked on the business analyses of farmer cooperatives.

In 1930 he returned to the Department of Agricultural Economics at Cornell as professor of business management. In this position, he taught courses in accounting, business management, and cooperatives; supervised graduate students; conducted research on the problems of farmer cooperatives; and participated in business management extension programs with agricultural cooperatives and other agribusinesses.

As one of his professorial duties Dr. Powell had served for several years as chairman of the Department of Agricultural Economics library committee. Then in 1944 he became chairman of the joint library committee of the Colleges of Agriculture and Home Economics, an assignment he held until 1952 and one that led to a change in his professional career. It was during this period that Mann Library was being planned and constructed. Professor Powell worked closely with members of the state architect’s staff and played an important role in the designing of the new library.

In 1946, upon the death of Willard Ellis who had served as the College of Agriculture librarian for thirty years, Professor Powell became acting librarian, and in 1947 he was appointed associate librarian of the College of Agriculture. When Mann Library was completed in 1952, Dr. Powell was appointed librarian-in-charge and under his supervision several small libraries were consolidated in the new facility. He was particularly interested in

collection development and under his leadership Mann Library grew from 200,000 volumes at the beginning to 400,000 volumes at the time of his retirement. Mann Library came to be recognized as one of the largest and best libraries of its kind in existence.

In 1961 Professor Powell was appointed assistant director of Cornell University Libraries. In this new capacity he became responsible for the administration of the College of Veterinary Medicine library on the Cornell campus and the New York State Agricultural Experiment Station library in Geneva in addition to Mann Library. In cooperation with the other University library directors, he helped with the coordination of library services and resources on a campus-wide basis. His major objective was to develop a library system that would be of maximum use to students and faculty.

During 1964-65 the Powells spent several months in the Philippines where he served as a consultant and made a survey of the library needs of the University of the Philippines College of Agriculture at Los Banos. As a follow-up in 1967 he returned to assist in preparing plans for a new library building. After his retirement he served as a library consultant to the Asian Vegetable Research and Development Center in Taiwan.

Whiton Powell retired from Cornell on June 30, 1969. The Board of Trustees awarded him the status of professor of business management emeritus. After retirement the Powells continued to live in Ithaca and maintained a keen interest in various University and community projects.

In 1927 Pete Powell married Jeannette Gardiner, a graduate of the College of Home Economics (now Human Ecology). The Powells shared many common interests in the areas of education and community service. For a half century both were active in a host of University and community activities and their mutual support of each other's activities continued until her death in 1978.

It is noteworthy that two educational facilities are named in honor of the Powells. In recognition of Professor Powell's contributions to the organization and operation of Mann Library, the periodical room was named the Whiton Powell Periodical Room in 1969. In 1971 the building that houses nurse's training, business, data processing, child care, and food service classrooms and facilities on the Board of Cooperative Educational Services (BOCES) campus on Warren Road was dedicated as the Jeannette G. Powell Building in honor of her leadership during nine years on the BOCES board, five of which she served as president.

Professor Powell was a member of Rotary, the American Library Association, the Association of College and Research Libraries, Sigma Xi, Gamma Alpha, Alpha Zeta, and Kappa Delta Rho. He was alumni adviser of Kappa

Delta Rho for many years. After retirement he was active in several volunteer community service projects. He developed a special interest in the volunteer surgical service of the Tompkins County Hospital Auxiliary and was contributing his services two days a week at the time of his death. The Powells were avid bridge players, and enthusiastic sailboat racing participants on Skaneateles Lake. Pete had an outstanding stamp collection that had been started by his father, was recognized as an authority on stamps, and frequently was asked to evaluate collections in the area.

Pete Powell had an infectious smile, an ever-present positive outlook on life, an ability to see things realistically and get things done in an orderly and systematic manner, and the faculty of enjoying whatever activity he undertook. His life was dedicated to the service of the University and the community. He and his wife contributed generously of their time, talents, and money for the betterment of humanity. They leave a legacy to Cornell University and the Ithaca community that will continue for many years to come.

The Powells are survived by four children, all of whom are Cornell graduates. They are: Jeannette Davis, Augusta, Maine; Gardiner Powell, St. Charles, Illinois; Andrew Powell, Merrimack, New Hampshire; and Anne Gatti, Shelburne, Vermont. They also leave thirteen grandchildren and three great-grandchildren.

Clifton W. Loomis, Henry T. Murphy, Robert S. Smith, C. Arthur Bratton

Arthur J. Pratt

May 3, 1905 — December 14, 1994

Arthur J. Pratt, Professor Emeritus of Vegetable Crops, was born to Bert and Gertrude Barber Pratt in Norwich, New York. He grew up on a farm that had been cleared and settled by his ancestors in 1810 and attended a one-room school and the Oxford Academy. Art received his B.S. (1926) and Ph.D. (1933) degrees from Cornell University. He retired from the Department of Vegetable Crops in 1962 after thirty years on the faculty.

Much of Dr. Pratt's early career was spent working in vegetables with students of all ages. He co-founded, with Professor Grant Snyder, the National Junior Vegetable Growers Association and was active in it for over seventeen years. He was also active in the Tompkins County 4-H Club and other 4-H groups; and he coached state 4-H teams that many times won national judging, grading, and identification contests. Dr. Pratt also coached collegiate vegetable teams for fifteen years. In 1940, Dr. Pratt was given the Duncan Memorial Award for his outstanding work in encouraging young people to continue their education in marketing vegetables; and in 1963, he received the State Honorary Empire Degree from the Future Farmers of America. Dr. Pratt was a member of the American Potato Association, the American Association of Horticultural Science, and Sigma Xi.

In 1955, Dr. Pratt began teaching a new general horticulture course that had not been taught since the days of Liberty Hyde Bailey. The course—which Dr. Pratt continued to teach until his retirement—covered fruits, flowers, and vegetables. It grew to be popular with students from many parts of the University, as it still is today. Dr. Pratt was recognized by the students in 1962 when they awarded him the Professor of Merit Award from the College of Agriculture.

Dr. Pratt wrote a number of publications on vegetable production, including Victory Garden leaflets and many service letters during World War II. He was author of the book *Gardening Made Easy* in 1955. In 1935, Dr. Pratt was an early developer of the Consumers' Cooperative Society of Ithaca, serving on various committees and as president several times over a forty-year span.

Potato culture was always an interest of Dr. Pratt's, and he did considerable research on effects of irrigation on yield and tuber set. After his retirement, Dr. Pratt spent time growing and testing potato varieties, and he developed the "Pride" potato variety. While working in Ithaca and in Arizona, Dr. Pratt's innovative research on the use of specialized irrigation techniques, spacing, and other cultural practices with peppers resulted in pepper yields that far exceeded what growers were normally achieving. He also did research throughout his career on irrigation,

plastic, and organic mulches for home gardens as well as for commercial vegetable crops. A particular research interest was finding a method to determine when a crop needed water. A common question was, and still is, "What is the best time of day to water vegetables?" His answer, "It makes little difference, just be sure you do it before the crops are damaged." Dr. Pratt liked to put into practice what he had learned from a career of teaching and research. For many years he grew potatoes on Mt. Pleasant, near Ithaca; and from 1968-74, he operated Perry City Farms, growing potatoes and vegetables for local markets and "U-Pick" customers.

His experience in farm operations and research procedures also took Dr. Pratt overseas. He served as a consultant on potatoes to the Tasmanian and Australian Departments of Agriculture, and he taught horticulture at the University of Liberia for more than a year. He taught for nearly two years in Jamaica, West Indies, on a U.S.A.I.D. assignment.

He is survived by his wife of sixty-three years, Terrace Pratt of Ithaca; a son, Dr. David Pratt of Davis, California; a daughter, Jean Washington of San Diego, California, and Thailand; and a daughter, Sarah Davis-King of Oroville, California. Surviving grandchildren are Michael and Bruce Pratt, Brian and Jeff Washington, Brian King, Wendy and Deborah Pratt, Laura Washington, Tamara Pulsts, and Melissa Hillis. Surviving great-grandchildren are David Washington, Amy and Karen Cucuvitch, and Geoff and Brennan Pratt.

Dr. Pratt was a man who enjoyed taking creative approaches to practical, applied problems. He loved his work and gave generously of himself to colleagues, family, and friends. His students kept in touch and visited him over many years. His personal and professional lives were woven together in an harmonious union. He was demanding of himself and tolerant of others; and will be remembered with respect and affection as a person of enterprise, integrity, and always good cheer.

Art thoroughly enjoyed his interaction with young people. Once, during the course of an interview, he was asked whether there was anything he would enjoy after having had a successful career as a teacher, researcher, and professor emeritus. He paused for a moment and simply replied, "I would love to hear from more of my past 4-H Club members and former Cornell students." It was typical of Dr. Pratt's generosity and interest in young people that he and Mrs. Pratt made a substantial contribution to establish the Vegetable Crops Graduate Student Fund endowment. This fund has grown over the years, and many graduate students have benefited from it, just as many young people benefited from knowing him.

W.C. Kelly, R.D. Sweet, L.D. Topoleski, E.E. Ewing

Frederick Clarke Prescott

1871 — July 26, 1957

Frederick Clarke Prescott, Emeritus Professor of English, died on July 26, 1957, at his home in Ithaca after a short illness.

Professor Prescott first attracted notice as an exceptional student at Harvard, and served there briefly as a teacher. In 1897, he came to Cornell to instruct in composition, and continued for nearly thirty years to supervise work in it. He also offered courses and conducted graduate study in a subject considered peripheral in those days—American Literature; and by editing three volumes of selections from the works of Poe, writings during the Revolution, and papers of Hamilton and Jefferson, he helped to bring our own literature to wider attention.

At the outset of his service here, he introduced another novelty, a course in literary criticism centering about the problem of the writer's inspiration; and out of this developed the investigations and publications that absorbed most of his attention for more than thirty years. Though he called his books *Poetry and Dreams*, *The Poetic Mind*, and *Poetry and Myth*, he actually dealt with passages in any medium so long as they had about them a quality of mysticism and revelation—attributes he detected in the prose of Carlyle or Lamb as readily as in verse.

As he portrayed such favorites as Shelley, Wordsworth, and Emerson, they possessed qualities which the ancients had ascribed to their bards. Each was in some measure a prophet, able to capture truths that eluded less agile spirits and to explain his revelations so that others would hear with rapt attention.

Professor Prescott occupied himself with such personages not because of mere personal enjoyment, but because he believed they had value. In his opinion, poets who themselves had made their way through doubt and darkness could furnish guidance to a reader; they could bring his disordered emotions into a harmonious pattern, show him a high-minded view of the future, exercise his imaginative faculties, and thereby prepare him for actions of a high quality. Seldom have writers of vision found a commentator so aware of their deepest intentions or so completely persuaded of their importance.

To know Professor Prescott was to feel that in many respects his character harmonized with his writings. On first acquaintance, he impressed students as the embodiment of their most flattering image of the university professor; gravely dignified in appearance and manner, yet pleasant and with quiet humor; in background a cultivated gentleman; expert in his field, yet continually adding to his knowledge; conversant with both the essentials and the

subtleties of his subject; and uninterested in executive duties, public appearances, and other forms of distraction from study and teaching. Those who came to know him better discovered his unusual powers of conversation: a want of interest in talking about himself or his activities; an ability to see beneath the surface of a topic, so that even his casual comment was unhackneyed; a “high grave impartial summing up,” at once interesting and disinterested; and an occasional sharp racy expression that in one phrase seemed to settle a good deal. His intimates and neighbors saw a still more attractive side: to them, he was the friendly companion, always approachable, ready for a walk or talk, and completely without reserve or assumption. He took special interest in children (who then lived on the campus in considerable numbers), organized and directed Fourth of July festivities, and during a war served as counselor for local boys who volunteered for work in a Maine shipyard. Presently ill health interfered with such activities; yet those who knew him in older days feel that his recorded achievements were only a part of his success, and that an equally important part was an engaging and impressive personality.

W. H. French, B. S. Monroe, W. F. Willcox

Alfred M. S. Pridham

August 12, 1902 — April 20, 1978

Alfred Melville Stewart Pridham, Ph.D., professor emeritus, Cornell University, was born in Toronto, Ontario, Canada, in 1902, the only child of William Stewart Pridham and Emma Charlotte Geddes Pridham. He died April 20, 1978, in his seventy-sixth year.

Professor Pridham did his baccalaureate studies at the Ontario Agricultural College at Guelph, since renamed Guelph University. In 1925 he came to Cornell University for graduate studies and served as an instructor in ornamental horticulture while completing both his Master of Science and Doctor of Philosophy degrees. Thereafter, he was appointed to the faculty and devoted the whole of his career to the study and teaching of ornamental horticulture at Cornell University and throughout New York State. He retired in 1967, having completed forty-two years in continuous service to the University. In that year, the Board of Trustees of the University appointed him professor emeritus.

But one cannot characterize this life with so simple a chronology. His contributions through the years have left an indelible mark on his colleagues and students in ways both personal and professional. Prid, as he was generally known, was vitally interested in students and especially in his advisees. And they in turn respected him. The respect he generated in his students was not drawn from his mastery of registration technicalities, but rather, it grew from his genuine and complete concern for each student as an individual. This concern convinced each of them that they had a real friend and an advocate in their adviser.

Several weeks before his death Prid received a letter from one of his students stating that he had heard he was not well and sending his best wishes. He also thanked him for the profound influence he had had on his life. The student, one of Prid's advisees in the 1950s, now owns and manages a substantial horticultural business in a nearby state. And so it was that as his department colleagues traveled, Prid's former students would ever inquire of them concerning their old friend and mentor.

Prid's empathy for others extended well beyond his students. Nurserymen, faculty colleagues, researchers, administrators, neighbors—Prid took time to be pleasant, helpful, cooperative, involved, and understanding. He was known throughout the University and the state.

Al Pridham, an understanding and dedicated teacher and adviser, also made his mark in horticultural research and extension teaching. From his early work in the 1920s and 1930s with classification of gladiolus varieties and the culture of garden perennials, through his major efforts in nursery crop propagation and management, and in post-World War II years, nursery weed control, Prid was ever in the forefront of the horticultural industries' needs. He moved among nurserymen freely and frequently. He saw at first hand their needs, and he interpreted these needs into research Projects, usually with some of the plots directly on their nurseries. From this research he gleaned the necessary new knowledge that he extended to his industry colleagues.

Of one thing there can be no doubt—Prid was a great horticulturist. He knew plants, and he knew their anatomy, physiology, and practical culture. His contributions of knowledge to the nursery industry and to the horticultural profession drew wide recognition. The *Proceedings of the Northeast Weed Science Society* contain more than fifty articles by Dr. Pridham on defoliant for nursery stock and on weed control in ornamentals and nursery crops. The pages of the *Proceedings of the American Society for Horticultural Science*, *American Nurseryman* magazine, and other horticultural publications contain literally hundreds of his contributions.

Numerous honors came to him in recognition and gratitude from numerous organizations, professional societies, horticultural firms, and students. Among these honors were the Norman J. Colman Award of the American Association of Nurserymen in 1952 for research in nursery work (he was one of only about twenty persons to be so recognized), the certificate of meritorious service of the New York State Arborists' Association in 1955, the Hall of Fame Award of the New York State Nurserymen's Association in 1960 (one of the first group of recipients of the award), the Epsilon Sigma "hi Award of Merit given by his extension colleagues to a devoted extension specialist in 1965, and New York State Arborists' Association life membership in 1967. He also received the highest awards from the New York State chapter of the Men's Garden Club of America and an honorary life membership in the National Shade Tree Conference, now renamed the International Arboriculture Society. He was cited for his work by both the American Horticultural Society and the International Horticulture Congress. In 1969 he was elected a fellow of the American Society for Horticultural Science. Upon his retirement, the New York State Nurserymen's Association established the A. M. S. Pridham Scholarship in the New York State College of Agriculture and Life Sciences at Cornell University, and the New York State Arborists' Association planted a black oak tree on the Cornell University campus in his honor and named their association scholarship fund the Alfred M. S. Pridham Scholarship Fund.

Prid did not look forward to retirement—indeed, he did not enjoy it. But he continued to have concern for others. When physical infirmities required that Al and Alice take up residence in Ithacare, our innovative senior residence, Prid became involved, serving on the Residents' Council and ultimately being elected its vice president. He took considerable interest in Ithacare's grounds management and served as resident horticulturist. During this same time he took an active interest in the newly installed Stewart Park rose garden, dedicated to his good friend, the late Arthur Stallman. Voluntarily he cared for the garden and spent many hours trimming, spraying, weeding, and advising on the care of the roses. He wrote articles about the garden and its development for the newsletters of several rose societies. Annually, he wrote to Mrs. Stallman to give her an enthusiastic progress report.

Upon hearing these remarks about Professor Pridham, the teacher, researcher, horticulturist, one who did not know him might envision him as simply another serious academic. Those of us who knew him well know better. Each of us could easily recount one or more happenings perpetrated by or involving Prid that brought forth smiles, indeed, robust laughter. There were the Pridhamisms, as witty comments came to be known with much affection, for example, "You can tell a dogwood by its bark!" And there are a legion of stories, usually told by former students and colleagues, about Prid's driving; these are invariably told with the mixed emotions of remembered panic and retrospective humor. And there are the mystery beech trees that appeared in the south lawn of Plant Science Building, much to the amazement of the buildings and grounds staff. And there is that rare botanical and automotive hybrid indigenous only to Ithaca but known worldwide as *Pridham dentatum*. The story is probably true that once Prid drove a fleet car to the Syracuse airport and then flew off to a conference somewhere or other, only to return by air several days later directly to Ithaca, leaving the Fleet Garage staff to ponder the whereabouts of their fleet car. Yes, Prid earned yet another distinction in his lifetime—that of the classic absent-minded professor.

And so we pay a final tribute to our colleague, teacher, friend, Cornellian—Alfred Melville Stewart Pridham.

Arthur Bing, George L. Good, Carl F. Gortzig

Dorothy M. Proud

April 10, 1904 — February 8, 1995

Miss Dorothy M. Proud was a native of Indiana, born into a close knit and caring farm family. She received her bachelor's degree from the Flora Stone Mather College of Western Reserve University in Cleveland, Ohio, majoring in Nutrition and Dietetics. After completing her undergraduate degree, she went to the Mayo Clinic to enter a training course for student dietitians.

Upon completion of the program, she was selected for the coveted position of Mayo Foundation Fellow. The fellowship provided her with the opportunity to work with Dr. Barboraka, a physician interested in the field of nutrition, at that time a singular opportunity for a young dietitian. During her time at the Mayo Clinic, Miss Proud was also a graduate student working towards a masters degree in Administrative Dietetics at the University of Minnesota. She received her degree in 1930, one of the early dietitians to obtain the degree, and was uniquely qualified to take her place in the profession.

Western Reserve University invited Miss Proud to return to the University and teach Foods and Nutrition. Following one year of teaching, she was invited to remain at Western University Hospital's Department of Dietetics with an appointment as the Assistant Director of the Department and Director of the Dietetic Internship Program. In the latter role, she was responsible for the planning and supervision of the courses prescribed by the American Dietetic Association for membership in the American Dietetic Association and recognition as a professional dietitian. These courses were taught by the members of the hospital administration and medical and surgical departments as well as the staff of the dietary department.

During her years at Western Reserve, she pioneered the program for dietetic interns to experience the application of the class materials in a planned rotation in the departments and services of the teaching hospital. She trained many of the future leaders who would direct the expansion of programs for dietetic interns in the following years.

Miss Proud joined the faculty of the Department of Institution Management in the College of Home Economics in 1942 as an Extension Specialist in Institution Management in Cornell Cooperative Extension. She was appointed Assistant Professor in 1946 and Associate Professor in 1949.

World War II brought many changes in the area of food and nutrition. To meet these needs, the New York State Food Commission was formed. The poor nutritional status of many migrants prompted the commission to provide

assistance to those living in migrant labor camps throughout the State. Miss Proud held the leadership position in this effort with only a small staff. They provided assistance in nutrition education and in integrating menu-planning, sanitary food service, storage and food purchasing in order to better the living conditions and health of the people. The day care centers in the labor camps were also a responsibility of the staff. Ration books were a way of life during the war years. Miss Proud and her staff went into factories and other work places to teach the use of the books and substitutes for rationed foods which might be available.

Miss Proud was a pioneer in the concept of a specialist in institution management in Cooperative Extension. At the end of the war, it was her assignment to provide help to community kitchens, located in churches, grange halls and summer camps. She was involved in planning the remodeling of buildings and facilities, the selection of food service equipment and efficient organization of the equipment. She developed both printed materials and visual aids to enhance the program. Many states requested her publications and her work received high acclaim. She later expanded her work to facilities for the school lunch program and the particular needs of nursing home kitchens. In 1969, Miss Proud received an award from the American Association of Home Appliance Manufacturers recognizing her use of technical knowledge in the development of educational programs.

During 1954 and 1955, Miss Proud participated in the AID program at Los Banos in the Philippines. She spent sabbatical leaves at the University of Wisconsin and the University of Washington, pursuing additional course work and research on facilities for quantity food preparation.

Miss Proud was a member of the American Dietetic Association, both State and local chapters, and the American Home Economics Association. She was active in community organizations, especially the Unitarian Church and the League of Women Voters. Programs for women and children were her primary concern. She was a strong supporter of the Women's Studies Program. Her home was open to many graduate students and new staff members and holidays were shared with students who were in Ithaca, including many foreign students.

Following her retirement, Miss Proud continued to maintain her home in Ithaca where she remained active in community affairs. She also traveled extensively. In 1980, she moved to Seattle to be nearer her family.

Many organizations benefited from Miss Proud's generosity. She endowed the Dorothy M. Proud Lectureship in the Division of Nutritional Sciences to bring outstanding members of the dietetics profession to Cornell to enrich the dietetics program. Many young dietitians learned the fundamentals of their profession from her and observed a professional with a strong work ethic and an understanding of the importance of integrity.

Gertrude Armbruster, Bernice Hopkins

Laurence Pumpelly

July 4, 1881 — March 14, 1954

Laurence Pumpelly had his roots deep in our own soil. He was born in Owego, N. Y., the son of Mr. and Mrs. James F. Pumpelly. His family, which numbers many distinguished members, had been established in Owego since the eighteenth century. He was educated at the Owego Free Academy and at Williams College, where he received the degree of A.B. in 1902. He took graduate work in chemistry at Cornell and at the University of Strasbourg, which awarded him the degree of Ph.D. (in Chemistry and Physics) in 1907. In 1909 he was appointed Assistant in Chemistry at Cornell. His tastes turning rather to language and literature than to science, he spent a year in study at the Sorbonne, and returned to Cornell as Instructor in Romance Languages in 1911. He became Assistant Professor in 1914 and Professor in 1923. He retired as Professor Emeritus in 1946, after thirty-seven years of service to Cornell.

During the First World War he was attached to the American Red Cross in Paris. In 1919 he was secretary-interpreter of the Red Cross Commission which visited the ravaged countries of eastern Europe. The Serbian government recognized his valuable aid by decorating him with the Order of Saint Sava. Deeply interested in the work of the American Field Service, he was concerned for years with the awarding of its scholarships for foreign study.

He married in 1921 Mile. Jeanne Pataud of Paris, who survives him. Their home was for many years a charming center of social life.

A brilliant, inspiring, and devoted teacher in both his introductory and his advanced courses, he was beloved by generations of students of French and Italian. His *French Reader for Beginners*, published in 1926, is still a standard text in its field. A linguist of unusual range, he was able to draw on his wide knowledge of Romance, Germanic, and Slavic languages in illustration of his special subject, Romance Philology; and his lectures on French Historical Grammar, which he was often urged to publish, were a model of clear and precise presentation. The French Government rewarded his long devotion to the cause of French culture by making him a Chevalier de la Legion d'Honneur. He served several terms as Chairman of his Department, as Chairman of the Underclass Advisory Board, and, over a long period of years, he was an invaluable member of the University Committee on Music.

Professor Pumpelly represented an attitude toward scholarship and life which seems rarer now than in the past. He sought and found delight in learning; he was convinced that the purpose of scholarship is to adorn and illuminate life as well as to serve social and professional ends. His humane spirit lives on in that of many students who were inspired by his example.

M. G. Bishop, Harry Caplan, M. L. W. Laistner

Mary E. Purchase

February 17, 1921 — March 6, 1990

Mary Purchase was a member of the Cornell faculty for twenty-eight years prior to her retirement in 1986. She came to Cornell in 1945 as a graduate student in chemistry, having earned the bachelor's degree from Eastern Michigan University in education and mathematics. After completing her masters degree, she was an instructor for three years in the Department of Household Economics and Management in the College of Home Economics. In 1951, she left Cornell to study and teach at Iowa State University, where she earned the Ph.D. degree in household equipment and chemistry in 1957.

After teaching in the Department of Home Management at the University of Tennessee for four years, she returned to Cornell in 1961 as an associate professor in the Department of Household Economics and Management. Upon the college's reorganization in 1969, she became a member of the faculty of the Department of Design and Environmental Analysis in the College of Human Ecology, where she served as graduate faculty representative and department extension leader. In 1973, Dr. Purchase was named professor. With the 1985 reorganization, Professor Purchase became a member of the Department of Textiles and Apparel and was named professor emerita the following year.

As a chemist and home economist, Mary Purchase used her scientific training in research, teaching, and extension in the interests of individuals and families. She was nationally known for her work in household equipment, detergency (particularly related to the phosphate ban), child-guard safety packaging of household products, consumer use of microwave ovens, metrication, and energy use. Teaching materials she developed provided sound and timely information to consumers on widely diverse topics, with particular attention to environmental issues and consumer products. Joint work with business and industry produced voluntary standards and educational materials.

Mary Purchase was active throughout her career on a variety of industry panels and boards. She was named to the Major Appliance Consumer Action Panel at its formation in 1970. This panel, composed of independent consumer specialists, represented consumers at the highest level in the appliance industry. She was also a member of the Technical Advisory Committee on Poison Prevention Packaging (Consumer Product Safety Division), the Evaluation Panel for the Center for Consumer Product Technology (National Bureau of Standards), and the Consumer Advisory Council of Underwriters' Laboratories.

She contributed to the profession of home economics in a wide variety of activities. She held district, state, and national offices in the American Home Economics Association and also served as a member of the editorial board of *Home Economics Research Journal*. She was also a member of the American Chemical Society, the American Association of Textile Chemists and Colorists, the American Association of University Professors, the American Association for the Advancement of Science, Omicron Nu, Sigma Delta Epsilon, Phi Kappa Phi, and the Society of Sigma Xi.

Recognition of Mary Purchase's achievements has taken several forms. In 1971, she was named a distinguished alumna of Iowa State University. In 1972, she received the Pacesetter Award for colleges, universities and research, given by the New York State Home Economics Association. In 1973, the Major Appliance Consumer Action Panel recognized her work in consumer education on appliance energy conservation. The American Home Economics Association named her one of 75 outstanding leaders in the profession in 1984. She was awarded the ASTM Award of Merit in 1986 and was named a fellow of the society, "in recognition of exceptional leadership, acute technical and editorial insights, and for diplomatic recommendations that brought together opposing points of view."

Colleagues, former students, and friends knew Professor Purchase for her scholarship, integrity, intellectual honesty and commitment. She demanded excellence of herself and stimulated her students to raise their own professional standards. For many she was a mentor in the development of their professional careers. She was active on many college and university committees, e.g. the University Academic Integrity Appeals Board, the Review and Procedures Committee, and the College Education Policies Committee.

Her interest in service to people was exemplified by her sabbatical leave in the developing countries of Sudan and Malawi in Africa. In the Sudan she taught home management at Ahfad University College in Khartoum and visited in both urban and villages homes to observe homemaking work and equipment. In Malawi she visited Chancellor College in Zomba where her work involved helping with a new design of a washing slab, and experimenting with insulated cookers and charcoal coolers, as well as lecturing in textiles and housing classes. She felt that there was much that home economists can do in developing countries to make life somewhat easier for women. She had hoped to continue her international work after retirement, but illness prevented such service.

Locally, she was a long time, active member of St. Paul's United Methodist Church where she served as lay leader and in a variety of leadership roles including Nominations, Council on Ministries, Administrative Board, and Finance. She was a member of the board of directors of the Wesley Foundation. Mary motivated others to become active in the church. She received strength from her faith and was respected by both clergy and laity. In addition to

the church, she was a member of the Cayuga Trails Club, participating actively in building and maintaining trails. She had a lifetime interest in sports and outdoor activities.

Professor Purchase had a deep commitment to home economics and human ecology. All of her activities and pursuits had a strong concern for human and social consequences. As the New York State Home Economics Association noted in presenting her with the Pacesetter Award, she was “a champion for consumers” and had “the gift of giving untiringly to her profession, to her job and to people.”

Betty Lewis, Mary Morrison, S. Kay Obendorf

Deborah Rabinowitz

September 9, 1947 — August 18, 1987

Deborah Rabinowitz was born in Willimantic, Connecticut. She grew up in Willimantic, attending the public schools there. Deborah received an undergraduate degree in biology from New College (Florida) and a Ph.D. in theoretical population biology from the University of Chicago in 1975. She then accepted a faculty position at the University of Michigan where she became the first woman faculty member in the Department of Ecology and Evolutionary Biology. In 1982 we persuaded Deborah to accept a tenured faculty position at Cornell in the Section of Ecology and Systematics within the Division of Biological Sciences, where she prospered until her death in August, 1987.

Although Deborah had only twelve years between her Ph.D. degree and her death at the age of thirty-nine, she made substantial contributions to the general field of plant population biology. By far her most significant contribution is to our understanding of why some kinds of plants are so much less common than others. The question of differences in species abundances has had a long history of interest in ecology, but Deborah brought to it a fresh and highly original approach. In 1981 she published a landmark paper in which she described seven different meanings of the concept of “rarity”. Deborah’s seven senses of rarity helped to eliminate confusion and fuzzy thinking in the literature. Deborah also published the results of empirical and experimental studies that helped our understanding of rarity in particular plant species. She recently, for example, used the well studied British flora as a case study with which to examine her seven concepts of rarity. Interestingly, she found that the least frequent kind of rarity was not what most of us think, namely endemic plants that have narrow geographical ranges and specialized habitat requirements. Instead, based on the plants of the British Isles, the least frequent kind of rarity is the class of sparse species which have large geographical ranges, occur in many habitat types, but which have small population sizes in any given habitat.

On the personal side Deborah was special in many ways. It is clear that she was an important role model for women scientists at Cornell, at the University of Michigan, and more generally within the Ecological Society of America. Both her scholarship and personal style were considered worthy of emulation. She was broad-minded and generous in sharing her insights and in encouraging others, especially women scientists. Her office and laboratory — which usually contained fresh flowers in elegant vases — had an air of organized productivity and clean, clear thinking amidst warmth and gentility. Deborah also had strong interests in international politics and was active at Cornell

in demonstrations, workshops, and other efforts to try to make the world, notably South Africa and Nicaragua, a more humane place. Those of us around Deborah since her cancer was diagnosed saw another dimension of her specialness: the strength of character and the grace that she maintained to the end. Deborah struck a balance: on the one hand, she seldom raised the issue of her sickness, permitting normal professional business and personal relationships to be maintained without awkwardness and without people feeling sorry for her; on the other hand, she talked freely and openly about her condition when asked.

Two anecdotes underscore these points. The first involves a faculty colleague of Deborah's. She and this colleague had served together for a couple of years on the curriculum committee of the Division of Biological Sciences, and their committee had many long meetings during this time, as there are few issues that faculties spend more time discussing than revisions of curriculum. Upon learning that Deborah had died of cancer, her colleague remarked that he hadn't even known that Deborah had been sick, so "normally" had she carried out her duties as a committee member and colleague. The second story is best known to those of us who shared Corson Hall with Deborah. In encountering her in the hallway in the last years, we would invariably be greeted with "How are you?" when it was we who should have been asking the same of Deborah. She asked about us before we could ask about her not because she was unwilling or unable to talk about herself, but because she had always been genuinely interested in her many friends and she saw no reason to change on account of her sickness. In maintaining her grace and humanity to the end, Deborah taught us all something about how to "live" with cancer, to borrow Jack Lewis' apt phrase.

Jonathan Silvertown, a British plant ecologist and one of Deborah's many international colleagues, expressed what many of us felt:

"To apply Deborah's classification to herself: her geographical range was broad (USA, Britain, Panama, Peru), she worked in several habitats (mangroves, prairie, agroecosystems), and she possessed a combination of qualities that are nowhere common. She was among the rarest of the rare."

Deborah is survived by her husband, Peter Ewel; her mother, Margaret Rabinowitz; and her sister, Margaret Russo.

Barbara L. Bedford, Peter L. Marks, Robert E. Cook

Isaac Rabinowitz

July 3, 1909 — September 11, 1988

Isaac Rabinowitz, the son of Bezalel and Lily Garowitz Rabinowitz, was born in Brooklyn, New York, and raised in Kansas City, Missouri. As a young boy, he was fortunate to receive excellent initial instruction in Hebrew. He subsequently embarked on an intellectual quest to resolve certain puzzling features of the Hebrew Bible, a quest that led him first to the University of California at Berkeley (B.A. in Greek, 1929), and then to Yale University (Ph.D. in Semitic Languages and Literatures, 1932), where he wrote a dissertation entitled, *The Syriac Versions of Tobit*.

At the time that Isaac received his Ph.D., the cultural climate in the United States made it exceedingly difficult for a Jewish scholar of Semitics to find an academic position. Isaac therefore turned his attention to Jewish education and communal service. Between 1933 and 1955, he held the following positions: counselor to Jewish students at Yale University (1933-34); director of youth education for the Union of American Hebrew Congregations (1935-38); Hillel director at the University of Michigan (1938-40), Brooklyn College (1940-44), and the University of Pennsylvania (1944-45), respectively; national director of B'nai B'rith Boys' Work (1945-46); and executive director of the East New York and Brownsville Young Men's and Women's Hebrew Associations (1946-1955). This work testifies to his life-long commitment to Jewish education and culture.

In 1940, soon after becoming Hillel director at Brooklyn College, Isaac met Alice Elson. The two worked together professionally for four years at Brooklyn College and later for the B'nai B'rith Youth Organization, where Alice served as national director of Girls' Work. Isaac and Alice married in September of 1946. Their thirty-nine years of marriage were filled with mutual love, devotion, and respect.

Although the academy had yet to open its doors to him, Isaac never abandoned scholarship. During the twenty-three years that he was engaged in the field of Jewish education and communal service, he pursued his academic interests with single-minded determination, finding time to conduct his research at night and on the weekend. When the Dead Sea Scrolls were discovered in the 1940s, Isaac was attracted to their potential for shedding light on the meaning of the Hebrew Bible. He took a special interest in the *Peshar*-texts, generally considered as commentaries, but which Isaac viewed as presagings of the holy words in the scriptural books to which they referred. His impressive record of scholarly publications enabled him to attain an academic position in 1955, when he was appointed associate professor of Jewish studies at Wayne State University.

Two years later, Isaac was appointed professor of Biblical and Hebrew studies at Cornell, where he became instrumental in establishing the Department of Semitic Languages and Literatures. He served as chairperson of that department from its inception in 1965 until 1970. At Cornell, Isaac regularly taught introductory and advanced courses in Biblical Hebrew in addition to occasional offerings in Aramaic, Syriac, and post-Biblical Hebrew literature. His most popular undergraduate course was “The Literature of Ancient Israel,” a year-long survey that attracted a wide range of students representing many departments in the College of Arts and Sciences.

Upon his arrival at Cornell in 1957, Isaac met Harry Caplan of the classics department, and the two became the closest of friends—true intellectual companions. It was at Caplan’s suggestion that Isaac began his translation of the *Sepher Nopheth Suphim* (*Book of the Honeycomb’s Flow*) by the Jewish-Italian Renaissance scholar, Judah Messer Leon. The *Nopeth Suphim* was the first attempt to write a classical rhetoric using examples drawn from the Hebrew Bible; it was also the first Hebrew book printed during its author’s lifetime. For more than twenty years, Isaac labored over this text, producing a Hebrew edition and annotated translation with a full critical apparatus. Published by the Cornell University Press in 1983, this massive tome has been widely and justly praised by its many reviewers as an exquisite example of meticulous textual scholarship and literary-historical insight.

Before his death, Isaac had completed a monograph entitled *A Witness Forever: Ancient Israel’s Perception of Literature and the Resultant Hebrew Bible*. In this seminal study, the originality of his scholarly vision emerges most clearly. Seeking to answer the question, “How were language and literature perceived in the culture that produced the Hebrew Scriptures?”, Isaac scrutinized the text of the Bible for clues that might shed light on what the scribes who wrote and edited the biblical texts believed about the nature and function of language and literature. On the basis of this investigation, Isaac developed a theory explaining the literary unity of the Hebrew Scriptures as they were understood by the men who assembled them. The key to this unity was the ancient Israelites’ conception of the nature and function of the “holy word” (*davar*) and their belief that the utterance of words created the phenomenal and physical realities represented by those words.

Though the quality and range of his scholarly writing is extraordinary, Isaac did not measure success in terms of the number of articles written or the number of books published. His inquisitive mind was driven by an intellectual hunger which valued knowledge and interpersonal fellowship as much as professional stature. Academic life, for him, was a lifelong process of wonderment and shared discovery—a process in which he was engaged with his students, his colleagues, and his readers. He was never too busy or preoccupied to listen, advise, read, or critique. With his younger colleagues he was ever the teacher, genuinely interested in questions and ideas, exacting in his

expectations, and gentle in his manner of imparting knowledge and communicating criticism. He was himself always the student, absorbed in learning something new, for no avenue of critical inquiry, no discipline or historical period was beyond the range of his curiosity and interests. By his splendid example, Isaac taught us how noble the career of the scholar could be.

By emphasizing Isaac's career as a teacher and scholar, we do not mean to diminish other aspects of his remarkable life. He was a loving husband, a caring father, a warm friend, and a true gentleman. He was also a talented athlete who was widely known and admired by his many friends at Teagle Hall, where for over thirty years he swam regularly.

The death of his beloved Alice in 1985 cast a pall from which Isaac never fully recovered. During the last years of his life he frequently spoke of the importance of the support and inspiration he had received from her. Isaac is survived by a brother, W. Gerson Rabinowitz of Berkeley, California; a son, Joel Bezalel Rabinowitz of Ithaca; two daughters—Susanna Rubenstein of Brooklyn, New York, and Abigail Geman of Amherst, Massachusetts; and seven grandchildren.

We will remember Isaac Rabinowitz as a warm, generous man and a consummate teacher who constantly strove to attain the very highest standards in his interpersonal relations and scholarship. His life's journey was a true intellectual quest, for Isaac was always propelled by a passionate search for knowledge and insight. May his memory be for a blessing.

Ross Brann, Steven Katz, David Powers

Alexius Rachun

November 10, 1911 — October 20, 1990

Alexius Rachun was a professor of clinical medicine and a member of the staff of the University Health Services and the team physician for the university for thirty-one years before his retirement in 1978, when he became professor emeritus.

Alex was born in Brockton, Massachusetts of Lithuanian parentage. As a child he learned the Lithuanian language and became skilled in his ancestral folk dances, which he delighted in teaching to his younger sisters and a multitude of neighborhood children. He was always interested in athletics and participated actively in a variety of sports from his days in high school when he was the boxing champion of the school, to his later years, which featured a hole-in-one achieved at the Country Club of Ithaca in 1979.

His father died when Alex was 18, and as an elder brother Alex helped to provide for his father's absence. About that time, however, he was one of a number of the students in his high school who were selected for testing by a psychologist who was doing a study in the school system. The fellow found Al's performance so amazing that he called the school authorities to urge that Al be persuaded to go to college to study either journalism or medicine (rather odd alternatives, it would seem). No one in Alex's family had ever attended college, and funds were not easy to come by, but family and friends rallied around and contributed to make his education possible. He graduated from New York University with a bachelor's degree in 1936 and from the Long Island College of Medicine (now the SUNY Downstate Medical School) in 1940.

During these years he continued his imaginative extracurricular pursuits. He continued his love of dancing and performed occasionally on the stage in New York City, most memorably at the World's Fair of 1939. During summers he and a friend toured the Borscht Circuit in the Catskills as magicians and sleight-of-hand artists. On other occasions he sought adventure in travel, sometimes by prolonged bicycle trips and occasionally by "riding the rods" of freight trains.

Upon completing his internship at Brooklyn's Cumberland Hospital in 1942, Alex was commissioned as a First Lieutenant in the Medical Corps of the United States Navy and was assigned as a battalion surgeon with the First Beach Battalion from 1942 to 1946. This was harrowing duty as the unit participated in landings in Africa and, more particularly, in Italy, where at one point at Anzio he spent 17 consecutive days in a foxhole. He was discharged as Lt. Comdr. MC USNR.

Following his naval service, Alex took another year of residency at the Lowell General Hospital. He came to Ithaca to inquire about the possibility of establishing a general practice in town. He talked to Norm Moore who convinced him to join the University Health Services with the intent of developing a program in athletic medicine. Although this was not a field with which Alex was familiar, he learned quickly, largely on his own for this was not yet a specialty with any depth of clinical or scientific expertise. He immersed himself deeply in his work, seeking out consultants who could provide him with instruction and attending an eclectic series of post-graduate courses that would round out his skills in this new area of specialization. He gradually became a leader in the field.

He published several papers on sports injuries in various medical journals and was a frequent speaker at meetings and teaching sessions all over the country. He was recognized for his skills by his appointment to AMA's Committee on the Medical Aspects of Sports and he became the first chairman of its subcommittee on the classification of sports injuries. He was a founder and the first chairman of the Athletic Medicine section of the American College Health Association. For many years he led the teaching sessions on sports injuries that he originated for the annual meetings of the ACHA. These sessions continue to this day and are now entitled the Alexius Rachun Teaching Conferences.

And during all these years Alex continued as the team physician for the football and other sports teams at Cornell. In this role he not only made full use of his diagnostic and therapeutic skills, but he had a significant impact on many of the athletes far beyond their clinical or orthopedic problems. Bob Kane was always impressed with how the athletes would flock around Alex, particularly on road trips, to hear words of wisdom and even guidance from this kindly master. Indeed, a number of former athletes later expressed their thanks to Alex for guiding them to careers in medicine.

In spite of Alex's sincere dedication to the well-being of his charges, it wasn't always deadly serious. His sly sense of humor was always just below the surface. Old timers recall the occasion of his dead-pan announcement to the football players and staff before an important game that he was going to replace the usual pregame steak breakfast with an intravenous meal of cabbage soup. This is hard to believe now, but apparently the proposal was convincing enough so that some alarmed parents called the higher authorities of the university to find out what kind of foolishness that crazy doctor was up to now.

Upon retirement from the university, Alex joined the staff of the emergency department of the Tompkins Community Hospital and provided a valuable service to the community in this role for three years. He then filled the position as medical director of the Reconstruction Home until 1989.

Alex was a delightful and remarkable man. An absolutely straight shooter. Crusty but tender. Serious but with a light touch. Dedicated but with a broad perspective. A most natural and complete physician, who established an instant rapport with his patients, whether they were sturdy athletes or frightened young women or frail and confused senior citizens.

He leaves behind his wife, Addie, whom he met on a golf course fifty years ago and married shortly thereafter; his son, Alexander, of Trumansburg; two daughters, Priscilla Rachun Linn, of Arlington, Virginia and Elizabeth Maria Rachun, of Ames, Iowa; a brother; two sisters; five grandchildren; and numerous nieces and nephews. He also leaves behind a host of neighborhood children, for whom he was a favorite and most revered story teller.

Norman S. Moore, W. Jack Lewis, Allyn B. Ley

Efraim Racker

June 28, 1913 — September 9, 1991

Efraim Racker came to Cornell in 1966 as Albert Einstein Professor (one of six awarded by the State of New York) and Chairman of the Section of Biochemistry in the newly created Division of Biological Sciences. He was a key figure in the expansion of the Section at that time, bringing with him eight younger colleagues as faculty members. His brilliant research, and concern for developing a strong graduate research program for the Section were instrumental in setting the pattern for the breadth and strength Biochemistry (now Biochemistry, Molecular and Cell Biology) enjoys today. An example of Ef's efforts to strengthen the biochemistry graduate program at Cornell led him to hold an evening seminar program in which each student spoke on his own research. For the first ten years, or so, Ef only occasionally allowed other faculty members to attend and he constantly interrupted the students with questions about the presentation or research. The seminars are still held, now with all faculty invited but the primary advisor not allowed to speak, and are known as the Racker Seminars.

Ef Racker was born in Neu Sandez, Poland, and grew up in Vienna. He had natural artistic talent, and almost went to Art School. Instead, he decided on Medical School for his advanced training, graduating in 1938. Biochemistry, brain function and art had become major interests, and remained so for the rest of his life. He escaped to England as the Nazis moved in, and began work on energy metabolism of the brain at the Cardiff Mental Hospital. In 1941 he moved to the United States. After short stays at the University of Minnesota, and Harlem Hospital in New York City, he worked for eight years (as Instructor, then Assistant Professor of Microbiology) at the NYU School of Medicine. There he pursued his interest in energy metabolism and made the seminal discovery of a thioester high energy intermediate, a bond previously unknown in biology. During a short period at the Yale University School of Medicine he discovered the enzyme, transketolase. For the next twelve years he was Chief of the Division of Nutrition and Physiology at the Public Health Research Institute of the City of New York. During that time he mounted large programs dealing with the nature of mitochondrial oxidative phosphorylation, and control of energy metabolism in cancer cells. He discovered the enzyme of mitochondria responsible for making ATP (called F₁), and isolated several of its functional subunits. After moving to Cornell he developed and refined methods for tearing apart the membranes that accomplish oxidative phosphorylation, then putting their pieces back together in small lipid vesicles to restore the original activity. This resolution and reconstitution approach to understand the function of membrane enzymes was one of the most important contributions of Efs career, opening up an enormous field of research for others to follow and revolutionizing the field of membrane biochemistry. Ef worked

at the lab bench throughout his career, and a particularly dramatic experiment he did himself was the incorporation of bacteriorhodopsin, a bacterial proton pump driven by light, together with ATP synthase from beef hearts to form a chemiosmotic chimera, which used energy of light absorbed by the bacteriorhodopsin to synthesize ATP on the beef heart enzyme. This work is often cited as the final evidence supporting the chemiosmotic theory of energy coupling. Later, he returned to the study of the biochemical basis of cancerous growth. He had long emphasized that ATPase is necessary for glycolysis and proposed that in many transformed cells the high glycolytic rate is caused by an aberrant ATPase that normally transports sodium and potassium ions. He was studying the probable role of protein kinases in such a pathway when he died.

During his career Ef published about 500 research papers. In 1965 he wrote an advanced text titled *Mechanism in Bioenergetics* and then wrote completely new texts in this area in 1976 and 1985. He received numerous honors, including the National Medal of Science, honorary degrees from the Universities of Chicago and Rochester, and was elected to the National Academy of Sciences in 1966. He was a prolific reviewer of grant applications, and a tremendous advocate for bright young scientists. He was concerned about public understanding of the importance of science, and in 1979 wrote a collection of essays in support of basic research titled *Science and the Cure of Diseases: Letters to Members of Congress*. He had a passion for hearing about new advances in science, and kept abreast of many areas. Ef admired good critical thinking, and was not very tolerant of that which he considered sloppy reasoning; he was known for almost always asking the first, and usually the most penetrating questions, at seminars that he attended. He had many students, postdoctoral associates and visiting scientists in his laboratory over the years; but never ceased to work at the bench himself (including the very last day, at the end of which he was overcome with a fatal stroke).

There were many other facets to Ef Racker's life, besides a total dedication to good science. He had a warm, supportive family life and was a wonderful husband, father and grandfather. With sterling help from his wife, Franziska Racker, their house was the site of ever flowing hospitality for lab members and visiting friends, most often other scientists. Ef and Francis both formed deep friendships with scientists and artists from all over the world. He had a rich sense of humor, and was a source for many stories. Ef enjoyed physical activity, and was an ardent (and competitive) tennis and squash player for as long as he was able. But above all Ef remained an artist. He would work late at the laboratory, come home, have dinner, and paint for the rest of the evening. He had several, usually Impressionist derived styles, and was amazingly prolific. Many paintings were sold in benefit sales, including the Edsall fund, a fund used for interest-free short term loans to graduate students and postdocs

in the Section. Many other paintings were gifts to departing students or visiting colleagues. Prior to a student's leaving, there was a small ceremony in which a choice had to be made between about 50 paintings available at that particular moment. There are Ef Racker paintings all over the world, in scientific institutions and in the homes of scientists. Together with the monumental scientific output, they will help keep his memory warm for all who knew him.

Andre T. Jagendorf, June Fessenden MacDonald, Peter C. Hinkle

Edgar Merrow Raffensperger

June 13, 1926 — May 2, 2003

Edgar Merrow Raffensperger, Professor Emeritus of Entomology passed away suddenly and peacefully at the home of his daughter, Catharine, in Urbandale, Iowa on May 2, 2003.

Ed was born and grew up in Gettysburg, Pennsylvania where in 1944 he volunteered for the U.S. Navy and served until the end of World War II. He attended Gettysburg College and later transferred to Pennsylvania State University where he earned a Bachelor of Science degree. He went on to earn his Doctorate in Entomology from the University of Wisconsin in 1955. Ed's career as an outstanding college teacher began when he was appointed as Assistant Professor at Virginia Polytechnic Institute in 1955. After six years on the VPI faculty, he joined the Cornell University Faculty of Entomology as Associate Professor and was promoted to full Professor in 1977.

Professor Raffensperger had an outstanding dedication to teaching and the excellence of his teaching achievements made him a nominee for the Edgerton Career Teaching Award. Ed received this award in 1991. His teaching excellence was also recognized as he received the SUNY Chancellor's Award for Excellence in Teaching in 1989, and the Award of Merit for Innovative Teaching in 1988 from the Cornell chapter of Gamma Sigma Delta. Ed taught two major undergraduate courses, Applied Entomology and Cultural Entomology. The course "Cultural Entomology" was a pioneering course (the first in the U.S.) in integrating entomology with the cultural history and problems of mankind, and served as the model for similar courses across the U.S.

While the Edgerton Award is specifically for teaching, Dr. Raffensperger was also considerably involved in research and extension. He was a recognized authority on household insects, in particular the control of the extremely pestiferous cluster fly.

Ed was a member of the faculty in the College of Agriculture and Life Sciences for 26 years. His top priority during this entire period was teaching and advising. His commitment to excellence was demonstrated in the way he conducted his lectures and laboratories and his innovative approaches to his subject matter. He used all of the new technology: computers, video, and graphics in his presentations. Interest was created also by his marvelous blend of stories, insect coffee cups, pictures, songs, sounds, etc.

Ed took his role as an adviser most seriously. He sought out the students with the biggest problems and, over the years, troubled students sought him out on the basis of his reputation for helpfulness. Ed was often invited by

Cornell coaches to talk to their athletes about how to improve their study habits. Many Cornellians, when they reflect back on their years in Ithaca, recall how Ed's concern and patience helped them.

Teaching material also was developed from international experience obtained during his sabbatical leaves. During 1968-69, he was a Visiting Scientist working in the Norwegian Agricultural Research Service and in 1985 he taught at Egerton College in Kenya, East Africa.

Ed was an all around guy. He enjoyed a good song and was an enthusiastic member of the City Club of Ithaca where his baritone harmony was enjoyed by all at the weekly Club meetings. He was a fly fisherman, a photographer, a gardener and a hunter and enjoyed all of the challenges.

Edgar Merrow Raffensperger was predeceased by his wife of 45 years, Shirley, who died in 1999. His daughter, Catharine of Urbandale, Iowa; sons, Thomas of Randolph, Vermont and Andrew of Rehrersburg, Pennsylvania; and five grandchildren, Andrea, Katya, Ian, Aiden and Katie, survive him. His sister, Anne of Gettysburg, Pennsylvania, also survives him.

Richard Root, Donald Rutz, Arthur Muka

Otto Rahn

April 9, 1881 — September 26, 1957

Dr. Otto Rahn served as Professor of Bacteriology at Cornell University from 1927 until 1949. In those 22 years, Dr. Rahn endeared himself to a large group of undergraduate and graduate students.

He was born in Tiegenhof in the Province of West Prussia between the cities of Danzig and Elbing in 1881. He was third of eleven children, son of Isbrand Rahn, a Mennonite storekeeper and Marie Rahn,, whose maiden name was Claassen. His early interests led him first toward the ministry but later toward mathematics and chemistry. In 1899 he matriculated at the University of Göttingen to major in organic chemistry and he received the degree of Ph.D. cum laude on December 24, 1902.

Young Dr. Rahn accepted a position as assistant in Dairy Science at Göttingen and served there from 1902 to 1906. In addition to his duties as an assistant, Rahn found time to do research on the biochemistry of bacterial growth. When it became evident that his chances of advancing to the rank of instructor were rather poor, he left Göttingen and became an assistant at the Agricultural Experiment Station at Halle where he remained for one year. During these years as an assistant, Dr. Rahn had corresponded frequently with bacteriologists in the United States. Through this correspondence and the reputation gained from publications in scientific journals, Rahn was offered an assistant professorship in bacteriology at Michigan State College which he readily accepted. From 1907 to 1912, Dr. Rahn divided his time between teaching and research. He and his assistant, Miss Belle Farrand, worked together on many bacteriological problems, both fundamental and applied in nature. This partnership became a permanent one on September 4, 1911, when Dr. Rahn and Miss Farrand were married in Lansing, Michigan. In 1912, Dr. Rahn left Michigan to accept a position at the University of Illinois, where during the next two years he built up a strong Department of Bacteriology. In 1914, Dr. Rahn took his family to Germany to meet his relatives from whom he had been separated for seven years.

Unfortunately, war broke out and Dr. Rahn was still a German citizen. He lacked about three weeks' time to complete the requirements for American citizenship. The Rahn family was trapped in Germany for the next 12 years. Professor Rahn was cut off from professional work and found it necessary to operate the family hotel until he was drafted into the German Army. Then he served for two years as a clerk at an airplane station in Latvia where he used his spare time to organize a classification of bacteria. This work was not published until much later, but it helped to establish his reputation as a bacteriologist in Germany. He was discharged from the army in

1918 and returned to his family in Danzig with no opportunity for work in his chosen profession. He could not return to America and he had no contacts with European institutions. In 1919 he received an assistantship in the Agricultural College in Berlin where he wrote a monograph on the effect of straw upon crop production. In 1920, he was appointed Director of the Physical Chemistry Department (which later became the Department of Physics) at the Prussian Experimental and Research Institute for Dairying in Kiel, with the title of Professor. In 1925, he became Verwaltungsdirektor of the Institute. At this time he satisfied the requirements as "privat dozent" of the University of Kiel which entitled him to teach in the University proper. Until his death, he retained the right to lecture in this German University. At Kiel, he studied the clumping of fat globules in milk and developed a theory of churning which explained many of the phenomena in butter which had not been understood before that time.

His work on the physical properties of dairy products so interested American investigators that in 1926 he received an invitation from a group of American universities to lecture in this country. He spent nearly a year lecturing in the United States. Cornell University was one of the inviting institutions and he so impressed the staff in Dairy Industry that in 1927, after his return to Germany, he was invited to become Professor of Bacteriology at Cornell University. At Cornell, he became an outstanding teacher and his laboratory in bacterial physiology was a highlight in the Cornell teaching program. He studied biological radiation, fermentations, and the growth and aging of cells.

Dr. Rahn preferred to work at his desk with statistics, graphs, charts and curves. He was not adept at laboratory work but he was a prolific source of ideas and set his graduate students and assistants a fast pace in providing questions which could be answered by experiment. He could read more from experimental data than could most workers, often much more than the authors of the paper he read. He preferred the theoretical problem to the practical. Often when he had shown that something could be done, all his interest was lost. His students found his enthusiasm and creativeness to be contagious and he was greatly respected as a teacher and leader in research. His European charm, his quick wit and lively sense of humor will always be remembered by those who knew him.

In 1949, Professor Rahn retired from Cornell University at the age of 68 and accepted a position at Idaho State College as Professor of Bacteriology. In 1951 he reached the compulsory retirement age at Idaho but he received a grant from the United States Public Health Service to continue his study on the aging of cells and he continued this work in Pocatello until 1954. During this period, he took six months leave to lecture at the University of Nebraska. After leaving Idaho State College, Professor Rahn and Mrs. Rahn made their home near a daughter, Margarete, in Delaware. There he died on September 26, 1957. The ideas and the research of Dr. Otto Rahn are well expressed

in his ten books and more than 150 research papers. His contribution to Dairy Physics and to Bacteriology assure him of a permanent place in the history of Science.

B. L. Herrington, J. C. White, Brooks Naylor

Robert L. Raimon

September 29, 1923 — August 31, 1995

Robert L. Raimon is remembered by his colleagues and the students he taught at the School of Industrial and Labor Relations as a labor economist whose policy interests and surpassing intellect combined to provoke both thought and argument. Students who took his courses regarded them as quite demanding, yet he received high marks from them for his stimulation of independent thought, the lucidity of his exposition, and his refined sense of humor. One student, who later became a professor of economics himself, regarded Bob as “... a wonderful teacher, both caring and fair.” Another has the following memory:

His classes, as I remember them, had a deceptively simple format. They would typically begin with Bob talking about a current issue in the news that related to the labor market. . . . Somehow, once Bob had formulated the issue, the remainder of the next hour would pass rapidly, painlessly and, in some cases even joyfully, as the class debated among themselves and with Bob's alternative views about the effectiveness of public policies. . . . Only after the session was over was it apparent that the discussion had been used to teach principles of economics in general and labor economics in particular. . . . Anyone who has ever tried to teach will recognize the remarkable accomplishment of making students active participants in the learning process rather than recipients of revealed truth.

Like many of his generation, Bob's undergraduate education, which began at Brooklyn College in 1941, was interrupted by World War II. He suffered a near-fatal neck wound during combat in the Pacific, but was able to finish his Bachelor of Science degree at Columbia by 1947. He immediately enrolled as a graduate student in the recently-opened School of Industrial and Labor Relations at Cornell, and he never left. His Ph.D. degree was awarded in 1951, the year of his engagement as an Assistant Professor by the School, and he immediately assumed primary responsibility for teaching required courses in labor economics, economic security, and corporate finance. He also taught several intermediate and advanced courses and seminars, and was often called upon to conduct courses in the School's off-campus programs (an activity he valued as a source of “real world” case materials for his on-campus courses).

During the 1950s and 1960s, when the field of labor economics was moving from an institutional focus to a more theoretical one—and from case studies to more general tests of hypotheses—Bob's works were among those that provided a “bridge.” His analyses of wage data and wage dispersion, for example, combined a theorist's rigor with the institutionalist's attention to real-world detail—a combination that was then quite rare but has recently become prominent. Similarly, he also wrote on such other now-fashionable topics as labor-management cooperation, international competition, and migration flows. Not surprisingly, his skills as an applied economist

were in demand by the private and public sectors, and he produced reports on railroad ratemaking, a shorter workweek in automobile manufacturing, plant location decisions, and the future of oil prices.

Sadly, Bob's formal career was ended by an automobile accident in 1969 that left him paralyzed below the waist. Unable to maintain both his required regimen of exercise and his high standards of teaching, research, and service to the University, Bob reluctantly chose to retire in 1974. After his appointment as Professor Emeritus, he served the School until 1989 as a member of the editorial board of the *Industrial and Labor Relations Review*.

Despite his premature retirement, Bob continued to be an epitome of the intellectual. He read both widely and deeply, was tireless in his quest for information, eager for debate, and dogged in his demand for logical argument on the part of himself and anyone brave (or foolish) enough to take an opposing view. He knew good research—and a good research topic—when he saw it, and he remained invaluable as a critic and as a source of ideas to his colleagues until his death.

For those who knew him, Bob will be remembered most poignantly for his strength: most assuredly for the strength of his intellect, but perhaps more dominantly for the strength of character that permitted him to cope with extreme adversity, the strength of idealism that fueled his interest in public policy, and the strength of love and concern for his children, Daniel, Eve, Martha, David and Jon Charles.

Ronald Ehrenberg, John Windmuller, Robert Smith

George J. Raleigh

October 22, 1898 — November 16, 1982

George J. Raleigh, professor emeritus of vegetable crops, died November 16, 1982, after a short illness, thus ending fifty years of productive, devoted association with Cornell University, the profession of horticulture, and the vegetable growers of New York State.

He was born at Clyde, Kansas, October 22, 1898, and received his B.S. degree from Kansas State College in 1922. His M.S. degree was granted by Nebraska a year later and his Ph.D. degree was received in botany from the University of Chicago in 1928. After the M.S. and prior to studying for the Ph.D. he was an instructor in pomology at Massachusetts State College. Following his graduate studies at Chicago he was employed as a chemist by Swift and Company in their fertilizer division. In 1932 he joined the Department of Vegetable Crops as an assistant professor and became full professor in 1937 and professor emeritus in 1966.

During his first eight years at Cornell Dr. Raleigh conducted a successful extension program on fresh market vegetables grown on mineral soils. He then transferred to a research position concerned largely with vegetables grown on organic soils. In this capacity he conducted a wide range of research designed primarily to assist the growers of these crops in New York State in remaining competitive with those in other production regions. He carried on fertilizer research with onions, lettuce, and celery, and lettuce improvement through breeding and selection. His introduction of the 456 lettuce variety in cooperation with the U.S. Department of Agriculture literally saved the New York lettuce industry in the early 1940s. The merit of his more recent lettuce varieties, Fulton, Oswego, and Minetto, is indicated by their almost immediate adoption in Michigan and Wisconsin as well as in New York. He also developed the varieties Summer Bibb and Buttercrunch, which made it possible for the first time to grow high-quality lettuce of the Bibb type during the summer months. Buttercrunch received an All-America Selection Award in 1963. Today, twenty years later, these varieties are still popular with both commercial growers and home gardeners.

George Raleigh was a leader in basic research on mineral nutrition of crops, particularly on boron for beets and cauliflower. He also investigated the role of silicon in plant growth and that of calcium and irrigation in tomato blossom-end fruit rot. Boron deficiency in beets caused the roots to color and made them nonmarketable for either fresh market or for canning. In cauliflower the problem caused the heads to deteriorate as they matured. In

some fields nearly the entire crop would be lost. His efforts contributed substantially to an understanding of these deficiencies and how to prevent them under practical field conditions.

He pioneered research on herbicides for controlling weeds selectively in onions grown on organic soils. His findings permitted growers to produce this crop without utilizing hundreds of hours of labor per acre for removing weeds by hand. Some of his findings are still standard recommendations.

George Raleigh's career at Cornell exemplifies our long tradition of freedom with responsibility. Although for most of his career his official job description included only research and his performance in this area was of very high caliber, he perhaps will be best known and remembered for his teaching and extension activities. He felt a strong responsibility to train graduate students in research techniques and philosophies, and his students are leaders in their specialties. Further, he believed that his research should help in solving vegetable production problems but that he could not be familiar with these problems, nor could he achieve rapid grower acceptance of his findings, unless he frequently visited with them and personally viewed their crops during the growing season. His personal concern for the welfare of growers as well as his sound scientific knowledge and judgment earned him their deep respect and trust. They were never aware that his official duties did not require him to spend those many hours viewing crops and counseling with them.

His wife, Janet, died August 2, 1980. He is survived by four children: Janet O'Connor of Ithaca; George, Jr., of Rochester, New York; William of Burlingame, California; and Edward of Wilmington, Delaware.

Elmer L. Ewing, Leonard D. Topoleski, Robert D. Sweet

Richard M. Ramin

November 22, 1929 — May 27, 1995

Richard M. Ramin, 65, who served as Vice President for Public Affairs at Cornell University for 24 years and as a member of the Cornell staff for 41, died peacefully and surrounded by his family on Saturday, May 27, 1995 at the University of Pittsburgh Medical Center, Presbyterian University Hospital. He died of pulmonary fibrosis.

A memorial service was held for Dick on Sunday, June 18, 1995 in Sage Chapel on the Cornell University campus. The overflowing crowd of mourners attested to the words of President Frank H.T. Rhodes:

The secret of Dick's extraordinary success is not to be found, I believe, in superior fund-raising technique or organizational structure, important as both things no doubt are. The secret lay rather in two qualities Dick embodied: his unwavering conviction of the transforming value of a Cornell education and his endless capacity for friendship. Dick knew everyone and everyone knew Dick. He was first a friend-raiser and a trust builder: the fund-raising followed. His friendship enriched us all too brief a while.

Richard M. Ramin was born in Williamsport, Pennsylvania, on November 22, 1929. He was the son of Richard and Florence Ramin. Dick was a starting player for his high school football team, the Williamsport High School Millionaires, and in 1946 was named a lineman for the Pennsylvania All-State Team.

Ramin was a 1951 graduate of Cornell's College of Arts and Sciences. While an undergraduate, he was co-captain, with Rip Haley, of the freshman football team and was a starter on the varsity football team from 1948-50, a time when the team won two Ivy League titles. As a student at Cornell, Dick majored in political science. He was a member of Delta Kappa Epsilon fraternity and the Sphinx Head honorary society.

After graduation, Dick served in the U.S. Army for two years as a First Lieutenant. He was then employed as a Cruise Director for the Holland-American Steamship Lines. Ramin joined the Cornell administration in 1954 as an Alumni Field Secretary. In 1956, he became an Assistant Director of Admissions, a position he held until 1959, when he was appointed an Associate Director of Development. From 1964-71, he worked as the Director of Development and in 1970 also became Assistant Vice President for Public Affairs. He participated in the Graduate School of Business and Public Administration's (B&PA) Executive Development Program in 1968. Speaking of Ramin's accomplishments as Director of Development, President Dale Corson said, "under Dick Ramin's guidance, Cornell's record in fund-raising has been unsurpassed by any educational institution in the United States."

In 1971, President Corson named Ramin to the post of Vice President for Public Affairs, in charge of departments responsible for Alumni Affairs, Alumni Systems and Gift Services, University Development, the University Council, the Trust Office, Office of University Events, college and unit Public Affairs offices and a network of ten regional offices, including International Alumni Affairs. For the past 24 years, Dick served in that position with great pride and distinction. During his tenure, the Cornell University Council and the University's Regional Public Affairs Offices were established—two precedent-setting achievements—and three major capital campaigns took place.

Under Ramin's leadership the Corneirs Centennial Campaign was successfully completed at \$73.2 million in 1965, and he had responsibility for the Cornell Campaign, completed in 1980 for \$250 million. Dick spearheaded Cornell's \$1.25 billion Capital Campaign, begun in 1991 and successfully completed in 1995. "Cornell never had a more devoted alumnus, nor I a more steadfast friend, than Dick Ramin," said President Rhodes. "He lived and breathed Cornell. He was a superb fund-raiser: his work will live on in the remarkable benefits that the present \$1.25 billion campaign will contribute to the future strength of the university he loved so much."

Robert V. Tishman (Cornell A.B. 37) reflected the thoughts of many alumni and friends when he said of Dick Ramin: "He was creative, knowledgeable, and the results of what I have done [for Cornell] under his guidance are among the most rewarding I have experienced. Behind that easy country-boy approach was a very sharp mind. I will miss him."

While serving as a Cornell administrator, Ramin was a member of the Board of Managers of Willard Straight Hall, the student union (1956-58) and a member of the Straight Board of Governors (1958-60). He was faculty advisor to Delta Kappa Epsilon social fraternity from 1956-59 and a member of the University's National Scholarship Committee during that same time. He also served as a member of the University's Administrative Systems Planning and Control Committee and was a member of the American Alumni Council (AAC) and the American College Public Relations Association (ACPRA).

In 1956, Dick married Frances Anthony of Penn Yann (Cornell A.M. '52), who was then employed in the Program Department of Willard Straight Hall. In all his activities, his wife Fran was a devoted and enthusiastic partner. In September 1960, Dick and Fran's first child, Robert Anthony was born, and in 1963, their daughter, Nancy Alice was born. Bob married Denise DeConcini in 1985. They have two children, Margaret Alice and Daniel Anthony. Nancy married Lawrence Dalton in 1987. They have a daughter, Christine Alice. Over the years, Dick enjoyed attending the children's school functions, traveling, cooking Sunday morning brunches, boating, barbecuing at

the cottage, playing with his grandchildren, winning at “The Poker Group,” listening to jazz, playing the boom bass, and relaxing with those he loved.

In Ithaca, Ramin was a member of the Tompkins County Chamber of Commerce, a deacon of the First Congregational Church, a member of the YMCA Board of Directors, and was active in Explorer scouting and the United Way.

Harvey Sampson, one of Dick’s closest companions for 48 years, remarked at Dick’s memorial service: “Dick was a very special person. He was modest and unassuming about his accomplishments, which were many and substantial. He was never boastful, nor did he do anything with fanfare or to promote himself. He always praised and gave credit to others.” Cornell is a better place because of Dick Ramin’s hard work and dedication to supporting its mission. He will be remembered fondly by those who worked for and with him, for his integrity, his kindness and compassion, his unswerving friendship, his gentle manner, the twinkle in his eye, and his pride in Cornell University and its potential.

Dale Corson, Walter Lynn, James Maas

Frank Harrison Randolph

November 7, 1892 — October 22, 1975

Frank H. Randolph, Cornell University professor emeritus of hotel engineering, of 101 Oxford Place, died Wednesday, October 22, 1975, in the Reconstruction Home after a long illness. The second of the original faculty members of the School of Hotel Administration, he initiated the courses in hotel engineering in 1923.

Born in Rahway, New Jersey, on November 7, 1892, he received his B.A. degree from Yale University in 1915 and his M.E. degree from Cornell University in 1917.

He taught at Cornell from 1923 until his retirement in 1960. Previously he had worked as an engineer with Goodyear Tire and Rubber Company, the U. S. Naval Steam Engineering School, the Raymond Concrete Pile Company, and the Turner Construction Company and was an instructor in the Sheffield Scientific School at Yale.

During leaves from University duties he worked with architects and engineers on the mechanical equipment for the Sampson Naval Station and for Chalfonte-Haddon Hall in Atlantic City. He also worked with the Hoover Commission Task Force on Subsistence Services in 1954.

A member of the American Society of Mechanical Engineers, Randolph was also a member of Sigma Xi, Beta Theta Pi, Tompkins County Professional Engineers Club, Exchange Club of Ithaca, and Ye Hosts.

The late Howard B. Meek, first dean of the School of Hotel Administration, said of him, "Professor Randolph pioneered in the organization of technical engineering knowledge applicable to the problems of hotel operation and maintenance and has developed here a whole series of truly unique courses in that field. He is a licensed engineer, has been active as a consultant, and has contributed a number of articles to the technical journals."

Professor Randolph will long be remembered with deep appreciation as a teacher who constantly encouraged and challenged his students.

Robert A. Beck, David C. Dunn, Paul L. Gaurnier

Lowell Fitz Randolph

October 7, 1894 — May 26, 1980

Lowell Fitz Randolph was born and raised on a farm near Alfred, New York, where he attended local schools and where he was graduated from Alfred University in 1916. He came to Cornell as assistant in botany in 1918, at a time when R. A. Emerson and L. W. Sharp and their students were beginning their intensive studies on the genetics and cytology of maize (corn). Randolph's Ph.D. thesis on the development of normal and abnormal chloroplasts in maize was completed under Sharp's direction in 1921. This was one of the first of a long series of studies and theses by faculty members and graduate students at Cornell that were to make corn the best known of all higher plants in these respects, a position which it still occupies today. Other students of maize who also went on from Cornell to become major figures in biology include Barbara McClintock, the Nobel laureate George Beadle, Harriet Creighton, Marcus Rhoades, and M. Demerec.

Randolph continued at Cornell as instructor in botany until 1923, when he took a position as cytologist with the Office of Cereal Investigations, United States Department of Agriculture. Fortunately, he was stationed at Cornell and continued his work with corn and his association with the Department of Botany. In 1939 he was appointed professor of botany, a title which he held concurrently until 1947, when he resigned from his position with the federal Department of Agriculture to devote full time to cytogenetics in the Department of Botany.

For his first twenty years Randolph gave his primary attention to certain unusual maize plants that had other than the standard twenty chromosomes. Some of these plants had one or more small extra chromosomes that seemed to have no visible expression in the plants. He gave these their name of B-chromosomes, and he found that by selective breeding he could produce plants with large numbers of them, still with no definite effects upon the appearance of the plants. Randolph's pioneer work with B-chromosomes is a classic in an area of investigation that is still active.

Other corn plants under study had extra chromosomes of one or a few or of all standard kinds. Using heat shock (applied at the critical time with an electric heating pad!) Randolph produced the first seedlings of corn in which the number of chromosomes had been doubled experimentally. This technique opened the door to a series of comparative studies of the morphological, chemical, and cytological differences between diploid and tetraploid corn that are classics still cited frequently today. He also was interested in the possibility of developing tetraploid corn that can be grown commercially and by intensive selection he developed some strains that approach this

goal. After World War II he was involved in the study of abnormal plants of corn that had been grown from seed exposed to atomic radiation at the Bikini testing grounds.

In later years Randolph shifted his attention to the problem of the origin of maize, a domesticated plant which cannot survive in nature without the intervention of man, and whose ancestry from wild plants has been a subject of much controversy. In this pursuit he made several trips to Mexico and Guatemala in search of wild relatives and possible ancestors of maize. After his retirement from Cornell in 1962 he continued his work with maize and its wild relatives, alternating between summers in Ithaca and winters as a research collaborator at the Fairchild Tropical Garden in Miami. This work culminated in a long review on the evolutionary history of maize, two parts of which he was still actively working on at the time of his death.

Beginning in the 1930s Randolph also became interested in the chromosomes and evolution of wild and cultivated iris. He was author or coauthor of a long series of papers on these plants and editor of a major book on garden iris. Together with his wife, he traveled widely in quest of wild species of iris for cytological study and for hybridization, collecting them in eastern Europe, the Balkans, the Mediterranean region, Russia, the Caucasus, Turkey, Iran, and India. The garden at his home in Cayuga Heights was famous for its iris and attracted many visitors in late spring. He discovered that experimental breeding of iris can be greatly accelerated by removing the embryo from its inhibiting seed coat and culturing it on nutrient agar. This procedure also greatly increases the number of seedlings that can be obtained from a cross, and it makes it possible to obtain progeny from some crosses that are not otherwise successful. These techniques, in which he was a pioneer, are now also used widely with many other plants.

Many honors came to Randolph. For his work with iris he received the Vaughn Award for outstanding contributions to horticulture from the American Society for Horticultural Science (1944), the Distinguished Service Medal from the American Iris Society (1951), the Sir Michael Foster Award of the British Iris Society (1955), a citation for distinguished contributions to horticulture from the American Horticultural Society (1962), a bronze medal from the Internationale Gartenbauausstellung, Hamburg, West Germany (1963), and a special gold medal from the American Iris Society in 1970. He served as president of the American Iris Society in 1960-62.

He spent a year visiting several laboratories in Europe in 1926-27 under a traveling fellowship of the International Education Board and six months in 1957-58 at Aligarh Muslim University in India with a Fulbright Award. He also served as president of the Cornell chapters of Phi Kappa Phi (1947-48) and Sigma Xi (1953-54).

He is survived by his wife, Fannie Rane Randolph, who was also trained in botany at Cornell and who provided valuable support and technical assistance in much of his work; by three children, Robert Fitz Randolph of Manlius, Elizabeth Jane DeMott of Herndon, Virginia, and Rane Fitz Randolph of Ithaca; and by nine grandchildren.

Harlan P. Banks, Adrian M. Srb, Charles H. Uhl

Edward C. Raney

May 23, 1909 — April 20, 1984

Edward C. Raney was born in Pittsburgh, Pennsylvania, the son of Anna (Devlin) Raney and Edwin O. Raney. He received his primary education in the public schools of New Castle, Pennsylvania, where he graduated from New Castle High School in June 1927. From 1925 to 1931 he was a nature counselor at summer camps in West Virginia, Pennsylvania, and Maine. After receiving his B.S. degree in education from Slippery Rock, Pennsylvania, in 1931, he taught science in the New Castle school district until 1935. Concurrently Ed received an M.S. in nature study and ornithology under Professors E. L. Palmer and A. A. Allen. Because of his profound and dedicated interest in the natural history of animals of the United States, Professor Alfred Hazen Wright suggested that Ed continue his graduate education at Cornell. Ed received his Ph.D. in vertebrate zoology in 1938 under Wright's supervision, minored in nature study and aquaculture with Professors E. L. Palmer and C. C. Embury, and began his academic career at Cornell. He was appointed in the College of Agriculture and Life Sciences as an instructor, assistant professor, associate professor, and professor of zoology from 1936 to 1952. He remained a professor with the college until his retirement in 1971. Dr. Raney enlisted in the United States Navy in 1942 and served as an executive officer on a destroyer escort until his return to Cornell as an instructor in fall 1945.

Dr. Edward C. Raney was a recognized leader among ichthyologists. His knowledge of fishes was worldwide, but his particular expertise was focused on the fishes of the eastern United States. As a lifelong student of fishes, Ed's particular interests centered around their taxonomy, ecological distributions, and behaviors. He insisted that all his students obtain, in addition to an exhaustive knowledge of the different kinds of fishes, a thorough indoctrination to field technique; this was no small task. During his tenure at Cornell thirty-seven students obtained their Ph.D. degrees and nineteen obtained their M.S. degrees; today most occupy commanding positions in biology and retain an active interest in fishes. Ed Raney's strong field orientation led to the accumulation of a massive record of water temperatures, stream flow rates, and a variety of other ecological conditions. In Ed's later years these data provided the baseline for his consultation on major environmental problems, such as the siting of dams and power plants. Ed recognized that although poorly designed facilities could be detrimental, they could also be designed to be compatible with the surrounding aquatic environment. He was not hesitant to take on controversial tasks, including testifying before the United States Senate Subcommittee on Resource Protection—Endangered Species Act Oversight in respect to the snail darter. Ed became such an expert on aquatic environmental problems that he formed a consulting service that has employed over one thousand individuals and, over the years, a multitude of

former Cornell students. Ed turned much of the profit from this endeavor into an endowment that today continues to provide grant awards to worthy students.

The numerous field trips that Ed Raney made with his graduate students also led to the amassing of a synoptic collection of fishes of the eastern United States that today ranks among one of the top four or five museum collections of North American fishes. The Cornell Ichthyology Collection is considered one of the best of its kind for fishes from the eastern United States. Its presence at Cornell is a treasure that serves innumerable specialists throughout the nation.

Ed Raney maintained membership in over thirty professional societies. Dr. Raney was made an honorary member of the American Fisheries Society in 1978. He was secretary (1948-51) and president (1955-56) of the American Society of Ichthyologists and Herpetologists. He served on innumerable advisory committees, including the New York State Joint Legislative Committee on Revision of Conservation Law; the National Science Foundation Committee on Inland Biological Stations; the American Nuclear Society Standards Committee, Environmental Impact, Evaluation, and Protection of Aquatic Organisms; the National Academy of Engineering Committee on Power Plant Siting; and the American Fisheries Society Study of the Connecticut River related to the Connecticut Yankee Atomic Power Station. Other formal appointments included ichthyologist, U.S. National Museum, identification of fishes taken at Bikini in connection with atomic bomb tests; coordinator of the Atlantic States Cooperative Striped Bass Program of the Atlantic States Marine Fisheries Commission, U.S. Fish and Wildlife Service; senior scientist, cruise 9, Indian Ocean expedition, research vessel *Anton Bruun*; director of Biological Survey of Charlotte Harbor, Florida, Mote Marine Laboratory; and member and trustee of the Sport Fishery Research Foundation.

Ed authored over 75 publications dealing with fishes, and over 250 reports and documents were compiled under his leadership at Ichthyological Associates. He also served on the editorial boards of *Copeia*, the *Journal of the Fisheries Research Board of Canada*, and *The American Midland Naturalist*.

Ed Raney's commitment to his students was equalled by the hospitality shown to them by Charlotte, who passed away several years before Ed, and more recently by his second wife, Ethel. For those who sampled the warmth and scientific stimulation provided during numerous social gatherings in his home, we render thanks, and know that our understanding of fishes has been greatly enriched because Ed and his family chose Cornell and Ithaca as their home.

Howard E. Evans, William D. Youngs, William N. McFarland

Arthur Ranum

Professor of Mathematics

— *Feb. 28, 1934*

Professor Arthur Ranum was first at Cornell University in 1893-96 as graduate student, Scholar, and Fellow. After receiving his doctor's degree from the University of Chicago, and teaching in western universities, he returned to Cornell in 1906. Here he remained, leading a quiet life as investigator and teacher.

As a productive scholar he won the highest respect of his colleagues and the mathematical public, especially through his mastery of two fields. His earlier publications dealt with Modern Algebra, and were full of new and interesting results. During the past twenty-five years, however, he wrote mainly on Differential Geometry. He devoted special attention to three topics: the differential geometry of hyperspace; the singularities of space curves; and quasi-spherical curves. His papers contain practically all that is known about the last-named subject. Apart from their originality and rigor, his writings are remarkable for their style and elegance. The subject matter is presented as a complete and harmonious whole; the procedure is strikingly simple and direct; laborious proofs are avoided; and the reader is left with an impression of the richness and beauty of the total conception. The effect is due partly to Professor Ranum's care in thinking through his subject, and partly to his rare genius for presentation.

These talents and his accurate scholarship made him an able teacher. He had a remarkable gift for making the most recondite ideas understandable and attractive. His students gave enthusiastic testimony to the lucidity of his lectures and the pleasure and ease of following them.

The love of harmony so evident in his mathematical research had a counterpart on the emotional side in a passion for music. Though not a skilled performer himself, he was intimately acquainted with the great masterpieces of musical composition, and over-looked no opportunity of hearing them.

In manner he was quiet and self-effacing. He had a considerable element of stoicism in his nature; although handicapped in his later years by ill health, he paid as little attention as possible to his physical disabilities. In his last months, when he was more seriously ill than his most intimate friends suspected, he kept to his work as long as his strength held out, attending to his university duties until within a few days of the end.

By his death Cornell University and mathematical science lose a scholar recognized at home and abroad as a distinguished worker in his field.

Marius Peter Rasmussen

October 1, 1893 — January 18, 1970

Marius Peter Rasmussen died in Largo, Florida, on Sunday, January 18, 1970.

Professor Rasmussen, believed to have been the first professor of fruit and vegetable marketing in this country, retired from Cornell University in 1959 after more than thirty-eight years of service in the Department of Agricultural Economics.

Professor Rasmussen was born at Bennington, Vermont. He received the B.S. degree from Cornell University in 1919 and worked as agricultural economist at the University of Vermont. In 1921 he returned to Cornell for graduate study in farm management, marketing, and economics. While pursuing graduate studies from 1921 through 1924 he served as instructor in farm management in the New York State College of Agriculture. Upon being awarded the Ph.D. degree in 1924 he was appointed assistant professor of marketing at Cornell. Six years later he was promoted to full professor, continuing in that position until the date of his retirement.

During his long period of service at Cornell, Dr. Rasmussen gave special attention to the marketing of fruits and vegetables. He taught an undergraduate course and also graduate seminars in that subject.

His experience in research as well as in consulting and advisory work outside the University enabled him to give his students an intimate view of the organization, methods, and problems of fruit and vegetable marketing. Many of his former students are now teaching and doing research at colleges and universities or in government departments throughout the United States and in other countries. Others are doing important work as executives of commercial organizations in the fruit and vegetable industry.

Dr. Rasmussen's research and that of graduate students working under his direction covered a broad field, including marketing costs and efficiency, regional and terminal market facilities, merchandising, cooperative marketing, and improved methods of supplying food to the armed forces. He was the author of numerous publications and articles based on his research, including several experiment station bulletins and government reports. He also supervised the preparation of many manuscripts that have been published under the authorship of graduate students.

In addition to his teaching and research, to which he devoted himself intensively, Dr. Rasmussen did a considerable amount of extension work with farmers, cooperatives, and other marketing organizations. His reputation as one of the country's leading experts in the marketing of fruits and vegetables caused him to be called upon to

serve as consultant to many government agencies and industry organizations throughout the United States and abroad. In 1929 he visited Europe as an American delegate to the First International Conference of Agricultural Economists (England). In connection with this trip he conducted a study of markets in England and Denmark. In this enterprise he was aided by his command of the Danish language. Among the agencies and organizations that he served on a temporary or part-time basis during his active professional career were the Bureau of Agricultural Economics, USDA, (1922-30); the U.S. Farm Credit Administration (1934-52); the U.S. War Production Board (1942-48); New York State Commission on Agriculture (1953-59); Fruit and Vegetable Committee, American Farm Bureau Federation (1933-41); Florida Citrus Commission (1941); American National Co-op Exchange and American National Foods, Inc. (1933-59); and the United Fresh Fruit and Vegetable Association (1935-50).

Dr. Rasmussen was a member of the honor societies Phi Kappa Phi and Sigma Xi and of the Alpha Zeta fraternity. He also was a member of the following professional societies: American Agricultural Economics Association, American Marketing Association, and International Association of Agricultural Economists.

Among his colleagues and students, Professor Rasmussen established a lasting reputation as a dynamic, industrious person of the highest integrity. He took his work seriously as he pursued it with unflagging energy. He had no patience with abstract theories but always sought to find the essential facts of any problem that he studied. To him they provided the only sound basis for conclusions. Professor Rasmussen was never an agitator for change in the University or in society. He found in his own field of study a sufficient outlet for his thought and his energies, yet he was not uninterested in other persons or in the progress of the Department or the University. He was ever the warm and helpful friend, completely dependable, and always the perfect gentleman. He will be remembered long by those who knew him.

He is survived by his wife, Ellen Nelson Rasmussen, and two sons, Allen E. and Kenneth E., their mother, Elsa M. Rasmussen, having died in 1957.

M. Slade Kendrick, Bennett A. Dominick, Jr., Maurice C. Bond

John Macklin Rathmell

July 20, 1911 — October 9, 1987

John Macklin Rathmell, professor of marketing emeritus in the Johnson Graduate School of Management died on October 9, 1987 at his home in Ithaca. He was born on July 20, 1911 in Painted Post, New York. Rathmell earned his B.S. degree at North Central College in Illinois and worked in sales and marketing in the Chicago area during most of the 1930s, before enrolling in the University of Pennsylvania's Wharton School, where he earned an M.B.A. degree in 1940. After service as a lieutenant commander in the United States Navy during World War II, he returned to Wharton to teach and study for his Ph.D., which he earned in 1951.

In 1952 Mac Rathmell brought to the Cornell Graduate School of Business and Public Administration (now Johnson Graduate School of Management) successful experience in business, teaching, research, and administration. Importantly he came with genuine interest in working with students, staff, and fellow faculty.

When Rathmell retired in 1976, he had served the university for twenty-four years, teaching a variety of marketing courses to three generations of Cornell M.B.A. students. In his teaching, he drew upon both his academic training and his practical experience in sales. Through his classes, seminars, writings, and counsel he helped hundreds of young men and women become effective marketing executives, sales managers and entrepreneurs.

Rathmell was especially interested in marketing for service industries. He was the author of *Readings in Marketing; Managing the Marketing Function: Concepts, Analysis and Application*; and *Marketing and the Service Sector*. The last book was the first of its kind to focus on the importance of marketing in the growing service sector of the U.S. economy. Among other things he was much interested in the structure of marketing, including the roles and problems of wholesalers and distributors and their relations with mills and foreign suppliers.

A loyal and committed member of the faculty, Rathmell was also active in national committees of the American Marketing Association. Dean Emeritus David A. Thomas, his longtime colleague, recollected: "Mac Rathmell was thoroughly conscientious and dedicated to the field of marketing." Many others who have worked in Malott Hall or currently work there certainly agree. He will be missed.

Mr. Rathmell was a member of the Tabernacle Baptist Church of Ithaca and the Clan MacFarlane Society. Mac had strong moral fiber with deep ethical and religious convictions. He could be relied upon to give his best attention and effort to any task he assumed. For several years he devotedly served as Secretary of the Faculty of the School

and provided dedicated service as a member of the Library Committee and assistant director of the School's Executive Development Program.

He gained the respect of his colleagues, students, and alumni by thoroughness, honesty, and integrity, and by volunteering to do what needed to be done.

In addition to his academic career in marketing, Mac had a second interest which he pursued with tremendous energy and dedication. That second avocation was related to railroads and trains. He would travel significant distances to look at old depots and trains, visit railroading museums or to see some private collection of memorabilia.

He is survived by his wife, Alba Liddle Rathmell of Ithaca; a daughter, Hester R. Deetz of Stroudsburg, Pennsylvania; a son, John M. Rathmell of State College, Pennsylvania; three granddaughters; and three grandsons.

Earl Brooks, John G.B. Hutchins, Vithala R. Rao

William Arthur Rawlins

December 5, 1908 — December 31, 2007

Art Rawlins, Professor of Entomology, Emeritus, died at Memorial Mission Hospital, Asheville, North Carolina, at age 99. Art was blessed with longevity and was active almost to the end.

The factors of time and place were positive influences in his life. He was the son of Thomas Henry and Elizabeth Rawlins. His father had immigrated to the United States from England, being drawn to the abundance of its agricultural land.

Art's childhood was spent on the Darrow farm, just outside the city limits of Geneva, New York, located on the northern shore of Seneca Lake, the largest of the Finger Lakes. Geneva was a sedate town. Its South Main Street, lined on both sides with picturesque American Elms, was the elegant place to live. The city's cultural atmosphere was strongly influenced by the two liberal arts colleges, and the New York State Agricultural Experiment Station.

The Experiment Station was initially independent of the State educational system. In 1923, it was placed under administrative jurisdiction of the Agricultural College in Ithaca, fifty miles distance on Cayuga Lake. In 1940, the professional staff at Geneva was given faculty status in the College of Agriculture. Thus began the Geneva staff's long climb to parity with the Ithaca faculty.

Art's early schooling was in the one-room local schoolhouse. Discipline was strict with punishment; a note to parents usually provoked additional punishment. Art's home life followed the well-established pattern of life on the family farm, industriousness, honest toil, and faith in Agriculture as the basis for a strong independent Society.

Teenage boys were expected to supplement farm labor with an outside job. This gave Art an entrée to the staff of the Experiment Station to whom he delivered fresh eggs. This contact led to employment in the Entomology Department. His next step on the educational ladder was enrollment in the College of Agriculture at Cornell University. After earning his Bachelor of Science degree in 1930, and the Ph.D. degree in 1936, he joined the faculty of the Department of Entomology, as a specialist in economic entomology, biological, chemical and cultural control of insect pests of potatoes, carrots, lettuce, and onions. To add to his duties, he taught courses at the undergraduate and graduate levels. During his career as a faculty member, he supervised the graduate training of over 40 students.

Art's tutorial style was unique, largely collegial, bearing out his philosophy that Cornell's entomology program attracted able, highly motivated students. His primary objective as a mentor was to create an atmosphere of

learning. His unobtrusive leadership encouraged a congenial setting where fellow graduate students would share in the learning quest.

Post World War II ushered in an era of assistance to third world countries. Cornell had become a leader in International Agriculture. Art's growing reputation and his humanitarian inclinations drew him to these opportunities. This was facilitated by his students having established themselves in Aid programs and welcomed collaboration with their mentor. The institutions that arose were the United Nations, Food and Agriculture and World Health Organizations, World Bank and foundations such as Ford and Rockefeller.

After retirement from academic life, he and his wife, Alma, traveled widely at home and abroad. In 1986, they moved to Highland Farms Retirement Community, Black Mountain in western North Carolina. This congenial setting saw them volunteering to assist newly made friends and neighbors.

Never having lost his devotion to gardening and sharing its abundant harvest of flowers and vegetables with friends, Art epitomized the spirit of generosity and excellence.

His beloved wife, son Stephen and daughter Elizabeth predeceased Art. His daughter, Phyllis Sherman, and three grandchildren survive him. It was a source of great pride to Art that the family established a thriving Roadside Market of high quality produce on the fertile soils of Conway, New Hampshire.

In reflecting on Art's life in retrospect, we cite the conventional wisdom of an earlier age, wisdom dear to his heart:

"...whosoever could make...two blades of grass to grow upon a spot of ground where only one grew before, would deserve better of mankind, and do more essential service to the country than the whole race of politicians put together."

Jonathan Swift (1667-1745)
Gulliver's Travels, 1726

Edward H. Smith, Chairperson; James E. Dewey, Arthur A. Muka

Clinton Beaumont Raymond

January 5, 1889 — October 23, 1977

Clinton Beaumont Raymond, professor of vegetable crops emeritus, was born in Penfield, New York, attended elementary and secondary school there, and graduated from the College of Agriculture at Cornell University in 1913. From 1930 until his retirement in 1954, Beau was a faculty member of the Vegetable Crops Department. He was appointed extension assistant professor in 1930, was promoted to associate professor in 1942, and became professor emeritus in 1954. He was a charter member of the Lambda chapter of Epsilon Sigma Phi, the National Honorary Extension Fraternity.

After graduating from Cornell, he returned to his home farm and two years later began teaching agriculture in high school. In early 1918 he became assistant county agricultural agent in Steuben County and a year later, county agricultural agent in Allegany County. He remained there four years before moving to a similar position in Yates County.

In the summer of 1930 Beau came to Cornell to take advanced courses in vegetable crops and plant physiology. He was asked to stay on to conduct extension work with New York's canning crop growers. He made field studies on vegetable crops to determine practices that would produce the best yields and qualities of canned vegetables. Among his many studies were those on the problem of dry rot in beets caused by boron deficiency, the causes and importance of defects in tomatoes, and methods of getting canning peas with high yields and quality. To get information to vegetable growers and processors, he was active in the production of motion picture films dealing with improved production and harvesting practices. These were usually made in close collaboration with colleagues from related disciplines. Films dealing with production of tomato transplants and harvesting tomatoes to maximize quality were in great demand and were shown far beyond the boundaries of New York State. He also wrote many bulletins on vegetable production and storage that were helpful to both commercial growers and home gardeners.

During World War II Professor Raymond spent much time working on the "victory garden" program, especially with urban groups who used vacant lots in cities and nearby farmland for community gardens. He cooperated with the New York State Grange in organizing and preparing teaching materials for their "Better Gardening for Better Living" project. He prepared slide sets and other teaching aids for a victory garden train that traveled throughout New York State and spent much time on the train giving information to the thousands who visited it.

During the last few years before his retirement Professor Raymond was asked to devote himself entirely to extension work with home gardeners. Using the experience gained in the earlier victory garden program, he undertook this responsibility with all the vigor and enthusiasm of a young man beginning his first job. One of his early efforts was to develop a correspondence course for gardeners. Another important program was the conducting of demonstrations of the use of sawdust, chips, and shavings as a means of improving soils, conserving moisture, and controlling weeds. In 1953 he established an herb garden at Cornell for the training of staff and students. For many years Beau was in charge of the department's radio program. He prepared much of the material himself. Not only was this effort highly regarded by his colleagues, but also he was cited by ABC for his outstanding public service, particularly to home gardeners.

Beau Raymond's career was marked by complete dedication to his work, whether it was aimed at improving the commercial vegetable industry of New York State or helping home gardeners. He was intensely loyal to his constituency, to his department, and to Cornell University. He was an active member of the First Presbyterian Church in Ithaca, served as an officer in it for many years, and maintained his interest in it after leaving Ithaca. He was devoted to his family and is survived by his wife, Lonnette Lovejoy Raymond; two daughters, Lonnette Joy Hammers and Gayle R. Kennedy; and five grandchildren.

After retiring, Professor Raymond and his wife returned once again to his home farm in Penfield, New York, where he was active in gardening and in civic affairs. For three years he was town assessor. When that became too strenuous, they moved to Florida and later to Minnesota to be near one of their daughters. A few months before his death they moved to Bethesda, Maryland, to live with their other daughter.

Henry M. Munger, Arthur J. Pratt, Robert D. Sweet

Jeanette Mann Read

June 24, 1909 — March 24, 1959

Jeanette Mann Read was born and brought up in Ithaca. During most of her life she was associated with Cornell University. As a child and adolescent, she knew the University through her father while he was a member of the faculty, then Dean of the College of Agriculture and, later, Provost of the University. She earned both her baccalaureate and Master's degrees at Cornell, the first in 1931, the other thirteen years later. In 1944, Mrs. Read became a member of the faculty of the New York State College of Home Economics. From that time until the day of her sudden death, March 24, 1959, she was a vital part of the life of the College.

Mrs. Read brought unswerving loyalty to Cornell, professional competency, intellectual acumen, and enviable personal qualities to her position in the College. Her undergraduate major in the College of Arts and Sciences was mathematics; her graduate major, counseling and guidance. Her post-Master's study was done in the field of education at Teachers College, Columbia University. Her scholastic ability was reflected in her election to Phi Beta Kappa and Pi Lambda Theta. This broad formal education and that derived from the academic atmosphere in which she spent her childhood, as well as her experience as a homemaker, a mother, and a community worker, gave Mrs. Read a rich background for her work with college students. Her poise and her sympathetic and serene nature were major factors in the development of young people who looked to her for guidance and leadership.

When Mrs. Read left the Counseling Service in 1951 to become assistant to the Dean of the College of Home Economics, she did so with the enthusiastic support of her colleagues whose admiration and respect she had already won. They were aware of her understanding of the scope of the College program and of the nature of the factors which were essential for its effective operation. Also, they were cognizant of her keen analytical mind and her excellent memory for detail, significant qualities for the type of work that her new responsibilities would require. Direct not only in her mind but also in her manner, Mrs. Read was forthright and courageous. She was able to strike a happy balance between a sympathetic understanding of any given situation and the hard facts of reality. Always approachable, she gave thoughtful consideration to the matters concerning which her colleagues sought her assistance. At the same time, she was objective, her sense of fair play ever uppermost. Those who conferred with her came away with a sense of moral support and a basis for further action.

Mrs. Read moved quietly but effectively in University circles. As a participant in the work of several University committees and as a keenly interested member of the board of the Statler Club, she not only rendered service to

the University as a whole but also won respect for the contribution of the College of Home Economics to Cornell University and the State University of New York. In addition to her local academic activities, Mrs. Read was a member of the American Home Economics Association and the New York State Association of Deans and Guidance Personnel.

Mrs. Read had an exceptional capacity for making and holding friends. She was well known in the social as well as in the professional life of the Ithaca community. One of the fortunate persons able to combine a satisfying home and community life with professional responsibility without jeopardy to either, she lived an ordered existence, giving deep devotion to her family and unstinted service to her profession.

Students who grew in stature under Mrs. Read's guidance, and faculty members who had the privilege of working with her, have a deep sense of personal loss, but their spirits are quickened as they remember her, a gracious, unselfish, fair-minded friend who was always ready to share her time, knowledge, and judgment with them, and who left with them a feeling that life is good.

Margaret Hutchins, A. L. Baldwin, Jean Failing

Philip Adna Readio

December 18, 1897 — May 28, 1947

Philip Adna Readio, Professor of Economic Entomology, passed away at Packer Memorial Hospital, Sayre, Pennsylvania, on May 28, 1947, at the age of forty-nine years. Until shortly before his untimely death, he was actively engaged in teaching economic entomology and directing the work of a large number of graduate students. In his passing the Faculty has lost a capable and loyal member; the profession of entomology a true friend and inspiring teacher.

Professor Readio was born at Northampton, Massachusetts, on December 18, 1897. Following graduation from Northampton High School, he attended Massachusetts State College, graduating with the B.S. degree in 1920. His academic training was supplemented by summer work with the U. S. Bureau of Entomology and for a brief period he served in the U. S. Army stationed at Camp Lee, Virginia. Graduate work in entomology was pursued at the University of Kansas from which institution he received his M. Sc. and Ph.D. degrees. During his period of service at Kansas, 1920-1934, he advanced from the rank of Instructor to Associate Professor. His teaching duties covered most of the phases of economic entomology offered at the University of Kansas, and introductory entomology as well. For one year, 1928-1929, Professor Readio held a National Research Council Fellowship and worked in the Division of Economic Entomology at the University of Minnesota.

With the outbreak of the Dutch Elm disease in eastern United States in 1933, funds were made available to Cornell University for an extensive investigation of both entomological and pathological phases of this problem. Professor Readio was invited to come to Cornell and take charge of the research dealing with the insect vectors of the pathogen and possible measures for their control. He arrived in Ithaca in June, 1934, and moved directly to the Boyce Thompson Institute at Yonkers where the work was to be conducted. His keen ability and broad knowledge of insect biology were reflected in the excellent contributions to our knowledge of the life history and habits of the European elm bark beetle, and in the guidance of an extensive program of research by his associates on the other insects associated with the American elm.

Upon the retirement of Professor Glenn W. Herrick as Professor of Economic Entomology in 1935, Professor Readio was placed in charge of the teaching of economic entomology in the department and relieved of all but supervisory connection with the Dutch elm disease project. His enthusiastic interest in this research program was maintained up to the time of his death, and the project received his active support.

Professor Readio was a member of Sigma Xi, Phi Kappa Phi, Gamma Alpha, Alpha Gamma Rho, The American Association of Economic Entomologists, the Entomological Society of America, Kansas Entomological Society and the American Association for the Advancement of Science. He published several comprehensive works and numerous articles dealing with various phases of entomology. His study of the biology of the assassin bugs, the Reduviidae, was particularly outstanding.

As a teacher of economic entomology at Cornell, Professor Readio made a lasting contribution. His friendliness and inherent enthusiasm for the subject were constantly revealed to the students. Anyone concerned about his work always found a friendly welcome. Professor Readio's almost spontaneous willingness to do anything to be of help to his students or associates is well remembered by all of us. Particularly appreciative of this gracious manner were the students from foreign lands who found Professor Readio sympathetic, helpful and willing to assist them at all times. His sense of fair play and natural humor endeared him to a wide circle of colleagues and friends. In his passing there is a very deep and painful sense of loss.

C.E. Palm, T.C. Watkins, D.S. Welch

William C. Rebhun

July 24, 1947 — March 24, 1999

Cornell University and the College of Veterinary Medicine occupied the majority of Bill's professional life. As a faculty member in the College of Veterinary Medicine from 1977-99, he rose through the professional ranks. From 1985-88, he served as head of the Large Animal Clinic. Bill was board certified as a Diplomate in both the American College of Veterinary Ophthalmologists and the American College of Veterinary Internal Medicine.

Prior to his faculty appointment, Bill was in private mixed veterinary practice in Troy, New York, from 1974-77, and in Delmar, New York, from 1971-74. His college days were spent at Cornell's New York State Veterinary College from 1967-71 and the New York State College of Agriculture from 1965 -67.

Bill was President of the Capital District Veterinary Group in 1973 and President of the New York Southern Tier Veterinary Medical Association from 1982-83. His professional associations included the American Veterinary Medical Association, American Society of Veterinary Ophthalmologists, American Association of Bovine Practitioners, American College of Veterinary Ophthalmologists, American College of Veterinary Internal Medicine, and the New York State Veterinary Medical Society.

Although a tireless clinician first, Bill still authored or co-authored 107 scientific manuscripts, 20 textbook chapters, and a textbook entitled, *Diseases of Dairy Cattle*, published by Williams and Wilkins, Baltimore and Philadelphia in 1995. He was a respected reviewer and editor of scientific manuscripts for a variety of journals with topics from equine and bovine medicine to ophthalmology. He gave countless seminars at national and international veterinary meetings as he was a well-respected and immensely popular speaker.

Both the regional and state veterinary medical societies honored Bill by presenting him with the award of Outstanding Service to Veterinary Medicine. These awards honored Bill for his contributions in education, research, and practice.

Since his appointment to the faculty at the College of Veterinary Medicine in 1977, over 2,000 graduate veterinarians from Cornell University were influenced by his unique teaching personality, thousands more in veterinary medicine have benefited by his publications, invited presentations, seminars, and continuing education programs. His practical, no-nonsense approach to the diagnosis and treatment of clinical problems, particularly

of dairy cattle, was a wonderful, almost mystical phenomenon. His ability to combine the science and artistry of medical practice was held in awe, if not envy, by many.

Bill was a competitive individual who worked extremely hard and played hard. His presence was commanding, comforting, candid, often passionate, and always appreciated. He had a remarkable gift for accurately recalling and relaying experiences. He had a prodigious and exact memory, and candid uncompromising honesty. These qualities were evident in his relationships, professionally and recreationally. He was entertaining in a wide spectrum of situations. These traits were also evident in his classroom. Bill was quick to use past situations and cases, both good and bad, as teaching material. He was quick to use mistakes he had made or witnessed to emphasize a point. Bill respected the opinion of others and relished the academic exchanges with colleagues. He was opinionated and passionate when expressing his own ideas. He admired and respected the talented individuals around him and held his head high and his mind open, always striving to learn — even in his final months.

Bill had a tremendous impact on many individuals but a group that was especially important to him were the residents in medicine, ophthalmology, and surgery. He spent time with them, nurtured them, celebrated their successes and commiserated when they failed. He touched their lives in a way that only a mentor can. Bill also held a special place in the hearts of the staff and technicians who worked with him. He treated them with respect and valued their efforts and their opinions. Bill was loved and respected by students, past and present, and served as a role model for hundreds of the veterinary students whom he taught in lecture, laboratory, and one-on-one in the teaching hospital. Countless clients and farmers in New York and neighboring areas have been devastated by losing such a talented and devoted veterinarian and friend.

Bill was as active with non-academic interests as with academe. He was not a spectator but an active participant in numerous sports, particularly softball. A rugged individualist, he was also a true outdoorsman and an avid hunter.

Bill is survived by his wife, Bridget Barry; son, Rob; daughter, April; and grandson, Zach. His professional influence lives on, especially in the minds of his colleagues, the 18 large animal medicine residents, 9 ophthalmology and numerous surgery residents who spent formative, unforgettable years in training under Dr. Rebhun, Bill, Boom, or “the Chief.”

He will be deeply missed and remembered by all his colleagues, clients, and friends as a warm and caring person who touched the lives of many people and their animals.

“The cow is the foster mother of the human race. From the day of the ancient Hindoo to this time have the thoughts of men turned to this kindly and beneficent creature as one of the chief sustaining forces of human life.”

W.D. Hoard, Founder of Hoard's Dairyman, Copyright 1925, by W.D. Hoard and Sons, Co.

Helen J. Recknagel

September 6, 1910 — November 19, 1992

Helen J. Recknagel, a member of the University Faculty for over thirty years, is best remembered for her remarkable effort and success in founding, then editing for fifteen years, the Hotel School's quarterly magazine, until recently the only academic journal in the field. In addition, Helen was the first woman faculty member in the Department and the first woman to gain tenure.

Helen was born on September 6, 1910, in Stratford, Oklahoma, and occasionally commented—always with great pride—on her Cherokee ancestry. She attended the public schools in Ardmore, Oklahoma and graduated from Oklahoma State University with a Bachelor of Science degree, in 1932. She continued her education at the University of Chicago (M.B.A., 1937) and New York University (Ph.D., 1953). Early employment included positions with Standard Oil of Indiana and the National Association of Manufacturers as well as an appointment as assistant professor at the University of Tulsa.

Helen joined the Department of Hotel Administration, then a division of the School of Home Economics, in February 1943 to teach business communications—then little more than secretarial courses. From this beginning she began to offer a variety of technical writing classes, not only for the women students, but to enhance the managerial skills of all “Hotelies.” During these early years Helen's research involved studying the role of professional women in the workplace. Among other projects, she conducted research with the Hotel Sales Management Association and worked for such organizations as Hilton Hotels. Too, she took an active service role with New York State Cooperative Extension and was a national officer of two business fraternities, serving as president of Sigma Alpha Sigma in the mid 1950s.

Without question, it is Helen's legacy at *The Cornell Hotel and Restaurant Administration Quarterly* which is most remarkable and for which she will ever be remembered. In 1960 Dean Meek decided to establish a journal to serve the hotel and restaurant industries and to provide an outlet for faculty writing and research. But the School needed someone to take on its leadership. There was only one logical choice: Helen Recknagel was selected, not only to determine the necessary logistics but to serve as its first editor, a position in which she continued for more than 15 years and for 65 issues. In this capacity, she dealt not only with all the faculty and other academics but, perhaps to her male colleagues' chagrin, with more industry executives than most if not all of them.

Her successor as editor, Paul Beals, recalled working with Helen: “It is impossible to be timid or bland in writing about Helen Johnson Recknagel. Helen had her own perspective, her own firmly held view of persons, of events, and of our industry in general. You may not have agreed with Helen or fully comprehended, but you knew where she stood. Pride, dignity, aplomb, and no small measure of grit characterized her. Surely *The Quarterly* would not have survived to be what it is today without Helen’s distinctive qualities.”

In addition to the magazine, Helen produced a number of manuals and two books during her editorship. One of these, *Marketing for a Full House*, written with C. DeWitt Coffman, became the seminal marketing handbook for the industry and still is in demand more than thirty years later. The book evolved out of a business communication class which had adopted a sales and marketing theme. Few remember that she was instrumental in adding sales and marketing courses to the School curriculum and finding the industry practitioners to teach the first several terms; the field has grown to be among the most popular in the School.

Stories abound about Helen’s forceful leadership. She was a part of everything in and about Statler Hall. She took many junior faculty members under her wing and counseled—even cajoled—them as they made their career decisions. She eagerly met with international visitors, especially the participants in the Hotel School’s “Summer School/’ as the week-long professional seminars were generally known for several decades. At an early picnic at Taughannock Park she fearlessly took her turn in a faculty-student softball game and was involved in a bone-jarring collision during a run-down between first and second base. Helen threw herself headlong into everything she did, and she accomplished so much.

When she retired in 1976, Helen was named professor emerita. She continued to live in Ithaca until her death on November 19, 1992. Her husband, Arthur B. Recknagel, had died thirty years earlier. Helen Recknagel is survived by a daughter and son-in-law, Carol I. and Earl B. Neigh, Jr., of Ithaca; two grandsons, Robert Neigh of Tupper Lake and Phillip Neigh of Ithaca; two nephews; and several great nieces and nephews. Countless others around the world, hotel and restaurant and tourism professionals especially, will always remember Helen for her myriad contributions to the School and to the hospitality industry.

Robert M. Chase, Glenn Withiam, Richard H. Penner

Donald Reddick

March 1, 1883 — April 2, 1955

Donald Reddick was born in Sheridan, Missouri on March 1, 1883. In due time he entered Wabash College where he became under the influence of Professor Mason B. Thomas, one of the great teachers of botany, who encouraged him to major in the field of botany. He obtained the degree of A.B. at Wabash in 1905 and came to Cornell that year for graduate study in botany under Professor George F. Atkinson. He was granted the degree of Ph.D. in 1909.

Reddick served first as Assistant in Botany in the College of Arts and Sciences and later as Instructor in the newly established Department of Plant Pathology in the College of Agriculture at Cornell. Subsequently, he became Assistant Professor, Professor, and at his retirement on December 31, 1950, Professor of Plant Pathology, Emeritus.

His early duties at Cornell included the teaching of formal undergraduate courses in principles of plant disease control and the instruction of graduate students in the field of mycology and in methods in the study of plant diseases.

Doctor Reddick's early contributions to the science of plant pathology included studies on fruit diseases, particularly the black rot of grapes. In the field of fruit disease control he developed effective practices in the use of fungicides in dust form, with particular reference to the time factor. He made significant additions to our knowledge of diseases of beans and of scab, ring-rot and virus diseases of potato. His best known work, however, deals with breeding of potatoes for resistance to the blight disease, a project which he pursued with energy and devotion for many years. In 1930 he visited the mountainous region of Mexico where he collected several species of wild potatoes exhibiting resistance or immunity to blight. With some difficulty he brought these back to Cornell and used them in an extensive breeding program. As a result of this long and painstaking study he produced several hybrid potatoes which combine blight resistance with good market qualities. The most popular of these, the variety Essex, is now being grown in England and New Zealand as well as in the United States.

The personal character of Doctor Reddick was reflected in his research work. His qualities of absolute honesty, attention to detail and high standards, combined with clarity of vision, resulted in attainments of the highest order.

In addition to his teaching and research work, Doctor Reddick was active in other ways in the rapidly expanding field of botanical science. He was one of the pioneers in bringing about the recognition of plant pathology as a

science in this country. He was one of the original members of the American Phytopathological Society and the first business manager of its official journal, *Phytopathology*. He served as editor from 1915 to 1918, in 1919 he was elected councillor and in 1920 president. He was also active in the launching of Botanical Abstracts, served on its Board of Control for two years, and represented plant pathology on its editorial board.

Among the honors which came to him was the appointment as Secretary of the Plant Pathology Division of the International Botanical Congress in 1929. He served as Vice President of the Union of Biological Sciences and was for twelve years President of its Section for Plant Pathology. He was a Fellow of the American Association for the Advancement of Science and served on its council for eight years. He also was a member of the following organizations: Society of American Naturalists, Botanical Society of America, Canadian Phytopathological Society, American Association of University Professors, Gamma Alpha, Sigma Xi, corresponding member of Nederlandsch Botanische Vereeniging and life member of Societe Linneenne der Lyon.

Doctor Reddick's scientific achievements were specifically recognized by citations for meritorious work by the New York State Potato Association, the Potato Association of America and the Canadian Phytopathological Society.

In 1900 Dr. Reddick married Emma Brill, who died in 1943. The children of this marriage are Robert Brill Reddick, Ithaca, N. Y.; Emma Louise Thompson, Detroit, Michigan; and Anna Elizabeth Dounce, Rochester, New York. In 1946 Dr. Reddick married Adeline Newman who survives him.

Doctor Reddick passed away at his home in Gainesville, Florida on April 2, 1955. The part which he played in the development and progress of the science of Plant Pathology is a lasting monument to his life and work.

Lewis Knudson, L. M. Massey, D. S. Welch

J. Saunders Redding

October 3, 1906 — March 2, 1988

J. Saunders Redding, Ernest I. White Professor of American Studies and Humane Letters Emeritus, was widely regarded as being the dean of Afro-American literary critics. The author of eight books and three dozen essays, and joint-editor of an anthology of Afro-American literature still much used in college teaching, he became— with his acceptance in 1970 of his chair at Cornell—the first Afro-American to hold an endowed professorship in literary criticism at an Ivy League university.

Not only an eminent colleague but an unforgettable friend, Saunders joined the Department of English at the culmination of a singular career. He was born in Wilmington, Delaware, the third of seven children in— as he writes — “an upper-class Negro family,” both his parents were graduates of Howard University. His father served as secretary of the Wilmington branch of the NAACP and founded the first black YMCA in that city. His mother, as Saunders tells us in his autobiography, *No Day of Triumph* (1942), taught him and his siblings the lost art of oratory and introduced them, through oral readings, to the canonical works of the Western tradition, especially to those of Hans Christian Andersen, Longfellow, and Shakespeare, but also to the poetry of Paul Laurence Dunbar, whose widow, Alice Dunbar-Nelson, would be the young Saunders’s English teacher at Wilmington’s all-black Howard High School.

Upon graduation at the age of sixteen, he followed his brother Lewis, later a noted civil-rights lawyer, in matriculating at Lincoln University in Pennsylvania, from which he transferred after a year to Brown University, where he earned the Ph.B. and M.A. degrees in English in 1928 and 1932; he was awarded the D.Litt. in 1963. A faithful alumnus of Brown, he served on the Board of Fellows of the Corporation from 1969 to 1981. In 1929 Saunders married Esther Elizabeth James, who together with their two sons, Conway Holmes and Lewis Alfred, survives him. He taught at Morehouse College in Atlanta from 1928 to 1931, when he was dismissed by the conservative administration of that prestigious black college for being “too radical.” After graduate study at Brown and at Columbia University, he taught at Louisville Municipal College from 1934 to 1936, at Southern University in New Orleans from 1936 to 1938, at Elizabeth City (North Carolina) State Teachers College from 1938 to 1943, and at Hampton Institute from 1943 to 1966, where he was named Johnson Professor of Creative Literature in 1955. In 1949-50 he served as visiting professor at Brown, becoming the first black person ever to teach at an Ivy League university, and he was visiting fellow in the humanities at Duke University in 1964-65. In 1952 he traveled to India as exchange

lecturer for the Department of State, and to Africa in 1962 to lecture under the auspices of the American Society for African Culture.

In 1966 Saunders Redding was named Director of the Division of Research and Publication of the National Endowment for the Humanities, in which office he served until he joined the Cornell faculty, serving thereafter as consultant to the Endowment. During his last year in Washington, he was also professor of American History and Civilization at George Washington University. In 1975 he was named to the Board of Directors of the American Council of Learned Societies and in 1976 to that of the Center for Advanced Studies at the University of Virginia. A member of Phi Beta Kappa, he served from 1954 to 1962 and from 1970 to 1973 on the Editorial Board of *The American Scholar*. He was a life member of the National Book Committee and from 1973 to 1976 served as honorary consultant in American culture to the Library of Congress. The holder of eight honorary degrees and recipient of the Mayflower Award in 1944 for *No Day of Triumph*, he was Rockefeller Foundation Fellow in 1940-41 and Guggenheim Fellow in 1944-45 and 1959-60.

Redding's first book, the pioneering *To Make a Poet Black* (1939), has been called "the first comprehensive [and] serious critical work devoted exclusively to Afro-American literature and written by an Afro-American." In it Saunders Redding sought to chart the contours of the canon of the broader black tradition, of his "Great Tradition," and not simply to supplement or refine the three or four broader, inclusive listings he inherited from the work of earlier scholars; he at the same time provided a system of criticism that with great subtlety and acumen formalized the basis for defining that tradition. He was the first scholar to show that, in the first century of its existence, "the literature of the Negro in the North (as of his brother in the South) was. . . essentially an oral literature," and he enunciated a nationalist ideology and esthetic that emphasizes the crucial roles both of black vernacular and of the growth of a free — and literate — black urban culture in the North. To celebrate the fiftieth anniversary of its first publication, Cornell University Press is now publishing a new edition of *To Make a Poet Black*.

The Saunders Redding we at Cornell came to know later in his career is the Saunders whose voice we clearly recognize in a memorable passage of the Phi Beta Kappa address he delivered at Brown University in June, 1968:

Preferential treatment must be accorded the Negro and other disadvantaged minorities if "racial equality" is not to remain a delusion....[However, the] Negro American...is no more African than the fairest Anglo-Saxon Protestant is...His destiny is one with the destiny of America...Let us not deceive ourselves. As the comic strip character, Pogo, once remarked, "We have seen the enemy, and they is us".

When in his senior year he was the only black student at Brown, he wrote of having felt as if he were “fighting the whole white world. ... I hated and feared the whites. I hated and feared and was ashamed of Negroes.” But at the same time, he recalled, “it was at college that I began to give serious attention to writing, not as a career but because I liked it; though only heaven knows why, since even then the effort used to tear me apart.” The complexity and trenchancy of those remarks (“trenchant” was a favorite adjective of Saunders’s, signifying a special sort of incisiveness that defines differences or categories with great sharpness and clarity) suggest both why that effort cost him so much and why we so prize its fruits — notably, in addition to the books already mentioned, *Stranger and Alone* (1950), *They Came in Chains: Americans from Africa* (1950), *On Being Negro in America* (1951), *An American in India: A Personal Report on the Indian Dilemma and the Nature of Her Conflicts* (1954), *The Lonesome Road: The Story of the Negro’s Part in America* (1958), and *The Negro* (1967). In 1949 the National Urban League cited Saunders Redding for outstanding achievement, and it is characteristic of Saunders that, when Cornell offered him the Ernest I. White Professorship in American Studies, he asked that it carry in addition the denomination “Humane Letters.” Since his retirement in 1975, the chair has in his successor’s hands retained the expanded title.

Saunders and Esther then continued to make their home in Ithaca and to travel widely, and for the better part of a decade Saunders continued his active schedule of writing, lecturing, and consulting. Shortly before his death, the University established in his name and honor a program of doctoral fellowships with which to bring outstanding minority students to Cornell. Like Saunders’s writings, this program stands as a memorial to an extraordinary colleague, to his elegance of manner and morals, to his pointed curiosity and his scrupulous care with words, to the combination of finesse and toughness that so contributed to the integrity of his character and brought him to a settled conviction of what his work in life was to accomplish.

Ephim Fogel, Charles S. Levy, Henry Louis Gates, Jr.

Harold Lyle Reed

June 29, 1888 — December 22, 1972

Harold Lyle Reed, Robert Julius Thorne Professor of Economics, Emeritus, died in Ithaca on December 22, 1972. Born in Iowa in 1888, he attended Oberlin College, where he received the A.B. degree in 1911. He came to Cornell as a graduate student that same year, receiving the Ph.D. degree in economics in 1914. He was an assistant professor at Cornell from 1916 to 1919 and at New York University from 1919 through 1920. He served in the American army during the first World War.

In 1920 Reed became professor of economics at Washington University, St. Louis. In 1923 he returned to Cornell as professor of economics where he taught with vigor and distinction until his retirement in 1954. On two different occasions he served as chairman of his department. He also found time to render outstanding public service to the state of New York during several terms on the important State Banking Board.

When Reed returned to Cornell from Washington University, he was already demonstrating his unusual capacity to analyze and elucidate the development of the major policies of the country's new central banking system - the Federal Reserve System. He was perceptive enough to appreciate the far-reaching consequences of the System's actions and of changes therein as political and social forces were brought to bear on it. His two books on the development of federal reserve policies were pioneering studies which brought him wide acclaim.

Reed was a stern critic of monetary fads and nostrums, particularly during the years of the Great Depression. His unrelenting criticism of what he felt to be unsound monetary and credit practices made him some enemies but also many admirers. His professional standards were high and he never softened his views or his remarks merely to be popular.

In the classroom Reed was a vigorous, intense, exacting teacher. He always taught a "full load" — two large undergraduate courses and a graduate seminar, also usually large. In his undergraduate courses Reed insisted on the observance of certain standards of classroom conduct and demeanor by students, standards which he adhered to strictly himself: no smoking, no tardiness, no reading of newspapers, and complete attention to the work at hand. In his retirement he was appalled at the decline in general student (and faculty) conduct, especially in classroom deportment, at his beloved Cornell. Definitely Reed was a professor of the old school!

Reed's graduate seminars were rigorous and highly respected by graduate students. He served on many graduate committees.

Harold Reed was a sociable man. He enjoyed the company of his graduate students and of his colleagues, junior and senior. He had been an athlete as an undergraduate at Oberlin. He continued to be interested in athletics until his death. He was an excellent golfer. His recollections of baseball players and their outstanding performances of sixty years ago, and of early twentieth-century wrestlers from his native state of Iowa, would frequently astound his academic friends. He had a vast and detailed knowledge of the Civil War. He read widely. He remembered an amazing amount of what he had read, well into his ninth decade. He was, indeed, an unusual and interesting man, and a colleague very much worthwhile having known and been associated with.

M. Slade Kendrick, Paul M. O'Leary

Hazel E. Reed

June 7, 1907 — January 4, 1997

Professor Emerita Hazel E. Reed joined the College of Home Economics faculty in 1949 as Associate Professor in Cooperative Extension work and an Assistant State Leader of home demonstration agents. Throughout her career at Cornell University, she provided strong leadership to community leaders and professional home economics educators in all counties across the state. She encouraged the development of innovative home economics programs at statewide and local levels, established a supervised professional development experience for extension home economists assuming program leadership positions, and chaired a task force whose deliberations led to new opportunities for extension to contribute to the quality of living for children and families and to expand programs emanating from the college to a growing audience. Her experience statewide as well as a love for travel provided her with important perspectives on how different cultures dealt with social concerns. She retired as Assistant Director of Extension and full Professor in 1967.

Professor Reed was born June 7, 1907 in Savannah, New York, the only child of Albert and Bertha Evans Reed. Valedictorian of the 1926 high school class, she received her Baccalaureate degree from Cornell and her Master's degree from Michigan State. After a seven-year career teaching home economics at Oswego High School, she held several key professional positions with Cooperative Extension in Monroe and Oneida Counties and in the City of Syracuse prior to joining the Cornell faculty and College of Human Economics administration in 1949. She became an Associate State Leader in 1954; Professor in Extension in 1962; State Leader in 1965 and Assistant Director in 1966. She witnessed major changes at the university, the college and Cooperative Extension during her tenure and in the years following retirement. The College of Human Ecology (nee home economics), was still in Comstock Hall when she was a student, its small size creating an atmosphere of close camaraderie among professors and students. Martha Van Rensselaer and Flora Rose were co-directors at the time. At her 50th reunion, Hazel Reed reflected upon the 25 year old discipline she had studied as an undergraduate and that her 50th reunion marked twice the number of years the college was old when she entered: "No wonder there are changes".

Professor Reed was a role model for Cooperative Extension staff and college colleagues; she demonstrated and encouraged commitment to educational excellence. She represented Cooperative Extension to the (then) Bureau of Home Economics in the State Education Department, and consulted on a statewide study of adult education programs in home economics. Acting as Extension Administration's official representative to the New York State

Nutrition Council, she also held leadership positions in the Council as vice-president, institute program chair and policies committee chair. Through responsibilities such as these she persisted in interpreting and communicating home economics extension programs to many people outside of the immediate extension family.

Her commitment to the Cooperative Extension system and the people of the state did not keep her from assuming responsibilities in the broader college and university community. College committee work (related to Cooperative Extension) included educational, extension studies and television policies, health and safety, inservice education and farm and home week. She served on the college's nominations and elections and institute committees and chaired the ad hoc College Study Name and Focus Committee that resulted in the change in name to the College of Human Ecology in 1969.

Her professional affiliations included: American Home Economics Association; Adult Education Association; Epsilon Sigma Phi; New York State Association of Extension Home Economists; Omicron Nu; Phi Kappa Phi; and Pi Lambda Theta. During her period of affiliation, she held district, state, and national elective offices. Among these positions were: chair, Extension Service section, American Home Economics Association; national recognition as an outstanding home demonstration agent in New York State; vice-president and president of the New York State Home Economics Association; and president, New York State Home Demonstration Agents Association. Although names of several of these have changed, Miss Reed remained committed to their missions and goals.

Throughout her life, Hazel Reed maintained a strong interest in Cornell activities and a commitment to the university's philosophy of extension and outreach. She was interested in the new directions of Cooperative Extension and a major supporter of the Human Ecology Endowed Family Policy Professorship in Extension. She established a trust to develop the professorship and to support the Herbert F. Johnson Museum of Art, Laboratory of Ornithology, the Cornell Plantations, the Cornell University Library Associates and the Fund for Quality Concerts. Professor Reed also made a testamentary commitment to Cornell by participating in the 1993 taping of the Planned Giving Video, "Close Ties".

She worked diligently to continue interaction with former colleagues and friends and to support many interests in the Ithaca community. Following retirement, she took an active part in the Tompkins County Hospital (now Cayuga Medical Center) auxiliary board and its volunteer staff, and the Friends of the Library Board, chairing its annual book sale. She was a member of the First Congregational Church, the Cornell Campus Club, Cornell Women's Club, and Tompkins County Senior Citizens. The concert series and lectures at Cornell and Ithaca College, as well as opera, local theater, bridge and dinners with friends were among the many social activities she

enjoyed. Traveling was a particular passion; she delighted in the many foreign and domestic sites she had visited. She loved returning to Ithaca as much to her roots, friends, and colleagues.

We, her friends and colleagues, miss her. She was a true professional, mentor, and a caring, gracious friend.

Lucinda A. Noble, Ethel W. Samson, Bettie Lee Yerka

Hugh Daniel Reed

Professor of Zoology

March 4, 1875 — August 23, 1937

Hugh Daniel Reed was born at Hartsville, New York, March 4, 1875. He entered Cornell University in the fall of 1895 and was graduated in 1899 with the degree of Bachelor of Science. Appointed a Fellow in Vertebrate Zoology, he pursued graduate study for four years and in 1903 was awarded the degree of Doctor of Philosophy.

From 1900 to 1910, Professor Reed served successively as Assistant, Instructor, and Assistant Professor in the Department of Neurology and Vertebrate Zoology under Dr. Burt G. Wilder, the Professor in charge. Granted leave of absence, he spent the year 1909-1910 at the University of Freiburg, Germany, working under the direction of the eminent zoologist, August Weismann, and the equally eminent comparative anatomists, Robert Wiedersheim and Ernst Gaupp. During his year abroad Dr. Reed also represented Cornell at the International Zoological Congress at the University of Graz, Austria.

Professor Wilder retired in June, 1910, and Assistant Professor Reed was selected as head of the Department. He at once entered upon the task of organizing a Department of Zoology, offering for the first time at Cornell a unified, systematic, and complete course in zoology. In 1919 he was made Professor of Zoology.

Despite the exacting demands of reorganization and administration, Dr. Reed found time to keep in touch with advances in his field and to contribute thereto. His first scientific paper was published in 1908, and the field of re-research to which he then gave his primary attention continued to hold his interest throughout the succeeding years. At the same time he was able to devote time and study to other scientific problems.

In the death of Professor Reed, Cornell University lost an administrator of marked ability and an inspiring and effective teacher. Within his department, Dr. Reed was a constant source of inspiration and advice. Those who were associated with him most intimately will not soon forget the debt they owe him as a counselor and they will also remember the emphasis which he placed on teaching in his appraisal of obligations to the institution which he served.

As an indication of the esteem in which he was held by his graduate students, we need only recall their presentation of his portrait to the University in 1934. His many personal friends will deeply regret the loss of a man in whom personal charm, wide culture, and a balanced judgment were combined to an unusual degree. Friends and colleagues alike mourn his passing, and the affectionate memory of his many sterling qualities will be colored by

deep admiration for the sturdy valor with which he carried on, cheerfully despite serious and long continued ill health.

William Woodland Reeder

March 26, 1911 — April 2, 1999

William Woodland Reeder, Professor of Rural Sociology, Emeritus, served as a member of the Cornell faculty from 1949-76. His lifelong passion was delving into the beliefs, disbeliefs, and social actions that he felt were the essential determinants of why individuals and groups behave as they do. He passed away on April 2, 1999 in Logan, Utah, his home after retirement from Cornell.

After his birth in Robin, Idaho, on March 26, 1911, his family moved to Brigham City, Utah, where he grew up on a dairy farm. There he learned the values of hard work and commitment to rigorous schedules and came to appreciate the importance of an education. After high school, he attended Utah State University where he completed a B.S. degree in Sociology in 1935 and a Master's degree in 1937. In 1939, he enrolled at Cornell University to pursue a Ph.D. degree program in Rural Sociology.

When military service loomed, with the outbreak of World War II, he was accepted in officers' training in the Army. As he completed his training, he had an opportunity to join the Army's Morale Research Division. Bill was one of the designers of the extensive study of the dimensions of morale among American soldiers in the European theater. His assignments required research in England, France and Germany. This opportunity launched his career pursuits in studies in human behavior.

Following release from the Army, he served as an Instructor in the Department of Sociology at Utah State University for a short period, then returned to Cornell to finish his Ph.D. dissertation. He taught for a few months at the Pennsylvania State University when he was offered a position as Assistant Professor in the Department of Rural Sociology at Cornell. Bill's mentors at Cornell were Dwight Sanderson, W.A. Anderson, Leonard S. Cottrell, Jr., Robert A. Polson and Olaf F. Larson, successive heads of the department. Professor Cottrell counseled Bill when he first joined the faculty as an Assistant Professor, thus, "When I tell people I am a sociologist they reply, 'What do you do with that discipline?' I would like you to stress its useful application in all of your teaching and research. Remember, the sky is the limit." Bill took that counsel to heart and dedicated his career to teaching both undergraduate and graduate students how to use theory and principles in improving their quality of life as individuals and in their service to families, organizations and communities.

Professor Reeder had an easy-going manner that was engaging to his students and colleagues, yet they sensed depth and earnestness in his warm, friendly style of teaching and service. He rose through the ranks to become a

full Professor. His popular courses on “Determinants of Successful Leadership” and “Community Development” attracted numerous undergraduate and graduate students. Throughout his career, he was continuously involved in conducting research aimed at testing his theories about the fundamental influences of beliefs and values as important determinants of behavior and social action. His long list of publications has added significant dimensions to the body of literature in this arena. He was also a member of the Rural Sociological Society.

In 1967, Professor Reeder filled a special assignment for his department when he traveled around the world to interview former graduate students to assess the quality and value of the training they had received and of the professional applications that they were making of that training. A report, “The Transferability of North American Rural Sociological Training to Other Cultures and Other Societies,” was prepared.

Professor Reeder long-practiced the principles that he taught. He was actively involved in the Ithaca community. He was a board member of Cornell United Religious Work, the South Side Community Center and the Bryant Park Civic Association. In his church affiliation, he served as Counselor in the Eastern States Mission of the Mormon Church for eleven years. He served as President of the Ithaca Branch and as Patriarch of the Ithaca, New York Stake.

After his retirement in 1976, the Reeder family moved to Logan, Utah. There he became affiliated with the Department of Sociology at Utah State University and was active in community affairs and served as a teacher and Patriarch in his church. In his retirement years, he loved to pore over his research findings on the “Determinants of Morale Among American Soldiers.”

Bill’s life was a rich legacy of love for teaching, for his family, for community service, for his church callings, and for his Maker. He is survived by his wife, Letty; and their four children: Kathleen, Claudia, Douglas, and Kimberly.

Eugene C. Erickson, Olaf F. Larson, Harold Capener

Katherine M. Reeves

July 19, 1899 — October 1, 1963

The sudden death of Professor Katherine Reeves was a profound shock to her professional colleagues and many friends in the Ithaca community. As a perceptive teacher, skillful writer, and creative worker for the welfare of children, she had served Cornell and the community for over thirty-six years.

Born in Winchester, Kentucky, Professor Reeves was the daughter of the Reverend John Reeves and Mae McCormick Reeves. She received her early education in the public schools of Pendleton and Weston, Oregon, and her later elementary and secondary education at Science Hill School in Shelbyville, Kentucky. After two years at Ohio Wesleyan University she transferred to Kentucky Wesleyan College where she received her Bachelor of Arts degree with a major in English in 1922. She taught for a year in her native Kentucky and then joined the staff of Hull House Settlement in Chicago. While there, she became interested in early childhood education in general and the relatively new nursery school movement in particular. To prepare for what she always referred to as an “exciting educational adventure,” she studied at the National College of Education at Evanston, Illinois, receiving the nursery-kindergarten-primary teaching certificate in 1927. She later attended Columbia University and completed her Master of Arts degree in 1948.

Professor Reeves joined the staff of the New York State College of Home Economics at Cornell University as a nursery school teacher in the fall of 1927 and was appointed Director of the Cornell Nursery School in 1937. She was named Associate Professor of Child Development and Family Relationships in 1943 and Professor in 1952.

As a teacher of young children, Professor Reeves was especially gifted. For her each child was a very special person, different from all others. She loved each one—the rebel, the conformist, the bright child, and the slow child—and each child responded with love, trust, and spontaneity. She was curious about how children see the world of nature, words, and people; insightful in sensing children’s needs; and skillful in providing a stable environmental situation conducive to individual and group development. Her knowledge of children’s needs for space, materials, and natural beauty was instrumental in determining the design of the present Cornell Nursery School, which for many years was regarded as a model for university nursery schools.

Professor Reeves’s concern for children and her activities in their behalf extended well beyond the sphere of her professional responsibility. Ever an active worker in the community, she took a leadership role in the establishment of wartime day care centers in Ithaca and throughout the state. She was one of the founders of the New York State

Nursery School Association. Throughout her life she was involved with a variety of community activities such as the Tompkins County Mental Health Association, the Social Planning Council, and the Youth Bureau. She was a member of the Advisory Committee on Nursery Education of the State University Agricultural and Technical Institute at Cobleskill, the International Association of Childhood Education, and the National Association of Nursery Education; she was named to the governing board of the latter in 1960.

Endowed with unusual ability to communicate ideas, orally and in writing, Professor Reeves's classes in "Kiddy Lit" (Children's Literature) will long be remembered by the many students she inspired. Students report being held spellbound by her "soft, pleasant, yet expressive voice" as she read from a children's classic or analyzed a child's behavior. They recall her patience and kindness, her willingness to arrange informal studies, and her encouragement when they had academic or personal problems. Her office and her home were always open. Students expressed their appreciation by choosing her Professor of Merit for the year 1961, a recognition that moved her deeply. But even more, she found satisfaction in the considerable numbers of students whom she helped to influence to enter teaching. She followed the careers of these students, taking quiet pride and deep satisfaction in their accomplishments.

Writing was Professor Reeves's major avocation. She loved to write and often said that she never wrote anything which she didn't enjoy writing. She conducted a monthly column, "The Children We Teach," for *Grade Teacher* for several years. She published many articles for teachers in professional magazines. For her book, *Children—Their Ways and Wants*, she received the citation of the Child Study Association of America in 1961. In one of her articles Professor Reeves wrote, "A book is a personal statement, a way of giving out again what you have learned and taken and come to consider important as you have lived." This was the essential characteristic of all her writings. From a seemingly inconsequential incident of everyday life she was able to elaborate a theme for an article or children's book. One of her books for children, *The Farmer's Catnap*, was the 1957 selection of the Kansas State Reading Circle, adopted for use in that state as a school text. In 1959 she was honored for her "outstanding contribution to children's literature" by the State Association of Elementary School Principals. Her last book, *The Cloud Eater*, was a selection of the Children's Literary Guild. She was at work on a fifth children's book at the time of her death.

In addition to writing for teachers and children, Professor Reeves wrote essays, fiction, and poetry. She received the Emily Clark Balch Award for adult fiction in the *Virginia Quarterly Review* in 1961. Of her many poems, twenty were selected for the 1958 Durham Chapbook Award and published under the title *Time Is a Cadence*. She was a member of the Poetry Society of America and the Central New York Branch of the National League of American

Pen Women. At the time of her death, she was serving as a judge for nonfiction and miscellaneous articles for the National League of American Pen Women. She was also a member of and past president of the Writers Association of the Ithaca area.

Endlessly generous of her self—her time, her strength, her concern—Professor Reeves will be sorely missed by all who knew her. She had that rarest of human gifts, unerring awareness of the moment when sharing would increase another's joy, or diminish another's sorrow. She has left splendid legacies in her writing, in the outstanding collection of children's literature assembled under her direction for the University Library, and in the weekly story hour which she founded at the Cornell Public Library and which will continue as a happy, living memorial. But to her friends she has left riches "for the mind to keep"; they are unique and immeasurable, the gift of one whose quiet, unassuming selflessness was a testament of faith.

Mary Ford, Catherine J. Personius, Virginia True

Felix Reichmann

September 14, 1899 — July 24, 1987

Those who knew Felix Reichmann well considered him to be the very embodiment of European culture, widely read, widely interested, with a thorough classical education, a life devoted to books—books as products of man’s total capacity, his technical skills, artistic ingenuity and intellectual power. He was a complete bookman, an expert in bibliographic history—especially the history of the medieval booktrade, the tradition of writing, illuminating and printing, book collecting, librarianship, and literacy in its highest sense of letters and learning.

Felix Reichmann was Viennese and he ran the family bookstore, one of the centers of the intellectual life in the Vienna of the twenties and early thirties. His preparation for such a career was not altogether typical for a Viennese intellectual in those days, having served as a cavalry officer in the Austrian army on the Russian front during World War I. But then, more suited to his future career as a bookman and art historian, he studied under the giants of the field, Julius von Schlosser and Max Dvorak among others. In 1938 at the time of the “amalgamation” (Anschluss) of Austria with the German Reich, Felix was interned in the infamous Dachau concentration camp and then in Buchenwald. A year later he was released, and he emigrated to America.

A new career began, still the career of a bookman, but now as librarian, first in Pennsylvania, and later, after a stint with the Office of Strategic Services, at the Library of Congress.

Therefore when Felix Reichmann arrived at Cornell, he brought unique qualifications for the tasks and responsibilities that were awaiting him. And, unusual as the extraordinary compatibility of talents to his responsibilities were, the timing of his arrival was even more so. It occurred at the moment when — after decades of neglect — the Cornell University Library was about to experience a period of revival and growth that placed it among the ten great research libraries in the United States.

The happy circumstance that was unfolding at Cornell after World War II just at the time of Felix Reichmann’s arrival offered the opportunity for the full exploitation of his rare assortment of talents. With the energy and capacity of the Library’s newly assembled leadership and the wisdom and vision of President Deane Malott ready to encourage and support the renewal of Cornell’s Library and its re-creation as a mighty instrument for scholarship and research, Felix was the man to accomplish the goals that were being set forth. He was a dedicated scholar with a breadth of knowledge and scholarship that equipped him to guide and encourage his fellow scholars at Cornell

in the development of the bibliographical resources he knew that they would need for the multiplying academic programs that characterized the post-war academic scene.

He was, however, first and foremost a librarian. He immediately established himself at Cornell as a leader among the library staff, earning their affection as well as their respect. Major decisions were not matters to be mulled over, referred to committees, delayed pending a consensus, or passed along for the consideration of some higher authority. A decision was something to be decided upon, and with the wisdom and experience that he had accumulated and the keen judgment that never failed him, he was ready to act. The shift to the Library of Congress classification and its cataloging rules and processes is a case in point. It involved major long term expenditures of thousands of dollars but the benefits that were realized are here today and will continue into the age of automation.

This small tribute to the memory of Felix Reichmann must also acknowledge how he and his wife, Lilly Dörfler Reichmann, helped to enrich life at Cornell. Much has been said on happier occasions than this about his attributes as scholar, bookman and librarian, but those who knew him and felt close to him — and there were many — knew him, too, as a gracious, witty and cultured gentleman. He shared this aspect of himself with all — not just within a small circle. One would not describe him as an extrovert, but as a whole person he opened himself to all with whom he shared friendship. This happy condition was apparent particularly among the staff with whom he worked. He held them in high esteem, respected them as human beings and fellow workers and as friends — and they in turn valued and esteemed him. Remarkably even the humblest among us seemed to acquire through our association with him a share of the cultural and humane values that were a part of him.

Recognition of the tremendous work that Felix Reichmann was undertaking in rebuilding the Cornell University Library collections and immeasurably extending their scope came about very quickly among the librarians and the research and teaching faculties. Word soon spread to the academic library community across the country and Cornell and Reichmann acquired a national reputation that continues. It was somewhat longer before formal and official acknowledgement came, in 1964, with his being named by the university as Professor of Bibliography recognizing both his scholarship and his success in achieving the goals that he and Steve McCarthy had set seventeen years before.

The qualities and attributes he demonstrated in his professional career at Cornell as assistant director of the University Libraries and professor of bibliography were complemented by his grace and distinction as a husband, father and friend to many of us. We are happy that we may share his memory with his wife Lilly, whose friendship

we cherish; his daughter Ingrid Reichmann Matheson; and his many friends and colleagues at Cornell and throughout this country and abroad.

H. Peter Kahn, Stephen A. McCarthy, J. Gormly Miller

J. Thomas Reid

March 14, 1919 — November 18, 1979

J. Thomas Reid, professor of animal science at Cornell for thirty-one years, and a Liberty Hyde Bailey Professor since 1977, was known and respected worldwide as one of the foremost animal nutritionists of the past three decades.

Professor Reid, known to everyone as Tom, was born and reared on a farm near Cumberland, Maryland. After his early education in the elementary and high schools in Cumberland, he enrolled in the University of Maryland, receiving the Bachelor of Science with honors in 1941. He earned much of his college expenses through work in the university dairy barns where he developed interests that ultimately led to his major contributions in animal biology.

Tom's graduate work was done at Michigan State University where he earned the master's degree in 1943 and in 1946 the doctorate, with distinction, in animal nutrition and biochemistry. He served as assistant professor at Michigan State for one year and as associate professor at Rutgers University for two years before joining the faculty at Cornell in 1948 as associate professor of animal husbandry (as the department was then known), with major responsibilities in research and teaching in dairy cattle nutrition and production. He was promoted to professor in 1951 and later served as head of the Department of Animal Science from 1971 to 1976.

Professor Reid's research and publications rapidly led to national and international recognition. Methods and principles he developed were widely adopted as research tools by fellow scientists around the world. His early work on perennial forages showed their nutritive value could be predicted by the date of harvest, a principle that changed forage harvesting and storage patterns throughout the Northeastern United States. It was an important factor in providing forages of higher nutritive value for livestock.

Professor Reid led a team of colleagues and graduate students in long-term studies on energy use by dairy cattle for productive, reproductive and life-span performance that led to the determination and clarification of the nutritional requirements of a number of species. A classical study was conducted on the effect of level of early nutrition on ultimate lifetime performance of dairy cattle that clearly showed the disadvantages of both overfeeding and underfeeding during the growing period. His intensive research on the quantitative nature of body composition as influenced by energy, growth rate, age, and species was acclaimed by animal scientists in

many countries. These studies with cattle, sheep, and swine demonstrated that sex, breed, and body weight are more significant in predicting the composition of carcass at slaughter than the kind of ration fed.

Tom Reid and his graduate students published more than two hundred articles dealing with nutrition and physiology in national and international scientific journals. He contributed one or more chapters to sixteen books on forage evaluation and utilization by livestock, physiology of digestion and metabolism in ruminants, body composition in animals and man, and food production and consumption.

Tom Reid was a popular lecturer and discussant and presented over seventy-five invitational papers at national and international meetings and conferences. He served on numerous committees of scientific and professional organizations and was a consultant to research institutions in Uruguay, Brazil, and Peru; the United States Department of Agriculture; the Food and Agriculture Organization of the United Nations; and the Latin American Society of Animal Production.

At numerous times, Professor Reid served on committees of the Cornell faculty and the College of Agriculture and Life Sciences on educational policy, graduate studies, and administration.

Professor Reid was a very effective teacher for both undergraduate and graduate students. His standards were high and he always gained the deep respect and admiration of the students. He was chairman or cochairman of graduate committees for forty-four doctoral students, plus many master's degree candidates, of whom about one-half were from other countries. Tom Reid's influence on the intellectual growth of these graduate students was deep, rich, and rewarding. Most of them now hold key positions in major universities and research centers in the United States and in other countries and in industries allied with animal agriculture.

Possessed with a keen, analytical mind, Tom Reid served very effectively as a critic and interpreter of research data. He was a theoretician, but was always seeking a practical application of the principles and postulates of nutrition and energetics.

To the public, Tom was always dignified, serious, and reserved. This often tended to mask an intense interest in sports and a dry sense of humor. He was a dedicated and prodigious worker, spending long hours both day and night, including Sundays and holidays, in his office and laboratories, even to the detriment of his own well-being. At the time of his death, Tom was engaged in the writing of extensive grant proposals intended to procure financial support for domestic and international research. Also, he was preparing an invitational paper for presentation at the Sixth Western Hemisphere Nutrition Conference in 1980.

In recognition of his accomplishments Professor Reid was the recipient of many high awards: the American Feed Manufacturer's award in nutrition in 1950 and the Borden Award in 1957 (from the American Dairy Science Association); American Grassland Council's award in 1965; and the Morrison Award in 1967 (the highest award of the American Society of Animal Science). His portrait was hung in the gallery of the world's leading nutritionists in the Royal College of Agriculture of Norway in 1968. He also was honored with a request to give an invitational paper at the 1972 Sir John Hammond Memorial Lectures to the British Society of Animal Production. He received a Guggenheim Fellowship Award in 1955-56 and spent the year as a visiting scientist at the National Institute for Research in Dairying, University of Reading, England. Also, he was visiting scientist at Cambridge University in 1960 on a National Science Foundation travel award.

Tom was a member of the American Dairy Science Association, the American Society of Animal Science, the American Institute of Nutrition, the British Society of Nutrition, and the British Society of Animal Production.

He is survived by his father, F. Ernest Reid of Cumberland, Maryland, his wife, Alice Smalley Reid, four daughters and one son, two sisters, a brother, and several nieces and nephews.

Kenneth L Turk, George H. Wellington, Samuel T. Slack

Otto August Reinking

February 11, 1890 — May 31, 1962

Otto August Reinking was Professor Emeritus and former head of the Department of Plant Pathology at the New York State Agricultural Experiment Station at Geneva. He died May 31, 1962, at the National Institutes of Health hospital in Washington, D. C. He is survived by his wife Addie.

Professor Reinking was born in Madison, Wisconsin, February 11, 1890. He was a graduate of the University of Wisconsin, where he received the B.S. and M.S. degrees in 1912 and 1915, respectively. He was granted the Ph.D. degree in Plant Pathology by the University of Wisconsin in 1922.

Prior to receiving his Ph.D. degree, Professor Reinking taught in Honolulu and at the Colorado Agricultural College, and from 1916 to 1921 was on the faculty of the University of the Philippines where he organized and headed the Department of Plant Pathology.

In 1922, Dr. Reinking joined the Research Department of the United Fruit Company and five years later was named director of the Tropical Research Division, a position he held until 1932. His accomplishments as teacher, researcher, and administrator in the Philippines and with the United Fruit Company won for him worldwide recognition as an authority on diseases affecting tropical plants, particularly sugar cane, bananas, and Manila hemp.

For three years, 1932 to 1935, Professor Reinking engaged in private research on the genus *Fusarium*; most of that research was done at the Biologische Reichsanstalt in Berlin, where he collaborated with H. W. Wollenweber in the publication of *Die Fusarien*.

On July 1, 1936, Dr. Reinking was appointed Professor and head of the Department of Plant Pathology at the New York State Agricultural Experiment Station at Geneva, retiring April 30, 1950. In addition to organizing and directing the broad program of the department, he also carried on considerable research on pea root-rot, cabbage yellows, and other soil-borne diseases of vegetable crops and continued independent research on *Fusarium*. He published numerous bulletins and scientific articles pertaining to his Station projects and was author of more than ninety publications. His findings with regard to disease control in important canning crops grown in New York and his wide general knowledge and experience led to many demands upon him in an advisory capacity, both from his professional colleagues and from farm organizations.

During the Second World War, Dr. Reinking filled special assignments for the United States Department of Agriculture, the State Department, and the Board of Economic Warfare in Central America. Upon retirement from the Experiment Station he accepted appointment as Counselor in Plant Pathology, Office of Foreign Agricultural Relations, United States Department of Agriculture, and served for four years in the Philippines to aid in the development of research in the western Pacific area. He won the department's Superior Service Award in recognition of his contributions.

Professor Reinking was consultant for the United Fruit Company, 1956-1959. He also was invited by the U.S. Department of Interior to be a tropical plant disease specialist in the examination of cocoanut decline in the territory of Guam, February and March of 1961.

Dr. Reinking was a Fellow of the American Association for the Advancement of Science, and a member of the American Phytopathological Society, the Botanical Society of America, the American Genetic Association, the Cosmos Club, the Explorers Club, Rotary, and Torch.

Dr. Reinking's scientific approach to a problem and his sound conservatism, coupled with a genial personality, won and held the respect and confidence of all who came in contact with him.

J. D. Lockett, W. T. Schroeder, J. M. Hamilton

Leonard Reissman

June 10, 1921 — January 29, 1975

Leonard Reissman died at the age of fifty-three in Ithaca, New York, on January 29, 1975, the victim of a heart attack that had struck him two days earlier. The day before he became ill was the opening of the spring semester, and in excellent health he had met his large class of students in Urban Society.

He had come to Cornell University as professor and chairman of the Department of Sociology in the fall of 1970. Before that he had held only one permanent teaching post, serving at Tulane University, New Orleans, for nineteen years, where he was the Charles A. and Leo M. Favrot Professor of Human Relations. From 1967 he was chairman of the Department of Sociology and director of the Urban Studies Center at Tulane. He also served from time to time as visiting professor or fellow at Columbia University, the London School of Economics, and the Center for Advanced Study in the Behavioral Sciences.

Len's parents were Polish Jewish immigrants who raised their children in the Workmen's Circle tradition, with its emphasis on non-Marxist socialism and secular (Yiddish) Jewish culture. Len grew up in Detroit and finished his undergraduate work at Wayne University just before World War II. After army service, he sampled several graduate schools: he studied at Wisconsin and Princeton and, under the auspices of a fellowship from the Social Science Research Council, was a visitor in the seminars of Robert K. Merton at Columbia and Talcott Parsons and Florence R. Kluckhohn at Harvard. But when his mentor, Paul Hatt, went to Northwestern, Len enrolled at that university and was awarded the doctorate in 1952.

During his years at Tulane he was engaged in a number of cooperative projects based on studies of the local community and its institutions. Among his partners were K. H. Silvert, J. H. Rohrer, R. V. Platou, and T. Ktsanes. They published many articles and monographs on local voting patterns, on the nursing profession, on the Jewish community, and on the urban South. Stimulated by these researches, his maturing theoretical interests focused on two interrelated themes: the nature of social stratification and the underlying processes of urbanization and urban life. The results were published in the two books that established him as a major figure in sociology: *Class in American Society* (1959) and *The Urban Process: Cities in Industrial Societies* (1964). Both reflected his creative talent at synthesis: the ability to absorb a huge body of empirical research and evaluate it with the eye of an experienced practitioner of the art and then exercise the higher skill of imposing theoretical order and coherence on what would otherwise be confusion and contradiction. He wrote with sophistication about complex matters

and led the rest of us toward understanding, and he did it without pretentious jargon; at its best, his prose was lucid and elegant, but it was never either fancy or oversimplified. He continued to read the theoretical masters of social science, both old and new (particularly Max Weber), and was always aware that social reality was more complex and challenging than our models could fully encompass. He learned new techniques, but never fell for new fads. Recently he again demonstrated his style in a critical review of current thinking on the linkages between social research and social policy concerning poverty in *Inequality in American Society* (1973), and the week before he died he finished the final proofreading of a book written with his long-time friend, Kalman H. Silvert, to be published as *Education, Class and Nation: The Experiences of Chile and Venezuela*.

Len Reissman was as steady in his family life and friendships as he was in his academic posts. He married Ethel Banner while they were both graduate students, and they were approaching their twenty-fifth anniversary. They have two daughters: Alison, who is a senior at Cornell, and Carla, who is a freshman at the University of Massachusetts, Amherst. His great warmth and blunt honesty, coupled with his earthy sense of humor, tied him to a network of friends that was started during his student years and never weakened. In turn, many of his own students joined the network and along with colleagues became a part of the Reissman family circle. He was at Cornell for fewer than five years, but the people who came to his memorial service from the local area and from miles away overflowed a large chapel on campus and thus attested to the impact he had made on so many lives. We wept, although Len would have preferred that we laugh in remembrance of the good times we had shared.

Recognizing his devotion to students, Ethel has asked that we establish a memorial fund for their benefit. Contributions may be sent to the Trust Office, Cornell University, Day Hall, Ithaca, New York 14853, with the request that they be deposited in the Leonard Reissman Memorial Fund.

Joseph A. Kahl

Thomas A. C. Rennie

February 28, 1904 — May 21, 1956

Dr. Thomas A. C. Rennie, who died at the age of 52 from a cerebral hemorrhage on May 21, 1956, was an outstanding clinician and teacher. After graduation from the University of Pittsburgh and the Harvard University Medical School, Dr. Rennie spent three years in internal medicine at the Peter Bent Brigham Hospital in Boston and at the University of Michigan. With this experience, it was not surprising that he should have become attracted to the psychobiologic teaching of Adolf Meyer. He spent from 1931 to 1941 in the Henry Phipps Psychiatric Clinic (Johns Hopkins Hospital), first as assistant resident and resident psychiatrist, and later as a member of the full-time staff. During this period he became especially interested in the dynamic understanding of schizophrenia, and the problems of effectiveness of treatment and prognosis of various schizophrenic disorders. Other publications during this period dealt with physiologic and psychopathologic aspects of psychiatric illness. When in 1941 he accepted the position of associate professor at Cornell University Medical College, he continued these interests. Much of his time was, however, devoted to the supervision of treatment of patients in the Payne Whitney Psychiatric Clinic and to the teaching of the resident staff. His interest in general medicine and in its relationship to psychiatry was demonstrated in his clinical activities and in his teaching. In all psychiatric patients he stressed physiologic findings as well as psychodynamic factors. He was greatly interested in teaching physicians his dynamic type of psychiatry and he participated eagerly in courses for general practitioners and internists. His excellent clinical judgment was highly valued as a consultant to patients in various departments of The New York Hospital, where he occupied the position of attending psychiatrist.

During the Second World War, Dr. Rennie organized a rehabilitation service for veterans. This successful venture brought him in close touch with activities in the community. He expanded his interest in rehabilitation to discharged psychiatric patients and to the utilization of community resources for minor and major psychiatric problems, and increasingly to the problems of social and preventive aspects of psychiatry. In 1950 he became Professor of Social Psychiatry, and with the liberal support of several foundations was able to develop the large project of social psychiatry at Yorkville in New York City. The new Department of Social Psychiatry became well organized and highly productive. National and international recognition of this new attempt in research in mental health soon followed. The results of a four-year study are now being put together in book form.

Dr. Rennie was born in Motherwell, Scotland on February 28th, 1904 and came with his family at the age of six to Pittsburgh. He remained closely attached to all members of his family, yet acquiring new friends readily wherever he worked. His friendliness, courtesy, and interest in all types of people, as well as his high sense of integrity made him not only liked but admired, and he became a recognized leader in his field. He found recreation in literature, theater and music. As a talented pianist he enjoyed music by himself and with others.

Dr. Rennie was an outstanding teacher whose lectures and scientific presentations were most carefully prepared and delivered in excellent style. His superb command of the English language made it a pleasure to listen to him, and he was in constant demand for presenting addresses at professional meetings. However, he enjoyed most the direct contact with students in individual discussions and in seminars. His efforts toward increasing the effectiveness of psychiatric teaching were untiring and he exerted a great influence on the resident staff of the Payne Whitney Psychiatric Clinic and the Franklin Delano Roosevelt Veterans Administration Hospital (Montrose). His influence in teaching and in broad social aspects of psychiatry made itself felt while he was a member of the Group for the Advancement of Psychiatry, and during the time that he served on the Council of the American Psychiatric Association. His attitude was well expressed in one of his last requests that instead of flowers for his funeral, contributions be made toward a scholarship for special work in psychiatry by medical students. The Cornell University Medical College has accordingly established the Thomas Rennie Scholarship Fund.

Dr. Thomas A. C. Rennie will be long remembered by his many friends, colleagues, students, and patients, and he will have a permanent place in psychiatric literature.

Oskar Diethelm

Ernest William Rettger

April 6, 1871 — October 9, 1938

In the death of Ernest William Rettger on October 9, 1938, Cornell University lost a member of its staff who had given the College of Engineering most distinguished service for over thirty years. After obtaining his A.B. degree from Indiana University and the degree of doctor of philosophy from Clark University, Professor Rettger taught at Warrensburg State Normal School and at Princeton and Stanford Universities before coming to Cornell in 1906. Here he held successively the positions of honorary fellow in Structural Mechanics, instructor in Civil Engineering, and assistant professor and professor of Applied Mechanics.

Professor Rettger's remarkable ability in using higher mathematics in the fields of applied mechanics and hydraulics made his services invaluable to the School of Civil Engineering and to a large group of engineers who sought his aid in the solution of many complicated technical problems.

He was a very modest man who had little or no appreciation of his great influence upon his associates. He hated sham in all its forms. He was the personification of honesty and all that was honorable. He was an indefatigable worker and a confirmed progressive. He was prodigal in his expenditure of time and energy for the benefit of the University, his fellow members of the staff, and his students. He enriched the University community by countless acts of kindness, and enhanced the reputation of the University by his masterly teaching and by his many contributions to knowledge in his chosen field.

He was especially interested in graduate work, and devoted much time in recent years to the guidance of graduate students. Foreign students in particular came to look upon him as their most sympathetic friend and adviser.

He will be sorely missed because of his value as a friend, his deep scholarship, his tolerance and humor, his sage advice, and his spirit of helpfulness. We are grateful for the privilege of having known him and shall always cherish the many happy memories of our long years of association with him.

Juan Estevan Reyna

December 26, 1878 — October 7, 1974

Juan Estevan Reyna was born in the state of Morelos, Mexico; received his early education in a private school in Cuernavaca, the capital of Morelos; and then spent three years in Denver, Colorado, in a Jesuit School, College of the Sacred Heart, later called St. Regis College. In 1893 he transferred for one year's work in the Ithaca High School, after which he spent three years in Sibley College at Cornell in electrical engineering. Then, because his father was interested in mining, he transferred in 1897 to Columbia School of Mines. Upon his father's death in October of that year, he changed back to electrical engineering and received the degree of E.E. from Columbia University in 1898, after which he returned to Ithaca and took a summer course in civil engineering. After a year in the engineering department of R. Hoe and Company, manufacturers of printing presses, he returned to Mexico to settle his father's estate, a sugar plantation of fifteen thousand acres, of which he became manager. In 1906 he was construction engineer of a canal eleven miles long, carrying 106 cubic feet of water per second to irrigate approximately five thousand acres of land planted in rice and sugarcane. This involved the design and construction of a dam across the river, the dam gates, the sluice gates, and twenty-two aqueducts.

In 1910 while Professor Reyna was visiting in Ithaca, political disturbances broke out in parts of Mexico; the state of Morelos was taken over by nongovernment forces; the large estates were overrun and financial return to the owners ceased. In 1912, being thus deprived of income, Professor Reyna accepted a position in the Department of Drawing at Cornell, under Professor W. C. Baker, to teach mechanical and perspective drawing, a connection that continued for seven years, when that work was transferred to the Department of Agricultural Engineering, where it has since remained. In 1921 the federal government in Mexico took over the Reyna plantation and divided the irrigated land into small parcels, which they distributed among the families of the neighboring towns, promising at the same time to reimburse the owners at a fraction of the fair value of the property. Because there appeared to be no hope of ever receiving this payment or recovering control of any of the property, Professor Reyna became a citizen of the United States. During World War II Professor Reyna spent six months in Washington as engineering consultant to the coordinator of the Inter-American Affairs Emergency Rehabilitation Division in preparing designs and drawings of improvements of simple implements and equipment to assist the less educated of the farming population of Latin America.

Professor Reyna was a master of his subject, being expert as a draftsman, a penman, and a scientific illustrator and in the special field of perspective drawing; as a teacher, while strict and demanding and always requiring accurate and correct work from his students, he was always sympathetic and cooperative with any young person who was desirous to learn, always ready to give special help where it was sought.

Professor Reyna was well known on the campus for his vigorous and skillful games of tennis and squash, which he played until his eightieth year. He developed an indoor tennislike game that he and his friends played frequently. His other interests included floriculture, the study of diet and vitamins, and the study of the archaeology of the Aztecs of his native country.

Professor Reyna retired on June 30, 1946, but was called back to teach for an additional year.

He attributed his long life to “clean living,” lots of sleep and a good wife, who died several years ago. He stopped smoking at age seventy because it might interfere with his “wind.”

He and Mrs. Reyna celebrated their golden wedding anniversary in 1947, marked by a special blessing bestowed upon them by Pope Pius XII.

He leaves a son, Leon C. of New York City, two daughters, Mrs. Phillip (Nenetzin) White of Mecklenburg and Mrs. Frederick (Nancy) Todd of Stamford, Connecticut, eight grandchildren, and twelve great grandchildren.

All who knew him will remember him as a very sociable, friendly person who liked company and enjoyed living.

O. C French, E. S. Shepardson

Eben Sumner Reynolds

June 23, 1917 — December 15, 1969

Eben Sumner Reynolds was born in Milford, Massachusetts, June 23, 1917, the son of Sumner C. and Esther Williams Reynolds.

He prepared at Loomis School, Windsor, Connecticut. He received his A.B. degree in English from Dartmouth College in 1939 and an M.S. in hotel administration from Cornell in 1947.

He started teaching as an instructor in hotel accounting in 1959 and was appointed an associate professor in 1965.

Following graduation from Cornell, and prior to his return, he was employed as food controller for the Sheraton Corporation of America during 1947 and 1948, as vice president and general manager of Exchange Buffet Incorporated from 1948 to 1953, and as an associate director of the Boston Children's Medical Center from 1953 to 1959. Here he formed a concern for children which persisted throughout the rest of his life.

During the war years he obtained a disability waiver from the armed forces, serving in the U.S. Army Medical Corps from June 1942 to October 1945 in England. Here he met Ann Gillespie Herbert, whom he married in 1944. Five children were born of this marriage—Peter E. 1946; Wendell A. 1947; Elizabeth A. 1949; Meredith I. 1951; and Alister 1957.

It is difficult to reduce a man's life to words. It is particularly difficult to convey the supreme attributes of gentleness and intentness which were Eben's.

His interest in teaching led to participation in the varied seminar programs conducted by the Hotel School for many segments of the hospitality industry and for the alumni in many countries. Eben was a particular favorite of the Club Managers Association, for whom he developed a financial management seminar program that has stood the test of several years and the scrutiny of hundreds of students from all sorts of clubs. Teaching trips—to England while on a leave of absence in 1967 and to the Far East in 1969—helped to spread his unique financial management concepts to many countries. Always eager for new experiences, he often said that he learned more from his students at such meetings than they did from him; however, it was his special knack for making everyone a participant in his teaching that enriched the educational experience of all who heard him.

Concerned by the fact that there was no text on financial management in the hospitality industries, he proceeded to remedy this situation and produced first a self-study program for the Educational Institute of the American

Hotel and Motel Association and then a text for publication on the same subject. At the time of his death he was busy planning an advanced text in financial management covering his chosen field. He wrote as he taught, not lecturing but encouraging participation by his audience. In his classes it sometimes seemed as though the students conducted the class until one realized that the proceedings had a logic and direction that could come only from one thoroughly familiar and even fascinated by the topic.

Professor Reynolds was vitally concerned with keeping the Hotel School program in tune with the times. He was prolific in developing suggestions to the administration relative to course improvement for his area. He was a member of many committees, among them the Petitions Committee, the Registration Committee, the Student-Faculty Committee, and the Subcommittee on Curricula Reorganization. As a teacher he was outstanding, attracting many students from outside his own college. He was interested in students as individuals, giving freely of his time to those who needed extra help with either scholastic or personal problems.

He was a member of the Cornell Society of Hotelmen, Ye Hosts, Phi Kappa Phi, Chi Phi, the Cornell Hotel Association, and the Statler Club, of which he was secretary.

Beyond his teaching responsibilities, Professor Reynolds advanced valuable suggestions for the structural redesign of the Statler Hall accounting laboratories.

Although he was an excellent teacher he never considered himself exclusively such. Rather, teaching was only a part of his many faceted life. His community activities and his hobbies were many and varied.

He was an accomplished golfer. Additionally, he served for many years as a director of the Ithaca Country Club, bringing his innovative views to the operation of that organization.

Fishing was one of his keenest interests. He enlisted a wide circle of friends who joined him fishing the Grasse River. He was a member of the Twin Falls Club, located on that river.

His summers, when not otherwise occupied, were spent at Star Lake. He was a very active member of the Star Lake Protective Association, taking a major part in the annual sailing regatta.

His interest in sports was widespread. In spite of early physical handicaps he played semipro ball. He was closely associated with basketball, contributing to the development of his three sons in this sport. He followed hockey and football with avidity.

A consuming interest in gardening led to the acquisition of a greenhouse where he spent many rewarding hours.

He and his wife taught Sunday school with a deep reverence and commitment. He was a deacon of the Congregational Church in Cayuga Heights.

Eben's loss is keenly felt. However, his inspiration is self-perpetuating, and his influence on and interest in the improvement of curriculum and teaching methods will be effective for a long time.

Charles E. Cladel, John D. Lesure, Charles I. Sayles

Cornelius Packard Rhoads

June 20, 1898 — August 13, 1959

Cornelius Packard Rhoads, Professor of Pathology in the Department of Biology and Growth of the Sloan-Kettering Division of the Cornell University Medical College, died suddenly at his home in Stonington, Connecticut, August 13, 1959. Dr. Rhoads was born in Springfield, Massachusetts, June 20, 1898. After receiving a Bachelor's degree from Bowdoin he graduated *cum laude* from the Harvard Medical School in 1924. Various internships and graduate fellowships followed. An instructorship in pathology at Harvard preceded his joining the staff of the Rockefeller Institute for Medical Research, first as associate in pathology in the laboratories of Dr. Simon Flexner and later as associate pathologist and member of the Institute in charge of a laboratory dealing with hematologic disorders.

With the erection of the new Memorial Hospital buildings on a site provided by John D. Rockefeller, Jr., and largely with funds provided by the Rockefeller Foundation, the board of Managers of Memorial planned to develop an institution where clinical investigation by experimental methods would have a predominant position along with pure laboratory research in the field of cancer. With the retirement of James Ewing from the directorship of Memorial the position was offered to Dr. Rhoads because of his great interest in clinical instigation. He came to Memorial in mid-1939 and officially assumed the directorship on January 1, 1940. He had scarcely begun his task when the war came and Dr. Rhoads assumed the position of chief of the medical division of the Army's Chemical Warfare Service, with the rank of Colonel. This position in turn introduced him, by casualty studies, to the possibilities inherent in the nitrogen mustards as chemical agents for cancer treatment. Cancer chemotherapy became his principal interest for his remaining years.

In 1945 Alfred P. Sloan, Jr., determined to build an institute for cancer research on land adjacent to the Memorial Hospital, and in 1948 the Sloan-Kettering Institute was opened. Dr. Rhoads was director of what had become the Memorial Center for Cancer and Allied Diseases until 1953, at which time he relinquished a portion of his activities, assuming the title of scientific director of the Center and director of the Sloan-Kettering Institute. The Center grew; it added the Strang Clinic, the James Ewing Hospital, and lastly the new Walker Laboratory of the Sloan-Kettering Institute. The Sloan-Kettering Division of the Medical School was set up. Arrangements were made for acceptance of graduate students and candidates for advanced degrees who would work within the Institute.

Dr. Rhoads was a member of many professional scientific societies, the recipient of many awards and of three honorary doctorates—two of sciences, one of laws. He was a trustee of the Charles F. Kettering Foundation.

The present American Cancer Society owes much of its being to him as the rejuvenator of the virtually extinct American Society for the Control of Cancer. He was a man of enormous energy and capable of a huge amount of work, but even these attributes could not withstand the demands made upon him. We know of no man about whom it can be more justly said that he worked himself to death.

Fred W. Stewart

Fred Hoffman Rhodes

June 30, 1889 — November 30, 1976

Fred Hoffman “Dusty” Rhodes, affectionately known as the father of chemical engineering at Cornell, died November 30, 1976, in De Land, Florida. He was born on June 30, 1889, in Rochester, Indiana, where he completed his elementary education, graduating from high school in 1906. He then entered Wabash College, where he majored in chemistry, also acting as an English instructor in his senior year. Apparently this was the start of his interest in perfection in writing that later plagued many Cornell chemical engineering students but proved to be a great help to them in their professional careers.

The Cornell Department of Chemistry needed an assistant in qualitative analysis in February 1910. Dusty accepted the job, although he had never had qualitative analysis at Wabash. He later became a personal research assistant to Louis Dennis, the head of the Department of Chemistry for many years.

After receiving his Ph.D. degree from Cornell in 1914, he went to the University of Montana for a year to teach chemistry and metallurgy. In 1915 he returned to Cornell as an instructor in qualitative analysis, the course he had never taken. After two years he decided that he needed industrial experience, and from 1917 to 1920 he worked for the Barrett Company, starting out as a research chemist and ending up as director of research. In this period he contributed to some of the developments that became the foundation of chemical engineering. He returned to Ithaca and Cornell in 1920 as a professor of industrial chemistry. At this time, Professor Dennis was buying equipment in Europe for Baker Laboratory, which was then under construction, leaving Dusty with instructions to buy some equipment that might be suitable for industrial chemistry. When Dennis returned, he found that some of the equipment that had been installed in the basement of Baker Laboratory was curiously similar to that found in chemical engineering laboratories. For the next ten years there is no documented evidence that chemical engineering as such at Cornell was anything but a figment of Dusty’s imagination. During this period, however, Cornell graduated many bachelors of chemistry, who later turned out to be some of the outstanding leaders of the chemical industry. It was also during this period that Dusty published a number of articles covering such things as soaps, lubricating oils and greases, phenol, and paints. Interspersed among them were research papers on unit operations. In the worst part of the depression he finally convinced the faculty there was such a thing as a chemical engineer, at least to the extent that they agreed the degree of chemical engineer would be granted to any bachelor of chemistry who completed a fifth year under Dusty’s direction. In 1933 the first class of three chemical engineers was graduated.

In 1938, the School of Chemical Engineering was created as a separate school in the College of Engineering with an integrated five-year course reading towards the degree of bachelor of chemical Engineering. At this time the school's faculty consisted of Rhodes and an assistant professor, with an occasional instructor when one could be found who would work hard enough to meet Dusty's standards. The official faculty, however, included two other engineers and two chemists carefully chosen so that faculty policies did not conflict with those of Professor Rhodes. This proved to be very satisfactory, and before long it became unnecessary to hold faculty meetings.

Since Dusty had achieved his objective and had created a separate School of Chemical Engineering, the next step involved obtaining a suitable building to house the school. Fortunately, S. C. Hollister, the dean of the College of Engineering at that time, proved an able and willing coworker in obtaining a chemical engineering building, which was to be the first unit of the new engineering quadrangle. In 1940, Franklin W. Olin donated the funds for Olin Hall, and construction was started early in 1941. The new Olin Hall of Chemical Engineering was first used in May of 1942, and Dusty was named the first Herbert Fisk Johnson Professor of Industrial Chemistry.

During the World War II period, in addition to a heavy twelve-month teaching load, Rhodes served in the Office of Production Research and Development, under the War Production Board. He was also developing staff, faculties, and a curriculum for metallurgical engineering, a new discipline for Cornell, and a bachelor's degree program was started in 1947. The school then became the School of Chemical and Metallurgical Engineering until 1963, when metallurgical engineering was combined with materials science. In addition, Dusty was elected a director of the former German firm, the General Aniline and Film Corporation, a post he held for nearly ten years. The influx of veterans after the war caused a critical housing shortage for Cornell, threatening to lower the number of chemical engineering students, so Dusty provided rooms for twenty in Olin Hall under strict rules to govern their behavior.

Dusty officially retired July 1, 1957, after a year's terminal sabbatic leave (the only one he ever took) to "go fishing." He then proceeded to write a history of the chemistry department and the chemical engineering school and was elected an alumni trustee for a five-year term. Shortly afterwards, the Cornell Alumni Association voted that all candidates for this position must have been a Cornell undergraduate, which Dusty was not.

Dusty, above all, insisted his chemical engineering students be given the best possible chance to achieve the competence needed to further their careers. He required excellence in teaching; he helped provide facilities and financial support for the school and for chemical engineering students; he strongly resisted interference by outsiders and had the personality to succeed in these endeavors. Dale R. Corson, president of Cornell University and former dean of engineering, made the following comments:

“Dusty Rhodes was himself no ordinary person, and he wanted extraordinary individuals as students. He wanted to teach and train superior engineers. With a humanity covered with a veneer of gruffness and mild chicanery, he built the curriculum and the program, forced his students to superior work, and then assured them of positions of status in the profession. He fought for his students, he supported them, and he defended them against incursions from alien beings. He continued to be concerned about them when they left Olin Hall. His continued interest in the fate and fortunes of chemical and metallurgical engineering alumni is well documented.”

About a year before Rhodes retired, a small group of his former students and Professor Winding of the School of Chemical Engineering, formed a committee to attempt to raise enough money from the then approximately seven hundred chemical engineering alumni to endow a chemical engineering professorship in Rhodes's name. It was an ambitious undertaking for such a small group, but by 1970 well over a half million dollars was accumulated, almost all of it from Dusty's former students. In 1971 the Fred Hoffman Rhodes Professorship in Chemical Engineering was established. Dusty was very pleased when one of his students, Professor Peter Harriott, was made the first holder of this professorship. The professorship is a fitting tribute to an extraordinary person, an example of the affection and high regard extended by his students.

He is survived by his widow, Ethel, of De Land, Florida, and a daughter, Clara Rhodes Rosevear of Toronto.

Peter Harriott, Franklin A. Long, Julian C. Smith, Charles C. Winding

Kathleen Rhodes

February 22, 1914 — May 12, 2002

Miss Rhodes was born in Finchley, Middlesex County, England, part of North London, on February 22, 1914. Her early education was completed in London where she received a teaching certificate in Domestic Science from the National Society's Training College in 1935. From then through the World War II years, she taught homemaking in a senior modern school in London, adults in one of the Polytechnic Institutions in London, and organized the Department of Home Economics at N. Gloucestershire Technical College in Gloucestershire. She also taught at the Teacher Training College in Liverpool, England. Miss Rhodes came to the United States in 1945 on a scholarship from the American Home Economics Association to study home economics at Cornell. She received a Master of Science in Education degree in 1947, and a Ph.D. degree in Home Economics in 1950. From 1949-53, she worked in the New York State Education Department where she was Assistant Supervisor for home economics education in secondary schools throughout the state. She was appointed Chair of the Department of Home Economics at Douglass College, the New Jersey College for Women in New Brunswick, New Jersey in 1953, and remained there until she returned to Cornell as Associate Professor of Home Economics Education in 1956. She was appointed full Professor in 1963.

Miss Rhodes was particularly interested in international work, helping new and developing institutions with curriculum development and teacher training in home economics or domestic science as it was often termed in African nations. Her interests in this field were broad; she saw home economics as a pathway for young women—both in the United States and in developing countries—to break out of a rigid family structure and restrictive larger society. West Africa provided insights into how new curricula could be effective in helping young girls and women to create a different kind of life for themselves. In the fall of 1963, Miss Rhodes went as a Fulbright Scholar to Winneba Training College and the University of Ghana to serve as curriculum development consultant. She also served on the Ghana Project Steering Committee for the United Nations Food and Agriculture Organization from 1964-78.

Over the years at Cornell, Professor Rhodes continued her interest in international home economics, offering courses describing and analyzing developments in the field, and becoming friend and advisor to the stream of international students who came to the College of Home Economics. She was continuously active on college and university committees having to do with international studies; the status of rural women both in the United States and abroad; and the development of college level programs in home economics which would offer students both

a view of the world they were not likely to get from other programs and an opportunity to become qualified for higher level employment as teachers and organizers in the field of home economics.

In 1978-79, Professor Rhodes' formal retirement coincided with an initiative of Dean Ziegler's to develop a formal program of international studies in the College of Human Ecology. At Ziegler's request, Miss Rhodes worked with college faculty and with the Center for International Studies in the university to create the outline of such a formal program, which would provide opportunities for Human Ecology students to study abroad for credit. Two courses were established, one which students could take before foreign study, and a second course after their return which asked them to reflect upon their foreign experience. The college's initiative came at the same time that the university was creating its Study Abroad Program so that after a few years, it was logical to fold the college's program into the university's.

Miss Rhodes was a strong believer in the education of young women for the variety of roles they could play in contemporary society. Her influence on generations of Cornell students was notable. She had a delightful personality, always cheerful, effervescent and good humored. Miss Rhodes was widely admired for her graciousness. After she had completed the project on international studies in the College of Human Ecology, retiring a second time, she shared a home in Ithaca with her friend and colleague, the late Irene Patterson. She continued to travel extensively and to pursue her many interests in education and foreign affairs.

Jerry Rivers, Jerome Ziegler

Thor Rhodin

December 9, 1920 — February 17, 2006

Professor Thor Rhodin died quietly in his sleep on February 17, 2006. He was an eminent scientist and educator, a dedicated Quaker and a devoted family man.

He earned his B.S. degree from Haverford in 1942 and his Ph.D. degree from Princeton in 1946. His career as an educator spanned more than 30 years beginning at the James Franck Institute of the University of Chicago and ending at the School of Applied and Engineering Physics at Cornell University during which time he taught at Cambridge University and the Massachusetts Institute of Technology as well. Professor Rhodin, widely recognized for his distinguished research in surface chemistry at DuPont and the University of Chicago, joined the Cornell faculty as an Associate Professor in 1958. Thor's enthusiastic dedication to the Engineering Physics undergraduate program throughout his long career at Cornell had a significant influence in the development of the Engineering Physics curriculum; his contributions were a major force contributing to the "first in the nation" ranking enjoyed by our Engineering Physics Department. He lectured on a wide range of subjects in the physical sciences to countless undergraduate, graduate and post-doctoral students on three continents. He is remembered by his students as an outstanding teacher and trusted and sympathetic advisor, whose office was always open. Long after his retirement in 1991, Thor continued as Professor Emeritus to be an active teacher and advisor, maintaining enthusiastic interests in graduate seminars in surface science and in introduction to engineering courses for freshman and sophomores.

Professor Rhodin is credited with pioneering work in the early days of solid-state surface sciences beginning with his research on surface analysis using Auger electron spectroscopy. He played a major role, over several decades, in shaping the development of the field from fundamental work, using the field ion microscope, on the imaging and bonding of individual atoms at surfaces to the fundamentals of surface catalysis of hydrocarbon chemistry by the transition metals. His early work at Cornell on the atomic processes that led to the formation of oriented epitaxial crystalline films on substrates is still quoted extensively in current literature. Thor had a reputation for excellent instincts in choosing the directions of research that would make the biggest impact in the fields of surface physics and surface chemistry. Author of more than 200 scientific articles over his career, Thor attracted the best students to work with him, many of whom have subsequently become recognized leaders in the field in their own right. He

received the Humboldt Senior Scientist Prize in 1986, was a fellow of the American Physical Society, and served as advisory editor on numerous scientific journals.

In his 80s, Thor actively participated in cutting-edge research in the field of atomic force microscopy (“AFM”). He enthusiastically pursued interdisciplinary initiatives involving physics, surface sciences, microbiology and genetics, culminating in the publication of several articles on the imaging of RNA polymerase II. This research illustrated the use of AFM as a direct imaging tool for large protein complexes that are being increasingly recognized to be critical for many cellular functions.

Thor worshipped with the Ithaca Society of Friends and actively supported its mission from 1958 until his health began to deteriorate. He served as its Clerk from 1976-78 and was active in its First Day School in the 1960s and the 1980s. At various times, he acted as Recording Clerk on numerous committees including the Program Committee, Ministry and Oversight, Trustees, Peace and Social Action and the Burt House Committee; in addition, he frequently served as the Meeting’s representative at Regional Meeting and the New York Yearly Meeting. As a longstanding member of the Union of Concerned Scientists, he was steadfast in his support of their work in addressing critical arms control and environmental issues. Working evenings and weekends, Thor was an active draft counselor during the Vietnam War.

He is survived by his wife of 57 years, Elspeth Lindsay Rhodin, his four children and seven grandchildren. His son, Robin, practices as an orthopedic surgeon in Beaufort, South Carolina. His daughter, Ann, is an artist living in Ithaca, New York. His son, Lindsay, is a merchant banker in London, England, and his son, Jeffrey, is a business process re-engineering expert based in Boston, Massachusetts.

John Blakely, John Silcox, Watt Webb, Terrill Cool

James Edward Rice

March 12, 1865 — October 25, 1953

After a long and eventful life, James Edward Rice, Emeritus Professor of Poultry Husbandry, died in Miami, Florida, on October 25, 1953. He and Mrs. Rice had made their home in Miami for a number of years. He had been ill for some time and for the last five years had been blind. Interment was at Grove Cemetery, Trumansburg, New York, near the farm which he operated with the help of his sons, when still Professor and Head of the Poultry Department at Cornell.

Professor Rice was farm reared and possessed in great abundance the sturdiness and character traditionally associated with a man of the soil. He was born at Aurora, Illinois, March 12, 1865. Both parents and foster parents died before he was fifteen. His father lost his business in the Chicago fire of 1871. His sense of honesty forbade him to take the name of the family which adopted him and his sister, so he lost an opportunity to become their heir.

He also defied his aunts and uncles who wished that he might become a doctor like his grandfather and who would have financed his education. Instead he followed the wishes of his father who urged him to go to Cornell University and become an “educated farmer.” It was necessary for him to earn all his expenses while in college.

His personal qualities of persistence, enthusiasm, leadership, and determination showed up early in his career during his attendance at Granville Military Academy and while in the officer-training unit at Cornell, where he earned virtually every honor attainable. Only his love for agriculture gained as a child and youth and the inspiration of articles he had read wooed him away from a regular Army appointment.

After graduation in 1890, Professor Rice remained at Cornell for a year as graduate assistant to Professor Isaac P. Roberts, teaching the first formal course in poultry husbandry to be offered.

The urge to carry on in the business of farming called him back to the land, and for eleven years he farmed in Bucks County, Pennsylvania, and Westchester County, New York. He took time out during this period to spread the gospel about scientific poultry raising, delivering 1134 talks at farm institutes in four states. He became head of the Cornell Experimenters’ League. Then when Liberty Hyde Bailey was made Dean of the College of Agriculture at Cornell in 1903, he asked Rice to join him as assistant professor of poultry husbandry. This was one of the most fateful business decisions Professor Rice ever made. He became professor and head of the department in 1907 and continued at that post until his retirement June 30, 1934. The poultry building named Rice Hall in 1940, and

the recently established Rice Memorial Library in the Albert R. Mann Library of the College of Agriculture are monuments to his memory. He was the first professor of poultry husbandry in America and probably in the world. An oil portrait placed in Rice Hall by friends and former students does him honor, as does a bronze bust, the gift of Mrs. Rice.

Professor Rice's achievements were many. He organized the first poultry judging school in the United States in 1918, and the first poultry show, emphasizing production qualities in 1922; served as the first institute lecturer on poultry husbandry and started the first poultry extension work. He edited the Poultry Science series of text-books and was coauthor of two poultry books, Judging Poultry for Production, and Practical Poultry Management.

He was one of the founders of the Poultry Science Association, serving one term as its president, and of the World's Poultry Science Association, and was a life member of both. He served as chairman of the 7th World's Poultry Congress, in Cleveland, Ohio, in 1938, and was president of the World's Poultry Science Association from 1939 to 1948. One of the peaks in his long and distinguished career came in 1948 when he presided as president of the World's Poultry Science Association at the 8th World's Poultry Congress, in Copenhagen, Denmark. At the meeting in Denmark he was made an Honorary Past President of the Association. He attended six of the World's Poultry Congresses (Holland, Canada, England, Germany, United States, and Denmark) and his contacts were so wide that he became the best known poultryman in the world. He was a founder of the Northeastern Poultry Producer's Council and served one term as its president.

It is impossible to measure or even grasp the wide influence of Professor Rice. Twenty-eight of his students became heads of poultry departments in the United States, Canada and other lands. Many others have become teachers in high schools and colleges, research workers, practical poultry farmers and commercial operators in the rapidly expanding poultry industry. Research that Professor Rice and his colleagues began in the nutrition and health of the lowly hen has not only made the chicken the most scientifically fed animal we have today but the fundamental knowledge gained has aided materially in improving human nutrition and health.

Youth always held an important place in the thinking and activities of Professor Rice. He early fostered club work for boys and girls which later developed into 4-H Club work. Locally and nationally he devoted much time to the Boy Scout movement. He served on the National Council and was primarily responsible for the establishment of a fine camp in his own district.

Student groups held his interest. Because of his enthusiasm for youth he established at Cornell several debate stages, speaking contests for university students. He played an important part in establishing Ho-Nun-De-Kah, an honorary society for students in the College of Agriculture at Cornell and for many years entertained the group with a chicken barbecue on his beloved “Egg and Apple Farm,” near Trumansburg.

Professor Rice’s long life was marred by two personal tragedies—the loss of his first wife, Elsie Van Buren Rice, in 1926, after 28 years of married life, and the untimely death of his eldest son at the age of 46. He married Louise E. Dawley, a lifelong friend in 1936, who was a most helpful and loving companion. Professor Rice is survived by Mrs. Rice, two sons, John V. B., and James E., Jr., both of Trumansburg, New York; and three daughters, Mrs. Alice Paddock, Gettysburg, Pa; Mrs. Ruth McMillan, Ithaca, N. Y.; and Mrs. Cyrus W. Riley, Oakland, California, and 15 grandchildren.

To describe Professor Rice fully—that is impossible. One of his former students said, “His character is made up of all the little incidents, like sparks from an emory wheel, that constitute his life.” Another said, “It’s his contagious vision.” A third said, “It’s in his every expression—in his sparkling eyes,” and a fourth said, “It’s his faith, ability, energy, enthusiasm and great and lovable personality; qualities of a pioneer and leader.”

J. H. Bruckner, G. O. Hall, G. E. Peabody

Floyd Karker Richtmyer

October 12, 1881 — November 7, 1939

Floyd Karker Richtmyer was born on October 12, 1881, in Cobleskill, New York, of a family settled in that region since colonial times. He received the A.B. degree from Cornell University in 1904 and after two years as instructor in Physics at Drexel Institute he returned to Cornell for graduate work, which led to the doctor's degree in 1910. He served as assistant in Physics during his senior year and was appointed instructor in Physics in 1906, assistant professor in 1911, professor in 1918, and dean of the Graduate School in 1931.

During the thirty-three years between his return to Cornell and his untimely death on November 7, 1939, his services to the university as teacher, investigator, and administrator were such as it is the lot of few men to give. Throughout the period he was giving prodigally of his time and effort to scientific and educational projects outside the university. The numerous positions which he filled do not adequately indicate the magnitude of the labors which he performed. He undertook each new task with an optimistic enthusiasm which persisted in spite of difficulties, and he gave to each the same careful attention as though it were his principal interest. As a result, his success in administrative positions brought upon him ever more demands. Four national societies, each of which he served in many capacities, honored him with the presidency, the Optical Society of America in 1920, the Society of the Sigma Xi in 1924, the American Physical Society in 1936, and the American Association of Physics Teachers in 1937. Similar services extending over many years culminated in his appointment as chairman of the division of physical sciences of the National Research Council in 1930, vice-president of Section B of the American Association for the Advancement of Science in 1930, vice-president of the American Association of University Professors in 1932, and secretary of the Association of American Universities in 1938. Active in the founding of the American Institute of Physics, he was a member of its governing board from its foundation and a member of its executive committee after 1934.

He was associated with the editorial staff of the *Journal of the Optical Society of America* from 1917 until his death and was editor-in-chief of that journal after 1933; he was largely responsible for the establishment of the "Review of Scientific Instruments," first as a part of that journal and later as an independent periodical; he was its editor from 1933 to 1939. From 1929 until his death he was consulting editor of the International Series in Physics. During that period thirty volumes of the series were published. In 1928 he published his *Introduction to Modern Physics*, which has been widely used as a textbook. At the time of his death he was preparing the third edition of this work.

In the classroom he was an inspiring teacher; outside he was the student's warmhearted friend and counselor. He won the affection and enduring loyalty of many a Cornell student by the help he freely gave in any kind of difficulty. He was particularly interested in foreign-born students and he made use of his nation-wide influence to assist them. No one of his many activities was closer to his heart than the International Association of Ithaca, of which he was the president for several years.

Professor Richtmyer's career as an investigator began when he was an undergraduate. Scientific research and its application to human needs became the dominant interest of his life. As a graduate student he published four notable papers on the photoelectric effect. Thereafter he devoted himself for several years to the fields of photometry, physiological optics, and illumination. In 1919 he began the series of investigations on x-rays which has given him an outstanding reputation, but his interest in optics continued. He studied the intensity of the solar corona during the eclipse of 1932 and was in charge of the polarization measurements of the solar eclipse expedition to Canton Island in 1937.

His classic work on the absorption of x-rays, a long series of precise measurements, led to the establishment of the law of variation of absorption with the frequency and with the type of absorbing material. It also furnished important evidence against the existence of the controversial "J" radiation. In 1926 he turned his attention to x-ray emission spectra and suggested an explanation for the existence of the x-ray satellite lines which was the basis of his subsequent experimental research. This work shares honors with the absorption work in perpetuating his memory in the x-ray field. When in 1935 it became evident that his original suggestion would not adequately account for the observed facts, Professor Richtmyer was among the first to recognize the limitation and he immediately directed the program of x-ray research at Cornell toward the broader aspects of the problem.

He contributed more than one hundred and fifty papers and abstracts to scientific periodical literature and gave uncounted addresses of which no abstract was published. He was awarded the Levy Medal of the Franklin Institute in 1929 for his work on x-ray satellite lines. He was elected to membership in the National Academy of Science in 1932, and in 1935 to the American Philosophical Society and the American Academy of Arts and Sciences. From one point of view it is unfortunate that a man of superlative capabilities for research should be drawn out of the laboratory by administrative duties. From a broader point of view, one that recognizes the far-reaching benefits to research that have come and will continue to come from his extraordinary administrative talents, his many activities were to the end an expression of his devotion to scientific research.

Despite these numerous labors and honors, it is as dean of the Graduate School, the genuine friend at the head, that most of us remember and cherish Floyd Richtmyer. As we look back over the years of his studies and progress and successes, it seems as if the direction of the Graduate School was his destiny. Thorough as a student, gifted as a teacher, enthusiastic and resourceful as an investigator, he proceeded to the deanship as to a natural no less than a deserved promotion; and his nine years in that office gave promise of an even longer period of devoted and zealous leadership. His administration from the beginning was marked by an ever increasing efficiency, to which the General Committee and the Faculty alike have borne steady testimony. No part of the diversified range of graduate studies, whether in the sciences or the humanities, went without his sympathetic understanding, his active interest, his helpful advice, his guiding hand. Here his own soundness of judgment and his insistence on the maintenance of standards was coupled with the spirit of tolerance, good nature, tact, and discretion which distinguished him as a leader. No call on his time and energy went unheeded; he was ever attentive to the incidental tasks of the office, the meeting of visitors, conferences, chairmanship of committees, as well as to the routine duties. All this is a record to be proud of; and we who have been associated with him on the Cornell campus are indeed proud that we have known and have had some share in the life and labors of Dean Richtmyer.

Charles Glenwood Rickard

May 4, 1922 — October 20, 1993

Professor Emeritus Charles G. Rickard, 71, of 1234 Ellis Hollow Road, died Wednesday, October 20, 1993 at his home.

He was born on May 4, 1922 on a farm near Cairo, Hall County, Nebraska, where he spent his early years in farming activities. His family moved several times, eventually settling in Ithaca, New York. On June 10, 1943 he married Florence Mae Gates of Hamilton, New York.

After having completed the pre-veterinary collegiate requirements at Franklin and Marshall College, he matriculated in the New York State College of Veterinary Medicine at Cornell University, and was awarded a D.V.M. (Doctor of Veterinary Medicine) degree in 1943. He practiced veterinary medicine for two years at Catskill, New York. Then, after having been admitted to study in the Graduate School at Cornell, he was awarded a M.S. degree in Microbiology in 1946. At that time, he was appointed as Assistant Professor in the Department of Pathology of the College of Veterinary Medicine where he established the first Clinical Pathology Laboratory at that institution.

After four years as Assistant Professor and then as Associate Professor of Clinical Pathology, he was appointed Professor of Pathology, a title he held until his retirement in 1985.

His first sabbatic leave (1952-53) contributed to his meeting the requirements for a Ph.D. degree, which he received in 1957. It was spent at the Medical College, University of Michigan, studying pathological aspects of liver disease under Dr. C.V. Weller, a preeminent pathologist. The title of his thesis was "Liver Cell Dissociation". He was elected a Diplomate of the American College of Veterinary Pathologists in 1953.

His second sabbatic leave (1960-61) was spent in Tubingen, West Germany, at the Federal Research Institute for Virus Diseases of Animals, where he studied electron microscopy of virus-induced diseases in collaboration with Dr. Eva Reczko, an internationally recognized scientist.

Dr. Rickard was involved in diverse activities at the College of Veterinary Medicine. He served as Chairman of the Pathology Department from 1965 to 1973, as Acting Chairman of the Department of Microbiology, as Associate Dean for 15 years (1969-84), and as Acting Dean for one year immediately prior to his retirement.

He was Professor of Aquatic Animal Medicine from 1980 to 1984, and co-founder with Dr. Donald A. Abt of the University of Pennsylvania of “Aquavet”, a teaching program in aquatic animal medicine. The program involved collaboration with scientists at the Woods Hole Marine Biological Laboratory in Massachusetts. This initial venture predated the expansion of the Department of Avian Diseases and its re-naming as the Department of Avian and Aquatic Animal Medicine in the College of Veterinary Medicine.

In 1962, Dr. Rickard established the Oncology Laboratory for Cancer Research. From 1965 to 1976 he was Principal Investigator for research projects on feline and canine leukemia, largely supported by federal grants and contracts. One contract, supported entirely by funding from the National Cancer Institute, called for the design, construction, staffing and operation of a splendid, biohazard-safe laboratory building on off-campus land opposite the P. Philip Levine Laboratory for Poultry Disease Research on Hungerford Hill. His research involved viral induction of leukemias and sarcomas, characterization of tumor-producing viruses, and chemicals that interact to produce cancer.

He served during 1981-87 as the College’s veterinary representative in a U.S. consortium which assisted in establishing a modern veterinary college at the King Faisal University in Saudi Arabia.

He had extensive involvement in the Veterinary College’s capital projects during his last fifteen years there, including the Veterinary Research Tower and the master plan for the present building program.

Dr. Rickard was actively involved in the design and operation of a biohazard-controlled facility for the study of equine infectious anemia, a disease of enormous importance to the horse racing sport, and two other major research programs involving horses. One, a program to study equine bone and joint diseases in collaboration with the College of Agriculture and Life Sciences, required readaption of the Warren Farm to construct a model harness racing track for experimental physiological studies. The other required a specialized staff of pharmacologists and facilities for research and monitoring of drug interventions in race horses.

The New York State Veterinary Medical Society awarded him the status of Distinguished Member, and in 1989 named him Veterinary Educator of the Year. He enjoyed membership in a large number of scientific societies and professional organizations, including the Societies of Sigma Xi and Phi Kappa Phi. In addition, he was elected to membership in the Society of Phi Zeta, the “Phi Beta Kappa” of veterinary medicine.

A careful and positive thinker, always sensitive to another point of view, never condescending and consistently optimistic, Dr. Rickard had a low-key and confidence-inspiring manner. His eloquent speech, his sterling integrity,

and his calmly persuasive manner were qualities that, along with his tall, strong physique made him a giant, indeed, among visionary, scholarly academic leaders. He was considered a genius by some, and admired for being a most patient teacher. He was a magnificent Cornellian whose impact upon the institution and the students he served will remain with them always.

An important avocational interest in Dr. Rickard's life was sailing his sloop, "Cricket". His sailboat, in turn, spawned his interest in and commitment to the United States Power Squadron (U.S.P.S.), an organization committed to teaching boating and boating safety, which consumed much of his retirement before and even after he became ill. He joined the U.S.P.S. in April 1976 and quickly rose through the ranks to become the Commander of the Ithaca Power Squadron for two years before he went on to become a Lieutenant Commander in New York's District 6. He was next in line to become the District Commander when his illness interrupted his boating career. All during his career in the U.S.P.S., he taught several courses every year and won the District Award for Excellence in Teaching in 1990 for his devotion to and active participation in more than 10 years of teaching boating. He is one of the few locally to have attained the designation of N, which signifies that he not only attained the highest possible rank in the U.S.P.S., but also that he took all of the courses available. He was rightfully proud of his "Full Certificate" classification.

Dr. Rickard is survived by his wife of fifty years; sisters, Mrs. Shirley Caplan and Mrs. Janice Stahr, both of Seattle; sons, Charles G. Rickard III of San Diego, David B. Rickard of Minneapolis, and Andrew W. Rickard of Burlington, Vermont; daughters, Jean (Mrs. Kenneth Sill) of Mendon, New York, and Claire (Mrs. George Whitcomb) of Orlando, Florida; and six grandchildren.

John M. King, Robert W. Kirk, George C. Poppensiek

Blanchard Livingstone Rideout

April 28, 1906 — December 3, 1993

“I came to Cornell in 1933 in the middle of the Depression. My salary was \$1,350 per year and I taught eighteen hours. One of my early students, Anna Louise Roehrig, got the highest grade I ever gave. She became my wife soon after.” These words written by Blanchard Rideout in a charming, light hearted letter he sent a friend shortly before his death, could be the beginning of the Cornell biography of a man who in the next sixty years was to grace us all with his presence and until 1971, serve the University in more diverse ways than probably any other individual in its modern history.

Blanchard, who was born in Johannesburg, South Africa, received an A.B. degree in 1927, magna cum laude, from Harvard College, the A.M. degree from Harvard University in 1930, and the Ph.D. degree in 1936 from Cornell. He came to Cornell in 1933 after teaching French Language and Literature at the University of Vermont, Harvard, Radcliffe, and the University of Rochester. While he is remembered by his students as a lively and devoted teacher, it is his many services as a gifted and innovative administrator that gave him a place in the University’s history. A series of deans and especially Presidents soon became aware of his talents and he was asked over the years to undertake a host of University-wide administrative tasks, including Assistant Dean and Director of the Navy V-12 Program, chairman of the committee on Admissions for the College of Arts and Sciences, and founding director of the Division of Unclassified Students (DUS). In this respect, his enthusiastic promotion and dedicated leadership of DUS was both typical and outstanding. It was his conception and that of the Division that scores of students would find themselves every year having selected and been admitted to the college at Cornell that was not right for them, yet unable to transfer at once to the new college of their choice. DUS offered them the transitional opportunity to remain at Cornell, change curriculum and prove their admissibility into that second college. Hundreds of students, now loyal Cornell alumni, will attest that Blanchard helped them in this way through a difficult transition in their lives, and in effect saved them for Cornell.

From 1962 to 1965, Blanchard was also the founder and Project Director of Peace Corps Training Programs at Cornell. Finally, in 1966, he was appointed as Secretary of the University and occupied this position until his retirement in 1971, when he became Professor of Romance Studies Emeritus. He also served for twenty years as University Marshal and as such led the yearly Commencement procession and presided over the ceremony including calling out the names (many of them with a distinctly exotic flavor) of all the Ph.D. candidates. What struck observers of these activities was Blanchard’s unflappable authority and control.

During his life he received many honors including being named to Phi Beta Kappa, Phi Kappa Phi, and many other honorary societies. He also served as director of the Sweet Briar Program in Paris and the Middlebury Graduate School of French during sabbatical leaves.

This brief list only gives a partial view of a man who served five Cornell Presidents but also touched the lives of thousands of students, many of whom remember him with affection and respect. Such was the case over the years for members of the Cornell University Glee Club, many of whom thought of themselves as part of the Rideout extended family. Blanchard was, if anyone ever was, a citizen of Cornell and of the world. He was always in love with France and spoke fluent idiomatic French, often traveled to that country and even served as a bi-lingual lecturer aboard the S.S. France on cruises around the world after he retired.

For Cornell, he was for many years an all around ambassador who received important visitors, introduced visiting VIPs to the University, and helped hundreds of foreign faculty members and students feel at home in Ithaca. The latter trait is typical of a man who was not only kind, but profoundly generous and thoughtful, as so many of us can attest. Blanchard helped many people in many ways, but always in a discreet and tactful fashion.

What perhaps stands out above all for his many friends was his irrepressible energy and sense of humor. He brought good cheer to all (including in his well known tour of friends' homes at Christmas as Santa Claus handing out outrageous ties). One always felt better off after talking to him, and his generosity of spirit included never burdening others with the problems of his jobs or his health. In the fullest and richest sense, he embodied an expression of his land of adoption: "joie de vivre".

Dale R. Corson, Alfred Kahn, Barlow Ware, Alain Seznec

Heinrich Ries

April 30, 1871 — April 11, 1951

Heinrich Ries, Professor of Geology, Emeritus, died unexpectedly and suddenly at his home in Ithaca on April 11, 1951. He is survived by two sons. Since his retirement in 1939, he had continued his consulting work in geology and was especially interested in research on molding sand. He was to have received a bronze placque at a testimonial dinner in Statler Hall on April 13 for his contribution to the foundry industry.

Dr. Ries was born in Brooklyn, New York on April 30, 1871. He received his early education partly in Europe and partly in the United States, and in 1892 he was graduated from the Columbia School of Mines. His graduate work was done at Columbia University, where he was awarded the degree of Master of Arts in 1894 and the degree of Doctor of Philosophy in 1896. The following year he studied at the University of Berlin.

Professor Ries came to Cornell in 1898, at a time when the importance of geology in mineral deposits and in engineering construction projects was not well understood. Recognizing the need for textbooks in these branches of geology, he wrote "Economic Geology", the first edition of which appeared in 1905 and the seventh edition in 1937, and was senior author of five editions of "Engineering Geology". These texts were very widely used and Heinrich Ries soon became well known, not only within the United States but also abroad. His advancement at Cornell was rapid. He was appointed Instructor in Economic Geology in 1898, Assistant Professor in Economic Geology in 1902, Professor in Economic Geology in 1906, and Head of the Department of Geology in 1914, a position he held until 1937.

He was a member of sixteen scientific societies and served on many committees. In 1910 he was elected President of the American Ceramic Society, and in 1929 he achieved the most distinguished elective office in geological affairs, the Presidency of the Geological Society of America.

Dr. Ries was an authority on the geology of clays and molding sands, and many of the more than two hundred technical papers and bulletins that he wrote dealt with these important materials. In addition, he established at Cornell the first laboratory in the country for research on foundry sands.

From 1928 to 1945 he was Technical Director in charge of sand research for the American Foundrymen's Association, and much of this research was done at Cornell. At the time of his death, he was still active in research

on molding sand and was writing the fourth edition of his "Clays, Occurrence, Properties and Uses". It may well be said that he led an active and full life to the very day of his death.

During forty years of teaching at Cornell, Heinrich Ries gave thousands of students their first insight into geology through his lectures to large classes in the elementary courses. But his greatest satisfaction came from the group of more than fifty students who completed their advanced degrees under his direction. Perhaps his most lasting memorial will be the contributions this group makes to geologic science.

J. D. Burfoot, Jr. D. S. Kimball, C. M. Nevin

Howard Wait Riley

May 2, 1879 — August 19, 1971

Howard Wait Riley, professor of agricultural engineering, emeritus, was invited by Dean Liberty Hyde Bailey in 1907 to develop applied engineering educational programs to improve the life of rural people. Professor Riley accepted this challenge and initiated the Department of Farm Mechanics in the College of Agriculture at Cornell, in the basement of Stone Hall. The name of the department was changed to that of Rural Engineering in 1913 and to its present name of Agricultural Engineering in 1930.

Professor Riley served as Department head until 1944 and was one of two men for whom Riley-Robb Hall was named upon its completion in 1956. He retired from Cornell in 1947.

Professor Riley was born in East Orange, New Jersey, son of William H. and Louisa Lord Riley, and came to Ithaca with his family in 1894.

In 1901 he received the Mechanical Engineering degree in electrical engineering at Cornell. Electrical Engineering was not considered mature enough at that time to award degrees, as alternating current was only then being proved as superior to Edison's direct current.

His initial employment was that of chief draftsman with United Telpherage Company in New York City. At the end of three years he resigned from this position to accept an engineering post with Morse Chain Company, then located in Trumansburg, New York.

Two important events in the life of Professor Riley occurred in 1906. He married Julia Whiton Mack of Ithaca, and he resigned his position with Morse Chain Company to accept an instructorship in the Senior Mechanics Laboratory of Sibley College at Cornell. In this position he became intrigued with internal-combustion engines, and in later years his knowledge of and interest in these engines earned him the title of "Gas Engine" Riley. During his early years on the faculty he owned and operated the only automobile making a daily appearance on the Agricultural campus.

From the time the department was organized until 1946, Professor Riley was known among students for his lucid presentation of subject matter in the courses that he taught, which included introductory mechanics, structures, drainage, surveying, and dairy mechanics. It was his aim to make his courses not only vocational, but to have his students understand sound engineering reasoning and application.

Wishing to add a firsthand knowledge of agriculture to an engineering background, Professor Riley in 1913 purchased a farm on West Hill, which he operated as a successful dairy enterprise until he sold his registered Holstein herd in 1946.

In his early days of teaching, to develop coordination between mind and hand, Professor Riley authored an extensively used bulletin on knots, splices and hitches. This bulletin became the pattern for that section of the Boy Scout Handbook.

Because of his innate interest in the improvement of life on the farm, it was clear to him that the most important improvement to rural living was running water in the home. This, however, required some safe means for disposing of the water following use. So he studied the problem of sewage disposal systems that would be satisfactory and at the same time simple to construct. This work resulted in a bulletin setting forth a new and original design of a concrete septic tank that is still recommended by engineers and health departments.

The work on septic tanks was followed closely by a 3,500-mile tour during the summer of 1920, when Professor Riley, equipped with a truck and trailer-load of demonstration equipment, covered the state giving demonstrations on how to install water and sewage disposal systems in farm homes.

Professor Riley was one of the judges at the last international Winnipeg Motor Contest, held in 1913, where huge internal-combustion engine tractors of the day were tested.

During World War I he conducted extension tractor schools; he also conducted one of the first tractor demonstrations in New York State and gave an early demonstration of horse-drawn grain combine harvesters. He designed the first test device to obtain a visual record of spray pattern from spray nozzles. He did research on milk cooling and electric fence controllers, and also devised an important element of the basic system for natural draft dairy stable ventilation. From 1943 to 1947 he was a consultant for Harry Ferguson, Inc., on haying machinery.

Professor Riley was one of eighteen charter members of the American Society of Agricultural Engineers, which was organized in 1907. He was a life member, and fellow, and the fifth president of this society. He was a member of Phi Kappa Phi, and for two decades prior to his retirement he served as a faculty adviser to the Christian Science Society at Cornell. He was also a devoted participating member of the First Church of Christ Scientist of Ithaca.

Professor Riley was a pioneer in the field of agricultural engineering; he was always ready to experiment with any new machine or mechanical theory if he thought that it would improve the welfare of the rural family.

Survivors include a son, Manton L. Riley, of Canandaigua, New York, two grandsons, and three great-grandsons.

Anson Wright Gibson, Orval C. French, E. Stanley Shepardson

George Stewart Rinehart

May 26, 1936 — November 2, 1972

George Rinehart was killed in an automobile accident in Ithaca on November 2, 1972. He is survived by his wife of fourteen years, Julie Roberts Rinehart, and three children, Matthew, Susannah, and Lucy.

Professor Rinehart was born in Ruston, Louisiana, and received his undergraduate training at Deep Springs Junior College, Deep Springs Valley, California, and at Cornell University, graduating with a B.S. degree in mathematics in 1958. After graduate work at Ohio State University and the University of California, Berkeley, he took his Ph.D. degree in mathematics from the latter institution in 1962. He held a postdoctoral fellowship at Columbia University during 1962-63. He joined the Cornell Department of Mathematics as an assistant professor in 1963 and became associate professor and associate chairman of the Department in 1969, a position he held until his untimely and tragic death.

George Rinehart's scientific work dealt with categorical and homological algebra, and he published a number of papers in this area; indeed, he had finished correcting the proofs for a paper a short time before the accident occurred. His work was widely known and has been the starting point of several mathematical investigations by others. This led to invitations to visit other universities, and he and his family spent the year 1968-69 at the Université de Strasbourg and the spring semester of 1971 at Queen Mary College of the University of London. He was also an invited participant at international scientific conferences in England and Germany.

In addition to his duties in the Mathematics Department, George Rinehart was a delegate to the Faculty Council of Representatives from September 1971 until his death. Since his undergraduate days he was a member of the Telluride Association and served for a number of years on its Board of Custodians. Throughout his adult life he maintained a serious and active interest in the affairs of his community and nation. During the late sixties he participated in the Peace Movement on the Cornell Campus, and for several years preceding his death he was a member of the Executive Committee of the Tompkins County Liberal Party.

He was the first associate chairman the Cornell Mathematics Department has had. Through his energetic and competent direction, this position developed into an indispensable part of the day-to-day operation of the Department, and the undergraduate teaching of mathematics at Cornell was greatly strengthened by his deep concern.

George Rinehart was one of the Mathematics Department's best teachers and advisers. He was extremely popular with students, and his door was always open to them. He gave most generously of himself to all who came into contact with him, spending many hours counseling and advising both undergraduates and graduate students, and discussing professional and departmental affairs with his colleagues.

His lively intelligence and clarity of thought and expression, coupled with an unfailing kindness and keen sense of humor, made him a uniquely effective and valuable member of our University community. To the very many Cornellians whose professional and personal lives were enriched by his presence among us, he was one of the very best representatives of his generation, and all of us are truly bereft at his passing.

Stephen U. Chase, Moss E. Sweedler, Alex Rosenberg

Seymour Harold Rinzler

May 19, 1914 — May 20, 1970

It is a great irony that Dr. Seymour Harold Rinzler died from the very disease he had studied and researched his entire professional life, namely, coronary artery disease. His desire was to prevent the occurrence of that disease. By reducing saturated fatty acid intake and substituting unsaturated fatty acids, he and his associates were able to demonstrate increased longevity due to diminution of coronary disease.

Born in New York City, Dr. Rinzler received the B.S. degree from Cornell University in 1934 and his M.D. from New York University College of Medicine in 1938. He served his internship in the Third Medical Division (NYU) Bellevue Hospital, New York (1940-41). His postgraduate training included a year (1939) in the Department of Metabolism, New York University College of Medicine, and a year (1941) in the Department of Pharmacology, Cornell University Medical College. He entered military service in 1942 and was assigned to the European theater of operations; he was discharged with the rank of major.

Dr. Rinzler held the following appointments: clinical assistant professor of medicine, Cornell University Medical College; attending physician, Beth Israel Medical Center, New York; physician in charge-Adult Cardiac Clinic, Beth Israel Hospital, New York; assistant visiting physician Second (Cornell) Division, Bellevue Hospital; assistant visiting physician, New York Hospital; Josiah Macy Fellow, Department of Pharmacology, Cornell University Medical College (under the tutelage of Dr. Harry Gold, 1952-58); cardiologist in charge, Diet and Coronary Heart Disease Study Project, Bureau of Nutrition, Department of Health, City of New York (1958-67); and director, Bureau of Nutrition, Department of Health, City of New York (1967-70).

He obtained his specialty boards in internal medicine as well as his subspecialty boards in cardiology. He was a fellow of the American College of Physicians, New York Academy of Medicine, Council on Clinical Cardiology, American Heart Association, and New York Academy of Sciences. In addition, he was a member of the New York Heart Association, American Federation for Clinical Research, Sigma Xi, Alpha Omega Alpha, Harvey Society, American Association for the Advancement of Science, American Therapeutic Society, American Society for the Study of Arteriosclerosis, Society for Experimental Biology and Medicine, American College of Clinical Pharmacology, and the American Public Health Association. He had been a member of the American Society for Pharmacology and Experimental Therapeutics since 1951.

Dr. Rinzler published over seventy articles on arteriosclerosis and coronary artery disease and was the author of two books, *Cardiac Pain* (1951) and *Clinical Aspects of Arteriosclerosis* (1957). At the time of his death, he had just completed a chapter for *Diet in Arteriosclerosis*, edited by S. G. Schettler and G. S. Boyd (Elsevier Publishing Co., New York, 1969).

The last twelve years of his life were devoted to the study of diet and its relation to coronary artery disease. He and the late Norman Joliffe organized the first large pilot study with sufficient controls to determine the effect of using low saturated fat, high unsaturated fat diet on the prevention of coronary artery disease. As chief of that study and then head of the Bureau of Nutrition of the City of New York, he was able to reveal the long-range preventive aspects of that diet on the disease. Although his work was far from finished at his death, the studies in which he participated are ongoing and the influence of his research will continue to provide them with momentum.

In 1938 he married Rita Bernard. They had two children, Lois and Robert. His wife died in 1968 and he married Mrs. Beatrice Lassoff in October 1969.

Maurice Goodgold, M.D.

Robert F. Risley

March 28, 1922 — January 20, 1994

Robert Risley who spent most of his working life at Cornell, grew up in Horseheads, New York and graduated high school in 1940. After two years working variously as a construction laborer, grocery clerk, meter repairman, and lathe operator, he enrolled at Union College. For the next half year, he was both full-time student and full-time industrial worker until he entered the U.S. Air Force.

The three and one-half years spent in the service provided early experience in two areas in which he would excel during his lifetime — teaching and administration. After his own training as a bombardier-navigator, he became an instructor of others. When he was shipped overseas as bombardier in a B-29 crew with the 20th Air Force, he held various administrative assignments including those of Squadron Intelligence Officer and Squadron Executive Officer. Captain Risley was mustered out in August 1946.

Graduating from Union College in 1948, Bob came to Cornell's newly established School of Industrial and Labor Relations where he earned the M.S. degree in 1949 and the Ph.D. degree in 1953. While still working on the degree, Bob was administrative assistant to ILR Dean Martin P. Catherwood. He also served a year as consultant to the President of the State University of New York on administrative organization and personnel policy. His dissertation dealt with faculty personnel policies.

Bob Risley was appointed to the ILR faculty in 1953 and a year later was promoted to the rank of Associate Professor. In 1959, he became Acting Dean of the School pending selection of a new dean. This was an assignment he was to take on again on two other occasions, in 1963 and in 1971. In 1960 and 1961, Dean Catherwood, who had become Industrial Commissioner for New York State, persuaded Bob to take a leave of absence to assist him as Deputy Commissioner for New York City. From 1963 to 1970, Bob was Associate Dean for Extension and Public Service. From 1971 to 1974, he served in Day Hall as University Vice Provost. All of these assignments called on Bob Risley's special talent and sensibility in working with varied persons and interest groups whether he was dealing with governmental bureaucrats, legislators, labor or business people, or university employees. He accomplished these purposes, less by rhetorical skill, than by dint of a keen, perceptive and creative intelligence. He was a continuing source of fresh, imaginative ideas to those with whom he worked, and in turn he encouraged others to perform at their best.

Bob was not concerned with style, either in manner or in dress, a fact that sometimes led persons initially to underestimate him. What did come across was the absence of pretention, his total genuineness. What you see is what you got. This directness, coupled with an immense capacity to enjoy life and his great energy, earned him a very large network of friends.

What particularly marked Bob as a teacher was his commitment to the notion that students in the ILR School should acquire some sense of practical problems in the field. Consequently he always made extensive use of practitioners in the classroom. In his first years in the School, Bob was identified with a required course on Industrial Occupations and Processes, known to all as “Bus Riding”, because it featured field visits to area industrial firms including a Pennsylvania coal mine. The course afforded students an opportunity to study labor policies within a specific work setting. Years later, Bob developed a new course on human resource management in small business that focused on entrepreneurship and students did case studies of a firm and reported their findings to management.

Extending the idea of learning from firsthand experience, Bob led the way in creating the School’s credit internship program that permits students to earn full academic credit for a semester while working with some private or public organization related to industrial relations. Bob scouted out the internship opportunities, primarily in Albany, New York City, and Washington, and supervised the program for several years. The program has continued to grow to the benefit of students and to the School itself.

Another example of Bob’s interest in relating education to current problems and issues is the annual conference now called the Netter Seminar that he initiated over 25 years ago. These seminars jointly sponsored by the National Conference of Christians and Jews and the ILR School examine timely issues with special attention to implications for race relations. It is a theme that was especially important to Bob harking back to his days as Deputy Industrial Commissioner for New York City when he inaugurated a number of programs dealing with the status of minorities in the work force, including a pioneering study of household workers. Also as Director of Extension, Bob initiated programs in urban affairs and civil rights leadership training, themes that have continued to occupy a prominent position in extension offerings. In cooperation with the Urban League and the Puerto Rican Forum, he founded Skill Advancement, Inc., a non-profit organization which conducted programs for upgrading the skills of low income workers.

In his various roles at Cornell, Bob was active in the affairs of the ILR Alumni Association. It was his idea to establish an annual award to honor a distinguished graduate of the School who has demonstrated exceptional

professional accomplishment in the field of industrial and labor relations. Over the years, the Judge William B. Groat Award has become highly prized. Fittingly, Bob himself was the 1989 recipient of the award.

From his graduate student days on, Helen and Bob Risley lived in Candor where they became central figures in the life of the village. Here they raised their two sons, Robert, Jr. and Thomas. Helen was a popular high school teacher. For over 25 years, Bob was active in public education as a member and president of the Candor School Board and also with the Tompkins-Seneca-Tioga Board of Cooperative Educational Services, including time as its president. Indeed, whenever the community needed to get things done, Bob Risley was usually called upon. Thus among many other public activities, he was at various times president of the Tioga County Economic Opportunity Board; president of the Tioga Industrial Development Corporation; and board member of the Tioga General Hospital and the Tioga County Chamber of Commerce.

The Risley's big house on Main Street was important in the social life of the community. Traditionally town and university friends would gather there for Fourth of July and New Year's Eve celebrations. Another regular event was the annual "Risley Open" at Catatonk Golf Course.

It was not uncommon for the Risleys to house or provide financial assistance to improvident students. One former student wrote to Helen Risley of her husband: "It was the quality of putting principle before personal advantage that marked him extraordinary. He taught me the job of giving, the job of reaching down and lifting up someone who needed a hand, the job of connecting with others rather than remaining aloof."

86

These and similar sentiments shared by the many people who knew him fairly represent the lasting legacy of Bob Risley.

Karin Ash, Ronald Donovan, Lois Gray

Marie M. Rivera

February 25, 1921 — January 21, 1975

The Cornell and Ithaca communities lost an important person this year. The troubled Cornell students whom she counseled have lost a friend. The people with whom she worked lost a colleague who was not only professional but also uniquely human in her work.

Marie Rivera was born and raised and received her education in New York City. She attended New York University and was awarded her A.B. degree in 1942. She then went on to graduate school at Columbia University and received her master's degree in social work in 1945. She was a person who had much experience in counseling prior to coming to the Department of University Health Services at Cornell in 1972. From 1965 to 1972 Mrs. Rivera worked at the West Nassau Mental Health Clinic as supervising social worker and therapist, and at the New York University Graduate School of Social Work as a fieldwork instructor. In 1972 she joined the Cornell University Mental Health Clinic as psychiatric social worker. In this position she was a counselor and psychotherapist to the Cornell students whose personal problems brought them to the clinic for professional help.

Mrs. Rivera was active in local affairs, being a member of the Tompkins County Mental Health Association. Her membership in professional organizations included the National Association of Social Workers and the National Honorary Sociological and Anthropological Society. She also was a member of the Academy of Certified Social Workers.

Marie Rivera's concern and care for her clients was one of her outstanding characteristics. She was devoted to her work; she really listened, and she could hear both spoken and unspoken pain. She expressed the "understanding" that her clients treasured and responded to so much.

Marie's friendship was cherished; it was a happy friendship. She was fun to be near. She was a wise and gentle person whose strength and determination were cloaked in graciousness. She was without bitterness and maintained a positive outlook, an ever-present sense of humor about things past and present.

Her love and closeness to her family gave her strength. It was no surprise that in the months of pain and heartache that preceded her death, her courage and her love supported her family and friends while she herself was sustained by her own unconquerable spirit.

Her son's tribute, made at her memorial service, expresses the essence of Marie Rivera:

Mom liked flowers, trees, rain, wind, mountains, and most of all the sunshine. Life for her was happiest when she could see a new place and a new sunrise, and it follows that freedom was Mom's paramount interest. She sought her children's freedom from the bondages of servitude to others because of their race: she fought with many a torn child or adult for freedom from their own inner problems. A smile always led to inner happiness for Mom, and a love of the living—earth, wind, fire, water, animal, and man— L.O.V.E. was her strength; Life Over this Vast Earth made her want to live on.

Marjorie Doris, Joycelyn R. Hart, Marvin Waldman

Byron Burnett Robb

August 8, 1882 — July 8, 1961

Byron Burnett Robb, Professor Emeritus of Agricultural Engineering, died on July 8, 1961 after a long illness. He was born at Webster, New York, on August 8, 1882, to Frances and Charles Robb.

He attended the rural school at Webster, New York, and in 1904 graduated from Webster High School. After a year of postgraduate study at the same school he was granted a three-year certificate to teach in rural schools of the state.

From 1905 to 1907 he taught in School District No. 7, Town of Webster, Monroe County. In the fall of 1907 he entered Cornell University as a freshman and in 1911 received the degree of B.S. in agriculture. In the spring of 1909, his sophomore year, he was employed as a student assistant to Professor H. W. Riley, head of the Department of Farm Mechanics (now the Department of Agricultural Engineering), which position he held until graduation. After graduation he was appointed an instructor in the same department and continued his studies as a graduate student. In 1913 he received the degree of M.S. in agriculture from Cornell. He was the first student at Cornell, and one of the first in the country, to make his major study for an advanced degree in the field of what is now known as agricultural engineering. He pioneered research in this field.

On August 7, 1912, he married Miss Georgia Bills of Union Hill, New York. To this union were born two daughters, Mrs. Frances (Robb) Bowman and Mrs. Julia Ann (Robb) Newman, both of Cayuga, New York. At his death there were ten grandchildren.

In 1913, after receiving his Master's degree he was appointed Assistant Professor of Agricultural Engineering and in 1919 was promoted to Professor. He served in this capacity until June, 1950, when he retired with the rank of Professor Emeritus. During the period 1945-1947 he was head of the department.

During the summers of 1911 to 1915 he was drainage engineer for the New York State Department of Agriculture. In the school year 1923-1924 he studied in the Harvard Graduate School of Education. During World War II, as a member of the Farm Machinery Division of the Emergency Food Commission of the New York State War Council, he organized a corps of twelve district agricultural engineers who did outstanding service to the state and the nation in mechanizing agriculture for greater food production.

Professor Robb's outstanding ability as a teacher was not limited to the Cornell campus. He pioneered extension work in his field and was project leader in extension in his department until 1935. He knew New York agriculture and understood New York farmers. His exceptional ability to interpret technical subject matter into the farmer's language and his unerring judgment on what was best for agriculture made his extension work extraordinarily effective. Under his direction the extension program in agricultural engineering in New York State became one of the best known and most highly regarded in the nation. He pioneered many of the aspects of present-day extension in agricultural engineering.

In addition to his extension work Professor Robb managed to carry on considerable resident instruction. At one time or another he taught most of the early courses offered by the department. His outstanding achievement in resident teaching was the organization and development of a course in household mechanics for women students. Here, as in his extension work, his ability to explain technical subject matter in nontechnical terms opened a new world of experience to the woman student. The large enrollment in his classes over a period of many years is indicative of his success. At no other institution has such a course been so successful.

In addition to his extension and undergraduate teaching he skillfully and understandingly guided many graduate students through their studies and their research. Many of his graduate students now hold important positions throughout this country and abroad. He also gave freely of his time and sound advice to younger men of the department. He never turned down a sincere appeal for help from anyone.

Professor Robb was senior author of the book *Farm Engineering* (1924) and was author and co-author of a number of extension bulletins. His unusual ability to criticize constructively and to edit what other members of the department wrote has left his mark on most of the books and bulletins published in the department during the past fifty years.

In addition to his work at Cornell, Professor Robb gave a brief series of lectures at Ohio State, Missouri, and Columbia Universities. He was chairman of the G.L.F. Conference Board and was special consultant to the industrial and agricultural machinery section of the Standards Division O.P.A. during World War II. He was active in his professional society, the American Society of Agricultural Engineers, and served a term as chairman of the North Atlantic section of the society.

Active in fraternal and civic affairs, he was a thirty-second-degree Mason and for 31 years was trustee of the Ithaca Masonic Temple Corporation. In March, 1961, he received a Masonic fifty-year service pin. He was a past president

of the Acacia Alumni Corporation and a member of Phi Kappa Phi and Epsilon Sigma Phi. He was a member of the Grange for fifty-three years. For many years he was a member of the Tompkins County Fish and Game Club and served as a merit badge examiner for both Boy Scouts and the Girl Scouts of the local councils. He belonged to the Episcopal Church.

Those who knew him as “Professor Robb” also knew him as a friend. He will be missed by a multitude of people whose lives have been enhanced by his long years of faithful service to his state and to his nation.

O. C French, R. H. Wheeler, F. B. Wright

Isaac Phillips Roberts

First Director of the College of Agriculture and Professor of Agriculture

July 24, 1833 — March 17, 1928

Isaac Phillips Roberts was born at East Varick, New York, July 24, 1833. He became Professor of Agriculture in Cornell University in 1873. Was made first Director of the College of Agriculture in 1896 and retired Professor Emeritus in 1903. He died at San Francisco, California, March 17, 1928.

For thirty years Isaac Phillips Roberts was the exemplification of Agriculture in Cornell University. He taught the subject wisely, managed the farms successfully, directed the students in their many activities with sympathy and good judgment, bore the difficulties of a pioneer period with courage and unfailing hopefulness, and was a trusted counselor and leader with his colleagues. He was admired and trusted by the farming people of the State, and became an acknowledged master throughout the country of the subjects associated with agricultural education. In the period when the rural subjects were unorganized pedagogically and when the way was not plain, he planned the work clearly and definitely for agriculture and had always in mind the welfare of the farming people; and in so doing he made a basic and enduring contribution. He lived to see his faith justified and established. His memory will occupy a large place in the history of the University.

For these reasons and for all the associations that cluster around such an upright and devoted life, the members of the Board of Trustees and of the University Faculty now place on record this expression of their profound regret at Professor Roberts' death and extend to his family and friends their heartfelt sympathy.

Source: Fac. Rec. p. 1544 Adopted by the Trustees and Faculty of Cornell University May, Nineteen Hundred And Twenty-Eight

Stephen James Roberts

August 5, 1915 — January 21, 2005

Stephen J. Roberts, Professor of Veterinary Medicine, contributed greatly to Cornell in several capacities over his lifetime. He earned distinction as a student-athlete, as a faculty member and athletic coach, and as an alumnus in private veterinary practice. Born in Indianapolis, Indiana, Steve was raised in Hamburg, New York where his father, Dr. James Roberts, also a Cornell graduate (DVM 1912), practiced veterinary medicine. Steve learned horsemanship in the Buffalo area, where the Knox family had established a polo club that brought players of international caliber to the town of East Aurora. Steve brought his riding skills to Cornell in 1933, where he enrolled in the College of Agriculture and earned a place on the Cornell polo team. While a student in the Veterinary College in 1937, Steve was a member of Cornell's first national intercollegiate championship team, along with fellow veterinary student Clarence C. Combs, Jr. and Tommy Lawrence. After graduating in 1938, Steve married Betty Jane Harris (Cornell '38), and they moved to Kansas State University where Steve taught veterinary medicine and earned a Master of Science degree.

Returning to Cornell in 1942 as a faculty member in the Department of Large Animal Medicine, Obstetrics and Surgery in the Veterinary College, Roberts established himself as a leading figure in domestic animal reproduction and was promoted to the rank of Professor by 1946. Roberts' colleagues regarded him as a prodigious worker who 'did the work of five people', according to his longtime colleague Francis Fox. During his career, Roberts served as chairman of his department twice: from 1965-66 and from 1969-72. Steve authored over 150 scientific articles and wrote what remains the most comprehensive textbook on veterinary reproduction: *Veterinary Obstetrics and Genital Diseases*. First published in 1956, Roberts produced new editions in 1971 and 1986. Generations of veterinary students and researchers from around the world used this book as an encyclopedic source of reference material. What is most remarkable about Steve's writing scholarship is that his productivity did not stop when he left academia to join a busy private practice. Indeed, he produced the third (and best) edition of his book while in practice, and he never stopped making contributions to scientific journals. He published many unusual clinical observations well into the 1990s, when he had officially retired from private practice. He continued to submit letters to the editors of professional journals until near the end of his life.

Steve Roberts was among the first faculty members to advocate for a research component in all faculty appointments. He is acknowledged for his pioneering effort to promote equine research at Cornell. In addition, Roberts played a major role in the establishment of the Cornell dairy cow mastitis control program (now the New York State Quality

Milk Program that is regarded as the flagship program of its type nationwide). He was also instrumental in the Veterinary College's development of a comprehensive nutrition program. Roberts served 13 years on the Judicial Council of the American Veterinary Medical Association (AVMA), was a charter diplomate of the American College of Theriogenologists, was an associate editor of *Veterinary News*, and provided years of service to the Cornell Veterinary Alumni Association. He received the prestigious national Borden Award from the AVMA for his research on cattle diseases, the Distinguished Service Award from the New York State Veterinary Medical Society, and the Salmon Award that is bestowed only on Cornell's most august veterinary alumni.

“Once a player, always an enthusiast” (Stephen J. Roberts)

Steve Roberts' accomplishments as a faculty member would fill the lives of most individuals, but Roberts' prodigious capacity for hard work left room for more. For 25 years Roberts served as the coach of the Cornell polo team that he had captained as a student. His scientific approach to training players and horses made Cornell a formidable power in intercollegiate polo from the 1950s into the early 1970s. Cornell teams won eight national titles under Steve's leadership. More important than the victories were the principles of team play, hard work, and sportsman-like conduct that Steve instilled into generations of Cornellians who came to Ithaca from across the globe to study and play polo. Those players became an extended family that helped host visiting teams in social evenings at the Roberts' home after every Saturday night polo game. No Cornell polo player of that era ever forgot the lessons of hospitality and generosity they learned on those evenings with Steve and his wife BeeJay. Roberts was inducted in the Cornell Athletic Hall of Fame in 1990, and in an even greater honor in 1996, into the United States Polo Association Hall of Fame in Palm Beach, Florida. Roberts chronicled the fortunes of Cornell polo in his book: *An Autobiographical History of Collegiate Polo and its Players at Cornell University, 1919-1972 and Beyond*.

Roberts' career trajectory was unusual in that he achieved international prominence as a veterinary professor and scientist, and then retired in 1972 to join his brother in private veterinary practice in Vermont. Known there for his work with large animals, he continued in practice for 21 years. While in Vermont, Steve engaged in many community activities, serving on the board of the local hospital and in other capacities that earned him widespread admiration and recognition. His beloved sport of polo was never far from his mind, and he helped establish the Quechee Polo Club in Vermont that continues today. During this period, Steve spent much time assisting his wife, BeeJay, through a chronic illness that resulted in her early death. In 1993, Steve married Ruth Webb Shipman and

began retirement in Bath, New York. Steve and Ruth enjoyed more than a decade of happy life together, and they were often seen at Cornell functions in the Veterinary College and polo arena.

In the year of Roberts' death the Cornell men's polo team won their tenth national championship, and the women's team captured second place after completing a string of five consecutive first place finishes—evidence of Steve's enduring legacy to Cornell sports and a fitting tribute to the “Dean of Intercollegiate Polo.” Stephen J. Roberts had an extraordinary breadth of interests and accomplishments rarely seen in academia. He was an independent and creative thinker, a pioneer of the specialty of veterinary reproduction, a pioneer of polo at Cornell, and one of the faculty members who made the College of Veterinary Medicine great. Steve Roberts was a towering personality, and we are honored to have known him. We have lost someone quite special.

Robert O. Gilbert, Robert Hillman, Douglas F. Antczak

Charlotte Brenan Robinson

August 29, 1884 — November 16, 1953

Charlotte Brenan Robinson, Associate Professor of Housing and Design, died November 16, 1953, after a long illness.

Mrs. Robinson was born August 29, 1884 at Saint John, New Brunswick. She was educated at Mt. Allison University, Pratt Institute and Teachers College, Columbia University. Prior to coming to Cornell, Mrs. Robinson held various positions including: Principal of School of Occupational Therapy, Montreal, Canada; Director of Occupational Therapy in seven hospitals of the Canadian Government in Nova Scotia and Prince Edward Island; Head Counsellor in crafts in several summer camps; proprietor and partner in Crafts Studios in Massachusetts and Connecticut; a member of faculty at Hunter College and Head of the Department of Household Art at Hampton Institute.

Professor Robinson came to the College of Home Economics at Cornell in 1932 and until her retirement in 1950, spent most of her time in Extension teaching. Her work, over many years of service as extension specialist in home furnishings, was highly successful and fruitful. She had the ability clearly to transmit color knowledge and usage in ways lay people could understand and apply in homes to family needs and wishes. Her manner and ease in teaching encouraged creative self expression but she kept standards high and stressed principles underlying choices. In addition to basic work in selection, buying and arrangement of furnishings and the use of color, Mrs. Robinson also was a key person in the extension craft program.

From her wealth of experience and knowledge, Professor Robinson prepared several publications which are an invaluable heritage. Her bulletin "Color in the Home" is being used throughout the United States and was one of the first Cornell bulletins to use color plates extensively. She also was the author of bulletins on room arrangement, braided and hooked rugs, furniture repair, and the coauthor of publications on making lampshades and buying of furniture.

Mrs. Robinson was a member of the National Home Economics Association, Kappa Delta Phi, Epsilon Sigma Phi, and Faculty Wives Club at Cornell.

Surviving are her husband, Professor Emeritus Montgomery E. Robinson, now at Los Banos, Laguna, the Philippines; two brothers and a sister, and several nephews and nieces.

R. B. Comstock, V. B. Hart, L. D. Rockwood

Gustavus Hill Robinson

January 11, 1881 — September 11, 1972

Gustavus Hill Robinson, a former law teacher at Cornell, died on September 11, 1972, aged ninety-one years.

He took all his degrees at Harvard, Bachelor of Arts in 1905, Bachelor of Laws in 1909, and Doctor of the Science of Law in 1916. He came to Cornell in 1929, after distinguished service at Tulane, Missouri, California, and Boston University, and twice at Harvard College. Prior to his teaching he practiced law in New York City and was an early associate of Charles C. Burlingham, then and later one of the most distinguished and influential members of the American bar. He retired in 1949, becoming William Nelson Cromwell Professor of International Law, Emeritus, after his retirement.

Several times in later years he came back to active teaching to present his course in admiralty in which he had attained national and international distinction. In over thirty-five years he ranged over the whole law school curriculum except property and procedure. In 1926 he published his case- book on public utilities and in 1939 his authoritative textbook on admiralty, a copy of which was in a few years to go into the library of every American maritime captain. He was a consultant of the New York Law Revision Commission and an admiralty consultant of the United States Lend-Lease Administration in World War II.

These are the bare facts of a most distinguished career, at the end of which he had become universally recognized as the leader of American scholars in the field of maritime law and the mentor of a whole generation of members of the Admiralty Bar. Yet, these facts tell only part of the life story of a man who was sparkling and venerable at the same time.

Husband and father, teacher and scholar, he lived out — to the end — a rich and rewarding life. We, his colleagues, as well as the students and alumni of the Cornell Law School, all knew him as Robie. Our affection for him — earned by his wit and deep human understanding as much as by his brilliant contributions to legal learning — was many times made manifest, and especially in his later years, when his annual appearances at the spring reunion of the Law School graduates became a cherished tradition. As the senior member of the Law School community, he kept his office a meeting place for us, and for the present and former students of the school. He came daily to his office for over twenty years after his retirement, keeping regular working hours and always adding new bits of wisdom and of humor to the living legend of “Robie” — a legend that will remain in the hearts and minds of all

those who were fortunate enough during his lifetime to become captivated by the grace with which he bore his greatness.

Rudolf B. Schlesinger, W. David Curtiss, John W. MacDonald

Montgomery Evans Robinson

April 30, 1884 — July 16, 1960

Montgomery Evans Robinson was born in Brooklyn, New York, the son of Dr. Franklin E. Robinson, M.D., and Lillie Ludlam Robinson. During his early youth his family moved to Carthage, Jefferson County, New York. He grew up in the rugged “North Country” along the St. Lawrence River. Here he acquired an intimate understanding of the life and problems of the sturdy farm and village people whose living came directly, or indirectly, from the soil, the forests, and “The River.”

After attending Collegiate Grammar School in New York City, he entered Cheltenham Military Academy at Ogontz, Pennsylvania. Here for four consecutive years he stood at the head of his class in both academic grades and general rating of the student body; he graduated as valedictorian of his class and with the highest four-year academic standing ever attained by a student in the Academy. In addition to his outstanding academic work, Montgomery Robinson was also captain of the Academy football team, captain in its military corps, and a member of its track team.

In 1902 he entered Princeton University, from which he graduated in 1906 with the degree of Bachelor of Literature. He spent some time studying chemistry and metallurgy in the Graduate School of Princeton University and then “went west” to serve as assayer and chemist for the Lone Mountain Gold Mining Company. For the next several years, he was engaged in Idaho, Nevada, and Wyoming in managing a gold mining company, in operating his own gold and silver mining enterprises, and in cattle ranching.

He then returned to New York State with plans for engaging in livestock farming, in preparation for which he enrolled in the New York State College of Agriculture, from which he received the degree of Bachelor of Science in 1914.

While he was a student at Cornell, his maturity and excellent literary training resulted in his appointment as an instructor in extension teaching. In this capacity, he taught classes in public speaking and English composition and assisted in organizing and supervising Farmers Institutes and the early Extension Service Schools of the College of Agriculture. He continued in this line of work for several years, being appointed Assistant Professor in 1916 and Professor in the Extension Service in 1920.

After serving for a year as Assistant State Leader of County Agricultural Agents, Professor Robinson became assistant to the then Director of Extension, M. C. Burritt. He then began working on the important problem of developing extension programs and serving as liaison staff member to coordinate and integrate the work of the subject-matter extension specialists at the College with that of county extension agents.

During his period of service with the College, Professor Robinson saw the staff of extension specialists grow from a few part-time workers to a large staff of specialists in many different subject-matter fields. This rapid expansion of personnel brought on an important problem, which Professor Robinson quickly recognized, and in the solution of which he made a most valuable contribution to the College and farm people of the state. This problem was that while the farmer thought of his cows, potatoes, and apples as complete enterprises, the extension work of the College was divided into many separate specialized programs such as feeding, breeding, fertilization, spraying, and farm and livestock management.

Professor Robinson was instrumental in introducing a change in Extension programs from a departmental or highly specialized type to one based on the enterprise or type-of-farming approach. This brought together all extension specialists concerned with an enterprise, such as dairying or fruit growing, in setting up programs to meet the many needs of farmers handling such enterprises. The results were that not only did the farmer get what he wanted and needed, but also that there was much more efficient use of extension personnel and of the results of research studies.

One of the later contributions Professor Robinson made to state, national, and world agriculture was his services as liaison officer and official host to hundreds of foreign scientists and public officials visiting Cornell on missions to study agriculture and rural problems. In this capacity, his friendly but dignified personality and his efficiency provided international guests of Cornell with much valuable information and advice and made many friends for Cornell University and the United States.

Professor Robinson was a charter member of the Cornell chapter of the honorary extension fraternity, Epsilon Sigma Phi. He served as chief of the local chapter and in 1947 was cited for outstanding service by the national chapter. He also played an important part in the development and activities of the Cornell Extension Club, which was organized to bring together the members of the extension staff of the Colleges of Agriculture and Home Economics for professional improvement and mutual cooperation.

While an undergraduate at Princeton, Professor Robinson was a member of the Princeton Campus Club and a letter man on the track team. As a resident of Ithaca, he served as president of the Ithaca Automobile Club and for many years was a vestryman of St. John's Episcopal Church.

On his completion of thirty-eight years of service with the College of Agriculture at Cornell, Professor Robinson retired on June 30, 1952. He then accepted the position of project leader in general charge of the Cornell Technical Assistance Program to the College of Agriculture, University of the Philippines. In this connection, he was appointed Professor of Extension Education in the University of the Philippines.

After three years of a most successful tour of duty in administering the assistance program for the rebuilding of the College of Agriculture of the Philippines at Los Banos, Professor Robinson established his residence at Munich in West Germany. Dean Umali of the College of Agriculture of the University of the Philippines, commenting on Professor Robinson's passing, said, "The College lost a man who had made himself one of us and whose work for three years on the campus had made important contributions to what the College is today. We, in the College, mark and feel the passing of a friend we will always fondly remember."

The responsibilities that Professor Robinson handled at Cornell involved dealing with many persons whose backgrounds, education, and points of view varied greatly. The ability to get the research worker, the farmer, the college extension worker, the resident teacher on the campus, and the county agricultural agent working together smoothly and efficiently on a joint program calls for the acme of judgment, diplomacy, patience, and discretion. These attributes Montgomery Robinson had and used in a way that inspired confidence, cooperation, and friendship among those with whom he worked.

Death came to him on July 16, 1960, at his home in Munich, West Germany. He is survived by his wife, Dr. Ina Luitgard Robinson, of Munich, West Germany; by two sisters, Miss Gertrude Robinson of Newton Center, Massachusetts, and Miss Katherine Robinson of St. Albans, Maine; by his daughter, Mrs. Janet Cantrell of Ithaca; and by his grandson, Cyrus Cantrell III, now an undergraduate at Harvard University.

C. G. Bradt, V. B. Hart, L. D. Kelsey

Willard Bancroft Robinson

April 19, 1918 — December 28, 1997

Dr. Willard B. “Robby” Robinson, 79, was Professor Emeritus, retired head of Cornell University’s Institute of Food Science, and retired head, Department of Food Science and Technology (1967-82), New York State Agricultural Experiment Station, Geneva. Robby served as head of the Department of Food Science and Technology for 15 years until his retirement in June 1982. He was appointed head of Cornell’s Institute of Food Science in 1975 that was established to help coordinate teaching, research, and extension activities in food science in Ithaca and Geneva.

Robby was an authority on New York State wines and wine making. He organized a Wine Industry Advisory Committee that served as a vehicle for the exchange of technical information between Cornell scientists and wineries. He also organized seminars and workshops for the benefit of the wineries. He helped organize and served as chairman, Eastern Section, American Society of Enologists, and in 1974, he was awarded the American Wine Society’s Annual Award of Merit. Robby served as co-chairman of the annual New York State Fair wine tasting competition from its inception in 1978 until his retirement from Cornell. His efforts also contributed towards the New York State legislature passing a bill that permitted establishment of small (farm) wineries.

Robby was also an authority on nutrition and food safety. He was a member of a number of committees of the National Research Council of the National Academy of Sciences: the Food and Nutrition Board and served as chairman of the Committee on Food Chemicals Specifications, the Food Protection Committee and served as its secretary and a member of the subcommittees on food technology, artificial sweeteners, generally recognized as safe (GRAS) additives, and chemicals used in food processing. He was a member of the panel on saccharin of the Institute of Medicine of the National Research Council.

As a consultant to the U.S. Interdepartmental Committee on Nutrition for National Development, Robby served as food technologist for nutrition surveys in Colombia, Bolivia, and Honduras. He also served as a food technology consultant in Bolivia for the Pan American Health Organization and the World Health Organization. Perhaps, because of his extensive international travel, he felt comfortable appointing several foreign-born faculty in the Department of Food Science and Technology.

Dr. Robinson was born in State College, Pennsylvania, the son of the late Clair and Helen Bancroft Robinson. He joined Cornell in 1943 after receiving his B.S. degree from Pennsylvania State University, and his M.S. and Ph.D.

degrees from the University of Illinois. He was named Assistant Professor, Associate Professor, and Professor of Chemistry in 1944, 1951, and 1955, respectively.

Dr. Robinson was a gladiolus enthusiast since boyhood and developed the color classification system used by the North American Gladiolus Society. He served as chairman of the Phelps Democratic Committee and was a member of the school board of Phelps Central School District. At the United Church of Phelps and its predecessor, the United Presbyterian Church of Phelps, he was a member of the choir, and served as Presbyterian Sunday School superintendent and ruling elder.

He is survived by his wife, Alice; five children; nine grandchildren; two siblings; and several nieces and nephews.

D.F. Splittstoesser, G.S. Stoewsand, M. Anandha Rao

Lemo Dennis Rockwood

March 28, 1896 — December 16, 1982

For close to forty years Lemo Dennis Rockwood was a leader in the family-life education movement in the United States. Born in a rural county in western Nebraska, Lemo Dennis taught grade school for a year after receiving her high school diploma in 1915. She was responsible not only for academic instruction but also for serving lunch to thirty-five students ranging in age from four and one-half to nineteen!

In 1919 Miss Dennis completed her undergraduate study in home economics at the University of Nebraska. For the next two years she ran a vocational home economics course for high school students in Lincoln that included supervised experience in a “practice house”—one of the first such programs for high school students.

From 1921 to 1925 Miss Dennis was assistant professor of home economics at Nebraska Wesleyan University. She spent her summers in graduate study at Teachers College, Columbia University, where she received a master’s degree in 1926. This was at the height of the progressive education movement. She wrote later, “The emphasis in progressive education on organizing the curriculum around functional nuclei rather than in fields of traditional subject matter fitted in exactly with the purposes of family-life education.”

Lemo Dennis moved next to Lewis Institute in Chicago (now Illinois Institute of Technology), where she was responsible for the home management house as well as courses in child development and economic problems of the family. She spent a summer working at Hull House and became a charter member of the Chicago Association of Family Living.

Her studies took a new turn in 1929, when she came to Cornell on a Laura Spelman Rockefeller fellowship to work for a Ph.D. degree in sociology and psychology with a special emphasis on the family. After two years she received her degree and then spent a year in Rochester as director of the Observation Home for Dependent and Delinquent Children. At the lowest point in the Great Depression she went to Washington, D.C., to become the field worker in child development and parent education for the American Home Economics Association (AHEA). During the next three years she established a national reputation in this still young and hopeful field.

As AHEA field-worker Dr. Dennis encouraged college and high school home economics teachers to establish family-life education as an integral part of the home economics curriculum. To aid in this effort she published two books based on her research at Cornell, *Living Together in the Family* and *Pictures of Family Life*, and a teacher’s

manual to go with them, *Teaching Family Relationships in the High School*. Conferences and workshops brought this material to the attention of home economics teachers in every state.

In 1935 Dr. Dennis, now Lemo Dennis Rockwood, returned to Cornell as extension specialist in the New York State College of Home Economics. Her husband, Cedric Rockwood, became a staff engineer at National Cash Register Company in Ithaca. The following year she was promoted to full professor, and from 1937 until her retirement in 1958 she devoted herself primarily to undergraduate teaching and research.

Teaching family-life courses to mixed groups of Cornell students was a very challenging task. The traditional sociology course on the family emphasized historical and anthropological materials, while the courses she had been designing for high school students emphasized the personal experiences and problems of the students in the course. Professor Rockwood was determined to combine both approaches in her teaching, but it was the experiential emphasis that brought large numbers of students to her course on marriage. There were presentations by physicians and nurses, and each year three or four married couples discussed with the class specific problems of marital adjustment. There were also frequent sessions in which students could explore their own attitudes and values. Lemo Rockwood was a superb discussion leader. She also believed that any faculty member offering such a course must be prepared to spend a great deal of time in personal counseling of students. She was extremely generous with her time and helped great numbers of students with emotional as well as academic problems during her years at Cornell.

Professor Rockwood's major piece of research was carried out with a younger colleague, Mary Ford, and grew directly out of her teaching experiences. It was a systematic study of the attitudes of several hundred Cornell juniors and seniors on such topics as sex education, premarital behavior, expectations of the marriage partner, working wives, number of children desired, separation, and divorce. The book reporting their findings locates Cornell students in 1940 along a continuum of attitudes—more liberal than their parents and the majority of middle class Americans but more traditional than students in urban college settings.

During Lemo Rockwood's last decade at Cornell she was in great demand as a speaker both on and off the campus. One of her major presentations was a review of the history of the family-life education movement, made in 1948 at the tenth anniversary meeting of the National Council on Family Relations. In this review she mentioned the interest in old-age clubs and counseling centers that had been developing since 1940; soon she was active herself in gerontology. She became a member of the Gerontological Society and with Professor Philip Taietz offered the

first course at Cornell on maturity and old age. She also helped with organization of the Tompkins County Senior Citizens Council—one of the first such organizations outside a major metropolitan area.

In July 1958 Lemo Dennis Rockwood was made emeritus and retired with her husband to Nebraska and then to Arizona, where she lived until her death in 1982.

Helen T. M. Bayer, Urie Bronfenbrenner, John S. Harding

Albert Sutherland Roe

April 16, 1914 — December 19, 1988

Albert S. Roe, or “Shad” as he preferred to be called, was a professor of history of art in the College of Arts and Sciences. He was brought to Cornell as a full professor and chairman of that department in 1961 in order to reorganize and revitalize its curriculum. He put the department on its feet, expanded its faculty, increased its course offerings, and negotiated outside funding for a newly initiated graduate program.

Born in New York City, Shad earned his Bachelor’s degree in 1936 and a Master of Fine Arts degree in 1940, both from Princeton University. During World War II, he served as a commissioned officer with the United States Navy. After the war, he resumed his studies in history of art, obtaining his Ph.D. degree from Harvard University in 1950. Before coming to Cornell he held academic appointments at Bowdoin College, Swarthmore College, the University of Pennsylvania, the State University of New York at New Palz, and the University of Delaware.

Throughout his scholarly career, Shad devoted himself to the study of Blake’s watercolors which culminated in the publication of *Blake’s Illustrations to the Divine Comedy* (Princeton University Press) that won the Emily S. Hamblen Memorial Award of the Poetry Society of America in 1954. He also specialized in the study of American art. Through his association with the Winterthur Museum, which developed during the period that he taught at the University of Delaware, he became increasingly interested in American decorative arts and the European sources for their designs. The highlight of his courses on American art at Cornell was the several-day field trip he organized at the Winterthur Museum so that his students could study real objects close at hand.

Love of the actual art object led Shad not only to collect art on his own, but also to serve in curatorial positions in a number of museums. He was curator and acting director at the Bowdoin College Museum of Fine Arts from 1946 to 1953, and keeper of prints and painting at the Winterthur Museum from 1958 to 1961. In 1964, while still in the midst of reorganizing and revitalizing the History of Art Department at Cornell, Shad was asked to take on the additional responsibility of serving as curator of collections at Cornell’s art museum, then housed in the building we know today as the Andrew Dickson White House. It was a much-troubled period in the museum’s young history when Shad stepped into the breach. The director had suddenly resigned and left the operation without an experienced leader. Drawing on his previous museum experience at Winterthur, Shad gave much needed direction and assistance to the staff. He was instrumental in designing and overseeing a major exhibition to celebrate the museum’s first decade of existence. Entitled *Desired Acquisitions: A Tenth Anniversary Exhibition*, this imaginative

project and the accompanying catalogue have become models of the type, and have stimulated similar exhibitions at other institutions like Cornell. Shad went on to serve as the senior curator at the museum before stepping down in 1967 to return to his regular academic duties. Without his timely help and nurturing, the art museum might not have survived this critical period in its growth. He also served as a consultant for the Museum of Fine Arts in Boston, assisting in the preparation of the catalogue for a major exhibition on American colonial art titled, "New England Begins: the Seventeenth Century." It was held in the spring of 1982.

A warm, generous, thoughtful person, and always a gentleman, Shad, together with his wife, Daphne, made it a point to take bewildered new faculty members, graduate students, and especially international students, under their wing, giving them a home away from home, and making them feel like welcome members of the Cornell community. For those of us to whom he reached out, his interest and caring hospitality will never be forgotten.

Shad was a faithful and active member of the Episcopal church at Cornell, a stabilizing, reassuring and beloved presence in the congregation for twenty-seven years. Shad's kind and generous disposition of heart and mind encompassed all who came his way.

He is survived by his wife, Daphne Roe of Ithaca; two sons, David Imbrie Roe of Portland, Oregon, and Adrian Nathaniel Roe of Washington, DC; one daughter, Laura Cynthia Roe of London, England; and one grandson.

Maurice F. Neufeld, Martie W. Young, Robert G. Calkins

Daphne A. Roe

January 4, 1923 — September 22, 1993

Daphne Anderson Roe was Professor Emeritus of Nutritional Sciences, Cornell University. A native of London, England, Professor Roe received her undergraduate training at the University of London, and was awarded a Doctoral degree in Medicine from that institution in 1950. She joined the Cornell faculty in 1961 as a Research Associate in the Graduate School of Nutrition. In 1970, she was appointed to the professorial faculty as an Associate Professor, and was promoted to full Professor in 1976. Professor Roe also held appointments in the Department of Medicine of the Cornell Medical College, and at SUNY Upstate Medical Center in Syracuse.

Professor Roe was recognized internationally as an outstanding teacher and researcher whose career spanned over four decades of achievement. Her scholarly talent was recognized early in her career by the award in 1950 of the Chesterfield Medal in Dermatology by the Institute of Dermatology, London. Later in her career, she was named a Fellow of the Royal College of Physicians, received the Lederle Award from the American Institute of Nutrition and the Joseph B. Goldberger Award in Clinical Nutrition from the American Medical Association, and was named a Fellow of the American Institute of Nutrition in 1990.

Recognition of Professor Roe as an outstanding educator grew from the many students she mentored through graduate studies, classes she taught in both the undergraduate and graduate curricula, and from the many texts she authored on various aspects of clinical nutrition. During her career at Cornell she taught classes in several subjects, including geriatric nutrition, public health nutrition, nutritional toxicology, and methods of human metabolic study. She attracted graduate students from around the world, and was keenly interested in nutritional problems of developing countries. Many of her former students have gone on to productive careers in academia, industry, medicine, and government. A sensitive and caring mentor, Professor Roe would often have students living in her home. She authored and edited 21 books and contributed to over 60 other books on various aspects of clinical nutrition related to aging, drug-nutrient interactions, and toxicology. Her treatise on the history of pellagra is considered a classic.

Professor Roe made significant contributions in many areas of nutrition research, weaving interests in geriatrics, drug-nutrient interactions, toxicology, carotenoids, and photodermatology. Her work is documented in over 150 original publications in the peer reviewed literature and invited reviews in her recognized areas of expertise. These papers, many utilizing imaginative approaches, expanded knowledge of the many aspects of health and disease

that influence vitamin utilization and requirements. Recently she was recognized for her contributions to the understanding of nutritional problems and food-drug interactions in older persons. Professor Roe was one of the first to draw attention to the subtle effects of chronic drug administration on nutritional status, particularly in vulnerable populations. Her recent appointment to the Committee on Nutrition and Aging of the International Union of Nutritional Sciences recognized her significant contributions in geriatric nutrition. Other recent research of note included the study of effects of ultraviolet light exposure on immune function, and the photoprotective effects of *β*-carotene. Having received medical training in dermatology, she was concerned with the effects of excessive sun exposure, particularly in the elderly. Combining imagination and curiosity with a constructively critical mind, Professor Roe was an effective collaborator. She was especially eager to offer her clinical talents and experience to colleagues interested in aspects of human metabolism. She carried out fruitful collaborative projects in many areas, such as regulation of energy intake, and the relationship between oral nitrate reduction and endogenous formation of N-nitrosoamino acids.

In addition to her teaching and research activities in nutritional sciences, Professor Roe was a practicing dermatologist. Prior to her appointment to the Cornell faculty, Professor Roe served at St. John's Hospital, London, first as Registrar for Diseases of the Skin (1948-52), then as First Assistant in Dermatology and Radiotherapy. After coming to the U.S., she served as a Research Associate in Dermatology at the University of Pennsylvania and the Memorial Hospital in Wilmington, Delaware. She continued her practice in the Ithaca area and was an Honorary Member of the Central New York Dermatological Society. She passed on her love of medicine through her involvement with the Health Careers Program at Cornell, and always made time for counseling students interested in medical school.

Although diminutive in size, Professor Roe possessed boundless energy, infectious enthusiasm, and emotional strength. A devoted mother of three (David, Adrian, and Laura), she combined her crisp intellect with wisdom, wit, and kindness. When her beloved husband of thirty-four years, Shad (Albert S. Roe, Professor of Art History, Cornell University) passed away in 1988, her many activities continued unabated. At the time of her death, Professor Roe was preparing for a third career, that as a priest in the Episcopal Church. She had long been an active member of the Episcopal Church at Cornell, and was instrumental in the endowment of its chaplaincy. This new challenge, taken on at age 70, typified Professor Roe's life as a helper-healer. Throughout her career, she championed the cause of the impoverished, lonely, elderly person, in need of medical and nutritional advice delivered with a caring

heart and hand. Her remarkable life will continue to serve as a role model for students and colleagues alike, a life with space for science, family, lifelong learning, and giving.

Cutberto Garza, David A. Levitsky, Robert S. Parker

Louis Michael Roehl

October 21, 1881 — September 16, 1956

Louis Michael Roehl, for 30 years an active member of the staff of the Department of Agricultural Engineering and Professor Emeritus since 1948, died in Ithaca on September 16, 1956 after a long illness. He was born on October 21, 1881 at London, Wisconsin to Christian and Sophia (Albrecht) Roehl.

As a boy he attended a country school at Helenville, Wisconsin, then did preparatory work at both Whitewater Normal, Whitewater, Wisconsin, and Stout Institute, Menomonie, Wisconsin, from which Institute he received the B. A. degree in 1919.

On August 3, 1910 he married Minnie Barbara Kaercher at Minneapolis, Minnesota. He and the late Mrs. Roehl are survived by their two sons, John and Harvey, and by two grandchildren.

Professor Roehl had a long and distinguished career as a teacher. This career began in the years 1903-1904 when he taught at Helenville, Wisconsin. From 1904 to 1908 he was principal of a grade school in Madison, Wisconsin. He then turned to the technical field where he was to find his main life work, holding in turn the following positions: teacher and Director of Industrial Arts at Negaunee, Michigan (1908-10); teacher of Farm Mechanics in the Dunn County Wisconsin School of Agriculture (1911-12); and teacher of Farm Mechanics at the Wisconsin School of Agriculture in Milwaukee (1912-18).

On February 1, 1918 Professor Roehl came to Cornell to teach Farm Shop in what was then the Department of Rural Engineering. This last position he held until his retirement, as full Professor, in June of 1948.

During his 30 years of service at Cornell, Professor Roehl spent many of his summers and sabbatical leaves giving special short courses in Farm Shop in other institutions, this work taking him into fourteen other states of the nation. A sabbatical leave of 1927-28 was spent in England, where he organized and taught farm shop courses at Dartington Hall, the Elmhurst School, in Devonshire.

In addition to being a teacher, Professor Roehl was an inventor and a writer. He acquired several patents on shop equipment, prepared a number of Cornell Extension Bulletins, and contributed numerous articles to professional magazines. His most outstanding effort in writing was his "Farmers' Shop Book", first published in 1923 by the Bruce Publishing Company. This textbook has gone through 10 editions and 17 printings, having grown to be the standard shop text throughout the country.

Professor Roehl was a good teacher in every sense of the word—expert at presenting his subject matter and possessing a skill in relating the subject matter to life and its problems that not only added interest but also inspired his students. He was first and foremost a teacher of men. Everywhere he taught he acquired friends and enthusiastic disciples. He has probably done more than any other man to raise the standards of shop work and to give it a place of dignity in the halls of learning. He was affectionately known as “The Father of Farm Shop Work.”

Aside from his professional duties, Professor Roehl was very active in church work and was for many years an active member of the Ithaca Rotary Club. He was a writer of poems, the printing of a collection of which, entitled “Poems of Farm, Home and Friendship”, was arranged for by his friends at the time of his retirement in order that they might have at hand a clear and helpful portrayal of his unique and philosophical outlook on life.

He was a kind and considerate neighbor, a loyal friend to all his acquaintances. His influence will be missed on the Cornell Campus, particularly by those colleagues who have had the privilege of working closely with him.

Harley E. Howe, W. A. Smith, Forrest B. Wright

Fred Stillman Rogers

December 19, 1886 — October 2, 1949

Fred Stillman Rogers, Professor of Machine Design, was born in Alfred, New York on December 19, 1886 and died in Tompkins County Memorial Hospital in Ithaca, New York on October 2, 1949 following several years of ill health.

Professor Rogers graduated from Alfred Academy in 1905 and received the degree of Bachelor of Science, *magna cum laude*, from Alfred University in 1909. He entered Cornell University in 1910 and received the degree of Mechanical Engineer in 1913. He was appointed Instructor in Machine Design at Cornell in 1914, Assistant Professor in 1918, and Professor in 1924.

From 1909 to 1910, before entering Cornell, he taught science and mathematics in the High School at Watkins, New York. During vacations and at other times from 1902 to 1916, for periods aggregating about 5 years, he worked as a machinist and designing draftsman for Rogers Machine Tool Company at Alfred, New York. During the summer of 1917 he worked as draftsman and engineer for Cayuga Cement Corporation at Portland, New York, and as a designing draftsman for Shepard Crane and Hoist Company at Montour Falls, New York during the summer of 1920.

In 1916 Mr. Rogers married Miss Edna M. Collins of Ithaca, New York. They had two daughters: Janet, Mrs. Leonard W. Kline of West Hartford, Connecticut; and Helen, Mrs. Karl H. A. Lorenzen of Ithaca. All survive him.

As an active member of the First Unitarian Church of Ithaca, Professor Rogers served for eighteen years on its Board of Trustees where he was esteemed for his sound judgment. The position of Financial Secretary he handled over a like period with skill, tact, and ability.

A loyal Mason, Professor Rogers was a member of Hobasco Lodge No. 716, Free and Accepted Masons, Eagle Chapter No. 58, Royal Arch Masons, of which he was High Priest, and St. Augustine Commandery No. 38, Knights Templar.

He was a member of the American Society of Mechanical Engineers and of the American Society for Engineering Education, and was a Licensed Professional Engineer of the State of New York. Among Cornell Fraternities his affiliations were with Acacia.

In view of the fact that Professor Rogers' thirty-five years at Cornell were devoted to the teaching of Kinematics and Machine Design, it is but natural that he appears as co-author of the book "Kinematics of Machinery" by Albert and Rogers.

Professor Rogers was for many years in responsible charge of the courses in Kinematics. He was highly regarded and very well liked by the many instructors who, through the years, were associated with him in the work. He captured and retained their friendship and secured their cooperation by his ability, helpfulness, and unfailing kindness. His good judgment and the quality of his idealism contributed greatly to improving the standards of instruction and to increasing the effectiveness of the department in which he worked.

Professor Rogers was an excellent teacher of Kinematics and of Machine Design and was held in high esteem by his students as teacher, counselor, and friend. He had a genuine interest in teaching and tried continually to improve his methods of instruction and to raise the standard of work of his students.

Professor Rogers will be remembered by his colleagues as an able, loyal, and devoted member of the Department of Machine Design and of the College of Engineering, and he will be remembered by all those who knew him as a loyal and kindly friend.

C. D. Albert, R. E. Clark, R. S. Hosmer

John Rogers

February 19, 1866 — November 19, 1939

Dr. John Rogers was identified with the Cornell University Medical College from its beginning in 1898 until his death on November 19, 1939. He was born in New York City on February 19, 1866, the son of John and Harriet Moore Rogers. His father was the noted John Rogers, sculptor of the story-telling “groups,” of which the replicas ornamented so many American homes of the Victorian era.

Dr. Rogers graduated from Yale College with an A.B. in the class of 1887 and immediately, with a rather unusual appreciation of the value of fundamental training, returned to Yale and entered the Sheffield Scientific School for work in the sciences essential to the study of medicine. He earned the Ph.B. degree in 1888. During that year, under Chittenden and Smith, he developed that interest in the scientific side of medicine which characterized his work throughout his life.

At Yale he was a member of the Delta Kappa Epsilon fraternity and of Skull and Bones. He was captain of his class crew and chairman of the junior promenade committee. In his senior year he was captain of the varsity crew, and he was crew coach for three years following his graduation. Those activities of his undergraduate years gave evidence of characteristics which distinguished his whole life—broad interests and qualities of leadership—thus early appreciated by his fellows.

Dr. Rogers took his medical degree at the College of Physicians and Surgeons in 1891 and then served as intern in the New York Hospital. He married Elizabeth S. White of New Haven, Connecticut, on November 27, 1895. She survives him, with two of their three children.

As was the custom of ambitious young medical men at that time, Dr. Rogers opened an office. He taught as a demonstrator of Anatomy at Yale, and he worked in the dispensaries and clinics of the city hospitals of New York. From the beginning his professional interests were based upon human interests; at Gouverneur Hospital the suffering of numbers of children from the effects of intubation after diphtheria moved him to a deep interest in the surgery of the larynx. His interest in the thyroid grew out of his concern for his own wife during a protracted illness. His later interest in epilepsy was derived from the care of one of his relatives.

Nor were his efforts limited to an interest in the physical ills of his patients. A kindly humanitarianism was shown in his constant successful effort to obtain money from his wealthier patients to aid the unfortunates whom he

was treating professionally in the public dispensaries. He did this long before the foundation of the hospital of the Salvation Army—the Booth Memorial Hospital—with which he was intimately connected from the day of its foundation to the day of his death.

Dr. Rogers was visiting surgeon to Gouverneur Hospital (1896-1909), surgeon to St. Francis Hospital (1902-1921), and visiting surgeon to Bellevue Hospital (1909-1921). He was a Fellow of the American College of Surgeons and a member of the New York Academy of Medicine and of the New York Surgical Society. He belonged to the University Club and the Boone and Crockett Club.

His connection with the Medical College of Cornell University was a threefold one, as teacher, as administrator, and as one actively engaged in research. With the founding of the college in 1898 Dr. Rogers became identified with the faculty, first as an instructor in Surgery and assistant demonstrator in Anatomy, then as an instructor in Clinical Surgery, as professor of Clinical Surgery after 1909, and as professor emeritus after 1926. He was secretary of the faculty from 1898 to 1908, during a period when the duties of that office included admissions to the school.

Dr. Rogers's interest in the thyroid gland led to some of the earliest work on the function of that organ and to the development first of a serum and then of extracts of the gland which have ever since been standard extracts for the treatment of thyroid disease. For nearly thirty-five years, with funds independently raised, he supported laboratory work in the Medical College along the various lines in which he was interested, chiefly the study of the thyroid.

In this day, when extracts of about every organ of the body are being used, it is difficult to realize the obstacles which had to be overcome by Dr. Rogers and other workers of that day. Fortunately for us, the field chosen was that of the thyroid gland, where substitution therapy gave clear-cut and definite response. To overcome the ridicule of one's fellows in the profession, to work out methods for the extraction and utilization of active principles, to see those products come into general use, to live to see one's work so firmly established that the early days of trial are completely forgotten—that is a gratifying experience granted to but few. The Cornell University Medical College ought to remember that this achievement of establishing the basis of modern organotherapy was in no small measure due to the imagination and the pertinacity of Dr. John Rogers.

From all these varied activities there stands out the man himself. Of tall, commanding presence, a natural leader, the man's most memorable characteristic is his kindness, whether as surgeon or teacher or administrator. If the story of his life could be told with all the human interest that informed his father's sculptures, for an example to

young persons who would study medicine, it would serve admirably to show that before one can become a great surgeon one must be a great physician and before that a great man.

Joseph Thomas Rogers

October 22, 1957 — May 25, 2004

Joe was born in Chicago and lived most of his childhood years in Glen Ellyn. His parents, Joseph and Gertrude, were artists trained at the Art Institute of Chicago. He attended SUNY at Stony Brook where he graduated with a B.S. degree in Physics in 1980. At Stony Brook, he received the Outstanding Student Award, also in 1980. After graduating, he worked as a Research Engineer for a laser manufacturer for two years. Joe then entered the graduate program in physics at the University of Rochester, receiving the Ph.D. degree in 1987. His thesis topic was entitled “Limits on the Electromagnetic Coupling and Density of Galactic Axions”. In this work, Joe showed great versatility in both technology and physics, as well as very broad scientific interests, although topics close to astrophysics and cosmology remained close to his heart throughout his career.

In 1987, Joe worked as a Visiting Scientist at Istituto di Fisica dello Spazio Interplanetario, returning to Rochester as a Research Associate stationed at Brookhaven National Lab (BNL), where he started working on an experiment to measure the birefringence of the vacuum using high field superconducting magnets and optical techniques. While at BNL, his outstanding talent did not go unnoticed and he received an offer to take a position with the National Synchrotron Light Source. Although unfamiliar with this kind of research, Joe’s experience with his thesis at Fermi National Accelerator Lab enabled him to begin making important contributions to the operation of two storage ring accelerators at BNL. His BNL colleagues had this to say about him:

“He was an easy person to like—cheerful, friendly, warm and gentle. Those with whom he worked at the time recall that he had a gift for finding simple solutions to complex problems. Also he was able to communicate his results in an elegant manner, quickly getting to the heart of the matter. Joe enjoyed his work, and that, combined with his quick intellect, led to very thorough and superbly performing systems that remain in use today”.

When an Assistant Professorship in accelerator or particle physics came open at Cornell in 1992, Joe easily got the nod and began his productive Cornell career where he made important contributions to teaching, service and research. In teaching, Joe was active in developing Peer Instruction using new technologies. He was very keen on student interaction and “active learning”. Joe was Director of Undergraduate Studies in the Physics Department from 1998 to 2001. Of his teaching, here is a typical quote from one of his student evaluations:

“From the first few days of class, it was very apparent that Professor Rogers was a genuinely nice man. There was nothing arrogant or presuming in his demeanor, and he always seemed happy to be sharing his knowledge of physics with the class... This class was the best physics class I’ve had at Cornell”.

In other service activities, he served on Graduate Admissions, Bethe Prize Committee, co-coordinator of Research Experience for Undergraduates, Faculty Search Committee, Colloquium Committee and Research Associate Search Committee. He also served in the Teaching Assistant Training Workshop of 1995 as well as several activities in the college and university.

When Joe arrived at Cornell in 1992, he joined the CESR operations group. At about that same time, the CESR group had undertaken the challenge of circulating trains of closely spaced bunches of electrons and positrons only to discover that multibunch instabilities limited the total beam current. Joe spearheaded the effort to develop a broadband feedback system to control the instabilities. He designed the digital signal processor and a stripline kicker that was capable of delivering distinct impulses to bunches as few as 10 billionths of a second apart. The digital processing electronics has evolved in the past decade, but we continue to depend on Joe's kicker to stabilize the multi-bunch beams.

Joe had an unusual ability to find simple explanations for apparently complex phenomena. In the mid 1980s, a collective instability was observed in the Cornell storage ring. The current dependence of the instability was so unusual and counterintuitive that it was designated the "anomalous" antidamping. We eventually learned to control the effect but its origin remained mysterious. When Joe came to Cornell, he reviewed the data that had been accumulated over the years. He made a few well-conceived measurements of his own and then proposed a wonderfully simple model of a photoelectron trapping mechanism. His calculations predicted precisely what we had long observed.

Joe applied his deep intuition for beam dynamics and his ability to translate physics of complex systems into computer models, to the study of the beam-beam interaction in electron-positron colliders. He worked with students to develop a so-called strong-strong simulation. His innovative strategy for treating the collisions yielded a calculation that relied on few approximations but could be completed relatively quickly. And he put a cluster of two dozen high-speed computers to work investigating the nature of the interaction.

Recognized as an international expert in the field of electron positron colliders, Joe was invited to give a review talk at the 2001 Particle Accelerator Conference entitled "Beam Dynamics in High Luminosity e^+e^- Factories." But Joe's interests in accelerator physics research extended beyond the Cornell Electron Storage Ring to the wider programs of the international community of elementary particle physics.

In recent years, the world community of particle physics has been planning for the next frontier facility, an electron-positron collider capable of investigating important questions about energy, matter, space and time. Joe

played an important leadership role in both the joint international efforts and in the American regional effort. In 2001, an international coordinating group commissioned a review of the worldwide state of R&D and design concepts on which to base a selection of the technology to be carried through to final engineering. Joe was a key member of that review, acting as leader of the review team for a major sub-system of the accelerator complex. In the American regional efforts, Joe has been a leader in the process of engaging universities in contributing to the R&D and planning for the future facility, taking on important coordination activities in creating a multi-university proposal to the National Science Foundation.

In addition to these community service activities, Joe has, himself, made significant contributions to the R&D and concept design activities. Together with his students and collaborators at Cornell, the University of Illinois, and Fermilab, he developed innovative designs for the injector sub-system of the collider. These ideas will continue to be developed and will play a crucial role in simplifying the design of a key element of the international linear collider.

Joe is survived by his wife, Rene; sons, David and Michael; his father, Joseph W.; and a brother, Steven. We have lost a dear friend and colleague and a major contributor to world science.

Gerald F. Dugan, Sam Krinsky, Adrian Melissinos, David Rubin, Maury Tigner

Mabel A. Rollins

May 19, 1909 — December 18, 1986

Mabel A. Rollins, professor emerita of household economics and management, died on December 18, 1986, in Chatham, New Jersey. She was born an American citizen in London, England, to the late John G. and Mabel Rollins. The family was engaged in an importing and exporting firm in both New York City and London. Mabel Rollins was at home in both countries. She was a partner in John G. Rollins and Sons in New York and a director of Rollins and Sons in London for most of her adult life.

She transferred to Cornell from Packer Collegiate Institute and received a Bachelor of Science degree in home economics in 1932. Between 1932 and 1940 she worked as a graduate assistant and lecturer in the Department of Economics of the Household and Household Management while she studied for her advanced degrees. There were several interruptions in her studies, as she returned to work in the family business for short periods of time. Mabel may have seriously been trying to decide her future. She was very close to her father; having no brothers, she could have had a career in the family business. However, with the encouragement of Professor Helen Canon, head of the department, Mabel completed her Ph.D. in 1940. Her doctoral program combined work in home economics with a strong background in economics, statistics, and related areas from throughout the university.

After completing her Ph.D., she returned to New Jersey and the export-import firm. It is evident from her correspondence with Helen Canon that her heart and her head were more attracted to academia. Professor Canon encouraged her enthusiasm for ideas, particularly those related to the world of work and more specifically to the neglected area of women's work in the home. These two women obviously sparked each other—they were intent on integrating an understanding of economics, markets, work, and home to address the basic problems of society: feeding, clothing, and housing people. They saw the family as the most efficient organization to do that task.

Mabel Rollins returned to Cornell in the fall of 1942 as an assistant professor in economics of the household and household management. Thus began a long and productive academic career. In 1952 she was chosen to receive the first annual Professor of Merit Award for Distinguished Teaching by the seniors in home economics. She was named head of the department in 1952 and continued in that capacity until she retired and was named professor emerita in 1969.

Mabel Rollins dedicated her professional life to studying and improving the economic well-being of families. Her understanding of the interrelatedness of activities in the home and the functioning of consumers in the market

furthered the development of programs that emphasized resource allocation and use. Her leadership in that area was nationally recognized. She served as a member of the advisory committee to the Bureau of Labor Statistics on the 1960-61 survey of consumer expenditures, and she chaired the Family Economics and Management Section of the American Home Economics Association. In her later years she helped develop programs related to the legal aspects of consumer issues, disadvantaged groups in urban areas, and health agencies responsible for training employees of nursing homes and other long-term care facilities.

Mabel Rollins's national reputation is impressive, but her strongest and most lasting accomplishments were made in her work with graduate students and faculty in a developing field of study. Her ability to generate ideas with unique linkages was an outstanding trait. A discussion with Professor Rollins was always a stimulating experience. She was an administrator of rare quality and provided evenhanded support among the faculty for the competing interests of management, economics, and science in the home. At the same time she encouraged developments in research, extension, and resident teaching. Her genuine respect for the individual—faculty member, clerical worker, and graduate student—brought forth dedicated service and achievement. She was a good listener—she encouraged the expression of ideas and helped create an environment that would enhance the development of each staff member. Her philosophy of providing support to seed ideas fostered new research directions and change. She insisted that graduate students develop a sense of professionalism while studying for their advanced degrees. She held memberships in, and contributed to, numerous professional associations and was elected to membership in Omicron Nu and Phi Kappa Phi, both national honoraries. She was listed in *Who's Who in America* and *Who's Who of American Women*.

Mabel Rollins viewed the responsibility for the department, the college, and the university as *ours*, belonging to faculty and students—even when it meant accepting the obligation for the more routine chores. As an administrator she was a strong advocate of Carl Becker's idea of "freedom with responsibility." One of the authors of these notes remembers being given a copy of Becker's book to read on the plane as she returned home after her initial interview.

Professor Rollins had a strong sense of economic and social justice. She passionately disliked segregation, whether by race, sex, or age; by social or economic status; or by political or religious thought. She was an avid reader, a producer of new ideas and insights. She resisted change for the sake of change but encouraged it wherever she could see the potential for progress.

Mabel Rollins had the ability to ask penetrating questions that helped to give perspective and provide impetus to progress. In recognition of her contributions as a teacher, scholar, and leader, at the time of her retirement the

faculty of the Department of Household Economics and Management (now known as Consumer Economics and Housing), together with former students, established a Cornell University scholarship in her honor—the Mabel A. Rollins Scholarship Fund. It is awarded annually to a graduate student who wants to specialize in the study of economic and managerial problems of families.

She is survived by a sister, Ruth Rollins of Madison, New Jersey, and two nephews. A memorial service was conducted on June 13, 1987, in Anabel Taylor Chapel during reunion week.

Nancy McNeal Roman

September 5, 1882 — June 9, 1970

Nancy McNeal Roman came to Cornell University in 1917 from the University of Chicago, where she had obtained the Ph.B. degree and where she had been an instructor in home economics for three years. The opportunity that brought her to Cornell University was the possibility of developing a program for rural girls in what was then Junior Extension, now 4-H Club work. Federal funds had recently become available through the Smith-Lever Act for extending the work of land grant colleges in home economics. While at Cornell University Mrs. Roman was a program developer, home improvement specialist, professor of housing and design, and always a dedicated teacher.

Her career had a contemporary flavor. She worked with the disadvantaged young, she worked under conditions that were often personally uncomfortable, she was acutely aware that not only must interest be stimulated, but that the results must be sufficiently swift and definite to maintain this interest. She had few guidelines: her tasks were to develop a program and an effective method of teaching it. Her problem differed from that confronting today's workers with the disadvantaged, mainly in that it was focused toward rural, not city, youth.

For more than thirty years Mrs. Roman worked with the 4-H Club program for rural girls. The tool she developed for stimulating and educating was the furnishing of the girls' own rooms. Through this medium, she demonstrated that not only could a girl's aesthetic appreciation and sense of accomplishment be advanced but that the results could be spread to other members of the family and community. Mothers were enlisted as local leaders, i.e., lay teachers. Rural families learned to appreciate the simple lines and sturdy workmanship of the handcrafted furniture that had often been relegated to the attic or barn, or which might be found in secondhand stores for a small price. Fathers and brothers helped to refinish and restore this furniture and build simple improvements in the rooms.

Nancy Roman had certain characteristics that were as crucial to her success as they would be to any present-day teacher. She had tremendous physical energy. She was willing and able to carry quantities of illustrative materials with her all over the state. She could turn unprepossessing rooms in churches and grange halls into acceptable teaching and work areas, even occasionally starting the fire in whatever heating equipment was available. She was highly skilled in the use of tools and materials, which enabled her to make practical applications of her theoretical knowledge.

She had the conviction that improvement of the most meager room was possible and worth undertaking. She constantly stressed that beauty in home surroundings need not, and should not, be limited to families of wealth. She believed that all persons responded to beauty and that to achieve it through their own creative efforts was doubly satisfying. She was familiar with the contents of many secondhand stores throughout the state and delighted in leading expeditions of would-be room-improvers through them, helping to discover the restorable pieces. She was aware of bargains in variety stores and mail order catalogs. She taught consumer education at the grass roots.

All those who worked with her, 4-H Club members, local leaders, and 4-H Club agents, were constantly stimulated. Her sensitivity to the capabilities and needs of youngsters and local leaders was coupled with an enthusiastic and innovative teaching style. Extension teaching, unlike classroom teaching, required practical demonstration of what needed to be done, but the actual teaching had to be left to the local community leaders. Thus the extension teacher had to teach the volunteer leaders how to teach, as well as what to teach. In 1927 Mrs. Roman completed work for the master's degree at Teacher's College, Columbia University, then noted for its new educational methods.

Her last five years at Cornell University, before her retirement in 1950, were spent in the resident teaching program. She found that the methods she had used in 4-H Club work, of stimulating and developing the aesthetic appreciation and creativity of the individual, were equally effective in teaching college students. She worked particularly with those who were expecting to teach, and with graduate students. She was the author of a number of bulletins, perhaps the best known of which were the *Handy-Man* series. This series has been adapted by workers in numerous states and has established a model for many of today's teaching aids.

She was the wife and widow of Dr. Frederick W. Roman, a well-known teacher and regent of the University of California. After her retirement she lived in Winter Park, Florida, with her sister, Wylle McNeal, former director of the School of Home Economics at the University of Minnesota.

Ruby Loper, Virginia True, Mabel A. Rollins

Alexis Lawrence Romanoff

May 17, 1892 — January 24, 1980

Alexis Romanoff was born in St. Petersburg (now Leningrad) and lived there up to the troublous times of the Russian revolution. He studied chemistry and engineering at St. Petersburg Teachers College and art at the Academy of Fine Arts. Before the Bolsheviki came to power, Alexis had become a lieutenant in the Imperial Russian Army. As such, he was a marked man, but he managed to escape and to make his way across Siberia to Vladivostok. That journey was made slowly, with stops at Kazan and Tomsk for study at the universities there. Many of his harrowing experiences and narrow escapes are recounted in his *Diaries Through War and Peace*, and in *Stormy Days*, the first volume of *A Solemn Promise* (in verse).

From Vladivostok, Alexis reached China, and thence, in 1921, the United States. He came to Cornell as a student in 1923. Here his training and talents were soon recognized and his Bachelor of Science degree was followed by a Master of Science degree and (in 1928) a Doctor of Philosophy degree.

After his appointment as a research assistant in the Department of Poultry Husbandry, Alexis climbed the usual steps on the academic ladder and was appointed professor of chemical embryology in 1948. He retired in 1960 after thirty-six years of distinguished service.

Professor Romanoff was a member of many scientific societies and of the Ithaca Rotary Club. From the Poultry Science Association he received the Borden Award for research in 1950. His interests took him to many laboratories in Europe and in the United States and during sabbatic leaves he held appointments as research associate at Harvard, Yale, and the University of Florida.

Professor Romanoff devoted his scientific career to the study of eggs and avian embryos. That, in turn, necessitated much study to find, not only the optimum conditions for artificial incubation, but also how the embryo kept changing and growing during its twenty-one day transition from egg to chick.

In the early 1930s when many poultry men still operated their own incubators, each year for several years Alexis conducted a one-day school of incubation to help them with their problems. He also perfected a technique whereby chick embryos could be kept alive and observed in opened eggs at all stages of incubation. In the years when Farm and Home Week brought crowds of visitors of all ages to the campus, his chick embryos and hatching chicks were always a stellar attraction. So was his motion-picture film "Where Chick Life Begins," produced in 1937, which

showed in color all the stages of development, as a small circular spot on the yolk was gradually transformed during twenty-one days into a fluffy chick. It won international acclaim as an educational film and brought many visitors to Cornell to see its producer.

To study incubation and embryology one should know all about fresh eggs before they go into the incubator. Years of his own research and study of the pertinent literature resulted in publication by Professor Romanoff (with his wife, Anastasia) of an indispensable book on that subject—*The Avian Egg*. It came out in 1949. Thirty years later it is still a standard reference book and is known throughout the world. Its 918 pages begin with the laying habits of hens and cover everything one could want to know about eggs, their chemical composition, food value, industrial uses, preservation, and even the decorations painted on their shells in different countries. The index alone is 46 pages.

That book was followed eleven years later by *The Avian Embryo* and, after his retirement, *Biochemistry of the Avian Embryo* (1967) and *Pathogenesis of the Avian Embryo* (1972).

While all of us in the department fully appreciated the achievements of Alexis in science, and their applications in practice, few among us realized until after his retirement that he was both a poet and an artist. There then appeared several little books of verse under his name. One of these, *The University Campus*, tells of his affection for the Cornell scene; another, *Ithaca*, does the same for the town, and in *Profiles of American Heritage* he salutes each and every state in the Union with a poem which refers to its distinguishing features as he saw them. The *Artist-Poet's Album* carries a frontispiece showing in color seven of his paintings. Four of these are scenes on the Cornell campus, and one is the very lifelike head of a brown Leghorn hen.

Professor Romanoff's philosophy of life is nicely revealed in his final book, *Encyclopedia of Thoughts* (1975) with its 3,007 aphorisms (all indexed), 187 pages of couplets, and 143 pages of epigrams. They expound his modest, industrious, and cheerful way of life that endeared him to us. One of those epigrams deals with a trait by which he was always distinguished:

*One's courtesy—a pleasant chore—
In daily life can always win;
It is most welcome at each door—
Acquired and held by discipline.*

Alexis died after a long illness. He is survived by his widow and helpmeet, Anastasia (Sayenko) whom he had married in 1928. They had no children.

Robert C. Baker, Ari van Tienhoven, Frederick B. Hutt

Flora Rose

October 13, 1874 — July 25, 1959

Flora Rose, former director of the New York State College of Home Economics at Cornell University, died July 25, 1959, at her home in Berkeley, California, where she had lived since her retirement in 1940.

As teacher and as administrator, Miss Rose gave thirty-three years of distinguished service to the development and guidance of home economics at Cornell University.

Born in Denver, Colorado, in 1874, she received her early education in the Denver schools. Then followed a period of travel, informal study, and reflection that brought both a sure desire to become a teacher and a growing interest in a newly developing field of education—a field that was later to be called home economics. In 1903 she received a diploma in Household Arts from the Framingham Normal School in Framingham, Massachusetts, and in 1904 the B.S. degree from the Kansas State Agricultural College, after which for three years she taught courses in food and nutrition at that college. The next year she completed work for the Master's degree at Columbia University under the direction of Dr. Henry C. Sherman in the Department of Chemistry. Her first association with Cornell University came in the winter of 1907.

At this time Martha Van Rensselaer had been at Cornell for seven years. She had come to the College of Agriculture to write leaflets and organize groups of study clubs for farm women throughout the state with the purpose of giving leaning and method to their work and thus easing their daily tasks. On this concept and on these beginnings was to be built slowly what has become the New York State Extension Service in Home Economics.

Another concept also was taking shape in the minds of both Martha Van Rensselaer and Liberty Hyde Bailey, Director of the College of Agriculture. They had begun to explore the possibility of offering courses in home economics at the college level within the College of Agriculture. They saw the scope of such a development and were not deterred by the difficulties that they also foresaw. A first step could be taken: an able person must be found to give assistance to the undertaking.

In Miss Van Rensselaer's files was a letter from Miss Rose expressing a wish to be considered for an opening in home economics should such a position materialize. In 1907 she was invited to teach a course for two weeks in food and nutrition as part of the winter course in the College of Agriculture. Impressed with her scientific training, her educational philosophy, the enthusiasm that her teaching aroused, the vigor of her personality, Director Bailey

offered her the opportunity to join Miss Van Rensselaer in building a Department of Home Economics in the College of Agriculture.

Thus began the long friendship and close association of two great women which continued until Miss Van Rensselaer's death twenty-five years later. Each one had fundamental qualities of clear and far vision, pioneering spirit, capacity for hard work, humor, and high courage. Each added to the power of the other; the two were greater than two times one. Through their work there came to be built first a Department of Home Economics in the College of Agriculture, then a School of Home Economics, and finally the New York State College of Home Economics at Cornell University, which was to become a force throughout the state and an influence in national education.

Miss Rose's unique contributions grew out of her vital interest in human nutrition. Generations of students remember the depth and vividness of her teaching. She was called upon for national and international assignments when food and nutrition were of critical concern, as during World War I and the depression years. She served as deputy director of the Food Conservation Bureau of the New York State Food Commission, the arm of the United States Food Administration in the state. She took a leading part in the research and development of low-cost reinforced cereals. For her study of the nutrition of Belgian school children, she was awarded the Insignia of the Order of the Crown by King Albert of Belgium.

In time the demands of a growing College forced Miss Rose to relinquish formal teaching, yet she never gave up her devoted interest in students and her contacts with them. For eight years after Miss Van Rensselaer's death, she continued as Director of the College—leading, guiding, experimenting, achieving. Enthusiasm, generosity, capacity for rigorous and sustained effort are qualities she possessed in full measure. When she retired, she left a College of Home Economics with a large Faculty and undergraduate student body, an Extension Service program enrolling 50,000 young persons and adults, and an expanding graduate student body and program of research.

Miss Rose's memorial will always be then the College that she helped to build. Yet for those who knew her, the person herself dominates. The abiding picture is one of vividness and warmth, of poise and strength, of open-door hospitality, of instant and personal interest, and of loyal friendship.

Mabel A. Rollins, Beulah Blackmore, Dorothy Delany, Mary F. Henry

Alex F.T.W. Rosenberg

December 5, 1926 — October 27, 2007

Alex F.T.W. Rosenberg, 80, died October 27, 2007, in Schwerte, Germany, following a long illness. He was born in Berlin, December 5, 1926. He and his parents, Theodor and Rela, and his sister, Edith, fled Nazi Germany in 1939, and subsequently obtained safe passage to Canada, and resettled in Ontario.

He received a B.A. degree (Math/Physics, Div. I) in 1948 and an M.A. degree in 1949 from the University of Toronto, followed by a Ph.D. degree from the University of Chicago in 1951.

Following a year as a postdoc at the University of Michigan, Professor Rosenberg began a decade-long association with Northwestern University in 1952. That same year, he married Beatrice F. Gershenson of New York City; and their sons, Theodore Joseph and David Michael, were born in 1953 and 1956, respectively. He became a naturalized U.S. citizen in 1959.

Professor Rosenberg joined the faculty at Cornell University in 1961 as Professor of Mathematics, and he served as chairman of the department from 1966-69. He was named Professor Emeritus in 1988.

He had been a Visiting Scholar at UCLA (1970-71); a Visiting Professor at Berkeley (spring 1961 and spring 1979); a von Humboldt Foundation Senior U.S. Scientist awardee at Ludwig-Maximilians University in Munich (fall 1975) and at ETH Zurich (spring 1976); Distinguished Lecturer in Mathematics at the University of Southern California, where he delivered a series of seven lectures (April and May 1980); and in 1984-85, he spent the year at the University of Dortmund.

While at Cornell, he was active in library affairs and was the department's liaison with the mathematics library for two decades. Hard times in the 1970s led to the cancellation of several journals due to a shortage of funds. Alex wrote to a number of Cornell alumni whom he thought might be in a position to help, and today these funds pay for a large portion of the library's monographs.

Professor Rosenberg maintained a high profile in both the AMS and MAA, serving as Editor of the *Proceedings of the AMS* (1960-65) and Editor of the *American Mathematical Monthly* (1974-76). He chaired, in the early 1970s, the MAA's Committee on the Undergraduate Program in Mathematics.

Following a divorce in 1984, Alex remarried in Germany in 1985, and in 1986 left Cornell to become department chair at the University of California, Santa Barbara.

Many Cornell colleagues remember his professional dedication, dark sense of humor and often-colorful language.

Peter Kahn recalls:

“He growled and grumbled and complained, but (in my hearing---at least most of the time) usually with a certain spark that let you know he was only partly serious. I think the most important thing I could say about Alex, beyond praising his mathematical talents and contributions, is that he cared deeply about the professor of mathematics in the broadest sense: from department administration, to teaching, to mentoring graduate students, to helping colleagues, etc. His level of caring was often intense and accounted for much of what might be called his acerbic quality.”

Steve Chase recalls:

“My impression of Alex’s attitude toward mathematical research is that it should be a collaborative effort. A great number of his papers were collaborations. One of my clearest memories of our collaboration of long ago is the fact that he was especially skilled at taking an afternoon of disorganized and occasionally incoherent discussion and blackboard work and transforming it all into intelligible and orderly exposition, often providing elementary arguments in place of more advanced methods that we had originally used to obtain the results...”

As Marshall Cohen observed, “Alex Rosenberg was a big-hearted man and champion of the underdog. I will always remember him fondly.”

Professor Rosenberg is survived by his wife Brunhilde, of Schwerte, Germany; his adopted son Daniel, of Washington, D.C.; his former wife Beatrice, of Ithaca, New York, and their son Ted, of Rochester, New York; and his sister Edith, of Washington, D.C. His son, David, predeceased him in 2002.

Office of the Dean of Faculty

Frank Rosenblatt

July 11, 1928 — July 11, 1971

Frank Rosenblatt died on Sunday afternoon, July 11, 1971, in a boating accident in Chesapeake Bay.

He was born on July 11, 1928, in New Rochelle, New York. He obtained his A.B. from Cornell in 1950 and his Ph.D. in 1956. He then went to Cornell Aeronautical Laboratory in Buffalo, New York, where he was successively research psychologist, senior psychologist, and head of the cognitive systems section. In 1959 he came to Cornell's Ithaca campus as director of the Cognitive Systems Research Program and also as a lecturer in the Psychology Department. In 1966 he joined the Section of Neurobiology and Behavior within the newly formed Division of Biological Sciences, and simultaneously became associate professor.

His research interests were exceptionally broad. One aspect dealt with models of brain function, and in 1958 he described his Perceptron, an electronic device which was constructed in accordance with biological principles and which showed an ability to learn. He developed and extended this approach in numerous papers and a book, *Principles of Neurodynamics*, and he gave an annual course in Brain Mechanisms and Models. In 1966 he added an interest in the transfer of learned behavior from trained to naive rats by the injection of brain extracts, and he published extensively in this area. He also had a serious research interest in astronomy and recently proposed a new technique to detect the presence of stellar satellites.

In 1970 he became field representative for the Graduate Field of Neurobiology and Behavior, and in 1971 he shared the acting chairmanship of the Section of Neurobiology and Behavior.

His other interests included music, which he composed, and liberal politics. His special contribution was the application of computer techniques to political statistics. He was active in the McCarthy primary campaigns in New Hampshire and California, in Democratic reform politics in New York State, and in a series of Vietnam protest activities in Washington. At Cornell he played a major role in the constructive aspects of the upheavals in spring 1969, and he was very active in the Constituent Assembly that set up the University Senate.

He had a deep interest in student affairs and a personal concern which led him to help very many who had difficulties in adjusting to University life. This willingness to help was a feature of all his relationships. We have lost, in his passing, one of the most selfless and sympathetic colleagues, whose good humor and brilliant mind left a deep impression on us all.

Stephen T. Emlen, Howard C. Howland, Richard D. O'Brien

Meyer Rosensohn

September 14, 1882 — April 26, 1953

Meyer Rosensohn was born in Russia on September 14, 1882 and was brought to the United States by his father and mother along with several brothers and sisters when he was two years old. The family settled on the lower East Side of New York City. At a very early age it became necessary for Dr. Rosensohn to work after school hours to help meet the family budget because of the untimely death of his father. He attended elementary and high school and by virtue of his own industry he was able to finance his way through college and was graduated from the College of the City of New York with honors and a Bachelor of Science degree in 1901.

Because of financial considerations it was not until the fall of 1905 that he was able to enter medical college, an early and lasting ambition. He was graduated from the College of Physicians and Surgeons of Columbia University in the Spring of 1909 with honors including membership in the Alpha Omega Alpha fraternity which he received after his third year. He served as intern in pathology followed by three years service as house physician in internal medicine at Mount Sinai Hospital in New York. This service was followed by an appointment as House Surgeon at the New York Lying-in Hospital. Upon completion of this duty he became an Assistant in private practice to the late Dr. Alfred Meyers. In 1916 he began his own private practice and was appointed to the attending staff (First Division) of the New York Lying-in Hospital, a position he continued to hold until he was retired by virtue of the age limit in 1949. For many years he was Director of Obstetrics at the Bronx Hospital and recently was appointed Consultant in Obstetrics at that institution. He also was on the Attending Staff of Montefiore Hospital for a number of years. Between the years 1932 and 1949 he was in turn Instructor and Assistant Professor of Clinical Obstetrics and Gynecology at Cornell University Medical College. Dr. Rosensohn made a great success of his life work and was indeed a true prototype of the Horatio Alger saga.

Doctor Rosensohn was a member of the New York County and State Medical Societies, a Fellow of the American Medical Association, The American College of Surgeons, the New York Academy of Medicine and the New York Obstetrical Society. His last scientific paper, still to be published, was read before this latter organization in December 1952. He was a diplomate of the American Board of Obstetrics and Gynecology.

Doctor Rosensohn was a deep thinker with an amazing memory, a scholar and a lover of history. He was thoughtful, kind and ever ready to offer instruction, in his modest manner, to any of the students or younger men with whom he came in contact. He delighted in sharing his knowledge With others. He was conservative in his judgment

and never shirked responsibility. He never wore the mask of pretense. Dr. Rosensohn was a prodigious student of medical literature, and to the amazement of attending staff and students, would frequently quote from memory titles of articles, names of journals, page numbers and brief summaries of contents. In these references, he always appeared to be right. He never missed an opportunity to talk to the students, and he did most of his teaching in the delivery and operating rooms, on the pavilions, in the corridors and in the Out-Patient Department. He was a great believer in the less formalized type of teaching. He made a substantial contribution to the training of the resident staff and preferred to have them do his operations but he was always present in the operating or delivery room, giving instruction to the best of his ability. This practice he continued until the last week of his life.

Doctor Rosensohn's patients idolized him, and they were one of his greatest pleasures in life. Seriously ill for several months, he attended patients in his office and in the hospital until his end came on April 26, 1953 in Larchmont, New York.

Doctor Rosensohn is survived by a son William, two daughters; Mrs. Lucy Rothlein and Miss Eleanor Rosensohn; and four grandchildren.

R. G. Douglas

A. Frank Ross

April 20, 1911 — March 28, 1989

Frank Ross was a modest scholar whose combined programs of teaching and research provided a model for many others. He applied his background in agriculture and biochemistry to his specialty in plant pathology—plant virology—with a success all out of proportion to the fact that he never had any formal training in plant pathology. Frank was a good example of the potential of a solid scientist working in a field different from that of his training.

Professor Ross was born in New Hampton, Missouri. His B.S. degree in agriculture, with distinction, was awarded in 1933 by the University of Missouri, where he also earned the M.A. degree. At Missouri his life-long interest in virology began when he worked in the virus laboratory of Dr. C.G. Vinson. His Ph.D. degree in agricultural chemistry was obtained at the University of Wisconsin in 1937.

He studied plant viruses for three years at the Rockefeller Institute for Medical Research at Princeton University, and for six years as biochemist at the University of Maine. During World War II, he served as a consultant on food dehydration and preservation for the Office of the Quartermaster General. He came to Cornell as associate professor of plant pathology in 1946, became professor in 1949, and was appointed professor emeritus in 1973. The first course in plant virology at Cornell, which Frank initiated, became one of the most effective graduate courses in the department of plant pathology. He also served the department as acting head and as graduate field representative. Other assignments included visiting plant pathologist, University of Puerto Rico; visiting professor, University of California, Berkeley; and visiting scientist, Laboratory for Virology, Wageningen, The Netherlands, under the auspices of a Guggenheim Fellowship and a Fulbright Award.

Frank was active in the affairs of the American Phytopathological Society. In addition to serving as a member or chairman of numerous committees, he represented the Society on the Council of the American Association for the Advancement of Science. He was editor in chief of the *Journal Phytopathology* from 1955 through 1957. Frank was associate editor of *Virology*, and a member of the editorial committee of the Potato Association of America. He was a member of the Virology and Rickettsiology Study Section of the National Institutes of Health.

Professor Ross held memberships in the honorary societies of Sigma Xi, Phi Kappa Phi, Gamma Sigma Delta, Alpha Zeta, and Pi Mu Epsilon. In 1968 the American Phytopathological Society presented the Fellow Award to him. Frank was also honored by invitations to lecture at many national and international meetings, such as the Third International Symposium on Virus Diseases of Ornamentals.

Frank made many contributions in research on the isolation and characterization of viruses, the analysis of mixed infections, and the nature of mechanisms that restrict virus replication and movement within plants. His balanced programs of research and teaching were supported for many years by the National Science Foundation and by the National Institutes of Health during his 27 years of service at Cornell. Graduate students benefited from the quality of his research, the clearness of his writing, the soundness of his teaching, and the preciseness of his editing. He was the major advisor for 20 completed theses and the informal advisor for many others. His insistence on seeking reasons and facts caused many students and colleagues to re-examine their concepts and statements. He truly made a productive application of the motto of his home state—"show me!"

Frank is survived by his wife, Avis Lucille Ross of Sun City, Arizona; his daughter, Rebecca Irene Ross of Phoenix, Arizona; his son, John Charles Ross of Mechanicsburg, Pennsylvania; and by grandchildren.

Carl W. Boothroyd, William F. Mai, William F. Rochow

Harold Ellis Ross

October 23, 1881 — July 1, 1966

In the death of Professor Harold Ellis Ross, Cornell University lost an outstanding teacher who trained hundreds of students during the forty years from 1906 to 1946.

Professor Ross was born in Leadville, Colorado, while that town was still a turbulent mining center; but while he was yet very young his family elected to move to the then more peaceful atmosphere of central southern New York State. His early education was gained in the rural schools of that region, and in the high school at Waverly, New York. In 1906, he was graduated from the College of Agriculture at Cornell University, with the degree of Bachelor of Science in agriculture.

Before graduation, he was employed on a part-time basis by the department of dairy industry as a student assistant, and immediately upon graduating he entered a full-time position as assistant in that department. In 1907, he was advanced to an instructorship. In 1909, he obtained the degree of Master of Science in agriculture and was appointed Assistant Professor in Dairy Industry. In 1912, he was appointed to a full professorship in the department, in which position he continued until his retirement on October 31, 1946.

For many years Professor Ross was actively affiliated with the Society of American Bacteriologists, and with the American Dairy Science Association. His university fraternal memberships include Sigma Xi and Gamma Alpha.

Although he had a keen interest in all matters pertaining to dairying, Professor Ross specialized in the teaching of fluid milk-processing, in the course popularly known as "market milk." Both by training and experience, and in personality, he was admirably fitted for this work. Actually, he pioneered in this field, being credited with having given the first course in market milk procedure ever offered in an American college. In periods free from classwork, he contributed substantially to the development of extension work in his department, in cooperation with county agents, through direct contacts with farmers and dairy plant operators, and by means of educational exhibits at county and state fairs. During all these years he was also actively concerned with the administration of the business affairs of the department. He was especially concerned with operating the College dairy plant in order that it would function to provide materials for teaching purposes and to provide promising students with an opportunity to gain experience under practical conditions.

With all this to occupy him, Professor Ross still found occasional time for research and writing. Either alone, or jointly with associates, he published a number of bulletins, and wrote on various dairy topics for dairy journals. He was also the author of four books which have been widely recognized: *A Dairy Laboratory Guide*; *A Laboratory Guide for High Schools*; *A Laboratory Guide in Market Milk*; and *The Care and Handling of Milk*. The titles of the first three definitely indicate their respective fields of application. The fourth book is much broader in its scope and is planned to serve all persons interested in its phase of dairying—the teacher, the student, the milk plant operator, and others.

During World War I, Professor Ross was released from his University duties for a period in order that he might assist the federal government in a national campaign for better utilization of the by-products of milk. During a sabbatic leave in 1917-18 he pursued additional studies along these lines at the University of Chicago. Again in 1925, he was released to permit his spending a year in Argentina, where at the request of the Argentinian government he established and equipped in Buenos Aires a laboratory for the production of modified milk for infant feeding, and trained resident physicians and nurses in the proper procedures of preparation and distribution.

Professor Ross was active in any movement which he felt led toward better dairy practices. Upon his retirement, the American Dairy Science Association conferred a life membership upon him in recognition of his service in teaching and research, and his contributions to the commercial dairy industry.

Professor Ross was an inspiring teacher, and untiring co-worker, and a faithful friend. Occupied though he was with the varied duties of his position, Professor Ross always found time to take an active part in the civic and social activities of his community.

Clinton Rossiter

September 18, 1917 — July 10, 1970

With the passing of Clinton Rossiter, Cornell University has lost a distinguished son and dedicated servant. A member of this Faculty since 1946, and from 1959 the holder of the John L. Senior Chair of American Institutions, his death at the age of fifty-two brought to a close a life of extraordinary achievement.

As few of us need reminding, his intellectual contributions were conjoined with a literary craftsmanship that carried his ideas to a wide and admiring audience. Significantly, this reputation never diminished his stature in the world of serious scholarship. Thus while more than a million copies of *The American Presidency* were sold in drugstores and supermarkets, the American Historical Association awarded him its coveted Bancroft Prize for *The Seedtime of the Republic*. And if editors, publishers, and producers continually called upon him for articles, interviews, and television appearances, his peers in the American Political Science Association twice elected him to their executive council.

The very subjects of Clinton Rossiter's books testify to his breadth of knowledge and catholicity of interests. Among his nine published volumes were a biography of Alexander Hamilton, studies of the Constitutional Convention and American political parties, and analyses of Marxist and conservative thought. It was not surprising that a worldwide community sought to share with Cornell his gifts of interpretation and analysis. Clinton Rossiter visited more than two hundred academic centers within this country, as prepared to speak at a small black college in the South as to deliver the Walgreen Lectures for the University of Chicago. In the same spirit, he accepted invitations to institutions on every overseas continent, ranging from an afternoon at an obscure Indian university, to six weeks in the Soviet Union, and a year as Pitt Professor of American History at Cambridge University.

While no stranger to the Tompkins County Airport, Clinton Rossiter's first loyalty was his citizenship in the Cornell community. Only on the rarest of occasions did any of his extramural engagements—including invitations to the White House—cause him to cancel a class. In his scheme of values this campus had first priority, to the extent that throughout his twenty-four years at Cornell he took only three sabbatical leaves, turning aside countless opportunities for more frequent respites from his scholastic schedule.

The son of a Cornell alumnus, and a graduate of our own College of Arts and Sciences, his affection for this community was manifested in countless ways. There was hardly a board or committee of which he had not been a member: Academic Freedom and Academic Integrity, Aptitude Testing and Long-Range Planning, Cornell

University Press, the Statler Club, and the Constituent Assembly are only a few of the assignments he accepted. The John L. Senior Professor even spent one Saturday morning on his hands and knees, scrubbing the floors of West Sibley Hall: a wash-in which moved Buildings and Properties to guarantee a more salutary standard of cleanliness across the campus.

He delighted in teaching the freshman class in American Government, even though fully entitled to confine himself to more advanced offerings. And his upperclass courses in American Political Thought and the American Presidency stood out as academic highpoints for literally thousands of Cornell alumni. At the same time, numerous letters from college and university teachers throughout the United States affirm that their graduate seminars with Clinton Rossiter demanded an intellectual rigor which provided a firm launching for their professional careers.

Here was a man who truly loved Cornell: who gave to an institution far more than he received in return; whose entire life was committed to the spirit and values of the educational mission embodied by this University. There can be no doubt that his imprint will endure. Yet bereft of his presence, Cornell can never be the same.

Herbert Briggs, Arthur Mizener, Andrew Hacker

Joseph Linville Rosson

December 7, 1919 — April 1, 1995

Joseph Linville Rosson was born in Memphis, Tennessee, on December 7, 1919. (Colleagues who know of the date would good-naturedly kid him by saying they knew two bad things that happened on December 7, one was Pearl Harbor, and the other)

After graduation from the University of Tennessee with a Bachelor of Science in Electrical Engineering degree in 1942, he joined the Naval Reserve as an ensign. It is interesting that he spent the 90 days of his commissioning indoctrination at Cornell.

By his discharge in 1946, he had risen to the rank of Lieutenant and the position of commanding officer of an LSM (Landing Ship Medium). Although he served in the Atlantic, Mediterranean, and Pacific theatres, his colleagues do not recall that he recounted any “war stories.”

Joe spent 1946-47 as an Instructor at the University of Tennessee Junior College. While there, he contacted Jack Tarboux (who had been the Head of EE at Tennessee when Joe was a student there, but who was now a Professor of Electrical Engineering at Cornell) concerning graduate work and employment. Through Tarboux’s efforts, Joe became an Instructor and a graduate student in Electrical Engineering.

Upon receiving his Master of Electrical Engineering degree in June 1951, he was appointed an Assistant Professor. He was highly recommended for promotion to Associate Professor in 1956, but the Engineering College administration felt that he had not had enough research experience and so decided not to promote him. He then took over the directorship of a research project on the atmospheric refraction of radio waves (an area completely unknown to him because his experience in teaching and in industrial contacts had been in electric power and feedback control). His performance on that project led to his promotion to Associate Professor in 1957. He became a Professor in 1969 and, upon his retirement in 1986, an Emeritus Professor.

If only one word could be used to describe Joe in his professional career, it would be *versatile*. Others would include *dedicated*, *loyal*, and *unselfish*.

Shortly after his promotion to Associate Professor, Joe was asked to represent the University on an extra-high-voltage cable project sponsored by the Association of Edison Illuminating Companies of the Edison Electric Institute. In collaboration with electric utilities and cable companies, he coordinated the construction and

installation of operating facilities and designed all the test and measurement systems. In addition, he trained more than 60 students to operate the field facilities on 24-hour schedules.

When the project was completed in 1964, the cable text was considered a landmark event and Joe was the recipient of the highest compliments and commendations from all the industry officials concerned.

Joe was appointed Assistant Director of the School of Electrical Engineering in 1965 and subsequently Associate Director in 1975. In these positions he was responsible for course and staff scheduling, the budget, non-academic staff, and student-faculty relationships. While carrying out these administrative responsibilities, he continued to teach undergraduate courses and to advise students. In all of these activities, Joe's performance was considered to be outstanding.

In 1968, he became the advisor for a Master of Electrical Engineering design project of an electric vehicle for urban and suburban transportation. More than 70 students participated in all aspects of developing and manufacturing five prototypes of electric vehicles, three of which were licensed for continuing study and evaluation. In 1970, a Cornell team was placed first in the National Clean Air Race, and in 1977, another Cornell team won the Emission award in the Urban Vehicle Design competition.

Joe was a member of the honorary societies, Eta Kappa Nu, Tau Beta Pi, and Sigma Xi. He was also a member of the Institute of Electrical and Electronic Engineers.

Joe's non-professional life was as interesting—and full—as his professional life. His dedication to students was as great outside the classroom as it was in. (The students lovingly referred to him as “Pappa Joe.”) He could always be counted on to participate in any activity that they would organize—golf, bowling, poker, bocci ball, Monte Carlo night, Delta club (a student-faculty organization whose only activity was beer drinking. The initiation consisted of chug-a-lugging a quart of beer and, for many years, Joe held the record—nine seconds over both students and faculty. He said it was simple—”just open up your throat.”).

Joe played golf on a regular basis with a Phillips Hall foursome for many years. He enjoyed all aspects of the game whether spectator or participant.

Joe had an extraordinary talent for getting people together whose cooperation was essential to building up a successful event. Every spring he collected an enthusiastic team of students and faculty (along with his devoted wife, Olive, whom he married in 1950) to prepare the food for the school's Annual Alumni Breakfast get-together.

While they were busily cooking away, Joe never failed to give them encouragement and, when all was done, they especially appreciated his sincere words of thanks (and the alumni appreciated the excellent breakfasts!).

The annual end-of-term picnics he organized were also appreciated. Many think back fondly of the refreshments, games, and especially the good-fellowship they enjoyed.

When Olive died in December 1991, Joe decided to move to a retirement home in Memphis, where he died. He is survived by his son, Michael and daughter-in-law, Marianne of Brooklyn, New York.

Paul D. Ankrum, G. Conrad Dalman, William H. Erickson

Oscar S. Rothaus

October 21, 1927 — May 24, 2003

Oscar S. Rothaus, Professor of Mathematics, died on Saturday, May 24, 2003, at the Cayuga Medical Center. Oscar was born in Baltimore, Maryland on October 21, 1927. He received his Bachelor's and Master's degrees from Princeton in 1948 and 1950 respectively. He served in the U.S. Signal Corp from 1951-53, during the Korean War. He was a staff mathematician at the National Security Agency (NSA) from 1953-60. He received his Ph.D. degree in Mathematics from Princeton in 1958. In 1960, he moved to Princeton to the new Communications Research Division (CRD) of the Institute for Defense Analyses at the invitation of its founding director, Professor J. Barkeley Rosser, of Cornell. Oscar was its Associate Director from 1963-66. A tragedy that affected Oscar and his family grievously was the loss of his two young sons, who fell through the ice and drowned in Lake Carnegie in Princeton. After that, Oscar left Princeton and CRD, where he had previously been very happy. He was a Visiting Professor at Yale in 1965. He joined the Cornell faculty as Professor in 1966, where he spent the rest of his career. Oscar visited Hebrew University in Jerusalem in 1972-73, the Institute for Advanced Study in 1979-80, the University of Strasbourg in the fall of 1986, and Kings College, London, in 1986-87. He was a consultant to classified projects as well throughout his career. He served as Chair of the Mathematics Department from 1973-76, and as Acting Chair in the fall of 1995.

Oscar had two careers. The first was in cryptanalytic research at the National Security Agency (NSA) and CRD, and its successor agencies. Most of his research from that career is still classified. But this work led to several papers in the open literature, one on "bent functions" and contributed to the formation of the theory of the Hidden Markov model. He inspired the authors of a seminal (classified) paper on the "E-M" or "Baum-Welch" or "forward-backward" algorithm. Lee Neuwith and Anil Nerode, who worked with him at CRD, describe him as a renowned mentor in cryptanalytic research. He had the ability to see the mathematics behind cryptanalytic problems, and to explain it to both mathematicians and cryptanalysts, often with surprising results.

His second career was as a Professor of Mathematics, teaching and publishing research in the open literature. His primary unclassified research interests were the theory of functions of several complex variables, combinatorics and coding theory, Lie and Jordan Algebras, and Sobolev and Log-Sobolev Inequalities. He was the author of about forty research papers.

He is remembered above all as gentleman and scholar who treated each person he met with kindness and respect. His wife, Tobe Barban; his daughters, Carla of Brookline, Massachusetts, Ruth Caston of Davis, California, and Tamar of Buffalo; and five grandchildren survive him.

Marshall Cohen, Harry Kesten, Anil Nerode

Colin Frederick Rowe

March 27, 1920 — November 5, 1999

So. What to say? (As he might have said.) In a eulogy for his great friend, James Stirling, Colin made this remark:

Jim loathed, as I do, the sanctimonious soft voice, the agonizing verbal message, which is apt to be the predominant tone of obituary eulogia. ... [Stirling] had a Churchillian vehemence about pietistic evasiveness; and I share with him an impatience about the whole sentiment of grief, often a spurious and nearly always a self-indulgent emotion.

So someone has died—kinda tough because you had wanted to say something to them; and now all possibility of communication is forever extinguished. Simply they are no longer there; in other words, we are denied our pleasure.

With Colin Rowe's death, on Friday, November 5, 1999, the world lost one of the century's greatest deducers on things architectural, and Cornell University lost the most significant fabricator of its sense of architecture. Among the complexity and chaos of an architectural education, two very simple principles made an education in Cornell Architecture unique and valuable. The first is that the individual building is part of a greater whole: it exists in a context. A building would then be designed in a manner that is not only affected by this physical context, but it simultaneously responds to that context and contributes to it. This building would not be a decorated object standing alone, but would be a part of the city, part of the landscape. The second principle is that history is important (not a particularly obvious concept in a modernist endeavor that considered itself to be founded on continuous invention): the student should be placed in a philosophical and historical context. The person responsible for making these two principles the foundation of Cornell's architectural pedagogy was Colin Rowe.

Colin Rowe saw the teaching of architecture differently from most. He taught students, colleagues and architectural scholars around the world that modern architecture in particular was not revolutionary, as it was supposed to be, but evolutionary and connected to history. In his first great essay, "The Mathematics of the Ideal Villa" (first published by the *Architectural Review*, 1947) he brilliantly and conclusively demonstrated the influence of Palladio's Villa Foscari (the Malcontenta of c. 1550-60) on LeCorbusier's modernist manifesto, the Villa Stein (1927) at Garches, France. In this one essay, he reunited modern architecture with a past that, according to the polemic of the time, it was never supposed to have. Many years later in an introduction to a book, *Five Architects* (Wittenborn, 1972), Colin wrote:

When, in the late nineteen-forties, modern architecture became established and institutionalized, it lost something of its original meaning. Meaning, of course, it had never been supposed to possess. Theory and official exegesis had insisted that

modern building was absolutely without iconographic content. That it was no more than the illustration of a program, a direct expression of social purpose. Modern architecture, it was pronounced, was simply a rational approach to building; it was a logical derivative from functional and technological facts; and at the last analysis it should be regarded in these terms, as no more than the inevitable result of twentieth century circumstances. There was very little recognition of meaning in all this. Indeed the need for symbolic content seemed finally to have been superseded; and it was thus that there emerged the spectacle of an architecture which claimed to be scientific but which—as we all know—was in reality profoundly sentimental. For very far from being as deeply involved as he supposed with the precise resolution of exacting facts, the architect was (as he always is) far more intimately concerned with the physical embodiment of even more exacting fantasies.

With statements like this, many have credited (or blamed) Rowe for setting the stage for “Post-modernism” and the “New Architecture”. However, far from criticizing modern architecture’s inherent ideas, Rowe was pointing out its inevitable relationship to historical precedent. Many years after writing *Five Architects*, Colin wrote:

While I am constantly moved by the magnificence of the original idea of modern architecture and while I can scarcely think except in terms of its repertory of forms, I cannot really believe in it any longer.

This is, in many respects, more a critique of modern architecture’s execution than its inherent principles. Characteristically Rowian, it professes an enthusiasm that is both faithful and filled with doubt.

As a teacher and a muse, Colin Rowe constantly crossbred an extensive knowledge of architectural history with equally extensive erudition in the arts, as well as in political and cultural histories. All were combined with one of the most perceptive eyes to have ever been cast in the direction of a building or a drawing. More than retellings, more than reconstructions, Rowe’s writings and lectures were biographies of architecture: chronology and documentation can provide only skeletal information; the mind and the eye would provide the organs and flesh. He conveyed a conviction that speculation was the mind’s most intimate engagement with a work. And that designing was the flirtation of minds through eyes. With his brilliant insights he was able to enlighten students to the notion that many ideas in architecture are universal; that by studying the history of architecture, the arts, politics and culture, one could liberate their ideas, and through a process we call transformation, apply them to contemporary problems. Colin Rowe went on to write many more important essays and books. His most influential work, *Transparency: Literal and Phenomenal*, was written as two essays with Robert Slutzky; the first in 1955, published in 1963, and the second published in 1971. The essays related analytical cubist painting and Gestalt perception psychology to architecture. Alex Carragone, in *The Texas Rangers* (MIT Press 1995), wrote:

Credit both of them for discerning a new perception and conception of architectural space, a reemphasis of the relationship of the plan to architectural space, and most importantly the recognition of phenomenal transparency as a means of conceptually organizing architectural space.

Colin was best known by colleagues and students at Cornell for creating the graduate urban design studio, which drew students from around the world and produced more educators in the field of urban design than any other such program. Colin's lectures on the architecture of the Italian Renaissance drew not only students, but many faculty members from all corners of the campus.

For all of his intellectual contributions, Colin will be best remembered and loved by many of us for his conversations—amazing conversations—late into the night, and for his friendship. In his eulogy address, David Rowe, Colin's brother, put it this way:

It is obvious that my brother inspired great affection, yet he was undeniably self-centered (although not selfish). He was certainly not given to showing emotion. I think the answer is that he liked his friends greatly, and he needed them for all sorts of reasons. Somehow and despite his apparent gruffness he made this known...elliptically, of course. I suppose this amounts to that indefinable quality—the gift of friendship.

We all retain our memories of this amazing, amusing, grumpy, sometimes infuriating, endearing, but above all, life-enhancing man. Memories make his loss so painful, but keep him among us in our hearts.

After a brief stay during the 1957-58 academic year (while on leave from Cambridge University), Colin Rowe returned to Ithaca and Cornell University in 1962, where he remained until his appointment as A.D. White Professor Emeritus in 1994. Andrew Dickson White, a great expounder of architecture and humanism, would have been delighted with Colin's appointment to a professorship in his honor. At Cornell, Rowe inveigled students and faculty alike with ingenious projections of everything from cities—ones where, as T.S. Eliot would have it, "...the women come and go/Talking of Michelangelo"—to rooms, like those of Edith Wharton's Mrs. Mingott, "which recalled scenes in French fiction, and architectural incentives to immorality such as the simple American had never dreamed of."

His presence at Cornell over more than three decades has directly inspired hundreds of architects, and through them, indirectly inspired thousands of other architects, and unaccountable numbers of individuals who have wandered, with eyes and minds, through the prodigious spaces engendered by Colin's scions. No one has built more for as many.

Val Warke, Jerry A. Wells

Supplement: Educated at Liverpool University, The Warburg Institute, Cambridge and Yale, Colin Rowe taught at the University of Texas at Austin and at Cambridge University before arriving permanently at Cornell. He was named Andrew Dickson White Professor of Architecture in 1985; in 1990, he was named Professor Emeritus. His contributions to architectural pedagogy were recognized by the AIA and the Association of Collegiate Schools of Architecture in 1985 when he was awarded the Topaz Medallion, their highest prize for teaching excellence. He was named an honorary fellow of the Royal Institute of British Architects (RIBA) in 1983, and became only the third academic to be awarded the Royal Gold Medal for Architecture by RIBA in 1995; it is widely perceived as the most prestigious award for architecture in the world. Colin Rowe's books include *The Mathematics of the Ideal Villa and Other Essays* (1976), *Collage City* (with Fred Koetter, 1978), *The Architecture of Good Intentions* (1994), and *As I was Saying: Recollections and Miscellaneous Essays* (1996). He was working on a book about Italian Renaissance architecture with Leon Satkowski (B.Arch. '70) when he died. (Elizabeth L. Kim, "The Reluctant Modernist: Colin Rowe at Cornell" in College of Architecture, Art and Planning Newsletter, Vol. 3:2.)

Professor Val Warke (B.Arch. 1977, Cornell; M.Arch. 1978, Harvard) was a student of Colin Rowe's both at Cornell and at Harvard, and a colleague of Rowe since joining the Cornell faculty in 1982. Professor Jerry Wells (B.Arch. 1959, University of Texas) was a student of Colin Rowe at the University of Texas and a colleague of Colin's at Cornell since 1965, and a life long friend. Both Professors Warke and Wells served as chairs of the Architecture Department during Colin's tenure at Cornell.

Willard Winfield Rowlee

Professor of Botany

1861 — August 8, 1923

The Board of Trustees and the University Faculty deplore the loss of Professor Willard Winfield Rowlee, who died, after a protracted illness, August 8, 1923. Professor Rowlee was graduated from Cornell University in 1888. For thirty-four years he gave his Alma Mater continuous, loyal service and was summoned just as he was taking up special research of a character for which he was eminently fitted,

On graduation he was appointed an assistant in botany and entered the Graduate School. In 1893, he received the degree of Doctor of Science. Beginning as an assistant in botany in the College of Arts and Sciences he advanced to the headship of that department.

Professor Rowlee was a painstaking teacher, a wise counselor and a careful investigator. He made many valuable contributions to the technical journals of botany, particularly through articles in the field of dendrology. He was keenly interested in the geography and ecology of the plants of Central New York. From his work with Willows, Professor Rowlee was generally regarded as an authority on that botanical family. In his later years his revision of the genus *Ochroma* served as the basis for his studies on the utility of Balsa. He also revised the genus *Costus* in Central America and investigated other tropical plants. It was ever his desire to seek the practical application of the results of scientific investigation.

Professor Rowlee served the University in a variety of ways. For many years he had supervision of the grounds and the planting on the campus. He was interested in athletics and devoted much time to the development of the playground and also of Schoellkopf Field and was faculty advisor for football. He served most acceptably on the Committee on Student Affairs and for several years was its chairman. He was long secretary of the Associate Alumni Association, was active in the organization of the Association of Class Secretaries, and was a most efficient Secretary of his Class. He was a Fellow of the American Association for the Advancement of Science a member of the American Society of Naturalists and of the Botanical Society of America. He had also been a member for many years of the Town and Gown Club of Ithaca.

Professor Rowlee was quiet and unassuming. He had the ability of impressing everyone with his personal sincerity and scientific accuracy. He was public spirited and interested in civic affairs. He was an alderman for four years and belonged to the Protective Police of the city. Few men have served the University for a longer period or in a

larger sphere of usefulness than did Professor Rowlee. In his death, the University has lost a friend of high ideals, a thorough and distinguished teacher, and a devoted and loyal supporter.

Charles Clyde Russell

September 29, 1919 — July 8, 1988

One of the truly great teachers in the field of Communication, Charlie Russell met his obligations in the truest sense of the word. As former Dean of the College of Agriculture and Life Sciences, Charles E. Palm, often said, “Charlie Russell never failed to put his entire self into whatever assignment he was given.” Using the hallmarks of wit, sincerity, compassion, and a great love for students, Charlie was beloved by all who were fortunate enough to have known him. Perhaps his brother-in-law best summed it up by saying, “every state should have one Charlie Russell.”

At a time when students seemingly suffered daily from strain, burnout, and campus anguish over the Vietnam War and race relations, Charlie Russell provided relief, and a chance to learn and enjoy. For thousands of students, over his 20 years at Cornell, Charlie demonstrated that showmanship and scholarship are not mutually exclusive.

Charlie was a leader in bringing innovation to undergraduate instruction. He was one of the first to use television to extend the teaching in one classroom to “satellite” classrooms. He spent a sabbatic leave in 1973 in Great Britain studying the Open University and visiting major universities in the United States that were noted for their high teaching standards. The following year he and his associates in the department received an award from SUNY for improving the teaching program.

As a teacher and as a human being, he had the unique ability to evoke joy and laughter no matter what the circumstances. Charlie was known for his ability to make teaching come alive, as evidenced by his having developed and taught two of the most popular courses in the department of communication: “Introduction to Mass Media” and “Advertising and Promotion.”

An example of his ingenuity was a pre-arranged class incident using a campus patrolman as his “partner in crime.” Halfway through a lecture there came a rap at the door, and the patrolman asked Charlie to remove his car from a no-parking zone. Charlie agreed, but indicated that he was in the middle of a lecture and would take care of it as soon as possible. After two more appearances by the man in blue, the discussion became increasingly heated and eventually resulted in a shoving match. At this point the officer pulled his gun, loaded with blanks, and fired. After falling to the floor, Charlie quickly jumped up and instructed the class to write a news article on the incident they had just observed. Students in the class probably never forgot the lesson of that day.

Charlie's education was truly southern-based. Following service with the Navy Intelligence from 1942-45, he received his Bachelor of Journalism degree from the University of Texas in 1948 and a Master of Journalism from the same institution the following year. He earned his Ph.D. degree at the School of Journalism from the University of Missouri in 1968.

Following his World War II service, Charlie was invited to join the faculty of Arkansas Polytechnic College, and from 1949-51 was chairman of its Department of Journalism and Director of Public Relations. After the next year as chairman of the Department of Journalism at Howard College in Birmingham, Alabama, he left academia to join the public relations bureau of the Portland Cement Association. While there, he prepared "The Cement Story," a publication used throughout the country as a supplementary text for high school science courses.

But Charlie missed the daily contact with students. During the academic year 1956-57 he returned to teaching, this time as a visiting professor at Cornell in what was then the Department of Extension Teaching and Information. At the end of that academic year, students took the unusual step of petitioning the dean to keep him as a member of the faculty. There not being an opening at that time, Charlie left for the University of Arkansas where he served as chairman of the Department of Journalism for two years. By then a position was available, and he returned to Cornell where he was granted tenure in 1963 and made a full professor in 1969.

For 15 years, including a two-year term as department chairman, Charlie charmed students, faculty and administrators alike. During his years at Cornell, he was a much sought-after speaker for county Cooperative Extension functions and for Cornell Club meetings. His sense of humor, enthusiasm, and stage talents made him a favorite master-of-ceremonies for many community events, including the venerable Savage Club. His election to Alpha Zeta was testimony to his leadership and scholarship in agriculture.

Charlie contributed in many ways to the Department of Communication during its years of rapid growth and its transition from a largely service unit to an academic unit with undergraduate majors and a masters program. Indeed, he left his mark on many parts of Cornell and its institutions. Each year he was advisor to more than 50 undergraduate and graduate students; he served on a long list of college and university committees; and he served on the *Cornell Daily Sun* Board of Directors, as faculty advisor to the College of Agriculture and Life Sciences Student Council and as chairman of the Faculty Committee for Minority Programs.

Meanwhile Charlie participated actively in professional activities outside Cornell, including affiliation with the American Agriculturalist Foundation, the Association for Education in Journalism and Mass Communication, the Advertising Research Foundation, Sigma Delta Chi, and Toastmasters International.

But the lure of his hometown of Russellville, Arkansas was just too great. In 1978 he was granted the title of professor emeritus at Cornell, and for one year served as Dean of Liberal and Fine Arts at Arkansas Tech. But administration was not his first love.

The University of South Carolina had long known of Charlie's talents as a teacher, so it was not a difficult decision for him to accept a professorship in its Department of Journalism. During his five years at South Carolina, Charlie devoted his summers to communication training with public affairs officers in the United States Army. Finally, in 1985 Charles E. Russell became a professor emeritus for the second time and retired to Birmingham, Alabama. But it didn't last long. Soon he was invited to join the Superior Federal Bank in Fort Smith, Arkansas, as its education and training coordinator, working with the bank's employees throughout the state. He held that position until his untimely death.

Charles Russell died July 8, 1988 at the age of 68, after being stricken with an inoperable malignant brain tumor. He will be sorely missed by all who knew and loved him. He is survived by his wife of 34 years, Mary Barnard Russell of Fort Smith, Arkansas; two daughters, Patti Lu Hill of Fort Smith, and Kimberly Brueggemann of Baltimore, Maryland; and six grandchildren.

Royal D. Colle, Chester H. Freeman, Russell D. Martin

William Logie Russell

July 24, 1863 — March 31, 1951

William L. Russell, Emeritus Professor of Psychiatry of the Cornell University Medical College and Medical Director Emeritus of the New York Hospital-Westchester Division, White Plains, New York, and formerly Psychiatric Director of the Society of the New York Hospital, died of a heart condition in Santa Barbara, California, on March 31, 1951, at the age of eighty-seven.

Of English and Scottish ancestry, Dr. Russell was born in New Brunswick, Canada, July 24, 1863. He received his early education in Canada and came to this country for professional study, receiving the degree of Doctor of Medicine from the Medical College of New York University in 1885. He served his internship in the Jersey City Hospital and had his first psychiatric experience in the New Jersey State Hospital at Morris Plains, New Jersey. He entered private practice in New York City in 1888 and remained there until 1897.

In 1897 Dr. Russell accepted an appointment as First Assistant Physician of the Willard State Hospital. There he became interested not only in clinical psychiatry but in the broader aspects of community needs, psychiatric administration, and training.

In 1903 Dr. Russell was appointed Medical Inspector on the staff of the New York State Hospital Commission. He visited and inspected all the state hospitals and licensed private institutions for the mentally sick. He early became interested in the training of nurses for psychiatric hospitals and gave much attention to the organization of the schools for training in the state hospitals.

Dr. Russell was impressed with the need for improved methods of caring for patients prior to their admission to state hospitals from their homes and was active in transferring by legislation this responsibility from the superintendents of the poor and other officials to the medical health officers of the communities.

His interest in mental hygiene came early. He realized the problem of mental health could not be solved by the hospitals alone. He was interested in the action of the State Charities Aid Association in undertaking aftercare service for discharged patients, and he became a member of the first mental hygiene committee of the State Charities Aid Association. Later he became an active member of the National Committee for Mental Hygiene and was chairman of the executive committee, and also Vice-President of that organization.

In 1910 Dr. Russell was transferred from the position of Medical Inspector to that of Superintendent of the Brooklyn State Hospital.

On July 1, 1911 Dr. Russell became Medical Director of the New York Hospital-Westchester Division, then known as Bloomingdale Hospital. With the support of the Governors of the hospital, Dr. Russell entered immediately upon a program of improving and advancing the various services of the hospital. Under his direction the hospital became a center for the training of psychiatrists and other workers in the field. The plant was completely renovated, many additions were constructed, and in 1916 the first of the buildings for the program therapies was completed, the building for occupational therapy for men. The following year a library for patients was established. Before the other occupational therapy building for women and the two gymnasias were built, the departments of occupational therapy, physical education, and physiotherapy were organized and staffed with trained workers. The grounds were developed including walks, play fields, and a golf course. Later a staff house, cottages for physicians, and a nurses' residence were completed. After bringing to pass the dreams of the founders of the hospital, he became interested in the establishment of a psychiatric department in the City of New York, and in 1926 he was appointed General Psychiatric Director of the Department of Psychiatry of the Society of the New York Hospital. He devoted much of his time to the planning and organization of the Payne Whitney Psychiatric Clinic of the New York Hospital, which was opened in 1932. He continued in active service until his retirement in 1936. His interest did not wane and in addition to his many community and committee activities, he compiled a History of the Psychiatric Service of the New York Hospital, which was published in 1945.

Dr. Russell was Professor of Psychiatry at Cornell University Medical College from 1928 to 1932. He was Consultant in Psychiatry to the New York Hospital, to Grasslands Hospital, and the Burke Foundation.

He was a member of the American Medical Association, the American Psychiatric Association, of which he was President in 1931, the National Committee for Mental Hygiene, the New York Psychiatric Society, of which he was President in 1914 and 1915, the New York Society for Clinical Psychiatry, the Medical Society of the State of New York, the Medical Society of the County of Westchester, of which he was President in 1919, the Association for Research in Nervous and Mental Diseases, and a Fellow of the New York Academy of Medicine. He was a Diplomate of the American Board of Psychiatry and Neurology. He was also a member of the National Arts Club.

Dr. Russell was a member of the Advisory Committee to the National Institute of Mental Health of the U. S. Public Health Service.

His many publications in scientific journals showed his broad interests in administration, teaching, and mental hygiene.

In 1888 Dr. Russell married Addie Lewis, who died in 1935. He is survived by two sons, Dr. Ernest F. Russell, a psychiatrist of Santa Barbara, California, and Mr. Blake Russell of New York.

Dr. Russell was a strong and vigorous leader who was loved and respected by all who knew him. He had great vision and a firm grasp of all that was good and constructive in the intensive treatment of the sick and troubled. A diligent student, he learned from those who preceded him and from those with whom he worked. With the courage of his convictions, unstinted devotion and indefatigable energy he accomplished much for the State, the communities, and the hospitals he served so long and well. Ever mindful of the trust and responsibilities of his positions, and with the generous support of those who believed in him, he was able to advance the psychiatric services of the New York Hospital, living reflections of his ideals, ability and life's work.

James H. Wall

Thomas Arthur Ryan

September 15, 1911 — June 16, 1996

“Art” Ryan was continuously associated with Cornell and its Department of Psychology since he arrived as a freshman in 1929. He was an undergraduate until 1933, then a graduate student until he completed his Ph.D. degree in 1937, then an Instructor until 1942, then an Assistant Professor until 1946, then an Associate Professor until 1949, then a Professor until his retirement in 1977, and finally an Emeritus Professor. He chaired the department 1953-61. He also taught in Administrative Engineering 1939-46 and in Mathematics 1943-45.

Art consistently pressed for connecting the Psychology Department to the real world. This interest was reflected in his teaching, which at various times included courses in industrial psychology, personnel management, occupational analysis, and fatigue and efficiency, in addition to less applied courses in experimental psychology, perception, statistics, and introductory psychology. Reflecting this wide range of interests, Art was Book Review editor of the *American Journal of Psychology*, 1957-67.

Art was in many ways an ideal model of a scientist—he worked on problems he considered important, his judgments in that respect were generally ahead of their time, and his work was of consistently high quality. His early work on the interrelations of sensory systems, on symbolizing, and (with Mary Ryan) on geographical orientation, all stand out as excellent pioneering work in areas still considered important. Similarly, his continuing attention to how statistics are used to draw conclusions from data anticipated more recent developments in that field. He recognized that artificially devised research problems could very likely lead to dead ends, or even misleading conclusions. He brought scientific concerns to the applied settings (effort and work) that guarantee what is now called ecological validity, well before there was a discipline of ergonomics. In all of these, he was extraordinarily open to new ideas, while soberly checking consistency and implications. Art was generally indifferent to the spotlight. Though well-known in his fields of interest, he never sought out the media.

During his career, Art published three books: *Work and Effort: the Psychology of Production* (1947), *Principles of Industrial Psychology* (1954) with Patricia Cain Smith, and *Intentional Behavior: an Approach to Human Motivation* (1970). He also was long interested in the problem of “multiple comparisons”—the fact that in a long series of significance tests, one expects some of the results to appear significant just by chance. In 1960, he developed a new method for handling such problems, which is still used and accepted. This interest in multiple comparisons

continued into his retirement, and in later years he ran numerous analyses on his personal computer, completing a manuscript on the topic in 1990.

As Chair of Psychology, 1953-61, Art was again thought of as a near-perfect role model for that position—not a manipulative or self-aggrandizing “Head,” but a considerate, thoughtful and fair chair of peers, each with his or her own agenda. He was known for his ability to minimize onerous and contentious faculty meetings by distributing memos in advance that laid out the major issues and alternative solutions. Under his chairmanship, the department built up a small but internationally known program in industrial psychology, with effective research connections to various firms around central New York.

Art consistently urged the department to trust its own judgments in hiring, promotions, and in decisions on new research directions, rather than seeking the advice of the same small cadre of outside psychologists whose views were simultaneously influencing many other departments. He was inspired more by the chance to be unique than by the fear of being thought out of fashion.

Art was truly a pioneer concerning women in academia. Under his leadership, Patricia Cain Smith became the first tenured woman, and later (1963) the first female full professor, in the College of Arts and Sciences—all years before this issue became important politically at Cornell and across the nation.

His students and colleagues also remember the conscientiousness with which he acted as a statistical consultant on numerous research projects. He once told a colleague that he avoided leaving Ithaca for sabbatic leaves, because he felt a responsibility to remain available for students. With his own graduate students, he felt it important to allow them freedom to choose their own research problems within a broad area; he felt that learning to select problems was perhaps the most important skill a student could gain in graduate school.

One of Art’s favorite activities was playing chamber music on his viola. For most of his adult life he played in various chamber music groups and attended string quartet workshops.

Art and his wife, Mary, lived for many years in a comfortable house on Linden Avenue, a short walk from campus, and spent their summers in a lakeshore cottage they built themselves near King Ferry, where they often invited students and colleagues. They also often invited new faculty and others to stay at their home while searching for permanent housing. After retirement, Art and Mary lived for many years in Ithaca, but later moved to the Foxdale retirement community in State College, Pennsylvania, where their son, Tom, served on the Board of Directors.

As a friend, Art was honest, fair, and unobtrusively and unaggressively upright and straightforward on all occasions. His politics were humane but subject to debate, and his assistance always available and generous.

Art's interest in statistics was picked up by his son, Thomas Arthur Ryan Jr., who created the popular Minitab statistical package. Besides Mary and Tom, Art is also survived by a daughter, Adelaide Lyon of Canandaigua, New York.

Elizabeth Adkins-Regan, Julian Hochberg, William Lambert, Richard Darlington

George Holland Sabine

December 7, 1880 — January 18, 1961

George Holland Sabine, one of Cornell's most distinguished scholars and teachers, died just after passing his eightieth birthday. Until several months prior to the end, Professor Sabine lived "in the midst of life," continuing lifelong habits of scholarship, writing, and editing. Throughout his life he was an excellent illustration of the statement of Montaigne that "we are born to inquire after truth." He was thus fortunate in his death as he was in life; for almost as soon as work became impossible for him, life itself became impossible and glided softly into death.

Born in Dayton, Ohio, Professor Sabine received a Bachelor of Arts degree from Cornell in 1903 and a Doctor of Philosophy degree in 1906. He taught philosophy at Stanford University from 1907 to 1914, at the University of Missouri from 1914 to 1923, and at Ohio State University from 1923 to 1931. He returned to Cornell in 1931 and served as Susan Linn Sage Professor of Philosophy until his retirement in 1948. From 1940 to 1944 he was also Dean of the Graduate School, and from 1943 to 1946 he was Vice President of the University, in which position he was concerned chiefly with academic matters.

Following his retirement, Professor Sabine was Visiting Professor at the University of Washington, Seattle, at the University of Oregon, and at Northwestern University.

For the last four years of his life, following the death of his wife, Professor Sabine lived at Telluride. In 1957 he delivered the Telluride lectures at Cornell —three lectures on Marxism that were heard by many hundreds of students at Bailey Hall. They were subsequently published as a monograph by Cornell University Press. At the time of his death he was active as one of the editors of the *Philosophical Review*.

Professor Sabine held honorary degrees from Union, Kenyon, and Oberlin Colleges, the University of Missouri, and Ohio State University, and he was President of the American Philosophical Association. When he became professor emeritus in 1948, there was presented to him a *Festschrift* prepared by a group of colleagues and former students: *Essays in Political Theory Presented to George H. Sabine*, published by Cornell University Press.

The most important of Professor Sabine's works was *A History of Political Theory*. This work has been translated into Greek, Italian, Japanese, Arabic, and Indonesian, and at the time of his death the publisher was negotiating for Hebrew, Hindi, and other translations. The book is probably the most widely read and cited work on the subject

in any language. Professor Sabine revised the book in 1950; and he completed the second revision several months before his death.

Professor Sabine had a lifelong special interest in seventeenth-century English political theories. Out of this interest came *The Works of Gerrard Winstanley*, which he edited, with a long introduction, and which was published by Cornell University Press in 1941. One of his most perceptive essays was the one he wrote on Jean Bodin for the *Festschrift* in honor of George Lincoln Burr, who was one of his closest friends. (For other publications by Professor Sabine, reference may be made to the bibliography in the *Festschrift*.)

Professor Sabine himself provided clues of his approach to political ideas. It is impossible, he said, to arrive at the truth of any allegation of fact through logic; and one cannot reach a value through either fact or logic; therefore, the combination of these three operations, as in Hegelianism or Marxism, means only intellectual confusion. Values are always “the reaction of human preference to some state of social and physical fact.” From the standpoint of social relativism, then, one cannot find support for democratic ideals in metaphysical beliefs; nor may these ideals be established in scientific propositions, for “hopes and ideals are not facts to be seen or theorems to be proved.” These ideals, like all moral values, “in the last resort are matters of choice,” and hence their authority must be found within man—in his heart, will, desire. “At some point,” he said, “a nation confronts its final conviction about what it is possible for human life to be and what they desire that it should become, and upon that choice they build their civilization and so they make their place in history. On that conviction it has to stake its life and fortune.”

Time and again Professor Sabine reiterated his position that “any clearheaded theory of politics requires discrimination between states of fact, causal connections, formal implications, and the values or ends that a policy is designed to achieve.” While in any political philosophy these factors are combined, “no combination can alter the fact that they are logically different and that conclusions about them are differently warranted.” While he was convinced that no man can stand apart from the values of his culture, he was equally convinced “that there is in intelligence and good will a power of discrimination and of intellectual honesty that is not wholly limited either by nationality or by social class.” For this conviction he was indebted, he said, “to the tradition of liberalism itself,” and hence he saw himself “forced to see in that tradition the most hopeful prospect for social and political improvement by peaceful means.”

Thus, the separation of the realms of logic, facts, and values did not make it impossible for Professor Sabine to develop his own configuration of values. He took his stand for civil liberties, intellectual freedom, and the use

of the intelligence in the peaceful solution of social problems. These beliefs were not, however, abstractions to Professor Sabine. They were tools with which he worked, from day to day, as a scholar, teacher, administrator, and, above all, as a thinker.

Professor Sabine influenced his students not by making them disciples or followers but by freeing their minds. No school can be built on what he taught. What mattered, and mattered greatly, was how he taught: he gave constant evidence of a richly endowed, sternly disciplined, liberal, free intelligence at work. Above his seminar door there might have been the inscription that Montaigne had for his library: "I do not understand; I pause; I examine."

But often he did not have enough time to examine; he pointed to unanswered questions. Often a bright, eager student noted the question, and years later he undertook his own scholarly investigation; and thus, through the stimulation of other minds, Professor Sabine opened up lines of inquiry and was justly credited, in private or public acknowledgements, with the seed that bore fruit in the works of other scholars.

Professor Sabine's physical presence was itself impressive. He was tall, well built, and gave the impression of muscularity. As a young man he had worked in a blacksmith shop and always enjoyed working with his hands, particularly with carpentry and a cabinetmaker's tools. Perhaps he expressed with his hands the same quality of spirit that was prominent in his work: a desire to see things cleanly and honestly done. The same instinct probably accounted for his lifelong interest in fine prints and etchings, which he collected with the knowledge of the expert and with the feeling of the amateur. If there was anything that he hated, it was humbug, whether in work, thought, or feeling, and he tested himself by the same demands that he made of others.

Professor Sabine takes his place in the annals of Cornell alongside Andrew D. White, Carl L. Becker, and Liberty Hyde Bailey: men who brought the world to Cornell and Cornell to the world.

Stuart M. Brown, Jr., Frederick G. Marcham, Milton R. Konvitz

Henri S. Sack

November 25, 1903 — March 16, 1972

In the death of Professor Henri S. Sack in Ithaca, New York, Cornell University lost a distinguished scientist, an educator of exceptional skill and insight, and an individual of the highest personal integrity. Institutions are built by people and reflect the character of their builders, and his service to Cornell was in the finest tradition.

Professor Sack was born in Davos, Switzerland, and received his education at the Eidgenössische Technische Hochschule in Zurich, receiving a diploma in mathematics and physics in 1925 and a doctorate in physics in 1927. For six years he was head assistant in the Department of Physics at the University of Leipzig in Germany, and then, for seven years, was chef de travaux in the Department of Physical Chemistry at the University of Brussels. While in Leipzig, he was a research associate of the late Peter J. W. Debye, Nobel laureate in chemistry who later became professor and head of the Chemistry Department at Cornell. Professor Sack came to Cornell in 1940 as a research associate in the College of Engineering. He became an associate professor in 1946 and a full professor in 1949. He was named to the Walter S. Carpenter Jr. Professorship in 1963 and held that post until his death.

The breadth of his early experience resulted in a depth of understanding of the basics of the physical world which allowed him to rise above the details of a current approach and take a leadership role in developing “new” areas of physics and applied science. For example, Professor Sack played a major role in the formation of the Materials Science Center, a highly successful venture in cooperation in research by five autonomous departments. During his tenure as second director of this Center, he solidified the spirit of cooperation which continues to this day.

Professor Sack was equally dedicated to improving the quality of education in his college and field at Cornell. He worked tirelessly on committees and projects for curriculum revision and, in particular, was a major force in forging the Engineering Physics degree program which rapidly attained national recognition as a major step forward in bringing engineering education into tune with the national needs of the profession.

His scientific career spanned a long dynamic era in the evolution of modern physics and to his last day, spent in the research laboratory, he was actively in contact with the forefront of his subject. His earliest contributions were on the physics of dielectric relaxation and he also was one of the first investigators to use ultrasonic techniques to study related molecular mechanisms. During World War II, he turned his inventive experimental talents to a variety of applied problems. From then until the present he was a leader in the use of ultrasonics and dielectric techniques to

study the solid state. Over all this time he constantly incorporated the latest theoretical and experimental methods into his programs.

Through his career, Professor Sack had three principal interests: an intense interest in physics as it developed through the years, a love for helping students to gain such knowledge and to acquire standards of excellence and industry, and an unswerving loyalty to his college and to Cornell.

A man of great modesty and total selflessness, Henri Sack was admired and beloved by the many students who knew him; there were about seventy-five who completed master's or doctoral theses under his direction. Above all, he was dedicated to excellence; this dedication demanded much of his students and sought to instill in them the code of excellence which guided his life. In the words of one student, "He has given us a gift of lasting value."

His colleagues respected Henri for his complete personal integrity in difficult negotiations and the compromises inherent in administrative activity. He was very human, quick to make a joke to relieve tensions, and, when things looked darkest, he would express an optimistic and patient attitude. He had a deep concern for the feelings of others. A widely read man, Henri Sack had a vast knowledge of literature and music and was a member of the University Orchestra for a time. He was a loyal supporter of the humanistic aspect of the Cornell scene, and it was a rare concert or play in which Henri Sack was not seen in the audience.

He was a member of a number of professional organizations, including the American Physical Society (Fellow), the Swiss Physical Society, the American Society for Engineering Education, the American Association of University Professors, and the American Association for the Advancement of Science. He was an active consultant to various industrial laboratories and other organizations on applied physics.

Professor Sack is survived by his wife, Lotti; two daughters, Renee Sack of Cambridge, Massachusetts, and Mrs. Samuel (Claudia) Adams, and a brother, Fritz Sack, of Bern, Switzerland. The Henri Sack Memorial Fund, initiated by his former students, will be used to further the endeavors which he himself long served so well at Cornell.

Dale R. Corson, James A. Krumhansl, Trevor R. Cuykendall

Wolfgang O. Sack

March 17, 1928 — June 21, 2005

Most of his associates called him Wolf. He was born in Leipzig, Germany and grew up in eastern Germany and in Berlin. By the time he was six years old, in 1934, the Nazis were in control of the national government. In WWII, his entire class and their teacher were drafted as a home defense anti-aircraft unit. They were expected to continue schooling in the morning and drill on their gun in the afternoon. Near the end of the war, Wolf was running from the advancing Russians when he was shot in the leg, but he made it to the American lines.

In 1951, he immigrated to Canada. While he was selling nursery stock in Ontario, he found his way to Guelph, the site of the Ontario Veterinary College, founded in 1862, and the oldest living veterinary College in North America—the alma mater of Septimus Sisson, author of the first comprehensive textbook of Veterinary anatomy in English (1910). Unaware of this omen, he applied for admission and was accepted.

Wolf was well grounded in veterinary anatomy, first under John Ballantyne at Guelph, where he received the D.V.M. degree from the University of Toronto in 1957. After two years in a veterinary practice in Chicago, he returned to Guelph as an Assistant Professor and later, Associate Professor (1959-64). On leave from Guelph, he completed an embryological study of the pharynx of the dog under Professor Tom Grahame of the University of Edinburgh and received a Ph.D. degree in 1962. After his stay in Edinburgh, Wolf went to Giessen in the spring of 1962 and studied for six months under Professor August Schummer, of Nickel Schummer, and Seiferle, authors of the five-volume gold standard, *Lehrbuch der Anatomie der Haustiere*.

In 1964, Wolf was appointed Associate Professor of Veterinary Anatomy at Cornell, and he and his wife, Lorraine Brant Sack, and their two young sons, Christopher and Kevin, moved to Ithaca. When his boys were old enough to crew for him, Wolf enjoyed sailing his 26-foot sloop in races on Cayuga Lake. Much later, Kevin and his wife presented Wolf with a cherished grandson, Jacob, now seven.

Wolf was an enthusiastic musician, with a particular love of baroque and early classical music. Soon after coming to Ithaca, he built his own harpsichord. He sang regularly with several Cornell and Ithaca choirs. His main instrument was the recorder, with a special preference for the bass. He played for more than forty years with groups ranging from trios to octets and larger, thereby sharing much pleasure with many friends.

Wolf was a dedicated teacher, illustrating his lectures with diagrams and models and carefully labeled dissections sealed in museum jars. He worked constantly on the improvement of the large animal dissection guides for the course he taught. His efforts were much appreciated by his students, who often celebrated his birthday (on St. Patrick's Day) with embarrassing enthusiasm. His rare lapses into German usually went unnoticed, but he confused the German an (at) with English on, resulting in a startling invitation to "sit on the table."

Wolf's translation of volume II of Nickel, Schummer, and Seiferle: *The Viscera*, was a significant advance in anatomy for Anglo-Americans, and his first big project at Cornell. His work in writing and translation and his compulsion to get it straight, to do it right, account for his early association with the International Committee on Veterinary Anatomical Nomenclature. The committee was formed because the terms of position and direction in the human nomenclature are not applicable to quadrupeds or embryos, and many features of animals are absent in man. The committee consists of about 40 members, varying from year to year. They work in English, French, or German. Wolf served as an English-German and German-English interpreter in heated exchanges at meetings in 1960 in New York, 1961 in Vienna, 1963 in Hannover, 1965 in Giessen and Wiesbaden, and 1967 in Paris, where the first edition was finally hammered out.

His contributions to the nomenclature went far beyond interpretation. The nomenclature is in Latin and his editing of those Latin endings made the American committee members look far more erudite than they really are. He served on the Subcommittee for General Terms and Regions and Parts of the Body, the Subcommittee on the Skin and its Derivatives, and the Editorial Committee. He took over the neglected committee on Veterinary Embryological Nomenclature, reorganized it, and turned out a complete list of terms in record time.

Wolf was the author or co-author of 28 research publications on the anatomy of domestic animals, including embryology, vagal innervation of the stomach, abomasal displacement, blood vessels and nerves of the bovine abomasum and intestines, bones and nerves of the equine limbs, genital ducts, clinical anatomy of the equine hock, parasites of the equine visceral arteries, passive stay apparatus that enables the horse to rest while standing, function of the bovine cecum, surgical access to the joints of the limbs of the sheep and goat, and the equine hoof.

Books written or co-authored, or translated by Wolf include *Guide to the Dissection of the Horse*, *Anatomy of the Horse*, and *Essentials of Pig Anatomy*. He organized a team to produce the *Textbook of Veterinary Anatomy* by K.M. Dyce, Edinburgh; W.O. Sack, Cornell; and C.J.G. Wensing, Utrecht; 3rd ed. Philadelphia, Saunders, 2002. It has reached worldwide distribution in six languages. This is a concise successor to Sisson and Grossman's *The Anatomy of Domestic Animals*.

Wolf was a joiner; he belonged to the American Veterinary Medical Association, New York State Veterinary Medical Society, Royal College of Veterinary Surgeons (London), American Association of Anatomists, American Association of Veterinary Anatomists (President 1981), European Association of Veterinary Anatomists and the World Association of Veterinary Anatomists (Secretary-General 1983-91, President, 1991-95). He handled sales in the Western Hemisphere of the 316-page volume containing *Nomina Anatomica Veterinaria*, *Nomina Histologica Veterinaria*, and *Nomina Embryologica Veterinaria*.

Wolf served on several faculty committees of Cornell University and the College of Veterinary Medicine. He was promoted to Professor in 1973, and retired to emeritus status in 1991.

Abraham Bezuidenhout, Alan Dobson, Robert E. Habel

Carl Sagan

November 9, 1934 — December 20, 1996

Carl Edward Sagan, David Duncan Professor of Astronomy at Cornell University, who died on December 20, 1996, was an enthusiastic scientist of great breadth, and a preeminent spokesman for science and for critical thinking. In the exploration of the solar system, the technical achievement for which our generation will be remembered, Carl was a pivotal figure.

The son of a garment worker from Russia, Sagan was born on November 9, 1934 in Brooklyn, New York. The University of Chicago granted Carl two undergraduate degrees and a Master's, all by the age of 20, before he continued for his Ph.D. degree there under Gerard Kuiper, at the time America's only full-time academic planetary scientist. Carl spent postdoctoral years at Berkeley and then joined the geneticist Joshua Lederberg at Stanford. After a faculty appointment at Harvard, Carl came to Cornell in 1968 where he remained.

Sagan's publications, more than 600 in number, spanned a remarkable breadth of fields. Among his earliest papers, written while in his early twenties, are discussions of the synthesis of complicated molecules by natural processes in early reducing atmospheres and of lifelike forms in meteorites, showing the direction of his emerging interests. The recent discovery of putative microfossils in a Martian meteorite has rekindled interest in these topics. The possibility of life elsewhere was his scientific passion, and much of his work touched on some aspect of this, often by pointing out the harshness of our own surroundings.

SETI, the search for extraterrestrial intelligence, gained scientific respectability following Carl's first book as an author, in which he heavily annotated a slender volume earlier written by the distinguished Soviet astrophysicist, I.S. Shklovskii. He participated in several SETI programs, most recently with Jim Cordes. With support from the 100,000-member Planetary Society, which Carl and Bruce Murray founded to involve average citizens in space exploration, Harvard's Paul Horowitz is now pursuing a multi-million channel search. The LAGEOS, Pioneer, and Voyager spacecraft carried messages designed by Carl, Frank Drake, and others, intended ostensibly for any extraterrestrials who might happen upon the craft; the real purpose (well achieved) was to advertise to other humans that our species had begun to visit the stars.

Most of Carl's planetary studies arose out of his participation in spacecraft missions. Carl was a member of the Infrared Radiometer Team for the Mariner 2 space mission to Venus, the earliest successful interplanetary flight, and wrote a series of papers during the 1960s with the late James Pollack, Carl's initial graduate student and

long-time collaborator on the radiation balance of the Venus atmosphere. He argued, correctly as it turned out, that a strong greenhouse effect warms Venus, thereby explaining the till-then mysterious high brightness temperatures observed by microwave measurements.

From 1966-73, Sagan was on the Imaging Team of NASA's Mariner 9 orbiter of Mars. Prior to the spacecraft's launch, he and Pollack suggested that seasonal variations detected in Martian surface markings by telescopic observations were caused by windblown dust. The Mariner 9 imagery verified this, and even today the most complete information concerning the distribution of global surface winds on Mars comes from mapping eolian streaks in spacecraft images.

The 1976 NASA Viking Mission to Mars placed two spacecraft in orbit to monitor the planet, and two landers on the surface, principally to carry out biological experiments. Sagan was a member of the imaging teams for both the landers and on the orbiters. These missions produced the first detailed maps of the surface of another planet, and the first in situ study of another planet. Together with Pollack and Joseph Veverka, Sagan analyzed the nature of wind erosion on Mars, and mapped surface erosional wind indicators. With Brian Toon and Peter Gierasch, he proposed climate change mechanisms for Mars in an effort to explain the puzzling drainage patterns that indicated water once flowed on a planet whose temperatures are currently below the triple-point temperature of water.

From 1970-90, Sagan was part of the Imaging Team for the Voyager missions to the outer solar system that made close flybys of the four gas-giant planets and of Saturn's satellite Titan. Surfaces and atmospheres in the outer solar system contain dark coloring agents in the solid form whose spectroscopic signatures are inconclusive and whose composition remains uncertain. Sagan, his students, the late Reid Thompson and Bishun Khare, argued that the dark materials are produced by photochemistry that leads to complex hydrocarbons formed by the action of sunlight on ubiquitous methane. They demonstrated the process in the laboratory, and carefully measured the optical properties of the products from the infrared through the visible.

By the 1980s, it had become clear that dust in the dry atmosphere of Mars affects atmospheric and surface temperatures, and that interannual differences in dust storm activity is a major cause of climate variability on Mars. This information, combined with his longstanding interest in radiative heat balance, led Sagan, together with Brian Toon, Richard Turco, Thomas Ackerman and Pollack, to explore the thermal effects of atmospheric soot and dust following a major nuclear exchange on Earth. The "Nuclear Winter" image that emerged from this work in 1983 stimulated wide discussion and study of possible global consequences of large scale warfare. The

size of the effect, even its sign, remains controversial, but the failure of national security agencies to imagine this horrendous outcome highlighted the limitations of previous models.

Carl was an Interdisciplinary Scientist on the NASA Galileo orbiter and probe mission to Jupiter, which was launched in 1989 and arrived at Jupiter in late 1995. His preparations for this experiment included extensive laboratory measurements, in collaboration with Khare, Thompson and Gene McDonald, of the optical properties of candidate organic materials that might be identified on Jupiter or its satellites. He became ill just before data began to be returned.

As a first-generation planetary explorer of the first rank, Sagan enormously influenced the direction of the early NASA program, not so much in mission details (although, as mentioned above, he was active in the Mariner, Viking, Voyager and Galileo flights), but through the public attention that he brought to these enterprises and through his access to policy-makers. He was an unwavering critic of NASA's manned space program, including the Space Station, and a staunch advocate of unmanned planetary exploration.

Planetary studies was born as a scientific discipline three decades ago, and Carl was one of its founders. He helped establish the Division for Planetary Sciences (DPS) of the American Astronomical Society, and was one of its first chairmen. Early on, he edited the journal *Icarus* for 11 years, introducing peer-review and guiding the journal's affiliation with the DPS. Most of all, Carl set the tone for the discipline, through his infectious enthusiasm about space exploration, his scientific generosity, and his interdisciplinary interests. He enticed students and faculty, including ourselves, to join him in the fun of exploring a previously unknown Solar System. In addition to others named above, David Morrison, Dave Pieri, Kathy Rages and Chris Chyba, were his students who are still influential in space exploration; although not officially his advisees, Steven Soter, David Stevenson, William Newman and Steve Squyres were greatly influenced by Carl as graduate students at Cornell.

Carl's talent as a popularizer of science set him apart. A remarkably gifted writer, he was aptly called the poet laureate of science. As James Michener wrote when reviewing the book, *Cosmos*, "His style is iridescent, with lights flashing upon unexpected juxtapositions of thought." *Dragons of Eden*, Sagan's ruminations on the evolution of the human brain, received a Pulitzer Prize. All told, his books stood on best seller lists for more than three years. At his death, he was co-producing the movie, "Contact," based on his novel, and the Omnimax film, *Comet*.

The Emmy and Peabody award-winning "Cosmos" television series, written with his wife-to-be, science author Annie Druyan, and Soter, was seen by half a billion viewers worldwide. It was a visually stunning amalgam of

anthropology, history, biology and astronomy, that showed how our changing perception of the Universe led to a new view of ourselves. In this series and especially during his frequent appearances on Johnny Carson's couch, Carl's charm, puckish sense of humor and boyish good looks overturned the popular perception of the scientist as a remote, stoop-shouldered character in a white lab coat. Suddenly science was interesting and woven into the human fabric.

Perhaps Carl's greatest public influence came through his columns in *Parade*, the Sunday newspaper supplement with a circulation exceeding 80 million. Here, sometimes collaborating with Annie, he shared his wonder at the Universe's beauty and he explained difficult scientific concepts, while simultaneously chiding the public for tolerating scientific charlatans. Because of his interest in exobiology and his visibility, Carl was frequently drawn into public debates about all manner of pseudoscience: from UFOs to parapsychology. With sharp wit, he argued vigorously for rationality and the scientific method, maintaining that the known world was fascinating enough; one need not look for extraterrestrials in every unexplained happening. This campaign led to Carl's most recent book, *The Demon-Haunted World: Science as a Candle in the Dark*.

Not an aloof academic, Carl ventured frequently into debates with public policy implications, such as the already mentioned Nuclear Winter, the reduction of nuclear stockpiles, the hazard posed by asteroid impacts, the best way to destroy threatening asteroids, and strategies to get the superpowers to explore Mars together. In the early 1990s, he brought together a broad coalition of scientists to alert the world's religious leaders, and ultimately its politicians, that the environment was in a crisis that would profoundly affect all the world's peoples.

Sagan received more than twenty honorary degrees, and numerous awards for his pioneering efforts in space exploration, and for his writing and public service. Yet, this most widely known scientist of his generation was never admitted to the U.S. National Academy of Sciences, reportedly because he was blacklisted at the last moment by a few members as someone whose pure scientific accomplishments were insufficient for membership. The paradox is that others have become academicians because of their influence in their field or their administrative positions. Nevertheless, in the last year of his life, Carl was awarded the Academy's Public Welfare Medal, its highest honor.

In a similarly odd twist, Carl was occasionally dismissed as a "mere" science popularizer by some scientific colleagues. His accomplishments in this arena, which would have been considered remarkable had he been a full-time journalist or author, were judged somehow less worthy because of his scientific training and professional standing. Yet most scientists agree that, strictly from self-interest, our community should be urging members to be engaged in interpreting scientific ideas and bringing critical thinking to the public at large.

Every life cut short is a tragedy. Perhaps the most poignant aspect of Carl's death is that life elsewhere—the search that was his scientific passion—may soon be found.

Joseph A. Burns, Peter J. Gierasch, Yervant Terzian

William Merritt Sale, Jr.

February 16, 1899 — January 7, 1981

William Merritt Sale, Jr., was born the son of a bank teller in Louisville, Kentucky, and attended public school there. He entered the University of Virginia in 1917, enlisted in the Army in 1918, and in 1919 enrolled in the University of Wisconsin, where he became editor of *The Daily Cardinal* was elected to Phi Beta Kappa, and was graduated *summa cum laude*. After taking a Master of Arts degree in English at Harvard in 1923, he taught English for two years at the Bernt School in the Philippines. In 1925 he entered Yale Graduate School. He wrote his thesis under the direction of Chauncey Brewster Tinker, whose standards of scholarship he especially admired, and who (Sale once said) convinced him that he had made the right choice of a life. In 1929 he married Helen Stearns, a fellow graduate student in English. In 1930 he received his Doctor of Philosophy degree, and for the next six years he served as an instructor at Yale.

Sale came to Cornell as an assistant professor in 1936. At the end of his first year he was made assistant chairman, and for most of his career at Cornell when he was not in the chair he was the strongest of the powers behind it. He was named Goldwin Smith Professor of English in 1959, and in 1968, upon retirement, he was made professor emeritus.

Sale was an authority on the life and works of Samuel Richardson, and his *Samuel Richardson: A Bibliographical Record* (1936) and *Samuel Richardson, Master Printer* (1950) will not soon be superseded. His occasional critical essays and special lectures (on Shakespeare, Upton Sinclair, Edith Wharton, John Marquand, et al.) were always elegant and original. But it was as a teacher that he made his greatest contribution—in his courses in fiction and literary criticism and in his sections of Freshman Composition. Many Cornellians remember the excitement of his lectures on the novel from Fielding to Joyce. In 1940, almost alone in the department in his interest in modern fiction, he offered a course that included Thomas Mann and Sigrid Undset, along with Hardy, Conrad, and Flaubert. To read fiction under his guidance was to discover ways of seeing, hearing, thinking, and talking that did more than simply illuminate a particular work. Good novels well read intensify one's sense of life, and clarify and focus one's vision of it—of people and societies, of manners and cultures. Sale left his mark on many who later became professional students of literature or writers of fiction.

Fascinated by the art of writing, he was also blessed with the knack of teaching it. Many Cornellians who were not primarily interested in the study of literature learned to write in one of his sections of Freshman Composition, a

course which he taught with great pleasure for most of his career. These students characteristically learned more than the syllabus promised: they discovered the moral implications of style and came to understand the ugliness of cant and jargon; they learned to test skeptically the clichés (ancient and modern) of the discourse of politics as well as of literary criticism.

As a teacher of the theory of “practical criticism,” Sale played an important part in the history of the English Department. In a way, he succeeded Frederick Prescott, and for a short but important period he was the Cornell authority on modern critical trends. He brought to the department and its graduate students a new “New Criticism” from the works of I. A. Richards and F. R. Leavis, and to his undergraduate teaching the most liberating aspects of the theory and method of Brooks and Warren. Never a zealot, he nonetheless took a line, and his lively and genial advocacy of it sharpened through many years the perceptions (and wits) of his colleagues and students.

By the natural ascendancy of his intellect, by his passion for perfection, by his devotion to his ideals of professional excellence, William Sale managed, during thirty-two years at Cornell, to exert an extraordinary influence on the shape and direction of the Department of English. In debates on appointments, curriculum, and academic standards, his judgments usually prevailed.

Beyond the walls of Cornell, the society of his family, the bounds of his garden, and the realms of sport—particularly, baseball—Sale’s chief interest was the English Composition Test of the College Entrance Examination Board. He was chief reader of that test for sixteen years during the period when the number of students taking “the Boards” increased tenfold, and the task of grading the tests required 150 school and college teachers of English to be brought together annually from all over the United States for a week’s work at Princeton. During the first two days of each session Sale persuaded this heterogeneous group of teachers to look beyond the easily recognized errors in spelling, punctuation, and grammar to discover evidence of the writer’s power to use English effectively—to find the right word, to choose the right idiom, to intuit the right syntax; in short, he taught teachers how to recognize in student writing better evidence of aptitude and achievement than the examples of faulty usage stressed by tradition. As chief reader for CEEB, Sale influenced the teaching of English composition in America out of all proportion to the size and frequency of the annual reading sessions at Princeton. As chief examiner, moreover, he was equally influential, for by changing the form of the test to improve its validity and the reliability of the reading, he also changed the emphases in writing courses.

Though Sale enjoyed the challenge of inventing tests that would be fair to all concerned, and the challenge of convincing his readers about how to grade them, he was always a skeptic about examinations—particularly in

writing and in literature. Yet he worked enthusiastically for the CEEB, partly because he believed that selective admission to college should be based on aptitude and achievement and not on social or racial evidence. He rejoiced that the board made it hard for admissions officers to admit a student from a posh prep school with scores in the 500s at the same time that they rejected a girl from Brooklyn or a boy from Louisville with scores in the 700s.

During the last three years of his life Sale lived at Ithacare. He endured the sorrow of separation from his wife, who lived in a nursing home, the victim of premature senility, and he bore cheerfully the miseries of his own poor health. He dressed for dinner in an oxford-cloth shirt with a button-down collar from Lewton's, one of his many rep silk ties from the Yale Coop, and a tweed jacket from Langrock's in Princeton. He watched the news and sports on TV, read detective stories at a brisk clip, and enjoyed occasional visits with old friends. Till he fell into a mortal coma, his mind was as quick as life and his humor was rich, ironic, and witty. He was a proud man with a fearsome temper; but he was also an extraordinarily honest and clear-sighted man with great self-discipline.

He is survived by his wife, Helen, and by their three sons: William, professor of Classics and chairman of the Department of Comparative Literature at Washington University; Roger, Professor of English at the University of Washington; and Kirkpatrick, a journalist and free-lance writer.

Anthony Caputi, James O. Mahoney, Scott Elledge

Edwin Salpeter

December 3, 1924 — November 26, 2008

Edwin E. Salpeter, among the most influential, prescient and innovative astrophysicists of the last half-century, died in his home on November 26, 2008.

Ed was born in 1924 in Vienna. In 1939, his family fled to Australia after the Nazi takeover of Austria the previous year. After he graduated from the University of Sydney, a prestigious scholarship allowed him to become a doctoral student of Rudolf Peierls in Birmingham. Peierls and his old friend, Hans Bethe, often sent outstanding students to each other for post-doctoral experience, and so Ed came to Cornell in 1949. He stayed at Cornell for almost 60 years, and for most of this time, occupied the same office in Newman Lab assigned to him on his arrival (“the worst of the postdoc offices”).

With the publication in 1951 of the Bethe-Salpeter equation, which governs two-particle bound states in quantum field theory, “Salpeter” became a household name in theoretical physics. For most scientists, such an early success would set the trajectory of their career. Not Ed. He soon decided that his own talents and temperament were not well suited to quantum field theory. He started to look for a field that, in his own words, was,

“more controversial, more open-ended and new, where quick was useful and sloppy did not matter too much because it would all change soon anyway.”

He found it in astrophysics.

In 1939, Bethe published his Nobel-prizewinning work showing how the conversion of hydrogen to helium powers ordinary stars like the sun. He subsequently received much correspondence on the subject. When Ed became the most junior of Bethe’s postdocs, he was often delegated to respond to this correspondence, sparking his interest in nuclear astrophysics. Beginning in 1951, Ed started spending summers at Caltech, working with Bethe’s friend, the nuclear experimentalist, Willy Fowler.

His very first astrophysics paper, published in 1952, solved the great puzzle of how giant stars, which have completed their burning of hydrogen into helium, transform helium into carbon. Before this discovery, the origin of the elements beyond helium in the periodic table was a mystery.

The puzzle was that it was already known that there are no stable nuclei of atomic mass number 5 or 8, and so there was no way to fuse hydrogen (mass number 1) with helium (mass number 4), or to fuse two helium nuclei.

Furthermore, the probability of three helium nuclei coming together directly to produce carbon (mass number 12) was much too low to be feasible. Using new data from Fowler's group, Ed realized that beryllium-8, formed by fusion of two helium nuclei was metastable, and would persist in sufficient abundance to lead to carbon-12 by fusion with a third helium nucleus. Fred Hoyle then predicted that there must be a specific energy-level structure in carbon that greatly enhances the probability of this final step. This work led the Royal Swedish Academy to award the Crafoord Prize to Hoyle and Salpeter in 1997.

As the new field of nuclear astrophysics burgeoned, a vital question was how much heavy-element enrichment of the interstellar gas occurs when massive stars die. The answer hinges on how many stars of a given mass have been born – the “initial mass function.” In 1955, Ed provided a “sloppy” answer to this crucial question that has turned out to be remarkably good and is still widely used today.

Ed showed his versatility with work in plasma physics, work that was important for understanding white dwarfs and neutron stars, as well as the physics of the ionosphere, which became important when the Arecibo radio telescope was built. Starting in the 1960s, Ed turned from stars to ever-larger scale phenomena: the physical chemistry of interstellar gas; galaxy rotational velocities and dark matter; and the development of galaxy clusters and superclusters.

Ed paid close attention to phenomenology, and while thinking about what might become observable, he often predicted new phenomena. The most famous such prediction, also made independently by Yakov Zel'dovich in the Soviet Union, was that black holes could be revealed by the radiation emitted by accreting gas, which has become one of the standard ways of identifying black holes.

In this and subsequent work, perhaps more than any other single person, Ed brought the full menu of physics into astronomy. This represented a transformative shift: there may have been a few “astrophysicists” before Ed, but he was the one who made astrophysics a real profession.

Ed was virtually unmatched in success in mentoring great students who themselves became leaders in the field. He created a diverse and vibrant “Salpeter school of astrophysics” that continues to energize the field today.

Ed became a tenured faculty member in the Physics Department in 1954 and eventually the J.G. White Distinguished Professor of Physical Sciences. He played a key role in helping to found the “new” Department of Astronomy at Cornell, and was one of its intellectual leaders from the outset. He received many honors, including election to the National Academy of Sciences (1967), the Gold Medal of the Royal Astronomical Society (1973), the Russell

Lectureship of the American Astronomical Society (1974), election to the American Philosophical Society (1977) and as a Foreign Member of the Royal Society (1993), the Crafoord Prize (1997), and the Hans A. Bethe Prize of the American Physical Society (1999).

Late in his career, Ed became increasingly interested in neurobiology, collaborating with his wife, Miriam (Mika, then Professor of Neurobiology and Behavior at Cornell, who died in 2000), on the interactions between nerves and muscle fibers. He also worked on epidemiology and the statistical analysis of clinical trials, both in collaboration with his daughter, Shelley Salpeter, a physician, and recently with his grandson, Nicholas Buckley. Of this work, Ed said,

“My switch to epidemiology was not as radical a change as you might think. Humans coughing tuberculosis mycobacteria into the air at different ages required similar mathematical treatment to stars of different lifetimes disbursing heavy elements into the interstellar medium.”

Among his numerous contributions to public service, Ed’s most important role was in the rigorous technical studies of anti-ballistic missile defense systems, starting in the 1960s. This impressed on him the limitations of such systems, and in the 1980s, he participated in an influential study by the American Physical Society that debunked the feasibility of the “Star Wars” Strategic Defense Initiative. Ed sparked some controversy by referring to the “dishonesty without outright lies” that pervaded the anti-ballistic missile defense community, then and now. Recently, with his second wife, Antonia (Lhamo) Shouse, he was a fervent opponent of the Bush administration’s use of torture.

In addition to his wife, Antonia, Ed is survived by his daughters, Judy and Shelley; his grandsons, Jamie and Caleb Irvine, and Nicholas and Jacob Buckley; and many devoted nieces, nephews, sons-in-law, and other members of this extended family.

Ed had come to Cornell at the age of 24, where Bethe had assembled one of the greatest physics departments in the world, with young members who would become famous in popular culture. Within a few years, Ed demonstrated comparable intellectual powers. But Ed was a modest man who did not display his depth and brilliance at first sight. His amazing productivity always seemed incompatible with his relaxed demeanor, his role as the engaged father of a large extended family, his worldwide friendships, and his endless zest for travel, grand opera and skiing. We count ourselves among the many who had the good luck to be touched by the truly remarkable life of Ed Salpeter.

Miriam (Mika) Salpeter

April 8, 1929 — October 24, 2000

Miriam (Mika) Salpeter was born in Riga, Latvia, on April 8, 1929, and died on October 24, 2000, in Ithaca, New York. She was born into a family of scholars and businessmen. Her father was a teacher and scholar of Yiddish, and Mika, who remained fluent in Yiddish, retained a lifelong interest in the history and culture of the Jewish people. Under threat from Nazi persecution, her family emigrated from Latvia in 1938, first to Canada, and then in 1945, to the United States. She completed her high school education in New York City, where she went on to attend Hunter College, was elected to Phi Beta Kappa, and graduated summa cum laude. Subsequently, in recognition of her professional accomplishments, she was named to the Hunter College Hall of Fame.

Mika received her Ph.D. degree in Psychology at Cornell University in 1953, in the record time of three years. Her dissertation, under the sponsorship of the distinguished behaviorist, Howard S. Liddell, was on stress-induced maladaptive behavior in goats. At the time, the Psychology Department had intrinsic strength in diverse experimental areas, with both neuroanatomists and physiologists in prominence. Although her research interests were later to undergo a major shift, her training in psychology provided her with a lifelong interest in the brain, and for many years she taught a successful course on the anatomy of the brain.

In 1950, Mika married Edwin Salpeter, then a Research Associate in Physics. There followed a year's study at the Australian National University in Canberra, and the birth of two daughters, Judy in 1953, and Shelly in 1955. The family remained in Ithaca, where Mika and Ed pursued their parallel careers in biology and physics.

Upon her return from Australia, Mika obtained a postdoctoral position in Marcus Singer's laboratory in Cornell's Zoology Department. Singer gave her complete freedom and she was soon to discover the virtues of the electron microscope, the instrument that would remain her research tool for life. Mika fell in love with cells and was quick to realize that biological exploration at the ultrastructural level was an immense frontier. Intrigued by the expanding field of neurobiology, she eventually settled on the study of the vertebrate neuromuscular junction, the connection between neurons and muscles that controls all voluntary movement. Mika became an acknowledged authority on this synapse, and many of her papers on the structure and function of the junction stand as classics of the literature.

Mika had a strong sense of right and wrong, which could find expression in her advocacy of women's rights. In the mid-fifties, women were not readily accepted into faculty ranks, and although Marc Singer championed her, she

was soon to lose him as an ally. Having found Cornell's biological establishment too conservative for his liking, Singer had accepted an offer from Case Western Reserve University. Mika was isolated, and without support from either the chair of the Zoology Department or the dean of Arts and Sciences. Her chances for an academic post at Cornell were reduced to nil. There was downright disbelief at the time that academic performance could be combined with motherhood and Mika did not initially escape the consequences of such misjudgment. It was not until 1967, after the Division of Biological Sciences had been created at Cornell, that Mika was appointed to the newly established Section of Neurobiology and Behavior, thereby finally receiving the professorship she deserved. Her talents had clearly been underestimated. Professionally she rose to the challenge in every respect, just as she succeeded as parent. Judy and Shelly are now themselves established as professionals with families of their own. And Mika's friendship with Marc Singer continued through life. Upon Marc's death, Mika organized a highly successful scientific meeting in his memory at Cornell.

Mika became a strong role model and rights advocate both at Cornell, and nationally within her professional community. The Miriam Salpeter Award was established in her honor by Women in Neuroscience to recognize outstanding women in the profession, and in the year 2000 she was herself honored by WIN for her achievements.

Prior to her appointment as Professor, Mika had been given a home in the laboratory of Professor Benjamin Siegel in Cornell's Department of Applied and Engineering Physics. She received a Career Development Award from the National Institutes of Health, and also spent a year in Cambridge, England, in the laboratory of the distinguished insect physiologist V.B. Wigglesworth. Those were productive years, during which she developed a technique, quantitative electron microscopic autoradiography that established her international reputation. The technique was put to use, both by her and others, to answer many a question pertaining to the function of the neuromuscular junction, in both health and disease.

While her appointment to a professorship had been late in coming, it was acclaimed by her immediate colleagues. Dale Corson, Provost at the time of her appointment, and former Dean of the Engineering College, openly welcomed her to the ranks, and Richard O'Brien, chairman of Mika's new department, let it be known that Mika's outside letters of support were the strongest ever received by his office on behalf of a candidate. Mika was promoted to full Professor in 1973, and in 1982 began serving a five-year stint as Chair of the Section of Neurobiology and Behavior.

In her new post, Mika was enabled to put together a strong research team, and her work flourished. She quantified the density of important molecules, such as the acetylcholine receptor and acetylcholinesterase at the

neuromuscular junction. She made major discoveries in developmental neurobiology, looking at the mechanisms by which the neuromuscular junction is formed, and studying the molecules that regulate the density and turnover of critical signal-transducing molecules, both during development and after peripheral nerve injury. She embarked on a long collaboration with her husband, Ed, to formulate mathematical models of the actions of the neurotransmitter acetylcholine at the neuromuscular junction, using the data that she obtained with quantitative electronmicroscopic autoradiography. These models are among the most detailed and sophisticated ever put forth to explain synaptic function.

Mika's legacy at Cornell extended beyond her achievements in the sciences. She was a veritable presence on campus, and will long be remembered for her strong views, loyalty to friend and cause, compassion, love of children, contempt for arrogance, and liberal politics. She sparkled when triumphant and did not easily yield to contrary views, although she was singularly reluctant to hold grudges. In dealing with Mika, you took one issue at a time. Total disagreement on one matter in no way prejudiced the debate over another. She could be wrong, but never uninteresting.

Humor was all-important to Mika, who viewed jokes as being curative. She remembered jokes, told them well, and was quick to make the departmental rounds whenever she heard a new one. Everyone benefited. When we ourselves were initiators of a joke, we always waited in eager anticipation, wondering when and in what form the joke would come back to us via Mika. She was a master raconteur, who told stories to diffuse tension, or simply to bring joy, and she used this talent with enormous success as chair, colleague, and friend.

Ed played a crucial role in Mika's life, not least in her professional activities. She could always count on Ed's support, and their collaboration was exemplary. To work with them was to experience a successful venture firsthand. Always inquisitive, Mika held herself and her collaborators, Ed included, to the highest standards. Whether over the kitchen table or on the ski lifts, she never hesitated to bring up science. The intellectual exchanges between her and Ed were exciting and memorable to participants.

In the course of her career, Mika received recognition for her achievements both in teaching and research. The National Institutes of Health awarded her a Jacob Javits Research Grant, an honor reserved for those judged to be in the top ranks of the neurobiological research community. She was invited to serve on the Council of the National Institutes of Health, being enabled thereby to help formulate policy for that most important of grant-giving institutions. Mika was, at age 71, still at the peak of her academic life, surrounded by a buzzing entourage of graduate and undergraduate research students. When she fell victim to the devastatingly quick-spreading thyroid

cancer that was to be her last illness, she came to her lab daily, to work, discuss ideas, and mingle—and, yes, to hear jokes—until almost the day she died.

Thomas Eisner, Ronald Harris-Warrick, Thomas Podleski

Gerard Salton

March 8, 1927 — August 28, 1995

Gerard Salton, Professor of Computer Science, died of cancer on August 28, 1995. Gerry was the preeminent researcher and leader in the field of information retrieval—almost from the time he started working in it in the early 1960s until his death 35 years later. Today, dozens of well-known commercial systems, including some “search engines” on the world wide web, use ideas developed in his work. Gerry was the first recipient of the award for research given by the ACM Special Interest Group for Information Retrieval (1983), and upon his death, the award was named the “Gerard Salton Award for Distinguished Contribution to Information Retrieval Research”.

We share the grief of his passing, as well as all the fond memories of him, with his wife, Mary Birnbaum Salton; younger brother, Jean Sahlmann; daughter, Mariann Salton Thompson and her husband; son, Peter and his wife; and three grandchildren.

Gerry was born in Nürnberg, Germany, on March 8, 1927, the son of Rudolf and Elisabeth Sahlmann. He spent his youth in Germany. During World War II, however, he and his parents had to flee Germany. Later, at one point, he and his brother Jean were spirited across a border in the middle of the night, taking care to elude German guards.

Gerry came to the United States in 1947, changing his name from Sahlmann to Salton, and became a citizen in 1952. In 1950, he married Mary, his wife of 45 years. He attended Brooklyn College, receiving a Bachelor’s degree in mathematics in 1950 and a Master’s degree in 1952.

Gerry entered the Ph.D. program in Applied Mathematics at Harvard, receiving his Ph.D. degree in 1958. He was the last of Howard Aiken’s Ph.D. students, and also one of the first programmers of Harvard’s Mark IV computer. He stayed on as Instructor (1958-60) and Assistant Professor (1960-65). Gerry was extremely fond of Harvard, and he often prefaced remarks with, “When I was at Harvard ...”.

In 1965, Gerry moved to Cornell to help create the Computer Science Department—along with Richard Conway, Juris Hartmanis, and a few others. He served as Chair of the Department from 1972-78 and was active in the Department until his death.

Gerry’s real professional love was not the Department but his research in information retrieval, which he had started while at Harvard. This research, including working with students, was all-important. To him, a good Department Chair was one who kept the administration away from the rest of the faculty, giving them a chance to

do their research and teaching—most administrative problems would go away by themselves, if you just let them alone. And to some extent, he practiced that philosophy very effectively while Chair of the Department.

While at Harvard, Gerry conceived of and began implementing SMART, an experimental computer System for the Manipulation and Retrieval of Text. He persisted with this work, despite discouraging comments about its relevancy and applicability from many people. But Gerry was right, and today, the concepts and techniques developed in SMART by Gerry, his students, and his colleagues elsewhere are found in dozens of well-known commercial systems on the Internet.

Gerry demanded the highest scholarship from himself and his students. It has been said that he was more responsible than anyone else for the development of a sound experimental tradition in his field. He was a prolific writer—the excellence of his 150-plus research articles and six texts on information retrieval make him the most cited person in information retrieval. His writing was indeed excellent—worth a Best JASIS Paper Award, a Best Information Science Book Award, and even an award for the best review in *ACM Computing Reviews*. He was a Guggenheim Fellow; he was selected as an ACM Fellow; and he received an Alexander von Humboldt Senior Scientist Award (Germany) and the ASIS Award of Merit.

In the midst of his research and writing, Gerry found time to be of service to his field. He was editor-in-chief of several journals at various times and on the editorial board of several others. He was on the Council of the ACM, was a member of the ASIS Board of Directors, and chaired Section T of the AAAS. He was founder and first chair of ACM's Special Interest Group in Information Retrieval.

Gerry was professionally literate across a variety of subjects, from linguistics to European literature. He could express himself like a professor of English; yet, he created a highly technical subject that depended heavily on computers and mathematics. Classical music was also important to him, and he and Mary rarely missed a Cornell concert. For years, he was a member of the Cornell University Faculty Committee on Music. A series of four Brahms concerts was dedicated to his memory and to Mary, and a plaque is being installed on the back of his favorite seat in Barnes Hall.

Gerry did not believe in “bigger is better”, and he did not like change for the sake of change. Talk of increasing the size of the Department would evoke the retort that it was better when it was smaller, as would talk of growth at Cornell and in Ithaca over the years. When the Department constructed two new floors in Upson Hall in the 1980s, Gerry said of his bigger and better office, “It’s nice, but I don’t like it—it’s *different*.”

Gerry loved his family, and took the time to be with Mary, Mariann, and Peter. Exercise and the outdoors were a source of joy for him. He sailed, swam, ice-skated, and hiked. He was a strong supporter of Cornell hockey. He skied regularly, both downhill and cross-country, in Ithaca and in Aspen, Colorado, where he and Mary had a condominium.

Richard Conway, Juris Hartmanis, David Gries

Martin Wright Sampson

Professor of English

— *August 22, 1930*

The sudden death of Professor Martin Wright Sampson in the fullness of his powers is felt by the University and the community as an irreparable loss.

Professor Sampson joined this Faculty in 1908 and was made Goldwin Smith Professor of English in 1912. After his early training under Professor James Morgan Hart, whose sound tradition he was later to maintain and amplify, he had prepared himself for a life of devotion to letters and learning by study in European centers. He came to Cornell with the ripe experience gained by service in three American universities.

His broad scholarship, his intellectual keenness, his delicate sensitiveness to all that is fine in literature and art, combined with his rare power of awakening interest and insight in others, are attested by the number of his former students who have made themselves names as writers or scholars and by those who, in other fields, have preserved the love of literature which they acquired in his classroom.

His readings and lectures for students in architecture and engineering were eagerly attended. His open-minded fairness, his patience and courtesy, his helpfulness to all who sought his aid or counsel, were unflinching.

He administered his department as a republic. He found time to render service on many Faculty committees. As chairman of the Committee on War Alumnus Certificates and as editor of the Military Records of Cornell Alumni in the World War, he made invaluable contributions to the records of the University. He promoted intelligent appreciation of the arts by the foundation of the Sampson Fine Arts Prize, and consistently advocated full recognition of their cultural value.

The esteem in which he was held by the Alumni caused him to be frequently invited to speak at their gatherings, and made him a bond between the University and its former students. His genuine comradeship, his broad humanity, and his interest in all civic affairs made him, in equal measure, a bond between the University and the community.

As a teacher, he brought to the interpretation of his favorite subjects, poetry and the drama, an understanding and sympathy possible only to one himself a poet. His editions of Milton and Webster are lasting memorials of his scholarship and his critical power. His own writings showed the grace, charm, and humor characteristic of the man. It is due to his innate modesty that most of these were known mainly to his close friends and to the young

men whose aspirations he was encouraging through the Manuscript Club, which he founded and of which he was the guiding spirit.

But those who knew and loved him will think foremost of all of his generous and winning personality, of his buoyant spirit, and of the inspiration to high intellectual achievement and fine character which by his own life he daily offered.

Martin Wright Sampson, Jr.

July 11, 1914 — June 6, 1999

Professor Emeritus Martin Wright Sampson, Jr., died on June 6, 1999, in Roseville, Minnesota. He was born in Ithaca, where his father was an eminent Professor of English at Cornell. He received the degree of B.S. in Administrative Engineering from Cornell in 1939 and the degree of M.S. from Cornell in 1945, with a major in Industrial Engineering and a minor in Industrial Psychology. His wife, his son, and many other family members also received their baccalaureate from Cornell.

After receiving the B.S. degree, Marty worked for one and one half years as an engineer at the Buffalo, New York Chevrolet Division of General Motors, gaining experience in plant layout, production methods, and industrial organization and management. He started teaching at Cornell in 1941, in the Administrative Engineering Department, which at that time was a part of Sibley School of Mechanical Engineering. This department gradually evolved into the present School of Operations Research and Industrial Engineering, and Marty played an essential role in constructing the new curriculum, teaching a variety of courses. He also played an important role in educating students outside of Cornell. He taught courses in job analysis and evaluation to industrial and labor union groups in several cities in Mexico, aiding about twenty different Mexican firms. He spent a year as a Visiting Professor at the Middle East Technical University in Ankara, Turkey, as part of a program administered by the Cornell Graduate School of Business and Public Administration, under the auspices of the United States Agency for International Development. In addition to teaching courses there, he advised the Department of Business Administration on curriculum revision and teaching methods. Marty also taught courses at the University of the West Indies in Trinidad as a Fulbright Lecturer, and numerous extension and adult education courses for many American corporations. Wherever he gave courses, he was known as an excellent teacher.

In addition to his teaching duties, Marty served on several college and university committees, and for several years before he retired in 1980, he was Director of Cornell's Summer Session.

Marty Sampson had broad interests outside of his academic work. He was active in track and field as a young man, and later officiated at track and field events. He was a vestryman and treasurer at St. John's Church in Ithaca. After his retirement, he served on several committees involved with improving conditions in the Ithaca area.

Marty Sampson was an exceptionally kind and considerate person. After he retired, he was a volunteer van driver for "Gadabout," an organization which transports the elderly and the handicapped to medical appointments and

shops. When students who were sent to Cornell under the accelerated military training program were invited back for the 50th anniversary of the program, Marty was still remembered with affection.

Marty's wife, Anne Beers Sampson, died in 1987. He is survived by his son, Martin Wright Sampson III; daughter-in-law, Ellen Sampson; grandson, Aaron Sampson; daughter, Debbie Sampson; a brother and sister; and nieces and nephews.

Robert N. Allen, Henry P. Goode, Narahari U. Prabhu, Lionel I. Weiss

Ethel Wiley Samson

May 3, 1918 — July 4, 2002

Born in Fall River, Massachusetts, the daughter of William and Rachel Wiley Samson, Professor Ethel Samson was a “New Englander,” living in Massachusetts and Rhode Island before moving to New York State. Following graduation from Nassau College in Maine in 1941 with a Bachelor of Science degree in Home Economics, she was an Assistant Dietitian at Women’s Hospital, Boston, and later an Administrative Dietitian at Rhode Island Hospital in Providence, Rhode Island. In these positions, she taught nutrition to student nurses and to Red Cross Dietetic Aides in addition to other responsibilities. She later studied at Columbia University earning a Master’s degree in 1947.

Professor Samson began a distinguished career of over thirty years in Cornell Cooperative Extension when she became an extension educator in Ulster and Rensselaer counties in 1947. In 1956, she was recruited from the field to join the Cornell Cooperative Extension administrative staff in the College of Human Ecology with responsibility for program leadership and supervision of extension home economists in northern New York. Promoted to Associate Professor with tenure in 1961, she was appointed Staff Development Officer for the statewide extension system with a joint appointment in the Colleges of Human Ecology and Agriculture and Life Sciences. A long time interest of Professor Samson was in continuing education for mature women recognizing the dearth of programs directed to advanced educational opportunities for them. In study leaves and sabbatics, she investigated approaches and actions of others across the country in addressing the needs of women in career development. In her position as Staff Development Officer, she was instrumental in establishing a nationwide process to recruit high caliber extension staff for the New York system; in upgrading staff competencies through the development and coordination of in-service education opportunities from both colleges; and in providing staff with counseling on their careers and professional development. Her effective pursuit of excellence in staff employed by county associations contributed greatly to the success of extension’s diversified programs for the people of New York State. The alternatives she recommended enabled staff both to build career ladders acceptable to them and to meet challenges in providing educational programs to a complex society.

During her career at Cornell, she served on college/university committees focused upon searches for extension administrators; extension curriculum; career ladders and continuing education for staff; educational policy and field study for undergraduates. She represented the College of Human Ecology on the Faculty Council of Representatives for a two-year term and was a member of the Provost’s Advisory Committee on the Status of

Women. Professor Samson also accepted national assignments to work on personnel management and staff development issues with the United States Department of Agriculture – Extension, the Extension Committee on Organization and Policy (ECOP), and the National 4-H Council.

She was professionally active in the Adult Education Association of the U.S., the American Dietetic Association, the American Home Economics Association (AHEA – now American Association of Family and Consumer Sciences), the American Society for Training and Development, Epsilon Sigma Phi, the national Association of Extension Home Economists (now National Extension Association of Family and Consumer Sciences). She chaired the Educational Grants Committee in Epsilon Sigma Phi. During her fifty-year membership, Professor Samson served elective terms in AHEA – New York State as district president, committee chair, state treasurer, president-elect/president, and she also served as officer and chair of the Home and Family Life Section in the Adult Education Association. She was recognized for her leadership in staff orientation/in-service education by Epsilon Sigma Phi in 1970, for meritorious service by the Adult Education Association in 1976, and for career counseling by AHEA – New York in 1982.

Professor Samson became an active community volunteer after her retirement in 1982. She assisted the staff at Cornell Cooperative Extension of Tompkins County by helping with a consumer hot-line, and, with others, establishing Housing Options for Seniors Today (HOST), a joint project of extension and the County Office for Aging that identified alternative housing solutions for the elderly. She served as the first chair of the HOST Advisory Committee. In addition, she chaired the Economic Vitality Program Committee and served on the Board of Directors of the Tompkins' Extension Association. Continuing her affiliation with Cornell, she was president of the Association of Cornell University Emeritus Professors. She also led a successful fund-raising effort to establish the first endowed Extension Chair in Family Policy¹ for the College of Human Ecology. She was presented with the Dean's Distinguished Leadership Award in 1993.

A Remembrance Tea honoring Professor Ethel Samson was held on Saturday, July 27, 2002 at Kendal at Ithaca. Services with internment in Spring Grove Cemetery, Northampton, Massachusetts were private. She is survived by her brother, Donald A. Samson, of Newport News, Virginia; two nephews, William D. Samson, of Northport, Alabama, and James G. Samson, of New York City; and a grand nephew, Stephen Samson, of New York City.

She is deeply missed by family, friends, and colleagues.

Mary Morrison, Bettie Lee Yerka

¹ The Hazel E. Reed Human Ecology Extension Professorship in Family Policy

Bernard Samuels

— *July 26, 1959*

It is with profound regret that we record the death of Dr. Bernard Samuels which occurred at Wiscasset, Maine, July 26, 1959.

Dr. Samuels was associated with the New York Hospital and the Cornell Medical College for many years. Beginning as instructor in ophthalmology in 1914, his outstanding abilities were soon recognized and his responsibilities gradually increased. From 1927 to 1941 he served as head of the Eye Department and as Professor of Ophthalmology, continuing afterwards as Professor Emeritus and consultant in his specialty. It was during his term as head of the Eye Department that the present building was opened, and he was largely responsible for the physical arrangement of the Eye Clinic, which has proved so satisfactory that it still remains essentially unchanged.

The teaching program of the Medical College was one of his chief interests, and he possessed a remarkable flair for student teaching. He always employed many charts and models, believing that the student should be shown as well as told. His methods were so successful that many a student, years after graduation, would clearly recall Dr. Samuels' demonstrations. We are fortunate to still have a large number of these same helpful teaching aids, which he acquired here and there in his extensive travels and donated to the Eye Clinic.

He was always interested in the welfare and education of the young physician who wanted to study ophthalmology. Nothing was too much trouble for him to further this aim. His personal advice and the contacts he arranged were frequently the starting point for a young doctor's successful career.

With the residents on his service, he would spend long hours instructing in the clinic, on the wards, and in the operating room. When reading and describing the daily pathologic eye sections at the New York Hospital and the New York Eye and Ear Infirmary, he was enthusiastic and inspiring and usually was surrounded by a group of appreciative and eager young physicians.

Dr. Samuels was of a scholarly type of mind, and books on medical and historical subjects were one of his chief pleasures. He possessed a fine library of his own and was always actively interested in improving the medical library of the College. He enjoyed writing and was the author of numerous lengthy publications on the subject of ophthalmology, many of them dealing with the microscopic changes in ocular tissues, in health and disease. His

historical interests were made evident in papers he wrote on the history of ophthalmology in New York City, and on the history of eye hospitals in New York and London.

No attempt is made here to recount his medical achievements, which were important. He was an active member, and usually an executive officer, of most of the ophthalmological societies here and in Europe, where he traveled each summer. It was a fitting and well deserved honor that he should be chosen, in the twilight of his career, to be the president of the XVII International Congress of Ophthalmology, which was held in New York City in 1954. This was only the second time that the Congress had ever been held in the United States.

Dr. Samuels conducted a very large private practice.

He always moved rapidly and was endowed with the most unusual and boundless energy. He was a fascinating and entertaining conversationalist and had a knack for learning foreign languages. He was fluent in several and could make himself understood in most of the languages encountered in a large New York City clinic.

In the setting of his spacious home and large gardens, situated in the Shenandoah Valley of Virginia, surrounded by his furnishings, books, and paintings collected over a long lifetime, he was a most charming host and dearly loved to entertain. Those who knew him well will sadly miss this talented friend.

Eric C. Richardson

Dwight Sanderson

September 25, 1878 — September 27, 1944

Dwight Sanderson, Professor of Rural Sociology Emeritus, passed away at his home, Elmcote, in Ithaca, N. Y. on September 27, 1944.

He retired from active service in the University as professor and head of the department on October 15, 1943, after 25 years of service. He had been the head of this department from its inception and was chiefly responsible for its growth and development.

Dr. Sanderson came to Cornell in 1918 to become its first active professor of rural sociology. He was not unfamiliar with the University. A year after receiving his Bachelor of Science degree at Michigan Agricultural College in 1897, he became a student here and received his second degree of Bachelor of Science in Agriculture, specializing in entomology, in 1898.

From 1898 to 1917, he served in several positions in the field of entomology in Maryland, Delaware, Texas, New Hampshire, and West Virginia. In 1904 he became professor of zoology and state entomologist at New Hampshire State College. That he was a successful teacher, research worker, and administrator in this field is evidenced by the responsible positions which he held and the long list of entomological writings which he produced. These included four books and more than 50 articles on entomological problems. During these years, he served as president of the Association of Economic Entomologists.

In 1907 Dr. Sanderson began a period of service as an agricultural college administrator, first as director of the Agricultural Experiment Station at New Hampshire. In 1910 he went to West Virginia as dean of the college of agriculture, a position which he held until 1915. In this period he became interested in the study of the human problems of rural life, and in 1917 he entered the University of Chicago to take graduate work in sociology. He received the Doctor of Philosophy degree in sociology at Chicago University in 1921 and immediately returned to Cornell.

The beginnings of the department of rural sociology at Cornell were humble. It was a new and uncharted field of work. For several years, Professor Sanderson and one other colleague did all the teaching and research work. Soon, he was able to add an extension worker, then an additional teacher and research colleague. In those early days he began research projects in the delineation of the rural community, and it was in this area that he made his most important contribution to rural sociology.

First there was produced by him and his graduate students, a series of monographs on the rural community. About the same time a series of his editorial writings were combined and published as ‘The Farmer and His Community.’ He next wrote a volume, “The Rural Community,” this was followed by a volume on “Rural Community Organization.” Later he produced “Rural Sociology and Rural Social Organization,” a text book in rural sociology.

Dr. Sanderson was active in the American Country Life Association of which he was one of the founders and the first secretary, and later its president. He was also a member of the American Sociological Society, and of the Rural Sociological Society and served as president in both organizations. In addition to holding membership in the sociological and rural life organizations, Dr. Sanderson was a member of Sigma Xi, and Phi Kappa Phi and a fellow of the American Association for the Advancement of Science.

That the department which he directed became recognized as a leading one in the United States is evidenced by the large number of graduate students who come to Cornell to study in this field. In the last quarter century, 40 students have taken the doctor’s degree in rural sociology, in addition to the large number who have received the master’s degree. Practically all of these men now hold responsible positions in the field of rural sociology in colleges of agriculture, experiment stations, and in the United States Department of Agriculture, as well as in several foreign countries.

Dr. Sanderson was a continuous writer in the field of general and rural sociology. In addition to five books, he published 17 research bulletins, most of them from the Experiment Station at Cornell, 48 articles in scientific journals and magazines, and a very extensive list of reports, proceedings, and book reviews.

It is rare that one man attains eminence during a life-time in two distinct fields, but this is true of Dwight Sanderson.

Besides achieving eminence in his scientific work, Dr. Sanderson was a public spirited citizen, taking part constantly in civic affairs. During his residence in Ithaca he served as a Director of the Community Chest, the Council of Social Agencies, the Social Service League, the Red Cross, and the Family Society.

His generous personality endeared him to a wide circle of colleagues and friends.

Roger F. Sandsted

August 5, 1918 — March 12, 2003

On Wednesday, March 12, 2003, Professor Roger F. Sandsted, 84, of Dutcher Road, Freeville, New York, passed from this world in the same manner he lived his life; in quiet dignity and in gentle poise. Roger was born in Holdrege, Nebraska to the late William and Otelia Sandsted. The family lived on a farm where Roger participated in many of the farming operations. He graduated from the Holdrege High School in 1936 and went to work on the family farm before entering the armed forces just prior to World War II. He joined the Air Corps and became a pilot of a B29, "Superfortress." He flew 30 missions over Japan, while stationed on Tinian Island in the South Pacific. He was discharged from the army in October 1945.

After the war, Roger finished his college studies at the University of Nebraska, College of Agriculture, receiving a B.S. degree in 1948. He continued his education at the University of Minnesota in the Horticulture Department, acquiring a Ph.D. degree in 1954. Roger's first job was at the University of Idaho in the Agriculture Department, where he lived in Parma, Idaho.

He came to Cornell University as an Assistant Professor of Vegetable Crops in 1957. He was elevated to Associate Professor in 1963 and to Professor in 1977. He also held the title of Department Extension Leader from 1976-83. As a research and extension Horticulturist with primary responsibility for legume vegetables, Roger made numerous contributions to the bean industry. He conducted yearly variety and cultural practice trials on snap and dry beans. His keen observations led to the selection and development of the small white bean "Aurora," which was released in 1973, and the black bean "Midnight," which was released in 1980. "Midnight" attracted national attention due to its improved growing characteristics. Another notable accomplishment as a result of his selection and breeding efforts is the red kidney bean "Ruddy." Roger made valuable contributions to the bean industry. The results of his research have been effectively communicated in extension bulletins, newsletter articles, motion pictures, and professional publications noted for their straightforward language. He was a cornerstone of the New York Bean Industry who made his mark on the national level through devoted research and infectious enthusiasm for beans.

He retired from Cornell in 1983 and was named Professor Emeritus. Roger maintained a strong interest in agriculture, establishing many gardens at his home. Roger became a Master Gardener with the Tompkins County Cooperative Extension, helping home gardeners with problems and answering questions. Professionally, he was a member of Alpha Zeta, Alpha Gamma Rho, American Society for Horticultural Science, Bean Improvement

Cooperative and Epsilon Sigma Phi. Roger became a member of the Town of Dryden Historical Society and served on the Board of Trustees. He was chairman of the Collections Committee and was a valued member for many years. Roger was a member of the Presbyterian Church in Dryden and served as a trustee. He was also a longtime member of the Ithaca-Cayuga Rotary Club of Rotary International. For many years, he was a member of the 40th Bomb Group Association, made up of members of the squadron he flew with. He enjoyed many reunions of the group.

He is survived by Gwen, his wife of 54 years; his three sons, Craig (Jane), Jeff (Reenie) and Eric; three grandchildren, Paul, Travis, and Sarah; one brother, Wesley (Dorothy), of Holdrege, Nebraska; cousins, nieces and nephews. He was preceded in death by a brother, Raymond and a sister, Helen.

He was known as a kind and generous man who always found time to help others. His quiet, sincere and gentle manner was a calming influence for many and will be remembered by his family, friends and colleagues.

Elmer Ewing, Robert Sweet, Hans C. Wien

Diva Sanjur

December 16, 1933 — December 7, 2002

Diva Sanjur was an internationally recognized scholar in international and community nutrition. She was one of the first individuals trained in nutrition to apply social science theories and methods to investigating food and nutrition problems in communities around the world. Throughout her academic career, she focused on several social science constructs in relation to nutrition: food habit formation and the influence of culture, ethnicity, migration, and socioeconomic status on food habits and dietary intake.

Professor Sanjur was born in the Village of Remedios, Chiriqui Province, Republic of Panama. One of ten children, she received a USAID Scholarship and studied home economics at the University of Puerto Rico, earning a B.S. degree in 1958. Graduating with the highest academic record in home economics, she received the University's Willsey Medal of Honor. She was honored in 1981 by the University of Puerto Rico as recipient of the 16th Lydia J. Roberts Memorial Lecture Award. Professor Sanjur earned a M.P.H. degree from the University of California at Berkeley in 1962. Following the completion of her doctoral degree from Cornell University in 1968, Dr. Sanjur joined the faculty in the Department of Human Nutrition and Food, now the Division of Nutritional Sciences. Her early research focused on the feeding patterns of young children in low-income families in upstate New York, and subsequently expanded to include minority populations in New York City. This research provided important insights for designing the nutrition education programs of Cornell Cooperative Extension and similar programs at other land grant universities. During her academic career, Dr. Sanjur conducted numerous investigations in Puerto Rico, where her research formed the basis of the current knowledge of food habits in the commonwealth. She and her students conducted research in Ghana and Nigeria, in Indonesia and the Philippines, and in many Latin American countries, including her native Panama.

Dr. Sanjur published over 40 journal articles from her research on food habits, dietary intake, and other nutrition topics. In 1995, she published *Hispanic Foodways, Nutrition and Health*, drawn largely from her studies of Hispanic populations including Mexican Americans, Puerto Ricans, Dominicans, Cubans, and Central Americans. Her statement on the goal for the book aptly captures the motivation for her lifetime of research: "We hope this book will help nutritionists and program planners better serve Hispanic populations through diet counseling and nutrition education." She was a founding member of the Editorial Board of the *Journal of Nutrition Education*, thus exerting major influence on the course of that scholarly journal. Professor Sanjur also conducted research and co-authored journal articles with her husband, Professor Malden C. Nesheim.

Dr. Sanjur was a leading scholar and teacher of dietary assessments (one of the major approaches to determining nutritional status), especially among minority, low-income populations in the United States and Latin America. She published a manual on dietary assessment that was used in her course on the topic at Cornell. She compiled an extensive collection of recipes and nutrient content information for Hispanic foods that serve as a researchers' resource around the world.

Dr. Sanjur's course on the Sociocultural Aspects of Food and Nutrition, became a requirement for nutrition majors in the late 1980s. In 1982, she published a widely used textbook on the *Social and Cultural Aspects of Nutrition*. She and Cornell University were recognized nationally for emphasizing the importance of this topic in the undergraduate curriculum.

During her 31 years on the Cornell faculty, Dr. Sanjur was the major advisor to 32 graduate students, served on the Special Committees of many more graduate students, and served as an undergraduate advisor to countless students. She was an understanding but demanding advisor, and an effective role model for an untold number of female and minority students from the United States and abroad.

Professor Sanjur's students noted the rigor of her teaching and her standards for writing and research and how these standards challenged them. They recounted her patience and generosity, and her skill in inspiring new perspectives on the importance of culture in nutrition.

She was passionate about teaching and learning, believing that education provides life-changing opportunities. She wanted her students to learn from everything they did, to maximize their academic experiences, and to continuously grow personally and professionally.

Dr. Sanjur knew firsthand how alone international students often felt so far from their families for an extended period. As a Berkeley student in her twenties, she left her young son in Panama in his grandmother's care. Such memories she found difficult to recount; but as a professor advising her international students, she could empathize with the personal sacrifices many endured in furthering their education. Dr. Sanjur understood that the challenges every graduate student encounters are multiplied for foreign students, especially women. She would often lament that so few women pursue graduate education in the United States, mostly because they lack support both in their home countries and their host institutions. Thus she worked to increase awareness at Cornell of many students' needs for extra support, such as developing personal ties with mentors sensitive to each student's abilities, who could therefore provide appropriate guidance and encouragement.

Professor Sanjur believed that international students and scholars greatly enhanced the educational experiences of their classmates. She considered bilingual literacy and bicultural experience as valued assets. She frequently conveyed this concept of extra strength and extra potential of international students to those inclined to rely on testing as a primary factor in selection for admission. She supported international students because they would go to the “front line,” to work to improve the lives of marginalized and impoverished populations. When students were overwhelmed, she would wisely remind them of their long-term goals and the necessity of perseverance. With her Latino students she would bring her “Hispanic ways” and using traditional sayings would advise, “remember, it is better to have it and not need it, than need it and not have it.”

Her students, and others she championed, repeatedly proved to be dedicated to their studies, intellectually able and committed to service. Their ability to work across cultures and to translate knowledge in culturally sensitive ways is legend.

Perhaps because of her own separation from family and culture, Diva remembered her international students during holidays and times of their customary celebrations. She and Malden opened their home to make these occasions memorable. Diva likewise reached out to American students to share her culture, providing a bridge for deeper learning about the role of tradition and culture in food, diet, health and art.

Professor Sanjur is survived by her husband, Malden Nesheim and her son, Leonardo Tunon-Sanjur.

Brenda H. Bricker, Christine Marie Olson, Pilar A. Parra, Francille M. Firebaugh

Francis W. Saul, Sr.

April 24, 1920 — January 20, 2005

Following a brave fight against cancer, Francis W. Saul, Sr., 84, died January 20, 2005 at his home in Cayuga Heights.

Professor Saul was born on April 24, 1920 in Washington, D.C., the son of Benjamin and Marthe Lanet Saul. Following an early high school graduation from Western High School in Washington, D.C., he served in the District of Columbia National Guard and then attended the United States Military Academy at West Point. Upon graduating in June 1943, he married Elizabeth (Betty) Edwards. He served in the European Theater during WWII with the 335th Field Artillery, the 87th Infantry Division, and the OSS. Decorated for his courage, he was wounded during the war and forced into a medical retirement in 1946.

After the war, Professor Saul graduated from Harvard University in 1948 with a Masters of Civil Engineering degree and went to work in the office and field in heavy construction for United Engineers and Constructors, and Day and Zimmerman in Philadelphia. He also taught civil engineering in the evenings at Drexel University.

Frank, Betty and family lived in Syracuse in the mid-1950s, where Frank was the district engineer for the American Institute for Steel Construction.

In 1959, the Saul family moved to Ithaca where Professor Saul had been invited to teach at Cornell's College of Architecture, a position he held for 26 years, retiring in 1985 as a Professor Emeritus. At Cornell, Frank and Betty loved to host students at their home and immersed themselves in campus life. Particular sources of enjoyment were summer travel all over the world and studying at many universities across the nation under National Science Foundation grants. In the evenings, Frank frequently taught at Tompkins Cortland Community College.

A resident of Ithaca for forty-five years, Professor Saul was an active volunteer in the community. For years, he could be found at the hospital bringing cheer to patients. When it was tax season, he would help seniors with their tax preparation. Later on in life, he volunteered at local public schools assisting students with their homework. A former president of the Ithaca Rotary Club, he was also active with his friends in Lambs Club and City Club.

Professor Saul is survived by his beloved wife of 61 years, Elizabeth (Betty) Edwards Saul; and his children, George K. (Sheila) Saul of Seattle, Francis W. Saul, Jr. of Ft. Myers, Florida, Nancy Saul of Buffalo, New York, and John Beau

Saul (Valerie) of Ithaca. Also surviving are seven grandchildren: Francis III, Matt, Kelly, Christopher, William, Luke and Ryan; his sister-in-law, Theresa Lambert of Tampa, Florida; and several nieces and nephews. Frank's parents, Benjamin and Marthe, and his brother, Patrick, predeceased him.

Office of the Dean of Faculty

Byron W. Saunders

June 27, 1914 — January 4, 1987

Byron Winthrop Saunders, retired dean of the University Faculty and professor emeritus of operations research and industrial engineering, died in Ithaca, New York, on January 4, 1987. When he retired in 1979, he had been a professor at Cornell for thirty-two years. He was always deeply involved in university and related affairs; at the time of his death he was president of the Association of Cornell University Emeritus Professors, an organization he helped found.

Byron was born in Providence, Rhode Island, on June 27, 1914. He received his B.S. degree in electrical engineering from Rhode Island State College (now the University of Rhode Island) in 1937 and spent the next ten years with the Radio Corporation of America and other industrial firms. In 1945 he received his M.S. degree in engineering economics from Stevens Institute of Technology. Byron's formal education and years as a full-time practicing engineer had a profound effect on his outlook on engineering education. He recognized early the key role that the efficient design of manufacturing and production systems plays in cost and output, and that viewpoint greatly influenced his outlook on engineering education in the School of Industrial Engineering and Operations Research as a professor and later as the director. He was always a strong champion of a balance between applied and theoretical work in his discipline.

In 1947 Byron joined the faculty at Cornell as an assistant professor of industrial and engineering administration in the Sibley School of Mechanical Engineering. He was promoted to associate professor in 1951 and to professor in 1957. He spent the academic year 1960-61 as the Joseph Lucas Visiting Professor at the University of Birmingham, England. There he investigated the design of manufacturing systems, including both production and warehousing, and he later used much of the new information in the development of courses. His stay in Birmingham broadened his perspective on engineering, and he made many friends for himself and the university. He was invited to return to Birmingham in 1978 and spent another very pleasant and fruitful sabbatical year there.

He served as acting head of the Department of Industrial Engineering from 1962 to 1964 and as head the following year. When the department was reorganized as the School of Industrial Engineering and Operations Research within the College of Engineering, Byron was appointed director, a position he held until 1975. During the academic years 1971-74 he was also the director of continuing education in the College of Engineering.

In 1974 Byron was elected dean of the University Faculty by his colleagues. His election was a fitting tribute to his willingness to be involved in a broad range of college and university activities and the recognition of the outstanding job that he did in every area in which he was involved. In every assignment, whether professional or administrative, Byron participated with full effort and dedicated himself to top achievement. His loyalty, integrity, and high moral and performance standards were always evident. While serving as dean of the University Faculty, Byron exhibited his strong support for academic freedom during the so-called Ky incident in December 1975. A speech by then vice president Ky of South Vietnam was disrupted by those protesting his policies. Byron urged the faculty to take a stand on the issue. His opinion was stated forcefully in his annual report: "There can be no honest search for truth, no honest hearing of differing opinions and differing perceptions, if one allows the closing off of views, no matter how objectionable they might be or how objectionable the people who are voicing these views." He served with distinction as dean until 1978. Then, following his sabbatical year in his much-beloved England, he retired in 1979.

Byron was a fellow of the American Institute of Industrial Engineers and chairman of its Visitor's Group, which performs accreditation inspections of industrial and systems engineering programs. In addition, he was a member of the American Society of Mechanical Engineers and chairman of its Materials Handling Division. He was a member of the American Society of Engineering Education and served as chairman of the Industrial Engineering Division and as chairman of the National Council of Industrial Engineering Academic Department Heads. He was also a member of the American Association of University Professors, the American Association for the Advancement of Science, and the Institute of Management Sciences.

In the College of Engineering Byron served as chairman of the Special Committee on Engineering Design, as chairman of the Engineering Policy Committee, and as chairman of the Graduate Professional Programs Committee of the Engineering Division of the Graduate School. During his years in the college he also served as a consultant to several industrial concerns, including the General Electric Company and the Western Electric Company.

At the university level he was a member of the original Faculty Council and the first chairman of the council's Committee on Research Policy and Personnel. He was a member of the Nominating Committee, the Committee on Membership of the University Faculty, the Administrative Board of the Cornell University Council, and the University Senate. He served as chairman of the board of directors of Cornell United Religious Work and was the faculty adviser to the swimming team.

Byron's interests were broad and varied. For example, he served with energy and enthusiasm as an official at the Cornell track meets. Less noticeable, but equally enthusiastic, were his behind-the-scenes responses to the financial needs of many groups at Cornell and elsewhere: he was an outstanding practitioner of quiet philanthropy.

For several years Byron was a member of the Faculty Committee on Music and later served as a consultant to the committee. When the committee was in dire financial straits and it looked as if the Statler and Bailey Hall concert series would have to be drastically cut back, he worked with former university president Dale Corson to organize a fund-raising campaign, the Fund for Quality Concerts. That effort was highly successful and continues today. Byron was also chairman of the Friends of Music of Cornell University.

Byron and his wife, Miriam, were active members of the First Unitarian Church of Ithaca, where Byron served at one time as chairman of the board of trustees. He was devoted to the church, which occupied a significant portion of his time and energy. Both he and Miriam were involved for many years with the Unitarian-Universalist conference center on Star Island at the Isles of Shoals, off Portsmouth, New Hampshire.

It was because of his great attraction to things marine and his knowledge of the Shoals that Byron became a strong behind-the-scenes force in the founding of the Shoals Marine Laboratory on Appledore Island, Maine. (This is a joint venture of Cornell and the University of New Hampshire that has become one of the most successful marine science programs in the country.) He was also a member of the board of trustees of the Sea Education Association at Woods Hole, Massachusetts, an organization that provides intensive nautical education for undergraduates of many colleges.

Byron was very active in community affairs. He served as a member of the Town of Ithaca Planning Board, as chairman of a citizens' committee to establish the northeast water district in the Town of Ithaca, and as president of the Eastwood Commons Residents Association.

Byron had a phenomenal memory for names and faces: he was able to call by name virtually all his students, including those who had graduated many years ago. He was very well liked by his students and helped them in many ways to realize their full potential. He kept in touch with many of them as their careers developed. In recognition of Byron's reputation as a humane and caring educator, the Byron W. Saunders Award was established in 1970 in the College of Engineering. This award, accompanied by a cash prize and medal, is presented annually to the senior who achieves the best academic record in the School of Operations Research and Industrial Engineering.

Byron was a devoted family man who took great pride in his children, William C. Saunders of Urbana, Illinois; Martha E. Nabation of Ottawa, Ontario; and Carolyn E. Munger of Seattle, Washington, as well as in his five grandchildren. His wife, Miriam Wise Saunders, whom he married on December 28, 1942, shared deeply his interests and ideals. She resides at 17C Strawberry Hill Road, Ithaca.

Byron expressed his credo in *Who's Who in America*: "My primary motivation and basis for decision making has been to try as best I can to help others as I have been helped and to make the world just a little bit better for my having been here." Throughout his life he more than achieved his ambition. He will be greatly missed by his family, his many friends and colleagues, and his former students.

William L. Maxwell, Martin W. Sampson, Jr., Robert E. Bechhofer

Elmer Seth Savage

June 15, 1884 — November 22, 1943

In the death of Professor Savage on November 22, 1943, the dairy industry lost one of its outstanding leaders, who had exerted a wide influence in this and other states.

Elmer Seth Savage was born at Lancaster, New Hampshire, on June 15, 1884, and grew up in that state on the home farm. After being graduated in 1905 from the New Hampshire College of Agriculture, he taught animal husbandry for two years in the Baron de Hirsch Agricultural School in New Jersey. He then took up graduate studies at Cornell University, serving as assistant in the Department of Animal Husbandry. In 1909 he received the degree of Master of Science in Agriculture and in 1911 the degree of Doctor of Philosophy. In 1933 he was given the honorary degree of Doctor of Science by the University of New Hampshire.

At Cornell he advanced rapidly through the successive ranks of instructor and assistant professor, and in 1913 was appointed to a professorship in the Department of Animal Husbandry. In 1929 he was placed in charge of the dairy cattle division of the Department. Throughout his period of service in the Department, Professor Savage taught large classes of students who were drawn to him because of the soundness of his teaching and of his rare gift of kindling enthusiasm for his subject.

The investigation upon which his doctor's thesis was based dealt with the same general problem on which, some years later, he conducted extensive experiments—the protein requirements of dairy cows. As a result of this early investigation he formulated a set of feeding standards for dairy cows, which became known as the Savage Feeding Standards and found wide use.

In 1927 he began an extensive series of experiments to determine how much protein was needed in the concentrate mixture for dairy cows fed the types of roughages common in the northeastern states. These experiments were of great importance to northeastern dairymen for they proved that it was entirely unnecessary to feed concentrate mixtures as rich in protein as those which had commonly been fed in this region. Just as high production was secured on lesser amounts of protein, and under usual conditions such rations were decidedly more economical.

Later, Professor Savage and his associates conducted extensive experiments to develop more economical methods of raising dairy calves in market milk districts. In these studies the method widely known as the Cornell Calf Starter was developed. Just prior to his death Professor Savage carried on tests to determine the effects of making

decided changes in the formulas of mixed dairy feeds, such as are frequently necessary under present war-time conditions. These experiments showed that considerable changes could be made in formulas without lowering production, provided the mixtures were made up of suitable feeds that supplied the proper amounts of protein, fat, and total digestible nutrients.

Professor Savage was the pioneer advocate of the manufacture of mixed livestock feeds according to "open formulas." Under this plan the manufacturer not only guarantees the chemical composition of the mixed feed, but also states on the tag the exact proportion of each ingredient. This plan was adopted by farm cooperatives throughout the country, and put into operation with the assistance of College Feed Conference Boards which Professor Savage was instrumental in organizing for the purpose of devising formulas for the feeds in question. This development has had a marked influence on the manufacture and processing procedures of the feed industry generally, and has resulted in a large benefit to agriculture.

Professor Savage traveled extensively to study agricultural and dairy conditions in various parts of this country. In 1931 he was a representative of the United States Government at the World's Dairy Congress in Copenhagen, Denmark, and at that time made observations on dairying in several countries.

In addition to experiment station bulletins and articles on dairying published in farm papers, Professor Savage was the author of the book, *Feeding Dairy Cattle*, and of *Feeds and Feeding Manual*, and was the joint author of *Better Dairy Farming*.

Professor Savage was always deeply interested in his fellowmen and took a prominent part in organizations for human betterment. For several years he was a member of the board and also treasurer of the interdenominational organization, Cornell United Religious Work.

Professor Savage always took an active part in the activities of farmers in his home county. He maintained continuous membership in the Farm Bureau and the Grange, and for several years he was Superintendent of Cattle at the New York State Fair. For many years he operated a dairy farm at Ithaca where he developed a purebred Guernsey herd to a 400-pound fat level.

In 1911, Professor Savage was instrumental in organizing the livestock breeders of Tompkins County into a County Breeders' Association with the object of "promoting the breeding and improvement of high grade and purebred livestock in Tompkins County." Professor Savage was Master of the Forest City Grange and Secretary of the Tompkins County Pomona Grange for many years.

Professor Savage was a fellow of the American Association for the Advancement of Science and a member of the American Dairy Science Association and of the American Society of Animal Production. In the last named organization he served as secretary and vice-president. He was a member of the social fraternity, Kappa Sigma, and of the following honorary and professional fraternities: Sigma Xi, Gamma Alpha, and Alpha Zeta.

Not only was Seth, as we all called him, an outstanding agricultural leader, but he also endeared himself to us all by his kindness and helpfulness. The host of his warm friends will long cherish his memory.

Will Miller Sawdon

January 1, 1873 — April 1, 1952

Will Miller Sawdon, professor emeritus of Mechanical Engineering, and one of the community's most beloved and respected citizens, passed away Tuesday, April 1, 1952 at his home in Ithaca. He was 79 years old, and had been an active member of the Cornell University Faculty for forty-one years. Professor Sawdon was born January 1, 1873 in Aurora, Indiana, the son of George W. and Annie R. (Miller) Sawdon. A district school in the town of his birth provided his early education, after which he attended the Aurora High School. He was graduated with a bachelor of science degree in Mechanical Engineering from Purdue University in 1898. As an undergraduate, he was a captain in the Cadet Corps, and president of the Emerson Society. He spent the next six years in the middle west gaining both practical experience and facility as a teacher: he taught mathematics and manual training at the Detroit School for Boys; a summer was spent with Cincinnati Shaper Company; for three years he taught at Kansas State College, after which he served as assistant professor of Mechanical Engineering at Armour Institute of Technology.

In September, 1904, Professor Sawdon joined the Engineering Faculty at Cornell as instructor in experimental engineering. He combined his teaching duties with various research projects and was awarded his masters degree in Mechanical Engineering in 1908. At that time he was advanced to Assistant Professor, and in 1919 he was appointed to a full professorship. For many years, Professor Sawdon served as secretary of the Cornell University Engineering Experiment Station. In this capacity, he directed its numerous and diverse projects and investigations, and prepared its scientific reports. He was responsible for the leather belting laboratory when this was the only center of its kind in the country. He pioneered work and initiated courses in heating, ventilating, and refrigeration, and contributed extensively to the literature in these fields. His broad practical knowledge combined with his versatility in so many phases of engineering work made him widely sought as a consultant by many industries and individuals.

Although he was officially retired from active teaching in June, 1941, such a valuable member of the engineering staff could not be overlooked when the university inaugurated its V-12 training program for the Navy. Consequently, Professor Sawdon was immediately recalled to teach the mechanical laboratory courses. He worked without vacation or recess until the war training program was completed in 1945, when he was again retired. Professional and academic societies to which Professor Sawdon belonged included: The American Society of Heating and

Ventilating Engineers, The American Society for Engineering Education, Sigma Xi, Gamma Alpha, Atmos, The American Society of Mechanical Engineers, and the Cornell Society of Engineers. Many of these societies honored him by election to executive office. Professor Sawdon was among the first to register as a Professional Engineer. His extensive knowledge made him a valuable member of the University Library Committee.

Although Professor Sawdon's primary interest was in teaching and technical research and development, coupled with an active participation in the affairs of the University and national scientific societies, he, nevertheless, found time to pursue his special avocation of civic and community service. This, for him, was a genuine avocation, for it called him away from his work on the hill, he followed it with vigor and ardor, and without any financial remuneration or the slightest thought of any personal gain. He had a sincere faith in his fellowmen, and an unselfish belief that this entire community deserved to benefit from any special talents which he might have to contribute to its welfare. With this thought in mind, he accepted an appointment to his first public office on the Municipal Civil Service Commission. His distinguished service on the Board of Public Works over a twenty-three year period is testimony of his technical ability and wise planning. He was primarily responsible for the development of the city's water supply system, its reservoirs, filter plant, and distribution system. He not only did the bulk of the engineering work involved, but he established it on a sound financial basis so that while this utility is operated by the municipality, it does not have to be financed from taxes.

Although Will Sawdon was never, in any sense of the word, a politician, the Republican party persuaded him to be its candidate for Mayor of the city in 1923. He won the election by an overwhelming majority and served the two year term without pay. At the time Professor Sawdon's candidacy was announced, the incumbent mayor said: "It would be difficult to find a citizen of Ithaca more interested in its welfare than Will Sawdon. I know his great capability, his earnestness and thoroughness, and above all, his great love for the city which has been his home for twenty years." This fine tribute to Professor Sawdon's ability and character is especially significant because it came from "Lou" Smith who has also unselfishly devoted much of his time to community welfare.

Further evidence of his interest in the social well-being of others is to be found in the enthusiasm and energy he devoted to his church, the Masonic fraternity, and the Rotary Club. He was a lifelong member of the Methodist Church, serving as trustee of the First Methodist Church, a member of the official board, a trustee of the Wesley Foundation Board and treasurer of the foundation. As an active Mason for many years, Professor Sawdon was a member of the original planning board which undertook the construction and financing of a new temple, following the complete destruction of the lodge rooms by fire thirty years ago. He was president of the Corporation at the

time the temple was built, and for a long time a member of the Board of Trustees. He was past high priest of Eagle Chapter 58, Royal Arch Masons, past commander of St. Augustine Commandry 38, Knights Templar, and prelate through 1950. He was also instrumental in establishing a DeMolay chapter in Ithaca, and served for ten years as chairman of its advisory council. Professor Sawdon was an ardent Rotarian, who rarely missed a meeting. Even in the most inclement weather during the past winter, he summoned the courage and effort necessary to arrive at the regular Wednesday noon meetings of Rotary where he would exchange a friendly greeting with his associates in the community and share their responsibilities. He also took an active interest in the Tompkins County Tuberculosis and Public Health Association.

During World War I, Professor Sawdon was inspector in the United States Fuel Administration, and during the summer of 1919 was inspector for Jersey City at the Carnegie Steel plant. He served on the Board of Directors of Treman, King and Company for several years.

In 1902, at Manhattan, Kansas, Professor Sawdon married Adelaide F. Wilder, who survives him. Surviving also are two sons, George W. of Garden City, L. I., and Will W. of Palo Alto, California; three daughters, Mrs. Walter C. Guthrie of Pavilion, Mrs. Warren Taylor of Plattsburg, and Miss Agnes F. who lives with her mother.

Rarely indeed has Cornell University had the distinction of having as a member of its faculty, one who has contributed so much to the welfare of the community as did Will Miller Sawdon. His sympathetic understanding, his wise council and cordial smile will long be remembered by the thousands of students whom he inspired. And a host of friends in the community will cherish his memory for years to come.

R. R. Birch, R. F. Chamberlain, J. O. Jeffrey

Charles I. Sayles

July 17, 1903 — January 9, 1991

This past year the Hotel School lost a most loyal friend, former faculty member, and alumnus, Charles I. Sayles. He was a member of one of the first graduating classes of the newfound hotel program and returned, in 1931, to spend almost 35 years on the faculty.

Chuck Sayles was born in Watertown, New York, into a family of New York educators and innkeepers. His father was president of the State Teachers College in Albany and, during the summer months, operated the Star Lake Inn in the Adirondacks. Chuck embraced these family traditions; he recalled taking the Inn's horse and wagon to the train station at Indian Lake, greeting summer guests arriving from New York, and carrying their trunks back to the lodge.

Graduating from Colgate University in 1924, Chuck then attended the Alliance Francaise in Paris before returning to the States where he received a second Bachelor's degree from the Department of Hotel Management (then in the School of Home Economics) in 1926. At that time, the hotel program was directed from a closet under the stairs in Roberts Hall. Chuck describes these humble beginnings of the School of Hotel Administration in his last work, *The Closet Under the Stairs* (1989). He later earned a Master's degree in electrical engineering from Cornell in 1937.

Chuck Sayles became an instructor in industrial engineering at the Hotel School in 1931. In those early years he would arrive back from the Adirondacks in late September, only a day or two before the fall term. He loved the outdoors and was an avid hunter and fisherman. A charter member of the Cayuga Heights Fire Department, the back of Chuck's car invariably held a combination of fishing and fire gear.

In his office at Cornell, Chuck loved to point out to the Home Economics dean the framed letter from his wife, "Ted", announcing her resignation from the faculty at the time of their marriage. Their nearly fifty years together produced three children, Harriet, John, and Margaret. Chuck's second wife, Janet E. Sayles, of Ithaca, and his son, John, survive.

Chuck created an impressive legacy at the Hotel School. He maintained, out of his own pocket, a personal loan fund for students, lending amounts up to \$100 as the need arose. He kept a ledger of names and amounts and, when settled, would tear out the appropriate page and return it to the student. No one ever failed to repay a debt.

Chuck taught courses in construction, property management, and electrical engineering to two generations of Cornell hoteliers. His inquisitiveness for education—and for the practicality of innkeeping—continued throughout his career. In the 1960s he became a pioneer in the emerging field of data processing and its application to the hospitality industry. As the School's first director of research, Chuck was highly involved with IBM, NCR, Hilton Hotels, and other leading firms in practical application of information systems to the industry. Chuck was the consummate faculty member. Engaged with teaching and research alike, he served at one time or another on practically every school committee as well as two terms as acting dean of the School. In 1949-50 he was appointed to supervise the construction of Statler Hall, which was built on the former site of faculty homes lining East Avenue.

All this time Chuck continued to operate his beloved Star Lake Inn, travelling north each spring weekend to prepare for the upcoming season. As a professional hotelier, Chuck also served as president of the Cornell Society of Hotelmen and was a director of the New York State Hotel Association. He is the quintessential faculty member and alumnus, combining passions for education, research, and service to the university and industry.

It is rare, indeed, when faculty and alumni together can honor the myriad contributions of one of their own. We remember with affection and love our friend, colleague, and mentor, Charles I. Sayles. Many lives are richer today for having known and worked with Chuck.

Richard H. Penner, Richard G. Moore, Robert M. Chase

Charles Bovette Sayre

January 3, 1891 — January 8, 1979

Charles Bovette Sayre, professor of vegetable crops emeritus at Cornell University's New York State Agricultural Experiment Station, Geneva, New York, died on January 8, 1979, following an extended illness.

Professor Sayre, "Charlie" to his friends, was born in Chicago on January 3, 1891. He received his Bachelor of Science degree from the University of Illinois in 1913. He was an accomplished fencer, and as an undergraduate, held the Western Intercollegiate Saber Championship.

Professor Sayre began his scientific career as an assistant professor of vegetable gardening at Purdue University in 1914. However, in 1917, just four days before the outbreak of World War I, he was commissioned a lieutenant in the field artillery in the United States Army. After serving as commander of the Second Battery of the 6th Field Artillery at Fort Benjamin Harrison in Indianapolis, he was promoted to the rank of major and was sent to Camp Zachary Taylor in Louisville, where he served as commander of the First Battalion of the 326th Field Artillery. His next assignment was as a student and, after serving in France, as an instructor in aerial observation at the Fort Sill, Oklahoma, Artillery School of Fire. While at Fort Sill, former President Harry S. Truman and former presidential nominee Wendell Wilkie were both students of Professor Sayre. Shortly thereafter, Sayre was promoted to lieutenant colonel and became a permanent staff member at the School of Fire until the end of World War I. He later became one of the founding members of the American Legion, an honor he greatly cherished. There are only a few living members of this group remaining.

At the end of the war, he resigned his commission to become an associate professor at the University of Illinois, where he received his Master of Science degree in 1924. He moved to Geneva in 1925, joining the New York State Agricultural Experiment Station as an associate horticulturist. In 1928 he was promoted to the rank of professor, and in 1930 was appointed head of the newly formed Department of Vegetable Crops. He remained head of that department until his retirement in 1959.

During his long scientific career, Professor Sayre published almost one hundred scientific articles. Many of these dealt with proper rates, ratios, and placement of fertilizers for obtaining maximum yield and quality of processing vegetables. He worked on methods of producing strong healthy transplants of crops such as tomatoes. He also did a lot of work studying physiological factors affecting quality and yield. Major contributions to New York agriculture included his development of effective starter solutions for transplanted crops and his development of

a heat unit method of scheduled planting for peas. The latter was a system for forecasting maturity of peas so that growers could schedule their plantings, thus avoiding a glut at harvest.

With the strong orientation of the research of his department toward vegetables for processing, Professor Sayre became closely acquainted with many food processors. The Fieldmen's Conference, held for many years at Geneva, was a highlight at which he expected his staff to report on their research.

He was a member of the American Association for the Advancement of Science, the American Society of Agronomy, the American Society for Horticultural Science, the New York State Horticultural Society, the New York State Vegetable Growers Association, and Sigma Xi.

Upon his retirement, Professor Sayre was awarded the title of professor emeritus of vegetable crops by Cornell University. He remained active for a number of years, serving as a special consultant on vegetable problems in the food processing industry of New York.

In local affairs, Professor Sayre was an active member of the Geneva Rotary Club and the Geneva Torch Club and was a past president of each. He was also active in the North Presbyterian Church. He is survived by his wife, who resides at the family home, 563 West North Street, Geneva, New York 14456.

Nathan H. Peck, Morrill T. Vittum, Donald W. Barton

George Albert Schaefers

March 19, 1929 — March 28, 2001

Professor Emeritus George Schaefers died at his winter home in Sarasota, Florida after a brief struggle with cancer. He is survived by his daughters, Lynn and Gwen; son, Richard; as well as four grandchildren; two sons-in-law; and a daughter-in-law. George's wife, Kathryn, died in June 2001. Together they created a home that was remarkable. They had a knack for welcoming colleagues, students and friends in a manner that mingled both the joys and responsibilities of rearing families with providing a social environment that was alive with discussions of an amazing array of local and international community issues.

George Schaefers grew up in Erie, Pennsylvania. He attended El Camino Junior College in Los Angeles, California for two years, joined the U.S. Naval Reserves at Long Beach, California from 1950-52, and then entered the University of California, Berkeley for a B.S. degree in 1955 and a Ph.D. degree in 1958 in Entomology. He immediately joined the New York State Agricultural Experiment Station at Geneva as an Assistant Professor and began his 35-year career at Cornell University. He was Chairman of the Entomology-Geneva Department for eight years (1983-91) during which time he was instrumental in maintaining the international reputation of the department as six of the twelve faculty positions were refilled.

Schaefers established himself as an expert on aphid biology, including aphid transmission of plant diseases. He and his students expanded their research interests to include work on other pest species of small fruits, such as mites, tarnished plant bug, leafhoppers, and leafrollers. He was recognized nationally for his studies in the laboratory in which he electronically recorded aphid feeding and salivation as a means of studying the details of aphid feeding behavior in relation to host selection and the transmission of plant viruses; as well as of understanding the mechanisms underlying resistance of selected crop varieties to aphid pests.

George's interest in the field of international agriculture began to broaden in the mid-1970s. He went on a sabbatical leave in 1974 for a year to work at the Nigerian International Institute of Tropical Agriculture, where he conducted research on aphid transmission of sweet potato viruses. While at IITA, he became fascinated by the challenges and opportunities of working in international agriculture. His work with international agricultural organizations, such as the Consortium for International Crop Protection (CICP) and AID, took him to such countries as Puerto Rico, Nigeria, Colombia, Zaire, Tunisia, and Senegal. After stepping down as chair of the department in Geneva, he was

awarded a one-year Rockefeller Foundation Environmental Research Fellowship in International Agriculture. He went to sub-Saharan East Africa and studied traditional crop protection among small farmers.

His most recent assignment had been with CICP where he served as its director from 1993 to the end of 1998. He worked closely with CICP for almost 20 years before becoming its director. During that period, he made frequent trips abroad, especially to developing countries to assist them in developing reasonable and responsible crop protection programs against insects and diseases. As director, he was effective in securing funding to sustain CICP through a critical period and was instrumental in planning and coordinating an international workshop to facilitate the development of a network for IPM in Africa.

George's interest in serving his local community was expressed by over twenty years of service as a member of Geneva Rotary Club of Rotary International, by his membership and work in the Trinity Church, and as a Board of Directors member of the United Cerebral Palsy Happiness House.

Robert L. Andersen, George G. Kennedy, Wendell L. Roelofs

Stanley Lewry Schauss

September 2, 1908 — January 4, 1951

At the prime of his development in his chosen career, Stanley Lewry Schauss, Associate Professor of Electrical Engineering, died while preparing to return to his teaching duties at Cornell University. He had just completed a one-term sabbatic leave, spent in engineering work with the Public Service Electric and Gas Company in Newark, N. J.

Born in Brooklyn, where he received his early education, Professor Schauss graduated from Cornell with the EE degree in 1929. After five years in industry, with the Westinghouse Electric and Manufacturing Company in Pittsburgh, he became instructor in physics at Cooper Union in New York. Simultaneously he worked to advance his own formal education, receiving a master of science degree from New York University in 1938. He joined the faculty of Cornell as instructor in 1942, was appointed assistant professor in 1944, and became an associate professor in 1949.

In 1940 he married Alice R. Northrop of Owego, N. Y., who is the only immediate member of his family to survive him.

Professor Schauss was a member of the American Institute of Electrical Engineers and of two honorary societies: Eta Kappa Nu and Phi Kappa Phi. He was secretary of the faculty of the School of Electrical Engineering and was active in a number of the standing committees of the School.

Endowed with an unusually precise and analytical mind, Professor Schauss was outstanding in his ability to quickly perceive the straightforward approach to the most intricate and difficult problems, and he was most conscientious, thorough, and patient in passing on to his students all that could be transmitted of his own high abilities. Backed by his unusual mastery of the sciences fundamental to his profession, his contribution to the mental development of his students was indeed great—the more so because he gave intensive study to, and knew how to make use of, the psychology of teaching. He was keenly interested in a wide variety of social and economic problems, and readily retained the salient content of his wide reading in these fields. This enabled him, in his position as class advisor and in student discussion groups, to contribute extensively toward broadening the interests and the knowledge of his students.

Stanley Schauss was deeply religious. He was a staunch Lutheran and he never failed to defend his faith and beliefs when the occasion arose. As a student at Cornell, he was faithful in his attendance at the Lutheran Church, and served it as Sunday School Superintendent and member of the Council. When he returned to Ithaca as a member of the faculty, he was soon elected to the Board of Directors of the Lutheran Association, where he served faithfully and well. But few men serve their God and church as fully and sacrificially as did Stanley Schauss.

The premature loss of this man was a great blow to his colleagues and to the institution he served.

P. D. Ankrum, L. A. Burckmyer, Jr., R. W. Leiby

George F. Scheele

May 23, 1935 — February 13, 1993

George Scheele was a prominent chemical engineer, a successful educator, a valued colleague, and, most of all, a much-loved friend and advisor to hundreds of undergraduate chemical engineers at Cornell. With his untimely death, Cornell lost one of its most beloved and effective professors. Although he had a recurring liver condition which became pronounced at the beginning of 1992, we had expected to see him recover as he had done before. Indeed, he had taught with his usual enthusiasm in both the 1992 summer session and the fall term. It was only at the end of 1992 that the prospect of a liver transplant seemed to become an urgent necessity. Our elation over an apparently successful transplant early in 1993 was turned to sorrow when he succumbed to complications. He is survived by his wife, Carol Teaman Scheele of Ithaca; his mother; one sister; and two nieces.

George came to Cornell in January of 1962 having just completed his Ph.D. thesis at the University of Illinois. There he had studied the effects of heat transfer on fluid flow instabilities under the direction of T.J. Hanratty. During a leave spent with the Dow Chemical Company in Midland, Michigan, he expanded his research interest to include the stability of jets and the general area of drop coalescence. Much of the work he directed in subsequent years grew out of these experiences. He spent other leaves at Exxon Research and Engineering and DuPont's Engineering Department. The latter contact led to his consulting for DuPont over a period of years. He also consulted for Union Carbide and IBM at various times. All of his exposure to industrial practice was incorporated into his teaching and made the subjects of transport phenomena and computer-aided design come alive for his students. Adding to his diverse background, one sabbatical leave was spent as a visiting professor in the Department of Chemical Engineering at the University of California Berkeley campus.

Growing up in Yonkers made George, naturally, into a New York baseball fan. He had a vivid memory of the Yankee's glory days from the 1940s on and could recall most lineups and batting averages with remarkable accuracy. He had numerous part-time jobs including a post as a doorman at Radio City Music Hall. He was certain that it was his height that got him that job although most of us would guess that his outgoing attitude was the key. As a Phi Beta Kappa student at Princeton majoring in chemical engineering, George found time to be on the crew. Through all his life he enjoyed many sports as a spectator as well as a participant. From Princeton he went on to graduate school as a National Science Foundation fellow at the University of Illinois. When he had completed his studies, he interviewed at several universities, then selected Cornell.

At Cornell, George directed research in the field of fluid mechanics. For example, a series of four papers with his student B.J. Meister appeared in the *American Institute of Chemical Engineers Journal* on the subject of drop formation from jets. These papers treated both experimental and theoretical aspects of the problem and had a major impact on research in this area. In addition to its influence on other academic research, insights from this work influenced practical industrial processes such as polymer formation. Other important papers appeared in quality journals such as *Chemical Engineering Science* and *Industrial and Engineering Fundamentals*.

In his teaching career, George taught courses ranging from a sophomore course in Material and Energy Balances to graduate courses in Numerical Methods and Computer-Aided Design. The latter course was introduced by George in 1980. On many occasions he taught the “meat-and-potatoes” courses of chemical engineering—heat and mass transfer, separations, and, of course, his first love, fluid dynamics. When chemical engineering first offered summer courses in the Engineering Cooperative Program in 1977, it was George who taught the fluid dynamics course. He continued to teach it almost every summer for the next 15 years.

Early in his teaching career, George established an easy rapport with students which made him an excellent teacher and advisor. Even when he was teaching a rigorous course in fluid dynamics, students recognized his combination of ability and conscientiousness. One result was his receiving the “Excellence in Teaching Award” sponsored by the Cornell Society of Engineers and Tau Beta Pi in 1970. Another kind of recognition came from students who were selected as Presidential Scholars (a campus-wide award). On several occasions George was named by awardees as the teacher and mentor who most influenced them. The summer Coop students in chemical engineering always had a team that competed in Cornell’s summer Softball league. George was an integral part of that effort which helped knit the Coop students into a kind of mutual support group.

Another aspect of George Scheele’s career was that of the “good citizen.” He served as member or chairman of numerous committees. He became associate director of the School of Chemical Engineering starting in 1982. In that post he ran most of the day-to-day operations at a time when administration was becoming quite complex. The undergraduate program became his primary responsibility. At the University level, he served several terms on the Faculty Council of Representatives including some key committees (Chairman of the Executive Committee, for example). In the Engineering College, he served at one time or another on almost every committee including those that established and administered the freshman and sophomore requirements. This gave him a superb knowledge of the life and governance of the University. George’s rapport with students and his common sense, along with

his knowledge of the University were called into action from time to time. On one occasion, the President of the University chose George to moderate discussions with student activists who had taken over a campus building. President Rhodes recalls that George successfully completed his mission with “fairness, strength, and grace/”

As a proud member of the chemical engineering profession, George was active in the American Institute of Chemical Engineers. Besides publishing in the AIChE Journal, he was Cornell’s main representative in the group that established the Twin Tiers Local Section. He was the faculty advisor for the Student Chapter several times and always took a great interest in their activities. At national meetings of AIChE, George (and his wife Carol) often supervised the reception which was an important link to our alumni throughout the United States. Recognition for his activity came in 1985 when he was honored as a Fellow of the AIChE. This signified “professional attainment and significant accomplishment in engineering.” In the endorsements accompanying his nomination, the admiration and esteem of his colleagues and students was very evident.

George was a sensitive and perceptive counselor to many students over the years. In addition to his formal duties as an assigned advisor, he listened to the problems of those who found him to be the most approachable and sympathetic person on the faculty even when he was not their official advisor. He was a good listener. His faculty colleagues also found him to be understanding and responsive. We miss his insight, humor, and genuine concern for the students.

Michael L. Shuler, Julian C. Smith, Ferdinand Rodriguez

Rudolf Berthold Schlesinger

October 11, 1909 — November 10, 1996

Rudi and his wife Putti Schlesinger, as they were known to each other and to the world, died together in San Francisco on November 10, 1996 facing in each case suffering, illness, and death. But their lives with each other and among us were an affirmation of the triumph of humanity over the disaster that occurred in Germany in the 1930s. And their triumph was not one of merely surviving and enduring, but a triumph of high achievement even in the face of horrendous moral and social failure.

Rudi Schlesinger was born in Munich in 1909. His parents were comfortably well off and he had a large, extended family that owned a bank in Munich. The family enjoyed a happy bourgeois life in pre-war Germany, and like many successful families, they watched the unfolding of the Nazi nightmare with incredulity and with a hope that it stop. But eventually Rudi's mother became convinced that it would not be stopped and in a breathtaking escape at the last minute after Krystalnacht to Switzerland, the family eventually landed in New York. Putti's family, which was acquainted with Rudi's, left somewhat sooner and their brief early acquaintance was renewed and flowered in New York in the 1940s.

On his arrival in New York, Rudi, who had the equivalent of a doctorate in law, remade himself as an American lawyer, attending Columbia Law School and then clerking for the eminent Irving Lehman on the New York Court of Appeals. During this period Rudi and Putti were married.

In 1948, Rudi was interviewed by Robert Stevens, long-time Dean of the Cornell Law School and offered a job. It seemed like an unlikely match at first, the worldly Jewish Rudi and the insular upstate New York law school but it proved to be a relationship of mutual transformation. Rudi transformed the Law School into a center of international and comparative law. His meticulousness and his vivacity charmed law students and helped move the school to be a world class law school. But in so doing, Rudi did not want the school to be a factory or to ignore the beautiful Ithaca surroundings. He told the story of how he and Putti stayed up late one night considering a job offer from another eminent law school and then the sun came up, splendidly, and landed on Lake Cayuga which they could see from their home. They turned the offer down.

Rudi and Putti were both scholarly. Putti was an eminent critique of art and became, in their post-Cornell existence, the art consultant to the University of California at Hastings Law School. Rudi was a detail-a-phile collecting stories and facts and insights into law and related social phenomenon.

Rudi and Putti have three children and several grandchildren whom they loved. They had high standards for them as for everything in their life and left a legacy of parental commitment and affection. Many students were admitted to this same circle over the years and also labored for the family as gardeners, dog watchers, and child care workers.

Rudi and Putti both faced serious declines at the end, but they were active physically and mentally right up to their decision to leave us together and at peace. We are grateful to them for what they gave us and also mindful of how their escape, along with their families, must remind all of us of the enormity of the Holocaust but the triumph of humanity even over it.

John J. Barceló III, Roger Cramton, Gray Thoron, Russell K. Osgood

Oscar Menderson Schloss

June 20, 1882 — October 13, 1952

Dr. Oscar Menderson Schloss did not awaken from his sleep on the morning of October 13, 1952. This peaceful death brought to an end 70 years of an active life and 47 years of a notable career in medicine.

Oscar Schloss was born in Cincinnati, Ohio on June 20, 1882 and he graduated from the The Johns Hopkins University School of Medicine in 1905. After three years of in-resident training at the Kings County Hospital and the New York Nursery and Child's Hospital, he embarked on a three-fold professional career of research worker, medical educator, and practicing pediatrician. It would be difficult to say in which of these fields he contributed most for he was pre-eminent in all.

Except for a span of two years (1922 and 1923) during which time Dr. Schloss occupied the chair of pediatrics at Harvard Medical School, his academic activities were centered in the Cornell University Medical College (1919 to 1952), the New York Nursery and Child's Hospital (up to 1932), and The New York Hospital (1932 to 1952). He served these institutions with distinction as professor and professor emeritus of pediatrics, and as pediatrician-in-chief, attending pediatrician, and consulting pediatrician. From 1919 to 1934 he headed the pediatric service and during these fifteen years there was a resurgence in the Department of Pediatrics at The New York Hospital-Cornell Medical Center. This Department continued to gain renown under his wise leadership. When he relinquished the Headship of, but not his interest in, the Department in 1934, it was a simple matter to carry further the plans and policies which had been so successfully formulated under his direction. During the entire 33 years of his academic life, Dr. Schloss gave unsparingly of himself to students and staff alike. His skill as a teacher, his clinical acumen, and his integrity as an investigator aroused in them an admiration, respect and affection which were memorable. His colleagues sought him out for his wisdom and experience and they were always rewarded by his good and generous guidance.

This high regard and esteem were shared by his medical peers. Dr. Schloss was a member of the American Pediatric Society (president, 1932-33), the Society for Pediatric Research, The American Academy of Pediatrics, the American Society for Clinical Investigation, the Society for Experimental Biology and Medicine, the American Society for Study of Allergy, the American Society for Serology and Hematology, New York Academy of Medicine, and other scientific societies. In 1925 he gave a Harvey Lecture on "The Intestinal Absorption of Antigenic Protein" and he was elected to honorary membership in that Society. He served as an editor of the American Journal of Diseases

of Children from 1924 to 1950. These honors were accorded to him in recognition of his many fundamental contributions to medicine in the fields of infantile diarrhea and dehydration, eczema, ketosis, and others. His pioneer work on food allergy presented in 1912 initiated the beginning of a new era in this field in the United States.

In his research work, Dr. Schloss revealed the same humility and modesty, integrity and honesty, self-criticism and keen judgment as in his contacts with students and staff. His mastery of the written word is reflected in his publications as was his mastery of the spoken word in his lectures and ward rounds. The conclusions reported in his scientific papers remain as valid today as when they first appeared.

In medical practice, Dr. Schloss was equally revered by his patients. His love of children, his sympathetic understanding of parents, his rapport with referring physicians, together with his great store of basic knowledge and broad experience, were some of the attributes which made him a great practitioner and a superb consultant.

Oscar Schloss is survived by his devoted wife, Rowena Farmer, and one son, Oscar Menderson. His students, friends, colleagues, and patients share with them a great sorrow in his inestimable loss. His gentle yet forceful spirit led with a kindly and just light all who sought his wise counsel and advice.

S. Z. Levine

Nathaniel Schmidt

May 22, 1862 — June 29, 1939

Nathaniel Schmidt was born in Hudiksvall, Sweden, on May 22, 1862. In 1884, after spending two years at the University of Stockholm, he came to the United States and until 1887 he was a student at Colgate (then Madison) University. After a further year of study at the University of Berlin, he was appointed professor of Semitic Languages and Literatures at Colgate. In 1896 he was called to the chair of Semitic Languages and Literatures and of Oriental History in Cornell University and, save for two years (1904-5) when he was director of the American School of Archeology in Jerusalem, he taught continuously here until his retirement with the rank of professor emeritus in 1932. Successive generations of students who attended his classes in the Literature of the Old Testament or his survey courses on the History of Asia and of Africa have borne witness to his learning, his great gifts as a teacher, and his integrity as a man and a scholar. Throughout his life, from his first book, *An Introduction to the Hexateuch*, published in 1896, to his last, *The Coming Religion*, which appeared in 1932, Professor Schmidt by his writings contributed constantly and with unflagging power to the advancement of scholarship. Besides a number of books, of which the most important were his *Prophet of Nazareth*, which reached a second edition in 1907, and his study of the Arabian historian, Ibn Khaldun, issued in 1930, he was the author of numerous contributions to theological and oriental journals and composed some 1,500 articles in the *New International Encyclopaedia*. He served as head of the American School of Archaeology in Jerusalem, as president of the Society of Biblical Literature and Exegesis, and as trustee of the schools of Oriental Research in Jerusalem and Baghdad.

Endowed with a remarkable gift of languages and with a knowledge that was encyclopedic in its range, he was yet the most modest of men and unfailingly generous of time and counsel alike to his colleagues and to his students. He took an active and weighty part in the affairs of our academic life and of the many learned societies of which he was a valued member. To a wider public he was known for many years as a persuasive and eloquent speaker on the religious and social problems of our time and as a fearless advocate, unswayed by the pressure of vulgar opinion, of what he believed to be the truth. His many friends will deeply mourn the death of one whose life exemplified the words:

“Happy is the man that findeth wisdom, and the man that getteth understanding. For the merchandise of it is better than the merchandise of silver, and the gain thereof than fine gold.”

Thomas John Schoch

May 31, 1907 — December 12, 1970

Although his period of tenure as professor of human nutrition and food at Cornell University was brief (June 1968-December 1969), Thomas J. Schoch's influence on teaching and research programs in the University covered a more extended period. His extensive publications in the scientific literature, principally basic research in starch chemistry, had contributed richly to the instructional program in the Department of Human Nutrition and Food for several decades. Discussions with members of the Faculty and graduate students, while he served as research chemist and group leader for the Corn Products Company, encouraged the research interests of several in this field.

Professor Schoch, a native of Ontonagon, Michigan, received his primary and secondary education in New York schools, and at Columbia University he was awarded the degrees of Bachelor of Arts in 1928, Master of Arts in 1929, and Doctor of Philosophy in 1933. Here the foundation was established for a long and distinguished career as a research chemist concerned with the properties of starches, exotic as well as common types.

From 1934 to 1936 he was chief chemist for B. P. Ducas Company of Jersey City, New Jersey, a manufacturer of modified starches and other products. From 1937 until joining the University Faculty on June 1, 1968, he was associated with the Corn Products Company at Edgewater, New Jersey, and later at Argo, Illinois.

Dr. Schoch's scientific career resulted in major discoveries which gave him a position of eminence among carbohydrate chemists. His development of the classical method for separating linear from branched starch molecules was one of the great achievements in starch chemistry. Adopted in carbohydrate laboratories throughout the world, this provided impetus not only to fundamental starch research but also to the entire field of theoretical high-polymer chemistry. He contributed to the substantial progress that has been made toward an understanding of the molecular architecture of the starch granule and the physical phenomenon of starch gelatinization, an area offering marked potential for useful fundamental research and industrial applications. His investigations of the reactions of polar lipids with starch have contributed to an understanding of the role of fatty materials in starchy foods and of fatty "plasticizers" in paper and textile sizing. Studies of the associative reactions of the branched starch fractions provided some explanation for the role of starch in bread staling and in certain changes that occur in starch products during cold storage or freezing.

He was the author or coauthor of more than sixty papers and articles in scientific and technical journals, had contributed chapters and sections to twelve books, and held eight patents.

In collaboration with Dr. R. P. Walton of South Carolina Medical School, Dr. Schoch developed an acid-thinned hydroxyethyl derivative of waxy starch as a synthetic blood-plasma extender to avoid the instability and hemorrhagic side effects of dextran.

Among the awards he received were the Saare Medal of the German Federal Institute for Cereal Research, Detmold, Germany, in 1959; the Thomas Burr Osborne Medal, highest award of the American Association of Cereal Chemists, in 1964; and the Medal of Merit and Honorary Life Membership, Society of Starch Technology, Tokyo, Japan, in 1965. At the time of his death he was a candidate for the highest elective office of the American Association of Cereal Chemists. He had served on the board of directors of the Association and on the editorial board of its official publication, *Cereal Chemistry*.

His accomplishments and influence are a reflection of Tom Schoch's personal philosophy of research. He "felt that the field of starch chemistry is sufficiently large and varied to share it freely with others and that there is no necessity for selfish withholding of ideas, techniques, and assistance." He was "convinced that almost all phases of fundamental starch research will eventually have some practical value" and regretted that often there is a "long span of years between fundamental discoveries and practical utilization." He wrote, "I have tried to develop a mid-ground which can draw on fundamental science to aid the practical, and in reverse can derive inspiration for fundamental research from the everyday practical new and totally different areas of utility can only be uncovered by long and intensive fundamental research."

Professor Schoch's capacity for new and creative ideas and his breadth of interests, enthusiasm, and ability to express himself with clarity and vigor were important factors in his many accomplishments. His colleagues remember him as a stimulating, versatile, and genial associate.

At Cornell, Professor Schoch was engaged primarily in research, but he also taught a graduate course and seminar and directed the programs of graduate students.

He is survived by his wife, Lydia, and three daughters, Nancy, Karen, and Deborah.

Catherine J. Personius, E. Elizabeth Hester

Ernest W. Schoder

August 17, 1879 — May 16, 1968

Ernest Schoder was born in the state of Washington and attended primary and secondary schools in Seattle. He received both the B.S. and the B.S. in Mining degrees from the University of Washington in 1900.

After two years with the United States Geological Survey in California, Schoder came to Cornell in 1902 as a graduate assistant in the recently built (1899) Hydraulics Laboratory; he immediately became active in the ongoing pipe flow studies to which he later devoted a major part of his energies during the next forty-five years. He received the Ph.D. from Cornell University in 1903; his published dissertation still stands as a landmark in hydraulic experimentation. The next year, at the age of twenty-five, Dr. Schoder was named engineer-in-charge of the Hydraulics Laboratory, succeeding Professor Gardner S. Williams, who had directed his doctoral study. Dr. Schoder became an Assistant Professor of Experimental Hydraulics in 1905, Professor of Experimental Hydraulics in 1919, and was named Professor Emeritus in July 1947.

Professor Schoder's total commitment to hydraulic research and consulting brought such renown to himself and to Cornell that it could be said that the majority of the leading American hydraulicians of the first quarter of this century either were educated, or participated in tests conducted, at Cornell."

Professor Schoder pioneered in recognizing the need for precise measurement and experimentation under conditions not to be expected in the field, long since a universally accepted premise of engineering research. Prior to Schoder's taking charge of the Cornell Hydraulics Laboratory, it, like other similar laboratories, had been devoted almost solely to commercial testing. Schoder immediately saw the need for distinguishing between commercial testing and experimental research and changed the laboratory function accordingly.

By the start of the twentieth century, leadership in hydraulics had largely passed to the German scientists and engineers. Ernest Schoder contributed significantly to bringing leadership in experimental hydraulics to the United States. In 1902-03, Schoder, working with another doctoral candidate, Saph, made the precise measurements on frictional resistance to the flow of water in pipes that served as experimental verification of the still-accepted exponential relationship between velocity and head loss. This study became a classic in hydraulic experimentation and was the first experimental recognition of the effect of velocity distribution in a closed conduit on apparent head loss. These measurements were used by Blasius to show that for turbulent flow with smooth boundaries, the friction coefficient 'f' varied inversely as the 0.25 power of the Reynolds number. This use of the Saph-Schoder

results was the first use of American experimental data in Europe, reversing the long-established direction of flow of this information.

Schoder, with a single-minded dedication to experimental hydraulics that brooked no competing personal interests, devoted himself to research, consulting, publishing, and teaching until his retirement. His painstaking measurements of friction losses over weirs, in curved pipes, and in pipe fittings were widely published and accepted. A textbook *Hydraulics* by Schoder & Dawson, published in 1927 and revised in 1934, was a widely used text that continues as a commonly quoted reference. Professor Schoder was the author of the “Hydraulics” section in the 1916, 1924, and 1930 editions of *Marks Hydraulic Engineers Handbook*.

Schoder’s consulting services were widely sought after by industry and by public agencies, and they included field and laboratory tests, calibrations of flow-measuring devices, and model studies.

Professor Schoder’s teaching reflected his conviction that laboratory experimentation was an essential part of both undergraduate and graduate instruction. He believed that experimental thesis research taught the student independence in thinking and in action. He felt also that the experience of laboratory experimentation requiring great accuracy as well as rigorous analysis and interpretation was a disciplining exercise necessary to the development of a good engineer. Students found Professor Schoder one of those rare individuals whose primary goal was the development of his students. His dedication to his field was infectious; his intellectual honesty was pervasive.

His colleagues and friends remember Ernest Schoder as a fundamentally shy, yet genial person whose manner and individualism evoked positive reactions in those who knew and worked with him. Students and colleagues alike recall the many campus stories and episodes in which Professor Schoder, the perennial bachelor professor, was the central figure.

Solomon C. Hollister, John E. Perry, Charles D. Gates

Wilbur Theodore Schroeder

January 28, 1911 — February 24, 1972

Wilbur Theodore Schroeder was born in 1911 at Des Plaines, Illinois, the son of a successful farmer and ornamented nurseryman. He early became familiar with agriculture in its practical aspects and appreciated these throughout his life. After completing his secondary education at Des Plaines, he entered the University of Idaho with a major in agronomy. He graduated with honors in 1937 and was awarded the M.S. degree in 1938. He then turned to plant pathology and continued his graduate studies at the University of Wisconsin, which awarded him the Ph.D. degree in 1941.

After a brief association with a commercial vegetable-processing company, where he served as field pathologist, he returned to academic research, first at the University of Wisconsin and then at the Geneva campus of Cornell University. He was appointed assistant professor of plant pathology at the New York State Agricultural Experiment Station in 1943, associate professor in 1948, and professor in 1951. This rapid promotion was in recognition of his outstanding abilities in research.

His successful career in research with a wide spectrum of vegetable diseases and their control resulted from a unique combination of dedication, thoroughness, persistence, and practicality. He believed that research should ideally lead to the development of practicable and economic control of diseases and that even fundamental studies of disease organisms and their epidemiology should be conducted with this end in view. His major interest was to identify and select genetic resistance to diseases, and this research led directly to the development of varieties of spinach, peas, beans, and tomatoes resistant to several important diseases. His versatility also enabled him to make significant contributions in fungicidal seed treatments, physiogenic diseases, concentrate fungicides, and the effects of environment on disease epidemiology and severity. His results, published in 112 technical articles and in innumerable popular presentations, led to recommendations for vegetable disease control that were widely adopted in New York and elsewhere.

Among his colleagues and acquaintances, Professor Schroeder quickly established a lasting impression of integrity and industry. He was forthright and outspoken about his convictions but tolerant of the opinions of others, even when not in agreement.

His major hobby was landscaping. The grounds of his country home were maintained immaculately, filled with flowers and a tree and shrub collection worthy of envy by many arboreta. He was justly proud of this collection and

delighted in discussing it with visitors. He was an active member of the First Lutheran Church of Lyons and had served as a member of its council. He was a member of Alpha Zeta, Sigma Xi, and the American Phytopathological Society.

Professor Schroeder is survived by his wife of thirty-three years, Charmion Childs Schroeder, a son, and two daughters.

Alvin J. Braun, Michael Szkolnik, Robert M. Gilmer

Andrew S. Schultz, Jr.

August 14, 1913 — March 13, 1998

Andrew Schultz, the Spencer T. Olin Professor of Engineering, Emeritus, died on March 13, 1998 at his home in Ponte Vedra, Florida. He was 86. He is survived by his wife, Mary; his children, Susan and Andrew III (Toby); and by hundreds of Cornell Engineering alumni for whom Andy made a tremendous difference.

Andy was the ultimate Cornellian. There cannot be many individuals who have experienced Cornell as completely as he did. He entered as a freshman, stayed for graduate work, progressed through each faculty rank, served as department chairman, and served as the Joseph Silbert Dean of the College of Engineering during a critical period of change for the college. Nor are there many that can match the impact Andy had upon his college, his university, and his students. Andy had a unique combination of the vision to foresee trends and needs, and the ability to lead his colleagues and his students in promising directions.

Andy was one of the founders of the academic discipline of Operations Research. His experience at the War Production Board during World War II led him to foresee the need for quantitative analysis in logistics. He returned to the Cornell faculty and began a campaign that led to the separation of industrial engineering from mechanical engineering and the development of a world-renown Department of Industrial Engineering and Operations Research. Andy's doctoral students during this era became the missionaries and pioneers of this new discipline around the country, and many have been recognized by election to the National Academy of Engineering. Few of these had planned on an academic career before they ran into Andy.

Perhaps even more important for Cornell was his leadership in the explosive field of computer science. Andy was a member of the committee that brought the first computer to Cornell in 1953. He was instrumental in creating the first course in computing at Cornell in 1956. In 1964, as Dean of Engineering, he sponsored the creation of one of the first university departments of computer science. Cornell's inter-college Department of Computer Science became one of the best in the world. Andy was also a leader in creating the Department of Materials Science and Engineering, which became a stellar department in that vital field. He also played a significant role in moving the Department of Geology into the College of Engineering and expanding its scope. In addition to his contributions to his department and his college, he was very active in University Faculty committees and professional societies.

For a man whose career was spent in academia, Andy had an uncanny appreciation of the problems and opportunities of the "real world". He somehow imparted to generations of students some fraction of his unique

ability to identify the critical problem in a noisy, complex system. This has helped them become remarkably successful in many different fields. On his retirement, they expressed their gratitude by endowing a professorship in his name. Fittingly, the first appointment to the Schultz Chair was one of Andy's own students.

Richard W. Conway, Dale R. Corson, William L. Maxwell

Otto Ernst Schultz

February 1, 1931 — May 30, 1978

Otto Ernst Schultz, professor of plant pathology, died on Tuesday, May 30, 1978, in Tompkins County Hospital. He was one of the outstanding extension specialists of his generation. A native of Pietermaritzburg, South Africa, he graduated cum laude from the University of Natal in 1954 with a Bachelor of Science degree in agriculture (agronomy). He served in his native country from 1949 to 1957, first as a technical assistant in the Division of Soil Conservation and Extension in the South African Department of Agriculture, next as a technical assistant in the College of Agriculture, Cedera, Natal, and then as assistant professional officer in agronomy at the University of Natal.

Otto came to the United States in 1957 to undertake graduate work in plant pathology at Pennsylvania State University. He was awarded the Doctor of Philosophy degree in 1961 for his studies on “Inter- and Intra-race Variation among Mass- and Mono-spore Isolates of *Phytophthora infestans* (Mont.) de Bary.” He became a citizen of the United States in 1967.

In 1962 he accepted a position as assistant professor of plant pathology at Cornell University and was placed in charge of extension activities related to diseases of potatoes and field and forage crops. He also conducted applied research on the control of diseases affecting these crops. He was promoted to associate professor in 1967 and to professor in 1975.

He spent 1969-71 as a visiting professor at the University of the Philippines, through the University of the Philippines-Cornell Graduate Education Program at Los Banos. During this period he contributed to the development of procedures for the control of the downy mildew disease of corn. In 1976 he was invited by U.S. Agency for International Development to return to the Philippines as a consultant for the establishment of the Pest Control Center for the Philippines. He frequently participated in international conferences. His advice was often sought by national and international bodies concerned with extending and adapting new technologies to agricultural practice. He was an active member of the American Phytopathological Society, the Potato Association of America, and the Potato Chip/Snack Food Association and contributed significantly to committee activities of these professional organizations. He was a member of Phi Kappa Phi and Sigma Xi.

Professor Schultz’s duties brought him into frequent contact with county agents, farmers, agribusiness personnel, and research and extension personnel throughout New York, the nation, and the world. His sincerity, warmth,

enthusiasm, and zest for living coupled with a thorough knowledge of his subject made him an exceptionally popular and effective leader in promoting the latest developments in the technology of production agriculture. He served as an able chairman of the Interdepartmental Field Crops Committee of the College of Agriculture and Life Sciences from 1974 until his death. He was an avid believer in and supporter of cooperative extension. He worked constantly to improve the subject matter competence of county and regional extension staff. It bothered him greatly when county or regional agents resigned their positions for jobs in industry.

Otto loved field and farm visits and winter meetings where he had direct contact with farm people who sought his counsel and valued his friendship. He had many friends among his contacts, including students, peers, technicians, janitors, farmers, agribusiness personnel, stenographers, and mechanics. His love for people, wit, and genuineness made him an exceptional communicator. His positive influences upon people, the agricultural industries, and the Department of Plant Pathology will be remembered and appreciated far into the future.

He is survived by his wife, Patricia, a son, William, and a daughter, Heidi, all of Ithaca; and his mother, Erika Schultz, a sister, Irene Hampson, and a niece and four nephews, all in South Africa.

Edward D. Jones, Arden F. Sherf, Durward F. Bateman

Jacob Gould Schurman

May 22, 1854 — August 12, 1942

The third president of Cornell University died in New York City last August in the eighty-ninth year of his age. Nearly three centuries earlier his Schurman ancestor had migrated from Holland, probably by way of France, to New Rochelle. Following the Revolution, Jacob's great-grandfather, William Schurman, a loyalist, removed to Prince Edward Island and there Jacob was born. After twelve years on a farm, two in a store, and one in a high school, he secured through a Canadian government scholarship two years at college and at the end gained a higher award, in a competition open to all Canadians under twenty-one years of age, which gave him three years of study in Great Britain. There he crowned his student career by winning, over a swarm of competitors, a Hibbert Travelling Fellowship open to any graduate of a British university. Thus he rounded out his preparation by two years of study on the continent before he returned at the age of twenty-six to Canada. The springs from which he drank deepest are identified by his dedication of an early book to James Martineau, "the ethical and religious helper of two generations," and by his tributes, one soon after his return, to Eduard Zeller as "the foremost thinker of modern Europe," and another, half a century later, to Kuno Fischer as "the most logical, the most lucid, and the most brilliant expositor I ever listened to, and the greatest of university orators."

Schurman's work after his apprentice years lay in three fields; as scholar and teacher, as educational leader and administrator, and as statesman and diplomat.

As teacher he excelled in the critical and sympathetic exposition of the work of others. One may apply to him his own characterization of Kuno Fischer, whose mind he said "was not of the creative order in the highest sense of that term, but his power of sympathetic understanding and appreciation and his gift of reproduction were marvelous. He was the expounder of other men's systems." This judgment is confirmed by the title of what Schurman doubtless planned to make his *magnum opus*, an *Examination of Kant's Critical Philosophy*, announced as late as 1896 but destined never to see the light.

The position he would have taken in that book, at least about ethics, was foreshadowed in his first publication, *Kantian Ethics and the Ethics of Evolution*, which was an outgrowth of his European studies. His conclusion was that neither the hedonistic system of Spencer nor "the empty abstraction formulated by Kant" could explain "the concrete facts of the moral world," but that "between them both lies the idea of humanity as foundation for morality."

On his return to Canada, Schurman taught for six years at Acadia and Dalhousie colleges and was then called to Cornell University to fill the chair of philosophy and Christian ethics which had just been endowed by Henry W. Sage, the wealthy and imperious chairman of the Board of Trustees. Sage and Schurman became friends as close as the difference of forty years in their ages and the wide diversity of their backgrounds would permit. From the start Schurman achieved such outstanding success as teacher and lecturer that four years after his appointment his patron endowed a School of Philosophy as a memorial to his wife, Susan Linn Sage, with Schurman as dean. When President Adams retired two years later Sage saw to it that his protege was selected as Adams' successor, a judgment which the ensuing twenty-eight years was amply to justify.

Schurman came to the presidency of Cornell University with an intimate knowledge of the institution, gathered during his six years as a member of its faculty, and was ready at once to take the helm. In several respects his career resembled that of the first president. Like White, he came to the office in his thirties and with the energy and confidence of youth and had a long term of service. Like White, he had at his elbow as co-worker and intimate friend an older man of wide business experience who was as devoted as himself to the University and a tower of strength in all matters financial. Like White, he was widely familiar with the institutions of higher learning at home and abroad. Like White, he interrupted his academic duties from time to time to undertake diplomatic service abroad. Over White however he had one enormous advantage: uninterrupted and abounding health.

With these qualifications Schurman in his inaugural address came out boldly for a radical change of university policy. He proposed to gear Cornell, as most beneficiaries of the Morrill Land Grant Act in other states were already geared, into the State system of higher education. Many in and out of the university were strongly against this proposal, but Sage, with the wisdom and tolerance of his years, urged: "Let the young man have his head," and Sage's word was law. Looking back over the intervening half-century one may doubt whether any other course would have brought as much gain to Cornell or to the State and Nation. The annual income of the university has increased since 1892 by more than ten million dollars including contributions from the State, which have risen from nothing to more than three millions. Three-eighths of Cornell's income now comes from State and Federal appropriations.

The success of a university president is gauged largely by the caliber of the men added to the faculty during his term of office and the ease with which they are able to work in their own fields or to collaborate among themselves without interference from the administration. It may be too early to apply the first of these tests, but undoubtedly in few American universities has the academic atmosphere been as free from strife and bitterness as it was at Cornell

during the Schurman administration. This fact is the more to his credit because it was mainly his creation rather than his inheritance. While professor he exemplified, and while president he exalted, vital teaching and productive scholarship as the essentials to which all the machinery of administration, including that of the president's office, should be subordinated. He insisted that the faculty's control over educational problems in peace and war should not be impaired by trustees or president, or by inflamed public or alumni opinion. He was tolerant of opposition and was unwilling that in vital matters a small majority of the faculty or trustees should have their way, preferring always to bide his time until substantial unanimity had been reached. Over considerable opposition from both sides, which he shrewdly conciliated, he secured the inclusion of elected representatives of the faculty among the Board of Trustees and thus increased the influence of teachers in all university matters.

His work as a diplomat was less important to Cornell. After seven years in the presidency he accepted an appointment as president of the first Philippine Commission, and for the rest of his life he maintained a warm interest in the people of those islands. This interest is revealed in a small book, *Philippine Affairs, a Retrospect and Outlook*, which appeared two years after his return to Cornell.

A dozen years later Schurman reentered the diplomatic field when he became American minister to Greece and Montenegro. This excursion also resulted in a small book, *The Balkan Wars, 1912-13*, which appeared just as the dragon's teeth sown at Sarajevo sprang up into a greater war. The First World War led him to abandon his plan of retiring from the presidency after twenty-five years, as White had done after twenty, but three years later he did so. His country then again urged its claims and sent him for four years as minister to China, and for a slightly longer term, 1925-30, as ambassador to Germany. During his residence in Berlin, in addition to other services in the line of duty, he obtained from American contributors more than half a million dollars with which to build an auditorium much needed by his German alma mater, the University of Heidelberg. The gift was made "in recognition of high and helpful service to American students for over a century."

Throughout his career he was aided more than the public ever knew by his wife, Barbara Munro Schurman. As he was, during the later years of his presidency, the most admired man in Ithaca, so his wife was the best loved woman. They had seven children of whom five are living.

Herbert Henry Schwardt

March 14, 1903 — May 14, 1962

Herbert Henry Schwardt, Professor of Entomology and head of the Department of Entomology, died suddenly May 14, 1962. His untimely death was a tremendous shock and a sad loss to family, friends, and associates.

Professor Schwardt was a native of Kansas and received the B.S., M.S., and Ph.D. degrees from Kansas State University. Early in his college career, which was leaning toward chemistry as a major field of interest, he had an opportunity to work on the problem of pests that attack stored wheat. That proved to be a turning point in his professional career. He changed his major field to entomology and zoology, with a background in chemistry to support it.

After completing the work for his Master's degree, he joined the Bureau of Entomology and Plant Quarantine of the U.S. Department of Agriculture to work on control of deciduous-fruit insects in northwest Arkansas. Shortly thereafter he was appointed to the faculty of the University of Arkansas as an assistant entomologist. His pioneering work on the biology, ecology, and control of blood-sucking flies—particularly those that attack farm livestock—received national and international recognition. Further, his original research on pests of ricelands, including the rice water weevil, storage pests of rice, and mosquitoes and gnats that breed in the inundated fields, provided the basis for control of many of these insects.

In 1938, Cornell University invited Dr. Schwardt to join its faculty in the Department of Entomology and Limnology. In 1957 he was appointed head of the department. Professor Schwardt was a stimulating teacher, and many of his students went on to graduate study and to positions of professional responsibility. His interest in his students was by no means confined to their academic needs—many times his keen sense of personal balance steadied and guided a graduate student who was shaken by grief or disappointment.

Professor Schwardt had a boundless enthusiasm for his work and a fund of patience and humor that endeared him to everyone. At Cornell he served in many capacities: first, he worked on the control of insect pests of forage crops, then on control of pests of stored products, and finally on control of livestock insects. His genuine interest in the welfare of farm people and in the industries that provide the goods and services for modern pest control brought him into contact with people in all walks of life. Probably no group in the entomological profession loved “Herb” more than his many friends in industry. He worked with them on a wide array of problems and was always ready to help with the issues that constantly arise in the rapidly expanding field of pesticides. Because of his ability and

prominence he was sought by all levels of government and industry for advice and assistance. This invaluable leadership tied college and industrial personnel into a working team for the benefit of producers everywhere. In the year before his death Professor Schwardt participated in a policy planning conference in Rome sponsored by the Food and Agriculture Organization of the United Nations. Here international policies for pesticide application and use were established.

Professor Schwardt's publications were extensive and covered a range of interests from fundamental insect biology to policy development in a wide scale of pesticide-application problems. His membership in professional societies included Sigma Xi, Gamma Sigma Delta, Phi Mu Alpha, Phi Zeta, the American Association of Economic Entomologists, and the Entomological Society of America. He served often on committees in the latter two organizations. Many university committees received his support and counsel, and the changing problems in academic development, his thoughtful attention.

His wife, Bernice Hedge Schwardt, his two children, and six grandchildren were a source of continuous pride and joy to Professor Schwardt. A capable photographer for many years, he attained professional competence in this art in recent years, with his grandchildren as the stimulus.

In the passing of Herbert Henry Schwardt the university has lost a distinguished professor and educational leader; his friends and associates, a man they can never replace. Yet in knowing and working with him, our lives are immeasurably richer, and his memory will ever be a part of us.

R. F. Holland, G. C. Kent, C. E. Palm

Hans J. Schwartz

1876 — February 15, 1956

Dr. Schwartz, Consultant in Dermatology and sound and generous contributor to our fund of medical and scientific knowledge, died on February 15, 1956, at the age of seventy-nine. Dr. Schwartz was born in Quebec and was graduated in medicine from McGill University. He came to New York at the turn of the century, and he was Professor of Dermatology at Cornell Medical College from 1920 to 1941 when he became Professor Emeritus. His association with The New York Hospital started in 1924; he was attending physician from 1932 to 1941. He also served at Memorial Hospital for Cancer and Allied Diseases, the New York Eye and Ear Infirmary, Booth Memorial and Post Graduate Hospitals.

His opinion was greatly valued professionally, and he was a kindly physician, a helpful teacher who many students at Cornell and former interns at the hospitals he served remember with affection and gratitude.

D. P. Barr

Herbert Henry Scofield

October 5, 1880 — October 6, 1975

Herbert H. Scofield, professor emeritus of civil engineering at Cornell University, was born at Bemus Point, New York, on October 5, 1880, the son of George and Sarah Brown Scofield. He was married in 1907 to Kathryn Margaret Pease.

The young Herbert Scofield attended public school in Bemus Point and preparatory school at the New York State Normal School, Fredonia, New York, from which he graduated in 1901. He received the degree of Mechanical Engineer from Cornell University in 1905.

In 1905, he became an instructor at Purdue University, advancing to assistant professor in 1912 and remaining there until he became an inspection engineer with the Curtis Wright Aeroplane Company of Buffalo in 1918. In 1919, he came to Cornell University as assistant professor of civil engineering, becoming professor of civil engineering in 1924, remaining here until his retirement in 1948.

In other professional activities, he worked for brief periods as a testing engineer for the American Locomotive Company at Pittsburgh and for the Society for Automotive Engineers. He consulted for the New York State Court of Claims and for the New York Telephone Company in connection with its building program. He was engaged actively in work involving Hoover (then Boulder) Dam and Mt. Morris Dam. He was a registered professional engineer in the State of New York.

Professor Scofield was engaged in various research activities and published numerous technical papers, primarily in the field of concrete. He was a coauthor, with W. K. Hatt, of a book, *Laboratory Manual for Testing Materials*.

He was a member of the American Concrete Institute, the American Society for Testing and Materials, the Committee on Materials of the Highway Research Board, the American Association for the Advancement of Science, Sigma Xi, Phi Kappa Phi, Chi Epsilon, Pyramid, Triangle, and an honorary faculty member of the Tau Beta Pi.

Professor Scofield was recognized as an effective and dedicated teacher and was respected, or even at times a bit feared, by his students. He demanded high quality work and gave assignments calculated to force extensive effort. He was regarded as tough but fair. His returning former students would pay him the tribute of especially seeking

him out to chat about their practical, professional experiences and to recall how Professor Scofield's teaching had been of great value to them.

Herbert Scofield was a sports enthusiast and occasionally officiated at track and field events. As hobbies, he enjoyed fishing, golf, trailer travel, and mountain climbing. He was a member and past master of Lodge 123, Free and Accepted Masons, Lafayette, Indiana.

Professor Scofield is survived by two sons, Herbert T. Scofield and Robert L. Scofield; by two daughters, Mrs. Elizabeth K. S. Nielson and Mrs. Dorothy A. S. Simms; and by a brother, G. Glenn Scofield.

Solomon C. Hollister, George Winter, Floyd O. Slate

Bernice Margaret Scott

August 21, 1919 — March 26, 1985

Professor Scott was a native of Steubenville, Jefferson County, Ohio.

Upon graduation from Wintersville High School in 1936, she entered Capital University, in Columbus, Ohio, earning a Bachelor of Science degree in music in 1941. From 1942 to 1944 she taught music in the public schools of eastern Ohio. In 1945 she became the public relations director for the Jefferson County Farm Bureau and in 1948 joined the Agricultural Extension Service of West Virginia. The following year she accepted the position of extension specialist in recreation leadership and leisure education at Cornell. Scotty's recognized competence in music and her ability to work with youth were important considerations in her initial appointment as an instructor in 1949. In 1951, when extension specialists were placed in academic departments, Scotty was invited to join the Department of Rural Sociology. She was appointed assistant professor in 1954 and associate professor in 1961.

Scotty's educational philosophy is summarized in one sentence, taken from her vast writings of teaching materials: "Through leisure education an individual becomes capable of choosing those activities which contribute to the achievement of purposes, the satisfaction of needs, and enhancement of the quality of life." Scotty inspired thousands of youth leaders across New York State when they attended her classes and workshops in social recreation, crafts, performing arts, camping and outdoor education, and cultural heritage and the 4-H Leadership Laboratory, which she established in 1965.

The pinnacle of her achievements came perhaps in recent years, when she launched a cultural heritage program based on history, folklife, and folklore of New York State. The educational emphasis was on personal development through greater knowledge and understanding of one's own heritage, one's community, or one's region of the state. The program was financed in part by the New York State Council on the Arts.

For many years Scotty helped organize and conduct management conferences for leaders of various youth agencies responsible for developing educational programs and implementing operational standards for camping. It has been said that through her educational programs for youth she developed more contacts with New York State residents than any other extension specialist. Her publications on recreation leadership and leisure education often had press runs of ten to twenty thousand.

In 1978 the New York State Association of Cooperative Extension 4-H Agents honored Scotty with the Award of Merit for leadership at state and national levels in camping, youth leadership development, and innovative approaches to the expressive arts. Again, in 1983, the same organization honored her by including her programs among those eligible for support from the New York State 4-H Foundation Leadership Development Fund. This is an ongoing fund to provide financial support for excellence in youth leadership programs.

Throughout a career extending over three decades Scotty kept abreast of innovations in her field through advanced study. In 1954 she received an M.A. degree from Columbia University Teachers College. She also studied at the University of Pittsburgh, the University of Maryland, the University of Illinois, and the Scandinavian Seminar for Cultural Studies in Sweden.

Scotty also served the University community through membership on the Faculty Council of Representatives and the Physical Education Committee. She was a member of the Agricultural Extension Faculty Committee. Her organizational affiliations included the National 4-H Extension Leisure Education Committee, the National Recreation and Park Association, the New York State Recreation Society, the New York State Camping Association, and the American Camping Association. The American Camping Association presented her with a leadership award in 1985.

Scotty retired May 1, 1984, from the Department of Rural Sociology with the title of professor emerita. At a retirement party she learned of the establishment of the Bernice Scott Fund, to which hundreds of her friends and colleagues have contributed as an expression of support for her philosophy and work with youth. She was also honored on that occasion by the College of Agriculture and Life Sciences; one of the young trees on the upper quadrangle of the campus bears her name as a symbol of the high esteem in which she will long be held.

Bernice M. Scott is buried back home in Steubenville, Ohio, at Fort Steuben Burial Estates. She is survived by two sisters and one brother: Mary Scott Riddle, of Mt. Sterling, Ohio; Emma Scott Christian, of Columbus, Ohio; and John E. Scott, of Kokomo, Indiana.

A remembrance service was conducted June 27, 1985, at the Anabel Taylor Chapel on campus. This coincided with the annual New York State 4-H Congress. In years past on such occasions, Scotty could be found either onstage in Bailey Hall, coaxing the last notes of musical talent from one thousand assembled 4-H'ers, or backstage, watching teenage music leaders conducting their own songfest.

Olaf F. Larson, James C. Preston, Gordon J. Cummings

Milton L. Scott

February 21, 1915 — July 11, 2001

Milton Leonard Scott, Jacob Gould Schurman Professor of Nutrition, Emeritus, was born in Tempe, Arizona. He attended secondary schools in Tacoma, Washington; Glendale, Arizona; Colton, California; and graduated from Riverside Polytechnic High School in Riverside, California in 1932. After graduation from Riverside Junior College in 1934, he completed an additional year of postgraduate study and was admitted to the University of California at Berkeley where he received a B.A. degree in 1937. His first job was as a vitamin chemist with Cooperative Grange League Federation (GLF) Mills in Buffalo, New York where he met and married his wife, Dorothy Marie Jaeger. After five years at GLF, he was admitted to the graduate program at Cornell University where he earned a Ph.D. degree in Animal Nutrition in 1945. Dr. Scott became a Research Associate in the Department of Poultry Science at Cornell University in 1945. He was appointed Assistant Professor in 1946 and quickly rose through the ranks to full Professor in 1953. He served as Chairman of the Department of Poultry Science from 1976 until his retirement in 1979.

Milt Scott began his professional career during an exciting period of discovery of nutrients and their functions. It also was a time of rapid developments in the science and technology of poultry production. Much of his early research was directed to identifying constituents of natural ingredients that had growth promoting activity for poultry. He identified an antihemorrhagic factor in brewers yeast, investigated folic acid needs and folic acid availability for poultry. He developed a fluorometric assay for riboflavin, demonstrated the essentiality of niacin for prevention of enlarged hock in turkeys and bowed legs in ducks, demonstrated the importance of physical form of dietary calcium as a factor in the strength of the eggshell in laying hens. He investigated the need for vitamins A, D and K and a host of other nutrients for growth and reproduction of poultry. Milt was one of the investigators to discover the nutritional essentiality of selenium. Collaborating with Klaus Schwartz, J.G. Bieri, and G.M. Briggs at NIH, he demonstrated that selenium was the previously unidentified factor in brewer's yeast that prevented the pathology known as exudative diathesis in chick. This research followed within months the demonstration by Schwartz and C.M. Foltz that selenium prevented liver necrosis in rats. Milt and his students went on to identify important interrelationships between vitamin E and selenium in the prevention of exudative diathesis and muscular dystrophy in poultry, and to carry out research that eventually contributed to approval by the Food and Drug Administration for addition of selenium to poultry feeds. In 1980, Milt was awarded the Klaus Schwartz Memorial Medal in recognition of his research on the nutritional essentiality of selenium.

Milt Scott had a keen interest in solving practical problems of poultry and developing nutritional approaches to increasing the productivity of poultry. His interests included a broad spectrum of poultry, including chickens, turkeys, ducks, pheasants, partridge, and quail and extended to other species such as rats and pigs as well. Not surprisingly, his research publications and technical articles have touched in one way or another on the entire gamut of nutrients. Milt also was among the first to advise the feeds industry in the formulation of feeds for use in aquaculture. Indeed, he was involved in research and the training of graduate students in the nutrition of fishes and lobsters. Milt's extensive research experience, his application of the scientific principles to the solution of nutritional problems and his knowledge of the practical aspects of feed formulation and poultry production resulted in great demand for his nutritional expertise. He was, beyond doubt, the most well-known and respected poultry nutritionist in the world.

Milt Scott was an enthusiastic teacher. He taught several courses at Cornell, including "Use of the Chick as an Experimental Animal, Vitamins and Essential Inorganic Elements in Nutrition, and Advanced Nutrition: The Vitamins". Milt was author of four books on nutrition and contributed chapters for eleven other books. He was a prolific publisher in both the scientific literature and the trade press. His laboratory provided a stimulating atmosphere for graduate students due to his innovative ideas and enthusiasm for research. He was the committee chair of more than 50 Ph.D. and M.S. degree students.

Milt Scott was a member of several scientific and professional societies, including the American Institute of Nutrition, American Society of Animal Science, Poultry Science Association, American Society of Biological Chemists, American Chemical Society, Society for Experimental Biology and Medicine, American Association for the Advancement of Science, Phi Kappa Phi, and Sigma Xi.

During the period from 1952-81, Milt Scott received ten awards for his research. These included the American Feed Manufacturer's Award, National Turkey Federation Research Award, Distillers Feed Research Council Award, New York Farmer's Award for Scientific Contributions to Applied Animal Nutrition, Borden Award of the Poultry Science Association, the Klaus Schwartz Commemorative Medal, and the prestigious Borden Award of the American Institute of Nutrition. In recognition of his achievements, Milt was awarded a Jacob Gould Schurman Professorship in 1976.

Milt is survived by his wife, Dorothy of Ithaca, New York; two daughters and one son-in-law, Grace (Noni) and James Saroka of Greene, New York, and June Scott Kopald of Richmond, Virginia; seven grandchildren; eight great-grandchildren; and a sister and brother-in-law, Clara and Ben Bergstrom of Miami, Florida.

Malden C. Nesheim, Robert J. Young, Richard E. Austic

Ruth J. Scott

July 23, 1893 — May 1, 1972

Ruth J. Scott came to Cornell University to serve as a clothing specialist in home economics in 1922, following graduation from Teachers College, Columbia University. The next year she became an instructor in the resident program of the School of Home Economics that was then within the College of Agriculture. Soon after Home Economics was organized as a separate college with departments, Miss Scott was promoted to assistant professor in the Department of Textiles and Clothing. She was later promoted to associate professor. On July 1, 1953, she retired after thirty-one years of service to the College and the University and was named professor of textiles and clothing, emeritus, leaving a legacy of creative and organizational skills that her colleagues appreciated with increasing awareness as time went on.

Ruth Scott will be remembered most for her special talents that contributed to the making of a strong Department of Textiles and Clothing. Her creative ability in apparel design was a motivating force for many students working to further their personal and professional development. Her exceptional understanding of the creative process, coupled with her teaching ability, resulted in experiences for her students that were in advance of traditional educational programs.

To enrich her own professional background she followed the recommended program of study esteemed by the educational leaders of the day. She studied art, specializing in fashion design in various art schools including The Academie de Coupe de Paris, and she did graduate work at Columbia University.

Professor Scott was one of the first in the department to successfully engage in an interdisciplinary approach to problem solving. She and Professor Marie Fowler, head of the Department of Family Life, collaborated in studies on the role of clothing in a child's development. Observations of children in the Cornell laboratory nursery school and estimation of children's clothing needs and design characteristics led to Miss Scott's using innovative ideas in clothing prototypes for children of nursery school age.

During the period when she was studying nursery school children, Ruth Scott attended the first White House Conference on Child Health and Protection (1930). She was the author of *Clothing for Children*, extension bulletin 328, published in 1935. Written for consumers, it offered information about styles of children's clothing that might aid in the physical, mental, and emotional growth of the child. Many of the concepts regarding children's clothing

developed by Miss Scott with the aid of Miss Fowler are still sound today. Their work has provided guidelines for recent studies undertaken in the Department.

Ruth Scott was one of a group of dedicated faculty members who gave of themselves unsparingly for the development of the College of Home Economics that was to become known nationally and internationally as a place where young people of proved intellectual ability could receive higher education of the finest quality. Perhaps her greatest satisfaction came from the knowledge that she could point with pride to many graduates who had gained economic and personal independence and had contributed vastly to the welfare of families. In large measure this was due to the dedicated efforts of Professor Scott and others on the faculty who were her contemporaries.

Born in Vicksburg, Michigan, Ruth was the eldest of a large family of children. Her dentist father died young and she spent years helping to put the younger children through college. She is survived by two sisters, Mrs. Dorothy Horst and Frances Scott, both of 295 Panoramic Highway, Mill Valley, California 94941

Elsie F. McMurry

Gad Parker Scoville

May 4, 1885 — March 9, 1971

Gad Parker Scoville, professor of farm management, emeritus, died in St. Petersburg, Florida, on March 9, 1971. He was born in Varysburg, New York, and received his early education there and at nearby Attica. He was graduated from Cornell in 1910 with a Bachelor of Science degree in agriculture. He did graduate work in economics at Harvard, where he was awarded a Master of Arts degree in 1922.

Mr. Scoville taught in the high school in Fresno, California, for two years, 1910-12. In 1912 he became the first county agricultural agent in Chemung County, New York. Agricultural extension work was a new educational effort and there was no definite pattern of procedure. While a student at Cornell, Scoville had learned the farm management survey method, which was a revolutionary method for studying farm businesses developed at Cornell. He pioneered in applying this method to extension work with farm operators. He was able to analyze the management problems of farmers and provide the basis for study of alternate solutions.

His work was so successful that it soon attracted widespread attention. In 1914 the Farmers' Cooperative Demonstrations Division of the United States Department of Agriculture arranged for a joint appointment with the College of Agriculture at Cornell in order that Mr. Scoville might train farm management demonstrators from other states as well as from various New York counties.

In 1916 he was appointed assistant professor of farm management at Cornell, and in 1920 he was promoted to extension professor of farm management, a title which was changed to professor of farm management in 1921. For more than two decades Professor Scoville devoted his research to the economic aspects of the production and marketing of fruit crops from the point of view of New York farmers. By means of surveys of fruit farm businesses nearly every year, he kept abreast of changes made by farmers and the effect of these adjustments on the profitability of their businesses.

For many years he taught a course in advanced farm management for seniors and graduate students. Field trips in this course were a highlight in the academic programs of many of his students. He used problem-solving techniques and worked personally with his students in studying farm business situations and solutions to management problems. Perhaps his greatest contribution to his students was training in assembling the pertinent facts and in basing conclusions on these facts. He was an expert in challenging ideas and particularly those which could not be supported with evidence. His challenges encouraged careful study.

Professor Scoville married Hazel Perrine on June 25, 1913. During much of their life at Cornell, Professor and Mrs. Scoville lived on and operated a poultry farm on West Hill where he practiced the farm management concepts which he taught. Professor Scoville retired in 1953 after forty-one years of association with the University and the extension service. For several years following retirement, Professor and Mrs. Scoville lived near their son at Goshen, New York. Later they made their home in St. Petersburg, Florida. He is survived by his wife; their daughters, Mrs. George McLellan of Ithaca and Mrs. Sidney Highley of Fredonia; and their son, Parker Scoville, of Goshen.

G. W. Hedlund, S. W. Warren, M. C. Bond

John George Seeley

December 21, 1915 — May 9, 2007

Professor Emeritus John George Seeley was born in North Bergen, New Jersey on December 21, 1915. He graduated from the Robert Fulton Grammar School, North Bergen, New Jersey in 1929 and Memorial High School, West New York, New Jersey in 1933.

As a child, he started his life-long interest in plants. His goal, when he started college, was to become a greenhouse carnation grower. Fortunately, for us, that changed, not his interest in plants, but his avocation. We have all, students, faculty, friends and the floricultural industry, benefited from his love, interest, knowledge and dedication to plant growing. John used this interest in all of his life's activities, from raising his children, to his professional avocation as a teacher and his deep involvement with Rotary.

In 1937, John received his undergraduate education at Rutgers University and graduated with a B.S. degree majoring in Floriculture. While an undergraduate student, he was elected to Alpha Zeta (National Agriculture Honorary Society) and awarded by that society "Best Senior in the College of Agriculture." John found his real love for teaching and research during his years at Rutgers and knew he required more training. He studied for his M.S. degree at Rutgers under Professor O. Wesley Davidson, a noted floriculturist and received his degree in 1940. He was superintendent of the ornamental horticulture gardens at the New Jersey Agricultural Experiment Station during 1940-41.

He matriculated at Cornell in 1941 as an Instructor to teach floriculture. In 1941, he left for a research position in South Carolina with the USDA, as part of the WWII effort, to study growth and extraction of rubber from field grown goldenrod. In 1944, he was a chemist in the Rubber Materials Laboratory of the Wright Aeronautical Corporation in Paterson, New Jersey.

In 1945, he returned to Cornell as an Instructor to continue his graduate studies under Professor Kenneth Post, who, at the time, was one of the world's leading researchers in the field of floriculture. The floriculture industry in the United States was changing and expanding rapidly. Post's research was a major factor in these changes and expansion.

John received his Ph.D. degree in 1948 and was appointed Assistant Professor in the Department of Floriculture and Ornamental Horticulture at Cornell University. In 1949, he was appointed at Pennsylvania State University as Associate Professor of Floriculture in the Department of Horticulture and ultimately Professor and Chairman

of the Floriculture Section. He was instrumental in creating a very active floriculture program, organizing the commercial floriculture industry in the state, beginning the Pennsylvania Flower Growers organization and publishing a monthly bulletin. He organized his colleagues in Plant Pathology, Entomology, Agricultural Economics and Agriculture Engineering to work together for the benefit of the commercial floriculture industry in the state. They created active teaching, research and extension programs.

Professor Kenneth Post, at Cornell, died suddenly in October of 1955, just after he was appointed department head. John was recruited to return to Cornell to take on the headship of the department. His tenure as head was historically significant for the Department of Floriculture and Ornamental Horticulture. Tremendous growth in the “Green Industries” (a phrase that evolved from the floriculture, nursery, landscape and turfgrass industries to describe them in total) was occurring. These industries enjoyed strong relationships with the Department, College and New York State government. John understood these dynamics and thus laid the foundation for many changes in departmental programs to better serve the changing needs of these industries. As an example, undergraduate education in landscape architecture, that had a long and significant history at Cornell, had disappeared. However, landscape instruction continued in the Department of Floriculture and Ornamental Horticulture. There were only two faculty teaching the courses included in the landscape curriculum for a rapidly expanding undergraduate enrollment. Furthermore, landscape audiences in the state that fully supported the Department landscape program, constructively urged that landscape design move toward accreditation as a Landscape Architecture Program. Under John’s leadership, the decision to move forward was begun with the hiring of a third faculty member who had the credentials to move the program towards accreditation. Today, Landscape Architecture (which has an accredited undergraduate program for over thirty years) is an independent department in the College and has a very close relationship with the graduate Landscape Architecture program located in the College of Architecture, Art and Planning. Collectively, these programs enjoy a national and international reputation for excellence.

Another example of change initiated under John’s leadership was associated with the need to bolster faculty support for the rapidly growing turfgrass industry in New York State. For almost thirty years, turfgrass science was someone’s part-time faculty assignment in the Department of Floriculture and Ornamental Horticulture. Under John’s leadership, the first full-time faculty position in turfgrass science was created and filled. Today, the turfgrass industry is supported by two faculty positions that interact with an interdepartmental team of turfgrass scientists from other departments and programs to field an outstanding program that enjoys tremendous moral and financial support from the turfgrass industry. Like Landscape Architecture, the Turfgrass Program enjoys a national reputation for excellence.

In addition to the “Green Industries,” John was also committed to youth and consumer education in floriculture and ornamental horticulture. John worked with the Department of Education at Cornell and the New York State Department of Education to get an appreciation of flowers incorporated into elementary school curricula. He also actively supported a full-time 4-H Youth position in the department that functioned to deliver floriculture and ornamental horticulture information and training to the extensive 4-H Cornell Cooperative Extension network in New York State. As head, John enthusiastically supported two Cooperative Extension positions that directed information to adult consumer audiences in the state. One channeled a program through the College of Human Ecology; the other through the traditional agricultural, county-based Cornell Cooperative Extension System associated with the College of Agriculture and Life Sciences. John was very proud of what these positions accomplished and followed their progress with great interest.

John was instrumental in organizing the Kenneth Post Foundation in 1957 after Professor Post’s death and served as secretary until his retirement in 1983. Monies for the endowment came from members of the floriculture industry. They collected over \$100,000, which was a very large sum in 1957. Interest from the endowment is still allocated to various research projects, selected by Kenneth Post Foundation board members.

John worked with the New York City Florists Club for many years, organizing programs and maintaining close liaison between the Department and Club members. At the demise of the Club in 1990, John was instrumental in having the Club donate its’ treasury to The Gloeckner Foundation (a philanthropic floriculture granting foundation), of which he was president.

John was active with the American Society of Florists, the national society for the floriculture industry. He served on numerous committees and was particularly active in one associated with “Grades and Standards for Cut Flowers and Potted Plants.” This committee and the society tried to convince the industry, including growers and retailers to have standards for their products on a year round basis. The arguments were very logical, but they were unsuccessful in establishing standards, which, by the way, are still not established today. John was elected to the American Society of Florists’ Hall of Fame in 1979.

Professor Seeley was active in the American Society for Horticultural Science. A national organization started in 1903 by a group of horticulturists that included Liberty Hyde Bailey. John a long time member of 68 years, was elected a Fellow of the Society in 1970, served on numerous committees and in 1981 was elected president. He also was active in the International Society for Horticultural Science, headquartered in the Netherlands. He was the

United States representative to the Section for Ornamental Plants from 1962-86, served as secretary from 1962-64 and chairman from 1964-70 and again from 1982-86.

In 1984-85, John was awarded the D.C. Kiplinger Chair in Floriculture by Ohio State University. This was a high point of John's career. This was a period of time when he was not under stress and could completely emerge himself in floriculture activities including teaching, research and extension. Colleagues at Ohio State still talk about the enjoyable, productive time they had working with John during that year.

John joined the board of the Gloeckner Foundation in 1970. This organization had a large endowment and granted monies each year to support floricultural research. In 1986, he became president, after the benefactor Fred Gloeckner died. John was particularly helpful to young assistant professors getting started. He advised and encouraged them on ways to improve their applications to obtain their grants. Many floriculture faculty in the U.S. still talk appreciatively about the help John contributed to their careers.

His interest in Rotary International was life long. He joined the Ithaca Rotary Club in 1957, rose to club president and became governor of District 7071 in 1973-74. District 7071 included about 50 clubs in central New York State. Part of his responsibility as governor was to visit each club during his one-year tenure. The theme of his talk to the Rotary clubs was "The Phenomena of Photoperiodism." John grew plants to demonstrate the phenomena and took them to these meetings. He related the phenomena to Rotaries' goals of service to mankind.

Honorary societies he was elected to include: Sigma Xi, Alpha Zeta, Phi Kappa Phi, Phi Epsilon Phi, Epsilon Sigma Phi, and Phi Alpha Xi. He received a Silver Medal from the Massachusetts Horticulture Society in 1980 and the Carl Bittner Extension Award from the American Society of Horticultural Science in 1982.

John met Catherine Cook, while he was a student at Rutgers and she a student at New Jersey College for Women (NJC). They married in 1938 and had five children. He was pleased all his children achieved their Bachelor's degrees and two, Daniel and Thomas, continued their studies to earn Ph.D. degrees. Thomas is presently Professor and Chairman of the Department of Neurobiology and Behavior at Cornell. John and Catherine were married for 61 years prior to Catherine's death in 1999. His son, David, passed away in 1995. John is survived by his daughter, Catherine Anne, of Ithaca, New York; and sons, Daniel, of Holliston, Massachusetts; George, of Cooperstown, New York; Thomas, of Ithaca, New York and 14 grandchildren and two great grandchildren.

In 1986, his colleagues in the Department of Floriculture and Ornamental Horticulture and Department of Plant Pathology organized the "Seeley Conference," where invited (100 limit) leaders of the floriculture industry of the

world came to Cornell for four days to a “think tank” analysis of major problems/changes facing their industry. This was an opportunity for intellectual exchange of ideas and thoughts among the participants, a unique innovative conference that was a great success. It has continued on an annual basis. The original conference board consisted of Cornellians, who during the initial years underwrote many of the expenses. Today’s board members aren’t necessarily Cornellians and the conference is self-supporting. This past June was the 21st conference and honored John.

John had a long and productive life; his accomplishments were many. He touched and improved the lives of many people, including hundreds of students. We are all pleased to have had the opportunity to know and work with him.

Robert Langhans, Chair; George Good, Ken Horst

Francis Joseph Seery

May 24, 1874—July 27, 1947

Francis Joseph Seery, the son of Thomas H. and Mary (Seery) Seery was born on May 24, 1874, in Waterbury, Conn. Thomas Seery was a mill superintendent and a grandson of Gregory Delacy Seery, the leader of the United Irishmen in 1798.

Francis received his secondary education in Waterbury High School, and then went to work. For seven years, from 1893 to 1900, he served his home city as engineering assistant on construction for additional water supply including Wigwam Dam. In 1900 he was transitman for the Isthmian Canal Commission exploring possible canal routes in Darien, Panama.

With this background of practical experience he decided to continue his education. In 1901, at the age of twenty seven, he entered Tufts College in Medford, Mass., and in 1905 received the degree of Bachelor of Science in Civil Engineering. During his summer vacations he was employed by the cities of Waterbury and of Fulton, N. Y., and also by the United States Geological Survey on topographic work in Kentucky.

After being graduated from Tufts he served, during the summers from 1905 to 1908, as assistant engineer in Department D of the New York State Engineer's Office on construction of the Barge Canal.

In September 1905, Mr. Seery was appointed instructor in hydraulic engineering in what was then the College of Civil Engineering at Cornell University in Ithaca, N. Y. This was the beginning of a teaching career at this institution which continued until his retirement as professor emeritus of civil engineering in 1942. In 1907 he was promoted to the grade of assistant professor, and in 1918 to a full professorship of hydraulic engineering, serving in the latter position for twenty-four years.

Professor Seery organized and taught courses in water supply, hydraulic construction, hydraulic engineering, water power (devoted to characteristics, hydrology, and operating conditions), water power and pumping plants (a design course), and conservancy and reclamation problems.

He was not idle during the summers of this long teaching career. Besides spending much time on very careful preparation of the practical engineering problems (on which he later had his students present reports), he undertook numerous jobs for which his assistance was requested. He prepared a report on hydroelectric development on

Geneganslet Creek, and Oswegatchie River in New York in 1909, and also a design of the Potters Falls Dam of Six Mile Creek in Ithaca. In 1910 he made a valuation appraisal of the water plant at Lyons, N. Y., and in 1913 a similar appraisal for Watertown, N. Y.

With the participation of the United States in World War I, during the summer of 1917 Professor Seery was superintendent of water supply and sewers at Camp Dix, N. J.; and, during the summer of 1918, he served as hydraulic engineer for the United States Geological Survey assigned to investigate and make a confidential report to the Capital Issues Commission, United States War Board, on a proposed water plant at Watertown. His activities also included: a design-survey and estimate for extensions to the water supply of Moravia, N. Y., (1919); a report on five proposed water power developments on Jacques Cartier River in Quebec, Canada, for the Donnacona Paper Company (1921); a report on proposed alterations of Hoffman Hill Reservoir in Elmira, N. Y., (1922); a report to Congress as member of the board of consulting engineers appointed to review the "Jadwin Plan" for flood protection of the Mississippi River (1925-1926); a report on the sufficiency of Helmlock Lake for the water supply of Rochester, N. Y., (1935); testimony as expert witness on hydraulics for the State of New York on the Montezuma, Oneida Lake, and Ley Creek Cases (1936); a report on the extension of water works for Hammondsport, N. Y., (1937); work as expert on hydraulic meters for the New York State attorney general's department on water supply in Rochester (1937-1938); and expert witness in the Harrington Farms case (1938).

Professor Seery served the City of Ithaca as a member of the Board of Public Works for six years, from 1919 to 1925, being vice-chairman for the last three years; also, from 1943 to 1946, he was a member of the Ithaca Civil Service Commission.

He was elected an Associate Member of the American Society of Civil Engineers in 1907, and a Member in 1921. He became a Life Member in January, 1942.

The varied practical experience of Professor Seery in the field of hydraulic engineering had convinced him of the value of such experience to the teacher and to the student of engineering. Design problems of considerable scope, length, and suggestiveness were made a part of the courses which he taught. The educational worth of these problems is attested by the fact that almost all his students valued them highly, preserving their reports when returned at the end of the course, and frequently benefiting by them in their professional careers after graduation. By spending much time and energy in the composition of these problems Professor Seery asserted his conviction of the basic truth in the words of Aristotle: "For the things we have to learn before we can do them, we learn by doing them." This feature of the teaching methods of Professor Seery has become incorporated in other fields in

the curriculum of the School of Civil Engineering at Cornell. His work thus will extend an influence toward the better training of students in the future.

Since he always had available in his memory much interesting and supporting extraneous material gleaned from his own practical experience and from extensive reading, his classes were far from dull. He made much direct use of current engineering literature, both to fortify the textbook and to orient the student toward the actual living world of engineering. He did not, however, neglect basic theory in developing the student's grasp of subject matter. In his work as a teacher he stressed conception, design, construction, and maintenance as elements in the structure of an engineering education and as activities that would be required of an engineer in his varied experience after graduation.

Professor Seery was a devoted member of his Church, and he contributed generously to the betterment of the civic life of the community. His sense of responsibility for his students' success and his kindly human interest in their welfare was most admirable. It encouraged a friendly intimacy and confidence that enabled his students to profit greatly from his comprehensive knowledge of the subjects he taught and from his wide practical experience. He will long be gratefully remembered.

Professor Seery was married to Elnora C. McElligot of Waterbury, Conn., in 1909. He is survived by three daughters: Miriam, with whom he resided in Dover, Del., after leaving Ithaca; Virginia, of New York; and Francesca (Mrs. J. Theodore Chamberlain), of Tarry town, N. Y.; and a grandson, Teddy Chamberlain.

R. F. Chamberlain, E. W. Schoder, Hugh Troy

Jason Seley

May 20, 1919 — June 23, 1983

About a year and a half after becoming dean of the College of Architecture, Art, and Planning at Cornell University, on July 1, 1980, Jason Seley learned that he had cancer of the lungs and that the condition was beyond the reach of surgery. Another person in such a condition would have resigned and withdrawn from society and would have spent his remaining days in harrowing self-pity. Jason Seley, however, continued to come daily to his office, fulfilled his duties, came often to the Statler, and met his colleagues and friends—and invariably with affability, a gracious smile, and warm civility. He continued to live and work as if he had all of life before him, though Clara, his friends, and associates knew that he must have been suffering excruciating pain. His conduct and bearing during the last year and a half of his life recall a memorable passage in William James's *The Varieties of Religious Experience*, written as if to fit Jason's case:

A life is manly, stoical, moral, or philosophical, we say, in proportion as it is less swayed by paltry personal considerations and more by objective ends that call for energy, even though that energy bring personal loss and pain....Even a sick man, unable to be militant outwardly, can carry on the moral warfare. He can willfully turn his attention away from his own future, whether in this world or the next. He can train himself to indifference to his personal drawbacks and immerse himself in whatever objective interests still remain accessible. He can follow public news, and sympathize with other people's affairs. He can cultivate cheerful manners, and be silent about his miseries. He can contemplate whatever ideal aspects of existence his philosophy is able to present to him, and practice whatever duties, such as patience, resignation, trust, his ethical system requires. Such a man lives on his loftiest, largest plane. He is a high-hearted freeman and no pining slave.

During those agonizingly difficult months and days we knew that there moved among us a very special person, a high-hearted freeman who did not pass up the opportunity to live on his loftiest, largest plane. And during the very last several days, when he was bedridden in the hospital and knew that his hours were counted, Jason talked as a man who had achieved reconciliation, peace, and a comfort that was above and beyond all earthly frustrations and indignities. The state of his mind during those hours can again best be described in the words of William James, written as if he had observed Jason Seley:

In this state of mind, what we most dreaded has become the habitation of our safety, and the hour of our moral death has turned into our spiritual birthday. The time for tension in our soul is over, and that of happy relaxation, of calm deep breathing, of an eternal present, with no discordant future to be anxious about, has arrived. Fear is not held in abeyance as it is by mere morality, it is positively expunged and washed away.

All his life Jason Seley moved among men and women as one concerned with their interests and problems, and yet one was aware that he all the time preserved a secluded center from which there radiated an inner, secret core of happiness, privacy, and ideality.

Seley was born in Newark, New Jersey. At Cornell, where he received his B.A. degree in 1940, he was influenced to become a sculptor by Kenneth Washburn. During the years 1943-45 he studied modeling under Ossip Zadlkin at the Art Students' League in New York. During the years 1947-49 he and Clara, whom he married in 1942, were in Haiti, where he taught a class in lifemodeling at Le Centre d'Art, of which Albert Mangones, a friend from his undergraduate days at Cornell, was one of the founders; and it was in Haiti that Clara turned from dancing to painting and sculpture. Seley's first exhibition was in 1946 at the centre. (This was in the days before "Papa Doc" Duvalier, when there was artistic ferment in Haiti.) In May 1947 he was back in New York for his first exhibition there, and then the Seleys went back to Haiti, returning to the United States in 1948. During the following year Seley had a Fulbright scholarship in France, where he studied sculpture at the Atelier Gaumond at the École Rationale Supérieure des Beaux Arts. The Seleys traveled in Italy, where Jason looked for and found the equestrian statue of Bartolomeo Colleoni, by Andrea del Verrocchio, an exact and full replica of which stands in Lincoln Park in Newark, which Jason had often seen. "I have been enamored of that statue," he said, "ever since I can remember." Years later Jason was to make his own replica of this statue, which became a part of the Nelson A. Rockefeller Collection at the Empire State Plaza in Albany. The Seleys returned to the United States in September 1950. In 1953 they went back to Haiti for a six-month period, and in September of that year Jason began the academic aspect of his life as a sculptor by becoming a faculty member at Hofstra College. He taught at Hofstra to 1965; then he taught sculpture at New York University from 1965 to 1967. In 1968 he came to Cornell as professor of art and chairman of the Department of Art. He held the latter Position to 1973, and in July 1980 he was appointed dean of the College of Architecture, Art, and Planning.

At first, and for many years, Seley used clay, terra cotta, and plaster as the principal materials to make largely figurative sculpture. Starting in the early 1950s his work became less figurative, and building directly in plaster became more frequent. He also started to use found objects in armature construction. In 1956 Clara found a bumper from the rear of a 1949 Buick Dynaflo, the beauty of which attracted her. They bought it for one dollar. Two years later Jason "saw an armature form in it," and the result was *Random Walk*. As he viewed this piece of sculpture, he "felt that the work was stronger and more volumetric than the work that immediately preceded it." At that point, he said, "I consciously sought out bumpers, using them as armature forms on which to build directly

in plaster.” After a time Jason realized that by this use of the bumpers he was, in fact, obscuring the qualities of the forms that had attracted him in the first place, and so in the winter of 1958-59 he learned to weld and performed welding after that. His work then expressed the material he was using and allowed it to reveal its identity, and this led to his becoming known as the “bumper sculptor.” On one occasion, in 1963, Jason Seley explained his use of bumpers: “I employ auto bumpers, which are, to me, inspirational. I move them around. Put them together. Add. Subtract. Then, if all goes well, something exciting begins to happen. It is like a voyage of discovery, like going somewhere one has not been before.”

In 1968, in reflecting on his own work, he made this significant statement:

I work, I believe, inspired by the nature of my time and place. To me an automobile bumper is an offering of nature's abundance. I am as much concerned with its prehistory as the wood-carver with the growing tree. The bumpers I use are chromium-plated steel of high quality. The individual pieces come in interesting and exciting preformed sculptural shapes that are as much a source of inspiration for me as the irregular shapes of fields tones were for John Flannagan. I use them with the care, thought, and reverence that their infinite grace merits. I do not think of myself as an “automobile” or “junk” sculptor, nor an “assembler.” I am a sculptor facing the challenge of the means and materials of my choice, just as my contemporaries and predecessors face, or have faced, that challenge of their own methods and media.

More recently, in 1980, Jason said:

Almost from the outset my conscious aim and endeavor was to transform the material but to have that transformation take place without obliterating the identity of the material. I did not want to destroy its prehistory....The complete bumpers are used as much as possible, but because of the way the various parts relate to each other as a totality, transformation takes place. That has always been a very conscious thing with me.

These reflections on his own methods and directions throw light on new phases of his work that emerged in the 1960s and 1970s. In 1965 he conceived the idea that one could show how many things of the world could be made out of bumpers; for example, how ancient statues could be copied, how articles of furniture could be made, or even an entire automobile. And Seley did make such things, which have been widely exhibited. But Seley saw this development as a change in his aesthetic position. “The point was no longer,” he said, “the bumper with its history exposed but rather the use of it as an art material. Since I was no longer committed to the history of a bumper—that identity was no longer essential to me—I had no reason to preserve the shape of a ‘59 Buick, a ‘47 Cadillac, or a ‘66 De Soto. It was about 1977 that I first used the sheet steel painted black and consciously destroyed the identity of the bumper by destroying its form. In my doing this, bumpers became truly an art material, similar to unopened tubes of paint.” Thus it came about that bumpers became, in Jason’s hands, “welded chromium-plated

steel.” Now he could say about a bumper that he was “not concerned with its prehistory any more than the wood-carver is concerned with the tree. The material I use is chromium-plated steel of high quality. The pieces of steel have interesting and exciting precast sculptural shapes that are a great source of inspiration to me.”

Thus it can be seen that Jason’s artistic development was not arrested at the point where he discovered the use of car bumpers in sculpture. Eventually the bumper became, in his conception and in his hands, fluid material that flowed into artistic forms of great beauty, expressing or suggesting the artist’s sensibility, imagination, wit, and wisdom.

Like other artists, Jason had predecessors and contemporaries whose works he admired and from whom he received inspiration. Most notable among them were Donatello, Bernini, Rodin, Jacob Epstein, Henry Moore, and David Smith.

Though dying at the peak of his powers, Jason had lived long enough to have won wide acclaim and recognition. He was the recipient of many awards and commissions; he was an artist-in-residence at various colleges; he had lectured at over thirty colleges and universities; his work was selected for numerous American, foreign, and international exhibits; his sculptures are in the Museum of Modern Art, the Whitney Museum of Modern Art, the Hirshhorn Museum of Sculpture at the Smithsonian, and in other museums and collections; his work was represented at the White House Festival of Arts in 1965. His appointment as dean at Cornell was a recognition of the esteem and affection he had won among his colleagues and students and a reflection of the international fame that he had won. And in the three years he served in that office he helped to unify the college’s diverse interests and intensified the loyalty and enlarged the generosity of its alumni.

Fame, let it be said, rested upon him lightly. Jason was always, in his relations with every person, gentle and affable. He passed no harsh judgments. His native wit was often an expression of irony and imaginative play, but he never allowed it to become satirical, and it is unthinkable that he ever would have permitted himself to say anything malicious. One hesitated to pass on to him any bit of nasty gossip. His encyclopedic memory was always a cause of amazement.

We and future generations of men and women at Cornell will have as reminders of Jason Seley the generous gifts he has given to the Herbert F. Johnson Museum of Art and the furniture he designed and welded for the office of dean of his college. But of no less substance will be the real yet intangible evidences of the fact that he was a person who supremely merited our profound respect, gratitude, and affection.

The major part of Jason Seley's life was devoted to an aesthetic gratification that was pure, clear, and disinterested. It was, to use Plato's terminology, an unclouded contemplation of images of eternity seen in the guise of the furniture of earth—beasts and men, chairs and automobiles— which became to him transparent ideas that were freed from the limits of time, space, and will; from pathos and pathology; from change and death.

Somewhere at his college there ought to be inscribed in bold letters Jason's artistic *apologia pro vita sua*, which he stated in one memorable sentence: "I just know I do sculpture because I don't quite know how I'd live through my life if I didn't do it."

Alvin F. Sellers

August 9, 1917 — January 19, 2008

Alvin Sellers joined the Cornell faculty in 1960 as Professor of Physiology and head of the Department of Physiology of the Veterinary College. At the time of the appointment, he was internationally recognized for his work on ruminant digestion and ion transport. He would soon attract talented new faculty members that became world leaders in research and graduate training in gastrointestinal physiology and in the emerging field of comparative gastroenterology.

Al was born in Somerset, Pennsylvania, the son of Addison B. and Marion F. Sellers. He received the VMD (Veterinariae Medicinae Doctoris) from the School of Veterinary Medicine, University of Pennsylvania in 1939. He subsequently did graduate work at the Ohio State University and received the M.S. degree in Pathology in 1940. He continued graduate research training at the University of Minnesota until 1942 when he joined the United States Army Veterinary Corp. During World War II, he served as Chief of the Section on Bacteriology and commanded one of three mobile units of the First Medical Laboratory in campaigns in North Africa, Sicily, Italy, France, and Germany. He returned to the University of Minnesota in 1946 to complete his graduate training and later served as Associate Professor, Professor, and head of the Division of Veterinary Physiology and Pharmacology in the School of Veterinary Medicine of the University of Minnesota. In 1957-58, he was a Guggenheim Fellow at the Physiological Laboratory, University of Cambridge and at the Rowett Research Institute.

Al's personality often appeared serious but this masked a huge sense of humor. For those who knew him well, he was the ideal dinner party guest because of his talent as a storyteller. His dedication of purpose in the laboratory was recognized by all with whom he was associated. His work and that of his close associates resulted in numerous, critical advances in knowledge of ruminant digestive physiology and, during the latter part of his academic career, in similar advances in the closely related digestive function of the equine large intestine. Al was a dedicated experimental physiologist but was equally committed to applying the sciences basic to medicine in teaching and in veterinary medical practice.

Al is survived by his wife of 65 years, Dorothy M. Sellers; by three children, Alvin F. Sellers, Jr., Mary Ann (George B. Seeley) Sellers, and Christine (Karen Grimm) Sellers; by two grandchildren, Kate Sellers Seeley and Laura Jane Seeley; and by one great-grandson, Jack Riley Wheeler Seeley.
